Both will be shown with an excerpt taken from qualitative data collected in group discussions and problem-centred interviews with eight young adults (age 14-20). Part of the data was collected during a 4-day workshop, where reflections and discussion about experiences of racism and strategies among participants took place. The analysis reveals the risks of openly addressing practices as hurtful and racist in a school setting among friends and describes irony as a tactic as well as the ambivalent consequences of the chosen tactic.

Beyond Economic Inequality - a Socio-Ecological Perspective

We live in times of multiple crisis characterised in particular by social and environmental problems. Within the social dimension, we find especially rising economic and social inequalities unfolding since the beginning of the 1980ies. In terms of environmental challenges, we observe that environmental pressures are putting our planet more and more at risk and resulting in ecosystem changes. Although much has been said addressing both crisis-phenomena separately, we argue that important aspects are not discussed with the attention that they deserve: the interaction between income distribution, different patterns of consumption and the resulting consequences for the environment.

Accordingly, our paper is a first attempted to take an integrated perspective on the social, ecological and economic dimensions of income distribution and consumption. Our central argument is as follows: the unequal distribution of income within a society is not only posing serious challenges for the economy but also adds to the steady erosion of a society's natural resources as inequality fuels luxurious and status consumption. This type of consumption, in turn, can be characterized as relatively more damaging for the environment.

To tackle the issue form an integrated perspective, we will review the existing theoretical and empirical literature on income inequality, status consumption as well as environmental issues of specific consumption patterns. In a next step, we explore household expenditures and the evolution of income inequality in Germany over time to understand the inequality-consumption-nexus and shed light on the hypothesis that consumption changes in times of rising inequality. This is then linked to data on CO_2 emission intensities for different household consumption patterns. We end by our paper with a discussion of our findings by placing them in the discourses around social and economic inequality as well as climate justice.

SCHAUM, INA* (Goethe University Frankfurt, schaum.ina@gmail.com)

From Outsider to Insider through „Discourse Splitting"

German Jews migrating to Palestine before 1939 were regarded as outsiders by the native-born *Sabras* as well as the pioneers of earlier Zionist settlement movements, the *Chalutzim*. They were regarded as stiff, complicated and overly intellectual, a stereotype reflected in many so-called *Jecke*-jokes (cf. Shifman/Katz, 2005 and Almog 2000). The *Sabra*, and those that could pass as native-born, constituted the hegemonic cultural and somatic norm who built and defended *Eretz Israel* with their sweat and blood. The *Jeckes* therefore found themselves confronted by intersected and gendered discourses, particularly the *Sabra*-, the *Chalutzim*- and the *Survivor/Diaspora*-discourses. My paper deals with ways of positioning oneself amid those discourses and methods of becoming insider through submission to, as well as modification and appropriation of those discourses. More specifically, I will present the case study of my interview partner Dvora Orbach, who gained herself an insider positioning through what I term discourse splitting. I argue that apart from the possibility to hold positions in two discourses at the same time or to "switch" discourse positions in different contexts and times (cf. Tuider 2007 and Spies 2009), discourses can be split, partly appropriated and partly rejected. I interpret this strategy as a way of overcoming the confrontation with a hegemonic norm that is difficult to meet.

The analysis of her narration reveals that Dvora splits the *Jecke*-discourse. While she rejects negative characteristics (e.g. blind faith in authority), she claims the positively connoted stereotypical characteristics such as reliability and high education. Another discourse splitting is evident in the reconstruction of the Sabra-discourse in her narration and its interplay with the Orbach family dynamic. Through the splitting, Dvora achieves for herself an insider position without having to distance herself completely from her family and origin. This strategy of discourse splitting might prove relevant for other outsider-insider contexts as well.

Integrating the Patriarch? Contested Representations of Turkish Migrant Men in Austria

In this paper, I analyze how Turkish migrant masculinities are represented in the Austrian context, how these representations are used politically and how migrants themselves engage with them. To study the contested representations, I employ discourse analytical as well as ethnographic methods and bring together critical masculinity studies, critical migration studies and feminist postcolonial theory.

Equipped with this approach, I analyze Austrian migration law and accompanying political discourses since the 1960s to show the role that shifting constructs of migrant male others in public discourse play in legitimizing restrictive migration legislation. Upon that, I briefly present three case studies in which I studied how Turkish migrants engage with the dominant public images. First, I focus on the contemporary discourse of homophobic Muslims and ask how a group of migrant LGBT activists in Vienna engage with this discourse and which notions of Turkish masculinity they construe in their work. I then present the analysis of a group of young men with Turkish migrant background, who engaged in rap music and seemed to correspond to images of problematic Turkish youth. But ethnographic data complicates this simplistic notion. Finally, I discuss how a young migrant film maker uses the medium of art for his critique of constructs of Turkish migrant masculinity, both amongst Turkish migrants in Austria as well as in sociological research.

I end the paper, by critically discussing how images of migrant Turkish male otherness are used to establish notions about a modern normative Western masculinity. Furthermore, I argue for the need to decolonize research on racialized masculinities. Such research should aim to highlight intersectional structures of dominance as well as sites of friction, contradiction and resistance to these relations of power.

SCHIEBEL, MARTINA* (Carl von Ossietzky University of Oldenburg, martina.schiebel@uni-oldenburg.de)

"the Respected and the Outlaws in Social and Political Change"

In Germany, the geopolitical faultline of the Cold War, enemy images played an important role after 1945 and especially after the creation of the two German states in 1949. One "result" was increasing anticommunist tendencies in the era Adenauer in West Germany. Official ideologies classified people whose political views differed from those of the majority as "subversive". A similar political atmosphere could be found in East Germany, where those expressing critical political views were also quickly labelled "subversive".

In my paper I would like to focus on people who had made the biographical experience of being sanctioned and arrested in Eastern and Western Germany in the 1950th and early 1960th. In my research study I've contrasted biographical narrations with the discourses of public press. Groups where because of their political opinions and ideals defined – I called them in my typology – as the respected or as the outlaws. But those labels where changing historically and produces – at least after the German unification – different groupings: Depending on political regimes and public discourses former insider became outsider and vice versa. The empirical findings are not only helpful discover the consequences for political action, political culture and commemorative culture in Germany. They give us a closer look into the process of figuration in social and political change.

SCHILLING, HANNAH* (Center for Metropolitan Studies, Technische Universitaet Berlin, Hannah_Schilling@gmx.de)

Urban Youth's Making of Social Infrastructures in a Context of Precariousness

Much has been said about the individual management of precarious working conditions (i.e. De Soto, 1989; Paugam, 2000), stressing the danger for social cohesion (i.e. Bauman, 2008; Castel, 2008). The focus of my article lies instead on the social infrastructures that an urban context generates for young urbanites. I develop my argument on the basis of narrative interviews and participant observations with young urbanites, men and women, of working class families living in Abidjan, Cote d'Ivoire. The notion of social infrastructure (Simone, 2004) is used to describe how young urbanites make use of the social fabric of the city to cre-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ate opportunities that generate resources to sustain their daily livelihood. This not only includes social ties (Hannerz, 1980), but also sociabilities that are more transient as stability in life gets rare, as well as policies shaping distribution mechanism, in form of categorical differentiations and moral orientations (Blokland et al., 2016). The analysis of practices of provisioning of Abidjanese working class youth allows me to explaining how (inter)national policies of social welfare and labor create gendered opportunities to use the resources of an urban context with a diversity of forms of economic activities. I show how the remainders of the institutionalized public employee and the respective gender arrangement promoted by an Ivorian Welfare State inform the way the youth develop alternative ways to provisioning themselves, and the way they draw upon the resources of informal economies. Hence I situate the making of social infrastructures in a global history of labor (Cooper, 1996; Eckert, 1999) and postcolonial realities (Boatca, 2015; Comaroff/Comaroff, 2005), with the ideals of youth transitions, work and gender roles attached to it. This case study finally contributes to a global youth sociology and labor studies that don't take the Global North as the center and starting point of analysis.

SCHINDLER, SASKJA* (University of Vienna, saskja.schindler@gmx.net)

Fragmented Staff – Temporary Agency Work and Its Meaning for Staff Relations in Austria

Temporary agency work is one of the most rapidly growing forms of atypical employment in Austria (Stichtagserhebung 2013, Specht 2010). In the area of atypical employment temporary agency work is an interesting case because it is the only male-dominated one (Geisberger/Knittler 2010) and it is frequently used in the industrial sector (Stichtagserhebung 2013). At the same time it is considered to have a high precarious potential (Specht 2010). Precisely the industrial sector has traditionally been characterised by powerful trade unions, stable labour relations and hardly any precarious employment. Thus the increasing use of temporary agency work causes important changes within this sector.

My paper describes the development of temporary agency work and the working conditions of temporary agency workers in Austria and it is concerned with the question what the use of a low secured group of workers (who perform the same tasks but under worse conditions) means for the staff relations in user companies: How does the examined situation affect the permanent workers and their working conditions? What does it mean for the temporary agency workers? And how does it transform the staff as a whole? Methodologically the paper is based on qualitative interviews with workers representatives (N=7), works councilors (N=9), industry representatives (N=5) as well as company staff from two user companies (metal industry in lower Austria; temporary workers and permanent staff; N=18).

Juvenile Delinquency in Austria: Results from the Isrd-3 Study

The paper presents results of the third wave of the International Self Report Delinquency Study (ISRD-3) in Austria that was conducted in 2013. 6000 pupils in all 9 provinces participated which allows for comparative analysis at the province level. The survey aimed at describing patterns of criminal offending, substance abuse as well as experiences of victimization. Factors that are associated with offending and victimization -- these are, for the most part based in ideas of control theory (Gottfredson and Hirschi) like family background, parental supervision, truancy, self control, delinquent peers, leisure activities, drinking patterns, etc. -- were also conceptualized and measured. These contextual factors allow for the conceptualization of protective and risk factors from the perspective of crime prevention. The paper focuses on descriptive results of offending patterns for all 9 provinces of Austria as well as substance abuse.

SCHLEMBACH, CHRISTOPHER* (University of Vienna, christopher.schlembach@univie.ac.at)

The Du-Problem and the Modern Democratic Kosmion

In his seminal Der sinnhafte Aufbau der sozialen Welt, Alfred Schuetz shows how modern Austrian society is constituted on ideal types structures that are, finally, based on the ideal type of the Du which allows for establishing anonymous social relationships and structures of reciprocity under conditions of high anonmymity in the world of contemporaries. Some 10 years later, Eric Voegelin based his monumental History of Political Ideas on the idea that society is based in an in-

tegrated social realm which he called a kosmion. This paper traces the idea of the Kosmion back to Voegelin's source which is a little book authored by the Viennese philosopher Alfred Stöhr. Stöhr focused the problem of constituting a Kosmion in the Du-Problem as discussed by Schütz. It will be argued that modern democracy is a form of society that is based in a new understanding of the Du in terms of structures of reciprocity between strangers under anonmyous conditions. This idea is rooted in Weberian social thought and the argument that rationality and reciprocity are key in modern society. Schütz and Voegelin push this argument further and enrich it by the experience of the rise and the breakdown of modenr society in Austria.

Precariousness in the Chinese High-Growth Society: The Case of Migrant Workers in the Pearl River Delta

Precariousness is used increasingly by scholars to describe an insecure future, little or no access to social benefits and a general disconnection from steady employment. However, as the concept mainly refers to the deregulation of employment in developed countries since the 1980s, it remains unclear whether precariousness is a suitable concept to grasp the social reality of the Global South. In this paper, we refer to a relational concept of precariousness (Pierre Bourdieu, Robert Castel and Klaus Dörre) in order to understand precarity for migrant workers in Guangdong province, China. For this purpose, we analyze 31 in-depth interviews with migrant workers in two cities in the Pearl River Delta, Shunde and Dongguan. We observe two main factors for migrant workers' subjective sensation of precariousness: First, as social ties to the rural countryside get weaker and rural subsistence work becomes less attractive, social security payments becomes increasingly important for migrant workers' livelihoods. Second, age influences migrant workers' subjective perspective on employment. Due to a growing labor shortage in China's coastal regions, young workers tend to have a high market-place bargaining power and, thus, do not fear unemployment. However, older workers continue to fear dismissal, as the current industrial transformation has resulted in factory downsizing and closures which makes finding new jobs for older workers difficult. Drawing upon these observations, we develop a zone model of precarity with three groups of migrant workers (the secure, the struggling and the precarious), older workers without pension are the major component of the precarious group. We conclude that precariousness becomes a new driver of labor conflict (e.g. Yue Yuen strike 2014) and due to China's shrinking GDP-growth, the zone of precariousness may continue to grow.

Parental Constructions of Masculinity at the Transition to Parenthood: The Division of Parental Leave Among Austrian Couples

Men and masculinity are considered a key factor in changing gender inequality at the transition to parenthood. Prior research on gendered division of parental leave concentrated on fathers' perspectives. This paper includes perspectives of fathers *and* mothers who make use of parental leave in different ways and asks how masculinity is jointly constructed, how these constructions are linked to the use of parental leave and if and how they are oriented towards hegemonic masculinity. The analysis is based on qualitative longitudinal data from Austria. We conducted 44 interviews with 11 couples before and after birth when decisions concerning parental leave were made. Our case reconstructions reveal that taking leave did not necessarily challenge but rather enhance hegemonic masculinity. Parents considered parental leave a central element of masculinity as long as it suited fathers' needs and circumstances permitted. The decisions for sharing parental leave were father-centred as both partners valued father's leave higher than mother's.

Climadapt.Local: Spreading and Strengthening Municipal Adaptation

Local authorities are fundamental in tackling climate change. They can bank on their close proximity to citizens and their strategic and mediating role in the interaction between civil society, private sector and central government.

In this context, and in order to promote effective Climate Change adaptation at the municipal level, the ClimAdaPT.Local project aims to develop a prolific interaction between municipal decision-making structures and local communities, in light of the main aims of the European Strategy for Adaptation to Climate Change and of the Portuguese Strategy for Adaptation to Climate Change.

ClimAdaPT.Local's trans-disciplinary team is currently supporting 26 Local Authorities in the development and implementation of their Municipal Adaptation Strategies (MAS). The project's team is simultaneously: (i) raising awareness of local stakeholders; (ii) providing training to municipal technicians regarding Climate Change Adaptation issues; and (iii) promoting Adaptation mainstreaming into local planning tools/policy. An additional project task is the development of a set of specific support tools to facilitate the MAS's elaboration and implementation by the 26 pilot-municipalities. In the near future, the goal is to extend this approach to the remaining 282 Portuguese municipalities.

This presentation will outline some initial key findings that have emerged from: (i) the project's deliberative workshops with the 26 local communities; and (ii) the results of the ongoing evaluation surveys applied to key-stakeholders, local policy makers, and municipal officers.

Climate Change Policy Networks in Portugal

2015 is another crucial year for climate negotiations. The Conference of Parts in Paris, at the end of the year, is yet another opportunity to reach a global deal on lowering carbon emissions and addressing climate change adaptation. Climate change is thus again on the international agenda and a policy priority for governments and stakeholders across the globe.

This paper will present the results of the survey conducted in Portugal in September-October 2015 within the international research project Comparing Climate Change Policy Networks (Compon). This survey of close to 80 policy actors and stakeholders allows us to build a network analysis of the connections between them, as well as collect information on their actions and opinions regarding climate change policy, its challenges and opportunities.

Climate change policies in Portugal have been sparse and discontinuous, with low stakeholder engagement. EU pressure has been decisive to reach some progress, rather than the internal consistency of decisions. Kyoto targets (which allowed the country to increase its emissions) have been met, but more as a result of economic downturn than of political action. Mitigation still holds the policy focus, whereas adaptation remains largely as a statement of intentions. The results of this survey may prove useful to stimulate the debate and raise awareness for the need for public and stakeholder participation in decision making and for more inclusive governance, as well as to give rise to fruitful international comparisons.

"Current Transformation Processes on the German Labour Market - Empirical Evidences and Theoretical Explanations"

The objective of the round table on relevant changes in the German system of labour force is to highlight some recent trends on the labour market as well as theoretical explanations by a dialogue between selected German work sociologists. The second title is "Current Transformation Processes on the German Labour Market - Empirical Evidences and Theoretical Explanations". The key note

speaker will be Klaus Dörre, professor at the Friedrich-Schiller-University Jena, an expert on Industrial Relations, Capitalism Theory, Precarious Work and Labour Market Theory.

The German Labour Market has changed dramatically in the last few decades. Starting in about 1990 after the German Reunification and extremely fastened after the Agenda 2010 decisions during the Schröder Government the former "Normalarbeitsverhältnis" in the primarily by huge Industry characterized Society Germany (full time job standard model) has lost its hegemonic character. A broad variety of different and highly flexible, sometimes precarious working contracts have been emerged (part time work, temporary work, freelancer, minijobs etc.). This trend goes hand in hand with a centennial shift in the relevance of Economic Sectors from Industry towards Services. Corresponding to this precarisation of contracts the German Labour Force has been splitted into several distinct arrangements and workforce categories, which range from permanently precarious, imformal and temporal employed to qualified personnel in long-term decent work.

Starting from this backgound the round table will pose several questions towards current conceptual explanations and interpretations by Sociology: Does the German Sociology of Work have not only empirical evidences and results but also a sufficient theoretical tool box and theoretical approaches? Does this not only indicate a transformation of the German Labour Market but also a complete disappearance of the German "Soziale Marktwirtschaft"? And are these trends indicators for a complete transformation of German Capitalism?

International Feminist Perspectives on Care Economy

The internationally observed "crisis of social reproduction" (Winker 2011) reveals that care work cannot simply be regarded as a female, pre-economic condition. Rather, care work has to be conceptualized as an issue of political economy that materialises globally in institutions and economic sectors and that is subject to politics and practices that it shapes at the same time. Feminist economic theorists have not only started to describe the different modes of care work, the specific dynamics of the care economy and its inherent power structures but also proposed engendered conceptualisations (Folbre 2001; Himmelweit 2007; Jochimsen 2003; Madörin 2010). These considerations can provide important theoretical starting points for a conceptualization of care economy from a socio-scientific perspective.

Against this background the proposed paper seeks to analyse which particular contribution these feminist concepts make towards the theoretical conceptualization of a political economy of care and its sectoral dynamics and interdependencies. It will identify specific characteristics, differences and similarities in theories on care economy on the basis of the above mentioned work on feminist care economy and the deployed approaches. The focus of this analysis will lie on
- their theoretical approach to care work and care economy
- their potential to describe the gendered rationalities of caring and sectoral allocation mechanisms.

The paper will furthermore explore the existing conceptual contributions for theorizing the political economy of care in a global context (Razavi 2007; Yeates 2005). On the basis of this analysis it will identify starting points for further theoretical considerations in particular with regard to the "5-Sector Model of the Economy" (Gubitzer 2006).

The paper is developed as a part of an empirical research project on care in the household sector carried out by Women`s Academy Munich and Munich University of Applied Sciences within the research cooperation ForGenderCare.

SCHNABEL, ANNETTE* (Heinrich-Heine-Universitaet Dueseldorf, schnabel@uni-duesseldorf.de)

Don't Ask What Your Nation Can Do for You... Welfare State Attitudes and Individual Religiousness

The presentation focuses on the effect of national heterogeneity on people's support for welfare states, in particular towards redistribution and taxation. Research has shown that objective contextual and institutional conditions matter as well as individual affiliations and group memberships. Objective qualities of heterogeneity refer to objectively measurable differences like the degree of language fragmentation or economic diversities or the diversity of religious affiliations. Subjective qualities refer to individually perceived degree of heterogeneity and to the individual affiliation towards the religious or national "imagined communities" and individual belief systems.

The presentation addresses the question of whether the degree of heterogeneity of religious communities has any influence on the willingness to support redistribution this community?

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Multi-level analyses on the basis of the EVS data from 2008 suggest that acceptance of taxation and of redistribution at least within the member states of the European Union (EU) depend to a considerable degree on religious identifications. According to the literature, religion is treated as a multi-dimensional concept comprising of belonging to a denomination, the individual salience of religiousness, the practice of 'service attendance', and the practise of 'praying outside service'.

On the basis of a multi-level regression analysis the presentation will show, that the acceptance of governmental redistribution and taxation follows the religious dimensions differently: Religious memberships affect governmental redistribution and taxation in the way that "higher authority is favoured, but cheating is ok as well" and that context matters as well:

The existence of religious majorities affect the acceptance of redistribution negatively.

The presentation will contribute to a better understanding of how religious group affiliations, memberships and beliefs affect the acceptance to care for others and for the wellbeing of a (national) society.

SCHNABEL, ANNETTE (Heinrich-Heine-Universitaet Dueseldorf)
BEYER, HEIKO* (Institut for Social Sciences,
　Heiko.Beyer@uni-duesseldorf.de)

Religion and Weltanschauung: The Politics of Religion and the Religiosity of the Political

During last years, the politization of religion became more widespread: the recent emergence of the Islamic State (IS) is the most palpable manifestation of this trend, the take-over of social care by faith based communities, Churches and charities a more common one. Instead of a 'banalization of religiosity' we observe that religion regains importance as an ideology ('weltanschauung') showing political consequences.

The presentation investigates this peculiar elective affinity of religion and politics theoretically and empirically.

We want to contribute to a better understanding of how and why political agendas seem so compatible with religious ones and vice versa. First, we provide an analytical distinction between the concepts of 'weltanschauung' and 'religion', defining the former as constituted by beliefs about the social and the latter by beliefs about the transcendental. Subsequently we investigate mutual structural elements, as Manichean categorizations of good/evil, utopian ideas of salvation, and the ontological construction of meaning.

The empirical part of our presentation presents evidence for these considerations. Using European Value Survey Data (EVS), we show correlations between different manifestations of weltanschauung and religious beliefs. We also tackle their embeddedness in social practices and memberships. Although the specific behavioral manifestations of religion and weltanschauung show differences they share a reinforcing function of the underlying belief system.

The presentation contributes to understanding of how religion becomes politicized and politics get religiously loaded and the mechanisms behind.

Convincing Evidence? a Meta-Analysis on Field Experiments on Ethnic Discrimination in the Housing Market

There exists a long research tradition of audit and correspondence studies in the US and European countries stating that ethnic discrimination limits the scope of available housing options. Despite being the gold-standard method to examine discrimination, experiments might nevertheless be biased: While the experimental set-up provides obviously a high internal validity, the generalizability and external validity of results is questionable. Threats to external validity stem for instance from small (convenience) samples that often cover only specific (and very small) geographical areas or suffer from reactive data-collection strategies in audit studies (see the critique by Heckman). Furthermore only specific sets of stimuli are in most studies implemented that may be confounded (e.g. names with social class).

So far, effects of these design features, are, however, mostly speculative. Meta-analyses allow exploring the heterogeneity of different experiments identifying systematic patterns (that might be caused by different methodological settings) using the high statistical power of pooled data analyses. But surprisingly so far not any meta-analysis on field experiments in the housing market exists.

We present a meta-analysis that sums up experimental evidence from nearly 50 publications covering a timeframe from 1973 to 2014 containing more than 60 experiments and 800 estimates of effect sizes of (conditions of) ethnic discrimination in the housing market. Is there a robust effect of discrimination in the housing market controlling for time as well as geographic location? How do findings covary with methodological settings, such as using audits or correspondence

tests, small or large sample sizes? In our meta-analyses we will demonstrate several robustness checks, including recent tools to detect publication bias that have been found to overcome limitations of classical meta-regression approaches.

Transforming Work Practices in Asylum Authorities. Practice-Theoretical Perspectives on the Implementation of a Training Programme.

The paper presents empirical insights into a particular instance of 'change management', namely, efforts to introduce elements of a 'service orientation' into asylum authorities. From a practice-theoretical perspective and based on a qualitative study conducted within the German Federal Office for Migration and Refugees (BAMF), the focus will be put on the socialisation and training of decision-making-officers within the organisation.

Asylum authorities can be considered state-bureaucratic organisations par excellence since they exercise a central societal function: to produce sovereign decisions on who is to belong to the collective and who is not. Until recently, and in contrast to bureaucratic organisations dealing with 'citizens', asylum seekers have been conceived not so much as 'clients' of the organisation but rather as subjects to be interrogated, policed and controlled. While asylum authorities have been at the forefront in terms of introducing important elements of managerialism (computerization, incl. the use of biometric data; output-orientation etc.), attempts to introduce a 'service orientation' are a quite recent phenomenon; a phenomenon that has, however, gained in importance as a resource in struggles around the maintenance of legitimacy.

The preliminary results of my study suggest that a) the conceptions and guiding principles contained within the new training programmes and organisational guidelines differ in fundamental respects from local work routines and the objectives measured by the organisation's workflow management systems, and that b) it is ultimately up to the individual caseworker to process the conflicting demands emanating from efficiency and quality norms. Looking at work and training practices in microscopic detail, I will argue that the changes taking place within the BAMF must be considered a hybrid of a return to bureaucracy and the simultaneous subjectification of its most central dilemmas. This fundamentally changes the way caseworkers relate to their work and to the organisation as a whole.

SCHNEIJDERBERG, CHRISTIAN* (University of Kassel,
　schneijderberg@incher.uni-kassel.de)

Films Conscript Interesting Life-Styles to Serve a Plot – or about Humane Scientists and Sciences As the Great Adventure of Our Time

Films in sociology are understood as visual forms, in which societies or groups in societies are being presented or represent themselves (Denzin 2003). However, the visual, the moving images are only one element of films; a second, neglected element of sociological film analysis are texts. Spoken words by actors support the visual of a film and vice versa. Sociology has a long tradition of document, discourse and sociolinguistic analysis which could be applied to text written down in film scripts as well. Nevertheless these valuable qualitative methods are limited in scope. Large amounts of texts can be explored and analyzed with text mining methods like topic modeling (Blei 2012; Blei et al. 2003).

Using a database with more than 600 films and scripts from 1925 to 2015 from a wide variety of genres (action, science-fiction, comedy etc.) topic modeling was applied to meta-analyze the social knowledge about science, scientists and universities in films, to discover which topics exist in these films, how these topics are connected and how these topics change over time. For instance, we find that more stereotypes than „power maniacs and unethical geniuses" (Weingart et al. 2003) are used to portray scientists in films. Scientists are important to generate key actors (e.g. bio-engineer ‚Captain America'), explore new worlds (e.g. ‚Interstellar'), discuss ethical issues beyond the sciences (e.g. ‚Manhattan Project'), and are funny guys (e.g. 'Flubber').

Topic modeling will be complemented by a qualitative content analysis. An in-depth analysis of typical examples of film scenes will be used to combine the text and visual analysis. The presentation will also reflect on the ambiguity expressed in the title – consisting of three quotes from Crichton (1999) in *Science* – and be concluded by discussing the limitations of this methodological triangulation to analyzing and interpreting films from a sociological perspective.

Framing or Praying? on the Paradox of the Discourse of Innovation.

The paper is based on a field study conducted in the financial sector in Germany. In particular the development of a private bank is recapitulated in respect of the role of language within a process of organizational changes. The main argument to elaborate is that a discourse of innovation could promote collective participation in the realization of a projected organizational future. But at the same time innovation-speech might lead to the opposite effect and rise fears and resistance against organizational changes. The balance between promotive and hindering effects and the paradox of success and failure of the discourse of innovation is reconstructed and illustrated in the paper on the basis of the empirical case: A middle sized bank was forced to develop a new business model for being able to survive within a highly competitive banking system. The strategy was based on the combination of retail-rationalization on the one hand and trustworthiness based on close relations to the customers within a socially controlled context, on the other hand. This business model was promoted as highly innovative and beneficial for both, customers and employees of the bank. It went successful even through and after the financial crisis, but started to lose effectiveness while the bank was growing and social relations - within the bank but also related to the customers - became more formalized. Instead of framing social action by a shared vocabulary the discourse of innovation turned into an abstract mantra of the management.

On (new) Moral Communities. Proximity and Normativity in Changing Professions

After decades of structural changes within the sphere of professional work, professionals seam to dissolve away of their former collective identities. Instead of the ideal typical construction of a homogenous elitist group, an encroaching of individualism characterizes the current development. Therefore different dimensions of individualization within professions are diagnosed: for example the influence of organizations on professional identities, a rising labour market competition, a turn from a professional to a more entrepreneurial orientation and the social diversity within professions in terms of gender, class and ethnicity, which complicate the social integration within professional groups. But not only is the social constellation of professionalism affected by these developments. In fact the consequences concern professionalism in general, insofar as professionalism connects the development and the reproduction of knowledge with a particular value system. With regard to empirical findings from different professional fields as medicine, journalism, lawyers and designers, the paper asks now for the analytical potential of the concept of the "moral community" on the background of these developments. According to Durkheim morality can't be understood isolated from the social context it is developed in and which at the same time is hold together by value orientations. We suggest, that identifying new moral communities within the larger established and non-established professional groups is an important key to describe and understand the transformation of professions in a future perspective.

Maternal Work and Care Arrangements for Children below 3: Increasing Socioeconomic Disparities in East and West Germany

This study explores changes in the take-up formal and informal child care and maternal employment for mothers with children under three years in East and West Germany between 1991 and 2013. We focus on differences between maternal education groups and changes therein following the massive expansion of day-care availability for young children since 2005. While attitudes towards using formal care for young children have also changed continuously, large differences between East and West Germany persist. By comparing the trends over time between East and West Germany, we examine if the substantially greater provision and acceptance of non-parental child care in East Germany serves to attenuate gaps in maternal employment and day-care use across social groups.

We estimate logistic regressions predicting the probability of i) maternal employment, ii) day-care use, and iii) informal care use based on waves 1991 to 2013 of the German Socio-Economic Panel Study (SOEP). The sample contains a total of 14,578 observations from 4,950 and 1,272 children under three in West and East Germany, respectively.

The findings indicate that the disparities in maternal employment and daycare attendance have increased over time between education groups in both East and West Germany. The increase in daycare use was most pronounced among children of high educated mothers. These mothers frequently complemented the use of formal daycare by informal care provided by relatives or nannies. Low educated mothers have been falling increasingly behind regarding employment and use of external child care, which may be seen as problematic in terms of mothers' longer-term labour market outcomes and children's opportunities to benefit from formal care. The findings suggest that expanding affordable formal day-care does not necessarily lead to more equal use of this publicly subsidized resource, but that social inequalities may even grow wider.

SCHOENECK, NADINE* (University of Bremen, nsv@bigsss.uni-bremen.de)

On the Nimbus of the Middle-Class Society. Perceived Stratification Realities and Perceptions of Social Conflicts in Cross-National Comparison

In many (Western) societies there has been an intensified academic as well as public debate on the middle classes for about three decades – not least because middle-class societies enjoy a nimbus of economic prosperity, political stability and social cohesion.

Generally, it can be assumed that a middle-class society is one with high economic welfare *(dimension: level)*, a comparatively low extent of inequality *(dimension: dispersion)* and a large share of people believing to actually live in a middle-class society *(dimension: belief)*. Compared to other more unequal types of stratification a middle-class society may therefore appear to be relatively classless. As a consequence, typical class-based conflicts (e.g. between people at the top of society and people at the bottom) may be less salient in a middle-class society.

Based on these assumptions my research question reads as follows: Apart from individual-level factors, how powerful is people's *belief* to live in a middle-class society with respect to perceptions of social conflicts – and compared against country-specific (objective) factors referring to *level* and *dispersion*?

In order to tackle this question, I draw on data from the International Social Survey Programme 2009 and suitable macro indicators (as measures of economic welfare: GDP per capita, Human Development Index, government expenses as percentage of GDP; as measures of inequality: Gini coefficients for income and wealth, share of unemployment as percentage of total labor force).

Results from multilevel analyses of 39 countries prove that people's *belief* constitutes a distinct dimension of reality and dominates indicators measuring *level* and *dispersion* with regard to national levels of perceived social conflicts. However, descriptive statistics reveal remarkable gaps between people's imagination of living in a middle-class society and the actual share of households with middle incomes. This finding, in turn, indicates that factors capturing *level* and *dispersion* should not be ignored.

How Round Is Flat? Crowdwork Between Relocalisation and Time Compression.

The creative industries are predestined to display new trends in work organisation. In this presentation we explore how spatially dispersed digital creative work affect workers' working hours and time organisation. Though 'crowdwork' or 'crowdsourcing' have been more common in low-skill- and highly standardised work, these labour practices increasingly spread to high-skilled labour with the creative industries on its forefront.

The emergence and progression of information technologies have vast impacts on how creative labour is organised. Better and easier access to the internet as well as faster and more reliable network structures allow creative producers to work online and connect themselves to clients from basically all over the world, for example via crowdsourcing platforms. From the outsourcer's perspective these new developments are primarily meant to reduce overhead costs and enable easy access to an enormous pool of skills and knowledge. For the crowdworkers these online platforms presumably open possibilities for e.g. new clients, acquiring new skills or the choice to work where and when one desires. In particular the autonomies of space and time are questionably when observed closely: we found it increasingly difficult for crowdworkers to act autonomously in respect to their choice of workplace and their time management. We could not identify a growing delocalisation but rather frequently encountered work at home. Furthermore a strong subordination under the clients' demands and expectations was

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

prevalent when it comes to availability, response times, long working hours or night work. As a result crowdwork can be described as highly individualised and often displays uneven power relations between the crowdworkers and the clients, fostered by the crowdworking-platforms' communication means and practices. In this presentation we are going to highlight our findings relating to time organisation, risks and possibilities for the crowdworkers also address organisational and technical aspects of platforms.

Role Models and Stereotypes in Germany from 1962 until Today – Women, Household Chores and Employment. an Empirical Longitudinal Study.

If, as many believe, Western European countries were undergoing extensive changes in gender roles, attitudes and behaviors due to cultural, political, legal and economic changes during the last 50 years - why was it not yet empirically examined? This longitudinal study deals with the question to what extent gender stereotypical attitudes and female role models underwent changes in the last half-century in Western Germany. Based on a representative survey named "The Situation of Mothers in Western-Germany" from 1962 data were compared and analyzed with data of the German General Social Survey (GGSS) 2012 using multiple linear regressions. For evaluation and discussion cultural, political and legal contextual factors from 1962 and the present were consulted. As a result, the analyses show partial changes in social attitudes, in gender-differentiated paradigms and behaviors. Possible explanations consist of an individualization process in the German society, an increase in female employment, the expansion of the education sector as well as the modification of political and legal arrangements throughout time. In the 1960s, gender role models were implemented very strictly and shaped daily life, as a consequence of collective norms and rules. The allocation of women to specific parts of the private as well as the professional life - especially to their family and household - was deeply ingrained in the population. At present, gender roles and -stereotypes in Germany have been modified, but not fully extensive. Hierarchical behaviors and attitudes still exists in daily life, contrary to popular opinion: women are still mainly responsible for reproduktionwork like housework and childcare, even if they are full-time breadwinners like their husbands. Policy makers should consider these results for further family and gender policies like the expansion of day care centers as a possibility to make traditional attitudes and behaviors losing influence.

RUBY, SOPHIE* (Friedrich-Schiller-Universität Jena, sophie.ruby@uni-jena.de)

Care, Care Work and the Struggle for a Careful World from the Perspective of the Sociology of Masculinities

Feminist research often links the issues of care and care work to women, both theoretically and empirically. This focus results from and reflects the dedication of reproductive work to women in modern West- and Eastern Europe, which is constitutive for these societies. The change of structure of labour from Fordism to Post-Fordism and the partially linked pluralization of family types has led to a transformation of the gender arrangements. The previous division of work between men and women cannot be considered a matter of course anymore. For men, one result of these changes is a 'reproductive problem', referring to the regeneration of the work-force on the one hand and reproduction in terms of fertility behavior on the other – hence to the familial patriarchal power. (In the Media this change is often scandalized as a 'crisis of men'.)

In our input we discuss the aspect, that in contrast to feminist theories, masculinities theories barely theorizes care and care work. Fatherhood for instance is neither included in Connells concept of hegemonic masculinity nor in Bourdieu's male domination. We would like to investigate in which way men and the construction of masculinities are affected by ongoing restructuring processes. Therefore, we focus on Eastern and Western Europe. For example, how remaining men and children handle the results of female care chains. We will put a sociologically founded concept of masculine generativity as a basis for discussion, which we developed referring to Erikson and King. We will discuss to which extent this can be a useful theoretical concept for the research of these and similar phenomena. We question if, and what kinds of non-hegemonic forms of masculinity exist and whether they integrate aspects of care and care work. Furthermore, who can foster processes to enhance the engagement of male actors towards a careful world?

SCHORCH, MAREN* (University of Siegen, maren.schorch@uni-siegen.de)

Co-Designing an Information and Support Platform for Elderly, Informal Caregivers

An accompanying effect of the ageing of the population worldwide is the increasing proportion of elderly people suffering from chronic illnesses like dementia or Parkinson's disease. In Germany, most of the care is practiced at home (Federal Statistical Office for Germany. Care Statistics 2013). Informal caregivers – the key actors of caregiving at home – are normally of older age too, may also have declining physical and mental capacity and are often under constant stress due to the 24/7-care situation. The research I conducted here deals with ICT development for this setting of domestic care using the example of 12 households in a rural area in Germany. It is within the scope of an interdisciplinary EU research project of sociologists, information scientists and practitioners (acronym: TOPIC, run time: 2013-2016). The overall aim of this qualitative project is to co-design and develop a web-based support platform for and with elderly, informal caregivers integrating requested services such as information provision about diseases and caregiving, exchange options (fostering communication and networking) and the coordination of care. This presentation will be based on data analysis from the intertwining three parts of my work: 1) ethnography in five households in Germany (participant observation over eight months, interviews and cultural probes) with inside perspectives about the everyday life of informal caregivers (average of age: 69 years), 2) the phase of introducing tablet-PCs to our participants and of teaching how to us them over five months as well as 3) experiences from the design process of the prototype of the platform that is currently in the phase of long-run field study. This contribution will underline the rationales for co-designing new ICT for this special and growing group of elderly caregivers and share experiences from empirical work in this field over the last two years.

SCHORCH, MAREN* (University of Siegen, maren.schorch@uni-siegen.de)

Narrative Consolidation of Transnational Biographies in Qualitative Interviews.

Following a constructivist point of view, identity and especially the identity of persons with multiple national backgrounds and on-going transnational relationships can not be understood as given or fixed over the life course, but as generated in interactions and undergo changes or modifications during lifetime. This contribution focuses on a specific interactive setting – biographical qualitative interviews – and the methodological research question how persons with a migration background and on-going transnational relationships interactively construct and present their identity in this context. Based on the concept of *narrative identity* (Ricœr 1991, 1996) and on positioning theory (Van Langenhove and Harré 1992, 1999), this talk will support the position that the method of reconstructing narrative identity, introduced by Lucius-Hoene and Deppermann in 2004, is a reasonable method for analysing the narrative identity of people within a complex (trans)national setting besides more traditional forms of analysis (like Schütze 1983, 1999 or Rosenthal 1995, 2005, 2011). This statement will be discussed and illustrated on the basis of the in-depth analysis of data material of four single cases (biographical interviews) with young scientists with diverse (trans)national belongings (Spain, Turkey, Denmark and Italy, all living in Germany). The different intertwined levels of positioning in the interviews were analysed in reference to the temporal, social and self-referential aspects of the respective narrative selves and were consolidated into case structures. Those levels provide a very suitable heuristic for the analysis of transnational biographies in general, and especially underline the importance of time (the reconstruction of the past, present, prospective futures) and the dialectic with social relationships (such as family, relatives, friends, but also the researcher/interviewer) for this *doing biography* (Dausien 2005, Völter 2006) in situ as well as in a biographical perspective.

Early Job Insecurity and Labour Market Exclusion: Structural Conditions, Institutions, Active Agency and Capability

This paper sets out to develop an original analytical framework for a comparative assessment of the individual and societal consequences of job insecurity early in a career. The framework integrates concepts such as negotiation, agency, capability, social resilience, networks, transition regimes, welfare state regimes

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and multi-level governance. A key interest is how to conceptualise the interactions between the young adults' agency and structurally given constraints and opportunities, (e.g. how they perceive and use their scope for action through networks and active agency, even in seemingly adverse circumstances) and in what sense young adults' find ways of negotiating the challenges of prolonged unemployment and job insecurity. As two notions that are highly attentive to interactions between structure and agency, we suggest that the concepts of 'capability' and 'social resilience' are particularly helpful in this regard.

We review and summarise relevant theoretical literature on key concepts and assess how they contribute to an understanding of the consequences of early job insecurity for young people. Of particular interest are factors that influence the extent to which young women and men are able to negotiate these conditions and avoid the most adverse consequences of such insecurity. Against this background, we are particularly attentive to mechanisms of gendered labour market outcomes and patterns of marginalisation of young people.

This work is developed as part of the Horizon 2020 funded collaborative European project NEGOTIATE, which seeks to examine how young people's scope for agency interacts with different layers of structural conditions in a multi-level governance system.

SCHREIBER, DOMINIK* (University of Mannheim, dominik.schreiber@uni-mannheim.de)

Climate Change and Humor? Revisiting Al Gore's Documentary "an Inconvenient Truth"

Since its very beginnings, western discourse on anthropogenic climate change has had a strong preference for apocalyptical narratives. Nothing less than the destruction of our environment and the end of the world have been imagined over and over again. The rhetorical strategy behind these narratives was, to put it simply: scare to initiate action. But recently it has been realized that the strategy of fear does not work, yet arouses counterproductive effects such as fatalism, neglect, or even denial. There are growing signs that, as a reaction to this, a paradigm shift is taking place. Terrifying narratives such as the opening video for the climate summit 2009 in Copenhagen are being replaced by a new humorous approach. One recent example could be the 2014 video campaign 'Zusammen ist es Klimaschutz' ('Together we can achieve climate protection') by the German Federal Environment Ministry, in which a teenager catches her parents literally with their pants down.

In my presentation, I will scrutinize this paradigm shift by focusing on a crucial turning point in climate discourse, that is Davis Guggenheim's groundbreaking documentary 'An Inconvenient Truth' (2006), starring Al Gore. Due to its huge impact on the public sphere worldwide, 'AIT' has also attracted the attention of academia and especially discourse analysis. Nearly unanimous, researchers attested that the documentary applies the aforementioned rhetoric of apocalypse, combined with Gore's act of self-staging (Bergin 2009; Rosteck/Frentz 2009; Smith/Howe 2015; or at least 'tempered' apocalypse Johnson 2009). However, it has been totally overlooked that 'AIT' seems to employ humor in many ways, too. For instance, the film engages self-irony, funny cartoon elements, and a wry critique of climate skepticism and the American car industry. Considering all this, AIT can be understood as a pivotal point, boosting the acceptance of humor as an appropriate rhetoric of climate discourse.

SCHREIBER, DOMINIK* (University of Mannheim, dominik.schreiber@uni-mannheim.de)

Climate Change and Its Entanglements with the Lifeworld – a Mundane Phenomenological Approach to Global Warming

Since its very beginnings western discourse on climate change has had a strong preference for apocalyptical narratives. Nothing less than the total destruction of our environment has been imagined over and over again. The rhetorical strategy behind this is, to put it simple: Scare to initiate action. But as we look back, we do have to state that this strategy obviously doesn't seem to work. The results are ambivalent at least. On the one hand, the issue of climate change has been recognized and discussed all over the world. But on the other hand, the problem of climate change is far away from being solved.

Reviewing the various sociological approaches on this issue (discourse analysis, impact research), it is striking that one promising perspective seems to lack so far: Alfred Schütz' mundane phenomenological approach of *lifeworld* (Lebenswelt) has not being applied on global warming, yet. This lacking is quite remarkable, as far as such a perspective offers some promising insights. Climate change can be understood as a phenomenon that combines geophysical and social concerns. Obviously, this nexus is situated strongly within our everyday life, in the sense that the whole problem is connected to and caused by our everyday behaviour and actions, such as driving cars, consuming energy and buying products. At the same time, the outcome of these practices exceeds our individual lifeworld by far, so that we are not capable of experiencing the attached global consequences. Communicating symbols and metaphors comes into play, to overcome this state

of great transcendence. In my presentation, I would like to scrutinize this tension field between everyday life, public media discourse, and the issue of climate change, to gain new insights on the question, how to make climate communication more efficient and how to strengthen the awareness of sustainability in the lifeworld.

The Importance of Linguistic Homogamy in (Inter)Marriages: Insights from a Multilingual Country

Factors that hinder intermarriage between individuals of different ethnicities or nationalities can often be subsumed under the header of culture. Differences in cultural norms, religious beliefs and more general values, for instance, are among those factors known to impede partnerships between members of different ethnic or national groups. Language is also one of the key cultural factors influencing partner choice and marriage behavior. Contrary to many other cultural features, the effect of the language, or more precisely that of the mother tongue, can hardly be separated from the effect of nationality alone. In this article, we aim to disentangle partially the influence of the "culture" on bi-national marriages as we disjointedly analyze the effect of linguistic and national homogamy. We use the multilingual country of Switzerland as a test case as it allows differentiating marital unions to co-nationals and non-nationals, each with the same or a different mother tongue. Our results suggest that, in addition to spatial barriers, linguistic differences are the largest obstacles to ethnic or national intermarriage. Accordingly, linguistic homogamy plays a major role in bi-national partner choice which is only then followed by religious homogamy, age similarity and educational homogamy.

Future Challenges of the Austrian Universities of Applied Sciences

The Universities of Applied Sciences (UAS) are a comparatively small, but fast-developing part of the Austrian higher education system. Like their older siblings, the research universities, the UAS are not only experiencing a time of rather rapid change, but are also confronted with, at least partly, contradictory expectations. This increases the need for a wellfounded knowledge basis for decision-making, especially when it comes to long-term, strategic decisions which are usually requested in the context of organisational development. Against this background a study on the future challenges of the Austrian higher education sector has been conducted, which focused on the special situation of the Austrian UAS. The paper draws on the findings of this study and will (i) discuss the theories of neo-institutionalism and organizational analysis which proved to be able to explain the past development of the UAS-sector to a large extent, and which therefore might be a useful starting point for anticipations about its future development, too, (ii) present the findings of a trend analysis which aimed at identifying and evaluating those societal changes which are expected to be most relevant for the future development of the Austrian UAS, (iii) imbed the specific situation of the Austrian UAS in an European context - the UAS-sectors of other European countries prove to have partly different approaches to similar issues. Even though the Austria UAS sector is quite specific, one can assume that the findings of the study are relevant for other higher Education sectors as well, (iv) Finally, the paper presents three explorative scenarios for the future development of the Austrian UAS sector which have been developed inductively on the base of the findings.

SCHUERKENS, ULRIKE M.M.* (Ecole des Hautes Études en Sciences Sociales, uschuerkens@gmail.com)

The Ecological Transformation of Modern Societies

The ecological transformation of modern societies
In many publications of national and international organizations, we can currently find discussions on the necessary ecological transformation of modern societies. The UNESCO *World Social Science Report* of 2013 with the title *Changing Global Environments* underlines this in particular. It argues in the preface: "The gap between what we know about the interconnectedness and fragility of our planetary system and what we are actually doing about it is alarming. And it is deepening." (3) In this sense, the report is in line with a reform movement that tries to bring forward the socio-ecological transformation of modern societies. This change is however slow and contradictory.

The question is why despite all activities (state programs and international conferences), we don't succeed in interrupting the predominant non-ecological development trend. Not only problems of poverty and inequality, but also problems

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of climate change, the continuing loss of species, the overfishing of the oceans, the deforestation, or the low level of drinking water are not stopped. One can see in day-to-day activities of politicians and in personal activities that sustainability targets don't matter. Why is the balance sheet so contradictory? Why do we hardly translate principles of sustainable development in a concrete way in politics, the activities of organizations, and daily life?

The ecological transformation of societies will certainly be one of the main challenges in the coming years. It is therefore important to reflect on the chances of an ecological restructuring of modernity in order to see which conflicts and dynamics are important.

SCHUETZ, CLAUDIA* (University of Innsbruck, Department for Sociology, claudia.schuetz@uibk.ac.at)

Capuling during and after Gezi - the Formation of a New Identity of a Young Liberalized Generation in Turkey.

The Gezi protests in Istanbul in 2013 presented a historical, nation-wide up-heaval against the increasingly oppressive and conservative course of the Turkish government. On basis of an empirical qualitative study in Turkey in 2014 with Gezi activists and Gezi movement initiatives such as neighbourhood forums, this paper dicusses analyses of the reasons for the protest and its social impact. Here, two particular features are defined: Firstly, the socio-structural examination of a young Turkish generation of protestors as main support group; secondly, the framing process of a culture of *Çapulcu*as a main explanatory approach of the protest movement.

While Turkey offers a long tradition of protest, the Gezi rebellion was a *young* protest movement, being formed by a highly educated and secular generation. The young protesters were reversing the swearword "Çapulcu" (looter), with which the Turkish prime minister tried to denounce the protestors as dregs of society in the first place, to the central self definition of the rioters. The word became synonymous for those young revolting people in Turkey, who do not feel attached nor represented by their state and its leading parties. *Çapulcu*thus does not only represent a young generations´ new identity but is rooted in their shared notion for a political culture of participation from below.

The paper argues that the Gezi protests represent a socio-economically lost young Turkish generation, which was given the opportunity to find and frame a collective identity. This identity is not only expressed by creative, humorous and artistic action practices, but also by a political culture of participation, which was established during Gezi. The guiding question is: What societal needs triggered the identity and the modes of action of the *Çapulcu* and what is the movements outcome?

SCHUETZE, LEA* (LMU Munich, lea.schuetze@soziologie.uni-muenchen.de)

Masculinity at the Margin? Self-Concepts of Elder Gay Men at the Intersection of Ageism and Homophobia

As research on elder men is slowly advancing (e.g. Bartholomaeus/Tarrant 2015), it is still the heterosexual elder who is the unquestioned ma(i)n figure when crossing masculinity studies with social gerontology. Expressing a form of subor-dinated masculinity (cf. Connell 1995) gay men can be seen as a marginalized and often discriminated group. With lives lived apart from 'normal biographies' they often suffer from the lack of financial as well as social support, for example when in need of elder care. When growing older, they are not only affected by differing forms of homophobia that always question the manhood of homosexual men, but also by various forms of ageism coming from subcultural scenes as well as from all spheres of society. Accordingly, elder homosexual men have to deal with phys-ical changes and restrictions who challenge images of the healthy, young body that mostly dominate gay communities and subcultures. Following the thesis that there is no common figure that implies a good way of ageing for gay men, I want to give insights into the various forms of how elder gay men in third and fourth age in Germany deal with this structural and symbolic challenge when growing older. Focusing on qualitative interview data conducted with men (60 – 90 years old) who identify themselves as gay, I will point out how they integrate discursive patterns about age, ageing and homosexuality into their self-concepts. Within an intersectional framing and using a poststructuralist concept of self-identity and subjectivity I want to shed light on how self-concepts show struggles with threat-ening forms of hegemonic masculinity, and how elder gay men find differing and often resistant notions of manhood when facing ageing in an ageist environment.

The Nonreligious/Secular Comfort Zone of Human Rights Reconsidered

Law, modernity and religion are merged. Brent Nongbri's "Before Religion" (2013) and Daniel Dubuisson's "The Western Construction of Religion" (2003) only are added to an old but growing stream of heretic sociology of religion. However, together with Decolonial theory in the 21st century we can even reach to a critical inquiry of human rights that pretend to strip the Western concept of nationhood of particularism. Nicola Perugini and Neve Gordon reveal the core as the "Human Right to Dominate" (2015) stemming on the allies' attempt to enhance the status of nation states in the aftermath of World War II. Annihilating competing animal and humane populations or cultural systems, human-rights-driven cultures safe-guard the elites' wealth, necessary working specialization and workers mobility. They exclude the majority of the others, claiming and violently defending national territories, also by brain drain towards the wealthier spheres. Human rights thus work as a trojan horse, states decolonial theory. "But what do we mean when we decide to embrace the quest to decolonize human rights?", asks 2013 José-Manuel Barreto in the introduction of the collection he edited, entitled: "Human Rights from a Third World Perspective: Critique, History and International Law". He de-fines "Decolonial Theory": "The conventional conception of modernity needs to be revisited to accommodate the legacy of modern imperialism, the conquest and colonization of the world – a vast enterprise of domination marshaled through wars of aggression, genocides, slavery, plunder and exploitation." (Barreto 2013, 2f.) Twelve years earlier, Kenyan originated US-law-professor Makau Mutua ques-tioned in Harvard International Law Journal "the universality and cultural neutral-ity of the human rights project", containing "a subtext which depicts an epochal contest pitting savages, on the one hand, against victims and saviors, on the oth-er." (Mutua 2001, 201) The paper will reconsider the comfort zone of human rights as presumably nonreligious.

SCHULZ MEINEN, HAIMO* (Institute of Sociology, h.schulz-meinen@ish.uni-hannover.de)

Total Mobilization in the West - Fiume 1919

Religious drive in public is prevalent when the majority feels inspired. Seen from a functional perspective on religion, if considerable parts of the broad public and of elites both are fulfilling their tasks and are keen on enlarging their mission to reach certain supported goals, the society should be considered religiously driven, not mainly secular.

A case study about a people less than a hundred years ago can indicate how modern mobilization can engage in an urban community. Italian fin-de-siècle-po-et Gabriele D'Annunzio invented and illustrated powerfully in 1919 how a city of 40.000 enlarged by volunteers from the rest of Italy and hundreds of inspired from abroad can be converted into a western caliphate. Heroic speeches from the balcony, rhythmic war cries, blackshirts with skull and crossbones and specific sa-lute forms as well as a very modern constitution were used to create successfully an all embracing feeling of difference. Everybody in then occupied Fiume (today Rijeka, Croatia) was urged to endorse the mission, *his* mission. Drawing on diverse elements of art, literature, political rhetoric, military talent and inventing modern propaganda, D'Annunzio with some colleagues set the path to what today has to be considered a religiously mobilized public. Being opposed to the then leading powers of the world turned to be helpful in mobilizing.

Analyzing the Fiuman adventure with the methodology of a sociologist of re-ligion can throw light both on recent forms of political units with religions dom-inant in public spheres like the caliphate of the so called „Islamic State" as well as on the mobilized society of the West enshrining the human rights utopia (see second abstract contribution to the session The Categories of Religion and the Secular in the Post-Secular Discourse).

Situational Scenarios in Engineers' Practices of Inventing Socio-Technical Futures

In our talk we want to present conceptual and empirical results from a research project funded by the DFG that investigates the role of future concepts as patterns of orientation in technology development. In this project we are focusing on situa-tional scenarios, a kind of future concept that envisages the future reality of a new technology within its imagined field of application. Our aim is to understand how engineers are guided by ideas about the future in their actual work of developing new technology. The results of our research on situational scenarios in the field of ubiquitous computing show that there are several ways how engineers derive technological or social requirements from the socio-technical settings depicted by situational scenarios. Some lead to rather specific technological solutions for very particular applications while others result in generic solutions for a broad range of possible uses. Situational scenarios on the one hand provide technology orient-

ed guidance, meaning that engineers derive technological features from considering a scenario. On the other hand they provide application oriented guidance: In this case the scenario provides the frame of reference for deriving the features of promising contexts of use from the imagined new technology.

We believe this kind of research to provide a basis for identifying promising ways of involving societal stakeholders in the process of making the future. Knowledge about how ideas about the future actually influence the work of engineers is a preliminary to any attempt of employing future concepts as a method of design or participation. Thus, in this talk our focus is on scenarios as they actually occur as patterns of orientation within the engineers' own practices of work rather than on scenarios as a dedicated design methodology or method of user participation.

Transnationally Distributed Software-Engineering: Do Technological Standardization and Professional Homogenization Make Cultural Barriers Disappear?

Abstract for the panel "The Regulation of Cross-Border Labor Mobility", RC02 Economy and Society, 3rd ISA Forum, Wien 2016

We focus on an issue which provides in two respects a useful complement to the main focus of the panel: In our case, labor mobility is mobility not of workers but of work tasks. That is, we are studying the effects of the relocation of work by offshoring software development tasks from Germany to East European Countries. Secondly, the kind of regulation, we are interested in, is not primarily regulation by laws, treaties, or agreements but regulation by technological standards and professional homogenization. The focus of our research is on the cooperation between software engineers in transnational teams of distributed software engineering. One of the most astonishing results of our empirical studies is that we do not find much frictions of conflicts in the task related cooperation which are due to cultural differences or language barriers. We assume that is on the one hand due to the fact that German as well as East European software engineers are not only familiar with the same software development tools but also share a quite similar professional culture. Our talk will provide evidence supporting this hypothesis. We believe this to be an interesting finding since technological standardization and common professional standards to some degree may substitute formal regulations in transnational work.

Addressing Uncertainty through Construction of Vision: The Potential of Scenario Planning.

Knight (1921) distinguished conditions of Risk from those of Uncertainty. Probability fit well the former, but is inadequate for the latter. Yet the future is predominately uncertain, and becomes more so the further into the future we delve. Perhaps due to the absence of a better approach, probability has been frequently used, or perhaps 'mis-used', to address uncertainty in policy and futures studies. The Scenarios-to- Strategies (S2S) technique was developed in a corporate setting. It offers an alternative approach to addressing uncertainty, that of exploring boundaries. In this sense, it contrasts strongly with the central- tendency assumptions common in probability-based approaches. The social process of building scenarios and strategies in this technique can be seen as an attempt to explicitly construct a shared social reality (Berger and Luckman 1966). Specific practices that support sense-making (Weick 1995) are used in this construction process. The shared understanding and commitment produced is consistent with a vision which is seen as a core feature of leaders who wish to promote change (Conger 1998). An important consideration in strategy or policy endeavors is the extent to which an actor can influence outcomes. The S2S technique carefully explores the control boundary in developing a vision.

Boundaries and Health: Perceived Discrimination and Health Inequalities Between Immigrants and Non-Immigrants in Europe.

This paper investigates from a comparative perspective if perceptions of discrimination give rise to health inequalities between immigrants and non-immigrants in Europe.

With a growing share of immigrants in Europe, it is important to understand the causes of health inequalities between immigrants and non-immigrants. Perceptions of discrimination are a major health-relevant stressor in the life course and have been shown to affect various health outcomes. Since immigrants are particularly prone to such experiences, differential exposure to discrimination may be a source of health inequalities. Yet, the receiving countries in Europe differ substantially with regard to modes of immigrant incorporation and the strength of ethnic boundaries between immigrants and non-immigrants. This will structure the interaction between immigrants and the receiving society, making it more or less likely for immigrants to experience discrimination.

This paper addresses the issues by investigating the following two questions: First, can experiences of discrimination explain health inequalities between immigrants and non-immigrants in Europe? Second, how do social and symbolic boundaries between immigrants and non-immigrants in different European countries affect the probability for immigrants to perceive discrimination?

Using multilevel modeling these questions are addressed with data from the European Social Survey (ESS) of the years 2002-2012. The considerable timespan allows assessing how changes in the strength of ethnic boundaries within different European countries are associated with changes in the probability to perceive discrimination – net of stable unobserved country characteristics. Results indicate that perceptions of discrimination are indeed a source of inequalities in self-reported health between immigrants and non-immigrants. Furthermore, immigrants are more likely to report discrimination in countries with strong ethnic boundaries. Thus, differences in the contexts of reception seem to impact the extent of health inequalities between immigrants and non-immigrants in Europe.

A Transdisciplinary Framework for Understanding Human Sociality and the Biological and Social Sources of Mental Illness

Émile Durkheim and Max Weber rejected Spencer's social Darwinist interpretation of evolutionary theory and instead developed a non-biological foundation for sociology based on recognition of the importance of altruism and group affiliation. But the development of multi-level selection theory in evolutionary biology and of the interdisciplinary field of social neuroscience suggest a new foundation based on understanding human sociality as a biological necessity and reason and emotion as inherently connected. This paper reviews the history of sociological perspectives on biology, identifies the major tenets of the non-biological paradigm that came to be accepted for much of the twentieth century, and identifies the findings in evolutionary biology and social neuroscience that provide the basis for the new transdisciplinary framework and improved understanding of mental illness. The paper also highlights two debates—both anticipated by Durkheim and Weber—that are shaping the implications of this new framework for sociology and its perspective on mental illness: (1) Does the evolved propensity for bonding within groups require intergroup conflict and intragroup suppression of deviance in order to maximize cohesion? Although there is overwhelming evidence of the value of cohesive social groups for organizations ranging from airplane crews and military units to group homes and college classrooms, implications for the larger social order are unresolved.   (2) Is emotional connection necessary for sustained human sociality? Social neuroscience accords emotions a central role, but some explain the advantage of group cohesion in relation to member self-interest or superior cognition emanating from cooperative social groups. Examples are drawn in part from research on homelessness and mental illness and interdisciplinary research in social neuroscience and mental health. The paper concludes with discussion of the potential for sociology to make a paradigmatic shift to reframe the importance of social relations as rooted in the biology of human sociality.

Re-Doing Generation By Un-Doing Gender: On the Absence of Gender Studies in Childhood Studies

The social constructivist view on gender seems to be common sense in Sociology when it comes to youth or adults (Butler 1991). Researching Children or Childhood, gender as a concept is either absent or – more often – referred to on a psychological level, indicating a more or less biologistic view on gender. Researching the healthy development of gender in childhood or questions of early sexual behavior are the domain of psychology, psychiatry or pedagogy. When the early gender studies address children or childhood, they are an argumentative proof for the construction of gender, seeing the socialization of children into dichot-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

omist gender structures as empirical evidence that 'before' there is a somehow gender neutral state of children.

Whether gender development is seen as a biological process or as a way of socializing a patriarchal gender order, both concepts use the generational order to substantiate their research and do not include childhood studies from a social constructivist perspective.

Analyzing current research we are editing in a volume of the journal Gender (Buschmeyer/Schutter/Kortendiek 2016, Buschmeyer 2016) we try to conceptualize a theoretical approach to Childhood Studies from a gender Perspective.

Re-Creating a Different Everyday through the Upgrading of Informal Settlements?

Since the 1990s a 'new generation' of governmental upgrading initiatives in informal settlements can be observed throughout Latin America, which rely on in situ physical upgrading to affect the inhabitants' quality of life and evade the negative effects of displacement. Public spaces are the primary intervention sites of these programmes, based on the idea that upgraded public space would trigger wider social and physical change. Design language and highly visible political campaigns play key roles in symbolically and materially connecting the formerly neglected areas with the city and more generally with urban establishment. Medellín/Colombia serves as a case in point for this development. Drawing on a case study of the upgrading process in one of the city's most deprived neighbourhoods, Comuna 13, this paper reveals the profound effects of the upgrading process on the everyday lives of the settlers: new practices of space use supporting the creation of an 'urban' identity and a narrative of integration and inclusion on the one hand, which on the other hand leads to the denigration of established 'non-urban' practices of use, such as small scale urban agriculture and informal trade, which are important for the livelihoods of the poorer community members. Against the background of persisting poverty in these areas, this paper questions in which ways the newly introduced design imaginations can foster the empowerment of the residents when it comes to increasing their political capacities and improving their ways of reducing poverty.

Brazil, June One of 2013. a New Social Movement?

From 2010 until now the world has faced the uprising of the so-called New Social Movements. In Brazil, was the case of the so-called June of 2013. According to current trends in the analysis of this new phenomenon, protests are related to economic issues or social inequalities, particularly those of a religious or ethnic nature which, in turn, produce new communications directed at the political and law system. In this sense, society integrates and disintegrates, as does the Law, movements that are connected and dependent of one another. When it disintegrates, it moves towards renewed integration, based on other foundations. Many of these go unnoticed at the exact moment they occur. Moreover, they tend to be co-opted by communication and the media according to established standards. Nevertheless, even when a different meaning is produced, a new reality will be communicated at some point.

In this sense, the focus of the paper is to prove that the June of 2013 can be characterized as a New Social Movement and if so what are the consequences to the law system?

SCHWARTZ, GREGORY* (University of Bristol, gregory.schwartz@bristol.ac.uk)

Labour and Authoritarian Neoliberalism in Russia: Resistance without a Movement. Crisis without an End

The perennial question facing students of trade unions in Central and Eastern Europe and Russia has been what happens when labour cannot exercise 'voice', while 'exit' appears exceptional (Ost & Crowley, 2001; Clarke & Ashwin, 2004; Meardi, 2013). In this paper I extend Hirschman's (1970) dialectic of 'voice' and 'exit' by exploring the current dynamics within the Russian labour movement. Official statistics, national media and public discourse convey an apparent absence of labour protest. In contrast, data from the Russian Confederation of Labour and the Centre for Social and Labour Rights show that there is a high and increasing incidence of labour unrest. These spontaneous protests and strikes are, however,

unofficial and illegal, given that unions are required by law to obtain agreements from employers and local authorities, file numerous forms with strict deadlines for approval by the judiciary, and face informal pressures and individual and collective persecutions. Existing research has shown that where dialogue and collective bargaining are stifled, workers opt for spontaneous protests as a last resort rarely are able to accomplish positive collective outcomes. I argue that two additional negative aspects result from the system-wide legalistic-bureaucratic stifling of 'voice'. First, the stigmatisation of collective action, achieved by criminalising particular individuals involved in protest, entrenches the non-viability of 'exit' for other workers. Second, by encouraging actions deemed criminal by the authorities it fosters the 'professionalization' of union activism by a decreasing number of ever more radical individuals, hindering the development of trade union democracy and democratic civic institutions. I conclude by showing that, rather than being simply an aspect of despotic employment relations in specific firms, the current legalistic-bureaucratic regime of labour relations in Russia cements an authoritarian social formation which becomes difficult to overcome in the longer term.

The Moral Economy of Indignation: From Individualized Despair to Collective Action in the Spanish Housing Crisis.

Owning property was a central feature of the informal social pact in Spain under Franco and after the transition to democracy. Moving out of one's parents' house for millions of young Spaniards was tantamount to taking out a mortgage for one's own flat or house. The state and banks heavily encouraged borrowing; at the same time, debtors unable to pay their mortgage were confronted with an extraordinarily severe mortgage law. Thus, the Spanish housing crisis since 2008 has not only destroyed hundreds of thousands of economic existences, but moreover resulted in severe psychological consequences for the affected. Suicide rates have been soaring, and often suicides were directly related to evictions of the victims from their homes, which now belonged to the banks. Those who lost their homes often describe their situation in drastic emotional terms as unbearable despair, shame, and depression.

In this situation the Platform for People Affected by Mortgages (Plataforma de Afectados por la Hipoteca, PAH) was founded in Barcelona: In their meetings they have combined aspects of juridical and psychological counseling and consequently collectivized the experiences of thousands of individuals who had just lost their homes. Most importantly, they translated these experiences into political action of non-violent protest. Sometimes they occupied banks' branches, or did *escraches*, in which they publicly and spectacularly accused individuals implied in the mortgage industry, to put pressure on them and ease the conditions for the respective debtors. By now, PAH has become a powerful nation-wide network, and in 2015, Ada Colau, one of its founders, was elected mayor of Barcelona.

This paper will analyze the role of emotions and their transformation in the political strategies of PAH, based on the accounts of their action and on the life story interviews conducted in 2015 with PAH activists from different social backgrounds.

Imagining Nanotechnology in Public Engagement – the Power of Analogies

In recent years, the governance of emerging technosciences such as nanotechnology has entered a new era, in which publics have become relevant stakeholders in deliberating possible sociotechnical futures, for instance via public engagement exercises. This paper will argue that participants in public engagement exercises assess nanotechnology by using their analogical imagination. Analogical imagination—the ability to compare and connect past experiences and knowledge with new phenomena—thus is central for opinion formation and anticipation processes in public engagement settings on emerging technosciences. Building on a detailed analysis of four discussion groups with Austrian citizens, in which nanotechnology was discussed, the paper explores how analogies are used to imagine and argue for specific futures of nano and society. It analyses how (dis)analogies are developed and (con)tested in the course of debate and how particular socio-cultural resources and argumentative strategies influence the way citizens anticipate governance approaches in the Austrian context. A specific focus will be on the role of rejection analogies, that is, how citizens use analogical arguments to plausiblize the collective rejection of specific nanotechnological applications such as nano-food or nano-enabled human enhancement. Based on the analysis, I will propose that not a lack of public trust but other criteria influence why citizens resist certain nanotechnological applications and simultaneously accept others.

SCHWEITZER, REINHARD* (University of Sussex, r.schweitzer@sussex.ac.uk)

The Local, Everyday Politics and Negotiation of Irregular Migrants' Entitlements and Effective Access to Public Healthcare. Insights from on-Going Research in London and Barcelona

This article aims to contribute to a better understanding of local processes of policy implementation in areas that are characterised by a high level of politicisation and where (policy) decisions are driven by conflicting normative and functional imperatives. Based on qualitative research data gathered in London and Barcelona it compares the formal entitlements and effective access of irregular migrants to publicly funded healthcare services in both local settings, through the perspective of those institutions and individuals that have to implement this complex, frequently changing and often inconsistent set of regulations. I therefor develop a framework that combines institutional approaches to (immigration) policy making and implementation with theoretical insights from organisation studies. This helps me to argue that where governments feel unable to openly justify a necessary level of inclusion, they have to resort to a contradictory rhetoric and ambiguous legal frameworks in order to manage – both politically and in practice – the inherent conflict between humanitarian norms, public health concerns and the logic of immigration control.

Same Same but Different? Challenging Dublin-Deportations in Austria and Germany

The paper analyses and compares local contestations of the Dublin system in Austria and Germany. These countries are in the centre of current public debates as many refugees use them as transit or destination countries. Surrounded by other Schengen countries, "Dublin transfers" - or deportations - back to countries where the refugees entered the Schengen area for the first time are a hot issue. For a number of reasons, only around one fifth of all attempted Dublin transfers take place. Besides micro practices of the migrants (ignoring the Dublin regulations) and court rulings at the European level (certain restrictions to send asylum seekers back), 'Dublin' is also contested at the local level through public protests by refugees and supporters. Protests against 'Dublin' are interesting cases, as one common sense in the literature on anti-deportation protest - protests tend to be more frequent and more successful the closer and more numerous their social ties are - cannot be taken for granted, because many of the affected refugees have only come recently and have been living in camps, which makes it difficult to establish social ties. In two qualitative case studies (Alberschwende/Austria; Osnabrück/Germany), we identify two main differences of the respective protests: first, the involvement of political elites vis-à-vis the lack thereof and the involvement of refugees themselves; second, the use of intermediary protest measures versus a mix of protest forms that combines symbolic action with radical direct action. Against the backdrop of the findings of our quantitative research component (a media analysis of anti-deportation protests from 1993-2013), we discuss whether the differences in terms of protest actors and protest forms can be understood in light of different political cultures and thus as characteristic of anti-deportation protests in Germany and Austria in general.

SCHWIERTZ, HELGE* (University of Osnabruck, h.schwiertz@gmx.de)

With or without Papers – We Will Always be Illegal: The Movement of Undocumented Youth Beyond Citizenship and Legislation

The movement of undocumented youth in the US that has emerged over the last 15 years challenges the illegalization of migrants as well as the strategies of the broader immigrant rights movement. This paper analyzes changes in their fight for equal rights that have not been prominently described yet in academic debates. Especially in California, political groups are currently going beyond a focus on citizenship and legislation. Instead, they are fighting directly against the enforcement of immigration policies and the deportation and detention regime on state and local level.

While legalization is a principal demand for established migrant rights organizations in the US, groups like the *Immigrant Youth Coalition* (IYC) in California are questioning its importance. Many do not think that they have to become US-citi-

zens, rather they fight for their rights as residents: defending their communities against deportations and fighting for driver licenses, health care and work permits. They criticize the citizenship status because of its racist and sexist limitations and its exclusion of future migrants - symbolized in the slogan "with or without papers – we will always be illegal". Furthermore, groups like the IYC challenge the focus on legislation and the attempt to appeal to the dominant US-society, a strategy employed especially by the early undocumented student movement, which has been criticized for excluding other migrants.

In this paper, I draw upon my research with the undocumented youth movement in California, where I conducted document analysis, participant observations and qualitative interviews. Referring to approaches of critical citizenship studies and radical democracy, I argue that these undocumented youth radically challenge the anti-migrant hegemony in the US by going beyond the fight for legislation and citizenship status, by favoring the organizing of affected communities over short term activism and by rejecting the criminalizing 'good immigrant' / 'bad immigrant' divide.

Education Changes Everything? a Comparative Analysis of Young Educational Migrants from Pakistan and Kyrgyzstan

"Education changes everything" – this is a claim that is frequently voiced in the developing as well as developed world in daily conversations, posters, news and scholarly literature. Especially for educational migrants, a group that is rapidly increasing in number, this promise is made by receiving and sending countries alike. However, there is need to scrutinize this notion and check if this notion is valid and reliable. In order to understand the impact of education, migration and their role in the real change of biographies, qualitative comparative research was conducted in Pakistan and Kyrgyzstan. Our data show that upon return, educational migrants oftentimes face conditions which make it difficult for them to apply their accomplished skills and knowledge in a professional context. That may be the case because the job market in the home countries don't offer appropriate employment opportunities. But reasons also lie in generationally and gendered demands and expectations which are held towards young returnees from the side of families, backed up by broader social norms and discourses. Case stories from Pakistan and Kyrgyzstan reveal, that young educational migrants enter into multifaceted negotiations with significant others regarding their further educational and professional perspectives, but also regarding choices in private life such as marriage and family planning. Among others, ideas of 'collective responsibility' as well as 'individualized' happiness make part of such negotiations which will be presented in this paper

SCHWITTEK, JESSICA* (University of Wuppertal, j.schwittek@uni-wuppertal.de)

Negotiating Transition into Adulthood in Kyrgyzstan

More often than not, youth in Central Asia is seen as a 'problem group', lost in the hardly comprehensible landscape of different orientations and ideologies following the collapse of the Soviet Union. This paper aims at taking a less deficit-oriented perspective by tackling the question how young people in Kyrgyzstan manage the enormous expectations which are held towards them within different interaction contexts and by a multitude of actors. Under conditions of economic shortages, growing social inequality, an inefficient educational system and corrupt (or alltogether missing) public structures, young people are expected and whish to accomplish status passages commonly summed up as 'transition into adulthood': obtaining an education and entering the job market, finding a spouse and starting a family. At the same time they rely on support from their family network which can be seen as the existential unit of Kyrgyz society at present. High (moral and financial) investments into family- and private networks are expected from the young in order to maintain the network's loyalty. By using formal concepts from the theoretical body of symbolic interactionism, this paper looks at the conditions and shapes of status passages and the accompanying negotiations of young people in Kyrgyzstan with their significant others. Based on a grounded theory approach, new theoretical concepts will be introduced to grasp the strategies of young people living and making ends meet in this 'transition society'.

Challenges, Opportunities, Risks and Hopes: Making the Voice of Children with English As an Additional Language (EAL) Stronger in Early Years Provision.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In the last decade, the needs of young children who are learning English as an Additional Language has been a popular research topic in the area of 'multilingual education' (Drury, 2007; Gorter et al., 2013), with a view of enabling children to have full access to the curriculum (Conteh et al., 2007). However, if the focus of the research is centred on Early Years settings, the situation appears to be under-examined.

This presentation discusses the results of a research exploring Early Years settings where communication is hindered by the absence of a shared language.

The research investigated the phenomenon of language diversity as observed by the professionals who deal with linguistic differences in their everyday practice (in the next stage of the research, the phenomenon will be examined from the perspectives of children and parents).

The first phase of the research consisted of the dissemination online of a survey using Survey Monkey for professionals in Early Years. With the support of partner nurseries, 200 completed surveys were collected. The survey offered information about the lack of resources experienced by staff and the attitudes towards the management of multilingualism in their settings.

The data from survey was used to design qualitative individual interviews. Twelve professionals were interviewed. The interviews highlighted the professionals' plea for empowering their practice through professional development.

This study offers valuable insights, developing a picture of actual practice with a view to generating understanding that can be applied to framing recommendations for good practice, and the development of new approaches.

SCOTT, BERNARD* (Center for Sociocybernetic Studies, bernces1@gmail.com)

Sociocybernetic Reflections on the Human Condition

Sociocybernetics is concerned with applying concepts from the system sciences to the social sciences. Talcott Parsons was perhaps the first well-known social theorist who incorporated concepts from cybernetics and systems theory in his work. These concepts remained central in his thinking up to the time of his final meditations on 'the human condition'. By this term, I believe Parsons meant a general and profound concern with understanding what it is to be human. In this paper, I reflect on what concepts taken from sociocybernetics can contribute to our understanding of the human condition in the context of the current and emerging global world, with its major issues of ecological crisis, conflict and its consequences, global economic instability and insecurity, and exploitation and inequality. In contemporary sociology, Parsons is but one example out of many theorists who have used concepts from sociocybernetics in their work. Others include Niklas Luhmann, Walter Buckley, Gordon Pask, Felix Geyer and Bernd Hornung. In answering the question what can sociocybernetics tell us about the human condition, I draw from several of these sources. In particular, I take from Talcott Parsons the analytic concepts of biological, psychological, cultural and social systems and from Gordon Pask's conversation and interaction of actors theories the concept of evolving psychosocial unities and his analytic distinction between the conversational cognitive systems that constitute psychosocial unities and the biological and technological systems that embody them.

The Social Supply of Cannabis: Local Observations and Global Context

During modernity drug suppliers were largely represented as pathological and anti-social figures whose primary motivation for selling drugs was to earn financial profit. The relative normalisation of cannabis use in many western contexts has prompted a re-evaluation of deviance understandings of drug use. In particular, the concept of social supply suggests some drug distribution may be motivated to accrue social capital and that drug distribution networks are not hierarchically structured and organized as has been previously suggested. Drawing on data from two studies of drug supply networks in the UK and Australia, the paper argues that a sociological understanding of contemporary drug distribution should draw on the rich tradition of community studies in sociology in order to account for the diversity of drug distribution networks. Finally, we briefly examine social supply in a global context, noting how legal and cultural factors influence the development of drug using communities.

The Blind Spot of Employment Statistics - Educational and Demographic Characteristics of Non-Registered Graduates in the Labor Market Administration System

The aim of the paper is to identify and describe background characteristics of non-registered employment among young graduates. As a result of individual level integration of higher educational and labor market administrative databases in the framework of the Hungarian Graduate Career Tracking Program approx. 90 per cent of the population of graduates was identified by statistics as students, employers, self-employed or inactives. The remaining part of graduates can not be found in labor market administrative databases and thus can be considered as "blind spot" of labor market statistics. The research focuses on this non-visible graduate subpopulation examining its demographic and educational patterns in order to create profiles for non-registered clusters.

In our interpretation behind this blind spot three current tendencies could be considered:

1. The development of the informal sector or shadow economy offers non-registered employment for graduates. (i.e. Hypotheses of informal sector employment)
2. The delayed transition period from school to work has led to postponed employment among young graduates. (i.e. Hypotheses of youth in transition)
3. The growing mobility trend of employment abroad increased the proportion of non-registered graduates in national labor market statistics (i.e. Hypotheses of international employment mobility)

During the investigation, we strive to identify underlying demographic and educational/structural dimensions in the interpretation of these trends. As a result of the research several graduate clusters will be characterized to describe the background determinants of non-registered employment. The characteristics of these groups can be further enriched reflecting on survey data on the same population.

'If You Don't like It, Don't Work with Us'. on Situational Position of Textile Suppliers in Turkey.

Managing supply chains is one of the major issues in the textile sector. Currently in Turkey big companies try to win back control over their scattered supplier landscape and strategically consolidate their suppliers, in order to work with a few but in close collaboration. As the market is changing fast and production cycles are becoming shorter, close communication and good coordination between various producers and buyers is needed to keep up sales to the end consumers. Supply chain audits are currently typically conducted as Corporate Social Responsibility (CSR&S) projects, as the topic provides both: links to core business strategies as well as to current social and environmental issues.

This paper draws on data from my ethnographic PhD research in a Turkish holding company operating in the textile sector, where social audits of the suppliers are being conducted since a few years to consolidate all scattered information within the subsidiaries. These audits create relationships between the headquarters and the producers and support a process of centralization in order for the headquarters to gain more control. Such processes often lead to resistance from the subsidiaries. However, using social and the environmental arguments for change makes resistance more difficult to legitimize.

Most of the information about the supply chain is currently found in the CSR&S department, which finds itself in an ambivalent position between global textile market trends of outsourcing to countries in the global south, producing cheaper, delivering faster, and contradicting globally demanded social and sustainable standards. Conducting audits, the CSR&S department is creating seemingly uncontestable spaces (Garsten and Hernes 2009, 429), although global ideas and practices of good business are being questioned. Using situational analysis (Clark 2011), this paper will discuss the position of the suppliers and their strategies to deal with these emerging restrictions and possibilities.

"Project to Become a UN Case Study". Myth and Excitement in the Creation of the Global Idea of CSR

Today's business corporations, in their push to take the lead in social issues, claim to compensate for political misconduct and step in where needed. Through collaboration with other societal actors, they claim a powerful role in defining societal responsibilities. In creating new relationships between political, corporate and civil society actors, Corporate Social Responsibility (CSR) shapes ideas of contemporary society by renegotiating what responsibility, fairness and well-being stands for. As a highly institutionalized concept CSR has been studied as

denotes a presenting author. Abstracts are organized by first presenting author's last name.

a case of moral transformation in which existing moral dilemmas and concerns are moved into a new moral field with its own particular configuration of values. (e.g. Rajak 2011, Dolan and Johnstone-Louis 2011). Anthropological studies about CSR mostly agree that the notion of CSR is strongly rooted in neo-liberal political ideas and built on western conceptions of human rights, progress, development, and sustainability (Garsten and Jacobsson 2013, 429). However, it is not only the global conception of CSR that influences local practices and implementations, it is also the local that informs back to the global policy making.

This paper draws on data from my ongoing ethnographic PhD research in a Turkish holding company, which is an active participant in several global networks, like UN Global Compact, where global policies and standards are defined. Constantly being present as a best-practice company in international network meetings and media, the company itself actively contributes to the creation of global knowledge and a hegemonic idea of CSR. As a participant observer, following Røyrvik (2011), I will provide a cultural analysis of contemporary practices of creating such global hegemonic knowledge where the frame of reference is the global. As this case study shows, creating myth and excitement about the global are important practices in generating global knowledge and legitimating local practices.

Academia Unplugged: An Intersectional Analysis of the Comparative Career Experiences of Black Women Academics in South Africa and the United Kingdom.

Addressing under-representation and inequitable treatment is important to higher education (HE) in South Africa (SA) and the United Kingdom (UK). However, studies have insufficiently examined how the combination of gendered and racial systems explain this under-representation. 'Intersectionality' attends to how social categories like gender and race interconnect to explain patterns of disadvantage. This mixed-method project examines how gendered, racial experiences play out in black women academics' careers, how these lived experiences compare between SA and the UK, and what successful strategies enable black women's advancement in HE. Black women's experiences will be analyzed against the backdrop of HE policies and through interviews and focus groups with black women and HE stakeholders in SA and the UK. This partnership project will contribute new scholarship and facilitate knowledge exchange on creating inclusive university cultures, co-produced with stakeholders in distinctive socio- historical contexts, thus promoting socio-economic development through enhanced HE performance.

Learning to Learn in Large Classes

The rapidly increasing number of students entering institutions of higher learning in a post apartheid South Africa, presents a challenge for academics, administrators, students and management alike. Excellence in teaching should be an absolute certainty at an institute of higher learning. Without this certainty the future of higher education in South Africa is ill-fated. This paper seeks to address the challenges that both academics and students face with an increasing number of learners appear in the classroom. The impetus for this paper lies with the annual increase of student numbers in the Social Sciences at twenty three Universities all over South Africa. While student numbers continue to increase, the number of academics that service these students remain constant; and in some cases are reduced. Little evidence of infrastructure improvement or its prioritisation is forthcoming. The results of this paper is based on participant observation through teaching and interacting with first year students; at two universities in South Africa over a period of five years from 2010-2015. Both the University of Kwa ZuluNatal and the University of Johannesburg had first year classes in excess of 1000 students. As a result of this qualitative study from an academic lived perspective; the results have indicated that the increasing number of students does not correlate with the number of graduates after a three year period. Large classes in the social sciences are not an uncommon feature in any institution of higher learning in South Africa. What was once a comfortable class of 100-200 students has now increased to classes in acess of 1200 students. The changing learning environment affects, students, academics, the process of learning and a series of other critical factors that are transferred into our communities and society at large.

EU Migrant Citizens, Welfare States and Social Rights

This paper contributes to the debate on social rights of immigrants in different welfare states. Specifically, it focuses on EU migrant citizens and emphasises the significance of decomposing welfare regimes and comparing, instead, specific policies.

Existing accounts of the relationship between type of welfare state and generosity of welfare rights granted to immigrants tend to be based on broad analytical categories, overlooking the specific intricacies of welfare rights access and generosity within specific policy domains. In addition, it is often assumed that EU migrant citizens have the same access to social rights as national citizens, thereby failing to acknowledge the stratified nature of EU citizenship. Finally, differences in national social protection systems can translate into differences of social rights between EU migrant citizens in destination countries. To properly understand what social rights EU migrant citizens' effectively have, it is therefore important to analyse not only the broad features of welfare states, but also the specific social policies in more detail and to look at EU citizens with different characteristics.

The paper compares EU migrant citizens' social rights in Germany, Sweden and the UK, each a typical case of different welfare regimes. Differences in EU migrant citizens social rights', with a special focus on social assistance, family benefits and unemployment benefits, across the countries is explored using ideal-typical examples of EU migrant citizens, based on their country of origin, economic status, length of residence and policy domain.

The Indicators of Dissension: Using Big Data to Assess Armed Conflicts and Political Instability

While many of our discussions on "big data" and enhanced computational capacity have focused on the structures and dynamics attending today's innovation-driven knowledge society, relevant features and relationships are realized under the various socio-political and cultural conditions that mark societal interactions. Of these, unfortunately, armed conflict and political instability continue to plague human existence around the world. Accordingly, relevant data needs continue to grow in relation to the pursuit of critical research and policy analysis. Based on the extant literature and theoretically-informed approaches, we investigate the use of various big data to construct and assess indicators for a wide range of analytical correlates and predictors of conflict and instability over time in countries and groups categorized in terms of allied and/or hostile positional identities. Using and integrating such data is not only a question of volume, but also, importantly, of data veracity, especially given varying collection platforms and the extensive re-purposing required for analysis, synthesizing, and modeling for relevant application and research questions. For example, what biases or limitations are present when synthesizing indicators across varied datasets? Also, what are possible correlates and/or predictors of conflict or instability in a country or region? To what extent do these indicators explain the presence of conflict or instability when modeled? What are methodological best practices for synthesizing complex indicators for use in analytical modeling? Drawing upon data from a wide range of international and regional organization sources (e.g., the United Nations, World Bank, North Atlantic Treaty Organization, and European Union) and from selected world and comparative research projects (e.g., the Armed Conflict the Armed Conflict Event and Location Data Project and the Correlates of War Project), we also develop data and tools to investigate relevant characteristics and conditions, taking advantage of the ability to manipulate them *in silico* to assess predictive efficacy.

SEGAL, EDWIN* (University of Louisville, esegal@louisville.edu)

Subverting the Dominant Paradigm

This paper is concerned with gender in sub-national ethnicities. These peoples represent a focus of strain in the processes of national development and consolidation. Here gender and ethnicity are major intersecting variables. In the instance of either one, their appearance is part of a transformative process beginning at birth and never coming to complete fruition.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Everyone is born genderless and must be transformed into a gendered being who will be expected to fit into the social and cultural organization of the society in which they live. Ordinarily and initially, this is the world of primary socialization. The process of initial transformation is universal. Ordinary expectations are that it will be the only process of transformation. However, there are two factors belying these "ordinary" expectations.

First, hegemonic cultural visions of masculinity or femininity are not unitary, but consist of variations of more or less culturally acceptable forms. At some point in a person's socialization the combination of unique individual experiences will blend with variations in the normative complex usually thought of as culturally appropriate gender expressions.

Second, for some individuals the ordinary processes do not seem to be heading in a personally satisfactory direction. Most likely there are biological factors involved, but the process of asserting an identity is largely cultural. For these sub-national groups, their native socio-cultural context offers more or less support for declaring a gendered stance other than one of the hegemonic possibilities. In both of these cases there is a second (or perhaps even a third) process of gender transformation.

However, as both gender and ethnicity are primary to social and cultural organization, they intersect in the creation of a functioning socio-cultural individual inhabiting a functioning socio-cultural system. This paper will also consider the shift from a traditional ethnographic, categorical paradigm to a more fluid, possibly topological one.

Creating Feminist Knowledge and Praxis: Gendered Dilemmas and Contradictions

In the late 19th century women raised their voices for the first time in Europe, demanding voting rights and equal access to higher education. In the early 20th century, but especially after World War II, feminism in Europe has increasingly become a compelling intellectual tradition, challenging the social and power structure and the gender division of labor. More recently, feminism has criticized the very notions of "economic crisis" and "austerity" that saturate today's dominant political narrative. And yet, women's voices have always been indigenous regardless of the place from which they are pronounced. Is there women's indigenous knowledge in Europe? Who qualifies to be a knower? In what ways, if at all, the knowledge by women's voices reaches a different, more powerful level? The presentation will address some of these questions by: a) elaborating on the reflexive turn stimulated in Western and European feminism by post-colonial thought; b) exploring how feminist thought has being inducing (within sociology of science and beyond) the questioning of the hierarchical dichotomy between indigenous and universal knowledge. All forms of knowledge uphold practices and constitute subjects. Emancipatory interculturality presupposes recognition of a plurality of knowledges, whose validity has to be assessed in the context of concrete practices, and not through the abstract disqualification of some. A counterhegemonic use of science consists of exploring alternative scientific practices made visible by the plural epistemologies of science and of valorizing the interdependence between scientific and nonscientific knowledges, within an ecology of knowledges. It so happens that knowledge about women's lives may be partially silenced and their lived experiences neglected in hegemonic science (notwithstanding the rhetoric of "gender mainstreaming"). At the same time spaces of liberation are created, in Northern and Southern Europe, through action research conducted by women researchers to promote gender equality and transform research organizations.

Roles of Social Network in Japanese Women's Prenatal Healthcare Utilization Patterns in the US - Implications to Migrants' Maternal Wellbeing

Positive effects of social networks on human well-being are well known. Little is known, however, on their roles and influences on migrants' maternal wellbeing. This study investigates into the types of social relationships maintained and established by Japanese migrant women who gave birth in the US. It asks the following questions: What kinds of social relationships and networks do they develop and maintain in the host society? How do different types of network influence the mothers' prenatal healthcare utilization patterns? How does acculturation and socio-economic factor play a role? What are the implications to migrant maternal wellbeing? Wellbeing in this study is understood from a saltogenetic perspective of sense of control and cohesions throughout the pregnancy, birth and postnatal period.

The study is based on in-depth interviews with 21 Japanese women who lived in Central New Jersey in 2014/15 and who have experienced childbirth in the US. It is partially ethnographic. The researcher took active parts in activities organized by the local Japanese community association during the 8 months research period

and conducted two workshops aimed at promoting Japanese women's wellbeing in the US. Field memos and workshop records from these activities are included in the analysis. Ethical approval was obtained from the Institutional Review Board of Princeton University.

Different types of networks influenced the sources of information and thus the prenatal health service utilisation pattern. Very few intra-nationally married Japanese women knew the option of midwife-led model of care in the US. Those who have chosen midwife-led care were more acculturated, married to American nationals and expressed higher sense of control and cohesions than intra-nationally married Japanese women who predominantly had obstetrician-led care. "Not being fussy" was regarded as a virtue among many women interviewed and prevented them from proactively seeking information outside their own network.

Kazakhstan: Between Silk Road Economic Belt and Eurasian Economic Union

The focus of the paper is economic and political intentions of Kazakhstan in the context of regional integration. It has been agreed that Kazakhstan is a political stable country with attractive taxation policy and friendly attitudes for minority shareholders. Also Kazakhstan is one of the relatively successful countries among former USSR republic in terms of foreign investments. Nevertheless Kazakhstan being a post-soviet country is experiencing enormous problems/obstacles with the formation of independent economic policy; secondly it's not easy for the new state to conduct, to implement new policy. Moreover Kazakhstan has a vast territory with the limited population. These economic difficulties along with the social reasons are forcing Kazakhstan to seek more stable economic partners; to consider opportunities for regional cooperation. Being historically connected with Russia Kazakhstan nowadays is getting new possibilities for cooperation outside of former USSR countries. One of the possible directions is China as a country who already made largest investments in Kazakhstan. So Kazakhstan today has two major integration vectors - Russia and China. Many experts have no doubt in the successful cooperation with these two countries. For example, the new Chinese Governemnt program Silk Road Economic Belt may be connected with the Kazakhstani Government program "Nurly Jol/Bright Future" as well as many Kazakhstani investment - industrial projects are connected with Russian industry. But obviously in both cases of regional cooperation Kazakhstan will be challenging with the problem of political integration. The point is how to make an economic convergence without political integration commitments? This politically sensitive issue will be explored in our paper.

Mobile Internet Use in the Elderly

For the elderly, the internet is potentially an important source of information and communication tool. However, the actual use of the internet and how providers of web content can best attend to the requirements of the elderly remains obscure. In two representative telephone surveys conducted from 2009 to 2015, a total of 2,142 persons aged 65 years and older were interviewed (Switzerland). In a third study (2013) based on focus group interviews (n = 36), views on the requirements for an "age-appropriate" web design were collected. In addition to socio-demographic characteristics, including age, education, and income, it was mainly personal attitudes toward technology, the proximal benefits, and support that promoted the internet use. Based on the results of the third study on age-appropriate web design, it was also shown that the elderly have particular web design requirements and requests. However, an exclusive focus on "websites only for the elderly" should be avoided. Thus, the findings show opportunities for and barriers of internet use in the elderly and provide guidance to overcome the "digital gap" of the generations.

Meanings Given to Counter Action Against Anti-Immigration Racism. an Intersectional Analysis of Accounts By Activists in Finland

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In the early fall of 2015 Finland has witnessed a turmoil of outright racist activities, as several groups and politicians have responded to the increase in the number of people seeking asylum in Finland by publicly defending their anti-immigration racist stands. The current events can be seen as a product of a longer term development. In Finland anti-immigration mobilization began as a separate movement that was then incorporated in to the right wing populist party (The Finns) supporting traditional conservative and Christian values. The Finns gained momentum in the municipal and in the parliamentary elections 2008 and 2011, and after the election 2015 they rose to the ranks of government. However, politicians from more established and older parties have also appealed to anti-immigration racist sentiments. Further, while anti-immigration racism has been rife in parliamentary politics, also non-parliamentary far-right groups have made (at times violent) outcomes in public. At the same time, Finland differs e.g. from the neighboring Sweden in the sense that there is no generally recognized story of a historical commitment to anti-fascism nor to antiracism.

The presentation focuses on emerged counter action against anti-immigration racism that is spread by both parliamentary and non-parliamentary far-right. The paper explores accounts by people who have actively challenged different forms of anti-immigration racism and fascism outside of parliamentary politics either as individuals or as members of grassroots groups. Theoretically and methodically the paper is informed by critical research on race and racism as well as by feminist discussions on intersectionality. The paper is based on an interview-data and bears a two-fold objective. First, it explores gendered, classed and racialized underpinnings that shape the understanding of racism in counter-activities to anti-immigration racism. Second, it explores how the interviewees from varying intersectional positions narrate their engagement in and motivation for counter action.

Round Table: Population Problems in India

The social structure in India perpetuates inequality owing to caste, class, occupation, education and regional disparities. Population policy pursued with the aim of achieving a demographic transition has not resulted in effective population control. The health and welfare measures of governments in India have improved life expectancy and reduced post natal and infant mortality, but they have not drastically improved the quality of life due to the prevalence of socio-economic problems of poverty, unemployment, child labour, migration etc. The brain drain, particularly concentrated among the higher echelons, and technically educated employment has reduced the birth rate but the National Increase Rate (NIR) in India continues to remain positive as the result of higher birth rates and larger family size among the marginalized groups and communities in India. The National Health Mission (NHM) launched at the macro level has not brought about the desired results at the micro levels. Therefore, a demographic transition which focuses on lower fertility and lower mortality are needed to ensure positive demographic developments in India. This round table will discuss the following issues:
1. Family welfare and Population quality
2. Fertility and marginalized communities
3. Tribal Population and Population dynamics
4. Population and Socio Economic problems
5. National Health Mission and Population control
6. Rural-Urban and Regional Disparities
7. Population Education and Optimum Population
8. Demographic Transition and Population Quality
9. Social Structure and Population Problems

Social Determinants of Senicide, a Cultural Killing of Elderly People in South Tamilnadu: An Empirical Reflection.

Elderly life is considered or assumed as a burdened life, full of struggle, illness, depression, exploitation, abuse etc. The young consider them as burden and deny care support of the terminally ill, bedridden, sick and immovable. Consequently they become liability, unable to meet all required care and support, finally decide to eliminate them through comfortable killing taking advantage of mercy killing in the form of a culture supported elimination of elderly in the southern part of Tamilnadu called thalaikoothal (Senicide-killing of the elderly). Thalaikoothal, is the traditional and a cultural practice, equivalent to that of or involuntary euthanasia, by their own family members to prevent them from long term suffering. The study has the objectives like to identify the social determinants and reasons behind the culture killing in the study area. and trace out the cultural traits associated with the problem of thalaikoothal. To expose the methods adopted in thalaikoothal to eliminate the elderly people. Moreover it suggests the measures to protect the life of old age persons and ensure happy ageing. The Methodology adopted to conduct the study in the selected cluster of villages in Virudunagar,

TN, India, where this cultural practice of thalaikoothal is widely prevalent, as reported in media and empirical researches. Whatever the reason justifiable or not behind this cultural practice of thalaikoothal, it is a disgrace and a criminal act which needs to be curtailed through understanding and recognition since they were once mentors of the young in contemporary society.

Social Mobility and Life Course Trajectory: Combining Biographical Approach and Mass Survey Data

The paper deals with the problem of combining biographical life course data and mass survey social mobility data in social mobility research. In order to deal with this the author will stop on the notion of subjective social mobility as a focus of working in this dimension. This approach helps to view the problematics of social mobility from micro-focus as individual or group attitude towards mobility in global society.

While demonstrating the results of empirical data from Russia received by intergenerational comparative mass survey combined with biographical data on the same age cohorts, the paper will stop on the micro/macro differences in understanding and experiencing mobility in its different dimensions which are more vividly seen in marginal groups then in high status groups. The low status individuals see social mobility more as private space movements and achievements (for example, as family status mobility or settle-type mobility) then high status individuals more confirm traditional-normative understanding of mobility.

Moreover in empirical data there appeared some new tendencies in perceptions of social mobility on individual level which could be discussed as first-hand hypotheses, such as geographical mobility, tendency to 'stable trajectory' or immobility, and horizontal mobility which enrich and change our traditional understanding of social mobility as a classical sociological term.

The special attention will be devoted to methodological aspect of the empirical results: the problem of combining biographical and survey data on mobility in several generations approach: field research problem, interviewee attitudes, the 'the language on mobility' in everyday life and on scientific level.

SEN, RUKMINI* (Ambedkar University Delhi, senrukmini18@gmail.com)

Practice in Development, Practicing Development: Shifting Contours in Knowledge from the Field

This paper intends to understand *knowledge*, that comes from the field—the field of the development practitioner. Being part of a research program on Development Practice which is based on the philosophy/methodology of immersion, this paper is an attempt to gauge how knowledge is generated through practice. By practice in development there is a paradigm shift from the development ethnographer to the immersed practitioner. The shift in methodology to map/comprehend development is intrinsically connected with the knowledge that is co-created in the field/from the field. Listening is what distinguishes a development practitioner—she is more aural than ocular, more an *engaged* listener than a participant *observer*. Much of what she will generate is people conversing, singing, laboring—everyday living. The attempt in immersion will be to converse and

comprehend characters, plots, or voices. Are the conversations around *loss* (from development landscape) and the comprehension about *recovery* (into a landscape of development)? And if the development practitioner is also *one* character in this plot and not one who is only observing the plot, then is it also about the loss and (re)covery, meaning transformation of her-self? Conversations *with* and comprehension *of* lives and practices is what seems to be the *practicing* development.

The field in development practice is as much a contested site as knowledge itself. Is the field *only* out there or inside the practitioner as well—the self as a field site? So the field-site is not at all an abstraction out there where one *visits* and *returns* rather it represents the beginning of an archeology of relatedness which forms the basis of any knowledge. In this case *knowledge* from the field is praxis-based, relationship dependent knowledge. This paper will be an attempt on sociology of knowledge production when there is practice in development.

SENDA, YUKIKO* (Tohoku-gakuin University, ysenda@mail.tohoku-gakuin.ac.jp)

Practice of Gender Discrimination By Government and Companies in Japan: Based on the Analysis of Official Surveys

The Equal Employment Opportunity Law (EEOL) was enacted in Japan in 1986; however, whether gender equality at the workplace has subsequently been put into practice remains to be examined. Furthermore, if it has been implemented or not, what are the reasons? Analysing a series of official surveys chronologically from 1977 to 2013, I examine the realities and the companies' perceptions/opinions on the utilization of female workforce.

The findings are as follows: (1) Companies continue male-only recruitment, hiring, assignments, transfers, training, and promotions to some extent. These violate the EEOL; however, they are never penalised by the Government; (2) Most companies do not intend to take positive actions because they state that 'women already play an enough active part'; this perception is against the realities and going by the EEOL, promoting positive action is the companies' obligation. However, again, the Government does not impose penalties; (3) On one hand, companies have recently explained that 'women having family responsibilities' is the obstacle that prevents more female participation. On the other hand, they state that what is necessary to promote female workforce's participation is 'providing women with support to continue working'. The problem and solution are inconsistent.

In short, Japanese companies' excuses are uncorroborated, and the Government overlooks them. According to the economics of discrimination, the excuses given by the companies can be classified into two categories – biased perceptions and inadequate measures to solve the problem. In addition, I emphasise that the Japanese Government too continues to practise gender discrimination, which makes the situation more difficult. I conclude by saying that currently, gender discrimination by Japanese companies as well as the Japanese government hinders the introduction of new policies to promote gender equality. An external pressure (i.e. CEDAW) or a shock doctrine (i.e. '1.57 shock') may be necessary to break this deadlock.

SENNOTT, CHRISTIE* (Purdue University, csennott@purdue.edu)

"Mothers of Nowadays Are Independent": Work, Money, and Motherhood in Rural South Africa

The past two decades have witnessed rapid globalization in South Africa, providing access to an array of new material goods and reshaping desires, norms, and practices related to gender and consumption. The new ethos – supported by the rainbow nation discourse, which emphasizes freedom, equality, and opportunity – is built on aspirations of upward mobility. As such, educational achievement is highly valued and viewed as the primary route through which individuals can improve their family's economic circumstances.

This study examines how these evolving "modern" desires, norms, and practices have influenced constructions of "good motherhood" in a rural area of South Africa. Drawing on interview and focus group data collected from 85 Black South African women (aged 18-79) in 2010, I ask how the ethos of achievement intersects with the ways in which womanhood and motherhood have been constructed. In a context wherein single motherhood is common due to high rates of premarital births and the fact that men are often absent due to seeking work in faraway cities, mothers are held responsible for the social and economic costs of raising children. Historical constructions of "good motherhood" emphasized having many children, caring for husbands and in-laws, and providing food from the family plot. Mothers today, however, face competition to provide the newest, nicest, and most expensive goods, foods, clothing, and education for children. These expectations require money and thus many women strive to fulfill them through working outside of the home. These findings suggest a pivotal shift in the social construction of good motherhood, which now relies heavily on women's ability to provide economic support to children. Given the limited infrastructure and job availability in rural South Africa, this construction of motherhood increases the

strain on women trying to fulfill multiple roles in their households and struggling to make ends meet.

Religious and Secular Attitudes Towards Death: The Study of a Sample of University Students in Tehran

Death is an inevitable phenomenon for all human beings and one of their main concerns and anxieties. However, people's thoughts and concerns about death are constructed in a social context; and religious traditions are one of the main sources for answering the question of death and overcoming unpleasant experiences associated with it. Meanwhile, with the growth of non-religious meaning systems in the modern world, new non-religious interpretations of death have accrued. Iranian society has had a strong religious tradition which has greatly influenced people's way of thinking about everything, including death. Nevertheless, with the emergence of modern ideas and philosophies, similar to many other societies, attitude towards death is getting more diverse, particularly when youth and educated people are concerned. This article tries to explore the diverse thoughts and understandings of a sample of Iranian students regardingdeath. Its main concern is to compare the ideas of religious and non-religious students about death. Regarding religious commitments, four categories of students were recognized, that is, atheists, agnostics, passive religious, and active religious. The datawere collected from a sample that were chosen both purposive and theoretically, through open-ended questions and in-depth interviews. They were analyzed by the application of grounded theory method. The religious and secular interviewees' thoughts about death are compared in eight major categories, and the concluded core category is "life oriented thoughts of death". These categories are explored and discussed in the paper.

SERAPIONI, MAURO* (Centre for Social Studies, mauroserapioni@ces.uc.pt)

Health Systems and Inequalities in the Southern European Countries

Despite the general increase in the standards of living during the twentieth century and the introduction of universal healthcare systems, many studies have pointed out the persistence of inequalities in all industrialized countries. Also in Southern European countries (SEC), despite the creation of universal national health services during the 1970s and 1980s and the concern to reduce geographical and social health inequalities, the equity issue only became a priority in the late 1990s. Therefore, it is important to explore the potential of iniquity, induced by health systems, which is being produced by health reform processes both at national and regional level, before and during the current financial crisis. Considering this framework, new institutional arrangements were introduced in health systems and new articulations between public and private sector within services provision were made, which will be analysed. Another way of inducing inequalities is to increase the involvement of users in the health spending through co-payments and users' fees. This is a common practice registered in SEC, which is not only erecting financial barriers to access health system as it is contributing to renew health inequalities. Another trend to be explored in the presentation refers to the progressive increasing of private health expenditure when compared to the total expenditure in all SEC (despite the recognition of the right to health and access to health services). The structure of this presentation will start with a brief contextualization of the Greek, Spanish, Italian and Portuguese health systems, then the main health inequalities affecting population and the role of the health systems in the production of such inequalities will be described through the identification of the potential of inequity induced by the current financial crises.

The Challenge of Citizens' Participation in Southern European Health Systems

The purpose of this presentation is to analyze citizens' participation (CP) in the health systems of Greece, Italy, Portugal and Spain, which will be framed under Southern European countries Welfare State "model". Through a review of the existent sanitary regulations, health plans and published literature on CP in the health sector, citizen participatory practices will be analyzed. First, the main stages of

the health reform processes will be described, so that we can take into account the context in which such experiences of participation in the health domain have been developed. Then, the preliminary results of the research on CP experiences in the health systems of the four countries will be presented. Some of the research results are noteworthy: a) citizens' participation in the decision-making process on health has become the focus of attention of the public policies only after the 1990; b) there has been a significant progress in the regulatory framework and in the acknowledgement of users' rights, particularly in Italy, Portugal and Spain; c) the development and implementation of participatory mechanisms were insufficient, discontinuous and limited to certain geographic regions; d) in Greece, despite the intentions to implement participatory practices within national health system, those do not exist until today; e) the scientific production and theoretical contribution of the South European Countries on the subject of public participation in the health sector still is insufficient. To conclude, some reflections on the possible developments of citizen's participation within the health systems of the Southern European macro-region will be proposed.

Do Air Quality Policies and Individual Attitudes Meet? Four European Metropolitan Areas for a Comparative Exploration

   Eurobarometer survey in 2013 showed how air pollution was perceived as one of the major environmental concerns in urban areas. Between EU policy makers and environmental civil society organizations (CSO) there is also growing interest for non-technical measures that aim to individual behaviour changes to improve the control over pollutant emissions. Policies try to integrate air quality and climate change policies at multi-scalar levels. Implementation of laws and norms, however, requires at each step of translation careful consideration as it entails risks of inefficiency, goal displacement, or even outright rejection and resistance. Within this frame our research addresses this translation process and focuses on four European metropolitan areas: Antwerp (Belgium), Malmö (Sweden) Milan (Italy) Warsaw (Poland) aiming at answering the following questions:
   a) how are relationships between air pollution policies and individual behavior configured?
   b) what are the intervening factors explaining cross-national differences?
   In order to answer these questions, we adopted a mixed-method approach carrying out an exploratory multi-scalar policy analysis, drawing on 40 semi-structured qualitative interviews with key stakeholders and policy makers and a CAWI survey on 4 EU countries with 9.200 respondents. This joint analysis allows to compare the representation of both individual behavior and attitudes on which air pollution policies are based with individual attitudes figures obtained through our survey. Indeed, a quantification process of qualitative data from interviews, has enriched the survey's analysis expanding the traditional study of environmental issues' perception adding the general profile of local air quality policy as an independent variable. On the other hand, socio-economic and material differences among countries may be further explored in relationship to policy-makers and CSO points of view.

Tensions and Future Scenarios of Elderly Care Policy in a Portuguese Municipality. a Case Study

   The reform of advanced welfare state systems has been subjected to controversial debates, especially in Europe. If its demise "is not an option" – as proclaimed by the "Advisory Group on Societal Challenge 6" (2014) – the role and weight of social investment is wide open to debate. In Portugal, the issue is intensified by the current climate of austerity and by the pressures of the neoliberal and New Public Management reforms on the policy decision-making process at local, regional and national levels.
   Drawing on a case study conducted in a municipality of the Lisbon Region, related to local aging welfare policy, this presentation aims to examine ongoing processes of inter-organizational collaboration and networking and explore the "policy possibilities" opened up to policy-makers facing severe demographic aging and poverty in the region.
   The preliminary analysis of the data, collected through a set of policy planning documents, semi-directive interviews to local policy-decision makers and the participatory methodology applied to a panel of different stakeholders (Delphi)

revealed some tension between fragmentation and strategic reorientation to sustainability. Besides the necessity of using the limited financial resources more effectively and prevent the fragmentation of the welfare provision, the main issue at hand is how policy-makers and professionals can facilitate the process to turn the older people into active stakeholders and policy co-agents and not mere recipients of social services.
   Applying a four future scenarios model of welfare policy - still in progress – the researchers want to demonstrate that the intensification of the collaboration and networking processes, involving actively the elder themselves, and other stakeholders are crucial conditions to ensure the sustainability of the welfare provision at local level.

NPM, Cooperation and Conflict: What's New in Multi-Professional Teamwork in Health Care?

   The discussion connecting professions and organizations particularly in the context of growing managerial frameworks, shows controversy concerning professionals' performance of their roles. Does professionals' identity and strategies are being shaped by entrepreneurial values? Or does professionals still to employ both individual and group strategies to maintain and reinforce their autonomy? This paper concerns multi-professional teamwork in health care in contexts of strong economic and efficiency controls resulting from the New Public Management (NPM) reforms.
   Efforts between different health professionals and work groups often result in conflict and tension. Cooperation difficulties are thought to exist and many of this problems are assumed as associated with (but not only) the differences between the several professional self-governance mechanisms involved in the multi-professional teams. Although, as several sociological studies show, most of this conflicts are built from the drawing of boundaries between medical specialties (Serra, 2011) and different health professions.
   As teamwork is a network of semi-independent professionals who tend to represent their professional organisations and groups despite sharing a mutual interest in the patients, frontiers between different health professions act, on the one hand, as articulating mechanisms to be found in the division of health work and as barriers to the interaction of the various skills. The argument is that NPM reforms in health care may not have improved the situation. Given these conditions, there is a good reason to understand how cooperation between different health professions is constructed as they work together in the best interest of patients. However, it is also possible that the continued influence of professional self-governance and the increasing strength of management mechanisms will resulting in new arrangements in terms of professionalism.

Emerging Communication Technologies: Cutting Across Nation-State Boundaries

   The Internet and recent advances in Information and Communication Technology (ICT) have revolutionized the way people communicate. This shift and transformation in communication also affects the way students in schools communicate. In the past, communication between and among teachers and students happen only inside the classroom. With the phenomenal growth of e-learning and online education in the last decade, students are not bound by borders of nation-states anymore when it comes to learning. Modern ICTs have facilitated the process of globalization and have connected the Philippines to the rest of the world despite the fact that many of its citizens are still considered poor by global standards. The transnational flow of people brought new types of learners who are able to interact beyond the brick and mortar classrooms. This study takes a look at how the University of the Philippines Open University (UPOU) as part of the National University of the Philippines is able to transform the current socio-cultural milieu by giving opportunities to the Overseas Filipino Workers (OFWs) to pursue graduate education. The remittances of OFWs represent a large chunk in the country's gross domestic product or GDP thus the important role they play in the economy of the Philippines cannot be ignored. This paper examines the views and experiences of OFWs who are enrolled in the following selected graduate programs of UPOU: Master of Environment and Natural Resources Management (MENRM), Master of Arts in Nursing program, and ASEAN Graduate Studies Program. This paper will also examine how globalization and modern ICT have transformed the socio-cultural milieu of the OFW community. Data from this study will be analyzed qualitatively. Results of this study will provide a critical insight on how the emerging mode of learning were able to transform the socio-cultural and socio-economic conditions of OFWs.

Doing Well By Doing Good: Exploring the Relationship Between Political Participation and Older People's Hedonic and Eudaimonic Well-Being

This study brings together two research fields of growing research interest in later life: civic participation and well-being. The aim of the study is to explore the relationship between political participation, as one important type of participation that has received little attention in the literature to date, and well-being. Furthermore, by exploring different dimensions of personal well-being, we also contribute to our understanding of this concept in later life. We designed a quasi-experimental study. Data were collected from 182 participants recruited from two samples. The first sample consisted of 97 participants purposively selected from three kinds of political organisations in Catalonia (Spain): political parties, trade unions and single-issue organisations. The second sample, used as a comparison group, consisted of 85 participants involved in two university programmes for older people. Participants completed a survey which included socio-demographic information, measures of political participation, and measures of hedonic and eudaimonic well-being. A series of one-way between groups analysis of covariance (ANCOVAs) were performed, using socio-demographic variables as the covariates. Controlling for socio-demographic variables, participants in political organisations showed significantly higher scores on eudaimonic well-being. No significant differences were found among samples on hedonic well-being. Suggestions for future research and social policy implications are discussed in light of the results.

Innovation Embedded in Entrepreneurs' Social Networks and Social Value "Trust": A Multilevel Analysis for the MENA Countries

Innovation is a social phenomenon. It is determined as interaction processes and exchanges knowledges between a large diversity of social actors. Social networks around entrepreneurs will enable them to access more resources (knowledges, ideas..) which may foster their innovativeness. Studies show that entrepreneurs oriented on innovation create high-performance firms, which in turn provide economic growth, employment, and significant improvements on the overall well-being of people's live. Thus, through innovation entrepreneurs can do untold good for society. In this paper, we argue that sociological factors are important for explaining for the differences of innovation's level among entrepreneurs. We are interested to examine the effect of social networks on innovation among entrepreneurs in MENA countries. In addition, we try to test the effect of national values, trust, as a main factor on innovation, and as a moderating factor between social networks and entrepreneur's innovative behavior. We use the Global Entrepreneurship Monitor (GEM) individual level data for 14 MENA countries from 2009 to 2014 (13.599 observations), merged with national-level data on trust from World Values Survey (WVS). Our findings show that social networks affect positively entrepreneurs' innovation. Public sphere networks have a positive impact on innovation, whereas the private sphere networks effect differently the innovation among entrepreneurs in MENA countries. National value "trust" has also a significant impact on innovation, in the way that trust encourages innovativeness among entrepreneurs in MENA countries. Furthermore, Trust moderates the social network effect on innovation.

SETTLER, FEDERICO* (University of KwaZulu-Natal, settler@ukzn.ac.za)

Imaginaries of Home: Somali Migrant Experiences of Identity and Belonging in South Africa

The proposed presentation is located at the intersection of religion, migration and identity in sub-Saharan Africa. It is premised on the idea that when people move, they take their religion and cultural identities with them (Spikard and Adegame 2010). In recent decades a great deal of scholarship in the field of migration studies has focussed on movement from the global South to the North, with most studies characterised by sentiments oriented around social exclusion, integration, multiculturalism, and citizenship. I hope to discuss the various ways that Somali migrant communities in selected South African cities imagine and make sense of narratives of home in the context of transnational belonging and identity.

Scholars of transnational migration have, over the last three decades, successfully demonstrated the numerous ways in which migrants maintain connections to their homelands while simultaneously becoming embedded in their new places of residence (Glick Schiller 2003; Itzigsohn 2000). Owing to the cross-disciplinary application of the transnational optic, scholars have proceeded to document transnational connections, processes and activities in a range of arenas. Religion, however, has only quite recently been brought into studies of transnational migration, despite the fact that most religious communities, both imagined and real, are global and transnational in nature.

Contemporary migrants use religion to stay connected to the places they leave behind and to forge new forms of transnational belonging (Carnes and Yang 2004; Levitt, Lucken and Barnett 2011). Nina Glick-Schiller for example, has argued that "religion provides migrants with a simultaneously local and transnational mode of incorporation that may configure them not as ethnics but as citizens of both their locality of settlement and of the world" (2009:126). I will argue that Somali Muslims in postcolonial South Africa variously forge forms of transcendental locality that reform understandings and articulations of what constitutes home.

Prevent Early School Leaving: The Risk of School Dropout Questionnaire (RSDQ)

Prevent Early School Leaving: the *Risk of School Dropout Questionnaire* (RSDQ)

Education and training are considered key tools in combating unemployment and social exclusion (Delors, 1993; Cresson, 1995), as well as key elements to invest in so as to promote economic growth and social development.

Against this background, it is essential to deal with the unfortunately chronic dysfunction that presently affects education and training systems: "school dropout". This dysfunction is recognized in the international context in terms of *Early School Leaver* (ESL), as a result indicator that refers to persons who have now left the school and education system.

In order to counteract this dysfunction, the authors, considering this phenomenon as a derailment of studies and training systems, rather than solely as a possible negative outcome of this, put the emphasis on the level of primary prevention and on signals that may precede it.

This complex phenomenon requires the adoption of a systematic interdisciplinary approach able to fathom both the social (and personal) reality of the students and the interaction between factors which are internal and external to education and training.

Therefore, moving from a sociological approach (sociology of education), assuming the theory of *disengagement* (part of the present interpretative and phenomenological aspect) on school dropout and, finally, opening horizons to other disciplines (pedagogy and psychology), the authors have developed the *Risk of School Dropout Questionnaire* (RSDQ), validated in the Italian context.

The RSDQ, made up of an *Identity form* and three scales – *School scale*, *Family influence scale* and *Self scale* – characterizing its interdisciplinary nature, measures the risk factors that may contribute to people leaving school early. This is underpinned by a "causal model" for school dropout (Colombo, 2010), which involves personal, temporal and contextual variables, otherwise declined into the three experiential and socialisation areas: school, family and labor market.

SEVILLA, ARIEL* (Universite de Reims, ariel.sevilla@univ-reims.fr)

Les inégalités De Diplôme Lors De L'embauche Chez Les Ouvriers De L'industrie Automobile En Perspective Comparée (Argentine, France, Brésil)

Le discours des directions d'entreprise sur l'embauche de leur main d'œuvre s'inscrit dans les attendus de la théorie du capital humain : le changement technologique demande des compétences nouvelles – associées à un travail plus intellectuel – que les travailleurs doivent acquérir par un investissement en formation.

L'explication par l'économie est souvent avancée. C'est vrai que les salaires sont plus faibles dans les pays « émergents » et que l'entreprise peut y acheter des compétences plus élevées et obtenir une productivité accrue relativement à une main d'œuvre faiblement qualifiée. C'est aussi vrai que les investissements capitalistiques sont plus forts dans les usines des pays « développés », caractérisées par la robotisation des ateliers ; alors que le travail reste largement manuel dans les usines des pays « émergents ».

Cependant, lorsque l'on regarde de près ces situations, ces points de vue surplombants ne sont pas convaincants.

Le travail de terrain par observation participante - dix huit mois dans trois ateliers de tôlerie du même constructeur automobile dans une filiale en France, en Argentine et au Brésil - montre deux situations contrastées et inattendues. D'une part, là où les investissements technologiques sont forts et les mutations du travail accentuées, les ouvriers sont les moins qualifiés, c'est à dire en France.

D'autre part, là où le *process* de travail est resté manuel (les deux usines sud amér-icaines) les ouvriers sont très qualifiés car entre un tiers et la moitié détient un diplôme équivalent au bac français.

Comment comprendre que pour la même activité l'entreprise embauche des ouvriers avec des niveaux de diplôme si différents ?

Les raisons du phénomène reposent sur les configurations (Elias) qui articulent les caractéristiques sociales de la main d'œuvre avec les systèmes d'assurance chômage, de sécurité sociale et avec l'inégale valorisation du travail salarié au sud et au nord.

Paternity and Parental Leave for Fathers to Promote Greater Domestic Work and Care Equality: A Global View

Support is nearly universal worldwide for fathers to become more involved with and responsible for domestic work to enhance the balance between employ-ment and family for parents. Pressure groups and legislatures have pushed for employment leave options to promote opportunities for involved fathering with children and more equality between fathering and mothering. Employment leave for fathers lags behind leave available for mothers. A recent analysis by UCLA's World Policy Analysis Center from the Adult Labor Database for 186 countries found that all but 8 provided some paid maternity leave to women. The Unit-ed States remains the only advanced capitalistic country that does not mandate paid leave for mothers (or fathers) of newborns. Although not the majority, 81 of these 186 countries extended paid leave to new fathers through paternity leave or parental leave or a combination of these. The majority of these countries (61) pay fathers at least 75 percent of their wages for at least part of leave taken. Evidence is mounting from Sweden and Japan that fathers taking leave, and for longer periods, increase their involvement with children, shared more equally in housework and childcare with mothers, and obtained the best balance between paid work and family. These fathers are exceptions as changes in fatherhood in the direction of expecting greater family involvement has yet to be matched by substantial changes in fathering in most countries. History, tradition, economy, and geography for each country are important factors that affect current status plus amount and rate of change. Differences in fathering in advanced capitalist countries appear to be increasingly mediated by the availability of father and fam-ily-friendly social policies and programs. Promotion of employment leave along with shortened work hours, flextime, and autonomy in work hours and workloads for fathers should contribute to greater domestic work and care equality.

A Comparative Research on the Deterring Effects of Religious and Non-Religious Factors on Economic Crimes in Iran

In this paper the results of the first cross-sectional study in Iran examining different correlates of white-collar crime both in private and public sectors are presented. Theoretically, the present paper is framed in competing or alternative theories of white-collar crimes including Hirschi & Stark's theory of the fear of hell's fire, Collins and Schmidt's theory of personality correlates of white-collar crimes, James William Coleman's sociological theory of corruption, and finally Cor-nish and Clark's economic theory of white-collar crimes. The data were obtained in the spring 2012 from 120 managers currently active in Iranian corporations and official departments and also 120 white-collar criminals who formerly held such positions and currently incarcerated in prisons. Participants filled out paper and pencil scales measuring some personality correlates of white-collar crimes (hedonism, narcissism, lack of behavioral self-control), motives (dealing with the crisis threatening the criminal, the family, or the company), level of religious so-cialization through interpersonal communication (via orientation family, close friends, schools, and community), level of religious socialization through the me-dia (religious programs broadcast from the national radio and television broad-casting organization, books, movies and CDs), level of the individual's religiosity, individual's perception of the probability of being arrested, individual's perception of the levels of criminal opportunity, and some demographic variables such as socio-economic status, age, education level. The logistic regression analysis ac-counted for 75 per cent of the variance between the two groups. According to the research results, white-collar crime in Iran is predicted by individual's perceived risk (probability) of being caught, and individual's perception of the levels of crim-inal opportunity.

Cyberspace As Sacred Space: Toronto's Universal Oneness Spiritual Centre

As a phenomenon that has had overwhelming social, cultural and political in-fluence, the internet has become so embedded in our lives that it is difficult to imagine what we did before its invention, how we communicated or how we did our work without almost instantaneous access to information. It is not surprising, then, that the web is also a very active religious environment. Like many organi-zations, religious and spiritual groups use the internet extensively to proclaim their beliefs and to be in contact with their followers. Broadly construed, religious activity on the internet occurs along a continuum bounded at one end by *religion online* and at the other by *online religion.* Conceived originally by Christopher Hel-land and further developed by Lorne Dawson, *religion online* means the use of the internet as a vehicle for providing information about or by religious groups, move-ments, and traditions and involves the traditional forms of web communication with no interactivity. Almost every religious group has a space on the web as an extension of its message or to provide information to their members. *Online re-ligion* looks to the internet as an interactive venue for religious practice, ritual, ob-servance and innovation. Rather than simply seek information online, adherents use the internet as an integral part of their religious lives. Chat-rooms turn into scripture study classrooms or prayer groups; web cameras provide adherents, who may be geographically dispersed, the opportunity for religious practices like ritual adoration or "virtual" pilgrimage; and with the emergence of such groups as the "cyber-coven" and the "cyber-church," some religionists are moving entirely online. Focusing on the Universal Oneness Spiritual Centre, based in Toronto, On-tario, Canada, this paper compares and contrasts the pros and cons of online and offline New Age spirituality, paying particular attention to issues of social, cultural and geographical differentiation.

The Power of Implicit Processing of Religious Symbols to Activate or Moderate Anti-Muslim Attitudes Among Jews

Recently several countries have outlawed the wearing of religious signs in pub-lic places. Although many theories assume that religion plays an important role in negative intergroup attitudes, social-cognitive structures of intergroup attitudes have not been sufficiently investigated. Thus, we aimed to investigate the process of negative attitudes as an outcome of exposure to religious content in a context of tense intergroup relations.

Two experiments examined the influence of religious concepts on stereotypes, prejudices and threat perceptions of Jews towards Muslims. In Study 1, students (*N*=68) completed a search puzzle by which they were exposed to out-group, in-group or neutral religious symbols, and filled questionnaires assessing their out-group attitudes. Priming did not affect attitudes. In Study 2 subliminal priming was employed and it was found that subliminal exposure of participants (*N*=63) to in-group religious concepts reduced their negative attitudes towards Muslims, as reflected by measures of prejudice, social distance, realistic and symbolic threat perceptions. All these negative attitude measures were positively correlated with religiosity. Stereotypes and inter-group anxiety, however, were not affected by priming, and the former was not correlated with religiosity.

The findings highlight the complexity of the aforementioned forms of inter-group negative attitudes. Exposure to religious concepts may evoke prejudices and threat perceptions but may also reduce negative attitudes and anxiety. More-over, a multicultural environment improves negative contact and may prevent its possible behavioral outcomes. Yet, exposure to religious content may prompt negative attitudes towards the minority in a culturally diverse and tense reality, suggesting the influence of minority-majority relations on out-group attitudes. These findings contribute to an understanding of the social context in which rac-ism and violence against minorities and religious groups exist as well as the emo-tional and cognitive mechanisms that generate or moderate negative attitudes.

Mental Health Care Use Among the Most Religious Jews and Muslims in Israel: Opportunities for Faith-Based Interventions?

Background: Involvement in a religious community can affect its members in many ways beyond religious ones, including health-related impacts. The most tra-ditionally religious segments of Israeli society, including both Jews and Muslims, have distinctive attitudes, behaviors and demographics, all of which can impact appropriate use of mental health services. Israel recently implemented mental healthcare system policy reform, with uncertain impact on utilization among sub-groups. Prior research found some underutilization among the most religious Israelis despite universal health insurance yet the topic has been understudied.

Research Questions: 1) To what extent do Haredi/ultraorthodox Jews and traditional Arab Muslims in Israel seek and/or receive mental healthcare? 2) Do results vary by key subgroups including religion and socioeconomic status? 3) What faith-based interventions can potentially be developed to increase use of needed mental health services among these religious groups?

Methodology/Results: This is a mixed methods study. A random-sample survey of all Israelis conducted in 2013 was analyzed. Outcomes included mental healthcare utilization measures and attitudinal measures related to potential barriers. Religious group was categorized by self-report. Univariate and bivariate analyses were performed using health, religious, and socioeconomic factors. Chi-square statistics were produced. Over 2000 Israelis were surveyed including 275 Haredi/ultraorthodox Jews and 200 traditional Muslims. Barriers such as stigma, lack of information and inadequate referrals were identified. Variations were found by religious and socioeconomic subgroups. Key informant interviews with 20 religious, community and medical leaders were conducted and analyzed. Faith-based intervention opportunities to help overcome these barriers were identified.

Conclusions: Opportunities exist to leverage social and religious capital in faith-based organizations-to improve the health of their communities and reduce inequalities. Culturally-sensitive interventions can be developed to increase appropriate mental healthcare system utilization for religious Israelis. This issue is particularly timely after mental health reform when exist opportunities to change relevant attitudes and behaviors.

Global Solutions? Efforts, Challenges and Contradictions of Global Anti-Trafficking Policy

Recent decades have witnessed the growth of global awareness and policy formulation in relation to social problem of human trafficking. With the passage of the Palermo Protocol aimed at preventing, suppressing, and punishing human trafficking in 2000, many governments have participated in its ratification as well as establishment of national anti-trafficking policies. The range of these policies includes forms of criminalization of human trafficking, prevention campaigns, and protection and rehabilitation measures. Other actors of these global anti-trafficking policy include international governmental organizations (e.g., International Organization for Migration, Interpol), and international and local nongovernmental organizations (e.g., Anti-Slavery International, ECPAT – End Child Prostitution and Trafficking, and others). This paper analyzes the shifting international context in which global anti-trafficking policy is taking place. By using several cases (Russia & Ukraine, USA, Turkey, and others), the paper discusses persistent challenges in local/global interactions within global anti-trafficking policy (e.g., adoption and negotiation of international protocols, standards, and procedures; translations of laws; differences in cultural contexts; power issues in geopolitical context, etc.). The focus of the paper is on three institutional levels – governments, international organizations, and local nongovernmental organizations.

Mobilizing the Past: Gender Politics and Neo-Traditionalism in Russia

This paper analyzes neotraditionalist ideology and its role in re/defining gender identities in contemporary Russia. Government officials, the Orthodox Christian church, various public organizations, and public figures construct and use this ideology that relies on strict and rigid "traditional" gender norms. For example, this ideology was prominent in justifying the infamous Russian anti-gay legislation passed by the State Duma in 2013. Neo-traditionalism is also prominent in discussions of domestic violence problem, gender equality, and other public debates. In this paper, I look at public construction of this gender neo-traditionalism as it shapes the shifting landscape of gender politics in Russia.

Environmental Disasters and Vulnerability to Human Trafficking and Exploitation: Initial Findings of a Pilot Research Study in Mongolia

The paper presents initial findings of a pilot research project, which interrogates a relationship between vulnerability to human trafficking and labour exploitation, on the one hand, and environmental disasters, on the other hand, by focusing on the impact of land degradation and desertification in Mongolia.

Despite the accumulating evidence of the links between environmental change and socio-economic vulnerability, there has been little reference so far to natural disasters in the literature on climate change and displacements, and even less discussion on the vulnerability of people affected by such disasters to coercion. The framing context for this study is the increasing socio-economic vulnerability of communities linked to the changing global climate and patterned by systems of social stratification on the one hand, and the promise of neoliberal economic growth, which remains a key factor in climate change, to deliver the vision of equity and social justice, on the other.

The impact of climate change on the movement of people within and across borders, and the social and economic impact of such forced displacements have been receiving an increasing attention from both scholars and policymakers. However, little scholarly research exists to systematically explore these issues with some of the key scholarly contributions and policy documents making distinctions between 'people devastated by conflict or natural disasters' and 'victims of trafficking' ignoring the often-occurring overlap between the two categories.

The paper will present initial findings based on a series of interviews conducted with scholars, policy-makers and representatives of the most affected communities in Mongolia. It will explore which factors increase the vulnerability of people in areas affected by environmental disasters to human trafficking. It will discuss what could be done to improve community and individual resilience to climate disasters and reduce the vulnerability of communities and individuals to violence, coercion and human trafficking.

SHARMA, NAINA* (University of Rajasthan, naina.sanskarjyoti@gmail.com)

Relationship Between Leisure, Unemployment and Labour Force

The labour force is defined as the number of people of working age, who are either employed or actively looking for work. The participation rate is the number of people in the labour force divided by the size of the adult civilian noninstitutional population. The nonlabour force includes those who are not looking for work, those who are institutionalised such as in prisons or psychiatric wards, stay-at home spouses, children, and those serving in the military. The unemployment level is defined as the labour force minus the number of people currently employed. The unemployment rate is defined as the level of unemployment divided by the labour force. The employment rate is defined as the number of people currently employed divided by the adult population. In these statistics, self-employed people are counted as employed. Variables like employment level, unemployment level, labour force, and unfilled vacancies are called stock variables because they measure a quantity at a point in time. They can be contrasted with flow variables which measure a quantity over a duration of time. Changes in the labour force are due to flow variables such as natural population growth, net immigration, new entrants, and retirements from the labour force. Changes in unemployment depend on: inflows made up of non-employed people starting to look for jobs and of employed people who lose their jobs and look for new ones; and outflows of people who find new employment and of people who stop looking for employment. When looking at the overall macroeconomy, several types of unemployment have been identified, including: Frictional unemployment, Structural unemployment, Natural rate of unemployment, Demand deficient unemployment etc. Leisure activities also affects the rate of unemployment and out put of labour forces. The present paper is an effort to analyse the relationship between Leisure, Unemployment and Labour Forces.

Role of Leisure Satisfaction in Health and Happiness

Leisure refers to activities that a person voluntarily engages in when they are free from any work, social or familial responsibilities. Leisure satisfaction is the positive perceptions or feelings that an individual forms, elicits and gains health and happiness as a result of engaging in leisure activities and choices. What can contribute to leisure satisfaction is to what degree an individual is currently satisfied with their leisure experiences and activities. An individual might attain positive feelings of contentment and happiness that result from the satisfaction of needs. Participation in leisure activities and leisure satisfaction are inextricably linked to an individual's health. Caldwell (2005) suspects that leisure activities may be associated with a number of defensive traits that enhance a person's resiliency to negative life experiences. Some aspects of leisure activities that can act as protective factors. Leisure activities, although ranging in types, have also proven to be beneficial to health cross-culturally. In a study by Hribernik and Mussap (2010), leisure satisfaction was found to predict unique variance in life satisfaction, supporting its inclusion as a distinct life domain contributing to subjective well-being. The present paper is an effort to analyse the role of Leisure Satisfaction in Health and Happiness.

Dealing with Gender Vulnerabilities of Women Migrants: In Reference to Female Domestic Workers of New Delhi.

Women migrate for related reasons, contributing to the social and economic domain of the country of origin and destination. This section undergoes lots of discrimination and violation right from the level of entry into the country to other forms of differences, prejudices and inequity. The present paper concentrates on the issues, rights and protection under law (if any) of domestic workers migrating into the Union Territory of New Delhi, India. The financial cost of migration (ticket/agent fees and other charges), lack of authentic and adequate information about actual procedure of migration, living and working conditions at destination country, strong government agencies/instruments, discomfort with adjustment to values, culture, language at destination. Women domestic workers are more exposed to gender segregated and unregulated practices. Due to hidden character of work-abuse, violation-which is absent or less apparent along with low job satisfaction, poor working conditions, and sexual/physical abuse. Unorganized Social Security Act 2008(for workers in informal sector including domestic workers); Domestic Workers Welfare and Social Security Act (2010)(for registering domestic workers, rest period, leave, working hours, maternity benefits);inclusion of domestic workers in Rashtriya Swasthya Bema Yojana in 2011 for health insurance and Final Report of the Task Force on Domestic Workers (2012) by Ministry of Labor, India and ILO calls for domestic workers to be included in the Central List of Scheduled Employment. These are some major legal apparatus along with other minor state interferences to secure women domestic workers' issues. Still they are excluded from Minimum Wages Provisions 1948, Maternity Benefits Act 1961, Compensation Act 1926, Equal Remuneration Act 1976, Employees' State Insurance Act, Provident Fund Act, Gratuity Act 1972 and many other benefits. To enable availability of mechanisms for support, their thorough assessment is necessary.

Re/Claiming the City - Questioning and Re-Imagining Public Spaces. Experiences from Three Cities in India.

As against the backdrop of the gruesome 2012 rape-case in the capital of India, many are questioning the safety and accessibility to their city-spaces. Women engage in a conscious self-monitored pattern of movement through the city. Space and its material environment interact in a dialectical relationship, each actively produces the other. Different bodies experience spaces differently. Social hierar-

chies are intrinsically linked to how spaces are used. Inequality and vulnerability extend to not only women, but include transgenders alike. Current feminist literatures recognize the nuanced multi-scalar stratification of structural inequalities in society produced by inter-sectionality of race, caste and class. Urban spaces are sites of negotiation and contestation. Gendering happens by locating certain bodies (male/female/transgender) in certain spaces as appropriate or inappropriate.

Representations of space as conceived by planners, policy makers as expressed through maps, signs, budgets (Lefebvre work on 'Production of space') determine the production of social relations and thus occupy a central position to be critically reflected upon. Current research asks how we go beyond the process of gendering spaces. The paper weaves through interesting recent movements by activist groups like 'Right to loiter, Right to public display of affection, Kiss of love movement against moral policing in public' to explore alternative visions of the city.It draws on the lived experiences and narratives of women which expose multiple layers of complexities; as well as survey data/ NGO reports from three cities in India- Mumbai, New Delhi and Kolkata. Practical examples are drawn from newspaper reports to critically look at solutions given by urban planners. The paper argues that increasing visibility of women and transgender community in public spaces could be an alternative to re/claim public spaces by challenging the dominant imagination of the city. This could be a way to mainstream gender and have a fare-shared city.

Negotiated Ethics in Reality: Exploring Participatory Video Research with Migrant Transgender Communities and Sex Workers in India

Practitioner-researchers are increasingly recognising the importance of critically interrogating the reality of participatory video practice in research and community development contexts. Questions have been raised about the multiple motivations (e.g. of participants, practitioners and financing agencies), the empowerment purposes and outcomes, the emergent power dynamics, and the ethics of public expression and reception. There is a compelling need to reflect honestly about how processes play out in the typically contested project context.

This paper draws on my recent experiences convening a visual research programme as part of the *Participate* initiative, which brought perspectives from extremely poor and marginalised communities to UN policy makers during post-2015 deliberations. In the presentation I explore participatory video processes that took place from 2012 to 2013 with migrant transgender communities and sex workers in Chennai and Maharashtra. I firstly, ground participatory video as a longer-term interactional process (the means) towards increased social influence (the consequence), because I contend that framing the purpose as *participatory representation* makes the curtailment of social possibilities more likely. I also emphasise that practice tensions are an intrinsic (and potentially productive) aspect of participatory video when negotiating to increase participant's influence *across* social divides, agencies and levels.

Next I use key critical incidents from the research, contextualised with visual materials produced by the transgender group, to raise key questions about the participatory video realities. These include the methodological contributions and ethical contradictions, the conflicting researcher and community agendas, the dynamic aspects as insight location and constraint, the translation of cultural aesthetics, and issues of ownership and creative commons with stigmatised groups. Consequently, this paper contributes to developing a more sophisticated account of visual methods, which acknowledges the theoretical and practical ambiguities and the often rather messy, indefinite and contingent actuality.

Pushing Back: The Publishing Hierarchy, Activist Scholars, and the Challenge of Solidarity

In my presentation I will approach the topic of power in research from a promotion and tenure perspective. I will ask how the publishing hierarchy for those bound by the traditional expectations of blind peer-review publishing holds power over the research agendas of activist scholars. I will discuss the risks scholars are forced to take in the face of said hierarchy, especially in our attempts to mediate power imbalances in research.

I will use my edited collection *Taking Risks: Feminist Activism and Research in the Americas* (SUNY 2014 & 2015) as the point of departure for this discussion. *Taking Risks* is a collection inspired by the researchers' commitments to social justice. In it we use the frameworks of activist scholarship, transnational feminist theory, and activists as storytellers and organic intellectuals to situate studies of local social movements and feminist activism in the Americas. The individual cases, particularly as presented as one complimentary narrative attempt to circumvent traditional promotion and tenure committees' biases against activist motivated and guided research by elevating the on-the-ground activists, the storytellers, to

the position of expert. This well-intentioned framework, however, can only go so far in challenging the researcher-researched power imbalance present in even the most progressive scholarship. In short, as the authors/editors we clearly have the final say over the words of the activists we research.

There are several cases in this collection but I will focus on the ones that lend themselves most to discussing the risks confronted by scholar-activists when we attempt to circumvent the traditional university publishing hierarchy. Additionally, the selected chapters grapple with the power imbalances in the field and subsequent challenges of and strategies to minimize the imbalances. These cases include: a video archive project in Medellín, Colombia, the independent library movement in Cuba, and Chilean exiles in Canada.

Public (in)Visibility of Faith: The Contrasting Responses of Two Muslim Organizations to the Debate on the Public/Private Divide in Switzerland

With a gradual transformation of Muslim migrant groups into diasporic communities (Schiffauer 2007) and their transition "from the status of the invisible migrant-worker to that of visible Muslim citizenship" (Göle 2011), an awakening of Muslim identity can be observed in almost all Western European countries.

The increasing public visibility of Islam has triggered hot public debates on the question of how to reconcile two core issues in the social contract of Western European societies: freedom of faith and the public/private divide.

Taking part in these debates, Muslim organizations have taken different stances to address the concerns of the autochthonous population. Based on narrative interviews and participatory observation, the study analyzes contrasting responses of two Muslim organizations: the *Jamaat Ahmadiyya* (AJ) and the *Islamic Central Council Switzerland* (ICCS).

The AJ, a persecuted minority in Pakistan, views secularity as an excellent framework for its congregation to freely observe its religious rituals. Internally a conservative, traditionalist community, the AJ follows externally an accommodationist policy thus retreating into private spaces to carry out religious rituals.

By contrast, the ICCS, an Islamist organization founded by a group of second generation Muslims and converts, sees in secularity a violation of freedom of faith and try to persuade its members to publicly live up to an orthodox code of conduct.

Finally, the paper shows how these two approaches are linked to the identity politics of the respective organizations

The study is part of a larger project funded by The Swiss National Science Foundation investigating the narrative identities of Muslims actively engaged in voluntary associations.

The Emergence of Inequality in Task Groups: How Task Type Affects Interaction Dynamics.

Sociologists have identified two distinct processes which govern the offering of suggestions for task solutions, asking of questions, evaluation of contributions, and exercise of influence. One is based performance expectations based on culturally valued attributes actors bring to the situation. A second process governs the emergence of inequality in groups composed of individuals who are not differentiated by status characteristics. This occurs when contributions for the group task are evaluated by group members. Contributions evaluated negatively earn those who make them low performance expectations.

Two distinct measurement processes capture interaction in task groups. In one acts are classified as questions about the task, task contributions, positive evaluations, negative evaluations, and influence. The second process is based on the content of speech activity of individuals in the group. Speech may be classified as attempts to organize the group activity, as concrete with respect to the task (simple lists of items or ideas), or as having varying degrees of complexity. Both types of measure assess volume of talk and consequently are correlated with one another. They are both associated with behavior interchange patterns (BIPS), a construct that captures the dynamics of interaction in groups.

We compare interaction dynamics in groups who are attempting to solve different types of tasks. One task type requires the group to identify a correct answer. The other type of task requires group members to creatively solve an ambiguous problem. Our interest is in how these different types of tasks affect the dynamics of interaction in groups. We analyze data from two different studies to determine how task type and status differences affect the emergence of interaction inequality in groups. We are particularly interested in the effects of task types and status on the complexity of speech content and organizing activity in groups solving different types of tasks.

Homeownership, Gender, and Intimacy in Urban China

This paper explores gendered disputes on contemporary moralities and practices of heterosexual romantic love and marriage between young unban Chinese men and women. Dramatic rising on housing price in urban sittings has been one of the most crucial indicator signifying rapid social changes in the post-socialist Chinese society. An increasing tension between marriage and homeownership among young urban Chinese is found in popular discourse. Owning a place has become a basic criterion for Chinese men to be suitable for marriage. By analyzing popular discourses from TV dramas and Internet discussions, and in-depth interviews with young Chinese people mainly in Beijing, this paper finds moral clashes between urban Chinese women and men on the relationship of romantic intimacy and economic activities. Chinese women and men share the cultural assumptions of the importance of economic security and men as the breadwinners in the family. However, Chinese women emphasize the "economic morality of the capitalist patriarch marriage" by which I mean that Chinese women's normative assumptions of marriage are that the institution of marriage under the capitalist economy is about increasing exploitations of women and economic security via the form of homeownership promised by men upon marriage is a necessary means for them to cope with such gender exploitations. Chinese men stress the "love morality of the economic marriage" by which I mean that Chinese men overlook how rapid social changes have shaped gender inequality and emphasize the institution of marriage as a mark of love and the foundation for them to achieve as masculine economic beings in the name of the family. This paper has implications for understanding how the transformation from a socialist to a capitalist economy has shaped people's daily intimate and family relations in China and the seeming problematic associations between economic activities and intimate life.

Does National Identity Influence Learner Attitudes Towards English Education?

The patriotism-nationalism distinction has been established as an etic aspect of national attitudes among certain nations. In order to understand how individual students will acquire a foreign language, one has to appreciate the emic characteristics that form national identity to be able to discuss the effects of these attitudes on English education. In Japan, one may curiously ask the question, why is it that Japan ranks as one of the lowest in TOEIC tests in comparison to other less developed countries; where students appear to have less adequate access to education, than Japanese students? Why is it that despite the six-year compulsory English education, as required by the Ministry of Education, Japanese students still fair amongst the lowest in TOEIC tests? In order to understand the influence of the Japanese national identity on English learning, one must appreciate the history of the introduction of the West and subsequently the English language in Japan. This would undoubtedly be the case for all countries where English was introduced and the general perception of the English language by citizens in those countries; for instance whether it is considered a hindrance or a tool for social or economic development. It has been asserted that attitude to the target language is understood as one of the essential elements influencing the course of one's language learning. If this the case how does Japan's history and its national identity, effect English education? This presentation intends to introduce ideas in an area, which lacks substantial studies, by suggesting a future research topic regarding the influence of national identity on English language education in the homogenous society of Japan and the correlation between attitudes and grades obtained by Japanese students.

Customers, Workers, and Leverage in Service Sector Organizing

One of the key features of the service sector is that most service occupations involve customers more directly than manufacturing occupations, in one of two capacities: first, in interaction between workers and customers; second, in the timeliness of delivery of services or goods associated with services (such as airline flight meals or clean offices or hotel rooms). While these jobs don't typically involve interaction with consumers, the demands of consumers provide leverage for workers in these jobs, where time is of the essence. Drawing primarily on evidence from the flight catering industry and the hotel industry, this paper looks at the role of customers in union organizing in both types of jobs.

SHERMAN, RACHEL* (New School for Social Research, shermanr@newschool.edu)

Uneasy Street: Privilege, Ambivalence and Moral Worth Among Wealthy and Affluent New Yorkers

While scholars have long investigated "the psychic landscape of social class," in Diane Reay's words, among working-class people, the emotional dimensions of inequality have rarely been studied among the wealthy. This paper draws on 50 in-depth interviews with wealthy and affluent New York parents in their 30s and 40s about their lifestyle choices, to explore how these advantaged respondents (from inheritors of millions to hedge fund financiers) feel about their privilege. The paper engages theoretically with questions about the cultural and sentimental foundations of legitimate inequality under capitalism, particularly how habitus and subjectivity relate to resource distribution and consumption.

In contrast to common representations of wealthy people as advantage-seeking, conspicuous consumers, these respondents express ambivalence about their social advantages, describing emotions such as shame, guilt, and fear. Responding to negative stereotypes of rich people, they struggle to occupy their wealth in *morally worthy* ways: by working hard, consuming reasonably, appreciating what they have, and raising children who are not "entitled." They also try to discipline their ambivalent emotions, often by avoiding talking about their material and experiential privilege. (Some say talking about money is "more private than sex"). Ultimately, I argue, their quest to inhabit privilege appropriately responds to and reproduces a dominant idea about inequality in the US: that legitimate privilege is about how you feel and what you do, not how much you have. That is, entitlement is legitimate based on behavior and affect, not on distribution.

SHETTIMA, ABBA GANA* (University of Maiduguri, agshettima@gmail.com)

SEEDS of Famine: The Boko Haram Insurgency and Agricultural Production in North-Eastern Nigeria

Since 2009, the radical Islamist group popularly known as *Boko Haram* has waged a relentless campaign of insurgency in Nigeria. The geographical area most affected by this insurgency is the North-Eastern part of the country. As a result of the insurgency, social, economic and political life has been virtually paralysed in the region. In the recent past and particularly since the beginning of 2014, the insurgents have ransacked whole villages, massacred tens of thousands of villagers and destroyed farms lands, food crops and rural infrastructure. Many rural areas in the epicentre of the conflict have been rendered unsafe for human habitation, pushing hundreds of thousands of farmers out of the land. Recent estimates put the number of people killed and displaced by the conflict as approximately 17,000 and 2.5 million respectively. This has seriously affected all forms of livelihood activities including agricultural production. In a region known for its debilitating poverty, aridity and periodic cycle of drought and famine, the *Boko Haram* insurgency has further sown the seeds of famine. This paper examines the impact of the *Boko Haram* insurgency on agricultural production in particular and rural livelihoods in general in the North-Eastern region of Nigeria. It explores how rural communities already rendered vulnerable by a combination of longstanding environmental crisis, neo-liberal globalization and weak state institutions are further threatened by localised insurgency. The paper further looks at the short and long term impact of the insurgency not only on the local rural economies of the North-East of Nigeria but draws its implications for the rest of Nigeria and the West and Central African sub-region. It concludes by recommending some short, medium and long term measures to make farms safe for farming and hence, prevent a catastrophic cycle of famine in the region and beyond.

Beyond the Orient: Contemporary Polish Discourse on Japanese Global Culture

The paper aims at inquiring to the "location" of cultural identities for Poles in the contemporary world in the face of Japanese otherness.

Poland occupies a curious place in the postcolonial discourse, going beyond the dichotomized hierarchization of the "West" over the Orient. Being geographically in-between the East and the West, Poland, due to both the loss of sovereignty and status as a former imperial power in Eastern Europe, as well as its "return" to Europe and entry into NATO, shows a unique presence in relation to Russia, Western Europe, other Eastern European countries and the Third World.

Observing the unique case of Poland as a country that experienced socialism and the aftermath of 1989, and more than 200 years of "Romantic-symbolic cultural style" that formed its sense of cultural identity around such values as fatherland, national liberty and national solidarity, I would like to consider how

Poles consume the otherness of *Japanese culture* that has been enjoying a growing popularity since the 1990s as they find themselves within the globalized world.

What are the general knowledge and images of Japan held by Polish consumers of Japanese global products such as sushi, anime, green tea, or even pornography? How do Poles perceive the Orientalist aspects of these products? What are the "valid" or "plausible" values, ideas and interests that Japanese cultural products offer for the formation of Poles' cultural identity? Which values are the most repulsive for Poles?

Materials for analysis based on a method of critical discourse analysis to answer the above-listed questions include semi-structured in-depth interviews with Japanese (sushi) restaurant owners in Warsaw, standardized questionnaires with their clients and in-depth interviews with Poles interested in or engaged in studying Japanese culture, as well as Polish press articles, reportage, travel literature and memoirs.

Raising an International Child: Parenting of Global Cultural Capital in Taiwan

How do ordinary people perceive and respond to a globalizing future? Recently, scholars point out a new phenomenon that global cultural capital (GCC) has become a new legitimate culture and status marker in East Asia. This article evaluates the concept of GCC by exploring how parents perceive and practice "raising an international child". Interviews with 30 families (including fathers, mothers and one child) reveal that the conceptualization of "being international" is diversified in three major types due to the cultural hierarchy and colonial memories in Taiwan: the Occidentals, the Omnivore, and the Japanese styles. The Occidental parents who pursue western cultural capital have a rosy perception of European and American cultures, emphasize the importance of English proficiency, and they utilize GCC as a pragmatic tool to maximize their children's future advantages. In contrast to this western adoration, the Omnivore parents attempt to prepare their children with values of multiculturalism. They are critical toward the mainstream culture and emphasize the importance of being open-minded and flexible to adapting foreign culture. For Omnivores, GCC is the by-product of being international, but not the primary focus of parenting. Lastly, a minority group of parents in Taiwan maintain their family memories and ties from the Japanese colonial era, usually across multiple generations. These families are connected to the global world via the ties and through the lens of Japanese culture rather than a western perspective. In sum, this paper further confirms that GCC is class-biased and has been growing into a new field of distinction in Taiwan. "Raising an international child" has become a hallmark vocabulary that many upper-middle class parents discussed in interviews. The concepts and practices of GCC vary mostly by parents' economic status, educational background, as well as their own taste toward local culture.

SHIH, YI-PING* (Fu Jen Catholic University, sleepingshih@gmail.com)

Whose Family Story to Tell? Reflection on a Longitudinal Ethnography of Asian Parenthood

Everyone has his/her own version of family stories. This paper examines how qualitative family study might imply innovative design, even incorporating with quantitative skills, to better configure stories in domestic settings with in-depth perspectives. Using fieldwork records from a two-wave longitudinal ethnography (2008, 2015) in Taiwan, three innovative approach of qualitative family research are discussed here. First, I propose that family researcher, especially whose study is related to children, might consider recruiting family via a school survey. Families recruited from same school usually are homogenous in socioeconomic status, age, and residential community. Here I demonstrate the advantages and weakness to do a pilot recruitment school survey, as well as my implication of pre-incentives and its effect for parents.

Another innovation on qualitative family study is about home visit. Having the mother or father tour around their household, display their family photography and things with memories, and treat the researcher food or beverage, all these fieldwork experiences is an alternative data collection in family ethnography. As previous studies indicate, the interior design, furniture and decoration of a home usually represents a family's location in a social ladder, as well as their children's educational resources (e.g. Halle 1996, De Graff 1986), yet very few family sociologists focus on these subtle yet significant details of family life.

Lastly, I propose to use "family" as the basic research unit instead of "individuals"—interviewing all family members. Not only the definition of family should go beyond the stereotype of heterosexual, legally married, nuclear family, in facts, young children's voice should be recognized equally as important data as their parents'. At the end of this paper, I would demonstrate how having the whole family interviewed might generate rich cross-check analysis on husband-wife dynamics and intergenerational comparisons.

MELLOR, PHILIP* (University of Leeds, P.A.Mellor@Leeds.ac.uk)

Learning to Work: Embodying Occupations

This paper explores how 'learning to labour' affects people's embodied abilities and identities, involving a fundamental education of sensory capacities and dispositions. In so doing, it analyses the transmission and consequences of those 'embodied pedagogics' that characterise contemporary occupations. The notion of body or embodied pedagogics emerged as part of a growing interdisciplinary concern since the 1980s with how society influenced people's *bodies* as well as their 'minds', and has been defined as ordered sets of practices and knowledges that seek to cultivate skills, values and sensory as well as cognitive orientations to the environment. We first explore the human properties central to learning, in order to highlight the range of capacities addressed by these pedagogics, through an engagement with John Dewey's writings on the subject. What is particularly useful about Dewey's work, is that by identifying the contrasting properties of (abstract) thinking and (immanent) sensing he suggests that knowledge and learning can possess a doubled character Building on this analysis, we then explore how occupations seek to educate these embodied capacities, focusing on their need to *synchronise* cognitive, sensory and emotional knowledge with physical action in order to facilitate particular tasks. Here, through case-studies of education within medicine, the infantry and dance, we explore the contrasting ways in which occupational pedagogics attempt to combine movement, sensing and thought into particular 'techniques of the body'. These examples illustrate some of the various ways in which learning occurs, but they also enable us to explore how individuals come to experience the world differently. In seeking to harness together particular patterns of sensory knowledge, emotion and thought, the contrasting embodied pedagogics and techniques associated with specific jobs *create* differences between people, doubling and multiplying further the contrasts and varieties that exist between them.

The Institutionalization of Traditional East Asian Medicine in Three East Asian Countries

There is little consensus on how to institutionalize the traditional, complementary, and alternative medicine (TCAM) along with biomedicine for the sake of public health and well-being. At the minimum, the world health care community needs to be informed of possible options of implementing plural medical systems. To this end, this paper investigates how the traditional East Asian medicine (TEAM), composed of herbal remedies, acupuncture, cupping, moxibustion, and massage, is institutionalized in three contemporary East Asian societies: China, Korea, and Japan. TEAM is one of the most popular TCAM practices in the world. This paper has found that the three contemporary East Asian societies reveal divergent ways of institutionalizing the historically shared medical tradition of TEAM. Based on the finding, the current comparative examination of medical systems in the three countries purports to conceptualize three distinct ways of organizing a plural medical system that incorporates both TCAM and biomedicine.

Potential and Limitations of Framing Analysis in Analyzing Individual-Level Framing of an Illness Category: A Case Study on Depression in Japan

Framing analysis is a methodological tool for analyzing various social actors' interpretive frames of reference; it investigates and relativizes various social actors' particular definition of a situation, attribution of cause(s) and responsibility of the situation, and subsequent action taking. In the field of the sociology of health and illness, a body of framing analytic research on contemporary illness categories such as obesity (Kwan 2009; Greener et al. 2010) and dementia (Van Gorp and Vercruysse 2012), has been accumulated. While this line of research effectively identifies the competing perspectives, or frames, between social groups such as patients, advocates, health professionals, and policy makers, it has a weakness in that the individual-level variation in the framing process are lacking in the analysis because the unit of analysis is confined to the collective level.

Drawing on the case of depression in Japan, with specific attention to persons with depression, this paper examines the potential and limitations of framing analysis in analyzing "when, where, why, and how" (Kwan 2009) individuals experience and frame their own illness. The conceptual and societal proliferation of depression in contemporary Japan can be said to have provided not only a ground for collective-level contestation surrounding its diagnosis, etiology, and therapeutics, but also the interpretive diversity of depression and availability of various resources for action for an individual. Following the analysis of interview data gathered in 2015-2016, this paper ends with a theoretical consideration for locating framing analysis in the field of sociology of health and illness, and sociology in general.

The Effect of Dropout from Tertiary Education on Status Attainment in Japan

The purpose of this study is to describe how different the status attainment is between tertiary education graduates and dropouts. Dropouts are said they tend to become unemployed or non-regular worker in Japan. In other words, dropping out may cause falling into lower status. While entering tertiary education becomes common in Japan and the number of dropouts is unignorable, very few studies focus on dropouts' status attainment. First, we focus on intra-generational mobility. We merge several national survey datasets and obtain the mobility table. The result of comparing some log-linear or log-multiplicative models shows tertiary education dropouts have higher risk of downward mobility and smaller chance of upward mobility than both high school graduates and tertiary education graduates. Secondly, we focus on the detail of career path. According to the result of event history analysis, there are 3 features of dropouts' career path; (1) dropouts gets the first job later than both high school graduates and tertiary graduates , (2) dropouts quit the first job faster, and (3) dropouts are promoted later than others (more precisely results will be shown at the presentation). Considering these results, dropping out from tertiary education should cause lower status attainment than both high school graduates and tertiary education graduates. This fact suggests that Japanese traditional school to work transition system and the development of internal labor market ignore people who dropped out. These system are wasting labor force in contradiction to the aim, effective assignment of them. However, this Japanese particular transition system can also be interpreted as the function of preventing dropping out. To avoid the exclusion from this system, students may manage to graduate the school and that results in the lowest dropout rate in the world.

Changing Elderly Care Diamonds in Japan and South Korea

This study aims to trace institutional changes of the elderly care governance in Japan and South Korea last three decades and to elucidate causal mechanisms of the changing elderly care diamonds at the intersection of decentralisation and socialisation of care. On the one hand, with strong national leaderships, subnational governments in Japan and South Korea have gained substantial administrative, fiscal and political authorities since the early 1990s. On the other hand, Japan in 2000 and South Korea in 2007 introduced Long-Term Care Service in order to respond new social risks and the aging society. While Japanese and South Korean Long-Term Care Services share substantial similarities such as insurance based financing and market based provision, one major difference is noticeable that Japan has multi-insurer system based on municipalities, yet, South Korea has a single insurer system based on National Health Service agency.

Based on these institutional similarities and differences, the first section of this paper traces the institutional changes in elderly care diamonds. The analyses cover *institutional legacies* such as decentralised Japanese and centralised South Korean health care governance, *actors* involved in the introduction of Long-Term Care system, *ideas* supporting the expansion of elderly care services, and *societal contexts* surrounding elderly care diamonds. In particular, to what extent the legacies of health care system influenced in long-term care system design, how the centralised/decentralised state actors formed diverse relations with the other actors in elderly care diamonds such as community, and to what extent the ideas upholding the introduction of long term care services shaped the relation to market are examined. The second section investigates the causal mechanisms engendered the changes in elderly care diamonds in Japan and South Korea by using historical comparative analysis.

This paper potentially contributes current debates on welfare expansion/retrenchment by explaining changes in elderly care diamonds and causal mechanisms.

From Democracy to Welfare State: The Evolution of a Cultural Theme in Korean Social Movements

Social movements are not only reactions to social problems by means of collective behavior, but often are creators of new ideas, symbols, and imaginations

about a different world. Prior literature about the cycles of protests have shown that the peak events in historical protest waves are characterized by the birth of new sets of discourses, and that such initial symbolic creations are elaborated by the spin-off movements into more concrete programs of change. Focusing on such cultural dynamics of social movements, this paper investigates the symbolic roots and transformation processes of the "welfare state movements" in Korean social movements. Unlike in many European countries, the welfare institutions in Korea have been meager until the democratic transition in 1987 and, in the absence of solid power resources of the working class, the agencies and cultural resources of the development of welfare state have been different from those in Europe. In Korea, the leading actors have been progressive NGOs and SMOs, while the role of the labor unions has been limited. Therefore, the analysis of the practices of signification and the discursive reservoirs in Korean social movement will help deepening our understanding of the particular cultural dynamics of the welfare state development in non-European regions. For this aim, this paper will try to reconstruct interpretively, first, the process of the transformation of the cultural resources inherited by the former pro-"democracy" movements into the civil republican ideas of the "public" in the protest actions of the late 2000s and, secondly, their programmatic specification in the discourses and policy projects toward a "welfare state" after the late 2000s through the 2010s. Methodologically, this study will conduct a discourse-historical analysis with a focus on the analysis of the inter-institutional (synchronic) and inter-generational (diachronic) dynamics of intertextuality and interdiscursivity.

Economic Crisis, Financialization and Debt Financing in South Korea

This paper explores the rapid financialization and the rise of debt financing after the economic crisis in 1997 in South Korea. The total debt ratio to the Gross National Product has been alsmot tripled since the economic crisis amid the fear of debt crisis. 1997 economic crisis in South Korea took place due to the solvency problem with the corporates' large debt from international financial instituturions. In the 2000s debts of individual households have rapidly increased due to the extensive financialization by which borrowing money becomes much easier and risk management was perceived less important due to the lower interest rate. This paper also interrogates differential impacts of financialization on social classes in South Korea, revealing that debt financing by households is most common among the poor. Excess financial deregulation that was introduced by the IMF for a remedy of the economic cirisis in 1997 has sharply increased the volatility of the national economy and the risks of households on the brink of debt crisis in the 2010s.

Role of NGOs in Environmental Protection and Conservation: A Study of Satara District

ABSTRACT
To address local environmental problems many environmental NGOs have been formed in Satara District. The present study was undertaken to document the environmental NGOs and their work in Satara District of Maharashtra, with a view to understand their role in environmental protection and conservation. The descriptive research design has been adopted for the present study. A list of NGOs working in the field of environmental protection and conservation was compiled by using snow-ball technique. After preparation of the list of 58 NGOs, each and every NGO was contacted and preliminary information regarding all these NGOs was collected from the contact persons. Out of 58 NGOs, 18 NGOs were working only in the field of environment. There were 493 total environmental volunteers of all the 18 NGOs selected as a sample. The 25 percent of the total 493 volunteers work out to be 120 volunteers. The data were collected by using a questionnaire.

Environmental NGOs in Satara District play a significant role in creating awareness among the masses about the environmental protection and conservation. They involve the people and persuade them by innovating different activities and strongly oppose the destructive developmental plans with the support of various NGOs. They have undertaken various programmes and activities to create awareness among the masses about the environmental protection. These organizations are working to nourish nature and protect the environment in surrounding areas of Satara district. 'ENCA' organization has undertaken various activities such as tree plantation and conservation, celebration of festivals, wildlife protection, save electricity campaign, organic farming etc. Collaboration with other NGOs results in creating new social and environmental movements in Satara district to protect the environment.

Employment Rights and Challenges in a New Country: Women Healthcare Workers from Southeast Asia to Japan

Women from Southeast Asia have begun working as professional nurses and certified care workers in Japan. The majority of them are female nurses and care workers from Indonesia, the Philippines, and Vietnam who migrated to work in Japan under the Economic Partnership Agreement legal framework since 2008. Others are privately arrived long-residing immigrants from Thailand and the Philippines. What challenges and problems do these women healthcare workers experience before and after migrating to work in Japan? Which law and regulation affect their work and family life both back home and in the county they work? What legal and cultural knowledge should these women workers have for their better career and living? This study introduces the female migrant healthcare workers' experiences with legal and other regulatory information and interviews with specialists. Analyses suggest the needs for legal (re-)arrangements and needs to promote education for both migrant workers and policy makers. This research contributes to the literature in sociology of healthcare, women's employment rights, and globalization of work.

Social Issues, Policy Changes, and the Future: Migration of Healthcare Workers from Southeast Asia to Japan

Healthcare workers from Southeast Asia have begun working as professional nurses and certified care workers in Japanese hospitals and care institutions. They are privately arrived long-residing immigrants from Thailand and the Philippines and newly arrived nurses and care workers from Indonesia, the Philippines, and Vietnam under the Economic Partnership Agreement legal framework. And currently, another policy planning with the Technical Intern Training Program is taking place to train those from developing Asia as future elderly care specialists to work at care homes. What skills and experiences do the different groups of these migrant healthcare workers have to gain for their work in Japan? What issues have emerged and policy changes have taken place around the migration of healthcare workers? How are they managed and policies designed? Analyses of media reports, government sources, and interviews with experts show the ways in which inequalities permeate such skilled workers. The definitions of equality differ among different groups. Yet, with the growing demand for healthcare workers, some problems have been negotiated and workers' voices have been reflected into the policy. Nonetheless, the feelings of and actual inequalities persists in the qualification ratings for professional licensing between the migrant workers and non-migrants. Two major challenges emerge for the future: 1) migrant workers' rights and their "rights consciousness" and 2) possible persisting inequalities not only between the Japanese and migrant healthcare workers and but also among skilled migrant workers who are licensed and unlicensed. This study contributes to the literature in sociology of healthcare, professional work, and social stratification in globalization.

Exploring Trend of Attitudes and Behaviors Toward Environment: The Time Series Analysis in Sendai, Japan 2000-2015

In Japan, a variety of laws and institutions for environmental protection were enacted around 2000. The Great East Japan Earthquake in 2011 caused enormous damage, which has realized us the potential of nature and has forced us to change the attitude toward environment. The main purpose of this report is to analyze statistically the temporal change of attitude toward environment and relevant behaviors of the residents in Sendai,which is located close to the epicenter of the earthquake, and very large number of residents have suffered from the earthquake and TSUNAMI.

The findings on the trends of attitudes and behaviors from 2000 to 2005 are as follows: (1) We have found little change on the percentages of those who think "the environmental problem become worse unless we change our lifestyle," "the environmental problem will not be solved if I behave environmentally," and "I don't contribute to protect the environment if most people in our society behave environmentally." (2) The percentage of those who think "The environmental issues

are serious" increased from 51% to 70%. Respondents who think "serious" are relatively young and highly educated both in 2000 and in 2005. (3) The percentage of behaviors to buy the eco product decreased from 37% to 16%, on the other hand, the percentage those who refuse unwanted excess packaging increased from 46% to 61% and who do not buy the disposable items also increased from 23% to 51%. (4) We have found positive relation between the environmental behaviors and the attitude that "we should contribute to protect the environment even if it takes time and effort" in 2000, while the trend disappears in 2005. We are planning to conduct the survey in November 2015. We intend to report the temporal change of environmental attitude and behaviors from 2000 to 2015.

Chances and Challenges of Migrant Care and Domestic Workers Organizing: Experiences from Germany

Germany was the second European country after Italy, which ratified the C189 in 2013. In the absence of nationally prominent migrant care and domestic workers organizing, compared to Italy, and major sending countries such as the Philippines, the ratification (may) have come as a surprise. In addition, migrant care workers from Third Countries, who work in private homes, are confronted with "double illegality" due to their irregular migration status and the lack of a work permit. Criminalized by law, structural obstacles to collective protests have been and still continue to be high for them. In fact, many studies, including my own, tended to focus on individual-based strategies at the workplace, rather than group-based organizing, in order to improve their working conditions. While a collective bargaining agreement has been concluded between the Food, Beverages and Catering Trade Union (NGG) and the Network Household, the NGG and the German Trade Union Confederation have long been indifferent to the plight of migrant domestic workers. So, how did the ratification happen? Based on a survey of the existing literature as well as my own cumulative research on migrant care and domestic workers in German cities since 2001, I aim to trace steps and cases of organizing and activism, eventually paving a way for the ratification. By doing so, I critically examine the dualism of trade unions vs. migrant NGOs as a form of political organizing. In addition, I wish to engage with the intersectionality debate. Intersectionality has been discussed mainly to renders the experiences of simultaneous discrimination and oppression along the line of gender, racialization and class. However, in understanding chances and challenges of migrant care and domestic workers organizing, this analytical tool may also be able to visualize the potential of an alliance and coalition along the same social divisions.

Social Mobility through Spatial Mobility? Migrant Academics in German Cities in the Time of the "Global Competition for Talent"

Social inequalities in migration studies have often been debated in relation to a 'classical' kind of labor migration into 'less-skilled' sectors of labor markets: they are located at the bottom of social strata because of their low level of skills and racial discrimination. Others may experience deskilling through migration because they (are forced to) take up employment far below their actual level of qualifications or skills, which often simultaneously operates with racial and gender stereotypes. This paper aims to question this presumption that equates migration into 'less-skilled' sectors with social inequalities, by looking at migrant academics in German case-study universities as an example of privileged transnational professionals. More specifically, drawing on statistics and interviews, the paper examines the ways in which their career progression intersects with gender, the type of migration/mobility experience, racialization and citizenship. Though not a nationally representative claim, my analysis of case-study higher education institutions shows that the proportion of non-German citizens tends to decrease as the career ladder goes up higher. However, how do migrant academics deal with obstacles through transnational mobility? It will then explore these migrants' strategies. The individual experiences of social and spatial mobility—or a lack of them—will be critically reflected upon in relation to Germany's recent liberalization of migration regulations and laws, which has articulated a shift from "not a country of immigration" to a country of skill-based, selective immigration.

Income Inequality Among Families with Children in the Society with Low Fertility Rates: Focusing on Japan with a Cross-National Perspective

The aim of the study is to examine the relationship between the fertility rates and the extent of income inequality among families with children. Japan has suffered from very low fertility rates since the mid-1970s, and, as a result, the number of families with children has decreased. Japan has tried to introduce several policies to increase fertility rates, without success, for about 15 years, and at the same time, she faces severe budgetary constraints for the social security system mainly due to the aging population. More importantly, in such circumstances, income inequality among children has increased. The study examines the mechanism in the high level of income inequality among families with few children and low fertility rates.

In order to make the situation of Japan clear, I employ cross-national comparison in this study. The data that I use are the Comprehensive Survey of People's Living for Japan and Luxembourg Income Studies for other societies. The societies I compare with Japan are Germany, Spain, Taiwan, France, the United Kingdom, and the United States. Japan, Germany, Spain and Taiwan have low fertility rates, and the others relatively high. Three aspects are particularly discussed in my analyses: the degree of income inequality among families with children, the re-distribution between families with and without children, and the impact of a mother's income in explaining income inequality.

I find that a low re-distribution between families with and without children and a low contribution of the mother's work to household income are closely related to low fertility rates and high levels of income inequality among families with children. It appears, based on my analyses, that a lack of variation in the way to provide economic wellbeing to children is closely related to a high degree of income inequality and to a low fertility rate.

Comparative Study on Japanese and French University System and Recent Reforms

In this paper, I compare the higher education and its recent reform in Japan and France in the 21th century, while being based on the history and the structure of each system of these countries. The reason that I compare these two countries is that Japan and France are relatively developed big countries who are outside of the English spoken university system. In the process of "globalization" of the higher education, universities in these countries may be tossed in "world university rankings" without regarding the history and the tradition of each country's university system.

It is true that each country has inherent characters and problems of higher education system. But the common difficulties of today's university can be found in various dimensions. To discuss plainly these difficulties and the ways to face with them, I set three main axis which may pushing forward the study, namely, 1) antagonism between "popularization" (e.g. expansion of number of students) and "seeking of excellence" (e.g. center of excellence and concentration of the budget) of higher education, 2) "liberalization" policy of the higher education and the question on governance of the university (for example, transformation of legal status of national universities in Japan in 2004 and promulgation of law about freedom and the responsibility of the university in 2007 in France) 3) historical development process of the higher education and its reform as general backgrounds of today's situation.

Based on these considerations, I clarify the logic of recent university reforms and the problems that can occur from them. I also intend to question an essential meaning of the higher education and university, without remaining in simple grasp of the superficial succession of policy and reform.

Morality and Individualism - Suggestion Form Durkheim's Theory

One of the contributions of Durkheim to sociological theory is his discussion on intermediate groups. In the context of the intermediate group idea, he thinks three structural layers, namely, individual, intermediate group and whole society. He supposes that actual biggest whole society is a state. Durkheim's argument on state is characterized by his point of view shich puts state in the context of discussion on morality. He asserts that state is above all organ of moral discipline.

Durkheim's discussion on morality is also developed in his *Moral Education*. He states three elements of moral education. They are spirit of discipline, attachment to group and autonomy of the will. These elements correspond to three types of suicide presented by Durkheim. Egoistic suicide may be avoided by attaching to groups; altruistic suicide may be avoided by autonomy of the will; anomic suicide may be avoided by spirit of discipline. It must be emphasized that

Durkheim gives importance not only to society but also to individual as element of morality.

Based on these discussions, I will inquire into the question of morality as well as the relationship between morality and individualism.

Market Making in Inter-Regional Comparison: Cross-Border Temporary Agency Employment in Europe and East Asia

Similar demographic and economic transformations in Europe and East Asia have fueled demand and created new labor supplies for cross-border placements of temporary workers. The transnational capacities of leading Japanese and European temporary agencies have played a strong role in the creation of cross-border labor markets for temporary labor in both regions. Based on empirical research, this paper draws on insights from the economic sociology of market-making and recent research on the transnationalization of economic activities to develop an inter-regional comparison of the emergence of transnational labor markets. The first part of the paper traces how cross-border labor markets for temporary labor have developed in East Asia and Europe in comparison, with a focus on market actors, including firms, states and labor on the one hand, as well as the political/regulative and economic/market dimensions of cross-border labor makrets on the other. The second part of the paper attempts to explain the differences in labor-market-making in these two world regions, to develop a theory of comparative transnationalization of economic activities. In line with recent theories of globalization, the paper concludes with an argument for approaching global labor markets from a world regional perspective.

Social Institutions and Gender Regimes in Conservative Welfare States

Recent institutionalist studies have focussed on how shifts in employment are leading to important departures away from the traditional sets of well protected employment practices and social citizenship, which characterized conservative welfare states, like in Germany and Japan up through the 1980s. While employment institutions remain at the center of understanding changes in the gender division of labor, improvements in equal opportunities, educational advancement and childcare provision tend to obscure the extent to which, at a macro-level, gendered divisions of labor, both in paid and unpaid employment, continue to persist. In this paper we begin by exploring institutional changes at the meso-level in two model conservative welfare states -- Germany and Japan -- where we find contradictory effects on the modernization of the gender division of labor in these countries. What seems a contractiction at the meso-level however, may appear more consistent at a macro-level of analysis, taking into account a broader understanding of historical transformations in gender regimes. The results are discussed in relation to what can be gained by taking a more macro-analytical perspective on institutional arrangements and how we conceptualize outcomes for gender-based inequalities.

Careers Development and International Mobility of Russian Doctorate Holders

The paper summarises the recent trends in the PhD's Labor Market, the employment and the role that international mobility can play in enhancing employability and career outcomes of doctorate holders. The international mobility of skilled personnel, doctorate holders in particular, is the subject of much European research. It should be pointed out that the mobility is a complex and sophisticated phenomenon which is not limited to a simple relocation from one country or organization to another but it is accompanied by a range of social causes and consequences. Mobility is related to the changes of an individual's position in a social space, to the rises or falls of social status or 'value', especially in the labor market. The view of 'mobility' as of a 'social process' along with a 'physical relocation' implies the study of an individual's position changes in the social hierarchy

and an individual's ability to mobilize various resources. The main trend of modern R&D system is intensification of international contacts and cooperation at all levels: individual, institutional and intergovernmental. Traditionally professional mobility is studied on the basis of trajectory analysis of researchers (diachronic mobility). But considerable part of researchers has positions in several research organizations i.e. they are mobile between institutions (synchronous mobility). This synchronous mobility is less studied. Our analysis of diachonic and synchronous international mobility of researchers is based on the evidences collected during two empirical studies conducted in 2010-2014 in the framework of the international project "Careers of Doctorate Holders" (OECD, Eurostat, UNESCO Institute for Statistics). The paper proceeds with exploring how past international mobility and multiple affiliation of researchers are associated with the development of their careers. The career trajectories are addressed in terms of career employment and effects on productivity (publications, patents, salary).

KATCHANOV, YURIJ (National Research University - Higher School of Economics)

Polarization of Labor Market: Careers and Mobility of PhD Holders

The statistics demonstrate a constant growth of PhD holders' population, and problems that they are facing with employment in different countries. On the one hand, recent PhDs who are unsuccessfully trying to find tenure-track positions in academia are concerned with their long-term investments into getting a PhD degree not being repaid. On the other hand, statistics from different countries evidences that the employment rate and income are higher among PhD holders compared to those who do not have a PhD degree. The science community is increasingly challenged by open access to scientific research findings and by online learning courses. Discussions go beyond purely knowledge and technology transfer linkages. It is argued the universities skills base incorporated in the researchers' competences a vital element of universities intellectual capital which should be included in the performance evaluation frameworks for universities. The paper addresses the recent trends in the PhD's Labor Market, the employment and the role that dedicated training can play in enhancing employability and career outcomes of doctorate holders. The career paths of doctorates are explored based on three types of mobility: inter-sectoral, intra-sectoral and international mobility. The analysis is based on the evidences collected during two empirical studies conducted in 2010-2014 in the framework of the international project "Careers of Doctorate Holders" (OECD, Eurostat, UNESCO Institute for Statistics). A study among PhD holders employed in research institutes, universities, and enterprises was carried out. The career trajectories are addressed in terms of career employment and effects on productivity (publications, patents, salary). This analysis is complemented by a second major issue, which aims to understand the role of motivations in decision-making processes concerning career paths.

RC16-209.5

SHOJI, KOKICHI* (University of Tokyo, kokshoji@nifty.com)

Proposing a Global Sociology Based on Japanese Types of Theories

I would like to propose a global sociology based on two of Japan's representative sociological theories after World War II.

YOSHIDA Tamito created a general scheme to reorganize all the natural, social and cultural sciences with a basic concept of information that patterns materials. The universe has been forming itself by its laws and it has created lives on the earth which organize themselves with endogenous signal-based programs (DNAs). And on the basis of the laws and the signal-based programs, humans have been developing individuals and societies with endogenous symbol-based programs (languages, cultures etc.).

MITA Muneske independently revealed the basic program of human individuals and societies by critically applying cosmic world views of peoples who still live pre-modernized lives and some evolutional theories of genes such as Ricard Dawkins' theory of "selfish genes". Genes are selfish, but they had lives, especially higher animals, engender and grow love to children and love between males and females, which have had developed various types of love and hate activities to weave the human history. Humans have killed each other many times in conflicts and wars, but it is altruism that has made the humankind to survive and build cultures.

Developing Yoshida's and Mita's theories, I would like to propose a theory of global sociology which can be used by any sociologist of any country to analyze one's own society in the world society backed up by the global ecology. Sociology is a program science to disclose programs which construct societies and their global nexus taking root in the earth's ecological system. Discovering endogenous or human selections in programing processes, sociology can propose to reform programs by rejecting bad selections and inserting new ones to make societies better. Thus it can become also a policy science.

Role of Gender and Socioeconomic Inequality in Women's Health and Health Care: Evidences from India

We have just crossed the deadline for the Millennium Development Goals (MDGs) – December 2015. The issue of maternal health is an important aspect of MDGs. It is time to take stocks of how far we have achieved so far as the health situation in India is concerned. If we faltered then why did we falter? Is it true that social and economic inequality is detrimental to the health of a society? Social inequality is likely to exist in a society, which is diverse, multicultural, overpopulated and undergoing rapid but unequal economic growth.

In India, women's position varies a lot across regions. This is possibly due to unequal socio-cultural development, deep rooted norms and values. With few exceptions, India bears a strong patriarchy and this patriarchal structure and power unevenness in household decision actually limit women's health and access to health care. The main focus of the study is to see the role of socio-economic and gender inequality in women's health and health care in India using National Family Health Survey (2005-06), India data. Analyses are performed to examine the role of socio-economic and gender inequities in women's health and health care.

Findings indicate that women's higher decision making authority have a significant effect on lowering the health hazards like underweight and help in improving delivery care of the women. The analysis also confirmed the importance of education, wealth index, place of residence, regional variation, mass media and several dimensions of gender inequalities in explaining women's health and health care.

In India, social and economic status, gender roles are all interlinked in the determination of women health and access to health care. Therefore attention should be given in designing policies and programs to reach to the appropriate social determinants for the equitable progress toward improved health and health care.

Counterterrorist Legislation and Subsequent Terrorism: Does It Work?

Over the last four decades, and especially in the aftermath of the 9/11 attacks, many countries around the world have passed various types of counterterrorist legislation. It remains unclear, however, whether such laws are effective in achieving their most important declared goal: to reduce terrorist activities. Some scholars believe that counterterrorist legislation should indeed reduce terrorist activities through protecting people and infrastructure, disrupting terrorist plots, and deterring some potential terrorists. Others, however, are more skeptical, suggesting that such legislation may often serves merely as lip service or, worse, actually contribute to increasing terrorist activities. Using a newly assembled database on nation-level counterterrorist legislation, we conduct a cross-national time series analysis of legislation and subsequent terrorism for the years 1981-2009. Our analyses show almost no significant relationships between national-level counterterrorist legislation and various measures of terrorism in the short run. Nonetheless, we find that comprehensive legislation might actually be associated with an increased level of terrorist acts when looking at the long-term impact.

Social Protection and Health: A Key Relationship for Achieving the Sdgs

Many changes have taken place in global social policy since the instillation of the Millennium Development Goals (MDGs), including in the World Bank and International Labour Organization's (ILO) recent announcement of a joint mission and plan of action to achieve universal social protection. As defined by the World Bank and ILO, social protection programmes are designed to help alleviate and eradicate poverty by insuring income support across the life cycle, particularly for the poor and vulnerable. In 2008, the World Heath Organization's (WHO's) Commission on the Social Determinants of Health drew attention to the root causes of poor health, many of which are related to or exacerbated by a lack of social protection. Equally, improving health is key to ending cycles of poverty and ensuring well-being at all stages of life, suggesting a bi-directional link between social protection and health.

Social protection policies have been cited as key to making progress on all of the MDGs, and they are again being discussed as one of the primary strategies to achieve the Sustainable Development Goals (SDGs). Recognising this link, WHO has been working to promote intersectoral action that strengthens both social protection and health at global, regional, and national levels throughout out its member states. This paper outlines the history of these efforts, offers a conceptual framework through which to understand the relationship between universal social protection and health, and articulates how this relationship may impact and support the achievement of the SDGs.

The Effect of Segregated Verses Integrated Schooling on Teaching and Learning of Syrian Refugee Children and Lebanese Students in Public Lebanese Schools.

The Syrian crisis resulted in the influx of over a million refugees to Lebanon, almost half of them are school age children. This has put a huge burden on the Lebanese Ministry of Education and Higher Education (MEHE) who attends to 200 000 students only. The majority of the refugees have settled in vulnerable communities that suffer from poverty and are already characterized with low educational outcomes. To accommodate the large number of students, MEHE initially opened its schools to Syrian refugees where the latter were learning alongside their Lebanese peers. However, as the number of Syrian refugees increased, concerns about the effect of integration on the quality of learning of Lebanese students started to rise. As the crisis dragged on for more years, the need to absorb more students lead MEHE to focus its effort on afternoon shifts designed specifically for Syrian refugees. As a result, the majority of Syrian children currently learn in segregated afternoon schools where they do not meet their Lebanese peers. Only a small number of Syrian children learn with Lebanese children in the morning shift. In the afternoon shift, students receive 4 hours of schooling every day compared to 7 hours offered in the morning shift. The majority of teachers of the second shift are public Lebanese school teachers' who teach in the morning shift and are compensated by international donors. The impact of integration verses segregation on students' learning as well as their social wellbeing remains unexplored. This study examines the experience of Syrian children in the morning shift with those learning in the afternoon shift. It also investigates the impact of integration on Lebanese children. Interviews with Syrian and Lebanese students as well as parents, teachers and administration are carried out.

Oil, Polity, and Civil Society: The Construction of the Hegemonic Apparatus in Iraq

Social scientists believe that rentier economies have a negative impact on the development of a democratic political system. This study fills an existing gap in research through focusing on the interaction between oil rent, the behavior of the political elite, and the civil sphere in Iraq through examining the period between 1950-1958. I concluded that, first; in Iraq, rent generated from oil had provided the resources for the state to oppress the political, social, and cultural opposition in all of their forms. Second, depending on the nature of the economic system, and a variety of internal and external factors, oil could generate different outcomes in rentier states. And finally, the battle for democracy is fought in the civil sphere, and the hegemonic development is the product of a long process of political, economic, and social action.

Globalization Jeopardizes Basic Social Institutions: Labor and the State

The report focuses on the issue of the changing role and status of work under neoliberal postindustrial economy and society. Not so long ago the most topical question on the agenda was the issue of workatsentrism, overwork culture. The crisis of labour in its classical sense was perceived as a consequence of the informational development, transition to new employment practices.

Today, researchers are raising the alarm, linking the crisis of labour to the most negative consequences for social development. Sharp criticism of the diagnosis of the "end of work in its classical sense" is replaced by open hostility to labor in terms of the post-industrial economy and neo-liberalism. Researchers see the causes of the crisis of labor in the global neoliberal economic policy regime.

Basic social institutions have become a major problem for post-industrial neo-liberal economy, and at the same time, the pain spot of globalization. To identify new areas of profitable production, global capitalism needs less labour, which justifies the need for the dismantling of the welfare state.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The trends are clear, but the questions remain: who will do heavy work in the countries that have chosen the path of post-industrial development? What will happen to mankind in the working environment where workers' parties and trade unions are losing their role in the political sphere? At the same time, there is a growing number of those who are thrown out of the labor market and deprived of chances for material and social security.

What should be done? Shall we reject labour and float freely on the waves of globalization? Or shall we overcome the alienation and return to the understanding of high significance of labour in human life and society?

Dealing with Uncertainty in Precarious Prosperity: Adaption As a Strategy to Improve the Quality of Life

This paper investigates a specific social position, defined as adjacent or slightly above a relative poverty line: precarious prosperity. Households in precarious prosperity are usually not a target group of the welfare state, even though they often face uncertainties and struggle to maintain or improve their socio-economic position. Despite these (objectively seen) difficulties, we found households with a good perceived quality of life in previous research: the studies on Romania, Spain and Switzerland point on strategies of adaption as elements to explain the subjective-well being and the perceived quality of life of these households. It is these processes of adaption that are the focus of the present study.

Firstly, this study seeks to understand, how strategies like "doing" or "adapting" emerge. Secondly, how uncertainty is handled by adaption when linked to precarious prosperity is examined in depth. Three waves of qualitative interviews in 50 households in Switzerland allow for a longitudinal analysis of adaption in precarious prosperity. The analysis is guided by a theoretical framework that takes into account the opportunity structures of the welfare state, the labour market, the community and the family as well as the household members' perception and evaluation of its living conditions and resources (scope of agency). Considering the perceived scope of agency as link between opportunity structures and household strategies helps to understand differences in agency among households in the same socio-economic position. When action does not seem possible to improve quality of life, adaption comes to the fore. Processes like reframing, hope or resignation lead to this adaption, depending on the household situation. Results show further, that those households that develop several strategies in parallel (doing and adapting) perceive the best quality of life.

Cancer Patients Perceptions on CAM and Their Physical, Emotional, Social and Spiritual NEEDS

Although cancer patients spontaneously use some kind of Complementary and Alternative Medicine seeking general well-being, research in Brazil on the usage of CAM in oncology is mostly about pain relief. The purpose of this paper is to present the self-reported perceptions of cancer patients submitted to conventional cancer treatment and different CAM modalities in a Brazilian hospital in 2013. Semi-structured interviews were conducted with 28 patients, of which 10 received acupuncture, 10 reiki and 8 medicinal herbs. The study wanted to find out if they thought the CAM practices had aided them in their physical, emotional, social and spiritual needs. Most of the patients performed the following low-wage occupations: maids, farmers, seamstresses, metallurgists, tractor operators, mechanics, and a few were housewives and retirees. The age ranges from 22 to 77. The majority of the patients interviewed were Catholic, and 14 are women and 14 men. The interviews were carried out by phone, recorded, transcribed and analyzed, according to thematic analysis. The majority of the patients reported some kind of improvement: in the physical domain, less pain and anxiety; emotionally: more calmness, willpower and courage to pursue conventional treatment; socially: a minority reported going out more to visit relatives or the church; spiritually: most patients reported feeling more faith and hope. In conclusion: for cancer patients CAM may have broader implications than simply pain relief. CAM may represent humanized health practices, social inclusion, personalized attention and positive support to continue conventional treatment.

SIEGLIN, VERONIKA* (Universidad Autonoma de Nuevo Leon, vsieglin@yahoo.de)

Hypertension As a Bodily Narrative of Traumatic Interaction in Academic Work Environment. a Case Study of a Young Female Professor in a Mexican State University

During the last decades there has emerged a considerable amount of literature about the incidence of hypertension (HT) and cardiovascular disease (CVD) in working population and their relationship to workplace features (for example, Albus et al, 2004; de Gaudemaris, 2011; Kivimäki, 2015; Loerbroks et al, 2015; Nyklicek et al, 1997; Pervickko, 2014). Most studies draw on quantitative methods and are based con the Effort-Reward-Imbalance-Model (ERI) or on the Job-Demand-Control-Model. Although they have generated valuable information about organizacional, social and psychological factors related to HT and CVD, only few studies highlight subjective experience, especially workers' suffering when being inmersed in unfavourable workplace environments.

Drawing on the phenomenology of Merleau-Ponty, psychoanalysis of Mitscherlich and Critical Theory of Marcuse, this paper explores the exposition of a 35 year old Mexican female university professor to three year lasting intense workplace harrassment, her struggles for sense-making and her ways of coping. Although she had no previous risk factors, she developped HT during this lapse. Symptom formation is understood as a substitution of words that could not be found and not be pronounced in a situation of extreme power imbalance.

This paper is part of an ongoing quantitative and qualitative study on health problems and work environment in Mexican State universities. The study comprises 733 full-time professors, all of them members of Mexican Researcher System. Hypertension (HT) affected 26% of participants. The actual paper is based on a semi-structured interview. Transcripted interview has been subject to discourse analysis.

Young Ph.D. Graduates in Poland and Norway: Expectations of Women and Men Vs. Reality of the Labor Market

Nowadays, at the time of massification of higher education, including doctoral studies, there are deep interests and efforts to identify what is of value of higher education and for whom. Policy makers, potential employers, staff members of higher education institutions and students express different expectations. In literature and public debates students sometimes are defined as „consumers", „independent learners", „needy students" and „future graduates" (Leatwood and Read 2009). The lack of convergence of the expectations and functionality of knowledge and skills possessed by Ph.D. graduates is often stressed by participants of the debates. Moreover, in Europe several authors and policy makers stress necessity to create fairly homogenous „European Higher Education Area" considering it as one of the goals of the Bologna process. Our goal is to compare findings of Norwegian and Polish studies on Ph.D. graduates, their motivations to study and evaluation of the doctoral training from the perspective of persons who already started their professional careers. We assume that Ph.D. graduates in the countries having different educational traditions and economies have different experiences in the workplaces as well as opportunities to develop their professional and life careers. The analysis is based on the comprehensive quantitative study of Ph.D. graduates of different fields, five years after obtaining their Ph.D. degree. The study was conducted in 2015 in Poland (N=800) and Norway (N= 464). The different sets of individual, institutional and structural factors influencing male and female Ph.D. graduates' aspirations and career paths were analyzed. First results show that individual factors and social relations (family background, support of mentor and peers) play a greater role in relation to professional success in the academia in Poland than Norway. However, despite equal opportunities programs existing in Norway, in both countries women more often than men consider family obligations as an obstacle in professional work.

Elderly People with Cancer and "Young People" with Alzheimer's Disease and Related Disorders: Social Issues and Challenges of Two Recently Identified Target Population in Western Societies.

This paper intends to discuss the social issues and the challenges involved in the aging society, the increase of life expectancy and longevity, in health care management and health policies in western societies, dealing two recently identified target population: "young people" with Alzheimer's disease (AD) and related disorders" (≤ 65-70 years), and elderly people with cancer (≥ 75 years), especially around the development of oncogeriatrics. This choice of these two groups allows to consider the opposite way, and therefore potentially heuristic, specificities and antagonisms of the age and diseases. Following Kaufman (2015), it is proposed to understand ageing effects and social issues as implications on health care strategies by analyzing how policies, institutions and actors involved promote and re-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

alize a specific framework based on age, and contribute to redefine medical and social needs and forms of responses to these needs.

Oncogeriatrics takes into account the deleterious effects of the very old age to rethink models of cancer care management. "Young people" is designed to meet specific expectations of adult people still considered as young, while they are affected by a pathology as the dominant social representation identifies as linked to old age.

Operate a policy of selection of populations in health and social policies are not a new operation, and the history of medicine and public health provides many examples. But, in the context of aging society, what does it mean and actually involve? Why isolate "youth" in one case, the "very old'" in the other even though it's two diseases whose prevalence increases with ageing? How does it contribute to develop coherent social and health policies?

The theoretical and methodological framework of this papier is based on symbolic interactionism and grounded theory, and on empirical investigations (studied in the context of my PhD and my post-doctoral research).

The Importance of Violence for Former Female Right-Wing Extremists

The importance of violence for former female right-wing extremists

From the perspective of gender construction, the topics of right-wing-extremism and violence seem to be highly male-dominated. Both fields are dominated by heteronormative masculinity constructions. Including women, who are engaged in the extreme right, into the analysis enlarges this perspective and provides an insight into the construction of gender as well as into the subjective meaning of violent action.

Based on biographical-narrative interviews with women who gave up their engagement with the far right and based on the findings of biographical case-reconstructions I will argue that violent action has different meanings for those women.

The references to violent action depend on the various biographical and historical contexts in which the young women first got engaged with the far right and the contexts in which they distanced themselves later on.

Dissociating from the extreme right can include a break with violent action and self-presentation – but it does not have to. Violent self-presentation can be maintained up to the present despite the statement of dissociating from the extreme right.

In addition, my paper aims to challenge the gender role stereotypes, which are currently determining the research on right-wing extremism. I'd like to increase the sensitivity for the diversity of biographies from female dropouts and contribute to a research perspective that takes into account the complex interdependencies of violent actions and gender constructions.

The Difficult "Cohabitation": Gender Violence and Religious Culture in a Mediterranean City

The paper aims to highlight the differences and similarities between the different religious cultures (especially Christian and Muslim) in relation to the way in which men and women are defined with respect to gender stereotyped patterns, to shapes relationships between the sexes, to models of sociability, to models of management time and space. It is assumed that gender violence is closely linked to an ingrained culture that considers "natural" man's dominion, guaranteeing countless benefits and privileges and sanctioning such a domain with role assignments and expectations rigidly and sometimes violently default. This paper reports the results of a research carried out in Palermo under the project SUNIA Geel 2, European project (coordinated locally by CESIE) co-funded by the Daphne III Programme (DG Justice) that aims to reduce domestic violence against women and children belonging to ethnic minorities marginalized. The fieldwork was carried out through the methodological approach of visual sociology: in pictures (collage or painting) the parties involved have expressed their views about family roles, forms of relationship between the sexes, the ways in which is expressed violence within the family.

Triangulating Two Techniques of Studying Longitudinal Data: A Case Study on Italian Families' Leisure over the Last Thirty Years

This paper stems from is based on two methodological interests. Firstly, it intends to use mathematical models in order to show how they can contribute

to the qualitative improvement of the capacity of systematic data observation in explaining social macro-phenomena. Secondly, it is interested in employing the so-called "time tools", that is those techniques by which the diachronicity of phenomena – both at micro-individual and macro-societal level – can be better understood. More specifically, this paper wants to analyze the leisure expenses of Italian families in the last thirty years. From a macro point of view it will take into consideration the historical series so as to identify emerging trends in these expenses while from a micro point of view it will analyze the textual corpus of a series of in-depth interviews done to members of these families so as to draw their biographical stories and life changes. By triangulating these two levels, the dynamics of larger processes of consumption building from the individual choices of social actors can be better understood. Ultimately, this paper will concentrate on a comparison between two different techniques of studying longitudinal data – objective, i.e. based on territorial aggregations derived from secondary sources in the first case, and subjective, i.e. based on retrospective interviews, in the second one.

SIK, DOMONKOS* (University Eötvös Loránd, sikdom@gmail.com)

Alienation and Psychopathologies: Towards an Alternative Grounding of Critical Theory

Critical theories have an ambiguous relation to psychopathologies. There seems to be a parallelism between notions normatively grounding critical theories like "alienation", "anomie", "loss of meaning", "ontological insecurity" or "identity crisis" and notions describing symptoms of mental illnesses such as "generalized anxiety", "depression" or "schizophrenia". However this parallelism has never been analyzed systematically by critical theories, which – since Foucault – were preoccupied with criticizing the domination aspect of psychological and psychiatric knowledge. While such criticism certainly has its relevance, it results in a theoretical blind spot. Critical theories never attempted to profit from the rich empirical descriptions provided by these sciences, thus they missed the chance of being grounded on the empirical level of the various forms of suffering identified by them. In the presentation these questions are analyzed on the example of the notion of alienation. Firstly an attempt is made to answer the question: what kind of psychopathologies can be connected to the various notions of alienation elaborated by Marx, Habermas and Honneth? Secondly it is analyzed how these psychological and psychiatric descriptions can be used by critical theories. The models of distorted social integration elaborated by Marx, Habermas or Honneth based on theoretical concepts of suffering are complemented with models based on the empirical diagnoses of psychology and psychiatry. In this sense the descriptions of psychopathologies expressing alienation are used as a ground of identifying new aspects of social pathologies.

SIK, DOMONKOS* (University Eötvös Loránd, sikdom@gmail.com)

Alienation, Civic Privatism, Emancipatory and Populist Activism: Patterns of Youth Participation in Europe

In project MYPLACE the patterns of youth political culture were compared in 14 European countries with a survey (n=16 800). Based on the susceptibility to radical and populist ideologies, the willingness to participate in formal and informal political action, the interest in the past, the nationalist or leftist orientation and the level of trust and security, idealtypical clusters of political participation were constructed: the anxious alienation (high level of distrust and passivity), the civic privatism (high level of trust, antiradical orientation and passivity), the emancipatory activism (high level of historical consciousness, antiradicalism and activism) and the populist activism (high level of radicalism, distrust, activism, both nationalist and leftist orientation). Based on the comparison of these patterns of participation three political constellations were identified in Europe. In Hungary, Slovakia and Russia alienation and populist activism dominates the political culture, which means that those actors are lacking who could prevent further radicalization. In contrast, in Denmark, Spain and Germany civic privatism and emancipatory activism are dominant, which seems to secure the frames of democratic participation. In Estonia, Latvia, Finland, Croatia, Portugal, Greece, Georgia and the UK mixed patterns were found: while emancipatory activism were lacking, neither populism nor alienation dominated the political culture, which means that even if democratic participation is not secured, radicalism is far from becoming dominant. Based on these differences both culturalist (claiming that participation patterns are the result of a cultural-social historical heritage) and structuralist (claiming that they are the results of economic situation) explanations of participation are reevaluated.

Choices of Mathematics Courses in Year 12: How Horizontal Gender Inequality Reproduces Itself in the Comprehensive Education System of Australia

Many secondary schools in Australia epitomize comprehensive education in which large groups of mixed-ability students of diverse social backgrounds select to study subjects that best fit their vocational interests. In this choice-oriented system Year 12 students do not have to study mathematics to pass their matriculation exam. If they elect to do so they can learn either very basic or advanced mathematics without jeopardising their chances of obtaining a high university entry rank.

In this paper we analyse in detail the processes that lead some male and female students to choose to study Year 12 mathematics courses below their ability level. To this end we examine complete administrative data on Year 12 examinations in New South Wales, the state that is home to over 23% of all secondary students in the country. Data from over 135,000 students who sat for their matriculation exam between 2011 and 2014 are analysed to establish whether choosing courses below one's mathematical ability level pays off with a higher university entry rank and if so, whether the benefit is greater for females than males. The paper is an attempt to highlight mechanisms related to student choices of secondary subjects that foster horizontal gender segregation or unintended 'gender tracking'. This involves self-sorting of boys and girls into different fields of study which limits their later study and employment opportunities.

We argue that a significant part of this self-sorting takes place in the last three years of secondary schooling, and not much earlier, as is commonly assumed. We discuss policy options for addressing this type of gender inequality which seems pervasive in Australia but also in secondary schooling in other comprehensive education systems.

The Buffering Effects of Leaders and Peers Normative Signals on Civil Servants' Inclination Towards Corruption

Many governments attempt to control and detect corruption in the public sector. These attempts usually build on the assumption that corrupt acts are the result of a rational cost-benefit calculation of gain seeking individuals. Accordingly, standard anti-corruption interventions consist in intensified monitoring (i.e. increasing the expected probability of detection), and increased severity of punishment (i.e. increasing the expected costs). However, these anti-corruption measures yield mixed results at best, raising questions about its theoretical foundations. We develop and empirically test an alternative theoretical foundation. Based on goal framing theory, we argue that since monitoring can never be perfect, compliance to rules and norms requires a salient normative goal frame. But since the goal frame is inherently brittle, it needs constant reinforcement through external "flanking arrangements" and cues that operate next to formal monitoring and sanctioning. We argue that if rule compliance by leaders and coworkers reflects costly signals, it can constitute a powerful cue to increase the salience of the normative goal frame. Hypotheses on the impact of monitoring, sanctioning, and signaling on corrupt behavior will be tested with multi-level data from a vignette study of 580 senior civil servants in Indonesia, collected during their attendance of a leadership training program organized by the National Institute of Public Administration (NIPA). *[The research finding and conclusion are in writing process]*

Financial Analysis As Expertise and Profession

Sociologists have studied financial analysts as market intermediaries linking their role to dimensions such as conferring legitimacy to securities (Zuckerman, 1999), and framing calculations (Beunza & Garud, 2007) in order to tackle uncertainty. The importance of securities analysis in financial markets begs the question of how such knowledge is constructed both as expertise and as a domain of activity.

The way analysts organize and maintain control of financial asset valuation as a specific domain of activity has been a less studied topic, but research in sociology of professions has been consistently addressing the question of how expertise is institutionalised as an occupation and can offer important cues regarding the relation between knowledge and profession.

Drawing from both the sociology of professions and sociology of finance literature, we present an account of how financial analysis became institutionalised as an expert domain of knowledge and an occupational activity in the Portuguese financial system, while considering how economics and financial theory in particular, embodied in institutional settings, conceptual and material tools, works as a driving force shaping professional practice.

The study we conducted used semi structured interviews with financial analysts and university professors of finance in Portugal and documental analysis (e.g. Portuguese law, association statues and deontological norms, university brochures and curricula, educational materials) between 2014 and 2015.

Since financial analysis was already an established practice in international financial markets when the Portuguese financial sector developed, the local institutionalisation of the profession followed an already existing model. Moreover, this late institutionalisation of financial analysis in Portugal happened when the features of professionalism in knowledge professions were being transformed. Thus, our research case conforms to a hybrid paradigm, sharing some qualities of a typical professional project while incorporating features of Corporate Professionalization, such as closure through market practices and legitimacy through market value.

The Sociological Dimensions of Innovation Indicators

In front of the recent scenario of diffused production of science, technology and innovation (ST&I) indicators we should question the real meaning and power of these statistics. For this purpose, the field of sociology of statistics must be centrally considered. Several authors from this field stress the idea that statistics conjugate knowledge and power, since they are a way to produce knowledge and a source of power in rhetoric. It happens because statistics have a hidden social side, once all the statistics are designed based on theoretical models that involves different conceptual choices and measurement interests. Therefore, we sustain the need to analyze the ST&I indicators from a sociological point of view in order to better understand their limits and reaches. The objective of this paper is to discuss the social aspects underlying the design and use of innovation indicators. Such indicators, as well as any other statistics, are the social outcome of theoretical understandings and measurement interests at the same time that their use influence the perception of social reality framing the various understandings and interests. Methodologically we ground our analysis in an extensive bibliographical review and documental survey seeking to establish a fruitful dialogue between the fields of innovation studies and sociology of statistics. To reach our goal of understand in depth the historical evolution of innovation indicators, we will work on four complementary steps. Firstly, we will explore the discussion about the present relevance of statistics in the governance of social phenomena. Secondly, we will highlight the particularities of ST&I indicators within the debates on sociology of statistics. Thirdly, we will present the theoretical models of measurement that historically grounded the design and use of innovation indicators. Finally, we will retrace the historical path from the measurement of science and technology (S&T) to the measurement of innovation.

Think Tanks in Transition: An Analysis of Scientific Development of Cebrap in the 80s and 90s

Founded on 1969, the CEBRAP (Brazilian Center of Analysis and Planning) is one of the 45 think tanks better evaluated in Latin and Central America (14th place, according to 2013's Global Go To Think Thanks Rankings). This paper investigates how the CEBRAP transformed and reformulated itself in the late twentieth century (more precisely in the 80 and 90 decades) considering the political, economic, social and scientific changes experienced by Brazil. When founded, the main purpose of CEBRAP was to undertake research activities in order to support social scientists and professionals with different backgrounds, so they could carry out their research projects, interrupted by the military regime. In this sense, "intellectual pluralism, lack of commitments to specific groups or organizations, thematic indeterminacy" was its distinctive trademark.

However, the democratization in the 80s generated new pressures: the advent of democracy meant not only the end of the internal consensus and the exit of several members from CEBRAP, but also the emergence of new questions and the change of Brazilian social sciences profile, with new theoretical references and an increasing specialization.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Assuming that the goal of a think tank is to produce knowledge and to undertake research in order to influence public policy, this paper investigates if the research products of CEBRAP changed in the same direction of Brazilian social sciences (empiricism, increasing specialization, the abandon of macro explanations) and if this has impacted on CEBRAP's ability to influence policymaking and to dialogue with the governments; in short, to act as a think tank. For this, we analyzed the CEBRAP's reports activity from 1980 to 2000 and the main articles published by its members in *Novos Estudos CEBRAP* journal (institute's official journal published since 1981).

The Embodiment of the Youth in the Charismatic Catholic Movement

This study aims at understanding the meaning of the experience of embodiment of the youth in the charismatic catholic movement, considering dance as a bodily practice that facilitates processes of social interaction and relationships with the sacred. It relies on field research of ethnographic inspiration, using the dense description of facts proposed by Geertz (1989). The data survey procedures were observation (registered in a field journal) and semi-standardized interviews. We chose the Agape Group of the Sacred Family Parish, in Vila Canaã, in the city of Goiânia - GO, Brazil, as it fit the criteria defined for the research goal. Results indicate that the meaning of embodiment for the youth in the group evince bodily practices of diverse natures and aim at the search for the sacred. Among the identified bodily practices, namely: meditative resting, glossolalia, freestyle dancing and choreographed dancing, dancing had a prominent role in the Agape activities. The relevance of dancing stems from two factors: (i) for expressing a bodily manifestation that fosters social interaction among the participants and (ii) for the clear relationship between sacred and profane in dancing. In this case, the efficacy and tradition present on the bodily practice are invested with body technique, with the aim of achieving transcendence, the mythical experience – from the perspective of the sacred, as well as an escape from daily life and embrace of socialization, joy and affection – connected to the profane aspects of the bodily practice. The conclusion is that embodiment on charismatic dance establishes social interaction in the search for the sacred.

The Oldness of the New and the Newness of the Old: Comparing the Occupy Wall Street Movement and the Global Justice Movement and Illustrating Their Connections

In this paper, I compare the Occupy Wall Street Movement (OWS) and the Global Justice Movement (GJM). The GJM is an extensive transnational network of diversified social movements, unions, political parties, non-governmental organizations, civil society organizations, intergovernmental institutions, non-governmental donor agencies, enterprises etc. that emerged in the late 1990s and early 2000s. The OWS is the American manifestation of the 2011 global wave of protests. Analysis is based on review of literature, especially on transnational social movements and networks studies, and in-depth interviews conducted with activists. Links between the two movements are found initially in the Adbusters' explanation of the OWS as a late development of the GJM and the expectation of the former as a potential "shift in revolutionary tactics." I affirm that the OWS has nonetheless gone through similar dilemmas and difficulties faced by the GJM. I explain why such a repetition occurred by taking into account specificities of the GJM in the United States and of American politics. The GJM's organizing dynamics lasted in the United States because the American GJM turned its attention to domestic issues and pushed forward a movement building perspective. Therefore, I assume that the national political landscape is important to an analysis and maintain that connection between the two movements is understood through their similar tactics and organizational structure. Finally, the two movements here discussed are not exactly the same and I defend that the OWS's dependence upon some individuals seems to have been even more intense than it has been the case in the GJM.

Natural Resources, Development and Modernization: The Social and Environmental Consequences in the Lower San Francisco River in Brazil

This communication presents the preliminary results of the project "Social and Environmental Change in the Lower San Francisco: The future of navigation and the consequences on the modus vivendi of boatmen", and that continues a larger study about sociocultural universe the local population forward the changes in the natural environment: forms of resistance and civil society engagement. The various government interventions along this watershed, on behalf of the energy sector, today has been reflected in the commitment of the survival of fishermen and navigability, compromising the identity of the boatmen and the river. The study seeks to answer for some questions: What are the main problems experienced by bordering the Lower San Francisco before the successive interventions of the Federal Government? As the locals, who can no longer live off fishing or rice planting in paddy fields, has survived? What is the future of navigation and boatmen in an increasingly threatened river? It is possible to reconcile the advances of modernization in the region with traditional forms of existence? The concept of sustainable development does not need to be rethought? The present study seeks answers to these questions in the field of contemporary sociology. The study is theoretical support the concepts of modernity and identity, cultural identity, the myth of untouched nature and the concept of sustainable development. The key point for the analysis is the reports and documents produced by the NGO Canoa de Tolda, which operates in the region for over ten years in a struggle to preserve the lives of boaters and fishermen threatened by numerous government interventions along the river that has harmed navigability and fishery exploitation.

New Technologies and Citizenship: A Discussion of Nanotechnologies Applied to Food and the Regulation of Its Risks

New technologies and Citizenship: A discussion of nanotechnologies applied to food and the regulation of its risks

This paper discusses the importance of civil society participation in technology innovation policies, having as analytical reference the case of nanotechnologies applied to food production. The society has the right to monitor progress in the techno-scientific field and these should be subject to approval of the public to be benefited or harmed with advances and technological innovations. This is certainly the case for foods that use nanotechnology at some stage of their production. The relationship between modernity and development and the doubts surrounding the nanotechnology production in terms of security for human health and the environment in the face of ignorance of the possible toxicological effects of nano particles, permeates our whole discussion. The Nanotechnologies are growing process of installation in scientific research, industrial production and availability of products in the consumer market. However, the regulatory issue is still open, and so we can have a regulatory framework that gives confidence to the consumer and the worker, the wonders of techno-science nanotechnology need to be better analyzed, especially so that they know more about toxicological effects. In this line of reasoning are also considered the food from the transgenic and what is announced for the future: molecular manufacturing food and fiber that, according to experts, will not need more of nature to produce. This study has the theoretical concept of complexity and transdisciplinarity Morin, E; the concept of the risk society Ulrich Beck; the criticisms made by Baumann, Z and Giddens, A., on modernity and the dangers of belief in the unlimited power of technology; besides Rose, Nikolas; Harvey, David; among other scientists and scholars.

Science, Technology and the Individualization Process in Preventive Public Health

The reflexivity of modernity is characterized by the radicalization of the individualization phenomenon, creating a new mode of socialization. This process produces new political and institutional challenges to public health, which is radically different from those established by previous stages of modernity.

One of the individualization process features is the intensification of scientific and technological production, which is materialized in social relations. For example, our society produces knowledgeable contemporary individuals, as well as, direct consumers of science though it is still dependent on modern and classical structures, such as the modern medicine, in order to validate knowledge and practices. This happens, for instance, on technological production towards

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

prevention of epidemic diseases such as HIV/AIDS, while using the Truvada drug to prevent HIV infections, placing an apparent freedom to individuals regarding sexual risk management and health status. However, this is inset that individuals experience the dependence of modern medicine to keep their sex lives 'safe', establishing a reorganization of their everyday lives by the biological, regular surveillance, a precarious freedom.

The momentum´s individualization occurs in its consequences. Given the scientific and technological resources through the medicalization of our bodies, non-expected side effects interfere upon social dynamics: the object becomes subject, science confronts itself and have to deal with unmeasured ecological risks and critique, and consumption produces market-dependence freedom, all of these producing a-historical identities, individuations with diverse ideological and desires apparatus. These are consequences that the reflexivity of modernity provides that clashes against the remaining modern progress placed upon the body, medicine, health and the social fabric.

These complex relations opens up room for reflection on modern institutions such as public health, resizing it, particularly with the imperative colonizer of science and technology over bodies, medicine and individuals, and vice versa.

Evaluation for Radical Democratic Transitions

Evaluation is a political project. The dominant bureaucratic approaches of evaluation tend to leave social and economic inequalities outside of the analytic frame, do not actively promote social justice, and can often exclude the everyday experiences of people who are the target of interventions. This paper will outline an alternative approach of evaluation for radical democratic transitions, which can point to a way of developing viable roadmaps for participative social transformation.

Through applied research, evaluation can provide a means for learning and generating democratic debate about social justice alternatives. This builds on the ideas of Erik Olin Wright in 'Envisioning Real Utopias' in which he proposes a framework for understanding the foundations of emancipatory alternatives to capitalism and the existing practices that inform them. This paper develops this for evaluation purposes, based on documenting the harm and causal processes of existing structures and the context in which a grass-roots initiative is operating; formulating alternatives by systematically testing the plausibility of alternative approaches through the practice of the particular grass-roots initiative; and using this knowledge to develop strategies for transformation through democratic debate. This connects with Edgar Pieterse's concept of 'radical incrementalism', which is the notion that improvements to people's everyday circumstances can lay the basis for future improvements, providing a basis for a radical inductive framework grounded in people's daily lives.

As alternatives can be produced through everyday actions, evaluation methods are required that can reveal, analyse and support such situated practices. This paper will draw on case study research in Manchester that is based on contextualised, participatory and creative methods that include storytelling, photography, co-design of info-graphics, ethnographic film, deliberative workshops and in-depth biographical narrative interviews.

Inclusion Policies and the Future of Racial Relations in Brazil

After the adoption of a new Constitution in 1988, race related issues have been transposed from the private to the public sphere. Affirmative action for blacks, native Brazilians, and the poor have been spread all over the country, and a Federal Affirmative Action statute and program was created. The Statute for Racial Equality was voted into law in Congress and Federal Education Guidelines were altered to include obligatory teaching on race relations, black Brazilian culture, and African history throughout basic education. Besides being a major symbolic break through, these new policies combined have the potential to lower the levels of racial inequality and discrimination that have plagued the country throughout its history.

Nonetheless, this whole process has not been devoid of tensions and contradictions. For example, if the recognition of a black identity put into question the narrative of miscegenation and racial harmony that underpinned Brazil's national identity for decades. It also challenges sociologists to make sense of these ongoing changes in public policy and of the role of the State in fighting inequality and fostering identity formation. Given that scenario, a central question organizing this panel is: How societies with a history of structural inequality and racial domination can evolve toward a more equal stand and mutual recognition among social groups? Answering this question implies discussing the possible paths opened to improving the status and standing of individuals and groups in a

context in which the ideology of racial democracy (or similar national narratives) still holds sway in the minds of many people, including the local elites.

The roundtable aims at addressing the above question from different perspectives, looking into the Brazilian and Latin America current debates and paying attention to the transformations and new challenges faced by these societies.

Return to Religion? Post Retirement Religious Roles Among Older Adults in the United States

Religious institutions in the United States are often important sources of roles and activities for older adults; however we know relatively little about how religious life changes over the adult life course. This paper examines religious practice, beliefs, and identity over more than 45 years in the lives of Baby-boomers participating in the Longitudinal Study of Generations. More than 500 respondents were surveyed in nine waves of the study between 1971 and 2006. It is hypothesized that some older adults religiously re-engage after retirement in search of social connections, volunteer opportunities, and spiritual comfort in the face of life transitions. We ask whether engagement in religion and religious institutions increases in later life, and whether it serves as an outlet for generativity and provides a source of meaning as one confronts the finiteness of life. There have been few systematic studies of Baby-boomers' religious and spiritual proclivities as they cross the threshold into old age. Mixed methods will be used to synthesize narratives from in-depth interviews with 25 older subjects about perceived motivations and benefits of religious re-engagement with quantitative analysis of discontinuities in religious engagement following retirement.

Representation of the Losers of the Crisis: A Comparison of Systems and Strategies of Representation of Vulnerable Workers

The issue of labour market dualisation is not new, but recent developments have made it more pressing: urban riots, protest votes, new social movements have questioned the capacity of western societies to provide representation and expression channels for the social groups that feel most affected by the economic crisis. The paper critically examines the idea that dualisation presupposes uneven representation in trade unions and policy making of certain groups (outsiders) in comparison to insiders (Palier and Thelen 2010). It proposes analytical tools to map the situation in three countries that have experienced the crisis for different durations (short and deep in Germany, long in the UK and very long in Italy) and represent different types of European trade unionism (Hyman 2001). Through the analysis of employment data on the crisis and of cases of organisation of under-represented categories, it discusses the country differences in the definition of the groups most affected by the crisis (by age, gender, ethnicity, residence status, qualifications, contract status). It then explores the extent to which unions have developed a variety of revitalization strategies to face issues of uneven representation, and the unionisation gaps between groups particularly affected by the crisis and the rest of the workforce. Finally, it discusses examples of new actors that have emerged besides the ones, analysing their relations (collaborative, competitive etc) with trade unions. The paper concludes by proposing analytical concepts to define commonalities and differences in the interactions between forms of representation.

Women's Agency in the Cash Transfer Program in Brazil: Fighting Precarity and Gender Inequality and Transforming the Role of the State in Public Policy Making

Our paper discusses the findings of a mixed methods research (focus groups and survey) with urban and rural women living in situations of economic precarity (extreme poverty), recipients a federal cash transfer program (PBF), credited with significant reduction of poverty and inequality in Brazil. Over 90% of the recipients are women. Our research showed important impacts of the PBF on the women, such as more autonomy in family relations, including the issue of domestic violence; more self-esteem; access to stable cash income enabling access, even if informal, to credit, among others). In this paper, however, we will move beyond PBF's impact on women's lives, and will focus on our study's recommendations for further developments of PBF in Brazil. We reveal, from a critical-feminist approach, **who** the women beneficiaries in the program are, and their potential to collectively become active participants in the construction of possible "exit doors" from the program, and from their situation of economic and power precarity. We offer several specific recommendations (such as bridges for dialogue and coordination among the women beneficiaries and the local technical bureaucrats in the frontline of the program; and initiatives to support local economies with the potential of strengthening the PBF women's entrepreneurship, among others). But beyond specific recommendations, we argue that a crucial gap in the current PBF – and in the role of the state and public policy - is not to create concrete **structures of opportunity** for women beneficiaries to meet and exchange information and experiences within the PBF, sharing their potential for critical thinking and individual and collective action to fight precarity, and, at the same time, enable the transformation and advancements of public policy. In most cases, it was in our focus groups that the PBF women beneficiaries in our research sample met for the first time.

SIMON, KARL-HEINZ* (University of Kassel, simon@cesr.de)

Gotthard Guenther's Claim for a Cybernetics of Volition

In the analysis of many real-world problems the gap between knowledge and behavior / action is recognized. From a philosophical point of view such a gap is not a surprise because of the influential Cartesian tradition in which mind and body, reason and will are strictly separated. Beside others, G Guenther broke with that tradition and claims for cybernetics to adopt a crucial role in solving social and political problems (1971/1979), going hand in hand with a closer connection of Reason and Will. He states that cognition and volition are two exactly complementary aspects of subjectivity.

Both aspects can be interpreted as forming a feedback loop: environment – (cognition) - subject - (volition) - environment. The different interfaces are identical with a change in structural form, a structural upgrading. The subject is urged to act in a situation which is not fully determined by the environment. What does that mean when that situation is characterized as of a higher structural complexity? A possible answer should refer to information processing in the subject's part of the loop, e.g. reflections on the future of circumstances which cannot be extracted from purely objective facts. Another crucial problem is about the differentiation of "subjectivity" or the general subject in manifold interacting subjectivities.

Some interesting consequences of such a concept of feedback will be discussed. However, Guenther goes one step further and tries to develop a calculus representing these interfaces that link cognition with volition. It is centered around a principal exchangeability of form (subjectivity) and the material content of form (objectivity). According to the change in structural form a new operator is introduced, called "proemial" relationship, which "represents a peculiar interlocking of exchange and order", thereby relativizing the difference between form and matter. A first impression of how the calculus works will be presented.

Moral Emotions and the New Work Ethic Among the Rural Population of Modern Russia: Alienation As a Strategy of Adaptation in Callenging Socio-Economic Conditions

The paper considers the new work ethic that has emerged among Russian rural population. This is achieved presumably through an analysis of the verbal markers employed in moral emotions. Building on the existing body of work on the sociology of emotions, which has focused on studies of shame and envy, the authors have identified new demonstrations of emotion arising from new socio-cultural conditions in the Russian village. This includes "contempt" for rural/ physical labour from both the immediate surrounding environment and wider society more generally. This emotional backdrop brings with it negative effects such as shame and envy that, in turn, corrode self-esteem and self-efficacy among the rural population, leading even to withdrawal from active employment on the land and the weakening of social ties. These we can describe as alienation strategy of adaptation under the hard living conditions in Russia. As a result, the rural ethical worldview views work as a thing needed purely in order to meet one's basic needs, a position that weakens any aspirations toward economic success and simultaneously promotes a sense of endurance and suffering among the rural habitants who are forced by 'necessity' to do such hard and 'dirty' work.

The data used for this paper were obtained during a research project entitled 'The Integration of sociobiological and sociological methods in studying the evolution of morality and altruism in the case of Russian societies'. 30 semi-structured interviews were collected in accordance with random sampling in several villages of Belgorod region. The use of qualitative methods provided evidence as to how the villagers used a mass of emotional evaluations to describe both actual socio-cultural conditions and their own situation. The emotions expressed by respondents, in the form of both verbal and physical markers, suggested that these emotions were being used a way to explain social processes.

SIMONOVA, OLGA* (National Research University - Higher School of economics, olgsimon@gmail.com)

Social Work Specialists in Russia: Standardization of Feelings and Moral Mission of Social Assistance

The paper is based on an analysis of the 50 semi-formalized interviews with social work specialists in six Russian regions in the framework of the research project "Professional culture of social workers: methodology of social and anthropological research (case of social work specialists)". Following A.R. Hochschild we distinguish the notions of emotion work and emotional labour in order to clarify the experience of social work specialists. Social work specialists pointed out that their work required a complicated psychological attunement to communicate with "clients", which were representatives of the disadvantaged groups. That attunement includes emotion work like the expression of empathy and sympathy, the ability to maintain positive state of mind and to resolve conflicts. With that emotional labour in this field is still emerging, because an emotional labour is standardized part of the profession, paid emotion work performed according to clear rules formalized in professional code. From the opinion of the respondents people underestimate the complexity of their mission, do not notice that they spend their own feelings, and that this work is fraught with emotional burnout. Then they insisted on the necessity of the professionalization of the emotions – standardization of emotion work – in order to reduce stress at the workplace. Although social work specialists regard the emotion management as an integral part of the profession, they experience the emotional problems. Therefore they thought they performed the important moral mission to take care of the socially vulnerable groups. They have no clear rules of emotion management, which they usually take from the general emotional culture instead of "specialized professional emotional ideology". This case reflects the shifts in the professional culture of social workers and the very process of professionalization of social work in Russia.

Does Protest Have a Sex? Women in the Spanish Protest Movement – a Case Study

This paper we argue, that women are not only affected specifically by the economic and social crisis of Spain, but they also play specific roles in the Spanish movement of the lindignados. These roles sometimes show a double face. In part, they reproduce gender stereotypes, in (the larger) part they are the prefigurative enactment of new patterns of gender relations, communication-styles and activism. In spite of declared goals of movement actors to strive for gender equality, some feminist activists criticize the everyday enactment of gender relations in

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

movement activities and see more emancipative chances in women´s groups, yet with very open boundaries regarding common activities with mixed groups.

Based on in-depth interviews with movement activists we present a case study of a women´s initiative, a group of survivors of domestic violence that combines protest and advocacy with social help for women in the same situation, cultural activities and entrepreneurial strategies, all explicitly based on feminist theory. In a first step, the paper describes characteristics, forms and strategies of participation of these activists related to their theories in use in an ethnographic way. This will be complemented in a second step with results of interviews with female activists of other groups of the Spanish protest movement about differences, conflicts as well as common goals and learnings regarding gender and the role of women and men in the protest movement. Gender is a contested terrain in the movement. Generally, women describe both subtle discrimination and substantial learning. The latter is achieved mainly by discussions and rules regarding everyday-practices of communication styles in assemblies. Based on that, we will elaborate tensions, achievements and strategies of feminist activists. We argue that women play a crucial role in the movement and that they see their roles and activity styles as different from that of men.

Contradictory Entitlements: Gendered Digital Inequalities in Urban Kolkata

Ground breaking developments in digitalization have led cyber genres to assert that ICTs are gender neutral unlike other technologies as they are based on brains rather than brawn, on networks rather than hierarchy (Wajcman, 2009), heralding a new unbiased relationship between men and women. But the realities of women's daily lived experiences belie these simple generalizations. While ICTs and the Internet offer vast, new and unprecedented opportunities for human development and empowerment in areas ranging from education to entertainment, they are also one of the key contributing factors to inequalities across different social and economic groups. The gender divide is one of the most significant inequalities to be amplified by the digital revolution, and cuts across all social and income groups. Throughout the world, women face serious challenges that are not only economic but social as well as cultural that limits their access to ICTs. There is a strong co-relation between gender and access to digital resources, while ICTs usage may seem gender neutral at face value however socially and culturally constructed gender roles and relationships remain a perennial impediment in shaping the capacity of young women and men in Kolkata and to participate on equal terms in the fast growing Information Society of India. The present study addresses through intersectional perspective how digital inequalities are enforced among young women of urban India based on their gender, social class and family background. With the application of mixed method techniques, the present study attempts to reveal how mutual compatibility of gender, class and family background reinforced disparate prospects among young girls, accentuating deprivation and shape their identity and lived experiences in digital world. The respondents are from male and female of upper and middle class students belonging to grade IX-XII in Kolkata.

SINGH, DEEPIKA* (DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF CALCUTTA, deepika.singh1810@gmail.com)

Intersectionality, Digital Disparity and Children in Urban Wired Habitat of Kolkata

With the proliferation of new ICTs in everyday life of children, it is redefining the concept of digital inequality and meaning of empowerment along with changing parent-child relationship among wired family of India. ICTs provide hopes and fear, excitement and uncertainty, freedom and control which induce both the empowerment and disempowerment among children. On one hand, ICTs provide new opportunities to surf internet for enormous information but it also opens up the new vistas for unwanted sexual sites; it creates anytime anywhere connectivity but also diminishes the face to face intimate time which changes urban families into 'apart together' hub. Both the promise and the peril entailed in children using ICTs have been giving parents great hope regarding the promise of digital technology as an educational tool but they also bestows fear of internet addiction, inappropriate content, and potential dangers. This conflicting reaction evokes a new genus of digital inequality where children are provided with ICTs access but having proscribed usage on the basis of their age, gender, social class, family and cultural background within internal sphere (i.e. home). This makes us think that even in 21st century, still children is understood as in the state of becoming and not an agency with embedded discrimination and disempowerment in their everyday life. The present study focuses through representational intersectional perspective which highlights how digital culture exemplify children as vulnerable huddle which affect their usage to ICTs and it adjoins complexities when multiple social identities (age, gender, social class, family and cultural background) intersect. With the application of mixed method techniques, the present study tries to

explore how multiple social identities strengthen unequal prospect among children, accentuating disempowerment/empowerment or both which shapes usage of ICTs at home among upper and middle class children of urban Kolkata aged between 13-18 years.

Social and Cultural Barriers in Transformation of the Legal Profession in a Less Developed Town of Central Uttar Pradesh

Globalization and the evolution of the knowledge-based economy have caused dramatic changes to the character and functions of higher education particularly in the field of professional education of law. The professional education in India has been passed through a process of transformation in post-independence era and its expansion can be seen in the form of the establishment of law colleges in different part of the country where the medium of instruction was either English or the local language. Most of the colleges were having evening classes so that in service persons could also attain the professional degree in law. This has opened avenues for the people who were, in fact excluded from the profession particularly rural people, lower and middle-order castes, minorities as well as lower income group people. In post-globalization era, a number of structural reforms were introduced in the field of higher education especially in professional education of law. With an aim to cater the growing demands for skilled legal professionals who can effectively function in the emerging legal order, a number of National Law Schools/Universities were set up by the state governments. In contrast to three years Bachelor of Law course, these newly established law institutions started *Five-Year Integrated Degree Course in Law* with a mixture of the subjects like sociology, political science, history along with a variety of papers on law with a very high fee structure affordable only by upper-middle and upper class students excluding the other section of society from high quality of legal education. The curriculum of these law schools is highly glocalized in the sense, that each institute has its own curriculum as per their local perception of the course within a general framework of five-year integrated course in law.

Social Background, Gender Inequality and New Communication Technology in Legal Profession: A Study of Women Lawyers in Allahabad (India)

Legal profession in India has traditionally been a profession dominated by the male and the urban based lawyers. In post-independence period, although the profession has become more inclusive for rural, lower and middle order castes but it continuously excluded the women from the profession who had a very low representation in the legal profession. In post-globalization era, the entry of the women in legal profession has been significantly increased. The patterns of their participation in legal profession are, however, very different from their male counterparts at the level of district courts, High Courts and Supreme (Apex) court. At the district level, most of the women lawyers work independently and handle their cases themselves. On the other hand, in High Courts and Supreme Court, they mainly work as associates of senior (male) lawyers, particularly while in appearing for arguments in the cases. This creates a kind of gender inequality in the legal profession and give rise to two categories of women lawyers in legal profession of India: i. Independent Women Lawyers; and ii. Associate Women Lawyers. The present paper makes an attempt to explore the social background and patterns of the work organization of both categories of women lawyers in district and high court bar of Allahabad through a highly structured questionnaire. The study also focuses on the patterns of using new communication technology by these women lawyers in organization of their work.

A Quest for Inclusion: Understanding the Marginalization of Dalit Quilt Women Workers (Case Study of Chandigarh)

The situation of dalits and their voice for betterment needs to be heeded considering the teeming numbers of oppressed – the dalits, who are perpetual victims of exclusion constituting about 16.23 per cent of India's population, (according to the 2011 Census,) they have for thousands of years remained neglected and ignored in the social milieu. Indian society is a marginalised society consisting of diverse groups of dalits, backward classes and women who have different socioeconomic characteristics and problems. Dalit women are placed at the absolute bottom of the social hierarchy

as they face systemic and structural discrimination threefold: as Dalits, as poor, and as women.

The present paper attempts to explore the socio-cultural, economic and political dimensions of the problems of dalit women working as quilt stitchers in the city beautiful, 'Chandigarh.' The study was carried out in the city on quilt makers engaged in stitching quilt and mattresses. The paper is divided into three parts; first section of the paper gives the introduction of the study, socio-economic profile of the women workers, second section present the vulnerabilities faced by the women workers at their place of work from various state authorities and the type of marginalisation encountered by them and the last part deals with the policies that would be helpful for including them in the main stream.

SINGH, VIRENDRA PAL* (Centre for Globalization and Development Studies, IIDS, University of Allahabad=211002, etdrvps@gmail.com)

Glocalization: Conceptual and Methodological Issues

The concept of glocalization is closely associated with the theory of globalization. Although the notion of glocalization, has its roots in Japanese business practices called '*dochauka*', (means global localization), originally referred to 'adopting farming techniques to local conditions', it was popularized in academic circles by Roland Robertson, reinforced by Keith Hampton and Banny William, and Zygmunt Bauman. For sometimes, the concept was confined to explain the economic dimension of the globalization but gradually it has been extended to other dimensions of the globalization. It has generated a debate among the social scientists not only about its relevance in explaining the process of globalization in local cultures but also enabled the social scientists to re-examine the very conceptual framework of globalization theory. Today, the concept of glocalization has been applied to different academic fields like mass media (including social media), educational leadership, cultural studies, and political analysis and so on. The present paper is aimed to analyze the conceptual and methodological issues emerged as a result of discourse on the phenomenon of glocalization in a critical fashion. It is argues that glocalization is a simulation of hybridization. In contrast to prevailing assumption that hybridization is an organic process the hybridization which represents the glocalization, in fact, is an inorganic way of change and evolution affecting various aspects of today's social life. The current form of globalization is best described as glocalization. Moreover, the theoretical strands of glocalization posed a number of methodological challenges for social scientists which are yet to be addressed.

Social Control and Racial Relations in Brazil: Old and New Affinities

There is a lasting bond in the history of Brazil between violence, social control and racial issues. However, there are analytical gaps on the new forms assumed by this link. Studies on violence tend to treat race as an attribute of the victims of crimes, and there are few analysis of racism in the police and crime control policies. Studies on racial relations mention violence against Blacks and indigenous as a key element of racial dynamics, but few studies analyse empirically the phenomenon. This paper seeks to contribute to new analytical and empirical problems in the relationship between social control and racial issue in Brazil. It brings evidence of racial inequality in the experience of violence, policing strategies and incarceration, using quantitative data. It brings also analysis of the black youth movement new agenda building and its social impact, based on qualitative data. Results point to the growth of racial inequality in recent years in the field of crime control, institutional denial of the problem, the weakness of mechanisms for social participation in security policies, the absence of viable proposals for police reform and criminal justice.

SINISALO-JUHA, EEVA* (University of Tampere, Sinisalo-Juha.Eeva.L@student.uta.fi)

Informal Education in Youth Work – an Opportunity for a Youngster

The basis of my study is on youth work, and its informal educational methods. This is because of my 30 yearlong experience as youth worker as well my academic studies of youth work. I have been clarifying how the development of youth's identity and moral reasoning can be nurtured using the methods of informal education in youth work.

During this late modern time, the period of adolescence has been lengthening. It has influence the whole idea of adolescence. When adult people are not interested in acting as adults, it cannot be of interest to young people to grow up to become adults. In the education and in the working life there are anyway expectations for the employees to have adult skills. The young people has special needs and we as educators have to be aware and able to understand and to support the process of developing identity and moral reasoning, ability for self-reflection. This will have an effect on the transmission from adulthood to working life. It is not a question of money, it is a question of educational competency.

My interest has been in the development of moral reasoning. My viewpoint is the ethics of care in the way of thinking by Carol Gilligan. How to reach adult competence in the field of moral reasoning. I have been looking for cases where it has shown that there might be some special influence on the development of moral reasoning. The main idea is to find nurturing methods to be used in youth work to work with young people in the transitions to working life. The research data has been collected among Finnish students in higher education. It has been as a part of the Identity Horizon – A Cross Cultural Study (IHCCS) in Finland.

Colloquial Lexical Means of Otherization: A Case Study

Colloquial Lexical Means of Otherization: A case study

Following a cognitive linguistic methodological framework (as outlined among others in Geeraerts et al. 2010), the author establishes a taxonomy of lexical means of otherization found in a case study of Bosnian/Croatian/Serbian colloquial discourse.

The first step of the present analysis comprised the extraction of overt lexical means of otherization (e.g., derogatory names for ethnic groups, sexual minorities, etc.), from a 25,000-entry colloquial Bosnian/Croatian/Serbian dictionary (Šipka, 2000). The next step involved quantitative and qualitative investigation of their functioning in web corpora generated by advanced Google search. Ethnic, religious, regional, gender, profession-based, and lifestyle-based means of otherization were taken into consideration. Their discourse context and impact was analyzed. The discourse part of analysis was partially inspired by Critical Discourse Analysis (most notably Van Dijk, 2009). The final step of the present investigation relied on bottom-up metadata gathering to build a taxonomy of means of otherization based on this Bosnian/Croatian/Serbian case study. The following taxonomic nodes were identified: a. domain, b. range of application, c. form, d. intensity, e. directionality, f. reactiveness.

The idea behind the taxonomy is that recognizing the types of otherization can be a useful tool in the attempts to replace hatred speech with more respectful forms of public discourse in still highly combustive Southeastern Europe. Additionally, a taxonomy based on one case study can be a first step toward building a more elaborate taxonomy of overt lexical means of otherization based on other languages.

Political Consulting Between Public Service and Deligitimization: Empirical Observations in a Secret Chamber

Political Consulting Between Public Service and Deligitimization: Empirical Observations in a Secret Chamber

Think tanks are relevant political actors in world wide politics and contribute to a wide range of important political decisions. However, their influence is often hidden from the public's eyes and hard to quantify or measure. Therefore, qualitative data on the process of consulting is particularly valuable.

In this talk I would like to present chosen results from an empirical study on *political* think tanks and political parties. In this field, the question of legitimate and/or illegitimate influence is evident, since political consultants, scientific advisors and lobbyists have not been elected or delegated by the *demos*. How do politicians and consultants/scientists handle this problem of legitimacy, practically? Referring to a corpus of 25 qualitative interviews with political consultants, politicians and scientific advisors in I will discuss how the immanent paradox of consulting a political decision-maker is processed and resolved both by the consultants and by the political personnel. How is the legitimacy of lobbying a certain cause justified? How do the consultants and the politicians (or think tank officials) describe their work? How do they explain the 'blurriness' and secrecy of the field?

In a second step and with regard to auto-ethnographic memos of activities in an international political think tank, I aim to provide an insight into organisational logics and characteristics of a political think tank. With an interpretation of selected memos I will demonstrate how diverging habitual ways of working and think-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

ing are able to complicate the collaboration of scientists and politicians. With this empirical approach the political think tank becomes visible as a complex organisation that coordinates diverse and sometimes conflicting interests and purposes.

Economic Crisis and International Mobility of European and Non-European Health Workers in the South-East of France: Citizenship and Gender

Economic Crisis and International Mobility of European and non-European health workers in the South-East of France: Citizenship and Gender
Francesca Sirna, CNRS, URMIS, Nice (France)

The present contribution aims to analyze the geographical and social mobility of European and extra-European nurses in the South-East of France (PACA) in the context of the global social and economic crisis.

If, on the one hand, the economic crisis that affects Europe has led to the strengthening of control over Europe›s borders, to limit "irregular" migration, on the other hand we also observe increasing "elite" migration trends. In order to better reveal the process and the dynamics shaping these latter mobilities, I propose a comparative analysis of professional and geographical mobility of intra- and extra-European migrants (men and women) in the health sector, characterized by an increasing shortage, a strong feminization and an increasing international and geographical mobility since the beginning of the 2000s. Besides, as a matter of fact, the integration into the European Union area of new Eastern European countries (with the automatic recognition of qualifications and degrees) has produced a competition between Europeans and non-Europeans in the French health labor market. This has happened despite the historic links that France maintains with African countries – the Maghreb and the former colonies of sub-Saharan Africa. Thus, there would be a new hierarchy of health professionals and a reconfiguration of the access to this employment sector according to citizenship, but also gender. Furthermore, analyzing the international mobility of these professionals means also to understand the balance between northern and southern countries in a context of globalization and economic crisis and the intenational process of health inequalities reproduction.

Regional Diversity of Components of the Natural Movement of People and Migration in Russia

There is a significant variety of indicators of the reproductive and migration potentials in the Russian Federation. The level of fertility varied from 8.8%o to 26.1%o in different Russian regions in 2013. The level of mortality varied from 3.5%o to 18.6%o. Thus, variability indicators of the people's natural movement made up 4-5 times. Likewise, the internal and external migration influence the number of people in regions in different ways.

Our research deals with the regional diversity of components of the population natural movement and migration. Russian statistics marks out six regional groups depending on results of the natural movement of population and migration, which influence reduction or increase in the number of the population.

There are 46 regions with decrease in population, including 19 regions with natural decline and migration outflow, 13 regions with excess natural decline over migration growth, 14 regions with excess migration outflow over natural population growth; and 37 regions with increase in population, including 17 regions with natural and migration growth, 12 regions with excess natural population growth over migration outflow, 8 regions with excess migration growth over natural decline.

Such monitoring enables us to evaluate the development of the regional demographics processes and include the most problematic regions in the state demographic support programs, such as the Program to attract compatriots or Demographic development of the Far East Program, aimed at the internal and external migration stimulation. This practice can be used in countries with similar demographic processes currently developing in some European countries.

Social Work Discretion in the Welfare State Organization of Employment Services

Social Work Discretion concerning employment services and eligibility for benefit provision of recipients of sickness benefits in Denmark is exercised by professional workers employed within municipal jobcentres. Since before and especially after the millennium formal and operational reforms including organizational reforms have gradually altered the politics, legislation and governance structure of employment policies into combinations of social protection and labor-market policies targeting all groups. This development in terms of active labor-market policy or activation policy is not unique to Denmark and is likely to have transformed the work of professional groups at the municipal level profoundly. Given these changes a single case study was carried out using one jobcenter to explore how social work discretion is unfolded concerning recipients of sickness benefits within work and the organization. Three research questions guided the case study; who has the authority to set the standards of discretion, what are the standards of discretion and what themes characterize the discretionary reasoning of the caseworkers. The study shows that the entire organization from local politicians to different levels of managers and the caseworkers themselves in various ways is involved in framing the discretionary powers of the caseworkers. The authority to set the standards lays however firmly with the jobcenter management i.e. the team manager and the general manager. The study reveals a comprehensive and complex set of organizational rules and guidelines aimed at both curtailing and supporting the discretionary powers of the caseworkers where speed, efficiency and quality are important elements. The standards of discretion are best described as a combination of (1) professional norms and judgement connected to professional knowledge in situations of indeterminacy (Grimen & Molander) and (2) organizational activities, resources and strategies connected to institutional work (Lawrence, Leca & Suddaby). The discretion of the caseworkers is substantial but constantly guided, monitored and controlled.

Education and the Working Class - Ambivalences and Paradoxes

The hero in the construction of the Nordic Model (full employment, collective bargaining, salary flattening, unified school, universal welfare rights) was the working class. However, the societal trends of the last decades have in a peculiar way given the working class a central place in political discussions and in the public sphere. The worker image is in a curious way influenced by sociological stereotypes, in the sense that it resembles an inverted (negative) copy of the virtues attributed to some of the elites, as cultivating the fine arts, having "green" values, liberal attitudes in issues of immigration, healthy lifestyle. As a counterpoint, the worker image of the public sphere is a person eating fast-food, drinking excessively, watching reality-tv etc. The backstage for this is that issues of welfare state services and their payment, "value" issues, immigration problems, has replaced many of the traditional issues of democracy, power and economic distribution on the political agenda. But the perhaps most dramatic role given to the working class in contemporary Norway is to be the electoral backbone of the Progress Party and the seedbed for currents of "rightist populism", introvert nationalism, egoism, xenophobia etc. The paradox is, evidently, this: Once the heroes of the making of the Norwegian welfare society, the Norwegian working class are now presented by many as an impending menace to this egalitarian social state. An important solution offered from all political parties is (higher) education. In this discussion there is a deficit of basic knowledge about the cognitive universe of workers, and their modes of thinking. Based on in-depth-interviews of a larger sample of workers we here report findings based on how the working class experiences the worker image and how this potential (class) ambivalence influences the values and educational aspirations the class promotes in child rearing practices.

Can Parental Wealth Explain the Low Rates of Intergenerational Educational Upward Mobility in Germany?

In Germany, intergenerational educational mobility is low. In 2012, Germany was ranked 22nd among 23 OECD states in proportion of educational upward mobility (24%), and third in proportion of educational downward mobility (18%) among individuals aged 25-64. Among younger German individuals (aged 25-34), educational upward mobility (19%) is even less common than downward mobility (24%). One explanation for the relatively high rate of downward educational mobility or stability in Germany can be the attractiveness of the vocational training track as an alternative to tertiary education. However, the strong German vocational educational system cannot fully explain the low rate of educational upward mobility. In our study we aim to narrow this research gap by focusing on the role of parental wealth. Specifically, parental wealth is likely to exert a so-called "social status maintenance effect", implying that children who expect to inherit their parents' wealth will show a lower motivation to invest in educational attainment because they will maintain their parental social status by means of wealth transfers.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Importantly, parental wealth has also been found to have a so-called "social insurance effect", implying that children to wealthy parents will opt for (risky) long-term human capital investments, because they have a familial safety net to fall back upon in case of set-backs. This positive effect of parental wealth on intergenerational educational upward mobility might however be offset in Germany by the generous welfare state, offering a social safety net to all citizens, independently of parental wealth. We therefore expect parental wealth to exert a negative effect on intergenerational educational upward mobility in Germany. We will test our hypothesis drawing on data from the German Socio-Economic Panel Study (GSOEP).

Was There a Third Way? H. O. Ziegler's Quest for an Alternative to National Democracy and the Total State

Heinz Otto Ziegler continues to be a less known contributor to the debates about democracy and the state of the 1930s, despite the relative success of his book 'The Modern Nation' (1931) and other writings which, as has been recently claimed, exerted a strong influence on Hannah Arendt (see Ch. Volk, 2015, *Arendtian Constitutionalism*). Ziegler has been portrayed (e.g., by Juan Linz) as a conservative partisan of an authoritarian political regime. It will be argued that Ziegler's aim was less to extol the virtues of authoritarianism and more to find a politically viable alternative to the two forms of political system which he rejected. These were the national democracy that originated from the Jacobin impulse of the French Revolution and culminated in the nation-state of the 19th century; and the all-powerful 'total state' which Ziegler saw in his lifetime triumphant in Italy, Germany and the USSR. His own position can be seen as deriving from his precarious status as a Czechoslovak-born German-language Jewish intellectual: an alien both in the Czech national democracy established in 1918 and in the totalitarian Germany of the 1930s, Ziegler was in search for something else. In this sense, he can be seen as a sociological version of Joseph Roth, Ludwig Winder and other literary figures whose uprootedness led them to look up to pre-1918 Austria as a positive model of political organization for Mitteleuropa. Importantly, however, evidence indicates that Ziegler's position in the 1930s evolved from an ambiguous advocacy of an 'authoritarian state' towards a positive appreciation of the liberal democratic regime. The paper will draw besides Ziegler's published works on the archival materials from the Rockefeller Foundation and the Archive of the former German University in Prague.

SKOVGAARD-SMITH, IRENE* (Anglia Ruskin University, irene.smith@anglia.ac.uk)

Globalization Writ Small: Ethnographic Fieldwork in Multicultural Social Spaces

Communities and groups are key sites for the micro-sociological study of individuals as embedded in local scenes, representing both the consequence and the cause of collectivity: 'society writ small' (Fine, 2012) and thus also globalization writ small. Studying the global calls for immersion in social spaces that represent lived globalization in various forms. In this paper, I reflect on two such fieldwork experiences. In different ways these ethnographic cases illustrate how people living local lives constitute and are constituted by the global.

The year is 2001 and the local scene a multiethnic group of girls in a Gymnasium (advanced secondary school) in Copenhagen with 80% ethnic minority students. Spending a year in their class, I experience how ethnic boundaries are maintained and strengthened in interaction, but also how these boundaries are in some situations trespassed, redefined and rendered permeable. Their lived globalization is one where societal categorizations and public discourse in the wake of the global shock of 9/11 contribute to internal polarization, but also one where unexpected identifications emerge.

The scene shifts. The year is 2009, it's Sunday and I find myself on a boat in Amsterdam surrounded by partying 'expats' from around the world who work in MNCs. The following days everyone is 'tagged' in pictures on facebook enabling this diverse group of global careerists to cement their local scene in virtual space. Their weddings are ritual celebrations of bicultural marriages and the 'multicultural vibe' of their 'expat bubble'. In interviews, they talk about their dislike of the 'monocultural' and identifying with a 'new nationality called globalism'. Their form of lived globalisation is radically different driven as it is by international business activities and high-skilled migration, but it is also one of selectively emphasizing and downplaying difference and redrawing of boundaries in the constitution of new forms of cultural identification.

RC31-351.3

SKOVGAARD-SMITH, IRENE* (Anglia Ruskin University, irene.smith@anglia.ac.uk)

The 'Non-Nationals': Multicultural Identity Making Amongst a Group of High-Skilled Migrants in Amsterdam

This paper is based on an ethnographic study of a diverse community of high-skilled migrants living and working in Amsterdam carving out global careers in multinational corporations (MNCs). The aim is to explore the emergence of new forms of collective identification that is neither national, ethnic nor diasporic. More specifically a form described in various emic terms as 'a non-national nationality', 'an international nationality' or 'a new nationality called globalism' as constituted by high-skilled migrants embedded in global environments and diverse networks in a global city context.

The argument put forward is that this form is analytically distinguishable from other forms of collective identity construction by a specific pattern in the dialectic of internal definition of 'us' and external differentiation in relation to other collectivities. Internal definition revolves around constructing difference rather than similarity. This particular symbolic signification of culture difference renders it benign and condenses it to make it suitable for aggregation and appropriation as a source of collective identification. This is achieved by way of a dual repertoire of both emphasising and downplaying difference in shifting ways to establish a notion of 'us' as united in difference drawing on discourses of multiculturalism as a 'melting pot' and cosmopolitan notions of openness. External differentiation on the other hand revolves around the construction of the local and the national as the antithesis, thereby establishing the boundary that is constitutive of collective identification. Boundary drawing is achieved through differentiation in relation to local nationals and more abstractly any national monoculture. Overlapping repertoires of the local as nationally embedded and the national as monocultural majority is evoked to construct the otherness in relation to which it becomes possible to conceive a multicultural, translocal collective identity. However, this sense of collective belonging is transcient, ambigious and context-dependent suggesting a range of potentially problematic implications.

Meet the Young European Mobile Employee: Context, Agency and Employment Mobility Patterns within the European Union

The contribution offers a case specific mapping of youth mobility within the European context while focusing on two cases: Luxembourg and Norway. It argues for a more systematic discussion of agency and structure, thus far overlooked in mobility research due to two major factors. On the one hand, mobility within the European Union and the fact that young persons are global and mobile is taken for granted. On the other hand, there is a prevailing tendency towards research focusing on specific cases/countries while overlooking general patterns of employment mobility. This is especially true for youth employment mobility within the EU, which is accompanied by uncertainty and fragility related to the transitioning into adulthood. Taking Giddens structuration theory and Bourdieu's field theory as a starting point, we approach the youth employment mobility from the perspective of an organisational field that is shaped by actors and structures like institutions, legal policies as well as specific rationalities and logics. This perspective is complemented by elements like young persons' social relations, kin and non-kin social networks, institutional frames, working and life-style. While comparing similarities and differences of mobility patterns in Luxembourg and Norway the contribution explores institutional and individual components of the European youth employment mobility. The analysis is based on 30 in depth interviews, which focus on young peoples' own experience towards the ways in which they are and can be active agents regarding geographical mobility.

SLACHEVSKY, NATALIA* (Université Paris Descartes, nslachevsky@gmail.com)

La Sociedad De La Información En Chile: Discurso Político y Sus Limites

Diez años después del retorno a la democracia en Chile, el sistema educacional sigue teniendo fuertes bases neoliberales heredadas del régimen dictatorial de A. Pinochet. Ricardo Lagos asume el 2010 la presidencia del país como el tercer gobierno consecutivo de la coalición de centro-izquierda Concertación, y propone un nuevo paradigma para posicionar al país en el proceso de globalización: la sociedad del conocimiento. Paradigma muy acorde con la senda de crecimiento económico en la que está Chile, que hace hincapié en la generación de conocimiento y en el procesamiento de la información (Castells, 2005).

La propuesta busca analizar como el gobierno se hace cargo de este discurso en el plano educativo, ¿este nuevo paradigma se materializa en las políticas educativas del periodo?

La sociedad de la información en el caso Chileno no va más allá del imaginario discursivo del ejecutivo, no permea el área de educación del gobierno ni las políticas implementadas por ésta en el periodo, que van en continuidad con lo que se venía haciendo en gobiernos anteriores. El vacío es tanto más significativo que el proyecto apuntaba explícitamente a producir una diversificación productiva y sentar las bases de otro modelo de desarrollo en Chile.

La autora propone un análisis del funcionamiento, del discurso y la política que el Ministerio de Educación implementa en el periodo, la manera en que el Estado se hace cargo parcialmente de este paradigma y las razones de los límites de su implementación. El trabajo se basa en el análisis de discurso y de entrevistas semi directivas a decidores políticos y funcionarios del ministerio de educación durante el periodo de estudio. Un análisis socio-histórico de la manera en que un discurso político y las políticas públicas van por rutas opuestas en el ámbito educativo.

SLESINGEROVA, EVA* (Masaryk University, eslesi@fss.muni.cz)

Bio-Art, Sci-Art – Encounter Human Technogenesis

We are witnessing profound change of our societies: a change both mediated by and manifesting itself through the emergence of various technoscapes relating to the biotechnologies, cybernetics, new genetics, etc. These sciences and technologies have transgressed inner biospace into frontiers for technological innovation and have brought new forms of objecthood and territories of naming, governing and dealing with (Mitchell 2002). Molecular screening and modern imaging technology have become a spectacle, a source of multiple metaphors and provocative visual images (Anker and Nelkin 2003). For this paper will be crucial area of the Bio-Art – works of artists who are at the same time scientists (geneticists, biologists, etc.) or artist working with biology or biotechnologies. There are lots of BioArt laboratories and groups of artists which are intrigued by DNA, genetics, and working with live tissues around world. Visual framing of understanding of the trans/non/human body within Bio-Art also implies changes in public understanding of the brain, the body, the person and the society he or she lives in. BioArt and SciArt are not only imagination of the human body at the aesthetical level, but through their works artists stimulate the audience to face some existential questions. Some of the questions are disturbing; it is difficult or impossible to reach simple answers about the fact of human embodiment, the borderlines of humanity, or the in/separability the self, mind, soul and body. Taking advantage of critical social and visual theory (Hayles, Foucault, Flusser), this paper examines the narrative concerning the production of knowledge within interpretation of various imaginations of DNA, genom, embryos, and cultural production of trans-human taxonomies and classifications as well.

RC54-613.2

SLESINGEROVA, EVA* (Masaryk University, eslesi@fss.muni.cz)

Sci-Art/Bio Art – Molecules, Bodies and Life

Biotechnologies, synthetic biology, new genetics or biomedicine in general represent the contemporary key areas of life sciences characterised by rapid technological and scientific development. We are witnessing profound change of our societies via biosciences and biotechnologisation. Such processes are not only a part of broader developments of sciences related to particular technologies and technomedia-scapes, but they also question existing approaches to the concept of human body and embodiment. *The paper will be focused on* the production and circulation of "bio-objects", such as stem cells, chimera, tissue samples or genetically modified organisms (Tamminen, Vermuelen, Webster 2012) and dealing with, materializing and visualizing them. Especially, the visual images of bio-objects (DNA, embryo, cells) have become cultural icons and important parts of how we see and speak about the human body, also they are referring to the potentiality or materialization in sense as Deleuze and Guattari wrote about "*body without organs"* (Deleuze, Guattari 1987) or body as symbolic space (Douglas 1966). There are many artists and visual performers who use live cells, tissue, or genes to create, perform and re - program living things, and work with the specific visual imagination of the human body. They are part of a broader current of artists who are intrigued by DNA, genetics, and working with live tissues. In this sense, the imagery and materialisation of body also in Bio-Art provide space for iconic representation of life and fact of human embodiment and also for its molecularization and essentialisation. Visual framing of public understanding of the bio-objects within Bio-Art also implies changes in public understanding of the brain, the body, the person and the society (Kac, Heyles). The paper is a sociological conceptualisation of the theme of human body as the specific space for assamblage of non/trans/humaness above all through the analysis of Bio-Art works.

SLOAN, MELISSA* (University of South Florida Sarasota-Manatee, melissasloan@sar.usf.edu)

Gender and Interpersonal Emotion Management in the Workplace

This research examines gender differences in managing the emotions of coworkers and their consequences for worker well-being. While an extensive amount of sociological research has examined intrapersonal emotion management, the performance of interpersonal emotion management, or the managing of others' emotions in the workplace, has been given much less attention. Building on recent work that illustrates the impact of coworker relations on worker health, we draw on gender frame theory to predict the relationships among gender, interpersonal emotion management, and worker well-being. Consistent with gendered expectations regarding emotion, we expect that women will engage in interpersonal emotion management at work to a greater extent than men. Following structural theories of emotion, we expect that workers in lower status positions will perform more interpersonal emotion management than higher status workers. We also predict that extensive interpersonal emotion management in the workplace will be associated with increased job stress and psychological distress. Finally, we expect that perceived support from coworkers will moderate this effect. We test these hypotheses using survey data from a random sample of 1,533 public sector employees in the United States. We find that women report significantly more interpersonal emotion management than men, net of occupation and job status characteristics. We also find that, in addition to supporting gendered beliefs about emotion, interpersonal emotion management can have negative consequences, and perceived social support from coworkers does not moderate the negative consequences of interpersonal emotion management. These results suggest that interpersonal emotion management is a burden placed primarily on women in the workplace. It is notable that this relationship holds regardless of workplace status characteristics. The substantial efforts devoted to managing coworkers' emotions create an increased and hidden workload for women that may exacerbate gender inequalities in the workplace.

Migrant Women's Life Narratives - Paths to Achieving a Strong Soc in the Face of Migration and Acculturation

Migrant women have the highest incidence of mental health problems in the Netherlands. Whereas previous studies mainly looked into the wide variety of risk factors this group is exposed to, we will take a salutogenic approach and look at how migrant women manage to maintain good mental health while facing stressors related to migration and acculturation. We do so by using the theoretical framework of the Sense of Coherence (SoC). SoC is a general orientation to life which consists out of 3 components; comprehensibility, manageability and meaningfulness. In a review of over 300 studies SoC was found to be a strong predictor of mental health. Hence, it is important to understand how a strong SoC is developed when trying to understand mental health problems among migrant women. The current literature on SoC mostly focuses on the consequences of SoC and uses almost exclusively quantitative methods. The aim of this study is therefore both empirical and methodological; Firstly, we study the development of a strong SoC through life narratives with a special focus on the impact of migration and acculturation. Secondly, we discuss the benefits of using narrative analysis when studying SoC. Through life narratives, migrant women can create coherence and meaning in their lives despite the experience of migration, acculturation and often a lack of decision power in these major life events. The intricate relation between the ability of individuals to create coherent and meaningful life narratives and SoC are discussed. We achieve these aims through biographical life interviews with native Dutch, Surinamese, and first and second generation Turkish and Moroccan women living in the Netherlands (N=50).

Overcoming Obstacles? Critical Transitions Between Vicious and Virtuous Cycles Between Health Problems and Employment in Migrant Women's Life Histories.

Migrant women have both the highest occurrence of health problems and the lowest employment rates in most European countries (Eurostat, 2014). Health problems are a serious obstacle to employment. In the Netherlands, for example, migrant women receive significantly more benefits than native Dutch women because they are unable to work due to health problems (CBS, 2014). Health problems are often omitted in explaining labour market integration of migrants.

This study examines the intricate reinforcing relation between health problems and (un)employment during the life course through life story interviews with women from Turkish, Moroccan, Surinamese and Dutch origin (N=60). The narrative analysis highlights four main (preliminary) findings. Firstly, women present health and employment as strongly interrelated and reinforcing within their life narratives. Negative job characteristics and unemployment are often mentioned as clear causes for health problems, whereas health problems are often clearly indicated as the reason why women stop working or feel unable to work even though they would want to. Interestingly, health problems often seem to be embedded within a variety of other obstacles to employment, such as discrimination, socio-economic status and gender roles. Secondly, due to the reinforcing nature of these relationships, women often present episodes of their health and employment history as a vicious or virtuous cycle in which different factors either negatively or positively reinforce each other. Thirdly, women identify clear transition points in their life histories, indicating shifts between vicious and virtuous cycles. These transition points provide insight in how women can break out of vicious cycles and overcome obstacles to labour market participation, which is interesting for policy makers. Fourthly, different patterns in the relation between health problems and employment are discussed in terms of ethnic background and migrant generation.

Ambivalence? Cultivation? or Simply Some Free Time? Transnational Short-Term Migrant Returns Across Three Family Generations

The continuing importance of the extended kin in the globalized world has been pinpointed by studies in sociology of family and particularly highlighted by migration research on transnational kin. The lives of transnational family members are embedded in the dynamically constructed practices of managing ties and kin relationships beyond borders.

This paper examines family practices that occur during the short-term visits of Polish migrant women, seeing these as significant transnational family practices and a particular kind of return. The notion of "return" is akin to that of transnational mobility, with an imprinted non-permanence, elusiveness and ambiguity. An ambivalent return refers to space just as much as to affect and the obligations that migrants feel obliged to fulfil within and beyond geographic borders. Short-term returns are therefore a form of border crossing that can be viewed as visiting friends and relatives, yet must also be recognized as primarily marked by duties (absence compensation and cultivations of family relations) rather than its understanding as tourism or leisure.

We propose a multi-sited mixed-methods approach. By combining data from Transfam project (2013-2016), and a doctoral study on migrant mothering (Pustułka 2014), the analysis benefits from data collected through web-surveys and in-depth interviews conducted with migrant women parenting in Norway (n=30) and United Kingdom (n=37). Furthermore, we provide backdrop data in the form of survey data deployed in the UK (n=81) and Norway (n=648).

The discussions feature the actions that women take towards their elderly parents on the one hand, and their children who normally reside abroad, on the other hand. The arguments showcase the tensions evoked by short-term returns home. They are viewed as resulting from nostalgia, guilt and ambivalence towards one's parents and home-country, as well as being conditioned on the efforts focused on cultivation of familial propinquity and Polish culture among children.

Shifting Social Solidarities and Genetic Risk in Communities Where Cousin Marriage Is Commonplace.

One billion people live in communities where marriage to blood relations (most often cousins) is customary. If parents are blood relations the chances of their children having a recessive genetic condition increases. Marriage within any restricted community also increases risk.

Born in Bradford (BiB) is a birth cohort study based in Bradford, the UKs 6th largest city. BiB has collected data from 12,453 women with 13,776 pregnancies (2007-2011) and 3,448 of their partners. Half the mothers in the study are of Pakistani origin and half of this group were born outside the UK. Two-thirds of Mothers of Pakistani origin were married to a blood relation, it is a customary practice that has a long history. So too does the practice of marriage within biraderi ("brotherhood") networks. Both these routes for choosing marriage partners are integral to trans-national marriage and are of widespread importance in migrant communities across the world. Rates of congenital anomaly in couples related by blood were double the overall rate in the cohort.

But cousin marriage and marriage within biraderi may carry positive benefits, including those that help shape health and well-being. For example comparing mothers in such marriages with those not related by blood to their husband we find evidence of a positive impact on economic and psychological well-being and on levels of positive health related behaviour, including less smoking. Providing social solidarity that gives psychological or practical support may improve infant health. We have a paradox that helps define health promotion and health education debates as well as contributing to debates about legal restrictions on migration; what can make a community stronger can also harm it. After exploring changing patterns in marriage choice and in the social structure of community solidarities this presentation will consider genetics, choice and risk.

Ambiguous Academisation of Vocational Education

During the past 40 to 50 years, several vocational programmes have, in most countries, been upgraded to higher education and greater emphasis has been placed on faculty research competence and academic publishing. On the one hand, these trends may be considered as professionalization of vocational programs. On the other hand, the terms academisation and academic drift have been used to describe a detrimental adaption of traditional academic values at the expense of the vocational relevance of these programmes.

The aim of this paper is to explore these changes more in depth based on analyses of archival documents, national framework plans and various other kinds of documents on teaching, nursing and social work education in Norway. It is well documented that the formal research competence and research publications has increased, but what kind of research is conduced and to what extent is the research relevant for the educational programmes and professional practice? Moreover, to what extent has the curricula become more similar to traditional disciplinary university programmes? Has the volume of practical training been reduced? Has the volume of organised teaching been reduced to give more time for self-study? Has the practitioners influence been reduced? Preliminary analyses indicate that the development is ambiguous. It is also important to distinguish between different types of academisation. Even though these dimensions are related, they are only loosely connected and sometimes contradictory.

Time Use and Energy Use: Exploring Conceptual Links and Assessing Sustainable Pathways

The way urban household members use their time, the energy demand of households and the spatial organisation of cities entail each other. Available time - similar to available money - governs everyday decision making of household members concerning living space, consumption patterns and means of transportation. All of these activities are energy consuming (transport energy, heating/cooling energy, etc.) – some more, some less. Consequently, lack of time often translates into spending more money and more energy, severely constraining individual and household choices.

Several policy measures such as public transport intervals, flexibility of working time, opening hours of public services, spatial planning and infrastructure have changed and will change society's patterns of time use and have an effect on both the economic performance (synergies, production and consumption patterns, income, etc.) and the natural environment (energy flows). In the research project "UTE – Urban time and energy: A socioecological model for assessing time-use and energy metabolism" we develop a simulation model which allows to explore the options for future development of urban energy use which depends on internal choices (of households) as well as on changes in the framework conditions, such as time-policy measures.

We analyse time-use data of the latest Austrian time-use survey from the year 2011, which deliver insights on time-use patterns of different household types. Additionally, we draw knowledge on time use preferences from a series of stakeholder workshops and semi-structured interviews with citizens in Vienna. This paper will show how we establish the conceptual links between time-use, energy use and sustainable pathways. The model enables the assessment of future scenarios based on different time policy measures and stakeholder assumptions. This tool can trigger and guide time-policy measures of the city's administration and planning processes which integrate time policy, participatory processes and energy saving.

Contemplating Repetitive and Symbolic Social Action: Viewing Family Rituals through the Eyes of Young Adults

Rituals have the potential of playing an important role in sustaining and enhancing quality family life. In focussing on family members' participation in rituals and the meaning they attach to these rituals, studies have turned to family members in different age groups during different phases of the life cycle of the family. Yet, there remains a paucity of research pertaining to the perceptions and experiences of *young adults* regarding family rituals. This is specifically the case in the multicultural South African society, where few studies have focused on family rituals in general and even fewer on family rituals as experienced and viewed by young adults in particular. The paper reports on a study with the aim to address the lacuna that exists in research in South Africa on family rituals by taking young single adults, who still reside in their families of origin, as the research population. Using a qualitative methodological approach, the focus fell specifically on the *different kinds of rituals* that exist in the family of origin of young adults and the *symbolic meaning* or value young adults attach to these family rituals. The narratives of the 40 research participants (across five different language categories) revealed that most of the young adults in the sample regularly partook in family rituals and that many of them ascribed positive symbolic meaning to these rituals. Apart from discussing the themes related to the positive value attributed to family rituals and what this means for gaining a better theoretical understanding of dynamic family life in South Africa, attention is also paid to the few cases where participants criticized some of the rituals practiced in their families, the reasons why they did not endorse these rituals and thus viewed them as having a negative impact on family relations and well-being.

Policymakers and Academic Researchers: How Do They Communicate?

Policy makers face challenges in obtaining action oriented research in a timely way that is in a usable format or has been translated into a language that is understandable. Researchers face challenges in obtaining funding in a timely way that meets their academic schedule, in conducting action oriented research, and in translating the academic language into policy language. Too often this results in a lack of communication and policies made without the benefit of research knowledge. This presentation will discuss how UNICRI has found a way to reach the policy makers, and how it lags behind in reaching the academic community. The United Nations Interregional Crime and Justice Research Institute (UNICRI) is one of the seven institutes of the United Nations and the only one with a mandate to conduct research, training, and technical assistance in the full spectrum of crime from prevention to intervention with governmental and non-governmental actors.

Gentry Distinction: How to be 'Not-Quite Upper' but 'More Than Middle' Class in Neo-Liberal Britain

In contemporary Britain, class is as much alive today as it ever was. However it is complicated by a deepening of inequalities and widening gap between the top 10 and 1%. As such claiming status distinction has become subject to new struggles and challenges. A group whose status distinction has suffered from this exaggeration of wealth and widening inequality is the British upper-middle classes. What this paper outlines is how Britain's upper-middle class are employing new strategies to demonstrate traditional status distinction. It will provide a comparative reading of three examples of what I am calling 'gentry distinction' through an ethnographically informed discussion of the British clothing brand Jack Wills and an interpretative analysis of BBC Three reality-TV show *Life is Toff*, about the landed family at Great Fulford, Devon. By comparing two different cultural sites of 'gentry distinction' what is demonstrated is how new, consumerised and popular genres are drawn upon and refigured to classic gentry scripts and identity claims. The ethnographic analysis of the Jack Wills brand demonstrates how the corporate strategies mimic gentry lifestyle in not merely appearance but substantively by employing economic regimes of restricted gift-giving and patronage to foster social exclusivity. What is evidenced is that an upper-middle class background and heritage become crucial to the successful performance of not merely the brand's narrative but also to upper-middle class social distinction. Comparatively *Life is Toff* employs the generic conventions of a foul-mouthed dysfunctional family to give space to gentry distinction. They display disregard for the conventions of middle-class manners and politeness, and moreover, disregard for the judgement of others. The Fulfords of *Life is Toff* utilise the scripts of the audacious reality TV star to perform gentry distinction beyond the measure of others.

The Turbulence of School to Work Transitions and the Earnings Outcomes of Young Canadians

Countries differ in the character of their school to work transitions. Germany is frequently treated as a model, across a fairly wide range of educational levels preparing young people to move easily into stable employment. The United States is not usually treated as a model. A significant proportion of its transitions involve interruptions as young people switch between educational programs and jobs. Canada's school to work transitions are rather like those of the US. This raises these questions. i) To what degree do turbulent transitions damage subsequent earnings? ii) To the extent that turbulent transitions damage earnings, what is it *about* them that causes the damage? Do multiple transitions between educational programs, employments, spells of unemployment, and absences from the labour market for reasons other than education all have negative effects on earnings or do their effects vary by kind of transition and by level of last diploma - secondary or postsecondary. iii) To the extent that there is damage, with what theory are the patterns causing the damage consistent? We use Canada's *Youth in Transition Survey* to address these questions. It started collecting data on a sample of the 1999 cohort of 15 year olds and followed them for the next ten years. Consequently, we have 120 observations of labour force status, including reason for not being present in the labour force as well as earnings at the end of the ten years and other variables. Our results show that the character of the turbulence does indeed influence earnings and does so differently for those who finished their education with a secondary or postsecondary diploma.

Cross-National Differences in Attitudes Towards Income Inequality and Government Policy to Reduce Income Inequality

Gender roles and family structure have undergone massive changes in most countries in recent decades. These relational and structural changes have in turn interacted with attitudes and values relating to gender roles and the family. Topics covered include views on the adoption of non-traditional roles by women in the paid labor market, politics, and elsewhere in society; the nature and purpose of marriage; intergenerational relations within families in general and the care of the elderly in particular; and having and raising children.

First, this paper follows changes in these attitudes and values from 1988 to 2012 using the International Social Survey Program (ISSP). There are trends across 31 countries. Second, this paper examines cross-national differences. The ISSP covered a total of 45 countries. Third, socio-demographic differences in general are examined and especially the impact of cohort, education, gender, and labor-force participation. Finally, multi-level, multivariate models are used to determine what individual-level and country-level variables explain the variation across countries and the changes over time. The specific gender role/family values changes are then related to general theories of modernization and globalization.

Shaping New Parties' Legitimacy: Members and Organization in Post-Accession Countries. Insights from Hungary and Romania

For more than two decades post-communist political parties exhibited loose electoral constituencies featuring limited membership figures. In-depth analyses have fine-tuned these initial diagnoses identifying not only variations among countries, but also within the same country. In line with the electoral breakthroughs of new parties in numerous Central and Eastern European countries, various scholars have recently analyzed the criteria according to which new parties are to be distinguished in relation to their name and organization, leader, candidates, and patterns of support (Hug 2001, Rahat and Barnea 2010, Arter 2010, Sikk 2012). However, the membership figures remain misleading for the party capacity in fostering mobilization. In Romania, high but volatile membership figures conduced to volatile party trajectories. Conversely, in Hungary, lower yet relatively stable figures of party encapsulation ensured organizational and electoral stability. Starting from these examples, this paper aims to examine the relationship between party membership figures and party activism. It argues that incentives to political entrepreneurship in gathering new members cannot guarantee electoral stability without organized structures of support. The paper has a two-fold goal. First, it investigates to what extent the conceptualization of party organization (notably membership activism) is dissimilar in our two cases. Second, it tests whether the grassroots' development increases the parties' electoral success. The analysis relies on the qualitative content analysis of party statutes/constitutions, party membership figures and electoral results. The conclusions will emphasize that although institutional and organizational incentives may play a role in boosting membership figures, the party electoral success heavily relies on the intensity of membership consistence

Social and Political Implications of Drought Northeast of Brazil

Abstract
SOCIAL AND POLITICAL IMPLICATIONS OF DROUGHT NORTHEAST OF BRAZIL
Maria Zefisa SOARES MENEZES
This article addresses the drought in Brazil as a social and historic phenomenon characterized by its broad scope and complexity. It aims to contribute to the debate about the challenges that the scourge of drought inflicts not only as a natural phenomenon but rather as a social and its consequences in the present-day context. The hypothesis developed in the research is that the government investment to combat the drought was not sufficient to resolve the multifaceted character of the social conflicts. The embezzlement of resources sharpens the contradictions in social context very fragile increasing the incidence of the conflicts. How to democratize the access to government resources allocated to combat the drought, considering of the power structure and the current political and economic dominance? How do social actors fight for participation in the definition and appropriation of public resources, in the elaboration and management of public policies to combat the drought, as well as the unveiling of this structure strew the "patronage"? In addition to food demands, social movements are demanding solutions to structure problems and beckoning changes, have in mind to overcoming economic and political forms of dominance.
Key words: Drought. Social mobilization. Public policies. Power structure.

Managing the Process of Production of Theatre Play

Warsaw is a city full of theatre institutions. After the economical and political transformation of 1989, a new era of free market based issues arose. Many theatre intstitutions became municipal in the mid 90's. In the early 2000's many private theatre were brought to life. Ever since two ways of thinking about culture are fighting each other.

Commercial or artistic profile of the institution defines the way of thinking of the managers and the policy of the institution. Each type has its unique goals and ways of achieving them. Depending on the type of funding and profile theatre directors aim at different audience and type of sponsors.

A qualitative study of a Polish public theatre shows the management technics and problems of a public artistic theatre. In this presentation I would like to describe the map of theatre institutions in Warsaw based on their funding, artistic/commercial profile and their management style. Howard Becker's "art world" consists not only of actors and directors, but also of managers, producers and other professions necessary for the creative production process to take place. Analysis

of managers and types of funding allows us to better understand different elements of the creative process. Creativity is thus required not only in the core of artistic occupations but also of the service industry.

Education and Fertility in Europe: Stylized Facts, Expected and Surprising Findings

It is widely known that the expansion of tertiary education affects family-related behaviour: university graduates tend to postpone childbearing, highly educated women often display the lowest fertility and the highest childlessness rates. However, sometimes the link between education and fertility decisions is far from intuitive. We will present the highlights of the more and less expected findings from our wide-ranging research on the macro- and micro-level relationship between education, fertility and family. From an aggregate perspective, we will show that highly educated women do not differ in life time fertility intentions from others. However, they tend to fulfil their intentions less often, so that their 'gap' between the intended and the realized family size is usually the biggest. The reason for that can be purely mechanistic: staying in education leads to childbearing postponement. Thus, university graduates have simply less time to have children. On the other hand, the institutional arrangements decisive for combining family life with career (i.e. family and labour market policies) can play a crucial role as our micro-level analyses prove: the labour force participation rates among highly educated women are positively related to their short-time fertility intentions, which are not necessarily lower than those of less educated women. At the individual level, also education of the partners plays an important role in fertility decisions. Homogamous highly educated couples postpone the first birth most, but subsequently display the highest transition rates to second and third births. When looking at how parents of small children distribute paid and unpaid work between each other, it seems that highly educated couples do it more equally. However, when policies are introduced that facilitate a longer employment break, the education-specific differences fade away as highly educated mothers delay their return to work.

Educational Participation of Adult Immigrants: Risk or Opportunity?

Adult immigrants who bring along formal and informal qualification from abroad are confronted with the substantial risk that employers and/or state institutions devalue these credentials. The consequence of such devaluation processes are unemployment or under-employment in badly paid jobs. One possible strategy for the individual immigrant is to "re-invest" into cultural capital (Bourdieu) to be accumulated in educational institutions in the receiving country. And research has shown that indeed newly acquired "native" credentials do help—but do not guarantee—immigrants' later economic advancement. This access to educational institutions—focusing on full-time education in a broad sense—is the subjects of this research project. Given the state of uncertainty and risk of downward mobility immigrants encounter after arrival: which factors prevent them from grapping the opportunity of educational participation and which support

them? And, given respective results in qualitative research, among those who do "go back to school", is the kind of degree they aim for actually above, below or on par with the level of education of their home country? I will present results on immigrants who entered Germany as adults in the years 1964 to 2005, based on my analyses of longitudinal life-course data provided by the nationally representative German Educational Panel Study (NEPS), waves 2009-2013. The analysis focuses on educational participation within the first few years after arrival. Among several factors that can be taken into account of in this new rich data base, the analysis will show the strong, but complex impact of pre-immigration qualifications. This quantitative research will be complemented by first results of in-depth interviews with immigrants currently attending educational institutions (e.g. government-sponsored vocational training for the unemployed) in Germany. This research is part of a three-year project on immigrants' transnational life courses and their educational opportunities, funded by the German Research Foundation (DFG).

TG04-677.2

SOHN, JANINA* (Sociological Research Center (SOFI) at Goettingen University, janina.soehn@sofi.uni-goettingende)

The Uncertainties of Life-Courses Across Borders: Adult Immigrants' Going "Back to School" As Risk Management

Immigration has the potential of being a critical life event bringing risk and uncertainty into the ensuing life course in a new country. While most people emigrate—broadly speaking—to seek a better live, many of them are confronted with the risk of having their foreign educational credentials and work experience devalued by potential employers and state institutions alike. That is, their cultural capital (Bourdieu) accumulated across their life course until migration might lose its social value; stable life-course patterns get disrupted. One way to handle this risk specific to immigrants is to re-accumulate cultural capital by going "back to school" in the receiving country. This option is a strategy of risk management on the part of the individual immigrant and depends on her/his resources and motivation. But also structural opportunities matter in terms of educational institutions being accessible at manageable "price" via e.g. government subsidies or ethnic communities giving respective information and support. My contribution on adult immigrants in Germany will first give a brief overview of such structural opportunities and then focus on the questions which individual and structural factors encourage or prevent immigrants from educational participation (focusing on full-time education in a wide sense). I will present statistical results on immigrants who entered Germany as adults in the years 1964 to 2005, based on longitudinal life-course data provided by the nationally representative German Educational Panel Study (NEPS), waves 2009-2013. The analysis focuses on educational participation within the first few years after arrival. This quantitative research will be complemented by first results of in-depth interviews with immigrants attending educational institutions and with institutional actors involved in the selection process into such programs in Germany. This research is part of a three-year project on immigrants' transnational life courses and their educational opportunities, funded by the German Research Foundation (DFG).

Class Structure, Structural Heterogeneity and Living Conditions in Latin America

International comparative studies of stratification and class mobility are based on class schemes from industrialized countries, i.e. Erikson and Goldthorpe's CASMIN scheme. Although the adoption of such schemes is important for comparative purposes, they may not be well suited to reflect the reality of societies with an asymmetric dynamics of job creation and development, where "modern", productive, and skilled jobs coexist with a traditional sector of the labor market, characterized by low productivity and income levels. Moreover, the relevance of class schemes is also challenged by precarization, which might be eroding the traditional hierarchies between skilled and unskilled salaried laborers and replacing them by the emergence of a "precariat" class of unprotected workers.

Latin American labor markets have been historically characterized as structurally heterogeneous, and precarization processes have added to diversity in labor relations. In this context: 1) To what extent the conventional CASMIN class scheme is able to capture the specificity of labor relations and conditions in Latin America? 2) Which modifications are necessary in order to adapt this scheme to Latin American labor relations? 3) What is the landscape of national class structures that emerges after these modifications? 4) How is this class structure linked to inequality in labor conditions and exposure to precarization?

To advance on these questions we adopt an empirical, structural-based approach. Using national household survey data for a number of Latin American countries, we propose an adaptation of the CASMIN scheme, which differentiates between salaried workers in large and small productive units and sets apart a class of unskilled self-employed workers. Then we contrast class structures among countries and link class membership to labor conditions. Results suggest that class remains an important category, but some adaptations to traditional class schemes are necessary to capture inequalities in job conditions and exposure to precarization.

Leveling the Field? Educational Expansion and Occupational Attainment in Latin America

Access to education is often portrayed as the "great equalizer" of opportunity. In Latin America, the most unequal region in the world, educational expansion is considered as the most important mechanism for the reduction of poverty and social inequalities. According to this view, expansion of education among children of disadvantaged households, and particularly access to higher education, will foster human capital and therefore contribute to break the cycle of intergenerational reproduction of poverty and social inequalities.

To what extent this view of educational expansion as a mechanism for the reduction of educational inequalities is supported by the actual experience of Latin American countries? In this paper we take a look at this question by analyzing national survey data on intergenerational occupational mobility by educational level in Argentina, Chile, and Mexico. Out aims are to establish, first, the nature and magnitude of the association between socioeconomic background and educational attainment, second, to what extent access to education increases chances of upward occupational mobility, and third, whether those individuals coming from a disadvantaged social background but with access to education are able to overcome inequality of opportunity and experience similar levels of attainment than those coming from advantaged families.

Our expectation is that our findings will support a "middle ground" interpretation on the effects of education on the equalization of opportunities of occupational attainment. On one hand, we expect a strong and permanent association between socioeconomic background and educational attainment. But given that access to higher education is still restricted for children of families with low socioeconomic background, those who are able to enter this level are positively selected by unobserved positive traits that compensate the negative effects of socioeconomic background, therefore generating a leveling off effect in chances of occupational attainment vis a vis children with an advantaged socioeconomic background.

SOMMER, ILKA* (Humboldt-University of Berlin, ilka.sommer@gmail.com)

Quo Vadis Reflexivity? Negotiating the Key Value of Education and Science

Reflexivity is not measurable. It does not fit into the widespread evaluation schemes of educational and scientific institutions, practices and outcomes. Nevertheless probably nobody who is professionally involved in teaching and research would call reflexivity useless or dispensable, neither for one's own actions nor for cultural innovation and social change as a whole. I would like to explore and discuss our reflections on our rating practices. What do we do with our reflections? Let's imagine we have reflected that somebody, be it an interviewee or a student, is not sympathique to us, that we consider his or her statements as dump or meaningless. Or let's say that we have reflected that the evaluation schemes we are daily applying are dump and meaningless. Which consequences do we draw from these reflections? If we see reflexivity in sociology as the paradigm of consequently questioning the self, how can we continue rating, classifying and comparing others as usal - or better do we have to continue doing so? What would be the alternative education and the alternative education research? Do sociological reflections on inequalities and power differences attempting to acknowledge the relational standpoint of the knowledge producer necessarily translate into and contribute to the social struggles for changing the world?

The Sociology of Lament. an Existential Mode of Critique?

We are confronted with imposed relevance in many situations in our everyday life, be it when we face medical diseases or social norms. Often this relevance leads to a diminution of the body's capacity to act. The sociology of lament focuses on lamentation as a genuine social practice in which individual's struggle to come to terms with the world is revealed. First, lament can be analyzed as an embodied practice in which the individual tries to maintain its motivational

relevance in resistance to the external world. Second, lament can be described as a performative act – a rite of interruption. The lament is not appropriately analyzed within a simple means-end relation. More than discursive reasoning it can be seen as a situational construction of reality with a focus on the potential openness of every social situation. It is a particular mode of critique which defers social selection and embodies spaces of possibilities. Lamentation is therefore a disintegration with regard to given social norms but open for collectivity. It is an existential experiment and one possible way of overcoming bodily alienation. The lamentation of the individual is not merely a response to the incongruity between the demands of (the external world's) social norms and the individual, limiting itself to the demands of a particular situation. On the contrary, with its goal to transform the circumstances, lamentation is an attempt to increase the abilities grounded within the individual. Based on qualitative research the presentation outlines a sociological theory of lament. The aim is to focus on the meaning of embodied critique. Following a conceptual localization of lament as a sociological phenomenon, a grounded theory based on the study of different types of practices of lament (i.e. persons dealing with experience of loss, suffering or social disturbances) will be presented.

Lawyers in Society 30 Years on

It is nearly 30 years since Abel and Lewis produced their seminal, comparative study of legal professions. The research strands which the work identified have been paradigmatic for later studies.   As a product of an epoch of counter-hegemonic political engagement and critical scholarship, it captured many of the major dimensions of these upheavals and their impact on the profession and contributed to the processes which were beginning to de-construct the basic tenets of the classical professional model.

The period since 1988 has seen an extraordinary acceleration of these processes, the emergence of new trends and the reversal of others. Most striking is the transformation of the world order: globalisation and the financialisation of capitalism and the related reconfiguration of the nation state and citizenship, and the hegemony of neo-liberal discourses. The impact on national professions of these developments, and of other forces such as technological change, the expansion and diversification of higher education and the increasing juridification of society, has been dramatic, furthering the transformation of, *inter alia,* professional rationales, labour markets and working practices.

There is, therefore, an urgent need to revisit the role of legal professions and, through collaborative work, to explore comparatively the impact of these transformations. This paper will discuss the proposal to update and extend this work, which will take shape through a series of colloquia. It will elaborate on the project, its research questions and methodologies

Transitions in Risk Society: Regional Case of Gujarat Solar Park

This paper begins with certain research questions, how significant the theory of risk society in the field of geography of sustainability transitions? why Gujarat solar park makes an entry point of regional transition thinking? Transition theory what so called Multi Level Perspective (MLP) are not able to answer these questions because of their national focused approach and also pay less attention to theoretical understanding of risk. This paper has criticized MLP on the ground of missing geographical dimensions where transition activities are embedded. Second generation Multi-Scalar MLP has been proposed to address the Gujarat solar energy transition at the regional level. In this background, Gujarat solar park has been selected for empirical case analysis. The geographical location of solar park has become an important space where solar energy transition takes place, characterized by the establishment of a new sets of socio-technical configurations in the form of networks, learning, social practices, experimentation, visions and expectations of the niche actors and institutions. Transition towards sustainability at the regional scale is an essential step for achieving sustainable low carbon society. Theoretically, Ulrich Beck's term environmental bads and side effects (such as climate change, air pollution and green house emissions etc.) have been challenged in the age of reflexive modernization of risk society by transition thinkers and practitioners at the local settings.

In Social Capital We Trust?

It has been generally assumed in the literature that social capital is positively related to or is the same as trust with a dearth of empirical verification. The present study suggests three theoretical perspectives on how social capital may be related to network and generalized trust: the compositional element (Putnam), functional equivalence (Fukuyama), and mutual independence (Lin). For the first two perspectives, we employed organizational social capital (number of memberships in voluntary organizations) and network closure as their measures of social capital while for the third, individual social capital (resources embedded in interpersonal network). Using nationally representative data sets from the United States and China, we developed a comparative research design by which a series of hypotheses were tested. The first two perspectives produced inconsistent patterns of associations between social capital and trust cross-nationally whereas the third indicated that social capital is decoupled with trust in both countries. These findings challenge the long-held assumption of the positive association or identification between social capital and trust in the literature.

The Maoming Anti-PX Protest of 2014: Mass Media Vs. Social Media?

This study takes the MaoMing(in Guangdong, China) anti-PX protest in 2014 as a case of contemporary social activism. It explores the dynamic interaction among social media, the conventional mass media and social activism.Thus this study aims firstly to re-examine the discussed linkage between social media and occurring of protest, and to contribute into theories broadly relevant to media and social movement.

Since 2007, there has been a wave of anti-PX protests in China. Para-xylene(PX) , a chemical used in the plastic bottles and polyester, is extracted from petroleum in a process that entails environmental and health risks. On 30 March 2014, a ten-thousands-participants scale of anti-PX protest rally gathered in front of the city hall, which then developed into a violent clash on that night.

The MaoMing anti-Px protest attract scholarly attentions, including interviewed based sociological and ethnographical studies, such studies appear to exaggerate the role of internet and social media and to treat them as the tools that intensified the protest. Instead, they tend to overlook the impact of public agenda that has been created and spread by mass media.

The incident attracted media attention in various ways. Whereas local news media promptly covered it, it was a week after when the national media intensively reported it. The latter developed the story in the context of whether the causality of this protest is scientifically correct. Therefore, by employing discourse analysis of the series of anti-PX protests since 2007, this paper argues that not merely social media, but (national) mass media play a significant role in inspiring such protests. Meanwhile it addresses the situation that mass media are no longer the mobilized resource for who lead movements, but are in the power of to frame and assert such protests movement.

Network Members' Occupational Status, Tie Strength, and Depression in Two Societies

Is the health effect of network members' (alters') socioeconomic status (SES) moderated by tie strength across culture? Using nationally representative data simultaneously collected from the United States and urban China, this study examines hypotheses derived from six theoretical approaches. Social capital theory and upward comparative reference group theory expect alters' SES respectively to protect and harm health. Two tie strength-based arguments—strong-tie-as-social-support-source and strong-tie-as-social-comparison-source—respectively state that social capital theory and upward comparative reference group theory have stronger explanatory power than each other with the increases of tie strength. Among two cultural explanations, the relational dependence explanation predicts that the two tie strength-based arguments have respectively stronger and weaker explanatory power in urban China than the United States, while the self-evaluation motive explanation has the opposite prediction. This study measures one major indicator of mental health, depression, and four indicators of alters' occupational status. In general results are more consistent with the relational dependence explanation. They support the strong-tie-as-social-comparison-source argument to a greater degree in the United States than in urban China. Also, they support social capital theory in the United States but upward comparative reference group theory in urban China.

Childhood Abuse and Depressive Symptoms in Adulthood: The Mediating Effects of Personality Traits

This study analyzed the effects of childhood abuse on depressive symptoms in adulthood, and investigated whether the Big Five personality traits (i.e., extraversion, agreeableness, conscientiousness, emotional stability, and openness to experience) would mediate between abusive experiences in childhood and depressive symptoms in adulthood. The data were drawn from the 2012 Korean General Social Survey, a nationally representative survey. Multiple regression analyses showed that abusive experiences in childhood were significantly associated with depressive symptoms in adulthood. As the frequency of physical and emotional abuse increased, the level of depressive symptoms increased. Personality traits also had significant effects on depressive symptoms. The lower emotional stability and conscientiousness were negatively associated with depressive symptoms. The findings also revealed that emotional stability mediated between physical and emotional abuse in childhood and depressive symptoms in adulthood. Exposures to child abuse were associated with a low sense of emotional stability, which, in turn, increased depressive symptoms. The findings suggest that the deleterious effects of childhood abuse on mental health in adulthood can be sustained through which abusive experiences in childhood affect emotional stability as a personality trait.

Sior: A New Tool to Evidence Social Impact of Science

The research project *IMPACT-EV. Evaluating the impact and outcomes of European Social Sciences and Humanities research* (2014-2017) funded by the 7th Framework Programme of Research of the European Commission aims at developing a permanent system of selection, monitoring and evaluation of the various impacts of Social Sciences and the Humanities (SSH) research. Special attention is given to the social impact of the research, defined as the results of the policies and actions based on research evidence in relation to EU2020 and all EU main targets. IMPACT-EV is contributing to enhance the visibility of the social impact of SSH research. Created within the framework of IMPACT-EV, in this paper we present *SIOR, the Social Impact Open Repository*. This tool has become an unprecedented data source at international level in which researchers can display, cite and store the social impact of their research results. SIOR gives rise to the international scientific debate about the scope that social research projects have or should have. One of the most important aspects of SIOR is the aim of providing not only a description of the evidence of social impact, but also to show contributions that may become useful tools for researchers to improve the impact of their current and future studies. The case of SIOR promotes new avenues to transform scientific research. On the one hand, displaying the social impact of scientific research brings about greater societal recognition and, on the other hand, gathering this information in a fully open access system greatly contributes to the dissemination of scientific knowledge to the wider society. Thus, SIOR helps boost the transformation of scientific research, developing a resource that enables viewing and valuing social improvements deriving from research projects.

Work on the Export Industry in Tanger (Morocco) from the Biography of Women: An Intersectional Analysis

The narratives of the women who live in border spaces are different, and we will focus on precisely such diversity. Various institutional discourses (academic, political or from interventionists), considering females to be a particularly weak group, submissive and subjected to men's dictates by their religion and lacking even will, have denied women capability of initiating a plan for their own lives. But we—which examine the experiences of working women in the export industry at Morocco's northern border—break with that belief, avoiding considering women as a single subject, or a passive one, waiting to be defined or saved by some discourse. We defend the view that women are part of the conversation in which knowledge is constructed where various forms of social stratification are interrelated with women's lives. It remains true, that a large majority of women are in a situation of greater economic exploitation, we opened the focus to analyze the situation of these and other women to identify the plurality of life situations. However, we recognize that most is in a subordinate position. The subject of this research (female workers in the export industry needs to stop being interpreted in universalized terms and start being thought about from "life experience," giving way to a diverse and plural subject crossed by multiple axes of social differentiation. Through the telling of their experiences we can combine the analysis of the power structures with the answers of the social actors. The position in the household together with socioeconomic status and the phenomenon of migration place the women in a power-relationship structure conditioned by the export industry in a border framed by symbolic spaces different. We research the symbolic spaces across her narratives and her biographies.

"Community Care Work", Social Policies and the Desprofessionalization of Care Work

The paper deals with "community care work" aiming at combating violence in the *favelas* that places women as carers for youths considered to be "in a situation of risk" in Rio de Janeiro. The "community care work" is a political construction in line with the new model of social policies that emerge in the 1990's named as *post-Washington Consensus.* The paper explores how the social policy design to foster community participation and responsibility in caring for the young people promotes traditional gender norms and the de-professionalization of care work. It argues that "community care work" escapes the dichotomous concepts of paid work in the public sphere and unpaid work done in the private space or the opposition between the commodification of care and unpaid domestic care. The research suggests the need to expand the concept of care work to include other form of expression that goes beyond these dualities.

Education for and with the Excluded: Broadening Horizons through Memory, Imagination, Spaciality and Sensoriality

Neoliberal education has been based exclusively in a market-oriented conception. It has been drawn to impose discipline, order and submission to future employees. This has not only impoverished educational systems, but also deepened exclusion and inequality in Latin America and elsewhere. Alternative possibilities can be opened by working on different, if not completely opposite principles: widening the horizons of individuals and communities through perception: memory, imagination, spaciality and sensoriality can become essential to build a new relationship with knowledge, education and the establishment of different forms of socialization, based in solidarity, respect and creativity, and not in competences. Latin American experiences will be discussed through the paper.

Migrant Motherhood and Care-Giving As a Pathway to Integration? Delegation of Child Care in Vietnamese Immigrant Families and Its Consequences for Settlement

This paper focuses on the role of social reproductive tasks (motherhood, child care) in migrant women's lives and settlements. It looks into how the activities—so called "bridging activities"—that migrant women perform as a part of their social reproductive tasks shape the process of women's integration in the new country. Many scholars argue that bridging activities include communication with bureaucracies, schools, incorporation into the local neighborhood, etc., and are normally performed by women in the country of origin. In the host country, however, these activities take on a new dimension (Kibria, 1993; Ryan, 2007). They become the means of integrating immigrant mothers, and establishing social capital and skills that help these women adapt to the new country. Based on my qualitative research on Vietnamese families and their Czech nannies I ask the following principal question: what happens when the care-giving (including the bridging activities) is delegated to another person? How does the role of mother—with its limited content—shape the women's position in the new country? The paper shows that the delegation of "bridging activities" offers mothers the option *not* to participate in those activities, and so and thus *not* to integrate into majority society. As these bridging activities are performed first by nannies and then by children, nannies and children serve as mediators between parents and the host culture, and allow parents to not invest their time in anything else but their business (integration competences are no exception). Addressing this particular case of migrant mothers who do mother only in a limited way, the paper illuminates the key role of

motherhood in women's post-migratory settlement and contributes to the scholarly discussion on the meanings of (migrant) motherhood.

Extensión Universitaria y Formación Contra-Hegemónica En Los Cursos De Derecho e Ingeniería

Tradicionalmente, los cursos de derecho e ingeniería concitan un alto interés en jóvenes que se preparan para la universidad: el ingreso exige mejor preparación y sus egresados serán mejor remunerados y gozarán de mayor prestigio social que otros de su misma generación. La actuación profesional en este campo conlleva la identificación de los titulados con los valores hegemónicos de la clase dominante, pues las prioridades en el objeto del trabajo cotidiano estarán determinadas pelos intereses de esa clase. Si la separamos en teórica y práctica, tradicionalmente la formación en las profesiones liberales tiende a cubrir, privilegiar y mantener tales prioridades, con contadas excepciones o modulaciones. O sea, tanto la visión positivista del derecho como la línea de producción en gran escala y automatización en ingeniería, dominan la formación de estos futuros profesionales, por oposición a la percepción de las posibilidades de ejercicio profesional convergente con las demandas de los campesinos de la agricultura familiar, los marginalizados de las grandes ciudades y otros segmentos excluidos de los beneficios del modelo capitalista. Los autores divisan en la extensión universitaria una herramienta de inserción de esta realidad y practican formas de afianzar la formación de intelectuales orgánicos (Antonio Gramsci, Cuadernos de la Cárcel, escrito entre 1929 y 1930), que actúen en la interconexión de clases o grupos sociales diferentes al tiempo que se involucren como educadores, traductores y productores para la clase social que los necesite, potencializándola frente a las instituciones del Estado y a la clase hegemónica. Mini-fábricas de desarrollo y procesamiento de productos locales, afianzamiento de la participación en mercados institucionales, catastro de propiedades urbanas en poblaciones periféricas, reversión de decisiones judiciales que les expropian la tierra a las comunidades tradicionales, asesoría jurídica para la aparición y madurez de líderes locales, son algunas de las posibilidades abordadas, que potencializan esta sintonía.

Migration, Education, Resilience – a Biographical Study on 'Educationally Successful' Persons in Germany Who Have a Turkish Migration History

The results of many different studies of the last decades (e.g. Bos/Tarelli et al. 2012, Bos/Wendt et al. 2012) show impressively the lower achievement scores of students with a "migration background" in the German school system in comparison to their peers who are not classified as such. Especially students with a Turkish migration history – and in particular male students (Klieme/Artelt et al., 2010) – bring up the rear, regardless of their own or their parents' migration. We still don't know much about the processes and conditions, which are relevant for the "educational success" of students in Germany who have a "migration background". Especially the relationship between formal and informal learning is seriously understudied in this context.

Against this background the focus of my current research project is on the resources in formal and informal learning, which "educationally successful" students of Turkish descent, who are living in Germany, have at their disposal. I have collected (a) autobiographical narrative interviews with women and men who completed at least the main part of their school, vocational or academic training in Germany, and (b) narrative interviews with professionals and family members who appear as significant biographical supporters of the persons with whom autobiographical interviews had been conducted. The data analysis is based on procedures developed by Schütze (2008).

In my paper I would like to discuss some results of my research from a transnational and an intersectional perspective. In particular, I would like to discuss the relationship between interviewees' self-identification, e.g. as "bicultural", and their (formal) "educational success" and to focus on social processes of support and mentoring by significant others and how they have evolved over time. (The interviews are also instructive with regard to historical changes in the last decades.)

Diversity Work in Community Sport: Beyond Individual Commitment?

Diversity is used as a key term in a broad range of public and private institutions to describe institutional goals, values and practices. Sport is a prominent social institution where the language of diversity is frequently espoused. Diversity has been constructed as one of the key issues and challenges confronting sport today, both as a social reality and as a normative principle. Yet, recent instances of racial, religious, gender and sexual discrimination, alongside other forms of social exclusion, suggest that the sport policy rhetoric of diversity has often not translated into inclusive practice. This paper will critically examine the commitment to diversity in community sport by drawing on the findings of a mixed methods study of diversity and diversity work across 37 sports clubs in Australia, combining in-depth interviews, surveys, social network analysis, participant observation and policy analysis. The paper will focus on the lived experience of 'diversity champions' within the clubs, who work to make diversity into an explicit institutional end by bringing it to the foreground of club life. The analysis is theoretically informed by critical diversity studies, in particular Sara Ahmed's critique of the way diversity is discursively framed and 'done' within institutional life. It is shown how Ahmed's work offers a compelling analytical lens for investigating how diversity and diversity work are experienced and managed in sport.

RC13-160.5

SPAAIJ, RAMON* (Victoria University, ramon.spaaij@vu.edu.au)

Sport and Belonging in the Super-Diverse City

This paper critically examines community sport as a (semi-)public sphere in super-diverse cities where young people with culturally and linguistically diverse (CALD) backgrounds negotiate a sense of belonging. Belonging is conceptualised as a dynamic interplay between the politics of difference and boundary-drawing and the personal, intimate experience of becoming 'at home' in a place or in particular collectivities. Drawing on long-term ethnographic fieldwork in community sports spaces in Australia and the Netherlands, three key questions are addressed: What kinds of belonging are constructed by young people with CALD backgrounds in community sport? What social processes facilitate or impede these belongings? And what forms of boundary work are involved in the negotiation of these belongings? It is shown how the kinds of belonging that culturally diverse youth negotiate in sport are multi-layered and situational, and how they intersect with, and are shaped by, broader discourses and processes of social inclusion/exclusion.

SPANNARI, JENNI* (University of Helsinki, jenni.spannari@helsinki.fi)

Compassion – the key to meaningful and decent work

Finding meaning is an increasingly central need and value in the late modern societies – and working life. In the context of 'decent work' the aspect of meaning should not be overlooked, although it is traditionally seen as ambiguous and difficult to define and dissect.

Meaning and sense of significance is most profoundly achieved in compassionate interactions, involving two or more persons or entities. The research project 'CoPassion – the Revolutionary Power of Compassion' investigates compassion in the workplace, on the levels of individuals, communities and organizations.

Compassion is conceptualized in the project as 1) knowlegde and skills, 2) empathy and willingness to help and 3) compassionate deeds big and small, including corporate volunteering. The claim of the CoPassion project is, that focusing on and offering opportunities for compassion has positive impacts on wellbeing at work, work satisfaction, commitment to work, to colleagues, and to the working community, creativity, and through this also new patterns of productivity.

Thus, compassion could be the 'missing link' between micro and macro levels; larger goals of i.e. social sustainability in the organization and the everyday life at the workplace.

Compassion can and will be measured in the project, accompanied by various neighbouring concepts and measures ranging from empathy to meaningful work and work-life balance, from wisdom to spiritual leadership.

This paper discusses compassion in the context of decent work, and presents relevant measures and preliminary results. The aim of this paper is to open up ways of examining compassion as a component of and viewpoint to decent work.

SPENDLOVE, ZOEY* (University of Nottingham, zoey.spendlove@nottingham.ac.uk)

Revalidation Repercussions: Challenging the Power of Enforceable Trust

Publicised health care scandals in the United Kingdom (UK), and subsequent changing attitudes towards healthcare professionals, have provoked public and political calls for the reform of healthcare professional regulation. The recent introduction of 'revalidation', a government led policy of regulatory reform, signifies fundamental changes in the regulation of healthcare professionals. Revalidation represents a shift from embodied trust in professionals to enforced trust (Light, 2010), seeking to govern professionals by means of national and organisational objectives (Evetts, 2012). New regulatory policies, such as revalidation, are noted to frequently challenge professional power and self-regulatory privileges, however controversy remains as to whether such policies do actually shift the balance of power and what the resulting effects of policy introduction would be.

This paper presents primary observational research findings, exploring the real-time implementation of medical revalidation within a UK National Health Service (NHS) organisation, and its impact upon professional power. The national policy of revalidation was subject to the existing governance and management structures of the NHS organisation, resulting in the formal policy process being shaped at the local level by the informal processes of the organisation. This paper explores how the unorganised nature of the organisation seemingly hindered rather than facilitated robust processes of professional governance and regulation, fostering ritualistic rather than genuine professional engagement with the revalidation policy process. Ritualistic professional engagement assisted the medical profession in retaining self-regulatory privileges whilst maintaining professional power over the policy process. Medical professionals were therefore able to directly and indirectly influence the revalidation policy process at the local level, questioning the ability of national regulatory policy to shift the balance of power, and to govern and control professional groups. This paper concludes by challenging the theorisation that professional groups are effectively regulated and controlled by means of national and organisational objectives (Evetts, 2012), such as revalidation.

Bolivian Transnational Families in Barcelona: Institutional Configurations and Care Arrangements

The transnationalization of families has often been conceived as a rational strategy for maximizing opportunities or as a direct effect of structural constraints to migration. From the contemporary debate on social recognition (Honneth & Fraser) our attempt is to contribute to set up an alternative standpoint, that emphasizes the moral dimension of the transnational families, and consequently, of the contemporary international mobility. In this sense, we conceive the transnational families as multi-sited and morally motivated strategies of resilience to face social, legal and economic deprivations, and the care arrangements that they promote as a kind of moral economy (Baldassar & Merla).

The present communication aims to highlight that the arrangement of care in transnational families is a daily and permanent effort of conjugation of partial rights, unstable social statuses and multi-sited family responsibilities, in order to struggle for the achievement of families' conceptions of good life. Therefore, we focus on how the obstacles imposed by welfare and citizenship regimes, and by modes of labor organization, both in origin and destination, interact with the care configurations within the transnational families. In a broad sense, our proposition is to explain the crossing points, through different social scales, between the legal, the productive and the reproductive migrants' worlds.

This article presents the partial results of the doctoral project "Bolivian transnational families in Barcelona and São Paulo: institutional configurations and migrant autonomy" developed with the support of the Coordination for the Improvement of Higher Education Personnel of Brazil (CAPES). Based on family life history interviews (Bertaux & Delcroix) performed in Barcelona, we tried to understand the interfaces between access / deprivation of rights and the different means of labor insertion, both in Bolivia and in Spain, and the care arrangements through the families' history.

SPIEGEL, ANNA* (Bielefeld University, anna.spiegel@uni-bielefeld.de)

Gendered Mobilities, Gendered Cosmopolitanisms: Male and Female Expatriate Managers and Their Accompanying Spouses

In recent management studies expatriate managers have been celebrated as 'global managers', members of a 'cosmopolitan business elite' or as successful 'boundary spanners'. However, most of this research has only focused on the (mostly male) managers without taking into account the role of the accompanying spouses. This paper reassesses the image of the expatriate manager being a cosmopolitan expert by analyzing the gendered division of labor within expatriate couples regarding the everyday activities of enabling, shaping and stabilizing mobility and cosmopolitan lifestyles.

Drawing on 28 ethnographic case studies of German and American expatriate managers in China, Germany and the US conducted between 2011 and 2014, the paper examines two different expatriate arrangements: 1) male expatriate managers and their female accompanying spouses, and 2) female expatriate managers and their male accompanying spouses. We analyze three sets of activities that are crucial for enabling, shaping and stabilizing the entangled mobilities and cosmopolitan lifestyles of mobile managers: 1) activities related to preparing and managing the relocation (mobility work), 2) activities related to building up social networks at the new place of residence (local attachment work) and 3) activities related to maintaining the ties and networks to family and friends at the place of origin or other places of the family's mobile trajectory (translocal attachment work).

Findings indicate that male managers delegate a significant part of these activities to their accompanying spouses, while female managers themselves are forced to assume a significant part of these activities, due to the reluctance of their male accompanying spouses to take over the role as 'family mobility manager'. We thus argue that the cosmopolitanism of (male) expatriate managers is a gendered social position which is highly dependent on the intense informal work of their 'non-working' accompanying wives.

SPIEGEL, ANNA* (Bielefeld University, anna.spiegel@uni-bielefeld.de)

Working in Cultural Contact Zones: Paradoxes in Expatriate Managers' Knowledge Translation and Identity Construction

In recent management studies expatriate managers have been addressed as core protagonists of economic globalization, management and knowledge exchange in Multinational Corporations (MNCs). They have been celebrated as 'global managers', members of a 'cosmopolitan business elite' or as successful 'boundary spanners'. However, large parts of the related literature argue from a strong normative, ethnocentric perspective and lack a sound empirical foundation. This paper reassesses the image of the expatriate manager being a cosmopolitan boundary spanner by exploring processes of identity construction and knowledge translation taking place at transnational corporate offices of MNCs from an ethnographic perspective.

Drawing on 28 ethnographic case studies of German and American expatriate managers conducted between 2011 and 2014 in China, Germany and the US, the paper argues that corporate offices are cultural contact zones where negotiations on both the cultural identity of the company and of its individual members take place. We suggest connecting the question of knowledge translation with the analysis of identity construction at the local office level, as the ways how knowledge is transformed, negotiated and translated depend very strongly on how the local 'Other' is perceived by the mobile expatriate managers. The paper, therefore, examines: 1) expatriate managers' interactions with local colleagues, 2) their perceptions of and strategies in dealing with local work practices, and 3) the cultural identity they display in the organization of their office space.

Findings indicate a variety of different modes of symbolic management and knowledge translation ranging from attempts to displace host country work and cultural practices from the office space to visions of creating cosmopolitan office spaces that integrate diverse cultural meanings and knowledge repertoires. Our findings suggest that expatriate managers' practices transcend the polarized images of mobile elites as either cosmopolitan 'global managers' or parochial anti-cosmopolitans.

Trends and Cycles. the Dynamics of Party Membership in the Multi-Level System of Germany, 1991-2015

Political parties in most Western European countries have declining memberships. While this well documented general trend has received considerable academic attention, with various macro-level theories like value change, new modes

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

of participation or declining political trust being put forward to explain this secular phenomenon, little is known about the trajectories of individual parties. Despite a general trend, political parties should be able to recruit and retain members under specific meso-level conditions we would like to examine in the proposed paper: Is there any evidence of a mobilizing effect of local-, state- and/or national-level elections, like an electoral cycle influencing the development of party memberships? Or is membership dependent on the popularity of a specific party, gaining or losing members in a bandwagon effect as their support in the electorate changes? Finally, does it make a difference for recruitment and retention if a party is in government or opposition?

Analyzing these conditions in a multi-level system like the Federal Republic of Germany allows us to address meso-level explanations in a most similar cases design, holding constant potential socio-cultural, political-institutional or economical differences, while substantially enlarging the number of cases. Applying a three level hierarchical model, we want to analyze the membership development of 5 established parties in the 16 states of Germany over a period of 25 years in this paper using a balanced time-series cross-section dataset of 2,000 observations. The dependent variable is the member/electorate ratio of a state party indicating its relative membership strength. While controlling for the general trend of declining party memberships we should be able to test various party- and state-level explanations for gains and losses in membership strength with this multi-level approach.

Behind Methodological Nationalism? How to Analyze Migration and Social Mobility in Biographical Research

In the age of globalization migration and social mobility constitute major challenges for qualitative social research and particularly for the implementation of biographical approaches. The subjects of research are people that are not only located in one (home) context, but rather move between different contexts. These contexts are affected by different discourses and therefore promote or require different narratives.

When analyzing a specific biographical narration of social mobility these contexts and discourses are to be considered. Equally, I as a researcher have to be aware of my own context: Within which discourses am I involved? Which hypotheses am I using when interpreting a biography? Where are blind spots of my own research?

The paper discusses biographical research in transnational contexts exemplified by a biographical narration of a young woman that migrated from Kazakhstan to Germany. On the one hand, this theory deals with the influence of discourses on biographical narratives and, on the other hand, with the researcher's interpretations. Furthermore, transnational, postcolonial, and intersectional approaches are important in this context. The questions that therefore arise are as follows: How can we reconstruct different positions within intersectional discourses? How can we work with multiple belongings and the becoming at the intersection of different social contexts (and therefore of different discourses)? And, lastly, how can we avoid the criticism of methodological nationalism in the age of globalization?

RC12-154.2

SPINA, FERDINANDO* (University of Salento, ferdinando.spina@unisalento.it)

Legitimation of Jurisdiction in an Age of Disssent

The contemporary legal landscape is marked by a heterarchical and poly-contextual law that has lost its unity and centrality with respect to other social spheres. In this context, the foundational principles of justice are increasingly fragile. Courts seem no longer able to ensure either formal or substantial justice. Moreover, jurisdiction is no longer immune from criticism, controversy and dissent. Indeed, it appears that *in*justice, whether presented as miscarriages of justice, judicial errors (due to subjectivism, politicisation, incompetence) or unfair trials (for example, trial by media before a case is heard in court), is now no longer the exception but the norm.

These phenomena are clearly visible in the case of Italy, which, as is well known, has some unique characteristics in terms of the organisation, autonomy and power of the judiciary. In addition, the administration of justice in Italy is characterised by inefficiency and uncertainty (the excessive length of proceedings, the large number of judgments overturned on appeal) and is consequently viewed with a high level of distrust by citizens and companies. In Italy as in other countries, therefore, the urgent constitutional problem is to balance the autonomy of the judiciary with its social responsibility and need for legitimacy.

The paper will explore the paradoxes of this scenario, based firstly on the seminal study by Luhmann of legitimation through procedure and secondly on the recent theoretical and empirical developments arising from the emerging "functionalism of links" approach. In this way, it will evaluate the drivers of change occurring in both formal and the material constitutions, the effects of which,

however, may also be dysfunctional with respect to the control and correction of injustice.

Orienting Teachers to High Stakes Data: The Increasing Role of Edubusinesses in Schools

The rise of major edubusinesses such as Pearson and multi-national entities such as the OECD are increasingly the focus of academic attention. Large-scale testing is often used to manufacture educational crises that create opportunities for those who are offering a "magic cure"(Taubman, 2009). The emergence of private-public networks (e.g., Hogan, 2014) demonstrates the links between high-stakes testing, accountability and edubusiness networks. However, less is known about how this phenomenon is orchestrating what occurs at the local level. This paper explicates how assessment products produced by edubusineses are now embedded within schools, and are central to teachers' work. Research data is drawn from two Australian schools – a primary and a secondary school – where teachers were interviewed about their use of various forms of data. What was common across both schools was a reorientation of teachers' work towards the production and analysis of student achievement data, most commonly in basic skills literacy. A somewhat surprising finding was the proliferation of proprietary products that were used at both schools to assess students, but which were all oriented towards school improvement on large scale national testing. This work is coordinated by the temporal demands of testing, and fills teachers' time with work that is oriented towards the demands of high stakes testing. This requirement to collect increasing amounts of data ignores the fact that ultimately, time is finite. The "rhetoric of quantification" (Porter, 1994) did not always provide opportunities to improve the quality of curriculum and pedagogy, rather in bracketed out significant amounts of time that might otherwise have been spent on producing context-specific and engaging pedagogies. When edubusinesses become entwined with high stakes testing, practices within schools are constrained, and restrict time available for teachers to address disadvantage, social justice or provide a curricula that extends beyond basic literacy and numeracy.

SPINA, NERIDA* (Queensland University of Technology, n.spina@qut.edu.au)

Ruling Relations in Hyperactive Times

The rise and rise of high stakes testing has created education systems that are "governed by numbers" (Ozga, 2008). In this data-driven educational landscape teachers are often positioned as "data-illiterate" and "data phobic". Using an institutional ethnographic approach, this research began by investigating how teachers at one Australian school work with educational data in their everyday doings. In contrast to media accounts, this study reveals teachers have long histories of working with data, and are not averse to doing so. Teachers' resistance to data is complex and often the result of a disjuncture between embodied knowledge and the "rhetoric of quantification" (Porter, 1994) that presents data as an objective measure promoting excellence and equity. In this paper I explore this disjuncture by examining the local effects of a state government policy, "Great Results Guarantee" that ties school funding to educational data. As educators at the school activated this "ruling text" (Smith, 2002), chains of events were unleashed that rapidly reorganized teachers' work. Central to this reorganization was the "acceleration of time" (Rosa, 2010) as the policy was released to schools and enacted within days. The hyperactive and mediatised policy environment in which the ruling text was created increased the pace and frequency of data collection at the local level, as teachers went about producing data that would "guarantee" improvement in less than ten months. This accelerated pace of work and orientation towards numbers was ultimately orchestrated by a ruling text that would enable the government of the day to make media claims about school improvement within a year. At the local level, the creation and use of "funny numbers" as evidence (Porter, 2012) was challenged by the principal and teachers who struggled to find ways of gathering and using rich sources of evidence to "guarantee" more responsive and socially-just pedagogies.

"Buy This One!" Migrant Beer Sellers in Southeast Asia

Migrant women working in service and care industries are engaged in some of the most precarious and burgeoning sectors of the global labour market. One understudied group of female service workers are primarily rural-to-urban migrants who work in the cities, towns, and beach resorts of Southeast Asia as beer sellers. Wearing uniforms—often a tight-fitting dress or short skirt adorned with a prominent beer logo–migrant beer sellers are employed in a range of venues from

restaurants and bars to special events and private clubs to generally promote a particular brand of international, regional, or national beer. Working primarily on commission, migrant beer sellers are thrust into competition with other young women for the attention of and sales by their customers.

In this presentation I draw from a participatory research project with migrant beer sellers in the capital cities of Thailand, Cambodia, and Laos that examines the intersections of gender, work, and health. I begin by outlining the journeys of migrant beer sellers from rural villages to urban centres, primarily at the behest of their increasingly dispossessed farm families, and describe how their social location is further complicated by globalized notions of beauty, which influences where they will be inserted into the variegated and hierarchical beer promotion industry. Although routinely subject to stigmatization, harassment and abuse, many women feel empowered by their earning capacity, distance from family, sexual expression, embrace of modernity and consumerism, and solidarity with other migrant beer sellers. I will situate these observations within the ways in which precarity is generated, resisted, and subverted across dimensions of: space (global, national, urban and rural); gender (roles, identities, and performance); and neoliberal globalization with its impacts on rural livelihoods, available economic opportunities, consumerism, hegemonic ideas of beauty and the creation of desires.

Assessing the Impact of the Smart Policing Initiative: "Hotspot" Neighborhood Saturation, Urban Disorder and Crime Prevention

Las Vegas, Nevada is a unique urban metropolitan area with the second highest official violent crime rate in the U.S., following only the District of Columbia. This study assesses the impact of a neighborhood crime prevention strategy implemented in urban communities across the metropolitan area. The Smart Policing Initiative project, supported by Grant No 2011-DB-BX-0022 from the U.S. Department of Justice, was implemented between 2011-2013 in partnership with the Las Vegas Metropolitan Police Department (LVMPD) and sociologists at the University of Nevada, Las Vegas.

The project was the first to examine high-crime and disorder in "hotspot" urban communities using a mixed methods data collection approach. Splitting the 24 highest crime hotspot neighborhoods into experimental and control groups, LVMPD employed a "saturation" treatment for rolling 60-day periods, involving extensive police presence and community involvement. Our data collection included prior/during/after treatment measures (and comparison of treatment to control group neighborhoods) of official crime reporting, as well as a community survey administered to 1,005 residents across six treatment and six control group neighborhoods.

Results suggest that police saturation as a preventive strategy for neighborhood crime and disorder may present challenges and unintended consequences. Crime reporting was reduced, but inconsistently, and some criminal activity may have been displaced to adjacent neighborhoods. Reporting of some offenses actually increased, possibly due to increased presence of law enforcement and heightened police-citizen interaction. Additionally, resident survey respondents in the treatment neighborhoods tended to perceive higher levels of crime, fear/safety, and disorder, as well as more negative perceptions of police. We discuss these results in the context of a possible "backfire" effect associated with policing solutions for public order maintenance in urban communities.

The Market for Sexual Leisure: Social and Attitudinal Deviance Among Customers of Legal Nevada Brothels and the Intersection of Leisure and Sexuality

This study examines the intersection of leisure, gender and sexuality in the consumption of sexualized adult entertainment, specifically legal prostitution in Nevada Brothels. Although many anti-prostitution policies target clients, few studies actually examine these consumers. While some prior research has compared social/demographic characteristics of men who have paid for sex with those who

have not, these studies rely on samples of arrested "johns," or general survey samples that do not specify the type of consumption (e.g., legal brothel, street prostitution, escort service). We conducted an online survey of "hobbyist" groups and individual clients of Nevada's legal brothels to gather clients' demographic information, consumption patterns, general attitudes and interests, and history of behavior with both legal and illegal adult industry commerce. As of September 30, 2015, the survey has 134 responses. We adopt questions from the National Opinion Research Center's General Social Survey (NORC-GSS) to compare client and non-client attitudes toward women, risk-taking and thrill-seeking behavior, and neoliberal attitudes on individualism and self expression. We are thus able to compare respondents' consumption across these dimensions and answer questions about the motivations for seeking sexual services, as well as whether legal brothel customers are also likely to patronize illegal services. Preliminary findings indicate that some clients do not seek sexual activity when purchasing time with a brothel worker, others are women and/or visit as couples, and some only engage in visits to brothels as part of travel to Las Vegas, Nevada for other leisure purposes. This study promises to say much about the ways the mainstreaming of the sex industry, changing values of leisure consumption, and the legality of prostitution can impact the construction of gender and sexuality in neoliberal consumer culture, particularly the construction of consumer masculinities.

Between a Rock and a Hard Place: The Role of Leisure as a Map for a Better Future

We live in uncertain times, with an uncertain future ahead of us. If the policies associated with neo-liberalism and globalization continue, we will live in a dystopian world more frightening than those imagined by the writers of science fiction: a world of gross inequality, poverty and environmental catastrophe. But the future does not have to be like this. There have been counter-hegemonic movements lined up against the dominant mode of capitalism for many years, seeking to resist, de-centre and re-align the social, cultural and material world. In this paper, I want to explore the importance of leisure as both a space and a cultural practice in these uncertain times. I will use theories of leisure from ethical and political philosophy, as well as the sociology of leisure, to show that leisure has the potential to be a shelter for humanity in the mobile, commodified world we live in. I will draw on examples as far apart as rugby league, rock music and hill-walking to show that it remains possible to be communicatively free in leisure spaces, but such freedom is hard-won, and subject to co-option and constraint by the instrumental power of capitalism. To be part of the project to build a better world, leisure spaces and need to be continually defended by those inside them, while at the same time those spaces need to offer room for constructing inter-cultural alliances.

The Futures That Subjects Could Want

The futures that subjects could want
After a long period of blackout, subjects and subjectivities are back in sociological discussion. Subjects could not become actors because of the lack of a principle of conflict. Nevertheless, systematic references to the phenomenological tradition or to the late work of Foucault are rare.The analysis of subjects and subjectivities must be situated in the contemporary society. The (autonomous or heteronomous) mobilization et conjunction of subjectivities in a given situation lead to the (auot)construction of subjectivity and objectivations forming their situation. As the call for papers points out, we live in a very contradictory world. It is not what it pretends to be; it is non-identic (Adorno). The acceleration of the production of this society is well known as well as the fact that the world governance tries to manage this world. People and citizens have no big influence, and they know it. This situation came up, inter alia, because people consent to this development. Subjects didn't choose it in a conscious and reasoned way but their subjectivities a highly mobilized. So they are alienated; future is uncertain, unpredictable and for theses reasons, it is agonizing, particularly because this word is in an "erosion crisis".

The fight for "the future they want" could be the process of constitution of subjects disposing a great and creative subjective autonomy.

In our paper we ask if he Weberian conception of "elective Affinities" (borrowed at Goethe) can help us to overcome more philosophical or psychological interpretation of subjects and subjectivities in a sociological way and to understand the reasons for which these "affinities" grow up and form a symbiosis: a new collective subjectivity that can make coming out new social relations, it means the future.

The Spatial Reorganisation of Elder Care in a Transnational Setting: Experiences from Kerala, India. Sreerupa.Pillai@Gmail.Com

Recent research carried out on transnational migration has shown that along with the lives of the global migrants, the lives of those who remain at the source areas of migration are also being transformed. In the context of the increasing spatial dispersal of family members across the globe, and the distances separating them, the paper examines the spatial and temporal reorganisation of care for the older persona staying behind. The paper examines the spatiality of care provisioning while exploring how care travels across space and time. Further issues of gender, class and caste are also addressed while examining the reorganisation of elder care. The paper engages with these issues in an empirical setting in Central Travancore, Kerala, India; where there is large scale migration of younger generation and an intensification of ageing among those staying behind. In-depth interviews and narratives of middle and upper middle class older Christians, their caregivers and observations about their care arrangements provide the empirical material for the study.

Young Cyborgs? Youth and the Digital Age

Most literature relating to youth and technology is devoid of nuanced or critical theory. The majority of scholarship is related to the use of digital media, the trends in growth of use, and/or the ways in which technology will liberate and save youth and education. We find this work inaccurate and inadequate in understanding the range of meanings and impacts of technology on young lives over time. This paper examines interdisciplinary theoretical understandings of technology and its influence on young lives. We briefly examine global use and trends, then examine the meanings of these trends and provide an analysis. We ask: What does the current digital technological project look like? How does it actually matter to modern youth? We provide theoretical and methodological direction to illuminate the deeply dichotomized and paradoxical understandings of youth in the digital age. We interrogate dismissive and/or utopian adult, business, marketing and state-centric responses to youth and digital technology that claim its necessity and desirability *for* youth. We do so within the confines of empirical work with youth and in the contexts of social, economic and political phenomena that comprise technology's place in young lives.

The Woman's Gharana: Social Capital Formation in the Indian Performing Arts

This paper examines the well-known institution of the *gharana* through the conceptual lens of social capital in order to bring out the special features of the Indian performing arts and their 'informal' contribution to the economy as a whole. Historically, the *gharana* system drew upon the symbolic discourse of family–based joint house holding systems familiar to the sub-continent, to take on the functions of art education, credentialing and trade organization, producing economic value not only for individuals but for the larger community as well. Bourdieu's understanding of the titled or powerful family as the ideal typical source of social capital the paper argues, can be extended through the *gharana*, to include the technically accomplished or skilled family. In the Indian context performing artists did not belong to the elite but were usually from a lower even despised section of society, needing patronage and protection from the king.

Even under the modern state, cultural capital remained embedded in the informal service economy. The training organization of the traditional performing arts of India did not fall under the purview of westernised, English education. The methods of transmission of musical techniques in the *gharana* remained oral, from senior generation to the younger, embedded in an overall context of eating and living together under the same roof. This privileged the social capital born of communication and participation amongst members of the same *gharana.*But by that same token, it kept non-initiates out.

It would be wrong however to view the *gharana* system as made up of mutually exclusive guilds, which jealously guarded their techniques as monopolies and were mistrustful of all others. The paper will take up with examples, the significant role played by women in "bridging" and "bonding" to create networks, making the *gharana's* capacity for social capital unique.

Festivals, Events and Family Well-Being – Short-Term Happiness, Long-Term Quality of Life?

Festivals are considered a 'time out of time' (Falassi, 1987); they hold a unique ability to entertain, educate, hold aesthetic value and provide a platform for escapism through the creation of an often unique event experience. The short-term, yet very intense nature of festivals and events produces 'liminal' experiences for participants which lead to the feeling of oneness and being part of the community. These concepts, alongside questions of socialisation, bonding and family togetherness, have been widely explored in festival and event studies, but research on the impact of event attendance upon family well-being, happiness and quality of life (QOL) is limited. Agate et al. (2009) argued that engaging in leisure activities, such as attending a festival or event, can enhance and improve family relationships and a healthy family life – important elements of family QOL. It is thereby not necessarily the amount of time that families spend together engaging in leisure activities, but how meaningful these are to individual family members and the family as a whole. This paper explores the short-term or 'present moment' happiness which can be achieved through festival attendance and poses the question of whether short term attendance and happiness can lead to long term well-being and family QOL? Data from focus groups and in-depth interviews with families in Hertfordshire, U.K., is analysed with regards to changes in perception of family QOL pre and post event attendance. The different phases of anticipation, attendance, liminality and flow and their impact on family QOL are also discussed.

'I Tend Not to Take Things Too Seriously': Australian Men's Conceptions of Their Futures

The *Life After School* Research Project documents the experiences, subjectivities and identities of sixteen Australian young men in their first year of non-compulsory schooling. Through focusing on young men's masculine identities in a time of transition and liminality – the post-school year – we explore how our participants negotiate their current identity work with both social and learner identities, and conceptualize their futures. This paper draw son data from early interviews where the boys discussed what was important to them in terms of their future, their conceptions of success, how they negotiated pressures and potential challenges/barriers the foresaw in the post-school year. We are interested in the subjectivities these young men present as well as the various identity negotiations as they come to understand their future trajectories. We argue that the university space, which contributes to the production of identities that are both continuous and simultaneously discontinuous, is a site where these young men engage in identity performances. While a range of subjectivities are presented we identify some commonalities in masculine identity formation, specifically how many of the participants present a subjectivity of 'easy-going'. Investing in this 'relaxed' social identity allows for negotiating risks around potential academic failure and is in line with a 'wait and see' approach to their futures. On the other hand the conditions of higher education – with intensified individual competition – creates new imperatives for strategizing to desired futures. We explore the dynamic tensions between these two orientations.

Is Migration from Central and Eastern Europe an Opportunity for Trade Unions to Demand Higher Wages? Evidence from the Romanian Health Sector

Industrial relations scholars have argued that east-west labour migration may benefit trade unions in Central and Eastern Europe. By focusing on the distributional aspect of wage policies adopted by two competing Romanian trade unions in the health care sector, this article challenges the assumption of a virtuous link between migration, labour shortages and collective wage increases. We show that migration may also displace collective and egalitarian wage policies in favour of individual and marketized ones that put workers in competition with one another. Thus, the question is not so much whether migration leads to wage increases

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

in sending countries, but whether trade unions' wage demands in response to outward migration consolidate collective solidarity and coordination in wage policy-making, or support its individualization and commodification.

Buddhist Buildings in England: Conserving and Constructing Heritage(s)

In this paper, we investigate the ways in which Buddhist communities in England interpret their religious heritage through an analysis of the buildings they inhabit. Buddhism is a growing religion in Britain, and Buddhist centres and temples are becoming an increasingly common sight, particularly in urban areas. Many Buddhist communities have chosen to renovate old, and often dilapidated, buildings (many of which are 'listed' as architecturally significant). These include a Victorian Fire Station, a Court House, stately homes, a former convent, and an industrial factory. Drawing on data from the first national survey of Buddhist buildings in England which we conducted with English Heritage, we argue that Buddhists in this context engage in a dual process of heritage building. In this process, which is both conscious and unconscious (and indeed, varies between groups), Buddhist communities adopt decorative styles and building functions imported from outside of England but also seek to preserve an 'English' aesthetic in their sympathetic adaptation and preservation of buildings. We argue that Buddhist communities in England are deliberately *constructing* a 'new' Buddhist heritage for England but at the same time, they are *conserving* an English past, which has wider public benefit beyond the Buddhist groups themselves. Whilst the idea of the adaptation of Buddhist practice to various global contexts has been well documented by scholars, we offer a novel way of examining this phenomena, as the built environment is a neglected area in studies of Buddhism in the West. Furthermore, this ongoing process of conservation and construction is, in fact, part of Buddhist practice for many of these communities, who view the difficulties in adapting old buildings as a means to promote mindfulness and community cohesion. Heritage is, in this context, a material thing that can be observed and preserved, but is also a living religious practice.

Religion: Protective or Risk Factor for Victimization Risk of Juveniles?

Research on juvenile delinquency is broad. Factors such as the family, peers, the neighborhood, but also individual traits have been found to be important players. According to the routine activity approach, spending most of the leisure time with friends outside of the home can be seen as a risk factor, because there are more possibilities to commit a crime. Conversely, spending time with the family or within an institutional context can protect from becoming a victim of a (street) crime. Additionally, according to social control theory, social bonds such as the involvement into the family, the involvement in conventional activities, or the belief in moral rules protect juveniles from becoming involved in criminal activities. One not well researched factor affecting all mentioned levels is religion. Belonging to a religious community, as well as the personal importance of religion can act as protective factors through staying away from risky route activities. At the same time, religious beliefs might attract victimization such as hate crime.

This paper takes an explorative look at the links between religion-related variables and types of victimization. Based on data of the newest wave of the International Self-Report Delinquency Study (ISRD3), Finland and Switzerland will be compared.

STEBBINS, ROBERT* (university of calgary, stebbins@ucalgary.ca)

Hedonism, Eudaimonia, and the Serious Leisure Perspective

Waterman (1993), in reviewing some of the modern literature on eudaimonism, describes it as an "ethical theory." Its practical message is that people should recognize and live according to the *daimon*, or their true self (Norton, 1976). The theory is ancient, with roots at least as far back as classical Hellenic philosophy, including Aristotle. Waterman's discussion shows clearly the import of eudaimonism for the serious leisure perspective (SLP):

The *daimon* refers to those potentialities of each person, the realization of which represents the greatest fulfillment in living of which each is capable. These include both the potentialities that are shared by all humans by virtue of our common specieshood and those unique potentials that distinguish each individual from all others. The daimon is an ideal in the sense of being an excellence, a perfection toward which one strives and, hence, it can give meaning and direction to one's life. Efforts to live in accordance with the daimon, to realize those potentials (self-realization), give rise to a condition termed *eudaimonia.* Such efforts can be said to be personally expressive of the individual.

It is during their serious pursuits that leisure participants are eudaimonic, are living according to the daimon. Casual leisure activities, which are hedonic, have a dramatically different appeal. The third form constituting the SLP -- project-based leisure -- is also eudaimonic, but significantly more weakly so than the serious pursuits.

We consider the SLP, showing how eudaimonism and hedonism are experienced in modern leisure. A treatment of the relationship of the SLP to well-being rounds out the paper. Here I use the concept of optimal leisure lifestyle to show how all three forms of the Perspective can contribute to personal well-being. That is, both eudaimonism and hedonism are important ingredients in the recipe for a life of lasting happiness.

Nonwork Obligation: Its (often troublesome) Place in the Study of Leisure

Starting with my book on positive sociology – *Personal Decisions in the Public Square* (Stebbins, 2009) -- I have been analyzing leisure life according to three domains: work, leisure, and nonwork obligation. The third of these is a new concept in the social sciences, even while it has been recognized since time immemorial in such commonsense terms as "chores," "duties," "pains" (in the neck), and "hassles." This domain is the classificatory home of all we must do that we would rather avoid that is not related to work (including moonlighting). To be sure certain obligations have been studied, particularly in the present, in spheres where they are notoriously contentious, namely, housework, do-it-yourself, and parents' facilitation of the school and extracurricular activities of their children. But the academic literature in these areas has little to say about the history of such activities or about them as constituting a special domain in modern life.

Yet, nonwork obligation as a domain of life absorbs a significant amount of time that could otherwise be dedicated to work or leisure interests. Moreover, in the face of widespread understanding of the concept of nonwork obligation, both leisure and work are sometimes confused with it, in both commonsense and science. Volunteering exemplifies well this problem, as does, for some people, doing health-promoting exercises and routinely shopping for groceries. Bringing nonwork obligation into our sights in leisure studies can help us sharpen our understanding of both domains. It will also help us sharpen our leisure education as it bears on work-life balance by examining where and how in this third domain participants might abandon disagreeable activities to find more time for leisure (serious, casual, project-based). One fruitful approach to cutting back on nonwork obligations lies in the program proposed by the voluntary simplicity movement.

DELHEY, JAN* (Otto-von-Guericke-University Magdeburg, j.delhey@ovgu.de)

Revisiting the Spirit-Level Theory: It's Competition, Not Inequality

The Spirit Level Theory by Wilkinson and Pickett (2008) explains differences in social problems among rich societies by levels of income inequality. According to this theory, inequality plays out negatively for everybody because it creates widespread status anxiety - a psychosocial response to an individual's (low) status in society.

Spirit-Level theory has been rightfully criticized for focusing too much on income inequality, ignoring other contextual conditions as potential triggers of status anxiety. Our article will therefore focus on this first part of the Spirit-Level equation: linking structural causes to status anxiety.

As a first step we review the relationship between various contextual inequalities, country affluence, and status anxiety. In a second step we broaden the Spirit-Level framework further by examining our alternative hypothesis that status anxieties are driven by how competitive societies are organized. We present two different approaches to measure this competition orientation, Selfish Capitalism (James, 2009), which emphasizes the organization of the economy and labor relations, and the Experience Society (Schulze, 1992), which emphasizes the spheres of consumption and leisure (as a mirror-image of competition).

We use data from the 2011/12 European Quality of Life Survey on 34 countries comprising more than 40,000 individuals. Applying a two-level-design we examine direct and indirect effects of the four main macro indicators on individual status anxiety. Our results clearly indicate that status anxieties are not "automatically" caused by inequality, but rather by a strong societal emphasis on competition:

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the more a society resembles an Experience Society, the less citizens are plagued by status anxiety.

DELHEY, JAN* (Otto-von-Guericke-University Magdeburg, j.delhey@ovgu.de)

The Good Life, Affluence and Self-Reported Happiness: Introducing the Good Life Index and Debunking Two Popular Myths

This paper examines the highly controversial question: in the richer parts of the world, is people's quality of life (QOL) enhanced by national prosperity? It is based on a novel concept, the 'elements of the good life', as sketched out by Skidelsky and Skidelsky in 2013. This new concept focuses on life results in seven domains: health, security, friendship, respect, leisure, personality, and harmony with nature. Our article refines the original concept and suggests, for the first time, a way to measure the well-being of individuals, based upon our development of the 'good life' approach in a lean and effective way. The resulting *Good Life Index* enables us to not only measure how well life is going, but also to test two key assumptions Skidelsky and Skidelsky (2013) hold about the relationship between affluence, the good life, and self-reported happiness. These assumptions are that affluence is, at best, unrelated to the good life and, at worst, is harmful, and that people report being happy mostly for other reasons than the ones embodied in the elements of the good life. By analyzing data for 34 European countries from the most recent European Quality of Life Survey (EQLS) within a multilevel framework, we can show that both assumptions are wrong: Europeans' QOL is better in wealthier societies, and they are authentically happy. This falsification, however, does not impair the usefulness of the good life approach as such, which helps to generate new and valuable insights into human well-being.

Civic Engagement As Biographical Work and Contribution to Mental Health

This contribution is based on results of my completed PhD thesis. It deals with life histories and stories of people who grew up and were socialised in the former German Democratic Republic (GDR), and suffer from mental illness. The reconstruction of these biographies (following Rosenthal 1995) as well as their respective biographical experiences provides the opportunity to investigate the processes of pathogenesis and salutogenesis. The case reconstructions give further insights concerning the socialisation in the GDR as well as the social transformation after 1989 – with reference to both mental health/illness as well as civic engagement. The contribution highlights the importance of a diachronic perspective in order to avoid partial and individualised views of pathogenesis and salutogenesis. In addition, it demonstrates the potential of resource-oriented studies in this field of research.

I will present selected biographical courses as well as effects and conditions – both adversely and resilient. In this regard, the ambivalent role of the families is one of the discussed issues. The familial position of the interviewees and their experiences of demotion, stigmatisation, and loss were major drivers of the pathogenesis. On the other hand, families are as well resources of cultural and social capital (Bourdieu; Putnam) for civic engagement.

I will illustrate to what extent the social conditions in the GDR potentially could stabilise people – for example through opportunities of employment and engagement – and how the transformation after 1989 led to adverse and insecure experiences. However, at the same time, the installation of democratic structures provided alternative opportunities to treat adverse and stressful life experiences. In particular, different sectors of civic engagement provide opportunities for biographical work. Summarising, I will show the perspectives and limitations for recovering mental illness under the conditions of ongoing familial dynamics, available networks, other resources, and new problems of action.

STECKLUM, HEIKE* (University of Göttingen, stecklum@gmx.de)

Social Inclusion of Mentally Ill Persons from the Former German Democratic Republic (GDR) By Means of Civic Engagement

There is a worldwide agreement about the importance of gainful employment for social inclusion. The loss of employment or the exclusion from it can be based on mental problems which, in turn, may lead to further unemployability. This contribution illustrates the role and function of civic engagement in this context, using biographies of mentally ill persons from East Germany as an example. These results are based on biographic-narrative interviews and case reconstructions (following Rosenthal 1995), performed within my completed PhD work.

In the former GDR, the interviewees were employed based on the right to work by law. In case of mental illness they were re-integrated into employment. Because of the closely linkage between the acquisition context and social institutions they usually were members of organisations, parties and/or engaged otherwise. This social inclusion was a normality or implicitness for them. The findings of my biographical case studies show, in which way gainful employment and civic engagement represented an important and protective framework for people with adverse experiences and stigmatisation in their socialisation.

As a consequence of the social change after the German reunification, the former inclusion became insecure and some interviewees got jobless. These experiences highly effected the clinical manifestation of mental illnesses of persons which were healthy until then. The diachronic perspective on the life and family stories revealed the interdependency between experiences made before 1990 and during the social transformation.

For what concerns the action strategies of the agents, I will highlight the importance of their socialisation and former experience of inclusion – particularly with regard to resources, competences, and continuing orientation on the framework of employment. At last I discuss chances and limitations for inclusion in various forms of work in society under the conditions of stigmatisation and psychiatric experience.

Education to Work Transitions By Detours: The Experiences of Young Spaniards in Germany

Spain and particularly its young population are still suffering from the consequences of economic crisis. Youth unemployment is around 50% and pressurises a whole generation. A strained labour market results in a massive exclusion of young people who have just accomplished their vocational training or their university degree and seek to either entry or establish in the labour market. Therefore, a growing part of young Spaniards seeks for better opportunities in other European countries.

In theory, three context factors create a perfect situation for successful migration from Spain to Germany: Firstly, there's demand in the German labour market. Secondly, formal barriers are low according to the fundamental freedoms of the EU. Thirdly, young skilled migrants exhibit ideal profiles for being integrated socially as well as in the labour market. But, in practice, a significant number returns to Spain within one year.

What happens in Germany? What kind of challenges do these young Spaniards experience? That is the crucial question we seek to answer in our presentation. In 2015 we conducted 30 qualitative interviews with Spanish nationals who were born between 1980 and 1990 and came to Rhine-Main Region in 2014 or 2015 for job reasons. The interviewees explain their motives and causes, also by drawing attention to their respective initial situation in Spain. They present and interpret the status passages of their professional development in transition between education and work, as well as the process of social integration. We found that pathways of coming to Germany can be quite different including their strategies and demands of social and labour market integration. Although belonging to an integrated social space like the European Union, perceptions of being "migrants" or "just being mobile" differ substantially. We can learn from their perspectives how Europe is performing in creating opportunities for futures we want.

The Rise of a New Populist: Monica Macovei's 2.0 Electoral Campaign

The case of Romania can be very useful in understanding the manner in which populism arise and grow strong in the nowadays post-communist part of Europe. Romania's late and biased modernization, its fast and forced industrialization in the communist period and its traumatic and resentful transition to democracy established a tradition of successful populist parties, before, during and after the communism.

The main question of our research is to what extend new media, and especially Facebook (the most influent social network in nowadays Romania), contribute to the coagulation of this centrifugal movement and concur to the spread of its ideology. We will try to answer this question by analysing the populist futures of Monica Macovei's electoral discouse of Facebook, during the presidential campaign in 2014.Our intention is to emphasise the ubiquity of the populist discourse, its ability to adapt to the new media and its capacity to engraft popular discontent.

The gap of information that this paper is willing to fill it refers to the (re)invention of populist movement in the new media public sphere and to deconstruct the mythology structure of this type of discourse. The methodology employed will be text analysis; the corpus will consist in Facebook posts of Monica Macovei official Facebook page during the electoral campaign.

Heterogeneous Effects of Youth Unemployment on Well-Being

It is well-known that job loss and unemployment depress the subjective well-being and mental health of those affected with long-term scarring effects especially in the case of youth unemployment. The causality of such effects has been confirmed by a (small) set of longitudinal studies. Although the consequences of unemployment on well-being and health have been extensively researched, the available work has paid only limited attention to the question of whether unemployment has different effects on different groups of people. This paper draws on original data collected in the frame of the *JuSAW Study* that focuses on young adults (ages 18-28) who have become unemployed in Vienna in the 2nd quarter of 2014, when they were recruited at the AMS (public employment services) to take part in wave 1 of a panel survey (inflow sample into unemployment, N=1,246). One year later (2nd quarter of 2015) the same sample of young adults was re-interviewed (wave 2 of the panel survey). Using the cross-sectional data we test 1) whether past unemployment shows scarring effects on present well-being, 2) whether subjective employability plays a protective role, and 3) whether such effects vary between socio-economic groups (by sex, education, work values, and personality). Using the panel data, that have been merged with high-qualtiy register data, we test the causality of effects focusing on 1) the effect of unemployment duration and 2) the effect of re-employment on subjective well-being and health.

STEINHARDT, ISABEL* (INCHER Kassel, steinhardt@incher.uni-kassel.de)

The Connection of the Habitus of Pictures and Habitus Awareness of Teachers

Pictures are getting more and more important for teaching and learning. This requires the competences of teachers to select an adequate picture to fit the content. In addition, a teacher needs to anticipate the possibly multiple approaches to interpreting a picture by students. The interpretation refers to symbolism, hidden cultural meanings, atheoretical knowledge (Mannheim 1982) etc. contained in a picture, which are amalgamated to the habitus of the picture. Sociology has developed methods like the "documentary method" (Bohnsack 2010) and the "segment analysis" (Breckner 2007) to analyze and interpret the habitus of a picture.

In this presentation I will argue that the methods will have to be developed one step further to including and recognizing the influence of habitus and conjunctive space of experience (Mannheim) of interpreters – both of students and teachers. Methods driven interpretation is supposed to generate inter-subjective results but even when taught how to use the methodology rigorously, habitus and conjunctive space of experience of students and teachers affect the outcome of an interpretation. For example, in a seminar students of sociology and teacher training were taught how to analyze pictures by the methods "documentary method" and "segment analysis". For this purpose, adverts are particularly suitable because they are generated to address specific target groups (Sinus-Milieu 2015). Depending on the conjunctive space of experience students did recognize c-list celebrities. But the interpretation of the advertisement-picture containing the c-list celebrities depended on habitus differences of the students (additionally, the interpretation of pictures by students reveal the habitus of students).

In the presentation a newly developed methodological framework for picture selection and use by teachers will be outlined. The framework aims for generating habitus awareness of teachers who have to take into account the habitus and conjunctive space of experience of homogenous and heterogeneous groups of the students.

Mobilizing within Networks of Solidarity: Resource Mobilization and Embeddedness of Refugee Activists in Local Solidarity Networks in Berlin, Germany

The last decade has witnessed an explosion of refugee and refugee solidarity activism in many European countries, including Germany. Since 2012, the German context can be understood as a 'cycle of contention' around the rights of migrants: previously scattered protest events are increasingly tied together in a social movement with personal continuity, an emerging collective identity and clearly identifiable movement organizations in various mostly urban centres. Furthermore, protest marches, hunger strikes and occupations of public space have contributed to a high visibility of these protests. Somehow, academic research has been taken by surprise by these developments – most likely, because refugees as 'precarious residents' have been viewed as unlikely subjects of mobilization due to limited economic resources and social and cultural capital. Furthermore, the constant 'deportability' of refugees considerably increases the risk of mobilization leading to a large majority of refugees remaining in the shadows and avoiding open confrontation with public authorities. Despite these obstacles, refugees do mobilize.

The proposed paper addresses the recent refugee mobilizations in Germany and scrutinizes how activists mobilise material and ideational resources. It draws upon social movement theory on resource mobilization and particularly the role of personal local and national networks for resource-poor 'challengers'. Methodologically, the paper is based on in-depth interviews and participatory qualitative social network analysis with refugee activists in Berlin; in this method, the research subjects are asked to create a visual map of their social network and discuss their significance (intensity of exchange, type of exchange, types of resources mobilized through the respective channel). In understanding the perception of support networks by refugee activists, the paper aims both at an academic contribution and at improving practices of migrant solidarity.

STEPHENSON, BARRY* (Memorial University, bstephenson@mun.ca)

Religious Heritage and the Mobilization of Cultural Trauma

One form of religious mobilization in contemporary Europe is the festivalization of symbolic resources. This paper examines one such case of mobilizing symbolic capital, the 600th Jubilee of the Council of Constance (2014-2018). The paper focuses in particular on the figure of Czech Reformer Jan Hus (1369-1415), who was the centerpiece of "The Year of Justice," the thematic focus of the Jubilee in 2015, and is based on collaborative fieldwork conducted in Constance in July of 2015. The "Konstanzer Konziljubiläum" is a mixed-genre event, through which the city of Constance markets itself as a place of culture and heritage, and a welcoming host. "Europa zum Gast" (Europe is our guest) is the tagline for the multi-year jubilee, echoing the choice of Constance 600 years earlier, when more than 70,000 visitors came to the city in the context of the Church council. There is, of course, a fly in this festive ointment. The Konstanzer Konziljubiläum is poised between jubilee and the more solemn and reflective mood of commemoration, due to the fact that the historic Konzil is best remembered today for having invited the reformer Jan Hus, only to summarily arrest him, convict him of heresy, and burn him at the stake on July 6, 1415. Organizers, participants, and visitors to Konstanz need to incorporate into this otherwise festive occasion the killing Hus, as well as the meaning of the death, and it is here that Alexander's theory of cultural trauma may help shed some analytical light on the conflicts and contests of meaning that emerge when iconic religious figures from the past are mobilized and used in the present, in the context of a diverse public event, with representatives and interests from various cultural domains.

Identity, Exchange Networks, and the Emergence of Inequality

We examine how identity processes can give rise to inequality in power-balanced, negotiated exchange networks. We consider two forms of inequality: the inequality that arises between networks as a result of actors making suboptimal agreements, and the inequality that emerges between exchange partners within networks. Two experiments are conducted in which, within the exchange network, we vary the fairness identity (high vs. low) and the distribution of the verification process (verifying-verifying vs. non-verifying-non-verifying) in networks that are either four-person (square) (*N*=216) or three-person (triangle) (*N*=162). Results show that suboptimal agreements are more likely in four-person networks than in three-person networks, presumably as a result of the information gained from the exclusion process in the latter. Suboptimal agreements are also more likely in high fairness networks than low fairness networks. Further, while inequality in the distribution of resources between negotiation partners is lower in verifying dyads, this is particularly the case in three-person networks compared with four-person networks. At the dyadic level, we find that dyads consisting of individuals who consider themselves to be very fair are more likely to reach suboptimal agreements. This effect is stronger in four-person networks than in three-person networks, and when there is a discrepancy between how fair participants think they

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

have been and how fair others think they have been. Dyadic inequality is lower in three-person networks than four-person networks as well as in mutually verifying dyads than non-verifying dyads. Aggregating the dyadic findings to the network level informs conclusions about how the identity composition of a network and the identity verification process, together with the network structure, shapes inequality in equal-power networks.

STEVIS, DIMITRIS* (Colorado State University, dimitris.stevis@colostate.edu)

Competing Transnationalisms: Form and Purpose in Global Labour Politics

Ever since the mid of the 19th century there have been vigorous debates as to whether various transnational interactions amongst unions were meaningful or superficial exchanges amongst national entities with different and often competing priorities. While this research question remains pertinent it is now time to investigate the forms and social purpose of increasingly strong transnational relations amongst unions and employee organizations. While such ties are still few their possible impacts on the future of global industrial relations and labor politics is likely to be profound. Global frameworks agreements, global employee organizations, strong relations amongst national unions, stronger global union federations and global union and workers networks are examples of this small but growing universe of transnational relations that are beyond ad hoc interactions and episodic engagement.

The primary goal of this contribution is to explore the interfaces between the forms and the social purpose of transnational labor relations. With respect to form I will argue that transnational relations can take a variety of forms depending on membership and the organizational ties amongst the participants. In short that there is no nomothetic correlation between forms of transnationalism and its strength. With respect to purpose I will focus on both the instrumental goals of transnational relations and their deeper structural and ideological foundations. Out of this discussion I derive an analytical scheme which I use to understand the dynamics of global union politics. On that basis I will highlight the need to examine competing labor transnationalisms as evidence of increasing contestation over global industrial relations, similar to the contestations that have taken place in national contexts over time.

STEVIS, DIMITRIS* (Colorado State University, dimitris.stevis@colostate.edu)

Labor and Green Transitions: Lessons from the USA

This contribution focuses on whether and how labor unions and environmentalists are trying to influence the green transition in a liberal capitalist economy, in this case the USA, and does so by employing a political coalition approach. The first task, therefore, is the identification of the major coalitions through which (some) unions and environmentalists are seeking to influence the green transition in the USA. In addition to unions and environmentalists these coalitions may include elements of the federal and subfederal state, particular sectors of capital as well as particular sets of corporations.

However, the approach recognizes that actors are embedded in and constituted within social institutions. A historically informed coalition approach cannot treat actors as atomistic interest groups that come to the arena independent of and equal to each other. The industrial and environmental relations of particular countries are the product of historical struggles and compromises that create path dependencies that variably enable and constrain the participating actors. An approach, then, that embeds coalitions within their historical and social contexts allows us to better understand the social-ecological purpose of the transition paths that emerge. While these contexts do influence the paths taken it is also evident that there is room for agency by unions and environmentalists.

This contribution draws on a long term study of the efforts of unions and environmentalists to influence the green transition in the US. It is based on an extensive and systematic review of the green transition positions of key labor unions, environmental organizations, green business associations, federal and subfederal governments, and selected corporations which are "allied" with unions and environmentalists. This review employs historical information, interviews, participant observation and close reading of primary and secondary material.

Social Networks of Children of Mentally Ill Parents

Introduction

Children of mentally ill parents represent a high-risk group for developing a mental illness themselves. The Relationship between mental illness and social networks can be negatively affected by isolation, caused by stigma experiences or a sense of shame. That implies the important role of functioning social networks regarding people's social participation as well as their morbidity and mortality. However, nothing is known about the network structure of children with mentally ill parents.

Aims

To identify relevant network data about the structure of social networks, interviews will be conducted with children and adolescents between six and eighteen years with at least one mentally ill parent.

Methods

Quantitative methods will be used. Interviews will be conducted with children of families participating in the German multicentre study "Children of mentally ill parents (CHIMPs)". Inclusion criteria will be informed consent of parents and children, presence of at least one mentally ill parent and having an age between six and eighteen years. To identify informations about the network structure including size, frequency of contacts, duration of contacts, and quality and quantity of support, two age-adapted Versions of the SONET questionnaire for children and adolescents will be used. Effects of clinical characteristics of children and parents on social networks and effects of differences in social networks on subjective quality of life will be analysed by means of path analysis.

Results

Preliminary results about characteristics of social networks of children with mentally ill parents and their associations with clinical characteristics and quality of life of children and parents will be presented.

Conclusions

Presented results will be discussed in view of implication for service needs and hypotheses for further research.

The Role of Engos in Canadian Climate Politics: Comparing Policy Network Actors' Perceptions with Insights from Sociological Theories

What is the role of Environmental Non-Governmental Organizations (ENGOs) in climate change policy debates? Based on a qualitative analysis of 73 interviews from a representative sample of policy actors in Canada, we examine the multiple roles that ENGOs are perceived to be playing within climate politics. We compare perceptions about the role of ENGOs held by climate policy actors with descriptions of the role of environmental organizations contained within the Treadmill of Production (TOP), Ecological Modernization (EM), Policy Networks (PN), and Resource Mobilization/Political Process Theory perspectives. The Treadmill of Production perspective takes a relatively pessimistic view of the prospects for sustainability in capitalist societies, but sees ENGOs potentially playing an important role – through protest and other tactics -- in pressuring government to take ecological sustainability into account. By contrast, Ecological Modernization theory takes a more optimistic view of these relationships, and sees ENGOs as playing a more cooperative and collaborative role vis a vis government and the private sector, and sees "greening" as a dominant trend arising from these relations. The Policy Networks perspective argues that the policy positions taken by particular actors is correlated with the positions taken by the network alters they are tied to through relationships of communication and collaboration. Resource Mobilization uses the metaphor of the market to understand the roles that different social movement organizations (SMOs) play within a social movement sector, and examines how organizations specialize within this context. Relatedly, Political Process theory examine how SMOs create and respond to political opportunities. Narratives about the role of environmental movements move across the boundaries between these perspectives, prompting us to rethink our theoretical understanding of the role of environmental movements within climate politics.

STOECKLE, L. M. ANABEL* (Wayne State University, anabel.stoeckle@wayne.edu)

(Troubling) Families in the Age of Surrogacy

Surrogacy arrangements create the possibility of new family combinations, not only by redefining motherhood specifically and parenthood more broadly, but also by destabilizing what constitutes a family today.

First, these new reproductive practices through surrogacy challenge the "traditional" way to have a child; the nuclear family consisting of a biologically related mother/father/child becomes troubled. Second, surrogacy offers women alternative pathways to motherhood and allows men to become fathers detached from heterosexual relationships. Third, surrogacy arrangements violate traditional

understandings of motherhood; since the surrogate relinquishes the child after birth, she violates assumed "natural" feelings of attachment a woman ought to have when she carries a child.

My paper focuses on the experiences of both surrogates and intended parents in the US, and examines how individuals within surrogate arrangements discuss the contours of "family." My paper further analyzes how individuals find this new form of family troublesome and how they normalize their experiences at the same time. The foundation for my analysis is interviews with surrogates and intended parents, as well as an online survey of surrogates.

RC32-372.3

STOECKLE, L. M. ANABEL* (Wayne State University, anabel.stoeckle@wayne.edu)

Surrogacy and the Meaning of Care Work

Global surrogacy arrangements have evoked many controversies over legal and ethical, as well as concerns about exploitation of women from the Global South who become surrogates for individuals from the Global North. Surrogacy raises questions and concerns about exploitation along class, race, nationality, and gender lines. Nevertheless, theorizing surrogacy as a form of work is relatively new.

This paper discusses surrogacy arrangements as a new form of intimate, emotional, and embodied body and care work. I apply the theoretical framework of Amrita Pande's (2014) groundbreaking fieldwork in Indian surrogacy camps conceptualizing surrogacy as sexualized care work to the US context, in which surrogates are more likely to be described in terms of altruism instead of the terminology of care work. Moreover, I pair this theoretical framework with the notion of multiple dimensions of body work, as conceptualized by Barbara Brents and Crystal Jackson (2013) in their study about sex workers. All of their five dimensions of body work apply to surrogates as workers: A surrogate performs (1) physical labor - the surrogate's womb is utilized to create the life of a child; (2) bodily labor - the surrogate pays attention to the physical need of the child she carries; (3) interactive bodily labor - the child, the unintentional "customer," is literally underneath the surrogate's skin; (4) emotional labor – the surrogate negotiates feelings to perform her "job" properly; and (5) aesthetic labor – she performs labor on her own body to produce a particular image that is crucial to her credibility as a surrogate, in this case, creating the image of being a good birthmother.

The commodification of surrogates' reproductive capacities therefore challenges feminist perspectives on this new form of (bodily) care work.

Socio-Economic Inequalities in Health Deficit Accumulation in Old Age. Cross-National Evidence from Growth Curve Models Using Share Panel Data (2004-2013) from 10 European Countries

Existing studies on the social inequality in health trajectories in old age yielded inconsistent results regarding whether or not such health inequalities converge, remain stable or widen in old age. This is likely due to the widespread usage of cross-sectional data, limited availability of high quality and long-duration panel data, and issues regarding survival bias in the latter. Furthermore, the literature is dominated by single-country studies, and cross-national differences and potential contextual effects have received little attention so far. The objectives of this study were therefore (1) to assess trajectories of health deficit accumulation regarding the impact of education, income and wealth in Europe in general, and (2) to assess country-specific deviations of these patterns. We used panel data (21,571 observations from 7,178 respondents aged 65 years or more) from four waves of the Survey of Health, Ageing and Retirement in Europe (SHARE) between the years 2004-2013 from ten European countries. Health deficits were measured by a sum index constructed from 40 identical items available in all four waves of SHARE. We estimated growth curve hierarchical regression models to examine trajectories of health deficits across time and controlled for both cohort effects and panel attrition. We found older adults with high education and income, and particularly wealthy older adults to have fewer health deficits at the onset of old age compared to their less educated and poorer counterparts. These gaps then widened between older adults with primary and tertiary education and between those of low and high household wealth over time but remained constant regarding income. Countries such as Spain, Italy and Germany showed higher average levels of health deficits and stronger deficit accumulation compared to Switzerland, Netherlands, Denmark and Sweden. Finally, the latter countries also tended to show less divergence in health deficit accumulation.

STOLZ, ERWIN* (Medical University of Graz, stolz.erwin@gmail.com)

The Impact of Income- and Asset-Poverty on Frailty Worsening Among Older Adults in 10 European Countries: A Longitudinal Analysis Using Share (2004-2013)

Recent studies documented effects of education and income on frailty status in old age, albeit mostly using cross-sectional data. Few studies have concentrated on the dynamics of frailty worsening across time or have focused on the role of material deprivation in income- and asset-poor households. Furthermore, potential cross-national differences and contextual effects regarding old age frailty have not been assessed so far. The objective of this study was therefore to assess the impact of both income- and asset poverty on the dynamics in the frailty index (FI) conceived as a systemic indicator of biological ageing in community-dwelling older adults (65+) in Europe. We used panel data consisting of 21,571 observations in 6.902 older adults across 10 years (2004-2013) and 10 European countries from the Survey of Health, Ageing and Retirement in Europe (SHARE). Results from growth curve models showed significantly higher average levels of frailty in early old age and a higher rate of subsequent frailty worsening over time among asset-poor older adults compared to their non-poor counterparts. Furthermore, we found average frailty in early old age and frailty worsening to be higher in the Mediterranean and lower in Northern European countries. Finally, the impact of asset-poverty on both initial frailty level and frailty worsening was strongest in the Mediterranean countries and lowest in Switzerland.

STONER, ALEX* (Salisbury University, amstoner@salisbury.edu)

What Does Climate Change? Value As the Continual Necessity of the Present

The domination of human and non-human natures is wrapped up in an alien, runaway developmental logic, which, despite current efforts, no one controls and to which all are subject. This paper advances a Marxian critical theory account of capital-induced planetary degradation (e.g., accelerating land degradation, biodiversity loss, and climate change) following the Second World War. In contrast to strands of environmental thought which critically examine the production of wealth (increasing use-value output) by counterposing finitude and limits against the expansionary tendencies of economic growth, the critical theory approach advanced in this paper conceptualizes accelerating environmental degradation in terms of the unfolding of the contradiction between wealth *and* value. The temporal dimension of this process, as I endeavor to demonstrate, is more adequately captured in terms of a treadmill of production of *value*, which gives rise to a fundamental tension between "capital time" and "ecological time". Against this background, I direct focus toward a dialectic of transformation and reconstitution whereby the necessity of value is continuously established in the present. The paper concludes by indicating how a Marxian critical theory framework allows one to better understand the widespread growth of environmentalism and the concomitant spread of post-Fordist (neoliberal) capitalism.

STORMS, ELIAS* (University of Antwerp, elias.storms@uantwerpen.be)

Debt As a Heterogeneously Constituted Relationship: Payment and Collection at the Household Level

Debt and indebtedness appear both at the heart of economic activity (as the complement to credit) and at its fringes (as the inability to meet payments). Aside from economic definitions, at the household level debt is experienced most tangibly at the moment of collection. Surprisingly, however, sociology has largely neglected how debt as a social relationship manifests itself in the everyday lives of people through the process of collection.

This paper provides a theoretically driven engagement of empirical observations concerning debt, indebtedness and collection. It builds on material gathered while researching indebtedness and debt collection in Belgium, focussing on both collection agencies and bailiffs. Theoretically, this paper takes the 'economization framework' (as developed by Michel Callon & Koray Çalışkan) as a starting point in an attempt to understand how debt collection is constituted through a network in which a variety of 'heterogeneous elements' is involved. Material and technical devices, knowledge (both scholarly and lay), legal documents and contractual stipulations are some of the elements that play a constitutive role in the establishment of debt as a social relationship.

Pertinent to the topic of the panel, this paper argues that we should broaden our theoretical scope and include not only economic aspects, but also textual, interpersonal and especially legal dimensions if we wish to understand debt as a social relationship. By approaching debt in this manner, this paper has two aims. First, it hopes to further theoretical sociological understanding of debt as a prominent aspect of everyday economic life. Second, and equally important, through the case of debt collection, it aims to explore how 'the economic' is constituted through a variety of elements from different social spheres.

STRECKER, DAVID* (University of Jena, david.strecker@uni-erfurt.de)

Social Exclusion and the Right to Justification: The Case of Slavery

The concept of social exclusion has usually been conceived of as referring to the horizontal axis of social structuration, juxtaposed to the established vertical categorizations of social inequality. Opposing such a dichotomous conceptualization of (horizontal) inclusion/exclusion and (vertical) stratification, this paper examines the linkages between both axes: In which ways might the excluded not be 'superfluous', but rather functional to the reproduction of social structure. This question is explored by investigating the "peculiar institution" of slavery from the perspective of the right to justification.

STRIEBING, CLEMENS* (Heidelberg University, striebing@hertie-school.org)
FORSTER, SARAH (Hertie School of Governance)

The Transparency of Philanthropic Foundations

Transparency is the fundament of any further accountability of NPOs towards their stakeholders. However, speaking for the German case, the sufficiency of NPO transparency is repeatedly contested – in the scientific and the political area, but even amongst NPOs themselves as the following argument will show.

In the context of a joint research project of Hertie School of Governance and Centre for Social Investment at Heidelberg University on the "Positioning and Contributions of German Foundations" we conducted the first representative survey on the self-perception of German Foundations. Besides other topics, we asked if foundations agree that they should be more open, more transparent. With an approval rate of 31%, transparency was the second often named organizational problem (after insufficient funds with 64%).

Our empirical data enable us to test for correlations between the self-perception of the foundations as "adequately transparent" and structural factors like budget size, mode of operation (grant-making, operative, mixed), number of regular employees and volunteers, founding date, and so on.

The focus of the research paper will lie on the effect of budget size on the self-perception of foundations: Building on current research we know the more professionalized a foundation is, the more it strives for "rationalization". We assume that the "professionality" of a foundation (e.g. having full-time employees with specific educational backgrounds and regular trainings) increases with its budget. Testing may proof, if more professionalized foundations perceive themselves as more transparent because of their higher capacity to be transparent, or if the opposite is the case and they are more sensitive to the lack of transparency in their organization. Furthermore, one may also argue smaller foundations think of themselves more often as being transparent enough, because they are better integrated locally and therefore have a more direct exchange with their stakeholders.

"Sometimes I Feel Lost in Transition". Muslim Middle Class Youth in India

Political and public discourses in India depict the 250-300 Million strong "new middle class" as the epitome of a globalized and modern India. This portrayal usually omits the existence of Muslim middle class families. The paper questions the tacit equation of middle class with Hindu-Indian modernity by drawing attention to the formation of a new Muslim middle class.

Based on an ethnography of various institutionalized sites in Lucknow (a North India city) that are involved in the production of "middleclassness" the paper is interested in recent transformations for Muslim youth due to economic liberalization, cultural globalization as well as labour migration to the Middle East.

Over the last two decades, the variety of competing lifestyles, contextually shifting subjectivities, moralities and consumption patterns has increased -- and thus the possibilities to make choices and to position oneself. Previous lifestyles are not just replaced with new ones, but continue concurrently, and serve to both construct new imaginaries as well as reconfirm old boundaries. The complexity of everyday has increased ever since. The pressure to feel responsible for one's own biography, the pressure to perform, to achieve and to make pro-active decisions on what to do with one's life has amplified.

The paper is interested how Muslim youth are juggling conflicting expectations by peers, the elder generation, religious leaders, and the competitive requirements of the modern employment sector. The focus is on the various strategies deployed by young Indian Muslims in order to negotiate simultaneously national belonging, being part of an "Indian" modernity or even a global modernity while retaining Muslim identifications of various kinds. The paper investigates the en-

tanglements and co-evalness of competing narratives of modernity. Western modernity, thereby, constitutes an important part of Indian Muslim imaginaries without being the only frame of reference.

Phew! Pathways to Health, Exercise and Wellbeing: A Qualitative Study of Exercise 50+

PHEW! Pathways to Health, Exercise and Wellbeing: a qualitative study of exercise 50+

Leisure, the product of increased economic affluence and cradle for consumerism has created the freedom to choose how to spend time within the confines of interests and resources available. However the effects on the body have not always been beneficial to health and wellbeing. For example increased choice and availability of food, added to more fluid eating patterns, have given rise to conditions in which obesity flourishes. Some leisure pursuits may promote sedentary behaviour threatening healthy living and risking the development of associated conditions such as hypertension and diabetes.

It is within this context that UK Chief Medical Officers have issued exercise indicators to fscilitste health promotion and to measure levels of physical activity within the population. Findings suggest that many people do not meet these levels of activity in their daily lives. A particular focus of concern is for the growing mass of older people with whom decline and disease is traditionally associated.

The prescriptive nature of such guidelines takes no account that, regardless of age, people are not a homogeneous group. Neither does the advice recognise that exercise engagement is part of a process related to lifestyle choices. I argue that Pathways to Health, Exercise and Wellbeing are not a simple matter of 'one size fits all'. Using data from the 50+ exercise classes that I lead I explore these processes and how choices are made. In my experience participants seek a 'package' of circumstances appropriate to their needs, interests and lifestyle. This often involves establishing a successful 'partnership' with the instructor and the exercise experience – a sense of belonging. When this happens the 'pleasure' experienced is both embodied and processual – the whole constituting a customised, individual pathway to health and wellbeing.

Factorial Surveys in Social Psychology: The Prospects of Professional Recognition in Germany – a Factorial Survey on the Acceptance of Officially Recognized Foreign Certificates in German Firms

With the "Recognition Act" in 2012, Germany introduced a standardized procedure to assess and recognize foreign vocational and professional qualifications. This procedure is intended to formally help employers with the identification of equivalent foreign and German vocational and professional qualifications. Yet, it is unclear in how far firms – as the central gatekeepers of the labour market – actually rely on the results of this official instrument. Our research question is therefore whether the official confirmation of equivalent foreign qualifications will, ceteris paribus, actually lead to equal chances in application and hiring processes. More generally, we investigate whether formal professional recognition enables foreigners to access qualified labour market segments more easily.

To answer these questions, we will employ a factorial survey. The basic idea here is to present firms hypothetical foreign applicants for a job position as a logistics manager. The characteristics of the applicants and their degrees will be experimentally varied. On the individual level, this includes the applicant's gender, age, job experience and salary expectations. For a detailed analysis of the effects of professional recognition, the applicants come either with a German vocational training degree or a foreign qualification, the latter either without any official evaluation or with partial or full recognition as an equivalent to a German degree.

The survey will be conducted among a representative sample of all German firms which employ at least one logistics manager. Because the degree of professionalization of recruitment processes and recruitment practices vary with firm size, we expect that recognition will have different effects for different firm types. To take account of this, we use a unique stratified sampling design for firms with 1-9, 10-49 and 50-249 employees. This will allow us to generate results for recruitment practices in association with professional recognition for different firm sizes and structures.

A Mature Entrepreneur –a New Social Role for Older Adults?

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In traditional discourses entrepreneurs are pictured as young, dynamic, risk taking, adventurous (often) white males. This view excludes women, minority members, immigrants, as well as older persons. However, these atypical entrepreneurial models are gaining momentum, and among them – the mature entrepreneur (referred to also as grey). Research shows that in many industrialized countries the number of older entrepreneurs increased in the last decades much faster that the number of younger entrepreneurs, and their visibility increases also on socio-political agenda.

The expression "mature entrepreneur" possesses a twofold meaning. Mature in the sense of chronological age (such as 50+), and mature in terms of life and work experience, as well as social, human and (often) economic capital. This group represents those individuals, who start their entrepreneurial activity at later stages of their professional careers. As described by Ainsworth and Hardy (2008) an older entrepreneur is considered a "risky project". With embarking on this new occupational path, the older entrepreneur takes on variety of risks that are common for all-age entrepreneurs (financial and legal risks of failure), as well as age specific risks of acting against certain age norms, social expectations and fixed behavioural patterns.

The question addressed in this presentation are: what is the image(s) of a mature entrepreneur and how is it being constructed in public policy, as well as in social imagination? How is it related to the policy discourses and models of Active Ageing Agenda in Europe? What are the characteristics of an emerging model of mature entrepreneurship? The presentation will reflect on the literature and policy analysis regarding the creation of a new model for late life activity- mature entrepreneurship, as well as present some preliminary empirical evidence from an ongoing project.

A Tale of Two Migration Streams: Vietnamese Immigrants and Refugees in Germany

In the United States, scholars have explained the formation of ethnic immigrant communities as resulting from a desire to interface with others in the native tongue; to draw on social networks for employment and related opportunities; and, in distinct instances, ethnic mobilization also emerges as a response to xenophobic violence. The draw of ethnic communities has been so great in the American context that immigrants engage in secondary migration to relocate to where coethnics reside *en masse*. Upon first glance, Vietnamese contract workers (from former North Vietnam) and refugees (from former South Vietnam) to Germany exhibit some of the characteristics that should predict the formation of an ethnic community: they speak the same language and may potentially benefit from coethnic social networks, and, as a visible racial minority in Germany, many Vietnamese former contract workers who migrated to the East have been subject to anti-foreigner sentiments and campaigns. Yet, 40 years after the collapse of the South Vietnamese government and 25 years after the fall of the Berlin Wall, the social worlds that first-generation Vietnamese immigrants and refugees inhabit remain largely separate, to the extent that one journalist described this national-origin group as "Berlin's Vietnamese Wall." My study seeks to address this unique case by examining the relationships of Vietnamese to home and host states, two of which—former South Vietnam and former East Germany—no longer exist. This study draws on participant-observation with immigrant-serving organizations and in-depth interviews with Vietnamese Germans. In studying the ongoing relationships of immigrants and refugees to (changing) sending and receiving states, I consider a theoretically unique but informative case in which regime change has propelled two entirely distinct and concurrent migration streams out of Vietnam and continues to shape coethnic relations.

The Market for Vietnamese Brides: Global Marriages As Strategy Deployments

In 1986, Vietnam implemented the policy of *Đổi Mới* ("Renovation") intended to usher the country toward economic development through the influx of foreign capital and investment. This transition coincides with the emergence of the "Four Asian Tigers" (South Korea, Taiwan, Hong Kong, and Singapore), economies characterized by pronounced free-market ideology and industrialization. Out of this climate of national and regional economic change emerged a bride market specializing in the "sale" of young Vietnamese peasant women to rural men from these neighboring "Asian tiger" countries. My study examines this market for Vietnamese brides to understand the economic dimensions of increasing transnational connections and commercialized intimacy. I do this by utilizing mixed qualitative methods, including in-depth interviews, ethnography, and document analysis. To investigate how individuals navigate macroeconomic changes such as market liberalization, I seek to answer: *How do Vietnamese peasant women learn about and decide to participate in a bride market in which they are sold to foreign, Asian bachelors? Why are men from economically advanced nations looking to devel-*

oping countries for marriage opportunities? Finally, *how do actors in the Vietnamese bride market reproduce or complicate socioeconomic hierarchies among countries in Asia?* To address these questions, I use the case of Vietnamese-Korean unions to analyze global relations. Since the 1990s, South Korea has been one of the top importing countries of Vietnamese brides. The economic viability of South Korea has created the possibility of new mobility strategies for the Vietnamese, who are increasingly turning to Asian countries in the pursuit of economic security. By looking specifically at Vietnamese-Korean marriages, I highlight new avenues for the exercise of agency within a context of changing global economies. Anticipated findings will offer insight into the type of strategies individuals, who are located within local and national peripheries, deploy to gain marriage and economic opportunities.

SUBRT, JIRI* (Charles University, jiri.subrt@ff.cuni.cz)

The Theory of Action and the Problem of Homo Duplex

The Theory of Action and the Problem of Homo Duplex

This contribution is devoted to a consideration of the possible consequences for the theory of action were the assumption accepted that human beings are inherently dual in the sense that Emil Durkheim supposes in the concept of "homo duplex". Durkheim argues that human beings are divided in an internally contradictory manner. Our physical body, on the one hand, is the source of our endless needs and desires, of our egoism. Our socialized being, on the other hand, is the construct of the society that lives and acts through us and controls and diminishes the symptoms of our egoism through internalized moral principles. A similar conclusion has been reached by many other thinkers before and after Durkheim. According to Georg Simmel, the human is a dual being, one part of which is directed outside itself, and attracted by society, by associations with others, while the second part is a "world in itself" which wants autonomy, independence and detachment from other people. William Isaac Thomas and Florian Znaniecki distinguished two components of human personality, temperament and character, the former being naturally given, while the latter is socially formed. George Herbert Mead presents the characteristics of the human "Self" as a contradictory unity of the two components "I" and "Me". "I" is an individual, subjective component which is active and creative; "Me" is an objective, passive component, which is formed primarily by the internalized attitudes of the social group or society to which the individual belongs. The first question which occupies this contribution is how the concept of homo duplex could be projected into the theory of action, structuring and social order. The second question it deals with is whether such an approach could be compatible with Parsons' AGIL scheme.

SUCHOVSKA, PETRA* (Charles University, petrasuchovska@yahoo.com)

Global Affairs Embedded in Historical Sociology

The spirit of modernity remain chaotic and obscure. Western-led idea of globalization and democracy imposed upon the world does not seem to bring the bright future for human progress anymore and the diminishing ability of intellectual community to explain entropy of global affairs might lead to another historical tragedy rooted in social disilussioment.

Sociological behavior is reliable reporter of every aspect of society, as its dynamics represent derivation of social reality of humanity in its historical and dynamic context, expressing eternal collective strive for an ideal social order. Solutions might be searched in the dependency relationship between global state of affairs and dynamics of sociological behavior that can trigger and be triggered in response to internal and external challenges and explain outlined causal linkage of events, which constitute logical framework for all possible variations of circumstances and experiences to unfold.

I argue that some of the principles of sociological behavior as "social dialectics", which touchs upon the "pendular theory of social change" of Pitirim Sorokin or "Axial Age" of Karl Jaspers, form the historical epochs of religions and material appeal for progress, during which the civilisations rise and fall. The civilisations proceed in a given linear direction for a time, progressing by constructive responding to the challenges, but eventually, as a result of need for inherent equilibrium of the social reality (religious/divine vs rational), shifts of direction and a new period of development will be ushered in

Clearly articulating these principles and its relationship to global affairs may clarify contemporary "crisis of societal agency". Such approach might represent body of knowledge about social structural change and provide critical understanding of contemporary affairs, while furnishing a framework for possible solution through a warning or encouragement of the political, religious, economic communities and individuals to better adjust to the social challenges.

Does the Internet Make People Conservative? : Effects of the Internet on Citizens' Political Attitudes and Their Rational Basement

This presentation aims to clarify the difference in political attitudes between respondents of an interview survey and those of a web survey, and to explain the mechanism that produces such differences. The internet is considered a new tool for organizing democratic movements; discourses on the internet, however, are often likely to generate new types of right-wing circles. In other words, the role of the internet as a political tool remains ambivalent. However, has the internet itself no effect on the political attitudes of citizens? In this presentation, I focus on the effects of the internet on political attitudes. Here I assume that people tend to manipulate their opinions so as to enable easy acceptance by target persons. Under this assumption, we can reasonably predict that a person slightly changes her/his political attitude depending on the target person (an interviewer in a case of an interview survey), and therefore respondents of a web survey are likely to be less cooperative than those of an interview survey. As a result, based on *rational judgement concerning target persons*, respondents of web surveys tend to not support social policies on equality. In order to test this hypothesis, I use data from SSP-I 2010 (interview survey in 2010, N=1,763) and SSP-W 2012 (web survey in 2012, N=2,839). Because these data sets have the same format for our target variables, the results are strictly comparable. After controlling for sample bias by using propensity score, I compared the political attitudes of the respondents of the interview and the web surveys. Results of the analyses show that respondents on web surveys tend to support neo-liberal opinions. This means that my hypothesis on the internet's effect on the political attitudes of citizens can be supported by empirical data.

SUENKER, HEINZ* (Wuppertal University/Faculty of Human and Social Sciences, suenker@uni-wuppertal.de)

Childhood Studies and Sociology of Education

Without overloooking differences of class, gender, ethnicity, childhood research since 1980 has focused on the social formation of children in the context of generational order and begun seeing children as socially competent actors. Complementary political initiatives emphasize the importance of participatory experience, whilst at the same time educational research highlights the reality and instruments of class-based social selectivity in education. Social inequality is reinforced in educational structures that fail to promote democratic competencies and thus undermine the ability of citizens to participate actively and consciously in society. Genuinely democratic educational policies in line with the UN-Convention on the Rights of the Child aim to remedy this situation by promoting the education of all. This would fight the reproduction cycle and empower children to be really competent actors.

Democracy Against Capitalism?!

Since the inception of the bourgeois-capitalist society there is a broad socio-theoretical debate about the relationship between capitalism and democracy. In the centre of this debate have been questions of the social form of individual and social existences of the individual (possissive individualism), the relationship between politics and economy, the tension between a "civilising influence of capital" (Marx) on the one side and the destuction of the social on the other side.

Nowadays there is a renewed debate on the end of capitalism (Wallerstein et al.).

The paper reconstructs relevant leitmotifs and figures of argumentation of this rich debate. Secondly, it tries to analyse the consequences of the formdetermination (Formbestimmtheit) of capital (Marx) for possibilities of democracy in everyday life and different societal institutions connecting this with questions of participation.

SUESSBAUER, ELISABETH* (Center for Technology and Society (ZTG), suessbauer@ztg.tu-berlin.de)

Workplaces As Enabling Structures for Sustainable Consumption Practices?

Since the United Nations Conference on Environment and Development (UNCED) in 1992, many attempts have been made to influence knowledge or attitudes of consumers but have not led to significant changes of resource-intensive consumption patterns (Jackson 2005; Fuchs/Lorek 2005). A main challenge is that everyday consumption is comprised of routines and habits that are rarely reflected upon and which are embedded in social and material contexts that can-

not easily be changed (Shove/Warde 2002; Spaargaren/ van Vliet 2000). Practice theory scholars (Shove et al. 2012; Brand 2014) emphasize that all elements of consumption practices have to be addressed for a change of daily routines: meaning, implicit and explicit rules, practical knowledge, and material arrangements.

The paper is based on the idea that companies are able to provide a context which facilitates sustainable consumption at the workplace by establishing supportive material structures and norms as well as enhancing respective competences. Experimenting with sustainable consumption practices at the workplace could – as a kind of "spill over" – result in positive effects on routines in private households.

This assumption is empirically analysed in the transdisciplinary project IMKoN comparing the provision of "enabling structures" of German companies of different sectors and sizes. We are interested in two perspectives: a) Are the companies open to take up ideas of sustainability oriented employees to optimize entrepreneurial structures towards sustainability? (outside-in perspective); b) Which effects does the provision of enabling structures for sustainable consumption at the workplace have on private consumption habits? (inside-out perspective)

We apply a mixed-methods approach including qualitative interviews with the management, a group discussion with 8-10 employees, narrative interviews as well as an online survey among the entire staff. In comparing the companies we will discuss, how unsustainable elements of daily practices can be replaced or linked up in a new way.

TG06-693.2

SUESSE, NINA* (King's College London, nina.suesse@kcl.ac.uk)

The Every-Day of German Family Policy Reform: New and Old Disparities in the Organisation of Childcare

Comparative welfare state theory has discussed at length the German welfare model, either in terms of welfare regimes or varieties of capitalism. A major point of interest and contention therein has been the question of institutional change and reproduction in German welfare provision. Seeleib-Kaiser, in an examination of political discourse, points towards a "dual transformation" of the welfare state, in which the social insurance state, targeted at income maintenance of the male-breadwinner, faces retrenchment. Simultaneously, family policy is moving to the centre-stage of social policy discussion and expanding despite constraints of austerity. This dynamic of reforms creates new disparities in the distribution of social protection. Existing explanations largely focus on macro comparative theory or policy-maker discourse. I argue that these approaches tend to miss how reforms and changes in political rhetoric are implemented and diffused through the layers of organisations in everyday life. To critically assess and complement existing accounts of German welfare state transformation, I intend to map how reforms are enacted in daily life, focussed on the case of childcare.

Germany has substantially expanded its public childcare programme, pointing to a need to improve work-family life reconciliation. Debate has also taken up themes of gender equality, working conditions of care-workers and the cultural and educational integration of children. In tracing how formal policy changes and wider discursive themes were taken up by local actors, I begin with the experience of public childcare managers and trace the discourses they engage with vertically as well as horizontally in different German locations. I explicate thereby how extra-local policy information traverses within institutional networks and how actors experience and enact policy locally.

SULEMAN, MUHAMMED* (University of Johannesburg, muhammeds@uj.ac.za)

Delving into 'Structural Prisons': As Insight into Muslim Women's Struggle in Dealing and Overcoming Marital Violence

The primary sources of Shariah: The Quran and the practices of the Prophet Muhammad (PBUH), prohibit violence against married women. However there is growing evidence of marital violence experienced by married women in the Muslim community in South Africa. While Islam allows women recourse to leave their abusive marital relationships, the context within which find themselves, acts as a barrier. As far as the marital relationship is concerned, there is a disjuncture in what is stipulated in Shariah and how Muslims adhere to its stipulations. Using direct, structural and cultural violence, this conceptual paper seeks to explore literature around these key themes with a focus on married Muslim women and Islamic law. A preliminary search on relevant literature, together with anecdotal evidence revealed that despite being victims of domestic violence, women receive little help from relevant structures such as family and religious organisations. If they choose divorce, they are stigmatised by relevant structures. Using direct, structural and cultural violence as analytical instruments, this conceptual paper explains why Muslim women remain in abusive relationships by problematising the context in which they find themselves. Certain structures act as either perpetrators or victims of structural violence. Hence they place women in 'structural prisons.'

Geographies of Children's Play in the Context of Neoliberal Restructuring in Istanbul

This research, operating at the interface of urban studies and children's geographies literatures, aims to analyze the material and discursive transformations of children's play in the context of neoliberal global restructuring in Istanbul. Looking at the private play centers for children inside shopping malls called "children's cities" and a public playground, it explores the impact of wider socio-economic transformations on children's play spaces through an inquiry of the socio-spatial mechanisms and characteristics that stand out in "children's cities" and the ways in which children's cities shape the conceptions and practices of play in relation to deprived public play spaces. Primary stage of data collection comprises observation in two children's cities and a public playground, semi-structured interviews and document analysis of the material from the websites. I suggest that neoliberal material processes of privatization, exclusion and securitization underlying the city space deeply structure the new geographies of play. Normalization of the play taking place in children's cities is tightly linked to poor conditions of public playgrounds due to municipal neglect, which brings about withdrawal of upper-middle classes from the public spaces but actually shows the most devastating effect on low-income groups since they cannot cease using public play spaces for children's play. While processes of private investment and public disinvestment in children's play spaces underline the hegemonic presence of the private spaces within the city, celebration of the children's cities showcases particular framing of "good play" that valorizes exclusivity, security and instrumentality. One important conclusion about the current state of play spaces in Istanbul is neither glamorous children's cities nor derelict public playgrounds can meet the benchmarks of "the right to play" that encompasses "free" play and the right to be safe along with the recognition of play as a right in itself rather than being instrumental for other developmental goals.

Linking Faith and Complementary Therapies in Cancer Care for African-Americans

Introduction: The role of faith and spirituality in medical decisions has been under-theorized in contemporary medical research. This has had a particular impact on patients of color who are more likely to rely on spirituality or religion in making major treatment decisions. Furthermore, how complementary or Eastern therapies might be used synergistically within these belief systems to better provide care for cancer care treatment side-effects has been unexamined.

Methods: This study uses a two-pronged approach to examine the role of religiosity in African-American cancer survivors and caregivers in the U.S. and to explore the possibility that complementary therapies may offer more culturally appropriate care options. Based on focus groups with African-American cancer survivors and caregivers in the American South, results suggest that faith and spirituality still play a major role in treatment decisions made by this racial/ethnic group. By combining focus group data with a systematic review on the use of complementary therapies to cope with the side-effects of chemotherapy for communities of color in the United States, we hope to theoretically and empirically link these two fields.

Results & Discussion: Thirteen focus groups with 123 participants were conducted between 2011 and 2013. Study participants commented on the centrality of churches in their communities, and the importance of one's faith in guiding medical decisions. Some participants discussed the practice of relying on both their physicians and faith to hope for the best outcome. The systematic review explored the literature on complementary therapies for dealing with side-effects of chemotherapy. Findings are currently being analyzed but suggest the need for greater attention to complementary medicine for communities of color.

Conclusion: Understanding strong ties to faith and spirituality could help inform how eastern medicine can be used to complement western medicine, and sometimes, could be more appropriate for reaching African American cancer survivors.

An Alternative Discussion on the Direct Participation in Hostilities: WHO ARE the 'Unlawful Combatants' or "Civilians"?

Although the arm conflicts of 19th and 20th centuries were between states, the modern conflicts are essentially between the states and different sub-state armed groups or among these groups such as in the cases of Rwanda, Former Yugoslavia, Iraq, Afghanistan or Syria. In that regard, the term of direct participation in hostilities commenced to be appeared as an ordinary way of defending/attacking for national or international rights.

However, at this new type of armed conflicts, not only men are the carrier of the missions and weapons, but also "children" and "women" turn into a guerilla in each night as experienced in Palestinian or ISIS cases. In this respect, the distinction between "civilians" as protected persons conventionally including women and children, and "unlawful combatants" as legitimate targets traditionally including males, becomes unclear. This paper aims to open a discussion on the term of direct participation in hostilities by particularly referring the situations of women and children in contemporary conflicts and interventions and to determine a close or narrow interpretation by attributing Geneva Conventions and Additionals protocols, commentaries and cases.

Keywords: Direct Participation, Civilians, Armed Conflicts

Capitalizing on Being Othered: Genomic Medicine, Racial Identities and a Globalized Pharmaceutical Industry

This paper critically examines the construction of racially and ethnically-labelled populations in the development of genomic medicine. In the (post-)genomic era, will medicine be "personalized" according to an individual's unique genetic makeup or will it be developed and administered in relation to that individual's racial and ethnic identities? Before genome-based personalized medicine can be administered in clinical settings, the question is what shapes drug marketing and development. This paper closely examines the story of Gefitinib (IRESSA, marketed by the pharmaceutical company AstraZeneca), a drug for treating non-small cell lung cancer patients with EGFR mutations. It suggests that the case of IRESSA deserves a closer look, because it has been hailed as an exemplary case of personalized medicine. It demonstrates that, in some instances, lying just beneath the surface of molecular-based personalized medicine is the reality of racially and ethnically-designated population-based drug development in the context of a globalized pharmaceutical industry. In addition, this paper analyzes the ways in which some geneticists and medical oncologists in Singapore have capitalized on being "othered" (Said, *Orientalism*, 1978). Their empirical pharmacogenomics studies of cancer drug toxicity emphasize ethnic diversity, for instance, by adopting comparisons between "Asians" and "Caucasians" in Phase IV trials. While previous studies have identified the role of the ethnic niche market in this phenomenon of the medicalization of race (Duster 2007, Lee 2003), this paper suggests that such a phenomenon cannot be fully explained without an understanding of the choices and rationale underlying the cooperation of participating clinical trial centres and doctors. Most importantly, this paper draws on interview data with geneticists and medical researchers to argue that the definition and identification of "Asians" and "Caucasians" are based on arbitrary criteria.

SUN, SHIRLEY HSIAOLI* (Nanyang Technological University, hlsun@ntu.edu.sg)

State Policy and Care Migration in Selected Countries in Asia

Care migration has become an important feature of care provision in Asia, and it is related to inequality in different forms. This paper suggests that while migrant care workers help address the issue of "reproductive labor" in selected Asian countries (South Korea, Japan, Taiwan, Singapore, and Vietnam), the degree of openness of the (foreign) domestic worker policies is less a function of demographic crisis (i.e. below replacement fertility and potential population decline), but more a function of whether the state supports local women's economic "productive labor" via its policies. Instead of treating women's paid labor force participation as a given (which is often the case in the demand-driven framework), we suggest that states adopt migrant care worker policies to actively shape local women's labor force participation. The state may encourage local women to participate in paid employment as a deep commitment to gender equality and/or driven out of the necessity of economic development. This study lends support to the importance of investigating supply-driven framework of care.

Utilization of Maternal Health Care in Yemen

A recent UN Report ranked Yemen 154 on its Human Development Index with a per capita income of less than $4000. Wide differentials are observed between rural and urban areas regarding utilization of maternal care services in Yemen. The recommended minimum of four antenatal care follow-up visits were received by 47 percent of births to mothers living in urban areas, but for only 16 percent of births to mothers living in rural areas. Similarly, 49 percent of deliveries in urban areas, and only 23 percent of deliveries in rural areas, took place in health care facilities. These measures indicate that the utilization of various maternal care services are not encouraging, particularly in the rural areas. In the present analysis we addressed the limitations that exist in the literature and used the theoretical framework developed by Andersen and Newman (1973). This approach incorporates both individual and program characteristics in addressing the utilization of maternal care services in rural areas of Yemen. To capture the complexity of the various aspects of maternal care utilization we constructed a composite index based on the various components of the maternal care services. The preliminary analysis indicates that among the various socioeconomic and demographic variables considered, variables such as birth order, education of woman, household standard of living index and women's exposure to mass media have larger variations in the utilization of maternal care services, even after controlling for other predictor variables. Similarly, among various community level and program variables considered, a health worker visit during pregnancy and the distance to a government health facility have strong and statistically significant influence on the utilization of maternal care services.

Children, Gender, Class and Fashion in Kolkata: An Intersectional Analysis of Discrimination

In late capitalism there has been a growing 'commercialization' of childhood where children are perceived as active consumers of fashion. This presentation critically interrogates the role of fashion, in the form of clothes, shoes, cosmetics, accessories in the lives of children of 15 to 17 years of age in burgeoning consumer society of Kolkata, thereby attempting to bring forth its class and gender dimensions which result in discrimination. There is gender politics behind fashion as girls' subjectivities are oriented towards fashion in ways boys are not. Though teen boys unlike their fathers or grandfathers are taking active interest in fashion, too much preoccupation with it is still defined by them as 'feminine'and is devalued. Fashion is also a site where there is production and reproduction of class inequalities and discrimination. Fashion industry creates a hierarchy of 'taste' (Bourdieu) in fashion, indicating processes of discrimination which defines and marks off the high from the low. Teen girls from privileged socio-economic backgrounds having access to first world fashion ideas and practices through the internet and popular media, consume and present themselves in ways that express their distinct "costly" taste. These children 'do difference' (West and Fenstermaker) along class lines by wearing branded clothes, global branded products and discriminate against girls from less privileged backgrounds who are held in contempt for their "inferior" taste and style.Teen girls from lower socio-economic backgrounds with limited buying capacity feel deprived and inferior in relation to their bodies which may have long term effects on their identity. The feelings of inferiority gets multiplied if combined with socially constructed undesirable physical traits. The global political economy of fashion industry reproduces hierarchies of inequality around 'habitus' and 'taste' where body is the central mechanism through which difference in terms of class is performed.

In Quest of Global Beauty: Gender –Technology Interface through Body Beautification

The consumer culture of late modernity has brought the body and the beauty industry to the centre stage where there is a growing obsession with the appearance of the body. Today products, images and ideas of beauty industry reach every corner of the world, including a developing country like India. This presentation focuses on how adolescent girls and boys of Kolkata within the age group of fifteen to eighteen are preoccupied with beautifying their bodies. Though both boys and girls invest in the body, beautification is gendered as boys invest less time, energy and resources on beautification. The majority of teens, especially girls choose internet technology, over any other medium, as a source of information on beautification. Traditional popular media is replaced by fashion blogs, cosmetic products' official networks that are feminized, primarily geared towards women, disseminating first world beauty images, ideas and practices of beautification which have power effects on adolescent subjectivities. The websites on beauty reflect the understanding or construction of girls as sexual, and reinforce narrow and stereotypical meanings of girlhood, beauty and consumption. A tween culture of the net generation has emerged oriented towards fashion and beauty through the net, includes those who participate as peers and treats

the non-participators as the 'other'. The influence of first worlds' ideals of beautification is visible in the girls' dressing style, skin care and body comportment though girls creatively assimilate elements of local beauty culture, stalling homogenization of beauty. This paper critically interrogates whether globalized images of beauty reaching a segment of the youth through the digital world creates a distinction between "us" and "them". The latter are those who due to their structural locale find themselves excluded from an access to globalized images and products of beauty.

How Do State Reforms Lead to Cooperation Between Different Professionals ? Statements about the Food Safety Sector in Switzerland

How do different public professionals react when they face organizational and managerial restructuring that press them for more collaboration ? This question is particularly interesting because administrative restructuring bring about uncertain results regarding the type of professionalism and the professional balance of power.

Our contribution is based on a ongoing study about the reforms occurring in the food safety sector in Switzerland in which veterinarians, food engineers and chemical engineers are involved. It intends to discuss the following aspects :

-        The effects of the reforms on professional autonomy, knowledge and working habits of each types of professional bureaucrats depend on the previous collaborative or competitive relationships between the administrative units at different territorial levels. Although these professionals are not front-line professionals, their working habits are not so easy to change because they are linked with the clients they have to cope with or they feel closed to (farmers, food processing industry, broad public).

-        The acceptance of the administrative reforms depends on the previous career patterns of these professional bureaucrats and not only on their future career expectations. Of course, they might consider the reforms either as an opportunity or as a decline (for themselves, for their organizational unit or for their profession as a whole). But their career path shapes their actual professional view too. In our case study, the three types of professional bureaucrats were not especially trained to become civil servants and a part of them worked for private firms or as self-employed before entering the state administration. We make the hypothese that the reasons that lead them to become professional bureaucrats impact the ways they identify (or not) with the reforms.

Two Necessary Ingredient: Role of Emotions and Efficacy in Social Movement Participation in Hungary

Emotions are able to foster participation in social movements and demonstrations, however they could decrease the propensity for participation as well. One could argue that certain emotions towards politics as commitment, anger, enthusiasm might lead to participation, while others, as disappointment or fear would withhold people from participation.

However, emotions predict participatory behaviour only if we also consider people's attitudes towards efficacy of demonstrations. Thus, any strong emotion might be a sign of a psychological commitment towards public issues. The question is, in what condition this commitment leads to political engagement or alienation. In our paper we argue, that confidence in efficacy of a given form of political participation is a necessary condition to channel emotions into political participation.

In this study, we focus on the relation of emotions and participation in protest events and based on the argument above we hypothesize that any type of strong emotion could be channelled into participation in protest events if one thinks that this form of political participation is effective, while the same emotions might block people from participation when they do not believe in the efficacy of demonstrations. In the same time, without strong emotions towards politics, the belief that demonstrations are effective forms of participation also does not lead to participation. Thus we detect mechanisms foster or imped participation in public rallies, taking account the role of efficacy.

We scrutinize the role of emotions in mobilization through a survey conducted in 2014 among the Hungarian adult population, their participation in certain protest events and their emotions toward politics.

Hermeneutic Bourdieu

The main purpose of this paper is to examine the extent to which Pierre Bourdieu may be described as a 'hermeneutic sociologist'. Given his in-depth engagement with the interpretive facets of human existence, it should not come as a surprise that hermeneutics represents a constitutive component of Bourdieu's undertaking. Yet, in the literature, one finds little in the way of a systematic discussion of the place that hermeneutics occupies within Bourdieu's oeuvre. To the degree that the hermeneutic aspects of Bourdieu's writings are overlooked, however, it is impossible to do justice to the epistemic complexity of his plea for a reflexive sociology. As argued in this paper, Bourdieu may be regarded as a 'hermeneutic' – or, at least, 'hermeneutics-inspired' – thinker insofar as his work is marked by a profound interest in the nature of 'interpretation'. Bourdieu's sustained concern with the interpretive facets of social life has major implications for his conception of human existence. As a thorough examination of his writings reveals, Bourdieu conceives of 'interpretation' as a socio-cognitive process that is crucial not only to procedures of sociological investigation, conducted by experts, but also, in a more fundamental sense, to quotidian practices, performed by ordinary agents. In order to illustrate this, the paper sheds light on ten significant elements underlying the 'hermeneutic Bourdieu'. As elucidated in this study, the hermeneutic spirit pervading Bourdieu's research programme is reflected in the fact that he stresses the (1) socio-relational, (2) practical, (3) unconscious, (4) situational, (5) doxic, (6) contingent, (7) meaning-laden, (8) experiential, (9) resourceful, and (10) power-laden constitution of human existence. By way of conclusion, the paper draws attention to some key questions arising from the critical analysis of these 'hermeneutic' elements, notably in terms of the pivotal role they play both in sociological enquiry and in everyday life.

SUSEN, SIMON* (City University London, simon.susen@cantab.net)

The Sociological Challenge of Reflexivity in Bourdieusian Thought

The main purpose of this paper is to examine Pierre Bourdieu's conception of *reflexivity*. The concept of reflexivity plays a pivotal role in Bourdieu's attempt to develop a 'critical sociology' (*sociologie critique*), often referred to as 'reflexive sociology' in the Anglophone literature. Based on a thorough textual analysis of his key works, the paper aims to demonstrate that the following twelve elements are particularly important to Bourdieu's conception of reflexivity: (1) 'science', (2) 'vigilance', (3) 'consciousness', (4) 'self-awareness', (5) 'critique', (6) 'self-objectification', (7) 'distance-taking', (8) 'rupture', (9) 'epistemology', (10) 'historicization', (11) 'understanding', and (12) 'emancipation'. Although the concept of reflexivity constitutes a useful methodological tool for the construction of critical epistemologies and for the pursuit of social research, it raises a number of significant questions. It is the task of the concluding section of this paper to address a number of controversial issues that arise when faced with the challenge of evaluating the merits of Bourdieu's account of reflexivity. In accordance with the structure of the foregoing enquiry, these issues will be synthesized on the basis of 'twelve theses on Bourdieu's conception of reflexivity'.

"It Was Necessary at the Beginning to Make This Whole Revolution". Men's Attitudes to Daddy Quota and Gender Neutral Parental Leaves in Poland and Sweden

The aim of this paper is to show the attitudes of Polish and Swedish fathers to daddy quotas and gender-neutral parental leaves. The comparisons of two distinctively different societies, which characterize with different family policy systems and gender equality policies, allow to show how the particular mechanisms of family policies influence people's thinking about parenthood and gender parental roles. The Polish family policy is mother-oriented and only recently started to recognize men as its recipients. Men's role in the family is still mainly seen in terms of breadwinning. Whereas in Sweden there is a long tradition of gender neutral parental leave and there are special mechanisms which role is to enhance men into a greater engagement in care work. I argue that such institutional contexts have a great impact on how Polish and Swedish men perceive their parental roles and what attitudes they have to traditional parental roles and division of domestic work. I claim that the family policy instruments play an important role in changing men's thinking about fatherhood (and motherhood) and can accelerate the decline of patriarchal fatherhood. The lack of such instruments only sustain the traditional gender order.

In this paper I concentrate on men's attitudes to daddy quotas in parental leaves. These attitudes are strictly connected to family policy systems and prevailing models of fatherhood and motherhood. My analysis is based on 52 in-depth interviews conducted with fathers in Poland and Sweden in 2012 and 2013. All interviewed men were from middle class, heterosexual lived with their children and shared a common household with their partners. Such homogenous group help to conduct the comparative analysis of fatherhood experiences in Poland and Sweden.

The Memorial Days and the Persistence of the Movement: A Study on the Palestinian Mass Mobilization from 1987 to 1993

Many studies exist on the reason for the occurrence of mass mobilization, as well as it successes and failures, but there currently exists a research gap on the persistence of this movement. This presentation analyzes why Palestinians succeeded in maintaining their mass movement for five years, called the Intifada, from 1987 to 1993. The Intifada is very rare because of its length. By analyzing the background of its persistence, this presentation highlights the important role of the memorial days in this mobilization.

Previous studies illustrate the importance of the newly formed United National Leadership (UNL) in the Intifada, which issued the leaflets to mobilize the people. Conversely, there are other studies suggesting the diminishing influence of the UNL during the dispute with a new Islamic organization, Hamas. However, this confusion among leaderships did not lead to the de-mobilization of Palestinians; rather, Intifada continued for five years. This presentation suggests that the similarity in the strategies of the UNL and Hamas, which invoke the collective memory of former movements. By referring to their Arabic leaflets, it is clear that the UNL and Hamas easily match their mobilization commands by utilizing memorial days in Palestine. For example, they both called a general strike each March 30th, which is the Palestinian "Land Day." This mobilization strategy seems to be working very well, as there are at least 10 notable memorial days in addition to the monthly anniversary of the occurrence of the Intifada. People are familiar with these memorial days and have personally experienced action on those days each year.

In conclusion, this presentation shows that the memorial days work positively for the persistence of the mass mobilization movement.

Struggles for Social Status of Manga: The Analysis of Joint Works By the Manga-Artist Group in "Asahi Graph" in the 1930s.

This research shows some manga artists attempted to change the existing social-cultural order by drawing and creating.

Previous researches examine modern manga originated in the Meiji period in Japan, but the social status of manga was subordinate, compared with ART. In the 1920's, some manga artists formed a group, Tokyo-Manga-Kai, and published "Manga" as their bulletin to change this cultural hierarchy. They originate the cultural movement against low social evaluation to manga, by asserting themselves.

In the 1930s, "Amateur" which is young and does not have social recognition as a manga artist, started to participate in this movement. Some groups were formed such as Shin-Mangaha-Syudan, Sanko-Manga-Studio and Shinnei-Manga-Group. It is the collaboration by one group that the characteristic of the groups in the 1930s is. They created one work (a joint work) as not authors but one group.

In this presentation, I clarify some kinds and features of the collaboration from the analysis of "Asahi Graph". Furthermore, I point out that there is appearance of "Drawing Readers" in the background of such situation.

Law and Justice from the Bottom: The Public Interest Litigation Movement in Contemporary India

In this paper, I attempt to examine the current socio-political dynamics of caste through protest movements of the marginalized Dalit community (formerly known as Untouchables) in contemporary India from a case study of Balmiki (a sweeper caste). In particular, I explore the political aspects of caste by focusing on the caste-based quota system, known as "reservation," which is a part of India's affirmative actions and the related movements.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Since the late 1980s, an important factor of Indian politics is the shift to a multiparty system and the rise of identity politics. With an increase in equality and social justice, marginalized castes have risen to challenge existing policies and demand an equal share in state resources.

I found that the success rate for the implementation of the reservation policy for the benefit of the lowest castes was significantly low. The distribution has been uneven among the targeted groups. Moreover, the results of my fieldwork revealed that most people tried to hide their caste. However, a number of them also affirmed their caste in order to obtain the benefits of welfare schemes and protect their rights by approaching to the judicial system through Public Interest Litigations (PIL). Who are the supporters and why do they launch the movements? These questions also explain why caste identity has become more positive and assertive, which has led to the politics of difference in contemporary India.

Khat Chewing and Dark Leisure

This paper draws on research currently being undertaken on khat chewing within the Somali community. Its aim is to address the moral debate surrounding the use of khat, a narcotic chewed by Somali males in their leisure time. The paper provides an overview of the arguments surrounding the morality of khat chewing, encompassing the views of detractors such as women's groups, religious authorities, and the UK Government. Who argue that the practice has a negative effect on communities, is prohibited by the Quran and funds terrorist activities on the Horn of Africa (Harris, 2004; Travis, 2013). The views of those who chew khat is also put forward through articulating their arguments on khats role in providing community and a sense of belonging to a wider Somali identity, which in Western societies helps them alleviate feelings of being threatened or stigmatised (Hansen, 2010). The key argument is built around how we articulate dark leisure. By using the philosophical insight of Zygmunt Bauman (2000) and Emmanuel Levinas (1985), it will be argued, that in contemporary society, referred to as liquid modernity, ethical legislation in the form of religious and political doctrine becomes increasingly hard to enforce. This is due to the ephemeral nature of contemporary society, caused by globalization and the subsequent increasing flows of populations and cultures which have penetrated the supposedly homogenous and uniformed structures of the nation state. As a result, it will be argued that institutionalised forms of ethical legislation have been replaced by individual notions of morality, due to the increased levels individuality imposed upon people. Leading to a situation where khat chewing and other Dark Leisure activities should be understood through the mantra of how they affect the 'Other', making morality more ambiguous, as each situation has to be understood within a variety of different contexts.

Making Sense of Ecovillage Senses

Ecovillage is an intentional community created with a foresight for the community to flourish amidst deep ecological concern. Senses of sight, sound, touch, smell, taste and the sense of social environment in ecovillages, engenders an inner feeling of satiety and peace, of the love of a life which can be lived simply along with care for other living creatures big or small. Ecovillage senses have the power to influence the socio-psychological ambience and inner feeling, which leads to a peaceful existence.

Modern ecovillages are shaped by sensual character and spirit of individuals who had taken the initiative to form ecovillages, but they in turn shape the senses of individuals who get involved with ecovillages as residents or as participants in their activities.

The activities which members of an ecovillage community are involved in forms interlinkages among various members living within the ecovillage, ones living on the outskirts of these ecovillages and outsiders who frequent ecovillages. The activities in ecovillages are created for children, students, youth, working people, non working individuals and the elderly, and these activities lead to the interaction of various groups and individuals. These activities beneficially impact the surrounding social and ecological environment.

This researched paper tries to bring out the essence of ecovillage senses. It explores ecovillage activities which are conducive to providing a sensory experience. This paper also analysis how these activities shape the senses for aesthetic living, ethical feelings, social relationship and social responsibilities towards the community, individuals and towards the environment.

The social energy and effervescence which pervades ecovillages soothes and provides the human soul an air, it contents in. The enchanting fragrances which ecovillagers breathe, hues they delight in, soothing nature sounds which heals, and social cohesion, pervades their inner-self.

Social Movement Organizations, Epistemic Communities or a "Third Sector"? the Divergent Roles of Indian Civil Society Organizations in Policy Networks of Climate Change

Three distinct literatures have discussed a purported increase in the involvement of civil society organizations in political contention, policymaking and implementation. Social movement scholars discuss the emergence of a "social movement society", where contentious political participation through social movement organizations is becoming the norm rather than the exception. The literature on "epistemic communities", on the other hand, argues that increasingly specialized civil society organizations take part in policymaking alongside scientific experts and government bodies. The literature on the "third sector", in turn, sees civil society organizations as ever more important actors in implementing policy, alongside the government and business sectors of society. Using data from a network survey and qualitative interviews, we find that civil society organizations in India that work on climate change are engaged in all three kinds of activities discussed above. Some challenge the government's positions through social movement actions, others are engaged in epistemic communities drafting the very documents that lay out what those positions are, while yet others are implementing third sector projects particularly related to climate change adaptation by poor communities. We investigate to which extent these three types of organizations have network ties to government bodies, international organizations and each other, and to what extent can the same organizations sometimes take on all three roles to varying degrees.

Racial Exposure and Neighborhood Choices of White Parents of Black and Multiracial Transracially Adopted Children in the United States

While past research on racial socialization tends to focus on providing cultural knowledge and pride, this paper looks at exposure to environments as a means of understanding how white parents prepare their transracially adopted children for racial discrimination in the United States. Neighborhood choices and decisions of where to send kids to school and who to befriend are analyzed using in-depth interview data from 19 white adoptive parents of black and multiracial adopted children to understand how they approach racial socialization. Analysis illustrates how those that adopted transracially both domestically and internationally stressed that they did not want their children to be in environments where they would be the only person of color because they were concerned about their child experiencing racism and feeling isolated. Even so, they tended to live in white neighborhoods and send their children to predominantly white schools. Parents expressed being conflicted by what they saw as opposing measures and perceptions of school quality and racial/ethnic diversity. The parents in this study said that they sought out social support through organizations and friendships to expand their social networks for themselves and their children. Findings are not meant to challenge or support transracial adoption, rather to gain insight into racial socialization practices and to inform social worker training, pre-adoption counseling and post-adoption support services, particularly for those adopting across race lines.

Demographic Change and Regional Population Dynamics in Germany - the Impact of Internal Migration on Regional Population Decline

Regional consequences of demographic change in Germany, the future aging and the shrinking of the population, strongly depend on the development of internal migration. Based on current trends, it cannot be predicted how this will change under conditions of aging and population shrinking. Though they only reach until the 2030s, recent model calculations indicate that competition between places of residence will increase and that regional disparities of population development will further intensify in the future. Based on forward projections of previous trends, these model calculations tend to present the long-term population development in suburban and rural regions -which have in parts strongly benefited from internal migration-, rather too positively.

The model calculation presented in this study is based on the assumption, that for differentiating population growth by internal migration, there have been other patterns in the past than this will be the case for the future, in which the population will decline in total. Based on a concentration of an expected long-term decline of the population in less attractive, structurally weak regions the model calculation shows, that beyond 2030 even such rural and suburban regions will experience a substantial decline of the population which still have, according to current trends, comparatively positive perspectives.

The presentation intends to:
- analyse recent internal migration trends in the context of demographic change and population shrinking
- discuss whether re-urbanisation is a likely scenario of future regional population dynamics
- assess alternative internal migration assumptions for regional population projections
- present projections of regional population decline up to 2060

SWIATEK-MLYNARSKA, PAULINA* (Institute of Sociology, Warsaw University, krzysztof.swirek@gmail.com)

The Advantages of Isolation: War on Terror and European Refugee Debate

In European debate on refugee crisis in 2015 several Eastern European countries protested against the quota system. In Polish public debate on the problem, right wing politicians and journalists often used the argument, that letting refugees in would be an act of „importing terrorism" into country. The language and imaginaries of war on terror was used not as a government's tool for rationalization of greater surveillance or security oriented politics, but rather became disseminated in broader public sphere and among right wing activists as a way of arguing for isolation and no-solidarity stance.

That way the semiotics of war on terror became a part of larger discourse, in which the community is shown as a fortress under siege. I will try to draw connections between these occurrences and an observation made by Fredric Jameson several years ago, that in times of late capitalism the middle classes of affluent societies are more and more perceiving themselves figuratively as closed in a fortress encircled by hostile surroundings.

I will further argue, that in times of late capitalism, certain (representational) 'politics of isolation' became necessary structural counterpart of global situation of multidimensional and disorganized conflicts: it provides a comfortable mapping tool and excuse for inaction at the same time.

Furthermore, I want to observe, that discourse of isolation in face of uncertainty is not produced only at the level of nationwide politics. The isolation of individual, constantly under threat in face of growing uncertainty, finds its reinforcement and justification in discourse of entrepreneurial self. Discourse of community under siege is an allegorical equivalent of the latter on the national level.

SWIDER, SARAH* (Wayne State University, sswider@gmail.com)

Building China: Informal Work and the New Precariat

Roughly 260 million workers in China have participated in a mass migration of peasants moving into the cities, and construction workers account for almost half of them. In *Building China*, Swider draws from research in Beijing, Guangzhou, and Shanghai between 2004 and 2012, including living in an enclave, working on construction jobsites and interviews with eighty-three migrants, managers, and labor contractors. This ethnography focuses on the lives, work, family, and social relations of construction workers. It adds to our understanding of China's new working class, the deepening rural/urban divide, and the growing number of undocumented migrants working outside the protection of labor laws and regulation. Swider shows how these migrants—members of the global "precariat," an emergent social force based on vulnerability, insecurity and uncertainty—are changing China's class structure and what this means for the prospects for an independent labor movement.

The workers who build and serve Chinese cities, along with those who produce goods for the world to consume, are mostly migrant workers. They, or their parents, grew up in the countryside; they are farmers who left the fields and migrated to the cities to find work. Informal workers—who represent a large segment of the emerging workforce—do not fit the traditional model of industrial wage workers. Although they have not been incorporated into the new legal framework that helps define and legitimize China's decentralized legal authoritarian regime, they have emerged as a central component of China's economic success and an important source of labor resistance.

Gendering China's Construction Industry

This paper explores the gendering of construction work and how that shapes what are considered rights and the potential opportunities to organize. In China, in the last 35 years the construction industry has been an important engine of China's economic growth and in the process it has absorbed more than 45 million migrant workers, mostly men, from the countryside. During this period, work has been (re) organized in a gendered way which has not only made it increasingly precarious but also shifted risk unto workers. While most of these migrant workers are men, there has been an increase in women in the industry, making visible the gendered organization of construction work and the gendering of construction workers as "single" men. This paper explores why there has been an increase in women in the industry, how they are being integrated into the organization of work, and how that makes the gendering visible. It shows how struggles over wages, working hours and safety on the jobsite are limited by the fact that they are "single men", their protests are more easily characterized as dangerous and unruly, and hence met with violence, and paternalism limits organizing efforts. Finally, it looks at how women entering the industry change some of these gendered dynamics.

The Ideational Effects of Foreign Aid: Accounting for Increasing Gender Egalitarian Beliefs in Malawi

Ideational change is an important outcome for improving the lives of women. Beliefs about gender have shifted toward more egalitarian views in the past few decades across most sub-Saharan African countries. What predicts gender egalitarian views and what accounts for this rapid cultural shift? I investigate the effects of foreign aid projects conducted in Malawi that are specifically aimed at changing gender dynamics. My outcomes of interest are: (1) Malawians' beliefs about when a wife is justified in refusing sex from their husband; and (2) Malawians' beliefs about whether a wife is justified in asking their husband to use a condom if he has a STD. Linking district level foreign aid data with multiple survey-waves from the Demographic and Health Surveys (2000, 2004, and 2010), I use multilevel models to test for cultural effects of aid. I find that *Women in Development* aid is positively associated with both gender egalitarian beliefs measured, and that *Population Policy* aid and *Family Planning* aid has a positive influence on one belief but not the other. My results show that foreign aid does exert significant influence on Malawians' beliefs about gender, and, more broadly, that foreign aid has ideational consequences, whether or not they are intended.

The Potential and Limit of Google Ngram Data and Other Historical Corpora in Sociological Research

The recent explosion of corpora of millions of digital historical texts such as the Google Ngram database invites many new opportunities for social research. Central to such inquiry are keyword analyses of how often a given term has appeared over time. The creators of many of these databases of historical texts claim that their data allow for quantitative measurement of cultural change. Many scholars, journalists, and others now use these databases to support such arguments. The rub is that these claims almost invariably ignore issues of representation bias in historical texts and suffer from significant measurement error. I outline how these massive, powerful historical corpora can be exploited more accurately and appropriately for sociologically inquiry. In doing so, I summarize research on historical literacy rates, publishing industries, and newspaper reporting practices that inform issues of representation bias, and I show several instances of common measurement errors made by many using historical corpora. I then include two empirical examples of what types of claims these data can support and how researchers can minimize measurement error with these data. The first involves the appearances of various terms that have been used to refer to the "Third World" and the second is a measure of when labels for Americans of African descent have shifted from "Negro" to "Black" to "African American."

Do Social Ties Protect Immigrants from Depressive Disorders?

There is a complex relationship between social ties and mental health of immigrants in the United States. Social ties are known to enhance mental well-being and protect against mental illness. However, social ties among immigrants are correlated with other factors, such as acculturation, racial-ethnic identity, and stress, which also have relationships to mental health and illness, resulting in sometimes unclear findings regarding the association between social ties and im-

migrant mental health status. In addition, the concept of social ties as they relate to health is multifaceted, and measurement of its various dimensions (e.g., social network, social support) is often limited, contributing to inconsistent findings across literature. This study is unique in that it considers immigrants' racial-ethnic background, other immigrant characteristics, and multiple measures of social ties to clarify the association between social ties and depressive disorders among immigrants. The data for the study are derived from the National Epidemiologic Survey on Alcohol and Alcohol-Related Conditions, a large representative, longitudinal sample of US adults. DSM-IV-based diagnoses of major depression and dysthymic disorders and measures of 12-month prevalence and 3-year incidence and persistence of each disorder were constructed. Social ties were assessed with previously published social network, social support , and racial-ethnic social preference measures. Acculturation, racial-ethnic identity, and stress were also assessed using existing measures. Logistic regression analyses were conducted to test unadjusted and adjusted models for each outcome, computing interactive effects of foreign-born status and race-ethnicity. In the final model, with a few exceptions, network close ties and network instrumental ties were associated with lower likelihood of having a prevalent, acquired, or persisting depression. However, social support and racial-ethnic social preference typically had no significant associations with the outcomes. The discussion focuses on how and why different aspects of social ties can be protective or neutral in immigrant depressive disorders.

Drawing on Interdisciplinary Perspectives to Understand Immigrant Mental Health

In this study, we utilize social/behavioral, epidemiological, and psychiatric perspectives to more fully understand the extent of mental health problems and treatment gaps among immigrants to the US. We describe how an interdisciplinary group of researchers came together to develop a framework to investigate factors shaping immigrant mental health and help-seeking for mental health problems. We draw on the history of immigration in the US and sociological and psychological research on acculturation, social stress, prejudice and discrimination, and the role of social ties in health to delineate potential factors shaping immigrant mental health and help-seeking. Furthermore, we use psychiatric conceptualizations of mental disorders (per Diagnostic and Statistical Manual of Mental Disorders [DSM]) and epidemiologic data to test hypotheses about the relationships of immigrant status and racial-ethnic origin to mental health outcomes, as well as the explanatory role of social/psychological factors (e.g., acculturation, discrimination). The data for the study are derived from the National Epidemiologic Survey on Alcohol and Alcohol-Related Conditions (NESARC), an excellent source of recent data on mental health for the US adult population. This longitudinal survey oversampled racial/ethnic minorities, targeted vulnerable/transient populations, and has detailed information about mental/behavioral conditions, immigrant characteristics, and social/psychological factors of interest in this study. We constructed DSM-IV-based diagnoses of depressive, anxiety, and substance abuse disorders from information in the NESARC collected using a state-of-the art diagnostic interview (AUDADIS-IV). Psychiatric expertise on this project was essential in correctly coding respondents based on the necessary and/or available DSM-IV criteria for each disorder. We used logistic regression analyses to test unadjusted and adjusted models for each outcome, computing interactive effects of immigrant (foreign-born) status and racial-ethnic origin. Our empirical findings are presented briefly while we discuss in-depth the interdisciplinary contributions in this project and value of interdisciplinary collaborations in research on immigrant health.

Going Rogue: Russ George and the Problem of Governance in Geoengineering

He convinced the Vatican that he was going to help it go carbon neutral by planting trees in the central plains of Hungary (where trees don't grow). He sold a Canadian First Nation tribe on the idea that seeding the Pacific Ocean with iron filings would make algae bloom, creating a powerful carbon sink while bringing back abundant runs of salmon.

Visionary dreamer? Manic-depressive? Incorrigible sociopath? Whatever the individual diagnosis, the phenomenon that is Russ George urges us to consider the question of governance. If the only thing that's left is Plan B, nation states are not going to be the only actors. That would be hard enough, given the troubles we see in reaching, and further troubles then enforcing, international agreements, treaties, protocols. But the problem of governance goes far beyond that, from the potential for action by a coalition of nations deciding to act without global

consent, to the potential for action by non-State actors of various kinds, from, possibly, private corporations down to and including (as the case of Russ George shows) rogue individuals.

In this paper I review the evidence on how the world has dealt – or, more exactly, failed to deal -- with Russ George. I then ask: What can we learn from the failure to control him about the problem of governance if the world's nations at some point start think that geoengineering is the only option left to them?

SZASZ, ANDREW* (University of California, Santa Cruz, szasz@ucsc.edu)

Red State; Blue State: Conflicts over Teaching Climate Change in U.S. Public Schools

Americans like to think of themselves as being NUMBER ONE. Surveys show, though, that American students rank about #24th in the world on scientific and mathematical literacy. Alarmed, a consortium of national scientific bodies worked to develop new standards for science teaching in public schools, known as the Next Generation Science Standards (NGSS).

There are impediments to reform, however: Teaching science means teaching *evolution* and it means teaching *climate science*, both immensely controversial in a society where roughly 40% of the public believes some version of Young Earth Creationism and where many are skeptical about climate change.

Adoption of the NGSS has gone smoothly in some "blue" (liberal) States. NGSS have been rejected, as one would expect, in several "red" (politically and culturally conservative) States. Surprisingly, though, NGSS has also been adopted in some very "red" States such as Alabama, West Virginia, Kansas (note: there are no instances of "blue" States refusing to adopt).

This paper explores two questions:

(1) Why are NGSS standards rejected by conservative State legislatures or Boards of Education? Is it: (a) the latest manifestation of a long tradition of American parents wanting to exercise control over what their children read (banned books) or taught (sex education)? (b) a continuation of the historic conflict over teaching evolution? (c) evidence that opinions about climate change have been subsumed into the larger "culture wars" that have riven American political culture over issues that range from abortion and gay rights, to religious displays on public buildings, to gun control? (d) all of the above?

(2) How can one explain "anomalous" cases where "red" States adopt the NGSS when everything we know about the current political situation in the U.S. would predict that in such places NGSS would be rejected?

SZOLUCHA, ANNA* (University of Bergen, annaszolucha@gmail.com)

Grassroots Mobilisations and the Democracy They Want: Renewable Energy and Anti-Fracking

Recently, a wave of local resistance to increasingly risky methods of fossil fuel extraction (such as exploiting shale gas in Europe and the USA, tar sands in Canada or drilling in the Arctic) has swept across many countries in the world. Some of the most sustained civil disobedience against fracking (an unconventional method of shale gas extraction) took place in Europe. How are this opposition to fracking and popular demands for energy transformation navigating the closely intertwined structures of state, finance and (carbon) democracy? May they be anticipating a new form of democratic politics?

Based on my fieldwork in the UK and Poland, I would like to explore how in practice, national policy narratives and local planning procedures appear to be designed in ways that help evade different forms of popular democratic contestation, producing some puzzling outcomes when they are met with grassroots resistance. I will also examine the inherent power imbalances between state, local communities and energy corporations during planning and negotiation processes. This conference paper will aim to explore how economic and political pressures are passed from the top national and international actors down to citizens living and working in regions potentially affected by fracking. I will try to uncover the consequences of national, corporate and international interests and narratives for local communities as well as how local communities respond, mediate and resist such pressures. This will also help describe persistent inequalities that are being played out in democratic negotiation processes between local populations, the authorities and energy corporations.

This paper will provide a comparative analysis of the changing nature of democracy in contemporary Europe as well as the issues involved in negotiating the future supply of energy – the two questions that perhaps, unlike any other in the contemporary world, demand our immediate attention.

SZOLUCHA, ANNA* (University of Bergen, annaszolucha@gmail.com)

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Repowering Democracy: How Grassroots Energy Initiatives Are Changing the Face of Democracy in Europe

In recent years, and in direct contrast to increased concern about global warming, the pace of unconventional gas development around the world has been staggering. The unlikely counterpart of the unconventional oil and gas boom has been a decline in conventional forms of democratic political participation (such as elections) and a simultaneous enormous growth in non-institutional forms of participation such as boycotts and protests. Many local communities are organising into action groups and campaigns against hydraulic fracturing. In places where the protesters managed to make the energy corporations abandon the drilling sites, communities are organising in egalitarian ways and forming new renewable energy co-operatives where regardless of their shareholding, all members have the same power to co-decide. The aim is to take responsibility for meeting their own energy needs in a way that is local and mitigates climate change. May grassroots mobilisations against fracking and new local energy co-operatives reveal the potential for a repowering of democracy?

Building on my fieldwork in the UK and Poland, in this paper, I would like to investigate the potential of such groups for a repowering of democracy, i.e. a reformulation of democratic models and a reorganisation of energy production along more egalitarian lines. The main objective will be to analyse (1) the forms of politicisation and imaginaries of egalitarianism in Polish and British communities and (2) to describe efforts to draw up strategies for local and systemic social innovation in the field of democratic self-organisation of energy initiatives as well as, more broadly, a more democratic way of local self-government.

This paper will assess the claim that only innovations in democracy and local renewable energy solutions that are complementary and occur in parallel can offer comprehensive frameworks to maximise the impact of local initiatives on pressing societal issues.

More Choices but No Chances? Making Sense of Neet Young People and Digital Technologies

There has been very little research concerning disadvantaged young people and their personal experiences of digital technologies. This paper aims to fill the gap by exploring the realities of the digital lives of Scottish young people who are not in education, employment or training (NEET). This paper employs a narrative inquiry methodology in association with a Bourdieusian sociological lens in order to capture and make sense of the complex relationship that exists between NEET youth and digital technologies. While a narrative approach allows participants to share their accounts of such relationships freely, the Bourdieusian framework seeks to position those accounts within unequal power structures and broader socio-economic, cultural and political dimensions. Three significant issues have emerged from NEET young people's accounts and are thoroughly discussed in this paper. The first concerns the experiences of being NEET, the impact of disadvantage on the education, training and employment opportunities of young people, and the ways they would like to be supported into positive destinations. The second issue explores the realities of their digital lives, how technology fits into their everyday lives and practices, and how cultural context shapes their understanding, interpretation and engagement with technologies. Lastly, the visible links between their offline and online lives and inequalities are scrutinized. Drawing on research across social science and utilising young people's knowledge and experiences will inform the most effective approaches in delivering support for NEET youth. The findings will have implications for current policy initiatives directed at tackling youth unemployment and social disadvantage, as well as for practice interventions supporting NEET young people into positive destinations in Scotland.

Measuring Unmeasurable - Evaluation of Studio Visits and Residencies

Mobility of visual artists is nowadays possible not only thanks to the easiness of travelling but also because of a many grant programmed offered by institutions such as British Council, Trans Artists, Res Artis, AiR Laboratory or Adam Mickiewicz Institute. Nobody doubts that international coopetarion in many cases can initiate a new exhibition, let the artist make new contacts and foster his personnal development. Though it is very hard to tell to what extend participating in a study visit to or a residency affected concrete project and to what extend subsequent stages of artistic career are related to talks, meetings or gallery visits carried during ones stay.

The aim of the presentation is to analyse selected examples of study visits realized by Adam Mickieiwcz Institute and reflexion on possible ways of quantifying its effects. The author presents tools for measuring such events used by other international institutions related to the contemporary art. The speech focuses on describing very pragmatic arguments concerning evaluation of cultural events, although the whole presentation will refer to classical sociological theories proposed by H. Becker (1982), T. DeNora (1995), or I. Wagner (1996).

From Representative to Participatory Democracy - Gram Swaraj for a Better Future.

India, the largest and most successful democracy holds periodic and regular elections to the houses of people's representatives. This is the strength of its representative democracy as a political system.

A nation of over 1 billion population cannot be effectively or efficiently managed by any centralized system, central, state or district level. The wisdom of Gandhiji is evident in his call for Gram Swaraj.

Traditionally, the Indian village even made and implemented its own laws. However, post-independence and modernization coupled with urbanization have impacted the 'independent village', in ways detrimental to Gram Swaraj.

While the 73rd and 74th amendments were intended to facilitate democratic decentralization, there is little evidence of change in this direction. The village has been orphaned requiring adoption by government departments and civil society organisations.

Efforts for democratic decentralization have been top down. While Houses of representatives at state and centre are critical for democracy to be alive and functioning, the Gram Sabha at the village is equally critical. For a successful grassroots democracy, a bottom up approach where representative democracy blossoms in a participatory democracy is required.

Villages in Partnership (VIP), a Civil Society organisation, having experimented and successfully demonstrated the contribution of people's partnership, has, since the last 6 years, been working on facilitating a vibrant grassroots participatory and responsible democracy. Enhancing people's self-respect, mutual trust, concern for the village through just and judicious use of public funds, local resources and people's contribution is the focus

 It is important to strengthen and expedite movement on the development continuum Charity – Participation – Partnership – Ownership – Trusteeship. In two villages the recently elected Gram Panchayats are involved in making the Village Panchayat the village government. The current experiment, it is hoped will make Gram Panchayats realize the opportunity to unite for establishing Gram Swaraj.

Cross-Cultural and Cross-Sensual Writing Processes - Exploring Relations Between Languages and the Senses

This paper presents an artistic research project on cross-cultural and cross-sensual writing practices. Writing, especially in the realms of poetry, mostly takes the form of an individual practice, in which the author works (seemingly) a. independently of others and b. in rather loose connection to sensory impulses and the movements of the body, settled in a specific (mostly sitting) writing position.

In an artistic research project, a group of young writers from different cultural backgrounds challenged this notion of individual and mind-centred writing by exploring forms of writing collectively and writing sensually, integrating and involving the whole body in the writing process.

The art group works with fluid forms of texts such as text islands, fragments, assemblages and collages in different languages as well as with different writing surfaces and materials. Collective writing was not only explored on large canvases, soil and paper in unusual shape (e.g. 50 m long) but moreover performed as writing on the body in movement. Writing on the moving bodies of oneself, of members of the art group and of others participating in the public performances of the group allowed to explore questions of the relationship between language formation (poetic voice) and sensory experiences (of bodies in movement): How does the poetic voice of each of the artists change in exploring the body as writing surface? How does the experience of the body change through the intensification of sensory explorations while writing? And how do the different languages and styles of the authors connect, integrate and constitute new images, languages and semantic forms? The presentation uses audio-visual material as well as texts to discuss different phases, types of performances and experiences by the artists in the exploration of these questions.

TAG, MIRIAM* (Bielefeld University, miriam.tag@gmail.com)

The Constitution of 'Early Childhood' As a 'Global Issue' - Universalising Processes in Verbal, Numerical and Visual Forms

The paper presents the results of an empirical research project on how early childhood is constituted as a 'global issue' in documents of international organizations, focusing especially on UN documents from 1990 till 2015.

The first part summarizes forms of argumentation with their claims, topoi and backings and argues that *time* and *subjectivity* - in relation to semantic forms of 'progress' and 'social actor' - appear as the two major axes through which the significance of early childhood is produced. I point out how the issue is constituted as 'global' through sacralizing and rationalizing processes with their specific universalizing logics, ascribing an instrumental function to the early years on the one hand and sacralizing the young child as a person on the other hand.

The second part of the presentation discusses the specific and shared structures and logics of *semantic*, *numerical* and *visual* forms in the constitution of the early years of human life as a 'world problem'. In analysing the logics which constitute the meaning of issue, not only knowledge claims are thus taken into account but also *acronyms* as specific semantic forms that stabilize the issue in constituting its unity and presence; *indicators* and their visual representations in the form of graphs, statistics and world maps, which constitute the issue on lines of complexity and simplification as well as through establishing global orders of observation and comparison; and *photographs* as visual elements, which universalize especially through forms of disembedding of faces, blurring of backgrounds and multiplication of figures.

The presentation will conclude with a discussion of the methodological approach employed in the analyses, especially the constitution of a layered corpus, the micro analysis of verbal, numerical and visual elements, and the comparison of their structures and logics across a larger corpus of documents.

The Possibility of Japanese Idol Culture for the Regional Promotion

Recently, one of the most common popular culture in Japanese media is idol phenomenon, which attracts attention to not only in Japan, but also over the sea. Especially, 'Local idol', who in most cases are girls only and active mainly at their local areas: sometimes the prefecture or only the city in Japan, are becoming more popular from the 2010s. Simultaneously, a number of media works are concerned with local idols. For example, *Amachan* (2013) which is the 88th early morning television series on NHK in Japan has gained popularity. This drama depicts a heroine who lives in Kitasanriku-shi Iwate-ken(its background is Kuji-shi) and goes to Tokyo to be an idol. This drama also focuses on the heroine's family and regional relationships. This narrative of 'locality' through *Amachan* is the archetype of idol culture in Japan. Additionally, success of this drama has brought about positive economic effects on Kuji and Kuji has its own local idol like this drama's heroine.

Similarly, fans are often interested in the content of the works, and visit their original production site. Several studies have addressed tourism based around movie, animation, and so on is growing and recognized this situation as 'contents tourism' in Japan, especially referred to animation as 'pilgrimages to sacred places'. In consequence, *Amachan* is regarded as one case of contents tourism. Furthermore Kuji's idol plays a important role in the local development.

Accordingly, focusing on the case of *Amachan* and Kuji, this presentation explores the interaction between contents and local residents. Moreover this study aims to identify and evaluate the understanding key characteristics of Japanese local idols, thus discusses the possibility of idol culture for regional promotion.

Youth Civic Participation in Iran: Explanations and Prospects

Review of various studies about youth participation in Iran indicates that young people are engaged in various social activities as well as diverse range of youth and youth-related organizations. However, the same studies reveal the fact that the participatory willingness and capacity of young people is not yet completely realized. The causes of this issue could be traced at macro, meso and micro levels. At the macro level, weaknesses in the policy making and planning system of the country (such as ambiguity in the status of instruments and programs pertaining to youth participation as well as the absence or weakness of a participatory approach in other youth related programs) is a serious barrier to the full, optimized and effective youth participation.

At the meso level, it is the case for existing participatory institutions and mechanisms to suffer from various shortcomings including: incomplete coverage of various groups, unequal access to and use of their services and benefits, narrow minded approaches and views in supporting various youth subgroups, elitist and non-democratic nature of some youth related institutions, government based or state oriented nature and inadequate autonomy of some other bodies, as well as lack of an Umbrella Youth Body (representing all youth and youth-related entities).

At the micro level, it is evident from existing research that young people do not find the society and its environment suitable enough for their maximum participation, despite their high level of willingness and interest. It is of special importance to mention the role of such variables as sense of efficacy, generalized and

institutional trust, sense of belonging and commitment in promoting or hindering youth participation.

Young people are now seeking new styles and spaces for engagement and therefore it is a vital agenda for youth policy in Iran to address existing barriers at the above-mentioned levels.

How to Survive a Tsunami: An Individualistic Maxim in Japanese Collectivism

Many researchers interested in disaster risk reduction have focused on precise prediction, a rapid alert system, or substantial buildings. However, these rational devices often make us more vulnerable to natural disasters. It can be called "self-domestication of humans" (Obara 1989). Why do many people fail to escape from natural disasters? Why do many people hope to remain in the affected area? Why do many people have guilt feeling if they have the fortune to survive? The human mind in emergency is not so rational, but rather is emotional, social and moral. "The heart has its reasons of which reason knows nothing" (Pascal 1670). In emergency situation, our sociality and morality operate so strong that we often feel it very difficult to trade off our survival against them. For successful evacuation, we need to explore this intuitive heuristics of the human mind.

The Ministry of Land, Infrastructure, Transport and Tourism of Japan conducted the survey of evacuation behavior among the survivors of the 2011 tsunami (MLIT 2012, N=10,603). Based on this data, we will explore three characteristics of evacuation heuristics.

(1) Priority of intuitive judgement as a trigger of evacuation behavior to tsunami alert.

(2) Strong bystander effects occur after the M9 earthquake.

(3) Gathering information, protection of one's family, and serving group mission are typical behavior to delay the time to start evacuation.

"Tsunami-Tendenko" (running to a higher ground by oneself, without finding family members) is known as an individualistic maxim of tsunami evacuation in northeast region (Katada 2014). Nominally, it inhibits us from helping our family members, but it maximizes the number of survivors by reducing the double contingency risk of deciding whether to help family members or not. In addition, the maxim emphasizes the preparedness against tsunami. Cooperation and trust must be prepared before tsunami, not during tsunami.

TAKAHASHI, NORIHITO* (Toyo University, takahashi021@toyo.jp)

The Characteristics and Effectiveness of Social Support for Foreign Residents By Faith-Based Organizations in Contemporary Japan

Public support networks for foreign residents are limited in Japan. Compared to other developed nations, Japan has considerably smaller foreign populations. However, many foreigners—called 'newcomers' in Japan—have been migrating to Japan for marriage or employment, primarily for blue-collar jobs and night-entertainment businesses, since the 1980s. Since then, support activities for newcomers have been developed to address their everyday difficulties.

Faith-based organizations, especially the Catholic Church, have played a larger role in providing social support for foreign residents compared to the central or local governments. In this study, I focus on support activities conducted during the economic depression between the Lehman shock in 2008 and the Great East Japan earthquake in 2011. In addition, I examine the characteristics and effectiveness of activities conducted by the Catholic Church, taking into account the rigid separation of religion and state in the constitution of Japan and peoples' apprehension towards religious groups after the *Aum Shinrikyo* incident in 1995.

While the idea of multiculturalism—often called '*Tabunka-Kyosei*' (multicultural coexistence or symbiosis) in Japan—is still nascent in Japan, the central government and business leaders have expressed the need for foreign workers because of the serious labour shortage resulting from decreasing birth rates and the growing aging population. Therefore, these pioneering support activities for foreign residents conducted by the Catholic churches serve society in general. In this presentation, I also discuss factors that have enabled the Catholic Church to conduct support activities in the Japanese difficult context.

TAKAHASHI, TORU* (Chuo University, ttakahashi0@gmail.com)

Systems Theory and Governing: Towards a Sociological Theory of Societal Efforts

Our societies are faced with various and numerous challenges at local, national, supranational and global levels. A multitude of actors with a variety of skills are tackling these challenges at each level. Actors from any functional domains (such as scientists, jurists, artists etc.) can contribute to such efforts with their expertise. And they often organize borderless networks of collaborations that expand across these levels. This situation even undermines the theoretical importance of spatial distinctions such as local/ global. This paper uses the adjective "societal" as connoting a horizon of social order which encompasses every spatial level and functional domain. So, societal efforts include from local practice of civic volunteers to multifunctional practice, which mobilizes a variety of expertise, through borderless networks.

Jan Kooiman's "sociocybernetic" theory of governance provides us a set of technical terms to describe societal efforts. He formulates people's practice to achieve common goals as "governing". How can sociological theory, especially social systems theory, formulate societal governing from its own perspectives? Niklas Luhmann prepares a specified category for protest movements (social movements) as one of four types of autopoietic social systems. However, while actors of movements and resolvers of targeted problems are often separated in protest movements (for instance, civic protesters and government), actors in societal efforts are trying to be resolvers. Despite the difference between nature of protest movements and societal efforts, Luhmann's theory of protest movements can be a good starting ground to elaborate the concept of societal efforts from a perspective of sociological theory.

Searching for the Missing Link in Economic Development: Productive Relations Under Stress in South Africa

South African workers toil under precarious and often dangerous conditions for very low wages. Yet, these workers are at the core of accumulation and value creation, although their role is conceptualised as one of cost within frameworks focused on productivity and competitiveness. A closer investigation reminds us that the engine of capitalist development rests on the conflict between workers and capitalists around the extraction of surplus value. This tension is to be seen in the context of underlying structures and nature of demand, not reduced to questions of supply and cost. Understanding the productive relations and the form of interaction between production and consumption is fundamental to developing alternative economic insights. Drawing on the insights of Amsden (1997), Seguino (2007) and Selwyn (2012), we explore the agency of labour in production in order to deepen the understanding of capitalist development.

The paper draws on empirical research in two labour-intensive sectors in South Africa, forestry and clothing. These highlight the varied, changing and adaptive nature of the labour-capital struggle. Clothing, textiles, leather and footwear contributed 60-80,000 jobs and ~8% of GDP in 2013. During the same period, the forestry sector employed some 165,900 people and contributed ~1% of GDP. Employment structures have been changing with a rise of outsourcing and informal employment, reproducing the marginalisation of labour. While economic theories make assumptions and conclusions about labour and the production process, these are usually at the passive end of transformations in capital accumulation. There is a gap in understanding the actual features and dynamics that take place in what Marx referred to as the 'hidden abode of production'. A more nuanced understanding of the labour process, the distribution of power, and nature of worker organisation in production is fundamental to developing alternative conceptualisations of the relations between supply and demand.

TAKEDA, HIROKO* (Graduate School of Arts and Sciences, University of Tokyo, h.takeda@law.nagoya-u.ac.jp)

Between Reproduction and Production: Womenomics and the Japanese Government's Approach to Women and Gender Policies

Japan as a country has long been known for its high degree of gender inequality in the areas of political and economic participation. The national government led by Prime Minister Shinzo Abe, who is internationally known to be a conviction conservative, has introduced a series of new policies and political initiatives to promote women's labour since 2014. The Abe government's policy-making has been inspired by so-called 'womenomics', an idea put forwarded by a Goldman Sachs strategist, Kathy Matsui, and placed a strong emphasis on the importance of expanding women's labour participation, locating it at the core of the national growth strategy. Do these recent political developments mean that the Japanese government is now seriously pursuing gender equality?

By identifying the gap between rhetoric and reality of the Abe government's policy-making through an examination of government documents and politicians' narratives, this paper argues that despite its apparent reformist approach, the Abe government's women and gender policies exhibit a strong continuity with previous policies concerning life and gender. Most problematic is the exclusion

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of the idea of 'gender' from the agenda-setting process and second, the strong emphasis placed on the national economic growth as the policy objective. Furthermore, the national government is concurrently trying to push labour deregulation, while underlining women's reproductive role through education. As a result, in the current form, the Abe government's initiative is most likely to result in driving many women to taking up irregular employment, while structural gender inequalities in the labour market and at home will not be removed and women are still projected as the main actor of reproduction---in other words, the existing gender regime in Japan would remain intact. What is required is a radical policy paradigm changing departing from the conventional 'productivist' line.

Collaboration Between Medical Staffs and Care Workers to Support Older Adults' End-of-Life Care at Home: A Case Study of the Daily Interactions Between Them in Service-Added Housing Facilities in Japan

Since approximately 40 years, end-of-life care in Japan is being managed mainly in medical institutions like hospitals or clinics. Recently, with an increasing trend in older adult mortality, provision of end-of-life care at home is being encouraged. Previous studies have pointed out that the collaboration between medical staffs (e.g., visiting doctor or home-visiting nurse) and care workers (e.g., in-home long-term care manager or home care worker) was necessary to support older adults' end-of-life at home. However, few studies describe how these professionals interact with each other in the daily support activities, and how the dynamic processes of end-of-life care progress through the interactions between them, especially from the care workers' perspective. To facilitate collaboration between them, this study aimed to reveal the nature of the same between medical staffs and care workers to support older adults' end-of-life care at home, through a case study of the practices in service-added housing facilities for older adults, which is a noteworthy new housing facility in Japan. A door-to-door or phone survey was conducted in 12 service-added housing facilities in which end-of-life care was provided to three or more residents. Thus, 22 cases of home-based end-of-life care were identified. Through the analysis of the support processes recorded in the cases, the following key results and conclusions were revealed: Collaboration between medical staffs and care workers during end-of-life care had 2 aspects. 1) Each group helped the other to provide their services (e.g., if the medical staff noticed the change in an older adult's condition, he/she informed the care workers the same, to help them modify their services accordingly). 2) Through their interactions, medical staffs and care workers interpreted and reformatted the changes in the older adults' condition (e.g. edema) during end-of-life care as the 'processes of end-of-life'.

TAKEZAKI, KAZUMA* (University of Tsukuba, so064089@yahoo.co.jp)

Reviving Masculinity in Postwar Japan ˉEmergent Bodybuilding Culture As a Form of Male Physical Cultureˉ

This presentation's aim is to show how Japanese men who experienced defeat in WWII tried to revive Japanese masculinity through the bodybuilding culture that emerged under the influence of the U.S. occupation. This study's methodology is interviewing and analysis of magazines.

On September 2, 1945, when the Instrument of Surrender was signed, Japan became a defeated and occupied country. Inflation and the extreme post-war lack of commodities resulted in near-starvation among the Japanese public. Under such circumstances, the Japanese people's first impression of the U.S. occupation army was not of wartime "devils", but of people who were «gentlemanly», with "a good physique", and "an abundance of high-quality goods». Japan was consumed by humiliation and envy toward the United States, and these emotions guided its efforts to revive Japan after the war.

One sub-culture that emerged during these efforts was bodybuilding culture. Having been defeated, Japanese men set out to obtain Western physiques to reconstruct their own national consciousness through bodybuilding. Indeed, *Body Building* magazine, which was first published with the establishment of the Japanese Bodybuilding Association, opened as follows, "Promotion of bodybuilding should be seriously considered as a means of remodeling the bodies of the Japanese race. It is not some passing whim, it is a concerted movement to remodel the bodies of the Japanese people, in whom an ethnic consciousness is seriously lacking". (*Body Building*, December 1955)

The bodybuilding culture resulting from the post-war humiliation and envy felt toward the United States seemed to involve a dynamic referred to as «postcolonial muscle» by Douglas Brown (2013). That is, the bodybuilding culture healed a national identity broken by the U.S. occupation, allowing a new national masculinity to arise. We could consider the "reviving masculinity" that emerged in this way as one aspect of the new masculinity apparent in postwar Japan.

Empirically Agent Based Modeling of Occupational Position Network in Japan

Social integration is one of the most classic themes in sociology and has become even more widely discussed in recent times. Despite growing academic interest in social integration, however, little is known about how social interactions are structured broadly in society due to the lack of adequate data and methodology to analyze broader network in a society. Previously, we developed the method generating macro-structural characteristics from egocentric network data, enabling to analyze the whole structure of social networks. Applying this method to a real data on egocentric networks in Japan that is generated by "position generator" focusing on ties with occupational positions, we obtained a occupational position network whose nodes represent occupational positions and whose edges represent similarity relationship between occupational positions. Surprisingly, this empirical position network was largely divided by two major clusters. The next step that we will take in this paper is to explicate generating mechanism of this segregated position network. For this purpose, we employ an empirically agent based modeling method. We incorporate two theoretical hypotheses into the model: status homophily and urbanity homophily. More concretely, in our model, two agents that are randomly matched with each other are more likely to be connected if statuses of them are similar, or if "urbanity" of their statuses are close. Specifically, the probability is determined by the following logistic functions,

$\exp(\alpha + \beta_1(-|\text{prestige}_i - \text{prestige}_j|) + \beta_2(-|\text{urbanity}_i - \text{urbanity}_j|))/1 + \exp(\alpha + \beta_1(-|\text{prestige}_i - \text{prestige}_j|) + \beta_2(-|\text{urbanity}_i - \text{urbanity}_j|))$

Both of status and "urbanity" parameters are not arbitrarily set up but can be measured empirically. The model well replicates the empirical position network in a certain range of parameter coefficients. From this result, it is concluded that the segregated position network in Japan would be generated from two major underlying processes: status homophily and urbanity homophily.

The Intersubjective Dimension of Memory: What Has Been "Left out"

We are developing a theoretical multi-cultural framework for working on the intersubjectivity of memory with a focus on what has been left out of the analysis: unporcessed dimension of social experiences of traumatic loss, focusing from a bottom-up approach, building on illuminating the latent, private, intimate, individual/personal dimension. In order to reconceptualize our work, we build on a re-reading of the Halbwachsian work on memory (ex. Namer's "undercurrents of memory" and "internal reciprocity") and other contemorary authors worldwide.

Spaces of Possibility for Transformative Teacher Learning

Teachers' work and teacher learning, in Australia and internationally, are increasingly governed by an accountability agenda embedded in texts related to national curriculum and national professional standards for teachers. This centralised, managerial agenda creates a view of teacher learning as an activity proscribed by technical descriptors and undertaken by individualised teachers. These texts are implicated in the production of local governing texts and processes that influence the way teacher professional learning happens within and beyond the school walls and as such, have the potential to act, in perhaps unintended ways, to narrow possibilities of how and what teachers might learn in relation to their work.

The study, reported on in this presentation, traced teachers' descriptions of the complex interactions revealed when they were asked to talk about a time when they knew they had 'really' learned something about their teaching work through to the evidence they demonstrated of how such learning had transformed their practice. Analysis of the teachers' stories of learning was informed by Bakhtin's (1986) dialogism and Smith's (2005) approach to mapping social and textual relations. Comparison of these maps speaks to the variability of experiences that support teacher learning for transformed practice. It also reveals the ways in which those acting in the role of 'professional learning architect' created the spaces of possibility in which such transformative learning occurred. These spaces of resistance or possibility can be likened to 'everyday utopias'; while they do not provide

a blueprint for action they do provide concrete imaginings of how teacher learning might occur in ways 'other' to those governed by accountability regimes.

Teachers Resisting 'Accountability' Agendas: Tracing Stories of Transformative Learning

This presentation describes methods employed to produce 'informant specific maps' (ISM) in relation to teachers' stories about their professional learning. The production and use of 'individual' maps represents a variation on the way 'mapping' has generally been used by institutional ethnographers. A dialogic analysis (Bakhtin, 1986) of research conversations and teacher-provided evidence of learning made apparent the extent of variation in teachers' learning about their work. It revealed the existence of both centralising, hegemonic discourses associated with a managerial agenda and contextualised, heterogeneous discourses supportive of transformative learning. It also revealed the uneven influence of extralocally produced governing texts on both the locally produced texts and the 'doings' of individual teachers. As such, it was difficult to imagine that taking 'schooling' in general, or even each school context as the institutional focus would allow for the production of a single map to represent the social relations governing teachers' learning.

From these informant specific maps, we can however, begin to observe some broad patterns in relation to the coordination of teacher professional learning both within a given context and from one context to another, for example, the presence of 'professional learning architects' (PLA) in each context. The PLA played a critical role in 'activating' the governing texts in such a way as to allow teachers to resist the accountability agenda associated with professional standards and accreditation that often serve to narrow opportunities for transformative learning. As with the dialogic analysis of the interview transcripts, the approach to the maps reflects a desire to 'stay close' to the participants as individuals while at the same time opening up the uniqueness of each of their complex experiences to better understand how a managerial agenda might be resisted in the interest of transformative learning.

Sport and Luxury Leisure Services

Consumption requirement of contemporary sports are finely tuned to the expressive needs and hedonistic desires of the individual. Sport is one of the most representative containers of socio-cultural changes to have occurred in recent years. Fitness enviroments are the new *catalystic* centers for many trends affecting the services dedicated to caring for the body. The metamorphosis in the pattern of sports consumptions sketches an unprecedented profile of consumers looking for momentary evasion which takes place in fitness areas of increasingly sophisticated in terms of sports technology. Within these new dimensions lies the success of sport which is driven by glamour, spurred by a demand for something which is high profile, pretentious and niche. Traditional pattern of the consumptions of sports (fitness, wellness and health care) metabolizes the new values and therefore has begun to stimulate the growth of a strong network of services around the body in the now ritualized luxurious temple of the body. This research aims to examine the relationship which is consolidating between the consumption of sports and the use of free-time in fitness environments (gyms, sports clubs and wellness centers) through the ethnographic observation of a sport that is enjoying a huge success both in England and in Italy: pilates. It has been used as the discriminatory to understand the consumption of sports. The analysis of the literature and the experiences considered outline the evolution of a kind of society where the consumption of free time in a new luxury enviroment is given priority. Questions on knowledge are used to explore new consumption trends through contemporary sports. The aim is to stimulate new reflections on the evolution of any differences between the consumer models and emerging forms of consumer culture in sports enviroment.

Political Journalism in the Wake of Jon Stewart and Stephen Colbert: Assessing the Lasting Legacy of "the Daily Show" and "the Colbert Report" on American Culture

In the United States, the influence of late night, political satire television shows like Jon Stewart's "The Daily Show," and Stephen Colbert's "The Colbert Report," have opened up the discussion not only of the boundaries between news and entertainment, but have brought into relief the larger question of the connec-

tions between popular culture and political discourse more broadly, especially for younger Americans. For example, there are several studies that have found that many younger Americans get their news about politics from "The Daily Show," and in 2012, the Pew Research Center for People and the Press found that 39% of "The Daily Show's" viewers were the demographic group of young people between 18 and 29 years old.

While both Colbert and Stewart have left their respective shows this year, they have made an indelible mark not only on the way in which we now view "real" news as opposed to "fake" news, but more generally, how we can begin to think about the possibilities for political journalism, not only in the United States, but in other countries that have created similar satirical programming. This paper will take the occasion of the retirement of Colbert and Stewart from these programs to explore whether these kinds of programs have made a lasting impact on the genres of news and comedy, and how in a media environment characterized increasing economic consolidation and the celebration of neoliberal subjects, these programs might point a way toward a more engaged form of advocacy journalism. I will also explore how these shows, by having politicians routinely as guests, changed how Americans view politicians and other political figures. Finally, I will explore whether and how these satirical political comedies influenced the increasingly polarized discourse that characterizes the landscape of the United States electorate.

Talking Back: Resisting Neoliberalization in the Academy through Feminist/Womanist Lenses

One of the recent areas where the concept of precarity has become particularly meaningful as an explanatory idea is in terms of thinking about academia in higher education, where the move from public funding to more neoliberal economic landscapes, what Briony Lipton has described as the move from an "ivory tower" to "Enterprise University," has created a fertile field for a precarious labor force. Writers like Rosalind Gill, in addition, point out that as academics with oftentime precarious job situations, we have turned ourselves into neoliberal subjects who are endlessly adaptable and "flexible"; our very subjectivities have become, as Skeggs points out, "the living embodiment of capital." (Skeggs 2)

Challenging Simon During's reading of this movement solely in terms of neoliberalism, scholars like Lipton and Fantone also note that while precarity has often been a function of women's labor, it is only when it effects the worklife of male academics who have become vulnerable to falling into the academic "bourgeois precariat," that it is highlighted as an issue. Because of the privatized, individualized nature of academic work, it is difficult to trace the ways in which this precarity is happening to academic workers. In this paper, we unpack this dialogue about ways in which current trends in higher education have contributed to an increasing sense of precarity that is intensifying the gender inequality in the modern university. By sharing our own positions as three female academics of different racial and ethnic backgrounds, we draw on the tools of auto-ethnography to map out what has increasingly become an endemic feature of modern university life. From here, we articulate the ways in which our work as feminist knowledge-workers can be used to critically engage other academics in solidarity and incitement to challenge forces of precarity within universities**.**

Dynamics of the Emergence of EIA As a Professional Group in Era of Globalization : A Case Study from Gujarat

The concept of Professionalism has been a central issue in the debate on globalization of professions in last two decades. A new category of professionals, namely, *environment impact assessment (EIA) professionals-* has been emerged with the growth of environmentalism in last three decades. Professions are generally have six characteristics: (a) the use of skills based on theoretical Knowledge, (b) education and training in these skills, (c) the competence of professional ensured by examination, (d) a code of conduct to ensure professional, (e) a performance of a service that is for the public good, and (f) a professional association that organize members. The paper attempts to analyse the dynamics of Environment Impact Assessment (EIA) practitioners as professionals on the basis of above criteria in terms of the assessment, how this profession has emerged so far and to what extent it fulfils the credentials as mentioned herein above. The paper is based on empirical study conducted on 10 institutions, 10 NGOs, and 10 Environmentalists based at Surat, Gujarat, etc. The paper also focuses upon the issues related to the formation of the profession of EIA in India and its dynamics in the era of globalization

Reading Against the Grain: Gender and Modernity in the Colonial 'public Sphere' in Maharashtra, India

With British colonialism many new institutions including judiciary and modern educational institutions were inaugurated in India. With spread of English education circulation of knowledge and exchange of ideas on a large scale became a felt need for the newly educated class. During early nineteenth century printing press was established first in Bengal and then in Maharashtra. Many newspapers and pamphlets were published at subnational level since the 1830s. Following this a vast array of periodicals were published in many 'native' languages including Marathi during the first 100 years itself.

This paper is based on a project that aimed at tracing, documenting and critically analysing the complex terrain of print culture in Maharashtra by focusing on periodical publications in Marathi language. Though newspapers have been numerous and significant for development of nationalist ideology in general, the scope of this paper is limited to mapping formulations of gender and modernity through popular monthly magazines from 1850s to 1950s. I have attempted to re-read the chosen texts with the complex Sociological lens that privileges the intersectionality of caste, class and gender based perspectives.

While doing so I have analysed selected magazines from *Marathi Dnyanprasarak* initiated in 1850 to *Stree* magazine established in 1930. The questions that I ask are who were the main actors in this print world in Maharashtra? Can we term this print world as the 'Public Sphere' in the same way as Habermas and later scholars identify European print world in eighteenth century capitalist societies? Was it bifurcated into binary opposites of hegemonic and the counter-hegemonic or public and the counter-public? Which themes emerge from the discourses generated in the print world in Maharashtra from 1850 to 1950?

Has Urban Cycling Improved in Hong Kong from the 1980s to Present? : A Socio-Political Analysis of Managers' and Activists' Contributions

The paper examines the flexibility of using the "stages of change" model in studying the variations in public policies in dealing with urban cycling mobility, by focusing on a 'bicycle unfriendly' city--Hong Kong (HK). By treating change as a process consisting of several stages, this research identifies which ones have occurred in the attitudes and actions of the HK government towards urban cycling in the past three decades. Consciousness raising, self reevaluation and environmental reevaluation are key responsible elements for the occurrence of changes in cycling policies in HK. They are initiated and facilitated mainly by cycling-advocating organizations/actors, pro-cycling experts/scholars, and the precedents of some other cities. This study provides a clear understanding of the change, and the reasons for it, in the governing of urban cycling mobility in HK. More importantly, the paper provides an instance showing that the "stages of change" model can be used on the analysis of non-individual actors' behavioral change. We also point to some limitations of the stages of change model and suggest ways to overcome them according to the findings of the HK case study.

Practice of Intergenerational Support and Its Predictors: Evidence from Bangkok Metropolis, Hanoi and Kuala Lumpur

Cross generation care-provision contract is changing among developing countries in Southeast Asia (SEA) which, in the last decades, experienced significant changes in age-, family-structures, life-course expansion and shifts in governmental responsibilities on care provision for old-young population. While the SEA societies share prominent over-arching patriarchal family values that prescribe filial expectation, support across generation is posited as a function of distinctive demographic, socio-political and historical trends in each society.

Guided by the intergenerational solidarity framework, the present paper aims to examine the practice for intergenerational support in functional and affective exchanges taking into account filial norms, structural arrangement and parental needs, focusing on the interaction of gender and marital status, within three metropolitan cities (i.e Bangkok Metropolis, Hanoi and Kuala Lumpur). Data from the Comparative Asian Family Survey (CAFS) of three metropolitan cities in Thailand, Vietnam and Malaysia which comprised respectively 910, 1,188 and 1,523 completed questionnaires from respondents aged 18 and above were analysed.

Findings demonstrated variation in norms and expectations on intergenerational support across these Southeast Asia societies. Result from regression analysis also showed that intergenerational support is determined by mutual support from parents, old age of parent, filial norm and the interaction effect of marital status and gender and, these effects vary for co-residence and non-residence families across societies.

Thus, findings imply distinction in the family system across societies whereby patriarchal family values were more obvious in Hanoi while Kuala Lumpur and Bangkok were less inclined. While, there is evidence on strong support provision from families irrespective of living arrangements; however, the new, diverse demographic and social challenges within SEA societies made the notion of family as the sole provider for old-age support unsustainable. This calls for engagement of non-familial sector to support family care and renegotiation of the gendered filial/familial obligation to accommodate changing needs and conditions in SEA societies today.

RC06-74.1

TAN, JOOEAN* (Nanyang Technological University, jetan@ntu.edu.sg)

Family Ties and Social Networks of Married Women in Post-Reformasi Jakarta, Indonesia.

The conservative doctrine of *Pancasila* was the cornerstone of many policies of Suharto's "New Order" for more than 30 years in Indonesia. This conservative doctrine, in which conformity was a key element, had profound impact on everyday life including marriage and the family especially the participation of women in society. The fall of Suharto's "New Order" in 1998 was preceded and precipitated by the Asian economic crises. Since then there have been a number of political developments such as the decentralization of government, democratic elections, and an anti-corruption drive. *Reformasi* also saw a rapid expansion of the media and reports on the visible Islamization of Indonesian society.

The aim of this paper is to examine the nature of family relationships as well as the social support networks of married women living in Jakarta in order to understand how women are experiencing family life, and if the family continues to be the main source of social support during this time of rapid social change now that the constraints of the "New Order" has been lifted. The data come from a project in the greater Jakarta area carried out between October 2013 and February 2014 in order to find out how all these changes have affected family life. 60 married women and 40 never-married women who were 30 years of age and older were interviewed. The focus of the project is on Jakarta because aside from the fact that it is both the political and economic center of the country, it is also at the forefront of social and cultural change.

The Meaning and Purpose of Leisure Activities of Manga/Anime Fans Called "Fujoshi": Contradictions and Ambivalences in Japanese Women's Fan Community

Fujoshi refers to female fans of comics (*manga*) and related products such as animation (*anime*) who enjoy works that feature male-homosexual relationships. What they consume are predominantly parodies of works in which male homosocial bonds are depicted. *Fujoshi* re-read these works and replace such homosocial bonds with homosexual ones. As amateur artists they create parodies so that they can develop fantasies of male-male relationships that being female, they can never experience in reality. In this presentation we will examine the meaning and purpose of this unique type of leisure activity, including their community formation, which can be seen in Japan and other Asian countries today. Analyzing narratives of seven fujoshi women, we will not only identify what makes them feel satisfied, fulfilled, or happy in their activities, but also present contradictory findings, namely the significant contribution of this type of leisure activities to the enhancement of quality of life of people engaged with these activities and the perceived tensions in the process of differentiation among these people as well as between them and others outside their communities. We will address the importance of sociological perspectives of social difference in a fan community,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

even if such a community can offer space to its members for mutual exchange, learning, understanding, and respect.

TANAKA, SIGETO* (Tohoku University, tanaka@tsigeto.info)

Dynamics of Ideology and Institution: Probable Scenarios for Changes in Beliefs about Gender and Family in Japan

This paper put forward a proposal for elaborating ideology analysis. In parallel with development of empirical analysis to specify causality in the real social phenomena, we should develop methods for analysis of ideology to explore dynamics of what we perceive and think about the real society. Using them in combination, we obtain a powerful tool to foresee the future.

This paper proposes a framework of ideology-institution dynamics with causal modeling (IIDCM). IIDCM defines ideology as a system of interdependent beliefs classified into three categories: beliefs about facts (how the society is), about ideals (how the society should be), and about norms (what we should do). A feedback cycle is assumed as follows. We have beliefs about facts based on our observations of society. We have also beliefs about ideals as criteria to evaluate whether the social condition is good or bad. Such criteria and beliefs about facts jointly justify a norm to realize a better society. If the norm is institutionalized, it determines people's action and brings social outcomes. And if we observe the social outcomes through empirical analysis, it will make changes in our beliefs about facts.

IIDCM theorizes relationships among ideology, institution, and people's action. We can write a scenario and select the cast to predict social changes, using IIDCM as a basic framework. This paper takes an example of fertility issue in Japan. Political responses to low fertility in Japan since late-1980s have been too conservative to set ideological changes about gender and family. However, facing the population shrinking, the government (and people) are now seriously recognizing the necessity of drastic social changes. We can write probable scenarios, with the framework of IIDCM, according to what policy will be selected and how public opinion will change hegemonic ideology related to gender and family. (See http://tsigeto.info/iidcm/ for details)

Educational Trajectories of Modern Youth: Problems of Choice.

The youth studies to become professionals and to get a worthy place in labor market (to get a job with good prospects). What kind of education shall they get to achieve such results? What happens in reality? We've examined Russian experience.

Modern universities are slightly aimed at the labor market needs. This problem is difficult to overcome because of the rapid changes of social structure and institutions, employment market conjuncture. Even if within the university a new specialty that is in demand in labor market, is opened, after four years of studying, the market needs for the specialty may reduce or disappear. Some expert groups try to give the forecast about professions which are to be demand in 5 or 10 years. But it is still difficult to speak about results.

Professional orientation work at schools, in particular Russian, is conducted by universities. What educational programs are offered? Universities offer educational programs on which they have accreditation. Whether the rating of educational programs and interest of employers is considered here? No. Students get approximately the same result from visiting exhibitions, meetings at universities etc.

So, what kind of higher education should the youth choose? Prospective students planning to get a bachelor degree should choose the major as whole, irrespective of educational program specialization. For example, sociology in general, but not sociology of the social sphere, economic sociology, etc. After graduating from the university a certified bachelor can specialize in the particular sphere by taking Master's courses, postgraduate courses or additional professional courses (studying individually). Such approach makes it possible to react on labor market needs and to change rapidly the educational trajectory.

All in all, only the youth's mobility, mobility of an educational system can influence the choice of future profession and commitment to the future job with good prospects.

Taiwan As Laboratory of Modernity: A Preliminary View from the Perspective of Multiple Modernities

This paper explores the development of modernity in Taiwan from the perspective of multiple modernities and world history. It takes Taiwan as an innova-

tive frontier of inter-civilizational encounters, and sees an overlapping marginal position in Chinese, Japanese, and European imperialist spheres during the formation of the modern world society since the 16th century. The so called modernity emerged in the interactions and interconnections between the different regions, cultures, and civilizations, and had different variants, if not different forms, since its birth. When we combine this new reconceptualization of modernity with the idea of functional differentiation as the most important structural characteristic of modernity, we would have a better theoretical equipment to escape the trap of Eurocentrism, and are able to integrate the sociological theoretical reflections with the fruits of world history study. Taking this as departure, I will illustrate why Taiwan was a significant laboratory of modernity in the modern world society. Lastly, I will discuss why the perspective of multiple modernities is useful in the contemporary situation and what kind of knowledge gain it can bring us when we unfold the paradox of observations of the modern world from this perspective.

Ethnic Minorities, Capabilities Approach and Recovery: The Experience of Using Mental Health Services for Chinese People in the UK

Ethnic inequalities in the use of mental health services need to be understood in the context of psychiatric power (Fernando, 2002; Moodley and Ocampo, 2014). The dominance of bio-medical model as well as state sanctioned coercion intersect with ethnic inequalities to constitute the experience of Black and Ethnic Minoritity communities. This paper reports on a qualitative research that uses Capabilities Approach (CA) as a heuristic framework to explore how mental health services contribute or hinder the personal recovery of Chinese mental health service users in the UK. The first part of the paper discusses how CA can be adapted as a pragmatic entry point for a sociological inquiry into the interplay of structure and agency during mental health service use. Capabilities as substantive freedom comprises of two interactive dimensions: process and exercisable opportunities (Sen, 1999). It can shed light on the extent which an individual can exercise agency during service use and the way structures of control and paternalism shape or limit one's agency development and the exercise of choice. Then, based on this framework, the paper will illustrate the findings on the Chinese people's experience of language barrier, receiving a diagnosis, the treatment choice and process as well as hospitalistion. The theoretical and pragmatic potential of CA in the field of critical sociology of mental health will be discussed.

Why Mothers Opt out?

Adopted institutional ethnography perspective, I explores the identity construction and the accounts of middle-class Taiwanese mothers when they faced work-care conflict either in Taiwan or in America. I found that mothers identified their choice to opt out from labor market is a voluntary one, while I argued that it is a choice gap conditioned by mothering identity and structural constrains. These opt out mothers would practice intensive mothering to avoid traditional housewife stereotype and win "good mother" social image. They would also work part-time or as a volunteer which helps establish positive self-identity. My research will compare immigrant Taiwanese mothers in America with mothers in Taiwan. Aim to examine if those immigrants in USA have different self-identity and mothering practice from those mothers who raised children in Taiwan. I would like to explain why and how the migration and social environment influenced mothers' identities, mothering and employment decisions for Taiwanese women.

State Violence, Participants' Framing, and Citizen Self-Mobilization: A Comparison of Taiwan's Sunflower Movement and Hong Kong's Umbrella Movement in 2014

Why do people join spontaneous collective action in large scale? Conventional social movement theories, focusing on resource mobilization from a specific opportunity structure constructed through interaction between the state and society, cannot provide good explanations for such kind of collective action. Rational choice perspectives, emphasizing the contingency of each individual participant's decision upon his/her perception of other's action, have done a better job in studying large-scale citizen self-mobilization.

This article inquires this process through a comparison of two large-scale citizen self-mobilizations in 2014 – Taiwan's Sunflower Movement in March and Hong Kong's Umbrella Movement in September. From a rational choice perspective, we can carefully analyze how participants' framing of the collective

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

action have changed during the process. Besides the role of the Internet Communication Technology (ICT), this article argues that the way the state violence was exercised and the way the participants responded during the process has a significant effect on how participants frame the meaning of the movement. By comparing these two cases, we find that the strength of the collective action was affected by the state capacity, the movement organization, and the perception of the society in general.

Building the Future through Collecting and Using Genomic Data – Case of Finland

In Finland biobanks combine abstract future and progress of biomedical science with expectations of boosting population health, patient care and economic growth. Visions of personalized and translational medicine are among the main goals of biobanks in Finland, which are mainly built around publicly funded hospitals or research institutes. At the same time the state has put effort on strategic work towards the goal of utilizing genomic information for the benefit of both citizens as well as competitiveness of the Finnish health care sector. The state has underlined this commitment for example through Health Sector Growth Strategy for Research and Innovation Activities in 2014. In addition Finnish Genome Strategy was proposed in 2015. The vision is that by 2020 genomic information is used in the daily health care of citizens and the people will by then be "empowered to improve their own health by effective use of genomic information" (Genome Strategy 2015, 5).

In biobanking and in the strategy work by the state the national population is framed as a source of value through vast amounts of register data and samples available for research use. However, even though Finnish population is often framed as a valuable source of genetic information due to its homogeneity, the "populations" in biomedical research of today are not necessarily the same as national populations. In the presentation I will analyse how this tension illustrates well the way visions of the future in relation to usage of genomic data are built in Finnish society. Theoretically I will utilize the concept of sociotechnical imaginaries. The presentation is based on i.e. 41 interviews, fieldnotes from 20 biobank- or biomedicine related seminars and policy documents collected widely from the field of biobanking and biomedicine in Finland.

Labeling the Crisis: Left and Right Wings Discourses about the Crisis and the Role of the Mediated Public Sphere in Italy

This paper discusses the economic crisis process in Italy, the left and right wings discourses about the crisis, the practices of dissent and the role of the mediatized public sphere in preventing and opposing the social consequences of the crisis. In particular this study focuses on the phenomenon of the suicides due to recession and considered as a social problem. It analyzes the left and right wings discourses on the crisis and on the economic suicides by workers, employees and entrepreneurs during the period 2008-2013 in the national press. The analysis is guided by a methodological approach based on a flexible form of Grounded Theory and the use of sensitizing concepts like anomie, *désaffiliation*, sense of vulnerability that stem from the seminal work of Durkheim, Boudon, Castel and others. The study identifies the dimensions of sense proposed by the left and right wings to interpret the economic suicides phenomenon, the practices of dissent of the right and left wings towards the reaction of the State to this phenomenon, and the active proposals to cope with the phenomenon in order to prevent it and to help the victims of the crisis and their relatives.

Furthermore, through the theory of the mediated public sphere, this paper discusses the importance of studying the contemporary dynamics of construction of the public discourse, and highlights the opportunities offered by the reactive public spheres in order to cope with the crisis effects, to oppose *désaffiliation* and to reconstruct ethic and responsibility.

The Future Trend of Migration in East Asia and Japan

What characteristics will international migration and migration policies have around 2020? In contrast with European countries, the cases of East Asia will give us insightful suggestions. Especially, an East Asian country, Japan, demonstrates peculiar future image, although it has developed with being similar to some European countries. Economic globalisation and depopulation strongly presses Japan to introduce labour migrants to its economic sector. Under this situation,

Japan still keeps the policy dogma of "no-introduction of unskilled labour from abroad". Instead, it allows Nikkeijin (Japanese descendants from Latin America) to work even at unskilled jobs, then it is gradually enlarging the technical internship scheme where foreign interns de facto work at unskilled jobs. In addition, Japan introduces nurses/care workers in a quite limited way of Economic Partnership Agreement (EPA). This Japanese development of restrictive immigration policies can be recognised as peculiar, if compared to South Korean policies that started to introduce unskilled immigrants officially. What will happen to migration to Japan and immigration policies of Japan around 2020? This paper will submit a relatively pessimistic scenario: The present trend of restrictive policies will be continuous for a while, because, As the recent hate speech demonstration against Korean residents designate, Japanese ethno-national understanding of citizenship is quite stable without any reason to be changed in near future.

Engendering International Human Rights Protection: Women Asylum Seekers on the Southern Borders of the European Union

This paper examines the IHR protection afforded to asylum seekers at the border, with a special emphasis on women, by the EU southern member states (Cyprus, Greece, Italy, Malta, Spain). In an effort to assess whether and how IHR protection works, the investigation of the IHR regime, at the UN and regional (European) levels, is coupled with key jurisprudence from the ECtHR and ECJ as well as diverse documents from the OHCHR latest Universal Periodic Review for the specific countries under consideration. Despite the legal protection by the high-level European courts, the research overall underscores the IHR regime gaps and violations by states. Moreover, there is a "conspicuous absence" of gender and "race" perspectives in law, state policy and OHCHR discourse. To the limited extent that asylum seekers are visible as a category, they are mostly lumped together, irrespective of gender-specific issues and vulnerabilities. Jurisprudential reference is frequently made to their national origins but there is a lack of problematization that the majority are "non-white" coming from "developing" societies. Emerging, new and "new-old" issues pertaining to refoulement, "interruption," "externalization of borders," the "shrinking of borders," push-backs, off-shore processing and re-admission agreements ("externalization of asylum"), suspension in a constant "state of arrival," sexual violence and the sexualisation of the everyday in detention, long-term detention, and "irregular deaths" are being examined with a special focus on women's experiences.

What Kind of Personal Networks Do Spouses Share with One Another? Focusing on the Degree of Urbanization

What kind of personal networks, if any, do spouses share with one another? This study analyzes this question focusing on the degree of urbanization of city centers, suburbs, and villages. This study was conducted with data from 335 married couples.

Consequently, several network patterns were identified, namely "wife's network-led (city centers)," "husband's network-led (suburbs)," and "a multilayered social sphere of relatives, neighbors, and friends (villages)." Overall, the sharing of networks between spouses was found to be marked by differences due to socio-environmental factors, namely "formation of relationships from indigeneity (villages)" and "formation of relationships by norms of gender roles (city centers and suburbs)."

In other words, urbanization has the effect of freeing spouses from the embedded social relationships of their indigenous context and simultaneously incorporates those relationships into the new norms of role division by gender. From this study, I would like to consider the impact of urbanization on spousal relationships and the resulting challenges that married couples confront.

Can Fathers' Parenting Change Gender? -the Work-Family Life of Japanese Fathers

For working mothers in the nuclear family, it is important whether fathers take care of their children. In my interviews with fathers, some said they take care of their children almost as much as mothers. They recognize the importance of their wives' work, and change their work style to fit with the requirements of childcare. However, their level of responsibility and the amount of work they have are the same as those of other males at their workplace due to *Salaryman* masculinity.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Salaryman masculinity is the hegemonic masculinity in Japan. *Salaryman* are protected by career-long employment and a seniority system, and take on the role of the breadwinner leaving domestic duties to his wife. However, childcare is the important care for inevitable dependency relationships, regardless of gender. This means that fathers are expected to work hard as *Salaryman*, and they face a paradox between their work and childcare. Yet they don't recognize this paradox, and they don't request that their company accommodate their parenting needs as workplaces normally do for mothers.

It is important for fathers who would like to actively care for their children whether their wives recognize the importance of fathers' childcare. Most mothers are the gatekeepers of their family, and can control the degree of fathers' parenting. In one of my interviews, I learned that a mother decreased her husband's hours of childcare because she believed that he has to work hard as *Salaryman* in his workplace. Consequently, *Salaryman* masculinity in fathers' workplace determines both their work styles and their parenting.

It is hard for fathers to take care of their children such as mothers because they have to work as *Salaryman*. Therefore, in order to change notions of gender in families, we need to research not only about families, but also the workplaces.

Can New Concept of Father Change Gender? | Ikuman and Masculinity in Japan

Ikuman is the contemporary Japanese concept of father who would like to actively take care of their children. Childcare has been seen as a part of women's gender role. Can *Ikuman* change gender order?

In the 20th century, especially after the economic growth period, most Japanese fathers were not at home; they worked for long hours as *Salaryman*. *Salaryman* are protected by career-long employment and a seniority system, and take on the role of the breadwinner leaving domestic duties to their wives.

Salaryman who only works and does not care for their families is the hegemonic masculinity in Japan. *Salaryman* was father who took on the role of the breadwinner, but not parenting. Starting in the 21st century, Japanese government policies and media began to encourage fathers to adopt the concept of *Ikuman* due to falling birth rates.

Japanese parenting magazines contain three images of fathers: "the breadwinner," "men not good at caring for children," "men taking care of children." The last father exemplifies *Ikuman*, and he cares for his children differently from his wife due to the *Salaryman* masculinity. Then, fathers can become *Ikuman* and mold their parenting styles to fit *Salaryman* masculinity. *Ikuman* possess *Salaryman* masculinity, and is the different parent from mothers. However, childcare is the important care for inevitable dependency relationships, regardless of gender. There is a paradox that the more *Ikuman* takes care of his children, the more he enhances notions of gender. However, we cannot recognize that paradox in the magazines because nobody asks what constitutes fathers' parenting styles, especially regarding the difference from mothers'.

We recognize that an image of men taking on women's traditional role can change notions of gender. However, if the concept of father has some paradox about notions of gender, it would not be able to change gender order.

TATSUNO, YOSUKE* (Sophia University, tatucon0703@gmail.com)

Transnationalizing Dynamics of Social Movements : Using the Integral Approach of Social Movement Theories

In recent years, transnational social movements have significantly increased in every corner of the world. Additionally, this phenomenon showed that the problem recognition has been globalized. For instance, in view of the wave of anti-nuclear movement since Fukushima, the participants have widely shared problem recognition in Japan, Korea and Taiwan.

In past several decades, studies of transnational social movements have focused on viewpoints of cultural /structural factors (i.e. Tarrow 2005; Edwards 2014). However, from examining previous studies, there seems to be little research regarding the mechanism that leads to the transnationalization process of social movement. In other words, they have overlooked what factors influences transnationalization process of protest. In this presentation, we will address one question: how does a local movement change to a transnational social movement? By clarifying this question, we aim to present requisite factors of a transnationalized process of social movement.

In this present work, we analyze a case study of environmental movements on Okinawa prefecture, by using the integral approach. This approach combines the structural approach and the cognitive approach. Therefore we have to extract two factors. In order to find out the cultural factors, we studied the motive of participation, the resource of motive, and construction process of problem recognition, by investigating the claims of protesters. Furthermore, in order to examine the

structural factors, we make investigation into history of protests, circumstances surrounding the social movement, by conducting the archival works.

Lastly, we will attempt to clarify that the transnationalized process has a strong association with changing structural/cultural factors of local participant. In addition, the result of this experiment shows that the integral approach can explain transnationalizing dynamics of social movement.

Health Consequences of Losing Job in Europe. Do the Contexts Make the Difference?

That socio-economic conditions influence persons' health is a well-documented fact. Especially the employment situation has received attention, and a huge literature so far has shown that entering unemployment is negatively associated with health. Moreover, literature recognizes also that health depends on the broader institutional context, especially in terms of economic inequality and general effectiveness of welfare state provisions. Nevertheless, these studies often remain descriptive and do not go in depth in studying mechanisms leading to undesired health outcomes.

This paper aims to go beyond the current state of the art providing several contributions. First, we study socio-economic conditions in a dynamic perspective, investigating the consequences of job-loss on health and thus putting our results on a sounder bases.

Second, we take into account context and ask to what extent it can mitigate the consequences of job-loss. Specific attention is dedicated to family as important source of support. We expect the family to shelter its members from the negative consequences of job-loss, also in terms of bad health, by pooling and redistributing economic and non-material resources.

Finally, the paper shows to what extent different kind of families manage to moderate the consequences of job loss on health and how does this capacity to shelter its members vary across countries. Indeed, it is known that the responsibility in health care is jointly shared by family and (welfare) state, but lack of evidences still persist regarding their interplayed role at the time of job loss.

We address the topic using 2004-2011 EU-SILC data, and model health applying fixed-effects regressions in different welfare states clusters (Nordic, Liberal, Conservative, Southern and Eastern).

Violence in Literature: The NOVEL of Violence in LATIN America

The age of late modernity has shown an increasing crisis of social control and policing, as an expression of a worldwide social crisis. In this context, it is possible to distinguish various narratives about violence, drug dealers, and violent crime in the contemporary societies.

So, the hypothesis of this paper is to present a new genre in crime fiction, called "the novel of violence", which show a main structural transformation of narrative, although incorporating some trends from the classic detective fiction.

To perceive this novel of violence, it seems important to remember that, since the fifties, the novel, following the metamorphosis of the social structure, undergoes a drastic formal change. The "problematic hero", present in the romantic and realist romance, leaves the scene and his place is occupied by the dissolution process of the character. To verify this hypothesis, we will analyze some novels published in Latin America countries, since the 1990s, particularly these outstanding Authors:

I.   Carlos Fuentes, from México ("La voluntad y la fortuna", 2008 and "Adán en Edén", 2009)
II. Fernando Vallejo, Colombia ("La Virgen de los Sicarios", 1994);
III. Jorge Franco, from Colombia ("Rosario Tijeras", 2004);
IV. Ruben Fonseca, from Brazil ("A Grande Arte", 1992).
V.   Elmer Mendoza ("Un asesino solitario", 1999 and "Balas de plata", 2008)

We will discuss: 1. The characters; 2. The plot; 3. The political actors; 4. The new forms of violent crime; 5. The solution, or not, of the enigma.

This analysis of several literary expressions around Latin America can lead us to discuss the existence of a social representation in contemporary society based in violence as a social pattern as it is figured by these "novels of violence".

Social-Material Aspects of Digital Consumer Finance: Findings from a "Portable Kit" Study in Hispaniola

Financial management is a social-material activity that individuals and households undertake with a broad spectrum of voluntary and involuntary relationships in mind, including those with friends, the household, businesses, society, and the state. However, digital finance's "virtuality" poses challenges for researching and theorizing money management mechanisms within everyday contexts. Digital finance increases product diversity and mobility across borders, while decreasing the visibility of transactions and obscuring their social nature (Maurer 2015). There is a need to develop methods and theoretical frameworks to observe such ostensibly virtual transactions and relate them to people's social-material practices in their everyday lives.

We present findings from our qualitative research on the movement of people, money, and goods across the national border between Haiti and the Dominican Republic, where the use of digital finance products is increasing (e.g., mobile money, remittances, phone credit). In our "portable kit" study, we asked participants to discuss the contents of their bags, wallets, and pockets (Horst and Taylor 2014). Participants combined digital / non-digital and money / non-money objects (e.g., cash, mobile phones, SIM cards, and identification documents) to achieve short-run and long-run socioeconomic goals, such as navigating border crossings, negotiating with employers, sending money via mobile phone, paying bribes, and managing remittances.

The portable kit method's value lies in rendering the material and immaterial mechanisms of socioeconomic actions ethographically visible. This method is a promising way to observe changes in financial practices,especially when combined with a theoretical framework incorporating advances in material culture studies (Miller 1987; Ito et al 2006), digital studies (Horst and Miller 2015), the mobilities turn (Glick Schiller and Salazar 2013), and socioeconomics (Callon et al 2002, Hart 2006). Such a framework can help keep relationships and their social contexts front-and-centre of our analyses of financial practices in the "digital age."

TAYLOR, YVETTE* (University of Strathclyde, yvette.taylor@strath.ac.uk)

Liminal Landscapes: Exhibiting Sexual-Religious (Dis)Identification

This paper draws upon the ESRC 'Making Space for Queer identifying Religious Youth project', focussing on the visual and textual data produced in participants' – and researchers' – mind-maps and diaries. I hope to chart some of the mutual and complex constructions, in mapping and 'making space' for sexuality *and* religion, and attend to what it means to 'exhibit' these intersections in public space and be 'out' in public. Across the course of the project, a mix of qualitative techniques (interviews, maps and diary exercises) allowed for rich insights into the everyday lives, practices and identities of queer religious youth: these techniques 'make space' to account for young people's experiences of being in – or absent from – religious *and* sexualised spaces. Yet methodological difficulties were encountered throughout, including in initially locating a sample, where some religious gatekeepers positioned potential participants as absent due to their identities not having been claimed, performed, or displayed. Visibly and publically making space for sexuality and religion through the project was also important for many respondents, seeking acknowledgement of identity rather than anonymity, and often disrupting research considerations of confidentiality and consent. This paper considers the space, ethics and aestehtics of research-researcher-researched identities as in process, and both enabled and constrained by religious-sexual fields. It complicates the legitimacy of being public, with 'queer', 'religious' and 'youth' adding other complications on the path to being 'public'.

RC22-275.5

TAYLOR, YVETTE* (University of Strathclyde, yvette.taylor@strath.ac.uk)

Mediated Belief: Queer Youth, Facebook and Faith

Drawing upon the ESRC funded project 'Making Space for Queer Identifying Religious Youth', this paper examines Facebook, as well as social networking sites and online environments and communities more generally, engaging with the notion of 'online embodiment' (Farquhar, 2012; Taylor et al., 2014). It revisits specific methodological dilemmas in qualitative research with particular groups of young people online, and the gendered dimensions of such quandaries. The lives of young people are increasingly played out online and young LGBTQ Christians are no different. Some have argued that the Internet can offer safe spaces, particularly for people of counter-normative sexualities, to construct an identity, forge connections and articulate voices otherwise subjugated in some offline spaces. The complexities of 'coming out' as LGBTQ and religious are explored, in asking how Facebook 'makes space' to construct identities, forge connections and articulate voices. An analysis of gendered emotion, embodiment and temporality is engaged with here in order to gauge the opportunities afforded by (dis)embodied

online profiles and the spaces and strategies utilised by queer religious youth. This involves examining how the role of (dis)embodiment in the construction of identities through online technology is developed, building upon earlier studies of Facebook to incorporate more recent theories around 'online embodiment'.

Invisible, Anonymous, Yet Politically Present. the Life-World of an Afghan Asylum Seeker in-Between Presence and Oblivion in the Asia-Pacific

While European nations agonise over the negotiations on the spontaneous flow of refugee populations (asylum seekers) from South to North and East to West, in the Asia-Pacific region, asylum seekers face significant barriers to finding protection. Chief in the creation of virtual 'zones of disappearance' of asylum seekers on boats is the Australian state. Australia has pursued a policy of off-shore detention of all asylum seekers arriving by boat through enforcement of a 'stop the boats' policy which includes no resettlement for those found to be refugees. Australia's approach, singularly hard-line and punitive to vulnerable populations, signals the legitimation of similarly tough approaches by near neighbours such as Indonesia and Malaysia as transit countries. Mindful of this context, this paper tells the story of an Afghan asylum seeker experiencing a liminal life in Indonesia through Australian policy change that has effectively left asylum seekers 'stuck' without the opportunity to seek protection. Achmed (not his real name) is not permitted to work in Indonesia to support his family and is also not permitted to engage in 'work-like' activities such as providing educational classes for other asylum seekers. Nevertheless, Achmed and other asylum seekers found strategies to circumvent their insurmountable circumstance of an endless wait for resettlement. Achmed, along with some of his friends, founded a learning centre in Cisarua in Western Java, beginning on a small scale for children with 'informal' instruction by women asylum seekers supported by 'sleeping leaders' such as Achmed. The story of Achmed is one of resilience, of 'survival community development' in the face of indifference and invisibility from powerful regional states such as Australia. The example of the Cisarua Learning Centre is becoming a powerful symbol in regional refugee politics linking refugee populations and their advocates transnationally.

TAZREITER, CLAUDIA* (University of New South Wales, c.tazreiter@unsw.edu.au)

The Visualization of Death at the Border. the Utility and Affective Realm of Representations of Suffering and Death for Political Advocacy and As the Circuits of a 'Crisis Politics' in Refugee Migrations.

This paper discusses the visualization of refugee journeys, journeys that all too frequently result in death while attempting to cross land or sea borders. Many of these deaths are of women and children, unable to cope with the extremes of border crossings, and particularly when the crossings are at sea on small vessels. The recording of deaths at the border is imprecise, yet numbers are conservatively in the thousands. In this context, the 'migration crisis' experienced in Europe in the last months has refocused attention on the plight of refugees drowning while attempting to reach the opportunity for protection from conflicts such as that experienced in Syria, Iraq, Afghanistan and numerous other conflicts. The death of one boy, three-year old Aylan Kurdi, sparked world-wide attention, sympathy and a softening in political hearts in relation to refugee intakes. The way in which the images of the body of Aylan washed up on a Turkish beach were used, circulated and re-circulated is emblematic of the issues surrounding the crisis politics of irregular migration and the challenges of visual cultures in this context. While the images of the body of Aylan were overwhelmingly used in a positive political advocacy for kinder policy responses to refugee arrivals, many examples of visualization of a politics of fear and social distance abound in the context of asylum seekers crossing land and sea borders. The paper draws on some of these examples, such as the 'off-shore' detention of asylum seekers by the Australian government, and on the growing literature in visual sociology alongside the sociology of emotions, to argue for a deeper ethic of care in the circulation and re-circulation of representations of disaster and death facing refugee populations.

TEIXEIRA, ANA LUCIA* (Federal University of Sao Paulo, alu.fteixeira@gmail.com)

Franz Kafka, Fernando Pessoa e Mário De Andrade: On the Meanings of a Minor Literature

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Seeking to give conceptual consistency to the term coined by Franz Kafka in his diaries, Gilles Deleuze and Félix Guattari support the notion of *minor literature* on three basic pillars: 1) production of a strong effect of deterritorialisation of the languages; 2) its intrinsic political effect, and 3) the collective value of what is produced by it, so that individual enunciation claims to be taken as the expression of a group.

The notion of *minor literature* is specially pertinent to think expressions of literature outside the centres of modern culture. It is the case of Portuguese modernist literature. In this case, one cannot talk of deterritorialisation of language, but of a reterritorialisation. To choose Portugal as a theme implies to produce a collective enunciation inasmuch as it means to establish a dialogue with the most fruitful theme of Portuguese literature.

Brazilian modernist literature, although differently, can be apprehended in the same terms: the binomial literature–literary criticism undertook a process of rationalisation of a national project, already established by 19th-century literature, maturing it into a project that aimed at aesthetic elaboration, intimately related to the local transformation of language, therefore, to its hyperterritorialisation, and the proposition of a national project with a modern face, enabled notably by literature.

In the three cases what took place was not only a literary production which gives visibility to national sentiment imbued with a political vocation, but the constitution of fundamentally literary structures of thought appropriate to its context of production. The aim of this presentation is to use the term coined by Kafka to discuss the works of three authors: Kafka, Mário de Andrade, and Fernando Pessoa, writers who produced, besides literature, an analytical grid which made it possible to give legibility to the political and cultural scene in which they belonged.

The Curitiba Urbanization Process: The Case of Iguaçu Park Garden

This communication is inserting amid the debates of Urban Sociology, discussing the urbanization process of contemporary Brazilian cities. The literature specifies points to an uncontrolled growth of these cities, which together with a private residential market restricted to the upper classes, produces a context of urban and environmental segregation. As the real estate market is not for everyone, most of the housing production in Brazil is made outside the law, with the portion of the excluded population occupying spaces without of urban infrastructure and services in the areas rejected by the private market and public areas, located in devalued areas such as: Border streams, hillsides, land subject to flooding, polluted areas or environmental protection. In these spaces, there is no access to urban services and infrastructure, less opportunity for employment and professional training, increased exposure to violence, racial discrimination, discrimination against women and children, and a difficult access to justice and leisure. The object of our research is the process of emergence of a new neighborhood in the city of Curitiba, Paraná state capital in southern Brazil, the Garden Iguaçu Park. The neighborhood in question arose from a movement of illegal occupation of an area once used only for sand extraction. The research points to the formation of an informal housing market, within budget of the families participants in the movement. In this case the informal housing market replaced the organized social movement in the direction of the process with the neighborhood association working as an organizer of this market. We discussed this context from the authors of the literature of Urban Sociology, as Henri Lefebvre, Mike Davis and David Harvey, in a dialogue with authors of Cultural Studies as E.P. Thompson and Raymond Williams.

Crises and Changes in Marital and Familial Life of Syrian Refugee Families: A Case Study in Mersin

There are over 2 million Syrian refugees in Turkey, more than any other country. The settlement conditions of Syrian refugee families have changed in the past year in response to swelling numbers of new arrivals and changing settlement patterns. Although, up until early 2013, almost all Syrian refugee families resided in camps, now almost four out of five families are sheltered in cities of Turkey. Many urban refugee families struggle to access adequate housing and services and they mostly find employment in the informal economy, often in unacceptable conditions and for extremely low wages. Other problems of refugee families settled in cities are communication in daily life and adaptation to the community they started to live in despite many cultural differences. Being away from home, experiencing these diffuculties and facing uncertainty about the future affect Syrian refugee family members psychologically, socially, and physically. These problems also leave them particularly vulnerable in terms of familial and marital

crises. In the study, the impact of these problems on familial and marital life of some Syrian refugee families that settled in Mersin, a metropolitan municipality of Turkey, will be examined on the principles of sociological biographical research. Data gathering and analysis will focus on embedding biographical self-presentations of these family members in the contexts of their familial biographies and the histories of their previous local social settings, interpreting them within these diachronic contexts.

Can Language Policies Alter Language Dynamics: A Language Competition Model

Can language policy alter language dynamics? In this paper, we develop a mathematical model of language competition between a dominant majority language and a minority language. The minority language group is a result of a continuous and ongoing migration process. Migrants enter the society as monolinguals or already as bilinguals, and they form families and generate offspring. Offspring can be raised in either one of the two languages or in both, but they are formally educated primarily in the dominant language. Offspring will produce a next cohort with its own linguistic repertoire. Besides language acquisition at home and formal language education at schools, we also consider adult language learning and the possibility that languages are forgotten if they are not used. Taking these three types of language acquisition as well as the social, cultural and official status of both languages into account, the model describes how the linguistic composition of the population changes over time. The process at the societal level is understood as an aggregated result of individual behavior, while individuals are seen as utility maximizing actors. Individual language decisions are made under certain socio-economic and institutional conditions, which can be addressed and changed by language policies. Hence, we investigate the long-term development of the population's linguistic composition and the effects of different language policies on this development. It is illustrated how language and status planning can be used to achieve wide spread bilingualism throughout the population to facilitate communication and participation possibilities for a large number of society members, which is seen as a good foundation for cohesion.

TENA-SANCHEZ, JORDI* (Universitat Autonoma de Barcelona, jordi.tena@uab.cat)

Field Evidence of Social Influence in the Expression of Political Preferences. the Case of Secessionist Flags in Barcelona

Models of social influence have explored the dynamics of social contagion, imitation, and diffusion of different types of traits, opinions, and conducts. However, few behavioral data indicating social influence dynamics have been obtained from direct observation in "natural" social contexts. The present research provides that kind of evidence in the case of the public expression of political preferences in the city of Barcelona, where thousands of citizens supporting the secession of Catalonia from Spain have placed a Catalan flag in their balconies and windows. Here we present two different studies. 1) During July 2013 we registered the number of flags in 26% of the electoral districts in the city of Barcelona. We find that there is a large dispersion in the density of flags in districts with similar density of pro-independence voters. However, by comparing the moving average to the global mean we find that the density of flags tends to be fostered in electoral districts where there is a clear majority of pro-independence vote, while it is inhibited in the opposite cases. We also show that the distribution of flags in the observed districts deviates significantly from that of an equivalent random distribution. 2) During 17 days around Catalonia's 2013 national holiday we observed the position at balcony resolution of the flags displayed in the facades of a sub-sample of 82 blocks. We compare the 'clustering index' of flags on the facades observed each day to thousands of equivalent random distributions. Again we provide evidence that successive hangings of flags are not independent events but that a local influence mechanism is favoring their clustering. We also find that except for the national holiday day the density of flags tends to be fostered in facades located in electoral districts where there is a clear majority of pro-independence vote.

Urban Development in North-Western India: Some Emerging Sociological Questions in Post Liberalization Era

Urban development in North-western India comprising Punjab, Haryana, Himachal Pradesh, Jammu and Kashmir and Chandigarh is at cross roads. North-western India is facing many crucial and new urban challenges in post liberalization era. The scale of emerging challenges such as housing, slums, poverty, access to infrastructure and services is unprecedented. Urban development seems to be neglected in urban policy planning over successive planning eras. Housing problem seem to acquire serious dimension in the wake of rapid urbanization, commodification of land and housing, distortion in land market and weakening of public sector housing provision. The onset of liberal regimes in promoting development of real estate markets, beginning of low interest home loans, etc seem to have made land and housing in urban areas commodity for speculation. Slums are growing rapidly even in the hilly states like Himachal Pradesh and Jammu and Kashmir with multiple deprivations. The social and environmental fabric of cities is under stress and many sociological issues are emerging in the urban areas. The social segregation continues to be a major challenge. The marginalization of urban poor is visible. The inequality in terms of access to housing, land, basic services and livelihood are emerging crucial social problems. The paper has been prepared on the basis of findings of the series of studies by the author on "State of Cities in Northwestern India: A case of Selected JNNURM Cities (Study focus cities-Amritsar, Srinagar and Faridabad)" and a recent book on "Urban Development in North-western India: Emerging Trends, Issues and Alternatives". An effort has been made to look into the emerging urban development patterns and governance systems that contribute to processes of urban fragmentation or to enhanced processes of integration. Many other important sociological questions emerging in the process of urban development in north-western India will be discussed in the paper.

A Proposal to Measure the Advance of Language Shift in Small Communities Using the Framework of Ecology of Pressures

Language diversity is decreasing all over the world, especially languages of minority groups. This may be beneficial for some members of the ethnic community as it means social mobility. For others it may be undesirable because the process of language shift could affect their group identity. There are different causes for these perceptions, and they might depend on the advance or progress of language shift.

To take the most adequate actions in language planning we have to know how to evaluate the sociolinguistic situation in a bilingual community. Our purpose is to present a model (model of ecology of pressures. See Terborg & García Landa, 2011) to analyse and explain language shift in small communities of minority groups in a given area. We support our examples on several researches of language shift of indigenous languages in Mexico. The framework includes the concept "utmost common routine" that may be partly calculated by a quantitative corpus obtained by a questionnaire applied to a representative population. The data of the indigenous language will be compared with the data of Spanish, the official language spoken in Mexico, to determine which language is the strongest one among a given age group of the population.

Affect of Unemployment on Leisure:a Study of Pregnant Women in Kanpur City

The promotion of social cohesion and social inclusion has been the central strategic goal of almost all the nations now. Monitoring the progress of such a policy requires the development of appropriate modes of measurement.

Elements of exclusion from social participation, or to term it as leisure, are many. Among the potential necessities which may be described as aspects of social exclusion are a hobby or leisure activity, a holiday away from home once a year, celebrations and gifts for special occasions, and having friends and family – or children's friends – round for a meal.

This is a study of a case of twenty five pregnant women from the City of Kanpur, India, less than thirty five years of age, employed prior to their conceiving. After almost a year, these women find it hard to regain employment, and this employment was treated both as a leisured activity and financially productive.

Study reveals, social exclusion due to unemployment is seen as multi-dimensional. "Lack of income, access to good-quality health, and the quality of the local environment all affect people's well-being". These are seen in the light of leisurely activities which kept them both socially and financially inclusive.

Unemployment results into social exclusion, which occurs where different factors including a shut down of their leisured acts combine to trap individuals. The prevailing social norms make unemployment illegitimate for these categories of women, which could have been legitimate for higher ages of women, as their leisure times and activities are restricted.

Exclusion in terms of social interaction is assessed by whether an individual lacks support in terms of: someone to listen, comfort, help in a crisis, relax with, who really appreciates them. However, due to this unemployment, the leisurely activities are coupled with a cohort of social exclusion and financial exclusion.

Leisure through the Lenses of Sport in the Context of India

The role and impact of sports in society has been a subject of debate for centuries. For some observers, sport is viewed as a physical activity always associated with competition among nations or teams for pride and glory.

But just as sport has the capacity to awaken exaggerated nationalistic sentiments, intolerance and even violence, there is also a sector of society that supports the notion that sport can serve as a means to advance social development processes, through leisurely practices. While there is currently direct evidence that leisure contributes to sociological development through fostering social inclusion and community development, sport possesses substantial social value, but less evidence. This study rotates around the two states of India, Uttar Pradesh and Bihar, where the researcher studies an excellent hook for engaging people through leisured sport practices, particularly those who may be suffering from disadvantage and providing a supportive environment to encourage and assist those individuals in their social development, learning, and connection through related programs and services.

These approaches are at the heart of the neoliberals agenda to improve individual freedom and opportunity. Sport and Leisure practitioners are passionate about the impacts their programs have on individuals and social development. While being anecdotal, this evaluation attempts to capture meaningful data to contribute to the evidence base for this claim that leisurely activities through sport attempts at doing socially and morally good to the society.

The challenge for the traditional leisure and sport sector in Uttar Pradesh is to move beyond current sport delivery practices to provide a range of products including low cost locally developed grass roots opportunities. In Bihar however, the opportunity exists for NGOs, with government support, to establish long-term viable programs that use sport in the form of leisure to engage with communities to deliver social outcomes.

Seeing Is Believing: South Asian Characterizations in Popular US TV Programming

In the 21st century, representations of non-whites have become increasingly common in popular US television programming. With the recognition of Black actresses like Viola Davis (How to Get Away With Murder), Taraji P. Henson (Empire), Kerry Washington (Scandal), and Uzo Aduba (Orange is the New Black) in popular media (and for some, in 2015 by the Academy of Television Arts and Sciences), analysts have recognized television as a entertainment space in which non-whites have finally "made it." However, these conclusions fail to acknowledge the role of entertainment media as a social institution; one that reinforces and perpetuated ideological norms about what race "looks like" in US society. In this analysis, I discuss contemporary representations of non-whites in popular US TV programming, focusing on examples of South Asian characters and actors. I emphasize the ways in which the "characterizations" that comprise the writing, casting, and production of these characters are intentional, and used to reinforce institutional ideologies that maintain dichotomous representation of "Black" and "White" in television and in society.

Trade Unions and Environmental Policies: Friends or Foes? the Case of the Austrian Energy Sector

The transformation towards a sustainable production system challenges current institutions and the predominant logic of actors along the whole production process. Trade unions as the main representatives of workers´ interests in the realm of production have to actively take part in this reorganization. Hence, questions arise how and in which form trade unions can engage in the transformation towards a sustainable economy and how they can deal with environmental problems on their different organizational levels.

In recent years, there has been a marked increase of literature analyzing trade unions' positioning towards environmental policy and more widely towards a social-ecological transformation. Alongside this growing field of research, we aim to contribute by analyzing the Austrian context. Specifically, we focus on renewable energy production, issues around energy efficiency and eco taxes as important and contested fields of policy making. To do so, we draw on expert interviews conducted with trade unions representatives on different organizational levels as well as in-depth analysis of relevant policy and mission statements, publicly-made statements of representatives in relevant print media.

The first part of our findings analyses the objectives and instruments put forward by Austrian trade unions in the realm of energy policies. Among others, the on-going liberalization and privatization as well as upcoming eco- and climate policies play a dominant role. Further, our findings suggest that considerable dilemmas exist in the nexus of environmental policy and the political goals of trade unions in the field of energy. We find obstacles preventing trade unions to strongly engage in issues around renewable energy as not being explicitly connected with their core competencies. Further, we find current power distributions within the organizational structure of trade unions but also in the labor market play a crucial role if trade unions are capable to adequately address environmental problems.

THEODORE, RACHEL* (École des Hautes Études en Sciences Sociales, racheltheod@gmail.com)

The "Inequality of Conditions", a Social Imaginary: Distinctions, Recognition and Democracy in Contemporary Chile.

Many research studies on the perception of inequality have shown that the Chilean population does not perceive socio-economic inequalities as they objectively are. Hence, we question, first, how these inequalities become normal standards, and are legitimized, to the point of disappearing from the population's perception and, second, how this key factor influences people's practice of democracy.

In 2015, in depth interviews were conducted in four Chilean cities to investigate the aforementioned topic of this research study, with the main focus on the question of how one can understand the perceptions of inequality by relying on the theory of the Social Imaginary.

Our main thesis suggests that Chilean society has developed an imaginary framework by means of images, social representations and discourse, which enable the normalization and legitimation of these inequalities, ultimately leading one to consider them as part of the social landscape.

Our first hypothesis is that these great inequalities are justified by the existence of what we would call an "imaginary of inequality of conditions" - a counter image of the Tocquevillian notion of "equality of conditions"- which underlies the mayor *significance* accorded by individuals to apparent *distinctions* — material, social, or personal.

Our second hypothesis is, therefore, that this specific imaginary is incarnated in social relations and is rooted in an *absence of consideration* or *recognition*, between individuals, which ultimately justifies socio-economic inequalities: if individuals are not morally equal, therefore, society justifies that some individuals are superior to others, making a strong, vertically structured society "the norm", providing the soil for inequalities to unfold.

Our third hypothesis is that this imaginary, shaped by an asymmetrical view of society, has a strong impact not only on people's idea of democracy - a political structure that presupposes equality as its core principle- but also on its daily practice and participation process.

UK Youth Participation in Climate Change Decision-Making: Perceptions of the International Climate Negotiations.

Youth are actively participating in climate change initiatives at all levels. However, little is known about the motivations and barriers which affect their participation and the degree to which their experiences shape their values, continued civic and political engagement and their broader life trajectories.

This empirical research aims to develop a deep, rich understanding of the factors which motivate and the barriers which inhibit youth participation in the United Nations Framework Convention on Climate Change (UNFCCC). Data to be presented in this session comes from the first wave of a qualitative longitudinal study which will be collected in the lead up to and during the UNFCCC's Twenty First Conference of the Parties (COP 21) in Paris in December 2015.

In order to contribute to an emerging research agenda on young climate change activists, this study takes an ethnographic, case-study approach, focusing on a pro-active, dynamic and entirely youth-led group: the UK Youth Climate Coalition. This research will follow these young people from their early preparations through their engagement in this landmark conference and beyond.

Initial findings will shed light upon youth perceptions of COP 21, comparing members of the group with full conference access with their peers who lack conference accreditation and will thus seek alternative methods by which to influence the negotiations from the streets of Paris. The influence of access upon individual perceptions, perceived efficacy and group dynamics will be discussed, along with the impact that the long-awaited global climate change agreement has upon youth motivations for continued engagement.

This research draws upon learning from a range of disciplines, combining sociological understanding of life transitions with geographical conceptualisations of identity creation and complementing environmental governance research on the role of non-state actors in climate change decision-making.

The Rules of Posting: Intra-European Mobility of Labour and Pressure on National Regulations

Posted work represents an intra-European mobility that we will analyse with a transnational research on Portuguese workers in the construction sector in France. Posting is described by a triangular relationship between the Portuguese employer and his employee, acting as a subcontractor for a French company. This situation can be analysed by the encounter between formal rules and unspoken rules on the basis of cross-European policy of the labour market. We call the production process of the rule of posting an *extraterritorial regulation* in order to account for its origin outside the workplace in France. On the one hand this regulation is based on different sources of normativity linked to European law, the identity of the workers, territorial mobility and economic clusters. On the other hand, it leads to a conflict between the rules of the country of origin, Portugal, and the rules of the country of destination, France.

THOLEN, JOCHEN* (Institute Labour and Economy - University of Bremen, jtholen@uni-bremen.de)

Trade Unions in Central East and South East Europe – Modernization or Sink into Oblivion?

Before 1990 (Fall of the Berlin Wall), the societies in CEE and SEE countries were characterized by a planned economy and a de facto one party dictatorship. Then these societies tried to overcome both societal characteristics voluntary.

Theoretical background: Insofar they had to cope with a double process of transformation:
- from a planned society towards a capitalistic market economy
- from dictatorship towards a (liberal) democracy.

In principle this implementation of civil society´s structures needs the recognition of and cooperation with the social partners, especially employees and their representations.

Thesis: But looking to the current situation, in CEE and SEE countries there is race between the (slow) reform efforts by the trade unions and the process of their insignificance. In the moment it is totally open, who will win this race.

Empirical evidence comes from (empirical) studies of Trade Unions and Labour Relations in almost all CEE and SEE countries (with the exception of Romania, Bosnia-Herzegovina and Montenegro as well as former SU countries), carried out between 2009 and 2013. Partly these studies were organized as single studie (comprising only one country), partly as comparisons between countries, and in two cases as panel studies (consecutively with a timed interval). Financial funds

Relationship Quality with Adult Children: Gender and Cognitive Limitations Among Older Adults

Objectives: Increasing risk for cognitive limitations at older ages along with a growing population of older adults presents critical challenges for caregiving families and health care systems. These challenges urgently call for research examining factors that may protect against or exacerbate cognitive limitations among older adults. We examine the impact of adult child-parent relationship quality, a feature of the social environment known to affect physical and mental health and may also influence the cognitive health of older parents.
Methods: Using nationally representative panel data from the Americans' Changing Lives survey (N=1,408), we analyzed the impact of both positive and negative dimensions of adult child-parent relationship quality on trajectories of older parents' cognitive limitations as they aged.
Results: Higher levels of strain with adult children were linked to steeper increases in cognitive limitations as mothers aged, but relationship strain with adult children appeared to be protective against cognitive decline for fathers.
Discussion: Older women are already at greater risk for cognitive limitations than men, and relationship strain with adult children may exacerbate cognitive decline for women. These findings point to the importance of taking gender into account when studying how positive and negative aspects of close social relationships affect older adults.

THOMPSON, BEVERLY* (Siena College, bevyuen@gmail.com)

Marijuana Legalization in the United States, Continued Imprisonment, and Felony Bans in the Cannabis Industry

We are facing the beginning of the end of marijuana prohibition in the United States. After eighty plus years of illegality, both Colorado and Washington states legalized cannabis in 2012 through the use of ballot initiatives. In 2015, voters again legalized it in Washington DC, Alaska and Oregon. The 2016 presidential election looks to have at least five states putting forth similar ballot initiatives. Public and legislative opinion appears to be making a sharp shift in favor of legalization, and the Drug Enforcement Agency is in retreat, facing major budget slashing in the wake of continued institutional scandals and the changing social tide.

Nothing has been more devastating to the black community than the so-called War on Drugs, which has decimated impoverished communities. Now that the end of marijuana prohibition is on the horizon, how can the social penalties against such populations be corrected? Prisoners of the Drug War continue to languish in jails and prisons, even for marijuana crimes that are now legal in some states, because there is no application for retroactive ameliorative relief, like there is in other countries. Further, once these drug felons are released from prison, they are barred for life from working in the legal cannabis industry, more completely banned than violent felons. A social reparations policy would encourage these emerging industries to employ those with experience in this arena—drug felons—but the opposite is the case. And the institutional racism of the legal cannabis industry is not limited to felons; because the market is oriented towards individuals with significant class privilege and liquid capital. Indeed, people of color barely own any cannabis dispensaries in the states where the business is legal. At this beginning of the cannabis industry, we can see that racism is being institutionalized through these policies.

THOMPSON, MICHAEL* (William Paterson University, thompsonmi@wpunj.edu)

The Automaton Society: On the Relation Between Anomie and Alienation

Since the nineteenth century and through the twentieth, anomie and alienation have been associated with forms of meaninglessness, powerlessness, normlessness and a sense of social-psychological dislocation. Contemporary culture, however, seems to evince new patterns of inclusion and assimilation to broader patterns of norms, values and social goals that socialize the self to the broader imperatives of elites and the social systems they steer. The thesis I will explore in this paper is that we are witnessing a new form of anomie and alienation where both are now to be seen as objective pathologies of moral reasoning and forms of social belonging. With a resurgent neo-liberal capitalism, anomie and alienation not manifest themselves as social problems in the traditional sense (crime, etc.)

but rather as deficiencies in moral and political reasoning that affect their forms of critical rationality and their capacity for democratic will-formation. As a result, what I will call the "automaton society" refers to a new way of seeing how anomie and alienation can be fitted together to explain the strong legitimacy of hierarchical social orders based on voluntary forms of authority.

RC36-417.1

THOMPSON, MICHAEL* (William Paterson University, thompsonmi@wpunj.edu)

The Loss of Alienation in Contemporary Critical Theory

Recent impulses in critical theory have tried either to rework the theory of alienation or have simply overlooked its salience, failing to incorporate it into theories of modern society, culture, consciousness and rationality. In this paper, I suggest that this loss of alienation in critical theory renders many of its contemporary proponents unable to grasp the defective aspects of modern capitalist society. Even more, their turn away from alienation as a concrete and central pathology of modern society and culture has allowed them to construct increasingly abstract and politically misguided approaches to political and social life. My thesis will be that alienation needs to be reconstructed as a concept that affects the cognitive dimensions of moral and epistemological elements of the subject. Only then can we see how alienation plays into a larger theory of social power and as a unifying theme in any critical theory of society.

State of the Art - an Investigation into How Students in UK Secondary Schools Experience Visual Historical Evidence, and How They Might be Used More Effectively.

Despite a widespread use of visual historical evidence in secondary school History classrooms across England and the emergence of practitioner informed research (Jaffee, 2006; Card, 2006 & 2011; and Eilam & Ben-Peretz, 2010), there is a sense that its use is used mainly illustratively and not interrogated or given the credence to the extent that more textual sources are. This reflects influences from institutions such as the academic community and UK exam boards, though there is evidence that in the last few decades, with the growth of subjects such as media studies and visual studies, this has started to change in some quarters. As experienced teachers of History and teacher educators, we have been interested in examining ways in which visual historical evidence is experienced in the secondary classroom, and what constitutes meaningful learning from their use.

We argue that the way students experience visual historical evidence holds pronounced differences and similarities with the ways in which textual sources are experienced, is an experience which is highly problematic, and that both teachers and students need to be aware of this and understand the issues involved as a first step to developing meaningful learning experiences. We also posit that the interpretation of visual historical evidence is a process that reveals much about the way students understand and make sense of the world, and which can be used to help develop a student-led construction of knowledge that incorporates a critical-analytical approach.

This presentation will therefore both share and discuss the findings of a pilot study conducted in 2014 and some of the initial findings of a larger-scale action research project currently being undertaken.

The Beliefs of Citizens in Middle Eastern Countries about the Relationship Between Development and Personal Freedom, Democracy, and Human Rights

This paper investigates the extent to which people in five Middle Eastern countries—Egypt, Iraq, Lebanon, Turkey, and Saudi Arabia—endorse the key beliefs of developmental idealism that associate development with freedom, democracy, and human rights. Developmental idealism is defined as a set of beliefs and values that endorses development as desirable, indicates methods for achieving development, and specifies the consequences of development. The literature suggests that the values and beliefs of developmental idealism have suffused worldwide among elites and lay citizens alike. This literature also posits that as these beliefs and values are disseminated, they become forces for social and economic changes, including social and political transformations such as the 'Arab Spring'. Although the research on developmental idealism has primarily examined family

and demographic issues, developmental idealism beliefs and values have tremendous potential to influence other aspects of society. This paper builds on and extends developmental idealism research by considering issues not addressed previously: personal freedom, democracy, and human rights. We use survey data to investigate whether individuals in five publics in the Middle East believe that increases in development lead to greater personal freedom, democracy, and human rights and whether they believe that increases in personal freedom lead to greater development. These data indicate that large majorities in all five countries believe that development brings about greater personal freedom, democracy, and human rights. Conversely, the data also show that large majorities believe that more personal freedom contributes to development. These findings provide support for the idea that the beliefs of developmental idealism concerning three key elements of world culture--freedom, democracy, and human rights--have diffused to diverse publics in the Middle East. These beliefs have great potential to affect the pace and direction of societal development.

THORPE, LEE* (The New School for Social Research, leethorpejr@gmail.com)

The Ontology of Lgbtq People of Color

My submission for the conference will explore how language affects identity formation and politics for LGBTQ people of color. In any given society, people come to an understanding of their identities through the deployment of language and the naturalization, and normalization, process of its usage. Yet when a person is outside the norms of society, how are language and experiences used to legitimize a person's understanding of their self? I would argue that for LGBTQ people of color language and everyday experiences are used as ways to gain an understanding of who they are both in the LGBTQ community, as well as, within their own racial/ethnic communities.

There is a need for further research in this area because the ontology of LGBTQ people of color is rarely visible. Although most people would claim there has been an increase in LGTBQ visibility and acceptance, it is a specific demographic they are speaking about: the visibility, and acceptance, of White gay men. The majority of news articles that I have seen about LGBTQ people of color have usually been associated with some sort of violence, or some other contestation.

From the Swinging Sixties to Their 60S: Considering the Role of the Past in the Subjective Experience of Sexuality in Old Age

This paper addresses the role of cultural changes that took place in the 1960s and 1970s in shaping older Australian women's subjective experience of sex and relationships in later life. Some scholars have argued that this generation of women will challenge ageist and sexist norms and reinvent social scripts for women and ageing (Calasanti and Slevin, 2001; Loe, 2004). In order to understand how women who came into adulthood during the "sexual revolution" conceptualised sex and relationships, I conducted semi-structured interviews with 28 women aged 55-81 and asked them to keep reflective journals. In this paper, I consider the women's recollections of their sexual experiences during these decades and how they represented the impact of these decades on decisions they made about sex and relationships later in their lives. I also consider the significance of social changes, such as attitudes towards pre-marital and extra-marital sex and the contraceptive pill on their sexual lives then and now, as well as the influences of timing, location and family circumstances. When discussing later life sex and relationships, the women often emphasised difference from early relationships, providing narratives of moving on and learning from the past, or conversely, of remaining in these early relationships. They therefore represented diverse possibilities for being sexual in older age. However, as I discuss, the possibilities for re-imagining sex and relationships were for many, also constrained by long-held ideals of heterosexual sex, gender difference and monogamy. These constraints suggest that it is in practice difficult, even for this generation of women, to completely reject sexist and ageist norms in old age.

THROM, MEGAN* (Wayne State University, ae2925@wayne.edu)

Exploring the Teaching/Research Nexus Via Institutional Ethnography

Entire institutions are regarded as less valuable when labeled as "teaching-intensive" in the United States. The goal of this project is to investigate the relationship between the undervalued nature of teaching in academia as evidenced by the teaching/research nexus, and the under-privileging of k-12 teachers by analyzing individual experience, agency, and power relations present at the institu-

tional level in order to develop a theory capable of linking structures in academia to privileging of research over teaching, and tracing this privilege to the devaluation of feminized labor.

Beginning with the stories of faculty members whose primary responsibility is teaching, I explore the pathways, choices, influences and obstacles they have encountered throughout their educational experiences, in addition to the perspectives of those who occupy positions further up the chain of influence in administrative roles. Common documents such as curriculum vitae, job postings and similar public displays (websites, bulletin boards, etc...) are woven throughout the analysis. Preliminary coding and early data analysis reveal themes dominated by agency and social class background as major influences into the pathways of academics at teaching intensive intuitions. Also prevalent are themes of institutional barriers in regards to initial job application procedures as well as in tenure and promotion, especially as related to more privileged research focused institutions. Across the board, these academics have lamented the lack of preparation for their teaching intensive positions on the part of the institution while in graduate school. Curriculum vitae also point to a narrowly focused research identity, while academics themselves speak about their identities in much more complex ways.

The Research on the Consumption Gap and Consumption Inequality Between Urban and Rural Households

As a modern academic concept, the government evaluation has been concerned by academicians since the nineteen nineties. The research of it enhanced the government's ability, increased people's well-being and quality of life. Compared to internet use, sense of fairness is a bigger influence on government evaluation. As "the new generation of youth", the post-80s generation and the post-90s generation have the dual meaning of the physical and social. A high proportion of Internet users and a low sense of social fairness lead to low government evaluation. Researchers give some policy recommendations about improving government evaluation.

"Adulting Is Hard" or Digital Back-Tracking Online

We live in a digitally saturated world. Social media not only mediate, but also constitute and constrain our lives. There is relative consensus among internet researchers, that social media provides an alternative to both interpersonal and mediated communication, allowing for identity work and providing flexible modes of sociability, which let individuals sustain strong and weak ties.

Today, perhaps more than ever before, young people's lives do not progress in a linear fashion from childhood to teenage years to adulthood. There is back-tracking or boomeranging, where young people go back to their parental home after having moved out, or back to school after having entered the labor market. Some may even say that in our youth-obsessed consumer cultures growing up or "adulating" (in internet speak) is not a desirable outcome. This presentation explores how social media practices and communities can serve as a way for young people to negotiate the external and internal pressures, (lack of) discernible markers of transition and digitally back track without too much jostling their material lives.

Relying on the example of a tumblr.com community of people who share sexy selfies, we explore how continuing self-exploration in a safe, communal space, serves as a way to manage social and personal transitions and alleviate the anxiety these may bring. Based on thematic and visual analysis of interviews, blogs, images and captions of 9 (21 – 30 YO) people, we question the potential of social media for helping with the experience of being an adult in the 21st century and offer the lens of digital back-tracking to understand the reflexive self-management young people today seem to have to undertake.

Young Cyborgs: Rituals of Resistance to Technology

This paper addresses modern youth and technology from over a decade of study into youth-machine mediated relationships. It provides selected results from a recent Social Sciences and Humanities Research Council of Canada funded project on *Digital Media and Young Lives over Time* that allowed for video interviewing, documentary film making and collection of digital data (facebook you-

denotes a presenting author. Abstracts are organized by first presenting author's last name.

tube, instagram, twitter, etc) from 95 Canadian young people and their "digital shadows" (close friends with whom they interact on line). We report on ways of being on-line and how they have influenced the mediated social lives of Canadian youth. Material gadgets and symbolic spaces used and resisted provide profound illustrations of what modern technology means for youth. The paper reports on what young people are doing on-line and how these doings command ritualized acts of resistance. Unlike the work of other current commentators (for example, boyd's *Its complicated: The social lives of networked teens*) who insist on complacency and/or hysteria, this work provides critical sociological analyses *with* and *by* youth. A rendering of supermodernity sets the context for excess and resistance that both interrupt and interrogate the present; one deeply held by the purveyors of technology. Young people illustrate their lives and interrogate gains and losses from their embedded positions. With the generous assistance of one such young cyborg (my son) in the presentation of this paper, we attempt a youth-attuned, visual and photographic rendering of rituals of resistance of Canadian youth.

The Future of Work: From Dystopia to Utopia?

The current world of work is largely a dystopia created by four interrelated processes. First, work has been degraded by widespread adoption of a neoliberal public policy package. Relatedly, most countries have devoted shrinking resources for public investment to meet massive needs for productivity-expanding, welfare-enhancing services. Third, technological change has been deployed to the disadvantage of workers, reducing the ranks of industrial workers historically most able to collectively defend their standard of living, and displacing workers from a broad range of sectors. Simultaneously, politically protected monopoly control of innovative ideas blocks workers' access to new means of production. Finally, employers have restructured their organizations to fragment the workforce. As a result of these trends, inequality has grown and precarious work has become the dominant form of new employment.

But four countertrends could pave a very different path. First, some democratic states have moved to limit or partially reverse the advance of precarity, expanding the scope of social protection and the "social wage." Second, mobiliziation strategies are essential, both to provide political foundations for more progressive state strategies and to shift the calculus of employers away from "low road" strategies. New models of precarious worker organizing are particularly promising. Third is the resurgence of visions of the cooperative organization of production—akin to Robert Owen's utopian strategies—most recently in experiments the "solidarity economy." Finally, while technological change has been used to degrade work, technology's current trajectory also has subversive possibilities that undermine capital's power and legitimacy and have the potential to support a modernized Owenite vision of collaborative "peer production". None of these countertrends is sweeping the field, but they have proven resilient and could be particularly powerful in combination. A utopian world of work is not as remote as it seems.

The Right Kind of Violence: Race, Belonging, and Militarism in the First World War Centenary

In the summer of 2014, the First World War centenary presented an opportunity to reassess Britain's national memory of a global, colonial war. Indeed, the "Commonwealth contribution" to the War received unprecedented attention in national commemorations. Further, a wave of politicians and popular media called for a re-nationalization of the War, foregrounding and valorizing Britain's role in the conflict. Yet the tone of the commemorations belied a context of growing uncertainty about the meaning of "British values" and a new wave of suspicion surrounding the loyalties of British Muslims. Taking this paradox as its starting point, this paper examines representations of colonial subjects in four key commemorations. A content analysis reveals that these events provided a means of managing contemporary notions of belonging. Specifically, I find that in the commemorations, colonial subjects engaged in "good violence" to support the British nation without challenging the substance of that nation. By extension, military service was represented as a contemporary form of "good violence" to facilitate the integration of racial and religious minorities into the mainstream. "Good violence" was juxtaposed, often explicitly, with the "bad violence" of Islamic State that dominated the news cycle as the commemorations unfolded. Implicit in this contrast were the omnipresence of violence in British nationhood; the veneration of violence as a response to violence; and the belief that Muslims, in particular, were prone to violence.

TIRYAKIAN, EDWARD A.* (Duke University, durkhm@soc.duke.edu)

Sacralizing Evil: Applying Durkheim to Genocide Studies

At one level, genocide, stemming from the efforts of Raphael Lemkin has become recognized as a crime against humanity, subject to the Convention on the Prevention of Punishment of the Crime of Genocide, adopted by the UN in 1948. But it is also a crime, whose perpetrators by and large have not been tried in court despite an enormous literature detailing and denouncing the practice of genocide. Although a crime against humanity, it is a crime against a people, seeking the destruction of all members and its culture. The violence involved is a xenophobic purification of the body politic by the total removal of an "alien" presence. To develop more broadly a Durkheimian approach, I consider the two most striking cases of genocide in the 20th Century, the Armenian genocide 1915-1922 and the Jewish genocide 1941-1945 . Each mass killing took place during wartime; however, it is the consequences of the genocide on the collective memory of the surviving members of the targeted group that merits attention. Effectively, the result has been a sacralization of evil by taking the act of genocide as an empirical manifestation of evil. In the Armenian case, the Turkish state where the genocide occurred has emphatically refused to accept scholarly evidence of its having taken place. The genocide and seeking for international recognition has created solidarity and a remembrance of the victims as newly designated matyrs. In the Jewish case, the genocide has come to be known as the Holocaust, originally used by Churchill before WWII in reference to the Turkish genocide or Armenians, but increasingly used after World War II to be associated with the Nazi genocide of Jews. As "holocaust" became more widely used "Shoah" has come to be preferred, albeit Holocaust Museums attract large audiences and promote as unifying mission "never again".

TIZIK, MIROSLAV* (Institute for Sociology of Slovak Academy of Sciences, miroslav.tizik@savba.sk)

The Catholic Church As an Actor of Neoliberal Changes in Education

One of the first changes in the Czechoslovak legal regime after the fall of state socialist regime in 1989 was the pluralization of educational system, which opened up for church or religious actors (along with public and private schooling) on all levels of education. After creation of an independent Slovak Republic in 1993 these three types of schools – public, church, and private – had gradually developed a model, in which a school receives funding according to the number of pupils or students attending the school regardless of its founder. The establishing process of church schools was based on the same principles and logic as the establishment of private schools – on the principle of competitiveness among the church schools and also between all three types of schools to attract the student or the pupil. Public schools attended by the majority of children and young people have become the main rival both for church and private schools. Church and private schools have become allies and the main competitor of public schools particularly in more urbanized and richer regions in Slovakia. It was mainly the Catholic Church, which competed with public schools in the most active way. It stipulated in its strategic documents goals such as to attract a higher number of children and to transform public schools into church schools. Church schools influenced by internal church policy have spread mostly in regions with the highest economic prosperity and the highest achieved education of its inhabitants, which are as a matter of fact also areas with the lowest religiosity. Thus, church schools have become part of the space of adaptaion to principles of free market economy in the Slovak Republic and the space for socialisation to the logic of neoliberal capitalism.

Is Mobile Parenting Possible? a Qualitative Study on the Parenting Experiences of Chinese Rural-to-Urban Migrant Mothers of Left-behind Children

In China, there were approximately 61 million left-behind children in 2012. While the psychosocial maladjustment and developmental problems encountered by left-behind children have been the focus of numerous studies in recent years, few of them addressed the parental concerns and practices of migrant parents. To fill part of the knowledge gap, this qualitative study aimed to investigate Chinese migrant mothers' parenting needs and their experiences in using

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Information and Communication Technologies (such as phone calls, WeChat, and Weibo) to perform their roles and connect with their children. A conceptual framework was developed to guide a process of examining their parenting experiences in terms of self-perceptions, knowledge, styles, and parent-child interactions. Twenty migrant mothers of children aged 11 or below were purposively selected as respondents. All of them worked in toy factories in Guangzhou. They had at least one child living in the hometown. Individual interviews were used to collect the narratives of these mothers. Their narratives indicated that although they faced intense challenges in parenting, they did not abandon their parenting roles upon migration. They were concerned about how they could enhance their parental involvement, maintain strong ties with their children, exert control over them, collaborate with caregivers and establish support networks for child nurturing through ICTs. Nevertheless, advancements in communication technology, the content of dialogues, and irregular communications may limit how children and parents perceive each other's life. Academically, the study's comprehensive analysis of their narratives can contribute to generating theory about migrant mothers' use of ICTs to construct the meaning of parenthood and carry out parenting practices while separated from their children. Practically, the findings can assist practitioners with designing a parent support and education program that can equip migrant mothers with the knowledge and skills in using ICTs to foster child development and enhance parent-child relationships creatively.

Tic y Educación Del Cuerpo En La Escuela: Maestros y Sus Concepciones

Este estudio objetivó identificar concepciones de cuerpo y educación en las prácticas educativas de maestros mediadas por tecnologías de información y comunicación. La investigación cualitativa de campo duró nueve meses basándose en el curso de educación continua "Elaboración de proyectos: TIC y educación del cuerpo". Participaron once maestros de seis escuelas públicas brasileñas. Los registros de actividades, foros de Internet y entrevistas con los maestros conformaron los datos empíricos. Los resultados mostraron diferentes concepciones de cuerpo y educación del cuerpo en el contexto escolar; del cuerpo máquina al cuerpo sujeto, de la educación del cuerpo en una práctica educativa fragmentada a una práctica educativa mediada por proyectos. Los maestros evidenciaron el uso de tecnologías de información y comunicación relacionadas al cuerpo; en algunos casos proporcionando una reelaboración de la vivencia corporal y en otros solamente reproduciendo lo que ya se hacía sin esas tecnologías. Las principales dificultades o desafíos para un "cuerpo sujeto" en la escuela serían el espacio físico y el gran número de alumnos en las aulas. Si bien los maestros tenían consciencia del cuerpo tradicionalmente tratado en la escuela como "objeto" (controlado, disciplinado), la mayoría deseaba contemplar la educación del cuerpo de manera contextualizada en sus prácticas educativas, independientemente del área de formación o actuación. Los maestros consideraron la articulación de la temática "tecnologías y educación del cuerpo" como un nuevo desafío poco abordado en el área de educación, siendo necesario profundizar el conocimiento por medio de estudios, proyectos e investigaciones. Las actividades desarrolladas por medio de proyectos pueden indicar avances en la flexibilización de los tiempos y espacios escolares, permitiendo mayor libertad de expresión corporal y mostrando un posible camino de superación de las limitaciones en la educación del cuerpo en la escuela.

Survey Data Versus Big Data: A Review of Issues and Approaches

In this presentation I will elaborate on the decline in response rates of surveys and the rise of big data. I will review issues and approaches in both fields, and relate them to Total Survey Error (Biemer, 2010). Can we use big data such as social media data, sensor data, transaction data and administrative data to replace surveys? Can we use big data to improve survey data? These issues will be discussed.

TOIKKA, ARHO* (University of Helsinki, arho.toikka@helsinki.fi)

Uncovering Multi-Level Governance and Policy Idea Transfer in Energy Policy Using Topic Modelling on Large Policy Corpuses

This paper uses a natural language processing method called dynamic topic modelling to map the transfer of ideas between policy levels. The paper presents a case study on energy policy in the European Union, Finland and the Helsinki metropolitan area, using policy documents spanning the past 25 years. The documents include laws and regulations, but also scenarios, roadmaps and admin-istrative documents, and constitute a massive corpus of circa 2500 documents and tens of thousands of pages. The corpus has been collected with web scraping methods.

The paper uses dynamic topic modelling to map the structure of this corpus and analyze trends over time at the three governance levels. Topic models are a family of machine learning methods that map word co-occurrence in documents to find word probability distributions that are, ideally, interpretable as topics to a human reader. Each document is a selection of words drawn from a mixture of topics. For example, the words "carbon" and "capture" might occur with a high probability in a topic, and that topic might then be interpreted as discussing carbon capture and storage technologies. Dynamic topic models also allow for the evolution of the word distribution, so that the prevalence of "greenhouse effect" might be overtaken with "climate change" as the vocabulary evolves.

This paper looks at the evolution of the topic structure and the words within topics in the three policy contexts, and evaluates whether the emergence of new issues and ideas happens first at the international, national or the local level, and whether the three levels are similar in the topics that are discussed and what vocabulary is used to discuss them. The analysis opens a novel vantage point into the relationships between formal and informal institutions and their development.

Una Escuela Sin Violencia: Zes Posible?

Una multiplicidad de formas de violencia, diferentes entre sí, atraviesan, se reproducen o se originan en la escuela. Estas violencias tienen orígenes diferentes, asumen distintas formas. Se articulan, se superponen, se potencian y/o se encubren. Hay violencias manifiestas e invisibles. Unas son reconocidas y denunciadas, otras silenciadas, sólo se captan a través de indicios.

Una investigación se realiza para identificar las violencias en su forma de discursos, prácticas e historias. Pero también para conocer la posibilidad de la existencia de una escuela sin violencias. Por ello, el objetivo de esta ponencia es dar cuenta de los discursos sociales de estudiantes, profesores y apoderados sobre las violencias y la existencia de una escuela sin violencia.

Para ello, se realizan nueve grupos de discusión organizados con la variable estructural de dependencia administrativa de los establecimientos educacionales y en su interior el Índice de Desarrollo Humano (alto, medio y bajo) en comunas de la Región Metropolitana de Santiago de Chile, curso (7° y 8° grado). Para el análisis se considera: unidad de la situación de enunciación, evaluación teórica y verificación sistémica y operatoria.

Los resultados indican que los actores reconocen una diversidad de violencias que tienen lugar en la escuela y todos las vivencian en lo cotidiano. Estas violencias adquieren diversas expresiones según el rol que desplieguen los sujetos, a saber, como profesores, padres/apoderados o estudiantes. Las violencias se configuran a partir de las tensiones: manifiesto/oculto y interior/exterior de la escuela. Estas tensiones ligan a la escuela con la totalidad social, como también, permiten dar indicios de las rupturas y dificultades de simbolización de las experiencias violentas. Se reporta, además, que no es posible imaginar una escuela sin violencias. La violencia parece ser consustancial a la institucionalidad escolar y las acciones que ahí se despliegan.

The Variety of Attitudes Towards Family in East Asia: A Comparative Study Using Issp 2012

This study has two aims. First one is examining the multiple dimensions of the attitudes toward family in East Asia. The other is considering the relationship between welfare regime and attitudes towards family.

Recently, the study about welfare regimes and criticism to it has been developed (Lewis 1992; Bussmaker and van Kersbergen 1994; Esping-Andersen 1999). In addition, the variety of familialism regime in Europe is examined (Leitner 2003; Calzada and Brooks 2013; Therborn 2013). However, the positions of familialism regimes, especially those in East Asian societies are still unclear.

On the other, study about family life in East Asia has been also developed (Ochiai and Ueno eds 2006; Iwai and Yasuda eds 2009; Chang 2010; Ochiai 2013). However, the empirical study about the variety of East Asian familialism is still developing.

This study tried to examine the variety of East Asian familialism based on a comparative study between Taiwan, South Korea, and Japan using ISSP 2012. Based on the previous study and institutions of those societies, this study set hypothesis below.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

H1: People in East Asian societies hold strong familialism about the childcare and elderly care than societies in other welfare regimes.

H2: There are variety between East Asian societies.

H2-1: People in Taiwan hold relatively weak familialism both about childcare and elderly care.

H2-2: People in Japan hold the weakest familialism about the elderly care.

H2-3: People in South Korea hold the strongest familialism both about childcare and elderly care.

Our analysis supported H1 but did not support H2-1, H2-2, H2-3 directly. However, East Asian societies are not uniform in a different way: people in South Korea hold weaker familialism about care significantly. On The date of the session, we will try to discuss the reason of this outcome with institutional viewpoints.

The Variety of Family Life in East Asia: A Comparative Study Using Issp 2012

This aim of this study is examining the variety of the family life, especially the variety of division of care work in East Asia.

Recently, the study about welfare regimes and criticism to it has been developed (Lewis 1992; Bussmaker and van Kersbergen 1994; Esping-Andersen 1999). In addition, the variety of familialism regime in Europe is examined (Leitner 2003; Calzada and Brooks 2013; Therborn 2013). However, the positions of familialism regimes, especially those in East Asian societies are still unclear.

On the other, study about family life in East Asia has been also developed (Ochiai and Ueno eds 2006; Iwai and Yasuda eds 2009; Suzuki 2012; Chang 2010; Ochiai 2013). However, the empirical study about the variety of East Asian familialism is still developing.

I revealed that people in East Asian societies hold strong familialism about the childcare and elderly care than societies in other welfare regimes, and that people in South Korea hold weaker familialism about care than Japan and Taiwan significantly (Toma and Takenoshita 2015). However, the difference of actual family life is still unclear.

So, I conducted a comparative study between welfare regimes and between East Asian societies using ISSP 2012.

Analysis revealed that (1) people in East Asian societies spend fewer hours to care their family than societies in other welfare regimes significantly, (2) there is a possibility that people in liberal regime and conservative regime bear the care work by their own more than people in East Asia, (3) couples in Taiwan and South Korea bear the care work more equal than Japan.

On the date of the session, I will discuss the relationship between global social changes and such variety of family life in East Asia.

How Do Patients Construct Their Identities Under Medicalised and Pharmaceticalised Conditions?

This study explores how medicalised and pharmaceuticalised bodily conditions of heart transplant recipients (HTRs) influence their identity.

HTRs need lifelong medical treatment to control their immune systems after surgery. The detailed process of controlling this treatment, such as the quantity of the medicine and the timing of the pill taking, depends on each HTR.

After overcoming heart disease through transplant operations, HTRs tend to think of themselves as individuals, while physicians see them as patients. In other words, the medicalised and pharmaceuticalised bodily conditions of HTRs are understood in various ways by different groups of people. Therefore, the experience associated with lifelong chronic conditions presents a difficult challenge for HTRs regarding their identity. The aim of this study is to develop an understanding of this experience.

The participants for this study were recruited through 'snowball' sampling. Inclusion criteria required individuals aged 20 years and over who had undergone a heart transplant operation more than one year before the time of the study. Nineteen Japanese HTRs were interviewed using semi-structured face-to-face interview techniques. Interview data was thematically analysed.

Physicians provide medicalised and pharmaceuticalised treatment to HTRs from their own medical perspectives, which have strong professional power. HTRs are not always passive about the medical care physicians provide them for immune control. In order to improve the quality of their everyday lives, HTRs learn from the medical advice they are given and perceive their own specific bodily responses to medical control. Within medically supervised conditions, they develop their own method of consuming their pills so that they can operate at optimum efficiency on certain occasions such as important business meetings or sports events.

HTRs' experiences show new perspectives on how patients construct their identities when they are medicalised and pharmaceuticalised under the guidance of their physicians.

Engine Noise and the Pleasurable Driving Experience

Recent scholarly work in the expanding field of sound studies has begun to investigate what sounds automobile users find pleasurable during the driving experience. Some studies have found that there is a growing and widespread preference for car cabins that are less noisy. This paper aims to investigate if this desire for a reduced noise car cabin is as prevalent as some suggest. To do so, this paper presents qualitative research undertaken on online car reviews of the 2012-2013 BMW M5 automobile. What this research reveals is that there are still some elements of the automotive community that want to hear the sound of the engine of the car they are driving. This paper describes how there is a culture of drivers who believe that engine noise is an integral component for a pleasurable driving experience. Why the existence of this culture is significant is because it reveals the complex and subjective nature of noise. This paper finds that noise can be received in a variety of ways. While many may feel that engine noise is abrasive or transgressive, it may facilitate or be a pleasurable experience for others. Through the prism of noise, this paper ultimately contributes to a more socially determined understanding of aural pleasure.

Public Involvement Tools Aimed at Strenghtening Citizens' Commitment in the Preservation of the Natural Area of DoÑana (SPAIN).

Strategies of nature preservation in protected natural areas have evolved over the years as a need to adapt to new realities regarding these areas as well as the social contexts they are immersed in. This research has allowed us to learn the connection between the Natural Area of Doñana and its civil society by analysing the perception, opinion and attitudes towards the implementation of involvement practices. We understand that this should be the starting point of the new reality of nature preservation today, and that during the next decades, it should allow us to make progress in public involvement as a new shared management strategy of protected areas preservation in general, and of Spanish national parks in particular. Our main contribution is a proposal for a new participatory structure of Doñana's local society. Its design and functioning basis are also established.

Educational and Social Mobility: Results from a Longitudinal Study

This paper addresses issues concerning educational and social mobility and reproduction theories, including a gender perspective approach, during the transition to adulthood. We argue that social and educational backgrounds still play a very relevant role for transitional outcomes in youth trajectories, but that there is also some room for social and educational mobility.

Drawing on data from a longitudinal cohort study of young people ("EPITeen24: Reproducing or going against social destiny? A longitudinal study of a cohort born in the nineties of the XX century in Portugal") born in 1990 and assessed at the ages of 13, 17, 21 and 24 (n= 2943), this presentation seeks to explore five defined educational mobility profiles: (1) UEM - Upward Educational Mobility; (2) LER - Low Educational Reproduction; (3) HER - High Educational Reproduction; (4) IER - Intermediate Educational Reproduction; (5) and TDEM - Transitional Downward Educational Mobility. We will combine these profiles with structural variables like family income, parents' occupation, school attendance, work situation and social capital.

Previous results at 21 confirm the persistence of social reproduction but also enhance the role of agency. For instance, one of our main findings was that youngsters with low educational background but with high educational levels (UEM, upward educational mobility) have very similar educational practices (like time spent reading or in other cultural activities) compared to youngsters of HER, high educational reproduction). Women also stand out in terms of educational mobility but reveal difficulties when entering the labor market.

We will account how these trends change with the dataset results at 24, and using also qualitative interviews carried at 24, to further capture youngsters'

Family and Gender Patterns in the Transitions to Adulthood: Findings from a Longitudinal Study

Based on findings from a longitudinal research, "EPITeen24: Reproducing or going against social destiny? A longitudinal study of a cohort born in the nineties of the XX century in Portugal", that analyzed a cohort of people born in 1990, assessed at the ages of 13, 17, 21 and 24, we develop a study of youngsters gender patterns' and transitions to adulthood. We will focus on school and family experiences at different ages, parenting styles, decisions on extending school and on entering the labor market, combing social class, social mobility and gender inequalities.

Previous results at 21 show that women stand out in upward educational mobility and seem to present very focused oriented practices to reach higher educational and social position. Young women's higher educational attainment has been largely discussed. Some authors also point out to what they call "school alienation", especially among working class background boys but affecting less young men from the middle or more advantaged classes.

But what happens when entering the labor market? Research findings seem contradictory: on one hand, the change from a production economy to a service economy seems to benefit women in terms of employment opportunities. This may translate into more advantageous positions for them, in comparison to men, at least in some type of jobs. But we can already account for gender inequality persistence, with women presenting more precarious and unstable situations. And women occupy more jobs in services and caring areas and men occupy more places in positions of authority, prestige and status.

So who is winning and where? Who is losing and where? More recent results from the 24 year old wave and additional carried out qualitative interviews also at 24 seek to clarify these issues.

Migration, Livelihoods and Nature Conservation Policies in the Villages of South Transylvania

As a consequence of transition towards market economy and Romania's integration in the EU, socio-economic changes following 1989 have pushed households into assuming new livelihood strategies seeking to integrate the existing capital and opportunities offered by local, regional and international markets. Temporary migration to different countries emerged as one type of income diversification strategy of households pursuing to reduce risks, all in the frame of new migration economy or vulnerability mitigation so as to put it in terms of the livelihood approach. Rural communities are turning to migration as a household strategy besides intensifying agricultural use or increasing non-agricultural activities in order to create wellbeing through the use of accessible physical, natural, financial, human and social capital. Both spatial mobility strategies and those addressing on site activities quest the same results – wellbeing, poverty reduction – hence the analysis can't dissociated migration consequences from the results obtained by communities through the combination of other activities. This paper explores the particular context of rural communities from South Transylvania which is a high nature value farmland. It's overall included in the Nature 2000 network and largely preserves a traditional agricultural model. This area represents a socio-ecologic system marked by several trade-offs, hence biodiversity is influenced by traditional farming while communities still benefit of local ecosystem services. Recent socio-demographic changes (depopulation, demographic aging, or changes in ethnic structure) open the debate on how EU's biodiversity conservation measures can be used in preserving traditional agro-ecologic systems. The main research question that this paper intends to answer is 'How biodiversity conservation policies affect livelihoods and how changes of livelihood strategies

transform the social structure or rural communities living in high nature value farmland?' Our results are based on quantitative and qualitative analysis of data collected from several communities located in South Transylvania.

GARABIGE, ALEXANDRA (Ined)

The Actors in the Reform of Provisions for the Elderly in France: Difficulties to Generalise a Global Service.

of provisions and benefits, on a categorical approach of people and on a sectorial approach of social interventions (poverty, unemployment, early childhood, old age, etc.). From the 1980s, decentralisation laws have strengthened their territorial implantation, in the name of proximity, while at the same time leading to a proliferation of scales of social action and their monitoring, generating tension, duplication and competition on both horizontal and vertical levels.

Discourses on and public measures to support dependent elderly now emphasize the need for a better coordination between care and cure sectors in supporting dependent people. This is particularly the case of the experimental "care and cure at home multi-service" (Spasad), included in the Law on the adaptation of society to aging (2014), which promotes its consolidation and generalization with a constant budget. The purpose of this paper is to analyse how this local initiative, which is today valued on the national level, is put in place in the territories and to identify the favourable factors and obstacles to this sectorial rapprochement. Indeed, there is a delay in the implementation of these provisions, termed as global support, which illustrate – this is the hypothesis that we will test – the difficulties in strengthening coordination between those fields (family caregivers, social/care professionals and health professionals) unequally present on territories, but also between institutional actors at different territorial levels (regional health agencies, pension funds for health and work who finance and organise various services) whose objective may be distinct.

Our interviews focus on the main institutional actors working at different territorial levels in the field of social and health (professional associations, territorial and national authorities, unions) and will allow us to think about the dissemination conditions of these social innovations.

TRAN, TRINH* (Middlebury College, trinht@middlebury.edu)

Overlapping and Disconnected Social Spheres: A Multi-Contextual Model of the Link Between School Choice and Neighborhood Effects on Adolescents

Because of the rise of public school choice programs, children who share a neighborhood are increasingly going to different schools. I explore the effects of overlapping and disconnected neighborhood and school spheres via two linked questions; first, whether and how the conjuncture/disjuncture of neighborhoods and schools affects the types of friendship opportunities available to students both at school and within their residential areas; and second, whether and how the conjuncture/disjuncture of neighborhoods and schools mediate children's exposure to neighborhood disadvantages like violence. What I find is that school choice amplifies the disadvantages that children encounter in their neighborhoods by fragmenting local adolescent community networks and exacerbating the violent conditions that children face at their neighborhood schools.

My data consists of 74 in-depth interviews with students from five public high schools in Philadelphia. Of these students, 45 attend a public magnet high school; the remaining 29 student interviewees live in the same neighborhoods as my magnet school sample but attend neighborhood schools in their local areas.

My findings suggest that school choice policies concentrate the advantages of children who are able to exercise choice while leaving behind a substantially larger population of children who are consigned to local schools that contend with a disproportionate load of student misconduct and school violence. Instead of closing educational gaps for all, these reforms further stratify poor neighborhoods by creating a new class of even more disadvantaged children who are becoming increasingly disconnected from positive peer role models both within their neighborhoods and at school.

Climate Scepticism in Cross-National Perspective

ISSP data show that Australia has perhaps the most sceptical citizens of all advanced industrialised countries regarding climate change. The majority of Australians believe that climate change is occurring, that its causes are mostly

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.*

anthropogenic, and that most scientists agree it is caused mainly by humans. Yet social background and deep political divisions underpin attitudes toward climate change in Australia, as do cosmopolitan worldviews, and information sources. A recent national survey shows that only four per cent of Australians disagree that any form of climate change is occurring, although close to one third maintain that although it is happening, climate change has 'natural' causes. Action on climate change is hindered greatly by the contrary views of coalition political party identifiers. In contrast to supporters of the Greens or Labor, politically conservative Australians are far more likely to believe climate change has non-anthropogenic causes, that most scientists do not agree about its causes, and that it will not threaten their way of life. Yet even a majority of coalition identifiers believe that climate change is a serious threat to the next generation. Women, cosmopolitans, consumers of public broadcast news and those who consider themselves to be knowledgeable about climate change are more likely to agree that anthropogenic climate change is 'real'.

Families and Work in Western and Non-Western Contexts: Global Convergences and Divergences

Contemporary discourse on the impacts of women's participation in the global paid labor force, masks a complex phenomenon: the experiences of women in developing societies seem at first glance to be similar to those of women in industrialized nations.   However, specifically when it comes to changing gender roles for men and women in families, the contrasts within and between societies can be striking. This is particularly the case when social class, regionality and education levels are factored into the analysis. While in the West, at least among middle class families, gender convergence has become an ideological goal, the same development is not necessarily taking place in other parts of the world. Social and political messages denounce the changed roles of women and men and in some places domestic violence is on the rise. As women increasingly move into the public sphere as breadwinners, and as men lose their once taken-for-granted role as the primary or only breadwinner in the family, every aspect of the social fabric of societies around the world is being irrevocably altered – however, in very local ways. While there is awareness of these transformations, much of the dialogue on these issues is limited in scope, and primarily restricted to social changes in the Western world. This paper will highlight some of these complex transformations and will contrast differing interpretations and practices between industrialized and developing nations with respect to family roles.

Visibility and Voice

Visual sociology has been mainly concerned with visual communication or visual expressions of the social. Less explored is the relation of the visual to the voice and the visual *as* voice. Bodies "give off" signs (Goffman) and can thus be read as symptoms of inner life. But they also "give" signs, and its utterances may be understood as a kind of speech act. The presentation will attempt a re-reading of Habermas theory of communicative action – considering the potentials of vocality and visibility for communicative reflexivity and a critical engagement with the social. We will explore visual and vocal activities which challenge boundaries between social domains through provocation, silliness, critique and displays of anger. Examples will draw from digital cultures research into online video practices and empirical research in disability studies.

Failure of Roma Inclusion As a Symptom: Nationalism, Balkanism and Neoliberalism in Bulgarian Context

The paper attempts to demonstrate how the failure of Roma inclusion should be analyzed as the symptom of late capitalism in the EU. Slavoj Zizek defines the symptom as the element of exclusion of the universal, which if applied to the universal principle would disintegrate it. One should situate the plight of Romani people inside Bulgaria in the context of Western European representation and perception of the region; the imagining and invention of Eastern Europe and construction of the Balkans as an Other (Todorova, 2009, Wolff 1994, Bakic-Hayden, 1995, Goldsworthy, 1998). Renata Salecl's and Zizek's Lacanian analysis of racism and xenophobia as "stealing your enjoyment" helps illustrate the peculiar otherness that Roma represent. In order to understand the Roma as a signifier of

otherness we need to look closely at the specificity of Bulgarians' identification, tainted by what Todorova defines as the discourse of Balkanism - the ambiguous way the region is perceived as the specific Other of Europe. This paper argues that racism and violence in Bulgaria is prompted by a plethora of paranoid fantasies of stealing the Nation's enjoyment, interrelated to historically formed perception and self-perception of being the Other in the EU, occurring in the socio-economic context of severe neoliberal regimes. In conclusion, Etienne Balibar's (2004) critique of citizenship without the social under the global neoliberal model, helps bring about the need to be suspicious of the approaches of integration and inclusion, which, in a country devastated by austerity measures, feed on the fantasies of the attack of inside and outside enemies against the "national body".

A Comparative Study of Labor Migrants' Discontent in the Eurasian Societies in the Time of Economic and Financial Instability

The paper presents an on-going research oriented toward studying reality of labor migrants' discontent in the time of economic and financial instability of the accepted societies. It starts with a discussion of theoretical and methodological framework for social analysis and methods of measurement of the discontent as a societal phenomenon. It takes as a basis for further analysis the theoretical concepts in sociology of emotions developed by J. Barbalet and R. Collins. It continues with an analysis of the field research materials.

The data and materials come from comparative field researches of the everyday life practices of labor migrants from Vietnam, Uzbekistan in Russia and from the former Soviet Union countries in Europe that were organized and conducted by the InterComCenter, St.Petersburg in 2007 -2015.

The overlapping issue in studying societies of Eurasia is labor migration. The paper tries to portrait the challenges that bring labor migrants from Central Asia to European societies. It is oriented toward an exploration into theoretical and methodological problems of comparative studying the Eurasian societies that are "sending" labor migrants and those societies that are "accepting" them.

Capitalist inequality in general and waves of economic crises in particular constitute macroconditions of a variety of emotions. However, structural conditions of emotions operate through micropatterns of interaction. From this perspective discontent could be regarded as "class" long-term emotion that is produced and reproduced in chains of interactions influenced by structural conditions. On the bases of sociological theories of emotions developed by Jack Barbalet and Randall Collins the paper proposes conceptual model of studying reality of the labor migrants' discontent. It also looks at the possibilities and special conditions that can determine the involvement of labor migrants in protest activities.

Transnationalism As a New Model of Integration: Comparative Analysis of the Migrants' Everyday Life in Russia and the USA after 1991

The paper will present some theoretical and methodological ideas and some preliminary outcomes of the activities of the International Research Laboratory in St Petersburg State University "Transnationalism and Migration Processes: Comparative and Institutional Analysis".

The overall goal of the Lab's research activities is to find out basic mechanisms that determine processes of social integration in the new paradigm of studying migration processes which has entered into the social sciences scholarship in the 1990s and has been called "transnationalism". In the center of authors' attention will be transnational structures of everyday life of migrants in the accepted societies (USA and Russia) as basis for the new policies of social integration in the system of coordinates not only of economic, political borders but also cultural borders of everyday life worlds.

The current migration studies are dominated by North American scholarship despite of the fact that new developments in the former Soviet Union countries bring new perspectives to the analysis as well as different approaches that have been developed on all the continents and notably in Europe shed different lights on migration processes. Until recently, migration research was strictly anchored in the nation-state experience of the receiving countries.

The paper promotes transnational migration research based on the belief that the potentials of comparative sociology will advance the theoretical development of migration research. Elsewhere we've proposed our understanding of comparative sociology – neither as a method, nor a subfield, but as a special organization

Right to Request "Decent" Work for Working Caregivers ?

In our aging societies, more and more people are called upon to offer support to aging parents. This is often a very time consuming activity and over time this often requires that these caregivers reduce their working time and in some cases leave the labor market altogether. Our paper will present results from a research on caregivers, starting with a portrait of these persons. We will then present what firms offer them in terms of working time arrangements; we conclude that is insufficient and often leads these caregivers, especially women, to reduce their hours or leave the labor market. We will then move on to a measure which could be considered in order to help these working caregivers have a more "decent" situation in terms of their working life, and work-life balance. While the "*Right to request flexible working arrangements*" is the object of debate, it may be interesting. This measure originated in Britain, in the 2002 Employment Act, which gave parents the possibility to engage procedures in order to obtain a flexible working time arrangement. From 2007 on, this right was extended to workers having to take care of a dependent adult, which is more often women than men. This model has been adopted in other states, particularly in Australia and New-Zealand. While it is not clear this is the ideal solution for caregivers, we will ask the question as to whether "*Right to request*" should be extended to other countries and if so, in what form. Indeed, there has been a debate on whether this right should be reserved for caregivers or open to all workers, parents, caregivers and others. The "Right to Request", if positive answers are given to the caregivers demands, may appear a more realistic solution than Citizenship Income, at least in the medium term.

Anti-Austerity Social Movement Repertoires of Communication: A Diachronic Analysis of Protest Media Legacies in Southern Europe

Various studies have addressed the recent wave of contention of anti-austerity movements in Europe, exploring the role that media technologies have played within them (della Porta and Mattoni 2014), as well as examining the journalistic coverage of the euro crisis in the media (Picard, 2015). Few studies, however, have connected the repertoires of communication of today's anti-austerity movements with the past protest communication ecologies that shaped the ways they use and appropriate communication technologies. This article is based on the findings of an empirical study that investigates the media ecologies that developed in anti-austerity protests in Italy, Greece, and Spain. Drawing on 60 semi-structured interviews (20 for each country involved) with activists, media professionals and independent media producers involved in anti-austerity protests since 2008, this paper adopts a systematic comparative perspective that is able to cast a nuanced light on the similarities and differences in the evolution of the media ecologies of southern European resistance. By digging into activists' memories of past protests, our findings trace the trajectories of protest media ecologies and communication repertoires from the Global Justice Movement onwards, allowing us to critically reflect on the challenges and achievements of two decades of communicative activism in Southern Europe. Our outcomes also emphasize the discrepancies in the formation of repertoires of communication in the three countries examined, where specific historical developments have shaped them in distinctive ways. Beyond unifying labels related to anti-austerity protests, our study stresses the need to situate the study of these protest communication ecologies diachronically within particular social, cultural, and economic realities.

Analyzing Neighborhood Effects on the Economic Mobility of the Inhabitants of Three Favelas in Salvador (Brazil) from a Social Network Perspective: The Importance of Urban Politics in Promoting Social Inclusion and Erradicating Residential Segregation

The paper studies the neighborhood effects on the economic mobility of the inhabitants of three *favelas* of Brazil's third biggest city, in other words the socio-economic advantages and disadvantages affecting the lifes of poor people due to their embeddedness in specific socio-residential contexts. Wilson (1987) concentrated on the structural dimensions of negative externalities in order to explain neighborhood-level variations in a field of different phenomena (delinquency, violence, access to labour market and education) in spatial isolated and socially homogeneous areas. Kaztman/Filgueira (2006), however, argue that the contiguity between residents of poor neighborhoods and higher-class condominio-dwellers provides structures of opportunities. Analyzing the variability of interpersonal networks and their activition in the struggle for economic inclusion, the study confirms that the proximity of Nordeste de Amaralina to middle-/upper-class communities improves the access to labour opportunities. Nevertheless, residential stigmatization and mechanisms of social segmentation annihilate these potentials. The residents´ interpersonal networks reveal a high degree of redundancy and localism, based on social ties connecting family members. The resilience of segregational structures and the scarcity of economic opportunities in Plataforma lead to the naturalization of social distance patters whereas the social heterogeneity of Fazenda Grande II interviewees and the socialising effects of public institutions mitigate the negative repercussions of isolation. The networks' composition admits a higher degree of heterofilia and greater proportion of weak ties (Granovetter 1973) facilitating economic mobility. Emphasizing the responsibility of urban politics in promoting social segregation in Salvador, the study reveals that public housing programs in Plataforma priorize technocratic habitational solutions without providing the residents' socio-economic integration. The Nordeste de Amaralina case portrays the failing interest of urban politics to bridge the distances founded on mecanisms of social segmentation whereas in Fazenda Grande II housing programs complemented by employment creation and investments in infrastructure positively affect the residents' economic mobility.

TREUKE, STEPHAN* (Universidade Federal da Bahia, StephanTreuke@hotmail.de)

The Reproduction of Segregation Patterns in Salvador's Railway Suburbs Via Public Slum Upgrade Programs: The Case of Novos Alagados (Brazil)

The paper analyzes mechanisms of residential segregation in the spatial structure of Brazil's third largest city, Salvador. Segregation and social inequalities remain a prevalent problem in Brazil's metropolis, accounting for negative impacts in a field of different social and economic outcomes (access to the labour market and education, delinquency, violence, institutional disadvantages) which affect an increasing number of *favelas* inhabitants. Abording the case of Novos Alagados (*Subúrbio Ferroviário*), it focusses on the responsability of public housing initiatives in consolidating a pattern of spatial confinement of the lower income classes in socially homogeneous, peripheral areas. The slum emerged in the 1970's when industrial takeoff accelerated the city's demographic growth, attracting large contingents of predominantly poor and non-qualified immigrants of Bahia's *hinterland*. The proximity to the industrial complex *Centro Industrial de Aratu* induced the rapid land invasion in the form of *palafitas* (dwellings raised in flooded areas) and semi-consolidated dwellings. Urban interventions to eradicate poverty initiated in the 1990's, relocating the *palafita*'s inhabitants in functional housing units situated in the same area. Instead of promoting local development via investments in social infrastructure and employment creation, slum upgrading programs priorized technocratic housing solutions, failing to provide the residents' socio-economic integration. According to recent statistics and ethnographic surveys, endemic poverty structures prevail in Novos Alagados with more than 60% of the relocatees living below the poverty line. The impact of concentration effects (Briggs, 2005), resulting from the inhabitants' embeddedness in a homogeneously poor environment suffering from urban disinvestment, risk to turn them socially invisible thus being isolated from vital resources of (social) support. The study contributes to the understanding of Brazilian's unequal urbanization process, emphasizing the ambiguity of State politics between tolerating land invasions by poor populations in peripheral regions while denying the Right to the City (Lefebvre, 1968) in terms of socio-economic inclusion.

Rural-Urban ?ontinuum in the Context of Urbanization, De-Urbanization and Recurrent Mobility of Population

The report examines some features of urbanization in Russia, where the growth of large cities is combined with a sparse urban network. The Russia's socioeconomic space is severely polarized and crowned by a pronounced dom-

inance of Moscow and its environs. On the other hand, intensifying social and spatial links between cities and rural areas manifest themselves in the accelerated formation of the rural-urban continuum. Seasonal *dacha*-type sub- and de-urbanization and the so called *otkhod* (a kind of long lasting labor commuting) are the Russian forms of recurrent spatial mobility. This leads to a pulsation of settlement patterns. The two streams are interrelated, as the temporal urban work and lodging of Russian *otkhodniks* instead of resettling eventually prolongs the life of peripheral localities where their families stay. This habitability, in its turn, facilitates the dacha development of small settlements. The authors try to reveal the reasons for labor mobility in Russian cities and the variety of dachas as well as their impact on both the urban and rural lifestyles. Mass movements of vacationers and workers and their two-house life complicate the knowledge of how many people actually live and work in countryside, in small and in big cities. The phenomena also affect the development of Russia's spaces and local budgeting.

Trade Unions and Precarious Employment in Eastern Europe

The recent economic crisis has accelerated the rise of non-standard employment forms and the decline of trade unions resources and capabilities in most EU countries. In this context, unions faced the dilemma of whether to focus their limited resources on improving working conditions for the majority of their members employed on a standard employment contract or on improving working conditions and social rights for the increasing number of precarious workers with non-standard employment forms (i.e. fixed-term contracts, self-employment and temporary agency work). This paper focuses on trade unions approaches to precarious workers, varying from inclusion to exclusion, in nine Eastern European countries (Croatia, the Czech Republic, Latvia, Lithuania, Hungary, Poland, Romania, Slovakia, Slovenia) and Greece, as an example of a country facing a significant economic crisis.

It is based on qualitative interviews with trade union officials conducted in 2015, focusing on developments since 2008 in the following sectors: construction, healthcare, metal, retail and temporary agency work. The preliminary findings confirm that there has been an overall increase in work precariousness, particularly by employing temporary agency workers, outsourcing and using part-time contracts as a disguise for full-time contracts to pay lower payroll taxes. Unlike in most old EU member states, one of the main causes of work precariousness in Eastern Europe is the low wage for employees on standard full-time contracts, which is also the case in Greece. Trade unions' approaches to precarious workers varied both across countries and across sectors within each country, ranging from unions' organizing temporary agency workers to exclusion of precarious workers. The paper identifies and discusses the rationale for the selected unions' approaches to precarious work, the instruments used to fight against it and the implications of those approaches for unions.

Industrial Relocation and Social Processes : The Case of Tanger (Morocco) .

The Tangier-Tetouan region, once an agricultural area, has become an attractive industrial centre for the business sector (in 2010 the primary sector accounted for 15.9% of the region's GDP, the secondary sector for 29.45% and the tertiary sector for 54.7%). Close to 1,400 export-oriented companies, have been established in the region. In addition, a new port, Tanger Med, has been built 35 kilometres from Tangier in the town of Oued Rmel, with an initial capacity for three million containers, which will increase to eight million by 2016. This port infrastructure is symbolic of Morocco's economic growth strategy, which has turned this border region into a prime area for the relocation of production processes.

But the impetus given to this local area, to make it economically competitive in the global economy has led to major social and economic changes. The socio-demographic structure of the area has changed; internal migration has been significant, on many occasions turning this border area into a stepping stone to international labour migration, the jobs offered are level low quality, and economic insecurity for workers is a fact of life. The development model based on export-oriented industrialization may generate significant socio-economic expectations, but it can also lead to great frustration. In order to analyse the process taking place, this research, funded by the National

R+D1 plan of Spain's Ministry of Science and Innovation, has been carried out with the following objectives:

1. To analyse the structural elements shaping the process of industrial relocation in the region.
2. To study the factors that explain the actions of the subjects involved.

Our point of departure is methodological complementarity; we have used in-depth interviews as a technique to produce data, carrying out a total of 96 interviews with workers in the export industry, business people, trade unions and associations, in addition to carrying out a statistical analysis based on secondary sources.

Development of a Regular Consumer Survey for Monitoring Transition Processes

Our intent is to create a consumer monitoring that focuses on the whole consumption act, including purchasing, using and disposal. Competences and practices, not just knowledge should be taken into account. The new survey should improve knowledge about consumption processes, especially regarding environmental and social aspects such as education, gender, and income. Key questions concern the interrelation between social class and consumption patterns, including their environmental impacts. Additional questions should be: Which are the underlying factors of consumption patterns? How do competences vary between different social groups and how could they be improved?

The research endeavor is embedded in the discourse on socio-ecological transition as there is a strong focus on patterns of consumption. The big question that is often raised is 'how much is enough'? Disadvantaged groups, however, are often not able to fully participate in a consumer society or feel excluded due to lacking access to desirable products. Social pressure and demonstrative consumption are especially a big problem for the youth. Social aspects and inequality, thus, must be regarded as central dimensions in these debates. Transition, a shift of values, and the reduction of the overall consumption level should therefore also be seen as a chance to create more equal societies.

Although several consumer surveys exist on different levels, a sound data basis for monitoring these transition processes is currently missing in Austria. While the *Consumer Market Scoreboard* on EU level and the *Konsumenten-Barometer* by the national ministry are well established, they lack essential features. Often data are only available on an aggregated level. Moreover, questions within the existing surveys are focused on the act of purchase (and ignore other forms of using). Because of these limitations, we attempt to show what an improved set of consumer data for our research endeavor would look like.

"Off the Clock": Generating Resources in Temporary Agricultural Labor

This paper is a case study of the people and institutions that in part facilitated, managed, and controlled the movements and resources available to approximately 50 Mexican migrant workers in Virginia. The men were employed as temporary agricultural workers under the H2-A visa program, picking apples and cutting branches from early-September through mid-December.

While seemingly isolated by the conditions of their labor and housing, the men interacted with a range of people and institutions beyond the apple company on both sides of the border. These included familiar components of the "migration industry," such as labor recruiters, paper processers, and moneylenders in Mexico and money senders, communication providers, ride givers, and miscellaneous vendors in Virginia. In addition to financially motivated actors, "rescue industry" groups, such as local religious, health, and legal organizations, offered a range of resources to the men free-of-charge. In some cases, service providers merged and transitioned from one ideal type to the other.

In charting these diverse exchanges and interactions over a three-year period, the paper provides detailed evidence of the inner-workings and contingencies of the migration industry. In particular, it draws attention to the emergence and organization of resource exchanges on the ground, whether driven by profit and/or goodwill. As one example, the paper describes how ride givers and the men created and negotiated services and payments. The paper also highlights the men's situational and contingent understandings of exploitation, solidarity, and survival in migration industry exchanges. For example, some seemingly exorbitant costs were more acceptable than others and the men adopted more efficient and affordable ways of acquiring contacts and services not provided by the company. Taken together, the men's experiences generating resources when "off the clock"

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

sheds important light on the social implications of temporary agricultural work, a growing yet largely invisible segment of U.S. immigration.

Más Allá De Las Exclusiones y Resistencias: Experiencias De Monomarentalidad En Mujeres Latinoamericanas En Contexto Migratorio.

En la actualidad se considera central la integración de la perspectiva de género para atender la complejidad de los procesos migratorios, lo que ha develado las particularidades de la experiencia femenina en un discurso que solía presentarse desde una óptica androcéntrica, situación que-sin lugar a dudas- ha implicado un giro epistemológico en el área (Mummert, 2010; Rodríguez García, 2010). Por otro lado, en el ámbito de las familias monomarentales a nivel europeo, se ha subrayado el "espectacular auge de las constituidas por familias migrantes" (Almeda y Di Nella, 2011: 24). Así, en esta comunicación se presentarán elementos relevantes a nivel teórico-conceptual para atender a la complejidad de este fenómeno desde una óptica de género; atendiendo al cruce experiencial que implica la construcción social de la maternidad, el contexto de monomarentalidad y los proyectos migratorios; para posteriormente analizar diversas historias de vida de mujeres latinoamericanas radicadas en Barcelona, cuyas experiencias vitales en el marco de la monomarentalidad e inmigración permiten comprender que dichas vivencias no se presentan de manera dicotómica "exclusión/inclusión", sino que se experimenta desde múltiples matices, lo que en la práctica implica que desplieguen distintas estrategias de empoderamiento. Si bien estas experiencias pueden revelar inequidades sociales, también dan cuenta del desarrollo de dinámicas y de la movilización de recursos que realizan estas mujeres, las que les permiten cumplir con sus objetivos migratorios así como con el cuidado de hijos e hijas; con todas las responsabilidades emocionales y económicas añadidas que conlleva el contexto de monomarentalidad.

A Tale of Four Cities: Mobility and Place-Making Among Ethiopian Migrants

This paper draws from race formation theory to analyze how Ethiopians experience the process of incorporation in four very different cities: Melbourne, Australia; Frankfurt, Germany; Moscow, Russia; and Dubai, United Arab Emirates. Race formation theory holds that race is constructed through social structure, including laws and collective action. This paper looks at how immigration policies, labor markets and community infrastructure (including collective action) shapes the meanings of race and space in these very dissimilar urban environments. It explores the ways immigrants groups create "place" in often unfamiliar and unwelcoming urban environments.

Managerial Control of IT Professionals Via IT Systems

In direct response to the call for papers on the transformation of work in bureaucratic organizations, this paper explores how a range of information technologies have been exploited within public sector bureaucratic organizations (operating under the influence of service-oriented 'best practices') for managerial control of IT professionals.

Through analysis of qualitative data collected across multiple teams at two public sector organizations in the UK the paper discusses how a range of IT systems are routinely implemented from a 'commercial-professional' logic and serve to operate as mechanisms of control over the everyday experience of IT 'professionals' trained to practice from a 'technical-professional' logic (Spence and Carter, 2014). A hierarchically-structured model is induced to illustrate how a range of IT systems combine to contribute to changed realities of work for 'managed professionals' (Russell, Trusson and De, 2015) working within managerially-designed process-oriented structures. Whereas the introduction of IT systems is generally considered from the perspective of providing efficiency benefits, this research demonstrates how IT systems implementation might also be seen from an alternative perspective of enabling the achievement of managerial rationalisation and control objectives: in this case by rationalising both the experience and the expertise of professional workers, thus reducing opportunities for autonomous working. Through observation and interview data, it is specifically illustrated how these IT professionals' everyday experiences are controlled through the prescription and intensification of the labour process (enabled by integrated systems comprising: computer telephony, workflow management and statistical surveillance technologies). It is also shown how managers implement knowledge management systems in an attempt to rationalise and thereby control and undermine the IT workers' professional expertise.

With a view to a broader contribution to the sociology of professional work, the induced model is tentatively expanded to include other rationalising IT systems implemented in other 'managed professional' spheres.

Risk and Uncertainty in Breast Cancer Diagnosis: Exploring Women's Experiences of DCIS

In this paper I will present findings from an ongoing study of women who have been treated for DCIS (ductal carcinoma in situ), which is a very early form of non-invasive cancer. In the UK, increasing numbers of women are being diagnosed with DCIS as a result of more efficient and more widespread breast screening. Mammograms are able to detect calcium deposits which are confined to the milk ducts of breasts. However, at the present time there is uncertainty about the risk of it developing into an invasive cancer. Consequently, DCIS is treated in the same way as invasive breast cancer, which is by surgery to remove either the affected cells (lumpectomy) or the entire breast (mastectomy).

Blaxter (2010) highlights how diagnostic tests are increasingly able to identify potential diseases but in doing so create a dilemma of risks of acting and not-acting. Do women opt for surgery and live with the consequences? Or live with the uncertainty of whether breast cancer may develop?

The women who took part in this study were interviewed after the initial shock of diagnosis and treatment were over. This presented an opportunity to explore complex emotions regarding the decisions they made, including changes to their body which could not be wholly justified as life-saving; but only potentially so.

The study of the complex emotions involved in the experience of DCIS is timely because it relates to ongoing debates in the public arena regarding 'unnecessary' breast cancer treatment. It seems that now, more than ever, there is a need for better information and support for women during and after treatment for DCIS.

The Lingering Influence of Family Relations on Subjective Well-Being of Young People in Taiwan: Evidence from a Panel Data

Transition from family and school to work indicates not merely role changes for young people. It also may suggest that they start to seek for new foundations or sources of personal happiness. In contrast to this role transition hypothesis, there is also a possibility that an intimate relation with parent continues to influence happiness of young people, as the market economy outside home can be harsh and brutal to the newcomers. This study uses data from the Taiwan Youth Project (TYP) for investigating these possibilities. Outcomes from an analysis of a sample of about 1600 young people at age 22 show that relationships with both parents matter much more than the role transition factors (such as already having a job, being economically independent, getting married, and having children) in affecting happiness and reducing depression. Relations with parents also strengthen a positive self-concept, which in turn enhance subjective wellbeing of young respondents. In assessing these relations, both the respondent's previous level of happiness (measured when in high school) and parental happiness are controlled.

Transforming Our Agri-Food System: The Case Study of Homemakers Union Consumer Co-Op, Taiwan

Aware of the high levels of contamination in the soil and numerous scandals associated with imported food products, several NGOs have decided to take control by instituting a system of collective purchasing directly from local farmers. Among these NGOs, the Homemakers Union Consumer Co-op (HUCC) has played a critical role since the early 1990s. The HUCC emerged during a time where there was increasing interest in environmental issues and started to purchase rice and grapes from small farmers through a buying club. The buying club soon became the co-op, with 90 percent female members. Despite the lack of capital and asset, the group established a worker's co-op, with twenty founding members each contributing about $600 USD as capital share. This was the group's first capital raised to try out collective purchasing. To be able to buy at the co-op, anyone has to sign up and pay membership fee. Currently, they have about 10 million USD, all from

volunteers' investments. The co-op has expanded with about 400 employees and more than 60,000 members, and now works with about 150 local farmers. A growing number of outlets (47) in a network around Taiwan established by the co-op to provide environmentally friendly and healthy foods. The co-op also aims to lead consumers to a better understanding of how they can make a difference on the environment and agri-food system. The co-op depends on the bonds of trust with members. Following a series of food safety scandals in recent years, Taiwanese tend not to trust a government logo. But more people will trust certain marketing channels, and among them is the Homemakers Union Consumer Co-op. In this research, we will explore how the HUCC transform local agri-food system and create a reliable marketing channel by adding social innovation and strengthening social solidarity in Taiwan.

Citizenship, Professionalism and Modernity: Revisiting the Conceptions of Citizen Between West European and Modern China from the Perspective of Functional Differentiation

This paper attempts to scrutinize the genealogy of citizenship, in order to contribute to the historical comparison on the constitution of political subject, the modernity between Western European and Chinese society. The concept of citizen rooted in European history and social context mainly appears in two distinctive modulus and their respective sub-models: pre-modern one including the Greek/Roman, Christian/Middle-Age, and Enlightenment/Natural Law; modern one including the Modern/Revolutionary, Nation-State, and Post-nationality. Although there are some differences between the modulus, the theoretical genealogy is written in terms of "political community". However, a sociological perspective can propose a distinctive observation on this genealogical writing. Sociological analysis not only accepts the assumption that the concept of citizenship concerns the membership of political community and the rights-obligation attached to members, but also reflects on the theoretical implication that the functional-differentiation principle in modern society, rather than the hierarchical-differentiation principle in pre-modern society, bring into the uni-dimensionality existed in the genealogy of citizenship. In this regards, the theme of "the rise of professional society" in the 19th century constitutes a crucial historical evidence, provoking a new genealogy of citizenship that differs from the "noble/bourgeoisie/middle class/working class" convention, a narrative based on the hierarchical-differentiation viewpoint. In sum, this paper first examines the elective affinity between modern profession and modern citizen in the 18-19th century through the theoretical viewpoint of functional-differentiation, and then referentially compares the distinctive roads of citizenship in modern Chinese society (the late 19th to the early 20th century) and European society (between the 18th-20th century), in terms of the sociological genealogy of citizenship, which is a reconstructed political modernity.

Occupational Segregation and Gender Representations at Cinema

Applied research in the past years about gender representations on cinema has been typically supporting the gender theory. In fact, while occupational gender segregation has been always a strong feature of the gender theory it has been depicted worldwide in the movies as well. However as shown in the films, professional occupations had been distributed unevenly between male and female characters to a much greater extent in relation to the actual percentages of the real world.

After reviewing the data of sixty top box office films our study aims to investigate "occupational gender segregation" as presented by those films in comparison with the actual unequal distribution of men and women in the occupational structure, through a historical point of view. Finally we aim to surmise the upcoming trends of the film directors concerning gender representation in relation to labor, hoping that the development of a more realistic male and female professional role casting at cinema in the future could move a step forward to the democratization of society.

The publication of this paper has been partly supported by the University of Piraeus Research Center.

"Gender Occupational Segregation in Films" Does the Story Still Goes on?

Numerous studies of the past concerning gender representation and cinema, have shown that professional occupations in film roles had been regularly distributed uneven between male and female characters in relation to the state of the things in the real world. It has been supported largely that females in cinema in comparison to males, were typically underrepresented as a labor force, either "horizontally" or "vertically", compared to their actual percentages at work.

This study is a survey of ninety top box office films, produced worldwide during the last three decades (1990, 2000 and 2010) that deals with gender representations and their professional occupations.

The purpose of our survey is to check and update the assumptions concerning the analogy of male and female characters in relation to their place in the labor force, as depicted in contemporary films worldwide. We question if gender stereotypes related to professional occupations still persist in the contemporary world of cinema. Consequently, we examine if the theory of the past supporting that there was an occupational segregation between males and females that was presented unevenly in the movies, corresponds to our research for the most recent decades.

Finally by putting the findings of our study in context with the historical perspective we can emerge the extent in which gender theory has activated the film directors' sense to change the biased gender representations about professions released in the past by the cinema. The publication of this paper has been partly supported by the University of Piraeus Research Center.

Agreeing on the Wage: The Contestation and Negotiation of Wage Levels in Chinese Factories

This paper aims at exploring how wage levels are contested and negotiated in Chinese factories. Recognising the social and political dimensions of wage apart from an economic one, I intend to further challenge the notion of economic supremacy in wage determination in China. Without strong worker organisation and formal collective bargaining mechanisms in most Chinese workplaces, wage at the factory level tends to be determined more contingently than in the Western context. Practically speaking, since collective struggles of workers on wage increase recur alongside calls from enterprises about rising labour costs, addressing wage demands of Chinese workers will help evaluate the future of China as a manufacturing hub, which has adopted a low-cost strategy for years.

I argue that wage rates are legitimatised and challenged by workers under the influence of labour process in a factory. The labour process reflects the extent of managerial control, which lays the groundwork for the conditions for contesting the wage system, such as the degree of atomisation or solidarity of workers, comparability of wage rates, as well as the arena to articulate wage demands. These conditions affect workers' understanding of the current wage system, motivation and action in making wage demands, and eventually wage adjustment.

Preliminary findings of a qualitative multiple case study will thus be presented. 4 Chinese factories in the electronics and automobile industries are studied. Data for this paper is mainly collected from interviews with HR managers, workers and labour NGO organisers in respective regions. They are complemented by document review and non-participant observation on the shop floor and in wage-related meetings in the factories.

Exploring Youth Participation Strategies in Chile

This presentation will discuss ongoing empirical work that is looking at the participation of young people in the Chilean context and seeks to explore current forms, processes, and strategies privileged among youth in order to express their social identities. Current research regarding the involvement of youth in Chile reveals a multiplicity of social roles and strategies adopted by young people ranging from political activity to volunteerism, and from formal representation to protest and activism. While we have some information regarding the content of citizenship notions among Chilean youth, this work is addressing the lack information regarding the interplay between such perceptions with the ways in which young people make use of available participatory opportunities. In other words, it explores how young people´s expectations, hopes, emotional response to the "here and now", and visions of the future (visions of the world they want to live in) mobilize particular kinds of involvement, in distinct spaces for involvement.

The presentation proposes an approach that is looking at youth participation not merely as involvement in political processes but also as a daily lived experience. This work uses the researcher´s existing typology of youth participation -devised by similar research in spaces for participation in the European context- to identify similarities and differences regarding understandings of the purpose

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of participation that would connect individuals across contexts. This research aims to contribute new knowledge regarding how younger generations collectively experience the world, develop identities, shape lifestyles, communicate with others, and work towards social change that impacts the self and extends to others. The presentation aims to contribute to a discussion about the ways in which young people react to the impact of socio-historical change and how participation can act as a terrain that allows them to think about future and to accordingly frame decision-making.

Professionalism in the Remaking: New Labour and the 'New' Teachers in England

In England, the Ruskin Speech in 1976 succeeded in establishing a publically accepted view of educational accountability marked by effectiveness, responsiveness and responsibility. Since then, the nature and purpose of education and the work of teaching have been gradually subject to management-oriented and performance-driven framing. This paper attempts to trace the remaking trajectories of teacher professionalism in England during the New Labour years (1997- 2010) by examining specifically the mutually-enforcing discourses of accountability and management. Drawing on a discourse analysis of policy documents and data collected from 18 interviews, this paper argues that there are two forms of control woven together in the remaking of teachers in England. That is, a structural form of managerial controls through curriculum and assessment and an inter-discursive network of power which entails the re-organisation of knowledge and power and enacts different ways of being a teacher. In so doing, I use the Labour Process Theory developed by Braverman and a Foucauldian conception of discourse to highlight that teachers in England's state schools are implicated in a dual process of re/de-professionalisation. They are remade with new skills, new ways of working and new sensibilities, all of which 'make-up' a 'professional' teacher. Concurrently, these 'new' teachers are in effect, increasingly being transformed from 'professional' to 'proletarian workers', who have diminishing autonomy in relation to their pedagogical practices and whose conditions of work have been gradually changed. They are essentially positioned within a duality of enabling and discipline.

Institutional Decoupling: The Paradox of Green Energy Development in China

China's rapid economic growth in recent decades has generated a dramatic increase of electricity demand, in which as high as 70% of China's electricity was generated from coal until recently. Looking for alternative energy resources now has become the mission of the central state, including developing wind, solar, nuclear, and hydropower. Supported by those green energy resourceful local governments, the Chinese central state's policy has gained enormous success, especially on Wind and solar energy sectors. But paradoxically, over capacity has become a salient phenomenon in developing these new energies in those provinces such as Gansu and Inner Mongolia: meaning the grid lines are not enough to send the electricity power out and the locality does not have the capability to absorb the generated electricity. Even more surprisingly, some of those areas still continue to build coal-based power plants. Based on data we collected from field trips to Gansu and Inner Mogolia separately in July of 2014 and August of 2015, this paper found that institutional decoupling has been the main cause to this over-capacity phenomenon. It is due to the central state's policy steering by providing financial incentives, plus the cadres' evaluation system, local officials were enthusiastically developing green energies for the sake of developing local economies. However, there are institutional hurdles that create this over capacity problem: the local officials are not able to coordinate the state-owned companies which have their own interests in the localities. We will show that the localities where we visited have different patterns of institutional decoupling that relate deeply with local resources. How to reconcile central state's environmental concern with local governments' economic activism and state-owned firms interest will be the central challenge that China has to encounter in developing green energy at the current stage and in the futre.

The Drug Addiction Treatment As Biographical Work: The Narrative Construction of a Reconstructed Self.

This presentation draws on the analysis of biographical narratives of women undergoing drug rehabilitation in a residential therapeutic community in Greece. Our starting point is that the healing process that takes place in therapeutic community "medication-free" programs has a character of "biographical work": the individuals undergoing treatment are exercised, through daily practices, in biographical reflection; they are invited to construct a new identity of self, away from substance abuse, by reworking their biography. Through the interpretative reconstruction of the biographical narratives of women undergoing treatment we sought to detect: (a) the narrative and symbolic techniques which are invoked by those women in order to incorporate experiences and images of the (former) self, from which they wish to differentiate themselves, in a coherent self-narration; (b) the arrangement techniques for dealing with the ruptures in their life history, as well as for attaining the symbolic normalization of the chaotic aspects of their life history, so as to ensure a biographical consistency. The analysis indicated that treatment is narratively constructed as a process of "purification". Purification has been preceded by complete personal disorganization which has been the result of the deterioration process that evolved during the period of drug use. However biographical work is not limited only to the life-period of substance use. It extends over the course of biographical time. It detects biographically crystallized distortions that are the source of suffering and attempts to rearrange them. Treatment, therefore, constitutes a radical reinterpretation of the self, its trajectory over social space, the creation of relations and practices, through reflexive biographical work procedures. The process of biographical work is mediated by the therapeutic discourse of the community. Understanding the treatment process as "biographical work" and detecting the narrative techniques through which it takes place, may contribute to the professional reflection of therapists and professionals.

Mothering Difference

Cultural maintenance is often understood as 'women's work' to be carried out through the family and particularly, in relation to child rearing. Can this work be understood as anything more than complicity with patriarchy? In this paper I wish to explore the radical potential of work undertaken within minority families where parents, often women, mediate both minority and majority cultures. This has the potential to break down boundaries as much as it has the potential to promote boundary keeping. Particular attention will be given to women as targets for racism, their role in formal and informal education and discursive constructions of them as lacking agency.

Citizen Participation in the Disaster Reconstruction Process: Lessons from the Great East Japan Earthquake

Citizen participation has attracted attention in the context of decentralization and rescaling (Lombard 2013). In a disaster reconstruction process, a business plan for reconstruction can be modified in line with diversified situations of disaster-affected areas by citizen participation（Edgington 2010）.

In Japan, the central government make a decision about the authority in charge of an overall disaster reconstruction and the budget planning, whereas local governments are in charge of making and implementation of a business plan for a reconstruction of each local municipalities. Therefore local governments play an important role to organize citizen participation in order to realize the reconstruction that fits reality.

It has yet to be shown by Ara Cho, as decentralization reform and citizen participation system in Japan produce the socio-spatial inequality after the Great East Japan Earthquake (Cho 2014). However, it remains to be elucidated how to local government and community operate the institution about citizen participation in the disaster reconstruction process.

I have been doing a fieldwork on three tsunami-affected sites in Miyagi prefecture past four years: Higashimatushima-city, Natori-city and Onagawa-town. I have investigated social processes of making and implementing a reconstruction plan, and citizen participation. The findings from my fieldwork are as follows;

First, citizen participation is based on organizing residents at the community level. Secondly, traditional community organization(such as neighborhood organization, Industrial association) contribute to organize residents especially in the emergency phase. Thirdly, As the disaster phase move, local government and community organization need to change the previous participation frame in order to ensure residents representation and policy legitimacy.

A Japanese Nurse's Self-Awareness of Caring: An Analysis of Biographical Understanding of Caring Experiences

This presentation discusses how a nurse has professionally matured by analyzing the self-awareness stories told by her. By conducting a life story interview with a nurse, the researcher tries to understand how the nurse has grown from the time of being a novice nurse through her present situation as a home visiting nurse. It is argued that this analysis of biographical understanding of the nurse's experiences will contribute to giving of nurse's perspective. An analysis of the stories shows developmental stages of self-awareness of caring. First, as a novice nurse she observed that many patients at the department of rehabilitation became better if a nurse with professional knowledge and skills treated them well. Then she became aware that she should improve her professional knowledge and skill as a nurse by attending training seminars and reading books on nursing care. Second, the nurse became in charge of a patient who suffered from pain and became hysteric regardless of the medical treatment she received. Since the patient made nurse calls repeatedly, the other nurses at the hospital were less likely to respond to them. But the nurse decided to care for her regardless of how much troublesome the patient became by being with the patient. Then the patient began to tell her untold story to her. After listening to the story with care, all the pain that the patient suffered was gone and the patient stopped complaining. Through this experience the nurse became aware of the importance of listening to patients' stories with care. Third, the nurse currently works as home visiting nurse to care patient with terminal illness. The nurse tried to do her best to cure her patients but now she has been engaging in terminal care to help the patients dying happily at the end of their life.

Housing Strategies in Multigenerational Rural Households Living in Precarious Prosperity in Romania

This presentation aims to describe and explain housing strategies of households living in *precarious prosperity* (Hubinger 1996, Budowski *et al.* 2010) in Romania. As a theoretical framework, we employed *housing pathways* (Clapham 2002), a perspective that allowed us to understand housing patterns in time and space by looking at individual, familial and historical changes of our households. The data comes from a qualitative survey carried out in a rural community in 2013-2014. The survey consisted in 25 in depth interviews with households situated above the poverty threshold and facing high material deprivation. Our qualitative analysis sheds light on the relationships and interactions that shape housing practices. Results show how housing difficulties and postponed improvements are connected to the wider structural context given by the rural setting and the housing policy in Romania. Findings also underscore how households under scrutiny deal with housing issues by prioritizing their everyday needs, this particular strategy revealing the precariousness of their living conditions. The paper situates housing strategies within the larger discussion of the ambivalent role of house ownership in the life of the precarious prosperity stratum in Romania: a certain security and protection on the one hand, coupled with the burden of maintenance and upgrading to modern standards on the other hand.

TUMMINELLI, SANTA GIUSEPPINA* (University of Palermo, santagiuseppina.tumminelli@unipa.it)

Common Places: Migrants in the Shared Spaces of the City

The aim of this work is to initiate discussion on new forms of production of urban space, and neighbourhood relations of the migrants in a historic centre of Palermo and in intersections between roads. The presence and the integration of migrants in cities lead to new forms of urban life. I observed whether the presence of migrants in an urban area traditionally "marginal" has triggered a transformation in its structure and the structure of the relationship with these spaces. To this end, observing the neighbourhoods of the city also lead to reflect on the city and especially to the correlation between immigration and cities. To investigate what happened it seems the categories tracked in the literature are not sufficient so it was necessary to include others. Hence the proposal to use the terms *rifunctionalization* and *risymbolization* to study the processes to transform space implemented by migrant residents.

Particular attention was paid to intersections between roads, city spaces, regulated by traffic lights and, today, meeting places between migrants and the occasion to find work for them. Intersections between roads marked by traffic lights is a place where traffic stops and where migrants stay and make it a space for their everyday life. The crossings at traffic lights have become the centre of migrants life in all the cities of Italy, because it is place of work and employment. Another interesting aspect is that intersections between roads become in the cities job

opportunities and expression of an informal economy such as window cleaners or itinerant salespeople who sell objects.

TURKYILMAZ, AYTURE* (Wuppertal University, tuerkyil@uni-wuppertal.de)

How Do Parents and Primary School Children in Germany Cope with Increasing Educational Pressure?

While in Germany, due to educational expansion, academic courses have become increasingly important, students who leave secondary school without a qualifying examination have rare professional opportunities. Consequently, the final phase of primary school can be characterized as directing high performance requirements towards children and parents.

Parents, who are aware of the central function of school for future life chances, want to position their children in the best possible way and hence intensify their educational strategies as the presented results of the qualitative study "SEBI – Self-orientation and Self-directed Learning: An Analysis of Socialization and Learning Environments of Primary School Children" will reveal. Focusing on interactions within the family, it can be shown how parents' reactions to this increasing pressure are constantly adjusted to school responses but also vary according to social background, the availability of resources and the specific features of the child's personality. The findings also demonstrate how the children as actors contribute to their own educational process – primarily, by the degree of their school success – but on a second level by detecting the expectations they are addressed with and developing a whole repertoire of strategies in order to make use of this knowledge. They easily find ways to fit into predetermined educational arrangements but they can also more or less reduce this kind of cooperation and thereby provoke adaptions of the educational programs.

With regard to the production and reproduction of inequality in education, it will be argued that a low social status has a double negative effect on educational programs in the family: The lack of resources and the experience of social marginality increase the intensity of parental efforts for school success, narrowing down nearly all interactions with the child to performance training, which causes a correspondingly low self-assessment of the children.

Hybridization of University and Its Societal Environment: Reflections on the Triple Helix Model and Ways Forward

Universities are central organizations in the current knowledge society. They provide new scientific and technological knowledge, educate people to serve the society and alleviate societal problems of various kinds. To these ends universities have been streamlined to perform more efficiently. Simultaneously, the separate institutional spheres of science, university, government, industry and the civil society have intermingled giving rise to hybrid organizations and many related theoretical models that underline the radical change of universities. Of these theories, the current paper will focus on the triple-helix of university-industry-government relations. It will claim that intensified interaction between university, industry and government has given rise to a new, hybrid type of research, which not only advances scientific knowledge but also tries to attain commercially viable products. The paper will summarize the major viewpoints of this theory and reflect on the commentary given to it. To better understand the vices and virtues of the model, it will also analyse the model's distinct theoretical status and claim that it is ambiguous, as it combines three types of sociological theory, i.e., diagnosis of an era, general sociological theory and research theory. After assessing the status of triple helix, the paper will contribute to the discussion about the model by probing different theoretical avenues that research associated with it might proceed. Of central importance here is systems theory by Niklas Luhmann, as major protagonists of triple helix have used his ideas in discussing the model. The current paper will thus draw concepts from Luhmann's theory to specify ways in which empirical research associated with triple helix and other hybrid models of university organization could be made more responsive to the multi-functional and internally contradictory character of the contemporary research university.

GORSHKOV, MIKHAIL* (Institute of Sociology of the Russian Academy of Sciences, director@isras.ru)

Civilizational Specific of Dreams in Russia and China

In the ordinary sense dream is associated with a cherished desire. But sociological understanding is not limited to that: dream is also a mental image of the desired future of the society. So sociological study of dreams is necessary - without it it's not possible to define image of the future desired by population of the country. So comparative project is especially interesting, since it not only reveals the specifics of dreams and their basic elements in two BRIC countries, but also defines cultural and civilizational specificities and correlation between norms and values systems of their population that are reflected in the specifics of the dreams. Understanding of the desired future and its elements that exist in the views of Russian and Chinese population also give an answer to the fundamental question of whether "Russian Dream" and "Chinese dream" represent alternative public projects and how they correspond with the proposed images of desired future in other cultural frameworks, both at the macro-and micro-level (ie at the level of the "big" dreams about a particular society, and at the level of individual dreams about something personal). This type of research is particularly important considering the fact that in the past three decades qualitative changes in ratio between planned and market principles in the economy have occurred in both Russia and China, but paths of transition to market that these countries have chosen were quite different. Among the key factors that determine characteristics of the modern development of these countries are norms and values systems that form the core of the national culture, and the key issue in this context is the problem of effective combination of economic modernization processes and development of market economy, on the one hand, and preservation of specific national culture - on the other.

PAULSEN, MICHAEL* (Aalborg University, paulsen@learning.aau.dk)

Between Competencies and Bildung in the Digital Medium Environment

We are living in a media revolution, in a period where new social structures arise in the communicative space of digital media. This means that psychic systems must try to adapt to a changing social world within all social arenas like economy, work-life, love relations and last but not least *education*. What happens is that the information– and interaction-situations change so almost any information becomes only few clicks away and everybody in the world can message you where ever you are. The problem is not that the students now must face a new digitalized school, but that students meet a school system that have not found it's own feeds yet. Especially two reactions to this unclear situation can be identified; one that tries to work against the new media because one cannot find suitable education methods, or have ideological opposition to the new social relations enabled by digital media. The other reaction comes from industrial and economic logics influencing governments and management of educational institutions to improve media literacy focusing on digital competencies. The latter reaction we find most constructive because looking at the history of media evolution the new media are here to stay and the social will evolve within their possibility space. But we also find the scope of just looking at *competencies* much too narrow. Therefor this paper tries to create a concept of *Digital Bildung* drawing on Klafki and Biesta who both in their theories points at the important aspect of making students able to think critically and become citizens taking social responsibility gaining not only technically competencies. Thereto we apply Luhmanns systems theory to integrate the concept into educational sociology and medium sociology. The paper draws on empirical findings from the Socio Media Education experiment, a Danish action research project in upper secondary school.

Evolution and Determinants of Language Attitudes Among Catalan Adolescents

This comunication focuses on language attitudes of teenagers as a cultural integration indicator between the two major linguistic groups in Catalonia (Catalan and Castilian). The Catalan case is of great sociolinguistic interest due to its distinctive features: the similar ethnolinguistic vitality enjoyed for both languages

and the widespread bilingualism that common schooling has encouraged. Specifically, this study analyzes linguistic integration from an intergroup relations perspective, based on the situated identity approach and sociocontextual model of second language acquisition. The empirical study focuses on the evolution of language attitude towards Catalan and Castilian based on a Catalan student panel sample. A longitudinal analysis was done, through the identification of typified trajectories that allow the identification of the main change trends and their relationship with other linguistic, identity and sociodemographic variables.

Champ Culturel Et Sens Pratique Du Galeriste. Une Recherche Qualitative Sur Les Intermédiaires D'art Dans La Ville De Milano

Je voudrais discuter sur le thème de l'économie des biens symboliques sur la base d'une recherche qualitative dédiée aux galeries d'art dans la ville de Milan. Ma contribution concerne une ethnographie, observations et entretiens en profondeurs, menée sur la communauté occupationnelle du galeriste d'art contemporain. Le galeriste est considéré comme un intermédiaire culturel particulier, selon une perspective bourdieusienne mais ouvert à des suggestions interactionnistes (Hughes, Goffman). Donc, je voudrais présenter quelques réflexions sur le champ des galeristes à la Bourdieu (Bourdieu, 2005). En ce sens, j'ai pu élaborer une typologie des galeristes: quasi-galeristes folk, galeristes historiques, galeristes intègres, galeristes intégrés, aspirants galeristes. En autre, j'explorerai les foires et les vernissages comme des cérémonies rituelles par lesquelles est contentement recréé la croyance et l'ethos du galeriste. Ces occasions sociales sont donc une lentille privilégiée dans l'analyse d'un travail complexe sur les frontières identitaires, des stratégies pratiques et discursives par lesquelles les individus viennent à se définir et à définir les autres en termes fondamentalement morales (Goffman, 2004). Les meetings des galeristes sont pourtant des petites cérémonies distinctives, des phénomènes rituels stratifiés et d'institution agissant dans la redéfinition continuelle des frontières symboliques de cette communauté occupationnelle.

Sociogenesis of the Artistic Vocation. The Study of Art Between Dispositions and Aspirations.

This research explores the relationship among the dynamics of the process of family and educational socialization and the development of aesthetic dispositions by means of a qualitative perspective with in-depth interviews and focus groups. The research takes place in, private and public, secondary art schools in Milan. I want to define art in the space of educational choices. Young pupils' choice to study the plastic art represents the primary interest in this research. What are the meanings of this scholastic choice? What are the scholastic and family dynamics that emerge in this process? How does act the representations, logics and attitudes about both art and school of the students and their parents and teachers? These are the main questions which my work attempts to answer through the conceptual tool of cultural capital and looking at the studies about the sociology of culture and, in particular, the sociology of education, art, cultural practices and the youth studies. I study the meanings of this choice, the representations and attitudes, both art and school, of the students and their parents, as well as the aspirations and ambitions on the future. I will investigate the school choice and the artistic aspiration as classed concepts. I want to consider how the educational and professional aspirations are linked to class identity and to neo-liberal order. I want to explore the class differences in the way in which students, and their parents, oriented themselves towards artistic educational routes and professional futures. The artistic pathway is problematized as atypical, an "against the grain" choice. In sum, I will explore the role of secondary art school to reproduce the social differences in terms of educational and professional aspirations.

Isolated Illness: Characteristics and Issues of Multiple Chemical Sensitivity

This paper discuss the social characteristics and issues associated with multiple chemical sensitivity (MCS), an environment-related illness that has become a chemical risk problem in Europe, the United States, and parts of East Asia over the last 30 years. The reported cause of MCS is exposure to large quantities or high concentrations of chemicals, such as volatile organic compounds used for making furniture or pesticides spread over fields. Once people are sensitized by this exposure, they hyper-react to diverse chemicals in their daily lives and develop

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

various symptoms. As a result, they cannot attend their schools or workplaces, or even live in their own homes. Even though the estimated number of patients with MCS in Japan is about one million, MCS is not well known and patients who suffer from it have been neglected.

　　The social damage from MCS is basically similar to that from other environmental-pollutant-related diseases, as indicated by previous studies: loss of income, strain on family relationships, and forced life changes. However, in our research conducted by Prof. Ryoichi Terada, extreme damage from MCS was observed; this was related to the impossibility of identifying and avoiding the causative substances, being diagnosed by doctor, defining the patients' situation, pursuing the company and persons responsible, and uniting patients and their supporters. These characteristics are brought about by the medical ambiguity and extensiveness of MCS. In short, patients are isolated both socially and medically.

　　In conclusion, recovery from MCS is defined as not only chemical detoxification and the ability to live in a clean environment, but also restoration of the patient's social life and ability to live with others. In the broader context, it is essential to establish transboundary research cooperation and to share chemical regulation throughout East Asia, because chemicals are transferred to, and pollute, environments across borders.

Beyond Push-Pull Dichotomy: Dynamics of Rural-Urban Migration in Bangladesh

　　Rural-urban migration has always been considered in both academia and public domain within a very stereotyping dichotomy of prediction: lack of opportunities at moving ends and relatively better scopes in receiving ends, which provides academics with the theoretical underpinning of push-pull factors. Most of the existing studies in Bangladesh also considered rural-urban migration as the resultant outcome of push-pull factors since conditionality against job opportunities in rural areas and mounting new scopes in urban centres determine the migration pattern. But this paper sheds light beyond this conventionality of understanding migration arguing that the capacity to aspire (Appadurai, 1991) and articulation of desire (Kearney, 2004) are instrumental behind rural-urban migration in developing countries particularly in Bangladesh. The paper has been prepared based on ethnographic data collected through year-long intensive fieldwork among the migrant labours in Dhaka. The empirical data challenged the conventional 'push-pull' dichotomy and revealed that many more reasons are in operation behind migration other than mere push and pull factors and sometimes those work in the frontline. Unlike the exiting studies in Bangladesh, this paper illustrates that many individuals temporarily migrate to Dhaka for continuing study what has been stopped due to family's inability to provide financial support, for retaining the desire of romantic relations, for escaping law enforcing agencies for some unruly deeds, for accumulating capital for doing business in rural area in future, for managing capital to go abroad, for managing marriage cost of migrants' daughter(s) or for repaying the loan borrowed under some unavoidable circumstances. Besides, some people migrate to Dhaka to uplift their social positioning as Dhaka has become a symbol of high status as it is the capital of Bangladesh. In this way, this paper explores and explains many growing factors beyond push-pull orthodoxies to unearth the dynamics of rural-urban migration in Bangladesh.

Social Vulnerability in Disasters: Migrants Experiences in Canterbury and Tohoku

　　This comparative study employed a ground-up approach to qualitatively explore how immigrants who are linguistic minorities in Christchurch (New Zealand) and Tohoku (Japan) experienced the 2010-2011 disasters, including their coping mechanisms and their perceived social vulnerabilities. Sociological research on disasters has found that disasters affect individuals, families and communities differently, and damage is usually uneven due to the structural inequalities that already exist prior to disasters. Immigrants, refugees and linguistic minorities are typically considered vulnerable in disasters. However, findings drawn from the in-depth interviews demonstrate the fluidity, complexity and contextuality of social vulnerabilities in disasters, possibly suggesting that these people are not necessarily powerless help-seekers in some cases and that we therefore need to re-conceptualize the social vulnerability approach. Using Bourdieu's capital theory, along with his concepts of habitus and field, this study demonstrates how immigrants, refugees and linguistic minorities were active social agents in these disasters. They individually and collectively generated, deployed and employed a variety of resources/capital to adapt to the rapidly changing situations in which they suddenly found themselves. Furthermore, some study participants had past experiences of going through wars and chaotic events, which made them more "resilient" and disaster "prepared". As McIntosh (1998) notes, this can be called an example of "earned strength" which can be a significant resource in extreme events for the socially vulnerable. Examples of the way in which these participants individually and collectively coped with disasters can provide practical knowledge drawn from their actual experiences that can help researchers, practitioners and policymakers develop more effective disaster risk reduction (DRR) and disaster response strategies.

Green Governmentality, Responsibilization and the Role of International Engos

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In a time with a political economy characterised by a globalization and market-based solutions and with topical issues such as climate change, questions regarding the role of the environmental movement have gained new relevance. For several reasons climate change has led environmental NGOs (ENGOs) to rethink their strategies in terms of which polities to target (international, national, regional or local). There is also a tendency that climate change leads to new forms of collaborations, or convergence, between ENGOs and businesses partly because of the perceived urgency of the problem. While nation states are still crucial actors in climate change politics, private actors and individual responsibility have been increasingly emphasized in environmental policy, which is a process of responsibilization and depolitization that has been captured by the concept of "green governmentality. The aim of this study is to examine international ENGOs' strategies to deal with climate change and discuss how these strategies can be understood in relation to green governmentality. How do this kind of organizations communicate about climate change, its causes and solutions? How and to whom do they ascribe responsibility? The study focuses three major organizations, Greenpeace, Friends of the Earth and WWF, and includes an analysis of their policy documents, public communication on web sites and campaign material. On the basis of this analysis we conclude that even though we can see some of the tendencies towards responsibilization, depoliticization and convergence between ENGOs and businesses the ENGOs also express resistance as well as alternatives to green governmentality.

La Subjectivité Des Femmes Qui Révèle La Sphère Privée: Une étude Sur La Manifestation #Sendeanlat

L'été 2013 en Turquie a témoigné une épanouissement dans la répertoire de l'action collective avec le mouvement Gezi qui était synchronique avec les autres mouvements de maïdan. Nous étudierons ce mouvement de la place publique féconde à analyses diverses d'un point-de-vue basé sur le genre. Nous nous focalisons sur deux aspects du mouvement dont le premier s'agit de la séparation entre la sphère privée et la sphère publique dont les frontières sont problématisées avec la mise en question de la notion de *mahrem* particulièrement par la présence du mouvement féministe et du mouvement LGBTI dans le mouvement pendant que le deuxième s'agit de l'intégration de nouveaux moyens de la contestation comme la résistance festive, la performativité, la dérision, l'humour dans la répertoire de l'action collective. En se basant sur ces deux axes principaux, nous essayerons d'observer en quel points Gezi a été un mouvement *queer-ing* au niveau du genre et de la sexualité et comment il a transformé l'activisme sur ces sujets en construisant une sphère hybride entre l'espace physiquement occupé de la ville et l'espace virtuel grâce à l'activisme sur le média social.

Afin de comprendre l'effet de ces transformations sur les sujets cités, nous nous concentrons sur l'activisme des femmes dans la période après le mouvement Gezi, particulièrement la mobilisation du hashtag #sendeanlat qui est l'un des exemples de l'activisme du média social organisé spontanément sur twitter après l'assassinat massacreux d'Özgecan Aslan le 11 février 2015. Pendant cette contestation réalisée dans l'espace virtuel, les femmes ont révélé les harcèlements sexuels et les viols qu'elles ont subi. À partir de cette mobilisation-là, on essayera de comprendre comment l'activisme au sein du parc Gezi a composé une expérience transformatrice qui met en question les relations du genre et la séparation de la sphère privée et la sphère publique.

Less Than Believing and Belonging: Weak Inclination Towards Spirituality in Estonia

Due to historical-cultural factors Estonians demonstrate the lowest level of importance of religion in several European or worldly surveys. Some non-theistic beliefs (e.g. in spirit or life-force or supernatural powers) and spiritual practices, however, enjoy high popularity, especially when not labeled as religious. In the modes of religious involvement the transition from the traditional commitment-obligation model towards the "demand-based" or "situational" model is visible. Therefore, instead of looking for the spiritual identity of a person we should ask how likely would he/she in case of need turn to spiritual milieu to find a solution there. The concept of 'inclinations' offers some new options to talk (and think) about involvement in post-believing-and-belonging era.

The presentation focuses on Estonians who are not regular participants in spiritual or esoteric seminars but have only some generally positive attitude towards spiritual principles. These weakly inclined people could be just readers of some spiritual books and internet news portals for general interest, or members of a thematic group in social media. They belong to the 'fuzzy fidelity' or 'nones' and are usually left unexplored. However, this group of people is especially relevant in Estonian context because they compose the 'religious majority'. Weak inclination also exemplifies the flexible nature of spiritual milieu that allows constant and mutual cultural influences. For some scholars of religion this feature seems to weaken the social significance of the spirituality as it is too easily becoming

"co-opted by the cultural mainstream and trivialized by the mass media" (Bruce 2000: 233). I will argue that (alternative) spiritualities are, in any case, strongly related to wider societal values and increasingly influence societal mainstream. The presentation is based on the analysis of qualitative interviews and representative survey data aiming to map the values and orientations the spirituality cultivates.

The Plurality of Meanings Related to Symptoms and Illnesses: The Experiences of Estonian Spiritual Practitioners

Medical pluralization has been rapid in Post-Soviet Estonia as the state-organized and controlled healthcare system has been increasingly challenged by alternative approaches to health and healing. With the growing pluralism in health, the range of possible interpretations of symptoms and illnesses has broadened. The milieu of new spirituality offers various conceptualizations of illnesses that tend to give wider meanings to bodily sensations that biomedicine classifies as symptoms of pathologies. For example, according to a wide-spread belief promoted by several teachers (including famous Estonian doctor and spiritual leader Luule Viilma) morally wrong deeds and thoughts affect certain organs and cause certain symptoms and diseases. The followers of these types of teachings aim to establish a 'dialogue' with the body and/or the organs; to learn to understand different sensations as messages. Personally experienced 'signs' are seen as the source of truthful information: it is often emphasized that people should not trust anybody else but their own experience and bodily signs. Different sources of knowledge may lead to open conflicts about the interpretations but there are also some attempts to combine and mingle the vocabulary and approaches. In the presentation I will observe the plurality of meanings about bodily sensations: how the symptom is recognized; what kinds of sources (e.g. professional, 'lay-medical', alternative) are used. I analyze qualitative material collected by in-depth interviews as well as discussions on different internet forums dedicated to health issues.

Families of Choice in Poland. Same-Sex Relationships As a Modern Alternative to a Family – Case Study.

I intend to present my own PhD research on the everyday functioning of homosexual families in Poland and social acceptance of same-sex families among the society. I would like to refer mostly to the narrative strategies of partners in homosexual families as well as their relations with children brought up in these families.

My research focuses on the same-sex family as an alternative to the traditional family model. I analyse the circumstances in which such a form of a family has emerged both in the Western societies and in Poland. The analysis includes changes of lifestyles, sexuality and interpersonal relations between partners, the key factors which influenced emerging of a same-sex family as a topic of public discourse. Outcomes of the qualitative research aimed at depicting everyday life of a number of same-sex families supplement these deliberations. The research was carried out with the use of individual in-depth interviews conducted with members of same-sex families.

The study showed that its participants do not expect acceptance of the family model they had chosen. They claim that their relationships does not differ from other forms of family life. The interviewees are mostly focused on bonding with children, raising them and performing the usual daily activities.

Movement Success and Its Unintended Consequences: Focusing on Japanese War Orphans' Litigation

This paper argues that although the success of Japanese war orphans' movement has provided financially better living conditions for orphans and their families, it has also caused conflicts among various groups in different organizations and demotivation of orphans from further actions to improve their life in Japan. This paper also claims that political settlement between orphans and Japanese government not only made governmental responsibilities for the past war atrocities and the abandonment of Japanese nationals ambiguous but also left the orphans and their families invisible in Japanese society.

Since over 3,000 Japanese remaining in China after World War II has come back to Japan with their Chinese families from the 1970s, their lack of Japanese proficiency, cultural understanding, and socio-economic resources has brought about various troubles and conflicts among orphans, their supporters, and Japanese government. After several attempts to achieve financial supports from Japanese government failed, orphans and supporters took series of legal actions against Japanese government. These legal actions strengthened the integration

of orphans and vitalized their political movement through mobilizing thousands of orphans, their families, and supporters in the protest rallies, remonstrating visits to both houses of National Diet, and other orphan-related events. However, legal actions also revealed different views and conflicts among various groups of orphans and supporters about their movement goals and methods.

To explain several unintended consequences of orphans' movement, this paper critically examines political environments affecting orphans' movement from the 1990s. By analyzing newspaper articles, government document, and academic publications, this paper also presents how different views among orphans, supporters, and government officials about orphans' issues have been shaped and reshaped during the movement, and how these differences led movement participants to conflicts and cooperation during and after the movement.

Stress and the Provision of Social Support in Gay, Lesbian, and Heterosexual Marriages

Previous studies suggest that women are more attuned than men to the emotional needs of their spouse, and that women are more responsive in providing support to their spouse during periods of stress. However, past research is built on the assumption of gender difference within heterosexual marriage. In this study, we analyze dyadic diary data from 100 gay, 100 lesbian, and 100 heterosexual married couples (N = 600 individuals and 6000 diary days) to examine the degree to which spouses are aware of each other's stress levels and how much support they provide to each to each other during periods of stress. We focus particularly on the possibility that gender differences in these processes will depend on whether individuals are in same-sex or different-sex unions. Specifically, we compare same- and different-sex marriages to ask: Do men and women differ on average in the amount of support they report providing (and receiving) from their spouse over the 10-day period; Does one spouse's stress levels influence the amount of support provided by the other spouse? Preliminary results suggest that men and women in same-sex relationships report receiving more social support from their spouse than do men and women in different-sex relationships. Further, increases in one spouse's stress levels are associated with significantly higher levels of social support from the other spouse, but only if the spouse providing the support is a woman. Subsequent analyses will focus on how stress/support dynamics unfold over the entire 10 day diary period across different union types. Understanding how stress and social support unfold in same-sex as well as different-sex marriages informs understanding of gendered relationship processes that have the potential to influence marital quality as well as the mental health of both partners.

Fixing Diseases - Locating Modernity. the Role of Technology for Improving Uganda's Health System

The paper starts with a brief summary of some core characteristics of modernity. Here I will mainly draw from Anthony Giddens argument that modernity – in contrast to more traditional types of social order – features a distinctive *pace* and *scope* in how social change is brought about and enacted. I will argue that this observation is mainly drawn from institutional change in western settings. To critical examine Giddens claim my paper will ask if this still holds true if we turn to concrete technologies and how these are implemented and used in non-western settings. Taking the example of introduction of Rapid Diagnostic Tests for Malaria in Uganda I will show that technical change is a complex process involving and requiring various temporalities and spacialities. I will argue that we need a particular as well as broader understanding of Giddens features of pace and scale of change if we want to fully grasp the practical and organisational implications the use of new technologies in non-western settings renders visible.

Broadening Local Mobilizations: Exploring the Possibilities of Linking "Northern Forest Defense" in Turkey to Climate Change

Despite the extensive transnational movement network formed over climate change, the participation of grassroots movements has been insufficient and/or haphazard mainly due to issue priorities, mobilizing structures, frames, local political cleavages, and local/national political opportunities. In my research, I analyze the Northern Forest Defense (hereafter KOS), a local ecology group in Turkey that has spun off the Gezi Protests and that resists ecologically hazardous mega-projects in İstanbul namely the third bridge, the third airport and Channel İstanbul. Based on 25 in-depth interviews and 18 months of participant observation, I show that KOS employs a broad frame of "right to life", constructs an inclusive collective identity, and organizes itself as a decentralized network, all of which enable them to mobilize for a wide range of issues other than their immediate cause including peace, human rights violations, and worker's rights as well as climate change. In that regard, KOS takes part in the climate change protests not only because their specific concerns are directly related to climate change, but also because they evaluate the whole process as a detrimental consequence of capitalist globalization much in the same way that they associate themselves with peace claims. I argue that the sustainability of local movements' participation in the transnational network depends on a mutual process of frame bridging and inclusive identity construction. On the one hand, local movements that utilize broader frames, construct inclusive identities, and organize themselves as flexible networks are more likely to remain part of the transnational climate change movement. In turn, it is crucial for the transnational climate change movement network to localize the impacts of climate change, which remain indiscernible at the local level, through bridging their frames to local claims, concerns, and issues while taking local political cleavages and opportunities into account.

The Transformative Impact of the Gezi Protests on New Social Movements in Turkey

During the 15 days of the Gezi protest encampment in Turkey, a multiplicity of actors with diverging identities and claims experienced a process of mutual recognition, solidarity and trust building, networking, and experimenting with alternative forms of democracy and social life within the free space of affections, cognition, and relations. My study analyzes the prolonged impacts of the Gezi protests as an eventful protest on the formation and strengthening of inclusive new social movement networks. To this end, I study the impacts of the Gezi encampment on transformations at the cognitive, emotional, and organizational levels in the subsequent phases of the protests, namely social forum gatherings at the public parks in Istanbul and formation of issue-specific movement networks. Based on 35 in-depth interviews and 18 months of participant observation, I argue that processes of collective identity construction and solidarity building that have been initiated at the Gezi protests are carried over to the succeeding stages. Yet, this process remained incomplete during the park forums stage due to salient organizational identities, concerns, and priorities –especially of the 'old' left groups/organizations- as well as robust social and political cleavages. However, relations of solidarity are sustained in the issue-specific movement networks with a clear focus that either have spun off the Gezi protests or are strengthened with the impact of the protests. Yet, resting on the relations established at the Gezi protest camp, these issue specific movement groups including feminists, LGBTQs, animal rights activists, urban movement activists, anti-capitalist Muslims, and ecologists do not confine themselves within the limits of their specific issues, but rather they bridge their frames and collaborate as a flexible and decentralized network under a broad master fame of "right to life". Moreover, they transcend the dichotomy between "old" and "new" issues by mobilizing for labor rights.

Impact of the Institutional Setting of ECEC on the Use of Child Care in Europe

Early childhood education and care (ECEC) is one of the most crucial elements of social investment to alleviate social and economic inequalities. As the European welfare states realised the importance of ECEC especially for disadvantaged children as an early investment in their human capital, the accessibility of ECEC services became a hot topic in Europe and the ECEC participation rate became an important welfare indicator. Certainly, the way ECEC services are regulated, provided and financed has a huge impact on their accessibility and actual use. This paper investigates the effect of the institutional setting of ECEC (regulation, provision and financing) on the individual use of ECEC services in Europe. We examine in which settings the families opt for formal centre-based, informal, and/or familial ECEC. Besides looking at general patterns of inequality, we also control

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

for belonging in a disadvantaged group (e.g. low-income, migrant, single parent) to see if they differ in ECEC use.

We use multilevel modelling to analyse the two-level structure. The first level is the family-level where various demographic and socio-economic indicators determine the use of ECEC services. The second level is the country-level where characteristics related to the institutional setting of ECEC come into play such as age of legal entitlement to ECEC, split or unitary ECEC, private provision, public spending, etc. Demographic, socio-economic, and ECEC type- and use-related variables are explored based on the 2013 cross-sectional data from the European Union Statistics on Income and Living Conditions (EU-SILC). Macro-level indicators are taken mainly from Eurostat and Eurydice. The novelty of this research is in examining the impact of the wider institutional setting of ECEC system on the actual use of these services. We expect the results of this study to help policy-makers in making better choices to improve access to ECEC, especially by disadvantaged families.

Intrinsic Crisis of Democracy: Fromm's Authoritarian Personality Theory Revisit

The Nazi-era was often called as crisis of democracy. But we do not have to forget the fact, before Nazi-era, it was "Weimar Republic". "Weimar-constitution" was famous for its democratic contents, and "Weimar-culture" was called one of the most established culture in 20th century. Then, Weimar was one of the most democratic countries in that time. So it sounds strange "from Weimar to Hitler". But this presentation shows Hitler got power precisely because he came after Weimar. In democracy, there is element that destroys democracy itself.

"Myth is already enlightenment, and enlightenment reverts to mythology." This thesis by Adrno-Horkheimer(1947) express that reason has violence in its nature. We can say similar thesis also to democracy. Namely, democracy has in its nature self-destroying element. Then this presentation revisits discussion of Erich Fromm's Authoritarian Personality. He, as a member of frankfurter school, also shared the same motif with the thesis. When country is modernized and democratized, it also increases danger of the authoritarianism. Fromm had done empirical German workers research in 1920s and found many people had authoritarian personality. Authoritarian personality people change their attitude depending on situation. They voluntarily obey to the upper class but show excessively aggressiveness to the lower class or minorities. Fromm explained this problem was not limited to Nazi-Germany but fundamentally rooted in modernity. In the process of modernization, we disenchanted the world, and we got freedom from old tradition, norm and community. But it also caused anomy or loneliness. Then, people come to want absolute authority. The widespread of authoritarian personality happened precisely because Weimar was actually modernized democratic country.The interesting thing is, Fromm's theory was so popular in post-war Japan also as explnation for the totalitarianism in Japan. Then this discussion about authoritarianism was suitable for re-thinking about democracy and modernity.

RC36-421.5

UOZUMI, TOMOHIRO* (The University of Tokyo, t.u.sakana@gmail.com)

The Meaning of Exile of Erich Fromm from Frankfurter School

This presentation shows the meaning of Fromm's exile from the school as the turning point of nature of the school. Fromm's exile has two meanings.

First, it means the nature of the critical theory changed from interdisciplinary materialism to a kind of philosophy. Horkheimer declared the purpose of the critical theory in 'Traditional and Critical Theory'(1937). According to him, critical theory aims interdisciplinary materialism that organized some discipline for practice. But regardless of the statement, actual interdisciplinary project was not so many. At least, actually successful project was only 'Authority and family'(1936). This project was based on large-scale Weimar workers survey and the project was mainly designed by Fromm. In earlier Frankfurt school, Fromm played a central role. But Adrno replaced Fromm. With participation of Adrno, the critical theory changed it's nature more to the philosophy. It originally aimed at theory and praxis but after Adrno's replacement, it gave up the praxis.

Second, it means change of basic understanding of Freud's libido theory.

Psychoanalysis was brought to the school by Fromm and used as effective tool. But later he was ejected because of conflict with members.

Fromm presuposed socialized person and at first Horkheimer followed Fromm's understanding. But Adrno opposed to that and Horkheimer changed his attitude to Fromm.

Creating "Idiom of Distress" Collaboratively: An Analysis of Practices of Self-Directed Research By People with Mental Illness

We clarified the interactive practices in which participants create "idioms of distress" collaboratively during a *tojisha kenkyu* session as a form of self-directed research by people with mental illness. In Japan, psychiatry is still in the middle of deinstitutionalization, with various attempts made to support people with mental illness to live in their communities. The practice of *tojisha kenkyu* is now attracting much attention; this is a type of peer-support practice in which participants talk about their troubles in their daily lives in order to understand the meanings behind them and the causes of them *in their own words*. This practice began in a group of individuals with mental illness in the town of Hokkaido, Japan, and has since been used with many other groups of people with various impairments. It is frequently used because it allows participants to collaboratively put their troubled experiences into words. In order to study these methods, we analyzed ten videotaped sessions of *tojisha kenkyu*. The focus was one type of action sequence often found in the early stage of each session. The sequence involves one participant discussing their troubled experiences and his/her own thoughts about them. Then, the audience tries to make sense of this, usually by confirming their understanding in relation to *their own* troubled experiences that they think are analogous to the experiences discussed by the teller. In other words, the audience confirms their understanding by trying to check the adequacy of the analogies they make between the teller's experience and their own experiences. Through this process of orienting themselves to the individuality of their own experiences, audiences seek to accomplish mutual understanding. Using this procedure, they eventually create new "idioms of distress," which are concepts through which they can understand their own troubled experiences in their own way.

El Aprendizaje Del Consumo De Alcohol Entre Adolescentes: "Coge El Punto Pero No El Pedo"

Este trabajo presenta resultados de investigación sobre el consumo de alcohol entre adolescentes españoles de 13 a 17 años, obtenidos a través de estrategias de investigación cualitativa y cuantitativa. Los resultados indican que la adolescencia puede suponer un periodo importante para el aprendizaje del consumo de alcohol. Para ello es necesario la articulación de políticas y estrategias educativas y de disminución del riesgo frente a las represivas y prohibitivas que resultan más ineficaces. Las medidas preventivas que influyan en sus conductas deben ir encaminadas a sus intereses y a sus contextos más inmediatos. Si bien es cierto que la presión del grupo de iguales actúa de forma contundente en el consumo de alcohol, también se despliega la ayuda mutua y el aprendizaje común entre ellos. Los efectos de la intoxicación son percibidos, asumidos y elaborados en diferentes estadios. Algunos de ellos son deseables, como el consumo que permite la sociabilidad, inhibición moderada y divertirse, a lo que llamaban *coger el punto*. Los adolescentes deseaban situarse en ese estadio que permitía control, seguridad y pasarlo bien. Otros estadios, modos y finalidades de beber eran calificados como *cogerse un pedo*, es decir, un estado de embriaguez que podría suponer la pérdida de control. En este caso se producían comportamientos y situaciones de riesgo sobre las que no tenían ningún control. El aprendizaje y prevención del consumo abusivo de alcohol debe producirse en la adolescencia involucrando a los propios protagonistas.

The Demographic Transition in the Nasa Indigenous People and Black Populations of Northern Cauca (Colombia)

The region of Northern Cauca (14 municipalities) is an interethnic-racial Andean area in Colombian southwestern, with indigenous (Nasa people) and black as well as white and mestizo populations, which integrates mountains with valley of Cauca River. In the last three decades the region has experienced a rapid process of modernization associated with a strong agribusiness development (for sugar cane and ethanol production) and industrial companies for *maquila* export and domestic market that have integrated as labor to women and men of black and indigenous populations. At the same time, this region is part of the largest urban-rural agglomeration whose main pole is Cali city. This paper analysis patterns

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of fertility and size of households of ethnic minorities (Indigenous and blacks) in comparative terms with the white and mestizo population, using data database fertility population censuses, 1993 and 2005, and other demographic information from households and their members in the database System Identification of Potential Beneficiaries of Social Programs State (SISBEN). Main questions are the following: how the increased levels of schooling and changes in the occupational structure in the region is affecting the demographic transition through women and the different types of household. The results point to note fertility differentials between the two minorities and the majority population studied, taking into account a number of contextual variables such as education, employment, rural-urban migration, and expansion of health services.

Protecting Whistleblowers: The Effectiveness of Legislation

This paper discusses legislation aimed at the protection of whistleblowers as well as the implementation of confidential reporting processes by organizations. Confidential reporting processes are generally considered important ways in which to encourage employees to disclose ethical and legal violations to an internal authority. If these processes are effective, action can be taken immediately to resolve the problem and to minimize the organization's exposure to reputational damage. In so doing the organization makes employees aware that the organization is serious about adherence to codes of conduct. In this paper, legislation in various countries is compared in order to determine ways in which the effectiveness of legislative protection for whistleblowers can be enhanced.

VACKOVA, BARBORA* (Masaryk University, vackova.bara@gmail.com)

Modern Art, Architecture and Urbanism in the Frame of Two Ideological Regimes: Modes of Dealing with Cultural Contradictions and Continuities in the Bata Company Town of Zlín.

The paper will focus on the relatively short history of the city of Zlín (Czech Republic; the company town of Baťa shoe factory build mostly during the first decades of the 20th century), specifically on the transformation of the capitalistic aesthetics and ethos into the socialistic one. The plan of the city as well as its architecture was based on the ideas of functionalist urban planning – besides the central position of the headquarters of the Bata's growing company, the zoning was applied. Next to residential, educational, health and social facilities were built also cultural facilities and infrastructure (film studios, space for exhibition of contemporary art, film festival, etc.). The city and the factory became tightly interconnected and the cultural politics was an inseparable part of the continuous building of the city identity: the avant-garde became an important part of the image of the city and was connected to the political and economic elite. Not only the cultural infrastructure, but also the myth (in the sense of Barthes) of the Baťa family and the city, became unacceptable after the coup d'état in 1948, the regime had to deal with this capitalist legacy. The transformation of the city from the capitalist regime to the state socialist one was a difficult economic, but even more complicated cultural and ideological task. But despite the fundamental ideological rupture it is possible to observe important continuities in cultural politics and it brings about questions we would like to discuss in our paper: What made a difference between the modernistic "socialist" and "capitalist" discourses and practices and what, in contrary, were the similarities? What techniques were applied in the process of redefinition of the city image, what role was played in this process by the cultural institutions of the city and also by the artists themselves?

Iranian Women's Stealthy Freedom

Iranian women have to wear scarves after Iran's Islamic Revolution which took place in 1979. Last year, the page of My Stealthy Freedom started to open the way for women's libration which has reached more than 880 thousands followers today. Hundreds of Iranian women who have to wear the scarf due to force or law, opened their scarves at the point where there is no morality police and shared their photos on this page.

There are legal rules and restrictions against women's demands and there is long term prison sentence for arranging street or any kinds of organized movements and attending to them. Therefore they could not develop any movement like woman's movement in other countries. Actually the page My Stealthy Freedom has provided the opportunity to freely express the problem which was blocked or feared to announce in public space.

We define this kind of activism as "new social movement" which tries to save individual identity from getting colonized by authority. Authority can not control this movement because of high number of women attending this movement and actors can make this fact visible which is suppressed and stored for more than three decades. Removing the headscarf as a symbol of collective action is sending a message which represents demands of gender equality. Through this Facebook page women can also send the messages "we can find each other, we are right, we can talk, we can appeal and etc." and also has became a place of arguing through the comments and also an opportunity to make communication with men and also women who believe in Hijab. Making this movement online has led it out of borders and in control of authority like Iran it should be an alternative way for social media to be active.

Familialism in Spain: Do Policies Match Individual Preferences?

Spain has historically assigned a large responsibility to the family in guaranteeing individuals' well being. Women have been expected to provide care to dependent family members, in particular the children and the elderly. However, in the last decades, the familialistic orientation of the Spanish welfare state has eroded, as a response to a series of transformations; including women's labor market

denotes a presenting author. Abstracts are organized by first presenting author's last name.

participation and their increased need for measures enabling work and family life reconciliation. This paper adopts the perspective of individuals and analyses their preferences towards the provision and the financing of child- and elderly care. Who should be the primary actor responsible for care work between the family, the state and the market and third sector organizations?

The paper has two objectives. First, I compare the current child- and elderly care policies implemented and determine the extent to which they match individuals' preferences. Second, I determine the social determinants of care work responsibility preferences. I use 2012 representative survey data on Spanish residents collected in the frame of the International Social Survey Programme (module *Family and Changing Gender Roles IV*). The sample size comprises 2595 respondents aged 18 and over. I apply cluster analysis techniques to four survey items in order to distinguish patterns of individual preferences regarding the organization of care work between familialistic, state, or market/third sector orientations. I then apply multinomial logistic regression in order to assess the influence of a set of independent variables for predicting these care work preference patterns. Drawing on two theories – self-interest and ideational theories – used in welfare attitudinal research, I assess the influence of sex, parenthood, age, employment status, education, income, political orientation and gender ideology on care work responsibility preferences.

Fathers on Leave Alone in Switzerland: Agents of Social Change?

Switzerland represents a unique case in the European landscape of leave policies. A minimal maternity insurance was implemented in 2005 and to this day, there is no statutory parental or paternity leave. This study uncovers the experience of pioneer fathers in Switzerland who nonetheless took leave in order to care alone for their child during at least one month. It analyzes the implications of leave uptake for fatherhood and gender equality, relying on 13 qualitative interviews conducted mainly in the French-speaking part of Switzerland.

Results show there are four different leave uptake situations. Firstly, men may take an *unpaid parental leave* in agreement with their employer or based on collective agreements. Secondly, companies may also have implemented a *paid paternity leave*, entailing job protection and salary payment. Thirdly, men may take leave in a more individualized way, for instance by making a *career break*. Fourthly they may benefit from *unemployment insurance* while caring for their children. Taking leave therefore almost always comes at a price, which explains why this is a rare phenomenon in Switzerland, observed mainly among well-educated and resourceful households.

Across these leave uptake situations, fathers report a positive as well as challenging experience during which they cared intensively for their children, yet mostly in a part-time manner. There is a mixed picture regarding the long-term implications for gender equality, as only about half of interviewees have adopted a gender equal division of paid and unpaid work. Finally, the study emphasizes the societal impact of men on leave alone in Switzerland. Because they embody involved fatherhood in public spaces and in work organizations, they can be viewed as agents of social change who redefine the cultural meaning of fatherhood.

Mexico: Political and Economic Inequality in the States

Economic inequality is in Mexico's foundations of political inequality, and this is furthermore expressed as poverty in states or countries. With this in mind we pose that political and electoral participation circumstances are limited by the experienced socioeconomic conditions. 46.2% of the population in Mexico, are immersed in at least a minimum degree of poverty, making it hard for them to obtain their basic needs and furthermore making them unable to politically and electorally participate in their communities, and thus, have effective incidence in the decisions and in the ruling of a state. Electoral participation is one of the means of expression and decision of the population among the political and governmental affairs. Therefore the problems that abstentionism generates in societies, exhibiting the non-participation in the election of the government and the authorities, which unfolds in the limitation of the population to influence the government's decisions and actions. In Mexico's last federal elections, abstentionism reached 53%, and in a state, it reached 70%. This paper analyses the relation that exists between poverty and electoral participation in Mexico, from 2005 to 2015, in the 32 states. It studies poverty in every state, comparing it with electoral participation in the last two governor elections, with the aim to establish if the economic inequality directly influences in participation and the political inequality that generates.

The Social Protection Policy in the Context of Crisis. an Analysis Portugal/Brazil

The Social Protection systems in Brazil and Portugal have their genesis in different realities despite the historical ties between the two nations. The objective of this study is to analyze the concept of social protection as a public policy relating to the socio-economic crisis context in both countries. As methodological procedure a literature review of the academic knowledge produced on this subject (books, scientific articles and other research papers) was conducted to produce scientific material through the analysis, organization and interpretation of the information collected. We used as a means of understanding the concept of Social Protection the Beveridge classic model, determinant for the universalization of social rights for all citizens, with or without conditions (but with a minimum guarantee) as well as the notion of contract established by Bismark which guarantees the coverage of social rights especially for the working class (Boshetti, 2003). To this end, we describe the historical trajectory of social protection policies, influenced by a change in ideological orientation of Brazilian politics from the emergence of Lula da Silva – The Workers Party - in 2003 and for the integration of Portugal into European Community in particular the period after the circulation of the single currency of the Euro - in 2002 to define and contextualize the different trajectory of social protection policies within the public structure of each country. We identified in this sense differences in scientific reference areas compared to the academic allegations made in the period of the 2008 crisis (an updated picture of the dominant scientific notions that point to a hegemony or disagreement in the discourse established on this material).

Welcome, but Please Don't Stay: Refugee Crisis' Implications in the South-East European Countries

'The Refugee Crisis' in 2015 shifted the visibility of the forced and irregular migrants' flows towards the Eastern Mediterranean and the Balkan route. In the Euro-Mediterranean area this has been articulated as humanitarian and security challenge where securitization of European borders seems more important than facilitating access to the territory and access to the asylum and integration system, with lifting walls, barbed wires and closing of Schengen borders. The EU has no common and effective solution to facilitate 'the crisis', rather some member states have chosen partial, restrictive and ad hoc solutions, even obstructing proposals for "quota system". This paper describes and analyzes the current asylum policies and measures in the South-East European countries (Croatia, Serbia and Bosnia and Herzegovina), on the very borders of the Schengen area. It attempts to answer the question: due to arrival of the increasing number of refugees, how do they access the territory and the asylum systems of these countries? What are the reasons why forced migrants circumvent to seek protection in those countries, and continue transiting to Western Europe? The paper is based on a research conducted in 2014 among a population of asylum seekers and refugees in Croatia, investigating reasons why they choose Croatia as a country of transit and avoid it as the destination country. Furthermore, it examines what could be outcomes of present national and regional policies on further inflows regarding access to territory and to refugee protection systems. We prove these three countries do not have a clear and systematic policy for future arrivals, nor they have reception/integration systems well-built, which poses a long-term threat to (in)efficiency of national systems of asylum, integration and security. We use a methodological approach of desk-study analysis, analysis of data from the above-mentioned research and synthesis of previous studies on this subject.

Margin Project (Horizon 2020): Knowledge-Based Approaches to Reduce Urban Insecurity

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

When the economic recession began in 2008, there was expectation among public authorities and scholars that crime would increase. Up-to-date criminological sources show that this has clearly not happened. Nevertheless, findings from EU-funded social sciences and humanities research projects on crime and deviance outline a paradox: while crime is decreasing, people feel more insecure. The correspondence between perceptions and reality is frequently imperfect given that insecurity may be affected by several factors (i.e. individual factors, mass media, personal experiences with crime and other individual and/or contextual factors). This heterogeneity may explain why, despite victimization being a relatively infrequent event, so many people are concerned about crime-related issues.

Assuming that fear of crime and perceived insecurity are clearly different topics, the MARGIN project (*Tackle Insecurity in Marginalized Areas*), coordinated by the University of Barcelona and funded by the European Union under the Horizon 2020 Programme, offers a comparative analysis among five countries (Spain, Italy, France, Hungary and the UK) enabling a comprehensive analysis of crime-related issues while considering contextual factors. The underlying assumption here is that public perceptions of insecurity can be explained by different socio-economic and socio-geographic conditions that affect subjective perception. With this in mind, the MARGIN project addresses four key dimensions of insecurity:

- The *objective dimension* focused on actual crime spread;
- The *subjective dimension* related to cognitive aspects such as fear of crime or perceived risks;
- The *socio-geographic dimension* referring to neighbourhood characteristics that have effects on the perception of insecurity;
- The *socio-economic dimension* referring to the social consequences of poverty and deprived living conditions on ontological security.

After five months of work, the consortium carried out a comparative analysis of two different sources (i.e. police recorded crime statistics and survey-based victimization data), which allowed for identifying key factors that have been proved to be drivers of insecurity.

VALENZUELA FUENTES, KATIA* (University of Nottingham, ldxkcv@nottingham.ac.uk)

Challenges of Militant Research in the Study of Autonomous Movements

The last two decades have seen an increase of newest expressions of anti-capitalist activism and collective action, both in Latin America and in the rest of the globe, characterized by the development of a radical and autonomous politics which challenges the grammars of capitalism and representative democracy along with the traditional forms of social change. Accordingly, exploring empirically the field of autonomous collectives from the standpoint of an activist-scholar demands to think carefully in the epistemology and methodology underpinning the research and in the particular methods to be applied. As Khasnabish and Haiven (2012) perceptively state, the methodological performance of the traditional studies of social movements, namely Resource Mobilization, Political Opportunities, New Social Movements, among others is "largely insufficient for the study of contemporary radical tendencies whose ambition and practice is a direct challenge to the very form of the sociopolitical itself…" (p. 412). Consequently, and in response to the difficulties presented by conventional methodologies "to see and make sense of radical challenges to the status quo [which] attempts [to cultivate] alternatives to it…" (Khasnabish and Haiven, 2012, p.412), this presentation will suggest an alternative path, drawing on the presenter's doctoral research experience with autonomous collectives in Chile and Mexico through the development of militant ethnography, understood as a politically committed and collaborative form of research carried out from within rather than outside grassroots movements (Juris, 2007). The presentation will be structured as follows: a) main assumptions of militant research and militant ethnography; b) gaining access to case studies; c) discussion of the field methods undertaken; d) ethical and methodological challenges; e) final reflextions: to what extent does militant research contribute to a collective and politically-engaged production of knowledge in the field of social movements' studies?

VALLE, TRINIDAD* (Fordham University, valle@fordham.edu)

The #Nothing-to-Celebrate Campaign: Mapuche Online Media, De-Colonial Forms of Knowledge and Redefined National and Ethnic Identities

The current Chilean media is characterized by its lack of plurality, where a few media conglomerates dominate the media landscape, thus the paramount need for alternative voices. This is a major concern for the Mapuche population, because Mapuche voices are largely underrepresented in the media.

The present research explores the role of online ethnic media in developing a counter-public sphere (Fraser, 1990), where alternatives narratives can be constructed and disseminated. In particular, the ethnic media narratives covering the Mapuche hunger strikes of 2008 and 2010 in Chile were studied, with particular attention to the campaign #nadaquecelebrar (nothing-to-celebrate) developed in 2010 during the celebration of the bicentenary of Chilean independence.

By focusing in the narratives selected by the ethnic media, with special attention to lexical selections to name key actors and events, the research analyzed the role of ethnic media not only in constructing a particular narrative to make sense of the Mapuche hunger strikes, but also a particular language to talk about the Mapuche cause and its social significance.

The narratives of the ethnic media were finally compared with the language used by mainstream printed media, to detangle the symbolic struggles over the process of naming. Particular attention was devoted to the different strategies of naming used by mainstream media, including processes of negative other-presentation and de-contextualization by the mainstream media (van Dijk, 2005).

The paper concludes analyzing how the ethnic media narratives can be analyzed as decolonial forms of knowledge (Mignolo, 2009), and their role in reconstructing a new Mapuche identity, a revitalized Mapuche identity within the context of a globalized society. Such strategies must be understood always in relation with the narratives of the mainstream media, as they are embedded in such struggles by symbolic power and challenges over the power of naming.

VALLEJO, ELIZABETH* (Pontifica Universidad Catolica del Peru, vallejo.er@pucp.edu.pe)

The Struggle Against Street Harassment in perú: New Media, Youth Feminism and International Political Advocacy

Paremos el Acoso Callejero –PAC (Let's stop street harassment) is a citizens' initiative created in 2012 in order to analyze and make visible the structures behind everyday violence towards women in Perú, such as catcalling and other forms of sexual harassment. This initiative started in Facebook and Twitter, and it also used DATEA, a platform that allows women to geo-reference their experiences. Even though PAC started in social media, it has had major impact in mass media in Latin America and it had influenced other initiatives in the region.

The PAC initiative has also got the involvement and cooperation of public bodies, including the Peruvian parliament. As part of the initiative, a national survey was conducted. The results were the main input for the making of the anti-harassment law that was discussed and approved in the Peruvian Parliament this year (2015). Peru has now the only anti-street harassment law in Latin America, a law that focuses on preventing the problem (the penalty section was not approved).

This presentation will explore the strategy and discourse of this feminist initiative and it will analyze the interaction between new media, mass media, supporters and policymakers to the achievement of the anti-harassment law. It will also discuss the reasons of broaden public support. Even though it was presented as a feminist initiative addressing a human rights issue, I think many people supported it because they understood it as a way to protect the honour and dignity of women. Peru is still a very conservative Catholic country and a traditional perspective on women remains. As this case shows in a paradoxical manner, sometimes behind a liberal cause a hidden a conservative support can be found.

VAN BOCHOVE, MARIANNE* (Erasmus University Rotterdam, vanbochove@bmg.eur.nl)

Positioning the Professional: New Roles of Paid and Unpaid Workers in Care and Social Services

Discussions on 'what counts' as a professional often center either on the essential characteristics of professionals (for instance, Sciulli mentions social esteem and fiduciary responsibilities as invariant qualities of professionals), or on the strategies of occupational groups that are not yet considered as professionals to be acknowledged as such (Noordegraaf and Schinkel, for example, studied how managers create associational and educational structures as professionalization strategies). While these essentialist and de-essentialized views are different in many ways, they have in common that they look at ('pure' or 'wannabe') professionals from a distance, focusing on the structural and institutional level. The approach I adopt in this paper relates to the second, more relativist and power-centered view on professionalism. However, it differs from both by taking a closer look at how professionalism is constructed on an everyday basis. The case study, care and social service provision in the Netherlands, is a strategic one. Nurses and social workers – who earlier put effort in acquiring a position as 'professionals' – are not only under pressure because of the standardization of their work and the dominance of managerialism; they also increasingly have to position themselves in relation to unpaid workers, particularly volunteers. In current care and social policies in the Netherlands, but also in other developed welfare states, volunteers are expected to take over some of the tasks of paid staff. While professional nurses and social workers are subject to de-professionalization, at the same time, volunteers are trained to become more and more 'professional'. Based on interviews with paid and unpaid workers in care and social services and observations of their everyday practices, I examine how 'the professional' is conceptualized and positioned in a context of increasing responsibilities for volunteers.

VAN DER GRAAF, ANNE* (Sciences Po, anne.vandergraaf@sciencespo.fr)

Negotiating Risk: The Relationship Between Financial Risk Management and Profit

This paper portrays the role of financial risk managers as negotiating risk with profit. Standard financial and economic theory put forward that when one wants more financial profit, more risk needs to be taken. Financial organisations have a similar division of labour, with risk management separated from the profit makers. In the social studies of finance, the focus has lied on profit making (instruments) in finance. While there has been research on financial risk, it has focused on the concept of risk. The roles of risk managers within large financial organisations remain understudied. Risk management activities could be conceptualised as negative to the profit centres, standing opposite to the risk takers, preventing risky behaviour, but ethnographic data shows a more dependent situation. Based on extensive immersion in both banking and insurance in the EU through two participant observations, network data of observation locations and 72 in-depth interviews, the paper shows that risk management is about negotiating with profit makers. The negotiating tools are influenced by the distance to the profit makers and regulatory pressure. With the help of regulatory legitimacy that is given to risk management in regulatory texts, risk management has obtained legitimacy in the organisation. However this legitimacy does not directly extend itself in a control over financial decisions. A decisive factor in being able to control the transactions is the distance to said profit makers. Being near (relational) gives risk management control over the decisions into the financial product transactions, while distances leave little control on specific transactions. In the negotiations with profit makers, risk managers move in a space between showing independence, loyalty to an organisation with profit making objectives and the possibility of being heard.

VAN DER HOEK, MILOU* (University of Lisbon, milou.vanderhoek@ics.ulisboa.pt)

Trans Health and Transitioning in Western Europe

My aim is to research how medical laws and protocols deal with the transition processes of trans people in Western Europe, more particularly in Portugal, the UK and the Netherlands. This inquiry will take place within the ERC funded project "TRANSRIGHTS - Gender citizenship and sexual rights in Europe".

Sociological research on transgender has shifted from a focus on psychiatric/medical discourse on the 'true' transsexual to performativity and later to transgression and subversiveness (Hird 2002). Research has focused greatly on identity formation and the deconstruction of the gender binary.

Namaste (2005) and Connell (2012) have argued this theorizing has often rendered the lived experiences and daily struggles of transgender people, and particularly transsexuals, invisible.

Transitioning is of major importance in a transsexual person's life (Prosser 1998). This is also true for others such as many transgender, genderqueer and cross-dressing people. Transitioning is crucial to a person's self-identity and has much practical implications for their life. National laws and medical protocols dealing with transitioning are of utmost importance for trans people as they depend on it for (required) diagnoses, access to hormonal, surgical or psychological treatments and related issues such as waiting lists and times.

According to Namaste (2005) a lot of research on transgender issues is rooted in Anglo-American imperialism. Vidal-Ortiz (2008) argues more comparative research is needed in other parts of the world. Since transitioning is key for many people, it is important not to forget the often more invisible categories in medical codification or in sociological research (e.g. trans with no desire to break the gender binary).

Following a comparative approach, I will critically analyze the laws and medical protocols in order to get a view of the functioning of the 'medical transition system' of Western Europe and the necessary implications it has on trans people´s lives.

VAN DER MERWE, SINTECHE* (University of Johannesburg, sinteche@gmail.com)

Getting the Employer to Understand the Importance of Employees' Work-Life Integration

My PhD research focused on strategies that 20 South African women, from different racial and class backgrounds, with MBA (Master of Business Administration) qualifications employed in order to gain and retain top management positions in Gauteng (South Africa). The problem statement of the study emphasised that about 43.9 % of South Africa's women are currently active in the labour market, 21.4% are employed as women executive managers, 17.1% are women directors and 9.1% are women CEOs and Board chairs (Dormehl, 2012:7). It is clear that women in top management are a minority within a minority and I hope that my study could help to address this problem. If South Africa is truly concerned with transformation and equality then surely there shouldn't be such a large gap between males and females in top management positions. This particular paper will discuss the strategies that these women employed in order to integrate their work and life responsibilities in order to maintain their current positions. This study can potentially serve to educate employers on how to provide more support to individuals who have responsibilities outside of their paid work. The image of the "ideal worker" as someone who is without responsibilities and who is fully committed to only the employer's needs (Lewis, Gambles & Rapoport 2007: 365) should actively be challenged, since it often ignores the realities that employees are faced with on a daily basis, for example, child care, caring for elderly parents or siblings, community engagement and responsibilities, to name but a few.

The Spiritual Significance of Xhosa Tobacco Pipe Smoking

In a number of cultures of the world, growing, smoking and using tobacco in other ways is still a significant part of spiritual practices and identity markers. The Xhosa people of South Africa use tobacco pipes as a means to communicate with their ancestors and plea for protection from bad spirits, as well as human solidarity since the ancestors can no longer smoke. In this paper I argue that smoking among the Xhosa people remained a religious practice even in cases when it is moved out of traditional rituals to the private sphere and everyday religion. Even under the pressure of antismoking campaigns the heritage of pipe smoking is kept strong among that Xhosa non-smokers, as they keep decorated pipes as a cultural marker.

I aim to show that traditional Xhosa pipe smoking as a well established custom acts as a right of passage for men and women and suggest different gendered types of smoking which is encouraged by society. The Xhosa heritage of smoking is still strongly practised among the village Xhosa people on a daily basis, where smoking is not a matter of addiction but a continual communication with the ancestors for protection. I suggest that Xhosa tobacco pipe smoking can be analysed as a religious practice and be a point of interest for the field of Material Religion due to the treatment of the pipe as a portable alter as well as the encoded messages in beadwork decorations of pipes and the symbolism of their shapes.

VAN KOPPEN, CHRISTIANUS* (Wageningen University, kris.vankoppen@wur.nl)

The Ontological Turn in Sociology and the Concept of Lifeworld: A Critical Reappraisal

Most, perhaps all, theories sprouting from the ontological or material turn can be understood as efforts of human sciences to position themselves vis-à-vis a material world by ways of thinking that neither dismiss the concepts and materializations of natural science, nor take them for granted. In other words: these theories aim to create vantage points from which natural science and technology can both be integrated in the social world, and criticized. In this respect, the concept of lifeworld is of interest because it represents an earlier attempt to do just that. The aim of this paper is to explore whether and how the concept of lifeworld can be used to criticize and enrich key notions of the ontological turn. It traces the concept of lifeworld from Husserl, via Schutz and Habermas, to Berger & Luckmann and constructivism, while bringing in kindred concepts from phenomenology (Merleau-Ponty, on the body-subject) and Foucault (on the modern episteme). It critically compares the recovered conceptualization of lifeworld with recent strands of STS and ontological politics. A conclusion is that a revised and actualized concept of lifeworld provides a useful road to tackling problems that these recent strands of thinking are concerned with.

Futures of Legal Governance in Globalization: The Case of Family Life

For many nation-states the regulation of family life and reproduction has been a central concern in the control of populations. More recently, processes of globalization and biotechnologization are redefining practices of reproduction

and modern parenthood – and are changing the ways in which states make legal sense of family and family life. Drawing upon sociological, anthropological and socio-legal studies – and working with a transdisciplinary framework that involves legal practitioners – this paper focuses on the changing landscape of reproductive governance in relation to processes of globalization and biotechnology. How to imagine society and legal practice in the field of family life that is increasingly affected by processes of geneticization and biomedicalization? And what kind of legal institution can better regulate family life in the age of globalization?

Scientific "truths" are active agents in producing public moralities and help carve out new technologies of governance. While there has been ample research in forensic science and criminology on how science affects legalities, there are only few studies on its ramifications in the field of reproductive legal governance. By analysing responses from immigration lawyers as well as family law lawyers on cases respectively involving family reunion and transnational surrogacy, my paper explores the relation between legitimacy and legal practice. I argue that the global regulation of family life depends more and more on the legitimacy of biology. Moreover, as I will demonstrate, the normalization of such a "biolegitimacy" in jurisprudence produces not only multiple legalities of family life but also the formation of genetic citizenship.

„before, They Were Passing Petitions Under the Tables, Now They Do It with Drugs" : Analysis of Construction of Dis/Continuity Between the Periods before and after the Revolution of 1989 in Czech Prose

The goal of this work is to explore how discontinuity, respectively continuity, is represented in prozaic texts referring to two legal Czechoslovak regimes which are historically separated by sequence of events generally known as The Velvet Revolution. The prozaic text, as I suppose, perfectly fits for studying phenomenon of historical dis/continuity in cultural context. Similarly to journalistic text or scientific paper, the prose provides us certain evidence about the world in which we live in. In contrast to these two styles, though, the prose is subjected to the rules of *artistic* – or *literary* – *field* which bears certain qualities regarding the communicated information. Prosaic text communicates particular historical experience using certain form of *phenomenological reduction* with which the author plays down phenomena considered as irrelevant and emphasizes phenomena considered as the most essential. The prism of literary field allows us also to see how a literary work reflects socio-historical phenomena in broader context – in which way the dis/continuity discourse circulates between cultural artifacts and social sphere.

My interest aims to the literary works which resonate in the society. For this purpose I choose my data sample according to the following criteria: 1/ Institutionalized and publicly well-recognized literary competitions, 2/ sales statistics, 3/ the way how particular literary pieces resonate in the public debate. To investigate the mechanism of mutual influencing between literature and social sphere, I concentrate on the public debate concerning literary field. I explore literary reviews, articles, online blogs, interviews and discussions. My research questions are: In which way is a historical experience represented within particular prozaic texts; How is this presentation related to the phenomenon of discontinuity of the year 1989 in Czechoslovakia. How this presentation constructs dis/continuity and which means of expression does it embrace for this purpose.

Politics Is Our Daily Bread: New Youth Political Subjectivity in Latin America

As a social generation in Latin America, young adult activists across the political spectrum work in an uncertain and unfixed context in which desired futures are articulated without an existing present to bridge to said future. This paper analyzes Venezuelan youth political subjectivity, the inner processes which people do to adapt to changing social, economic, cultural, and psychological circumstances. They respond with new formations of participation and political subjectivity. Our paper theorizes youth political subjectivity in Latin American through analysis of ethnographic data on Venezuelan young adults between 2008 and 2012, the height of popularity of Hugo Chávez's "Bolivarian Revolution." These data include sixty interviews, analysis of material culture, and visual data that include graffiti and online sociality.

Youth politics in Latin America increasingly cross previously assumed dichotomous categories: between culture and politics, individual and institutional, global and local, virtual and "real." We find that political subjectivity is increasingly decoupled from parties, unions, and the state. Global cultural repertoires intersect with localized and territorialized interests. Activism extends beyond traditional sites to new forms of action and among new places: marginalized sectors of urban and rural society, feminist and indigenous politics, sexuality, and cyberspace. Young adults simultaneously engage institutions while participating in deinstitutionalized, interactional politics. The paper concludes with consideration of how

Venezuelan youth political subjectivity illustrates the concept DIY citizenship suggested by global north youth studies but also differs due to the unique context created in-place.

Environmental Inequality, Collective Action Frames, and Social Theory: A View from Latin America

Latin America is going through a cycle of environmental protest. Many studies have been published describing socio-environmental controversies, mostly around the exploitation of natural resources—i.e. mining industry, energy production, genetically modified crops, and the pulp and paper industry. However, there has been little work done on the discursive aspects involved, which as we know are crucial for social movements in terms of framing the dispute, recruiting allies and sympathizers, and identifying political opportunities, among other aspects.

We intend to focus on a master frame on natural resources that has re-emerged at the current cycle of environmental protest, and its links, resonances, and tensions with discourses developed by social scientists—that is, theoretical frameworks.

We have already traced the origin of this Latin American master frame to the early decades of the twentieth century, and called it "neocolonial counter-discourse on natural resources," since it evokes colonial times in order to denounce a current neocolonial situation. The story suggested by this framing is one of extreme exploitation: key words recurrently used are "sacking", "pillage." It is an injustice framing that talks about environmental inequality, and may be considered proto-environmentalist. It is also Latin Americanist and antiimperialist. We have previously analyzed its presence in processes of frame alignment between social movements in different Latin American countries (Vara, 2013a and b).

In this presentation, we intend to analyze its dialogue with theoretical frameworks, such as those developed by Latin American social scientists—particularly the ones on "extractivism", "neo-extractivism," and "the commodities consensus" (Svampa, 2013); but also with more international ones, like "the curse of natural resources" thesis; and with Ulrich Beck's "global risk society" theory. We expect to make a contribution to the discussion on the dialogue between activism and academic work from a Latin American perspective.

VARGA, MONIKA* (Université de Luxembourg, vamonika@gmail.com)

Signes D'externalisation D'une Opération Mentale De Substitution Conceptuelle En Passant Du Catholicisme Au Protestantisme Pentecôtiste: Une Mentalité «Affichée»

Cette contribution vise à présenter une partie thématique de mon projet de recherche portant sur l'examen du comment la transformation de la mentalité corrélée à la conversion s'externalise en des artéfacts des néophytes pentecôtistes de type classique de la première génération.

Le croire des sujets de ma recherche, notamment de la première génération des pentecôtistes italiens dans la Grande Région (Luxembourg, la Lorraine, les Länder de Saar, de Rhénanie-Palatinat et la Wallonie), sans exception d'extraction catholique romaine, se désigne en tant qu'une « religion de la différence ». L'identité de foi recomposée, en « ostension » en espace social, est également « affichée » en espace matériel, se prêtant à proclamer les frontières différentiant les néophytes par rapport à la croyance antécédente. Cette génération a extériorisé cette opération mentale, en sus d'une conception particulière de leur génération de la Sainte Cène, également par l'opération de substitution des artéfacts de connotation religieuse dans leurs demeures privées.

Je propose une analyse autour des interrogations suivantes: Comment la nécessité subjective d'une opération de substitution d'objets de connotation religieuse s'explique-t-elle? Quelle est la particularité de la transformation de la mentalité des pentecôtistes de la première génération? Pouvons-nous relever une opération d'externalisation de l'émotion religieuse, des indices autobiographiques?

Cette investigation a demandé une approche qualitative et ethnographique, visuelle (entretiens approfondis, observation participante, recherche vidéo/photographique sur le terrain).

Fomentar La Empatía Para Formar Ingenieros Con Responsabilidad Social

Resumen

***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

El significado de una institución de educación superior, se fundamenta en el reconocimiento social que se le otorga para dar solución permanente a un problema particular de la organización social. Así, el vínculo de las instituciones de educación superior con la sociedad, se establece a través de los profesionistas que forma. Los perfiles profesionales, se modifican paulatinamente, en respuesta a las demandas del sector social y laboral, incorporando nuevos elementos con la finalidad de mantener vigente su función social.

La formación de ingenieros en los tecnológicos, ahora agrupados en el Tecnológico Nacional de México, ha incorporado a sus planes de estudio, asignaturas que permiten abordar de manera explícita, el compromiso social, la ética y la responsabilidad social. Este logro que ha permitido sacar del currículum oculto la formación en valores, enfrenta diversos obstáculos derivados de un contexto social y económico complejo, dominado por las desigualdades sociales, el descrédito de las instituciones, la corrupción, un mercado laboral precario y un clima de violencia.

En respuesta muchos estudiantes, asumen conductas de indolencia, apatía e incredulidad respecto a las posibilidades de un cambio positivo en el entorno inmediato y global, existe una escasa conciencia respecto a las consecuencias de su conducta en su medio ambiente y hacia otras personas. Se contradicen así, las funciones sociales de la educación superior pública para crear una conciencia crítica, promover actitudes solidarias y participación ciudadana.

Se presentan las estrategias utilizadas durante el proceso formativo de las/os estudiantes de ingeniería, para la adquisición de competencias éticas y solidarias que apoyan la responsabilidad social, a través de actividades que desarrollan la empatía, la sensibilización hacia las problemáticas sociales y conductas responsables con su entorno inmediato. Son un llamado a la concientización, a tomar acción y abandonar la simulación escolar.

Land Use and Legitimacy of State the Institutions

Social relationships are always in a territory, and always also this affects the construction of them, establishing a reciprocal relationship. Today more than never the study of this link is necessary. Given that have emerged worldwide social-territorial movements whose demands beyond being against global capitalism, are related to self-management, self-organization, local demands and in times crisis even appear against the state.

This work attempts to show how the "spatial segregation" and "territorial concentration of power" have been naturalized in urban settings, despite obvious fragmentation inequality and violence that produces and the impact over that this have over the "legitimation of social order current". It is a preliminary analysis of the interview results applied to Chilean's elite during the year 2015.

Why Chile would be interesting how case of study? Because this country is the paradigm of the neoliberalism around the world. In the eighties, Chile implemented the recipe of the Structural, adjustment from the World Bank literally. That is even before of John Williamsons and his systematization of the concept "Washington Consensus", it mean: "Fiscal discipline; decrease public expenditure; tax reform; financial liberalization; deregulation of exchange rates; trade liberalization; foreign direct investment; privatization; and property rights" (Auty & Toye, 1996), with attendant consequences for the urban space. It means increase of the urban segregation and the inequalities in general. Chile is among the 20 countries with the worst income distribution in the world, a situation that has not changed in the last 40 years (Castillo, 2012)).

Sacred and Segregated: Women of the Fourth Age in Turkey

Ageing is a biological, social and psychological process. Growing old is precious however it can be traumatic in some cases.The reason behind this is, being elderly may be accompanied by disabilities and chronic diseases, increasing demands for health and social services. Most of the elderly people tend to feel themselves "alone", "useless" and "excluded from society" quiet the contrary of the fancy promises of active ageing discourse. Those negative feelings cause them to think that they have lost their independence of their lives. In addition to that the most vulnerable group of elderly people is the fourth age. In Turkey, as in many other countries, in this age group, women outnumber men. The majority of the fourth age women are widowed with poor social, economic and psychological consequence. This paper has two aims. Firstly to discuss the interrelationship between gender inequality and the fourth age in Turkey. Secondly to underline some of the social, economic and cultural difficulties if not impossibilities of active ageing for many women of the fourth age in Turkey.

The Dance Coming from the Streets: Understanding Recognition and Consecration in Independent Artistic Contexts

In this paper, we intend to exercise the approach and analytical framework developed in a PhD research about *independence* in artistic fields with a new object. After analyzing independent filmmakers and their positioning strategies in Brazilian cinema field, we aim at another kind of independent group: the dancers of the so-called *street dance* circuit in São Paulo city. One of our main research interests is to comprehend the construction of *consecration* in such contexts, where recognition itself is usually seen as a form of institutionalization that threatens the condition of *independent*.

Relying mainly on Bourdieusian theory, but also bringing contributions of Raymond Williams (in his observation of dissident formations) and Howard Becker (in his considerations about *mavericks* and *outsiders* in art worlds), we bring empirical data to analyze the *logic of creation of artistic value* in street dance context, the borders that differentiate *good* and *bad work,* as well as the main ways of legitimation of dancers.

São Paulo represents a considerably established context for contemporary dance in its "erudite" form, mainly made by dancers with university degrees. Since at least 20 years, the context of street dance has been flourishing through independent ways, mainly from the outskirts of the city, and mainly under a political orientation towards the appropriation of public space. This process, even being apart from the whole universe of the "official" contemporary dance and the "official" forms of public support to dance, resulted in a myriad of styles, festivals and awards, that made this production visible to the larger dance field – in a way that policymakers themselves begin to question if cultural policies really takes into account the diversity of contemporary dance forms of the city. We focus on understanding the parameters of valuation and ways of recognition around which this context has developed.

Internet Memes in Designing of New Meanings: Structural Transformations and Social Interpretations

In the report the dual nature of an Internet meme as a mechanism of creation and functioning of a cultural product is considered. On the one hand, the Internet meme is an element of the industry of culture (because of standardization of the images and the characters, absence of authorship, mass distribution and availability to wide audience thanks to the Internet). On the other hand, the creation of Internet memes includes elements of cultural creativity (exclusivity, non-trivial mix of images in a collage, innovative nature of semantic connotations). The analysis of Internet memes is particularly interesting for sociologists because it allows to see how the new understanding of social events is born and how these new meanings and valuations disperse on mass audience.

The report presents the results of an empirical study of structural transformation of Internet memes as the process of the emergence of new meanings. The structure of an Internet meme is considered as the iconic system, which includes «core», the elements of «periphery», «background» and also various proportions of these elements. Emergence of new meanings is treated as the result of various transformations of this iconic system (transformation of a core, transformation of a background, merge of cores, mutual strengthening of cores, complementarity of a cores and background, etc.)

The authors offer a sociological interpretation of the structural transformation of Internet memes. An analysis of the most popular memes shows how social event affects the structural transformation of Internet memes, and how new versions of memes change the attitude to events that took place.

Enabling Social Networks a Response to Constrained Individual Agency Approaches to Long Term Condition Management Under Neo-Liberalism

Constrained individual agency forms the backdrop to contemporary approaches to managing illness. This is demonstrated in the increasing adoption of systems of self-care support for long term conditions which focus on enhancing individual, competencies, skills, behaviour and lifestyle changes to the exclusions of networked and structural and socio-economic aspects implicated in the population's ability to self- manage. A potential counter to this is a re-focus in theory policy and practice on the collective power of networks to connect to and mobilise resources. Social networks and capital are key constituents permitting individuals

to make choices and relevant for understanding flows of trust, reciprocity, altruism, social participation that underpin collective action and mutual support. They are also associated with improved health and well-being through the mechanism of contagion, collective efficacy navigation and negotiation.

In this paper we argue that the construct of social network type offers a way of capturing the inter-personal environment (Shiovitz-Ezra and Litwin 2012) that counters the constraints of individualised actions and agency. Drawing on a study conducted in six EU countries, UK, Netherlands, Spain, Bulgaria, Greece, and Norway, with 1,800 respondents, we identified five network types: family-centred, family supported, isolated, diverse-weak ties, diverse-friends. We show how diverse networks are likely to promote high levels of informational and emotional support and self-management capacity, while family-centred networks report higher levels of happiness and well-being. We use the findings from this study to analyse how network types are important constructs in understanding the capacity and constraints of individuals to manage chronic illness and the how engagement with a wide range of links including to community group memberships, friends, and acquaintances are facilitators of managing illness and to accessing high levels of network support.

Neoliberalism and the Political and Economic Embedding of the Experience of Diabetes Chronic Illness Management in Bulgaria and the United Kingdom

The shift from social democratic to a neoliberal consensus within modern welfare capitalist states has been characterised by a growing emphasis on individual responsibility, consumer choice, and market rationality, and associated with growing social inequalities. There is variation in how these macro level processes have played out across nation-states and shaped the contexts within which long-term conditions are managed.

Building on Mol's distinction between logics of care and choice (2006) we explore the interaction of macro and micro level processes and investigate the different articulations of neoliberalism in Bulgaria and the UK in order to illuminate the new illness management landscapes that have emerged as a consequence of contemporary neoliberal shifts.

In biographical interviews conducted with people with diabetes, respondents discussed their experiences of chronic illness management in terms of *struggling with diet*; d*iabetes as a personal failure; i*ntegrating illness management and valued activities; trust and trustworthiness of the healthcare system*. While respondents in both countries faced challenges related to failures of consumer and healthcare markets, there were differences in how these markets were regulated, what stakeholder and interest coalitions emerged, and how users navigated markets, and experienced, expected, and adapted to market failures in their everyday chronic illness management practices. We argue that UK and Bulgarian articulations of neoliberalism can be described as logic of managed choice and logic of unmanaged consumerism.

Making Institutional Change in Small Ways: Introducing Institutional Ethnography to First Generation University Students

Undergraduate students in the United States attending public universities seldom see themselves as change agents in their community or in their work setting. I teach at a large public university where the majority of students are the first generation in their families to attend college, are working fulltime, and often are supporting families. In the last several years I have been experimenting with a course in institutional ethnography primarily aimed at this audience. Beginning from George Smith's article, "Political Activist as Ethnographer," I have worked to show students how the research practices in IE unfold for them "how things actually happen as they do" and how their own investigations can provide an empirical basis and strategy for reorganizing relations with the aim of transforming them. In this presentation I discuss a number of student projects and the ways in which their IE research and subsequent activism lead to small organizational changes on behalf of those outside ruling relations

Linkages Between Political Orientations and Religious Tolerance in Russia

My sociological analysis was focused on the finding relationships between political practice and religious tolerance. Political orientations are usually an important indicator of people's trust to political authority and legitimization of political decisions, especially in crisis periods. Strengthening trend of religious values in Russia changes the context and conditions in which religious tolerance could be preserved. But the problem of readiness of Russians to this transformation of their worldview needs more profound analysis. Rising of the affiliation with religion didn't lead Russian people to more intensive relations with church and religious practices. From one side we reveal the signs of increasing interest to religious beliefs and traditions in the political sphere. From the other side the paper focuses on the contradictions between levels of nominal tolerance and the real observation of inter-confessional relations. Analyzing such contradictions is necessary to assess the level of tolerance in Russian society for a better understanding of the future development of political situation. The case study of political orientations of young Catholics in Moscow allowed a specific example to analyze how religious tolerance is turning into a political loyalty in society. The methods which have been selected and used in my research were: secondary analysis of surveys of poll centers: Russian Public Opinion Research Center, Russian Fond of Public Opinion, Pew Research Center (International Social Survey Programme) and others. The data were obtained from surveys that included questions on religion, face to face and on line interviews. Analyzing these materials, I investigated haw religious tolerance impacts on political culture of Russian people. My findings helped to formulate some assumptions haw use these linkages in politics. The study of this problem is rather important for Russia. My paper could provide some thoughts on this subject and help to elaborate scenarios of preferable future for inter-confessional relations.

The Livability of Modernity

Long-term macro-social development involves both positive and negative effects on human happiness. Sociologists tend to emphasize the negative effects and turn a blind eye to data showing that the level of happiness has gone up during the proces of modernization while inequality of happiness has gone down. The latest trend data are presented and possible explanations for this positive development are explored. On that basis it is predicted that, in the future, ongoing societal modernization will also bring greater happiness for a greater number of humans.

Conga Va Vs. Conga No Va: A Case Study on the Pervasiveness of Poverty in Cajamarca, Peru

Habermas reflected on the importance of proper communication, where social debate and openness to include diverse viewpoints, would be beneficial in a democratic society. An interesting contrasting debate was seen during the intense demonstrations in favor and oppose to *Conga*, a mining project in Cajamarca, Peru. The motives defended by those in favor of the project, the government and transnational corporations, were the development and economic progress of this impoverished region. The main argument defended by those opposing the project, NGOs and region leaders, was the protection of the environment. The symbols of these two sides depicted gold in one side, and water on the other; both, sustaining contrasting moral choices of economic progress vs protecting the environment.

As massive demonstrations made headlines accusing police brutality, the level of organization of these resistance groups suggested a well-planned scheme that led to investigate possible associations with organizations seeking to destabilize the government. Balancing the controversy, known cases of environmental pol-

lution pointing to the actions of Newmont Corporation attracted attention from international NGOs and local sympathizers.

This study analyzes both arguments identifying their motives, connecting these to the broader historical and economic context. This content analysis examines online news reports from *Radio Programas del Peru* (2011 to 2012); accounts of international reactions; the Environmental Impact Assessment of Conga; and the historical impact of mining in the region.

The importance of this study is the understanding of the relevant imbalance among the actors that take part in the triangulation of this case. The great majority of people in Cajamarca are historically isolated. In this region, blessed by abundant minerals and natural resources, the levels of illiteracy are high. Regardless of the arguments presented on both sides, a third fundamentally chronic and persistent issue comes afloat: the pervasiveness of poverty inherited since colonial times.

Multiple Strategies to Challenge Gender Inequality within Muslim Societies

Religious beliefs about complementary gendered roles that contribute to unequal gender relations in Muslim tradition have been articulated within Islamic framework. Men's lack of comprehension of religious moral principles and women's exclusion from the Islamic knowledge have paved the way to justify male authority and domination in all aspects of life. Orthodox male-interpretations of religious texts have considerably contributed to injustice, violence, and distress to Muslim women's lives throughout the centuries. On the other hand, the exported western and Euro-centric feminist theories are often incompatible with the historical experiences of local women to deal with gender issues.

One of the notable achievements of progressive Islamic discourse in the recent decades has been changes in the main theoretical/methodological approaches. Muslim female scholars have embarked on using Islam and religious texts as a framework to promote women's rights and gender equality in Muslim contexts. Through constructive and critical use of western feminist thought and concepts, they re-examine religious texts with gender conscious. At the same time, by using Islamic concepts such as justice and equality as basis of their theory and progressive Qur'anic interpretations, they contest the conservative gender discriminations and unequal treatment of women wrongly associated with Islam.

In this paper, I will look at the work of some of female Muslim scholars, who engage with the liberation theology; and some women's organisations. These scholars and organisations actively use Islamic ethical framework, as new discursive patterns in their response to misinterpretations and literal reading of the religious text with regard to gender issues, and the demystification of allegedly endorsed patriarchal modes of gender relations in the name of Islam.

They embrace religious identity and feminist consciousness and challenge culturally imposed gender relations and meanings through advocating alternative religious discourses that are compatible with gender equality and advocate values and rights.

VELÁZQUEZ LEYER, RICARDO* (University of Bath, rvleyer@gmail.com)

Social Policy Reforms in Brazil and Mexico

During the last decades Latin America has become the world's social policy laboratory. Many recent innovations in the field have been pioneered and tested in the region and are promoted by international organisations as optimal tools for social protection. Policy innovations have expanded social policy to groups of the population historically excluded.

Brazil and Mexico have embarked on similar expansion processes of their social policy systems. Throughout most of the twentieth century social policy in both countries was based on social insurance systems of limited coverage to urban formal sector workers and their families. In recent decades, social policy has been expanded to unprecedented levels. However, outcomes of expansion processes differ substantially between the two countries. Whilst Brazil has registered important improvements in its social indicators, Mexico falls among the few Latin American countries where indicators like poverty and inequality rates have not decreased in a substantial way. This article explores the causes of the different results obtained from social policy reforms in the two countries, the largest in the region, by estimating the impact of changes in their institutional design at the household level.

The article applies the 'model families' approach to map each country's welfare system, covering all core social policy areas; identify the predominant logic followed in the design of policy changes, e.g. universal or selective; and analyse its impact on different sectors of the population. Findings establish the patterns of redistribution that have emerged from expansion processes, the potential of social policy to raise and keep families above poverty threshold, and the achieve-

ments and limitations in the design of social policy innovations introduced in Latin America.

VELIKAYA, NATALIYA* (Russian State University for the Humanities, natalivelikaya@gmail.com)

Transformation of LG in Russia and Participation of Citizens in Solving Local Problems in the Context of Standards of European Council.

The paper is devoted to the features of local authority development in Russia.

We consider organizational forms of LG, territorial grounds of LG, political participating, activity of local elite and real role of local communities in political process. Analyzing the evaluation of local government we pay attention to the context of reforms and to the evaluating of transit regime. We describe shortly reforms of LG during last 20 years, paying more attention to the last changes, connected with unifying and centralizing system of LG.

Mainly Reforming of LG have been done according European principles of local governing, but real practice shows us that kind of centralization and strengthening of power vertical even it was not in the line of European Charter. Federal juridical regulation of LG was too strict. Experts, representatives of LG have the same opinion about norms of last Federal Law which are too superfluous, don't count with territorial peculiarities and restrict the freedom of regional and local power. This fact can be confirmed by the great number of amendments to this law which tried to adopt it to the real conditions.

Developing of self governing and local communities is connected directly with the democratization of political regimes. Municipal authorities are still organized according the principles of hierarchy.

We point out some factors that determine the key features of municipal territorial practices: 1) social structure and mentality of local community and elites; 2) regime of cooperation between regional and municipal power; 3) dominating system of settlement. We also estimate some risks of centralization and restricting direct elections and some prospects of different institutes of civil society and new form of local activities.

Public Policies on Big Data and Open Data: Ibge, a Sociocybernetical Approach

La manera como se produce y difunde la información en la sociedad actual es muy distinta de como era hace pocos años. Las tecnologías disponibles permiten que sea posible producir y almacenar un inmenso volumen y variedad de datos en una velocidad y escala cada vez más grandes. El desarrollo de la sociedad en nuestros días no puede pensarse sin tener en cuenta la influencia de la cibernética. Los gobiernos, organizaciones y ciudadanos cuentan con plataformas informáticas que les permiten interactuar en escala global, haciendo que todos sean, a la vez, productores activos y receptores masivos de información. El reto es generar información de valor a partir de esa enorme cantidad de datos. Los institutos oficiales de producción de estadísticas son instituciones que suelen tener históricamente un papel relevante en la producción y diseminación de gran volumen de datos. Así, esa *expertise* institucional les daría, en teoría, una ventaja competitiva en el nuevo mundo de la información global.

En este trabajo, desde un enfoque sociocibernético, se discute como son esos procesos y si eso de hecho ocurre, proponiendo un estudio de caso. El IBGE - Instituto Brasileño de Geografía y Estadística - busca estrategias para adaptarse al nuevo escenario y emprende acciones para su inserción positiva en la actual realidad. El análisis de las acciones de IBGE pretende contribuir a la discusión sobre el rol y el desempeño de las instituciones públicas en este nuevo y cambiante sistema social. Para ello este trabajo se divide en cinco apartados, incluyendo introducción y conclusiones.

VELOSO, DIANA THERESE* (De La Salle University, dmveloso1@gmail.com)

Armed Conflict, Religious Extremism, and the Normalization of Violence: The Abu Sayyaf in Perspective

This paper examines how the Islamic faith has been used to justify the use of violence on the part of the Abu Sayyaf Group (ASG), an extremist group operating primarily in the southern Philippines. The researcher makes the case that the armed struggle of the Abu Sayyaf has not occurred in a vacuum and is not solely motivated by the desire for profit; rather, the conflict is rooted in the historical use of religion for violent means, deep-seated tensions between the Philippine government and Muslim citizens, and the Muslim separatist movement in the

country. This paper provides a historical perspective on the clashes between the Philippine government and Muslims and the emergence of the Abu Sayyaf as a breakaway faction of prior separatist movements in the country. Aside from undertaking content analysis of local and international articles about the Abu Sayyaf and its activities, the researcher utilizes interviews with academics, non-government organizations, and civilians affected by acts of violence perpetrated by the ASG. The researcher's theoretical framework is based on Juergensmeyer's cultural perspective on religious extremism, which underscores the distinctive world views and moral justifications of religious militant activists, and the communities and networks behind acts of violence, rather than the "terrorists" who commit them. Juergensmeyer's framework is used as a point of reference in analyzing the relationship between Islamic causes and the militancy of the Abu Sayyaf, and in assessing how the conditions that produce religious violence apply to the Abu Sayyaf. In looking beyond the stereotype of the Abu Sayyaf as a group of armed bandits sowing terror for its own sake, and in illuminating the ideas, communities of support, and social and political contexts underlying the group's activities, this paper aims to promote a new understanding of religious extremism in the Philippine context.

Gender-Based Violence and Human Rights in (Post)Conflict Zones: The Narratives of Internally Displaced Persons in Zamboanga City

This paper presents the findings of a research project on the experiences of internally displaced persons (IDPs) who resided at the Joaquin F. Enriquez Grandstand in Zamboanga City, and who have since relocated to other evacuation sites and transitory sites in the city. Focusing on the experiences of people displaced by the September 2013 Zamboanga Siege, the researcher examines women's and men's heightened risks for gender-based violence in conflict zones and the ongoing challenges in the promotion of their human rights in post-conflict settings. The researcher examines the dynamics of violence, conflict, and war from a gendered perspective and illuminates the extent to which gender-based violence exists on a continuum from personal, to community based and/or state-sponsored violence during war and conflict. Drawing upon interviews and focus group discussions with residents and community workers, the researcher discusses the trends and nuances in women's and men's experiences of private and community and/or state-sponsored violence and the challenges in the promotion of IDPs' human rights. The researcher exposes the numerous incidences of violence and human rights violations experienced by IDPs during their displacement and prolonged stay at the Grandstand, the vulnerability of women and children to domestic violence and trafficking, and the attempts to recruit men into extremist groups. The researcher also highlights the links between racial, ethnic, gender, and social class inequality in the Philippines and the vulnerability of IDPs due to dismal living conditions, their struggles for dignity and subsistence, the absence of normalization in their lives nearly two years after the siege, and neglect in the provision of decent housing and other basic needs due to limited interventions by government authorities. This paper highlights the intersections between private and public violence, the human rights issues confronting IDPs in Zamboanga City, and the local and international responses to their situation.

Professionalisation of Research: Organisational Hybridisation and Professional Trajectories and Identities

The present paper develops an approach on the professionalisation of research in Portugal in different organisational contexts: research laboratories and companies. In the first ones, it discusses the increasingly precarious working conditions and career instability, translated into a gradual deterioration of the research career which co-exists with the growing difficulty of accessing a stable professional situation in the labour markets and, hence, having expectations for career advancement. Inside companies, particularly in the domain of Research and Development (R&D) activities, the analysis focus on highly qualified professionals with non precarious situations, whose activities demands the development of research procedures, albeit with different configurations of the first ones, as the last ones are oriented to the application of new or renewed knowledge to technological solutions (applied research). Both organizational contexts share two characteristics: i) research activities are developed within science and technology projects (S&T), developed in temporary work teams; ii) research activities, with different configurations, is a common parameter, promoting a reflection on the professionalisation of research. Understanding these professionalisation trends, requires an analysis of: the professional careers and their objective settings, external and internal to the organisational context; work content; and professional identities. The analysis is part of a research on science and innovation networks in which it was adopted an ethnographic approach in two companies in the area of Information and Communication Technologies (ICT) and the energy sector in and two research laboratories in the fields of biology and chemistry. Seven S&T projects were studied, including interviews, documentary analysis and direct observation.

What's in the Cracks Between Concepts? Meeting Bourdieu and Laclau-Mouffe for a Multi-Level Analysis of Urban Conflicts

How can we build an integrative methodological frame for looking at complex social and political conflicts embedded in the multi-level structures of modern society, yet in the heightened fluidity of its neoliberal phase? Can we hold in view both structure and agency, both discourse and subject; how can we tease out the mutual embeddedness and mutual constituting of these entities during social action? I am attempting to approach these questions by critical rethinking and cross-pollination between Bourdieu's field & habitus theory and the Essex School discourse theory. My work is grounded empirically in a 3-year anthropological case-study of a conflict between urban communities, which is embedded in (and triggering) a project for urban development, in its turn engendered in a number of institutional and discursive environments. An urban project forces different levels of the urban social into contact and into a competition over the interpretation of a 'problem' to be solved.

Unlike discourse theory, my analysis looks at conflicts not merely as antagonism of discursive systems trying to colonise more discursive elements, or political subjects trying to forge alliances through chains of equivalence, but as a struggle between whole structured fields that bring along their inner social complexity, dynamics and power structures. On the other hand the underlying principles of Laclau & Mouffe's discourse theory help unsettle the rather static structuralist conceptual apparatus of Bourdieu. It gives us instruments to look at the in-between space of heteronomy that Bourdieu never seriously approached, and to postulate it as the most significant site of contention in a contemporary society.

Further, the question can be approached how a complex urban (or political) project may endure as 'one' and not fall apart in the polymorphic context of diversity of positions and conflicting interests constituting the very institutional and social 'structure'.

New Religions in Montesacro

This work shows the results of an ethnographic study performed by a team of researchers that has as focus the settlement of some families inside an Italian mountain community that we would call Montesacro. These new inhabitants belongs to an international new religious movement (NRM) originating from the United States, classifiable as psychosect with *millenarism* and *new age* features (Pace 1997). The typical message of joy and positivity has been replaced by a catastrophic and frightening dialectic about forthcoming doom. The Leader identified this place as one of the few that will be saved from the cataclysm announced at the end of December 2012. Focus of the research: the problematic system of relations between the NRM, the local Catholic Church, the entrenched Islamic community and the local politics. The presence of the Islamic community is a secondary effect of the economic migrations in the last decades. This has created some frictions with locals, due the insufficient occupational resources in the area. The NMR, drove by his belief system, invested greatly on the territory, turning back on the productive tissue and breathing new life in the local market. In particular many contruction companies had been activated for building and modify real estates by needs of the small community, mainly needs of protection and self-sufficiency (underground bunkers, well, etc...). Different features of the two religious systems had brought local population to develop a different approach toward the believers, affected by the presence of actors such Lega Nord (xenophobic Italian party) able to influence public debate negatively for Islamic immigrates. The study has been conducted with a non-continuous presence during two years (Summer 2011-Autumn 2013). One of the researcher has performed covert observation inside the cult, then other two researcher started a participant observation that has allowed a direct contact with locals.

Comodificación y Fetichización: Desafíos Para El Estudio Del Racismo En El Chile Neoliberal.

El racismo en América Latina está moldeado por los procesos de colonización y posterior formación de los Estados nacionales, así como por las políticas multiculturales y los nuevos desafíos de un neoliberalismo avasallador. Esta genealogía –articulada de forma singular en cada territorio- genera y entronca diferencias raciales, étnicas, de género, de clase y de sexualidades. Sin embargo, hoy tenemos un desafío particular: comprender el racismo y la alteridad étnica en un contexto de masiva comodificación de los cuerpos de hombres y mujeres indígenas, afro-descendientes e inmigrantes en el marco de la extensión de políticas neoliberales, el consumo como esquema de distinción, la intensificación del movimiento de población migrante latinoamericana al interior del territorio, y un boom del turismo místico y cultural. Así, debemos atender no sólo a los procesos de alterización y exclusión social de estos grupos, sino también a su producción como mercancía exotizada. Asimismo, cabe preguntarnos: ¿cómo impactan estos procesos al imaginario de la blanquitud en Chile?

Impulsada por los estudios en las ciencias sociales sobre racismo e identidades nacionales de los último 20 años (Wade, 1997; Gutiérrez, 2004; Stoler, 2013; Briones 2005; Hale 2002) y consignando la relativa escasez de investigaciones de este tipo en la academia chilena, esta ponencia tiene como objetivo reflexionar en torno al racismo, poniendo especial énfasis en los diversos métodos, fuentes y formas de análisis que empleamos en nuestras investigaciones, incluyendo métodos interpretativos, análisis del discurso, trabajo etnográfico y análisis literario. A partir de tres casos de estudio (cocina/turismo "indígena", trabajadoras domésticas inmigrantes, representación político-religiosa de "la mujer mapuche") compararemos formas de estudiar construcciones ambivalentes de la raza-etnia a partir de las cuales el 'otro' es deseado y rechazado a la vez, reflexionando simultáneamente sobre los efectos de esta ambivalencia la construcción de la blanquitud en Chile.

VERDIER, MARGOT* (SOPHIAPOL Universite Nanterre Paris-Ouest, verdiermargot@gmail.com)

"Against the Airport and Its World". Autonomies at the Zad Notre-Dame-Des-Landes.

La période contemporaine est marquée par l'influence de l'« *individualisme de la différenciation* » (Le Bart, 2008) sur les modèles d›organisation des mouvements sociaux. Ce « *droit pour chacun de se définir sur la base de ce qui le différencie des autres* » (Ibid) s›apparente au désir du Sujet que Touraine interprétait comme « *la volonté de l'individu d'être acteur de sa propre existence* » (2005). A cette appréhension émancipatrice de la notion d›autonomie s›oppose l›injonction néo-libérale qui participe du développement des techniques individualisées du contrôle social. L›un des enjeux des luttes sociales est donc de se réapproprier le sens de ce concept ambivalent et de lui donner corps à travers la mise en place de pratiques et de structures permettant sa réalisation.

En France, la ZAD de Notre-Dame-des-Landes (NDDL), auto-proclamée *Zone d'autonomie définitive*, est à l'origine d'un mouvement d'opposition sans précédent contre les *Grands Projets Inutiles*. Ses militants entendent lutter contre la construction d'un aéroport international, mais aussi et surtout contre « *le monde qui va avec* ». Ils opposent ainsi à la « *colonisation de nos vies* » par les « *aménageurs* » (L›aéroport qui cache la forêt, septembre 2012), une expérimentation individuelle et collective visant à lutter contre toutes les formes de dominations. Mais cette « *autonomie ça veut dire plusieurs choses* » (Jean, 20 mai 2013). Quels sens sont attribués à cette notion et comment sont-ils mobilisés dans la lutte contre l›aéroport et son monde ? En nous appuyant sur l›enquête ethnographique que nous y avons mené pendant un an, nous interrogeons les discours et les pratiques se revendiquant d›une recherche d›autonomie individuelle et collective. Nous nous intéressons plus particulièrement aux rapports qu›ils entretiennent avec la valorisation de l›expérience et de la réflexivité considérées comme les remparts contre la reproduction des relations d›autorité.

The Transgression of the Normative Frame. the Reception of Individualization and the Relationship to Formal Rules in Two French Squats.

The renewal of the practice of squatting goes along with the mutations of contemporary social movements. These heterotopias open spaces to experiment original forms of social organization, adapted to the evolutions of political involvement. They thus allow to question the receptions of the process of individualization which is currently characterized by the subjectivization of the relationships with collective norms and the valuation of individual autonomy.

The controversy on the relationships squats should have with local authorities divides the french squatting movement since the 80's. The appearance, in 2001, of the "*Conventions of Precarious Occupation*" led to a process of institutionalization that conducted to the legalization of tens of occupations, mostly in the artistic squatting scene. The anti-authoritarian squats oppose to what they consider as a "*normalization*", the necessity of a transgressive, experimental and informal dynamic, the only way to maintain a permanent questioning of domination relationships and to free the expression of individual subjectivity ("*Interface sabote nos squats*", 2003).

This communication analyzes the relationship squatters maintain with formal rules according to their political positions, both in their representations and practices. I compare the results of two ethnographic fieldworks I conducted for two years in the ZAD of Notre-Dame-des-Landes, an anti-authoritarian occupation and in the Shakirail in Paris, an artistic legalized squat which is based on a hybridization of anti-authoritarian and liberal principles. Which types of behaviors are formalized and which processes lead to this formalization? How rules can be called in question? By focusing on the conditions and procedures that lead to the formalization of rules of behavior and to its critic, I interrogate the way each group deals with the antinomy that unites individual freedom and the necessities of collective life (Masnata, 2000).

VERDUZCO, GUSTAVO* (El Colegio de Mexico, gverduz@colmex.mx)

Migration Policies and Migratory Facts in Mexico: A Vision for the 2020'S

Mexico as a nation has accompanied the economic bonanza of the United States for several times in their mutual history. This is its fate for being a poorer country and the neighbor of the richest country in the planet, however migration flows from Mexico have experienced sharp variations depending on the circumstances. Are there lessons to learn? The author offers some interpretations but other phenomena like transmigration mainly of Central American people and the deportation of hundreds of thousands of undocumented Mexicans complement the picture especially for recent times: flows going in, going out and flows crossing by but why?; what forces are behind? The author presents some explanations which have to do not only with economic variables but also with state policies in the U.S., Mexico and Central America.

In view of the above facts and circumstances, the author offers his vision for this region in the 2020's He points out to several hypotheses based on demographic and socioeconomic trends without displacing the fact that the two diverse countries share a common border.

Changing from Local-National to Global: Cultural Consumption and Youth Festivals in Romania

In this paper we analyzed how the cultural consumption related to youth festivals changed in Romania from the local and national specific taste to the consumption characterized by global patterns, between year 2000 and 2005. We looked for the typical recreational activities of young people and how the various activities fit? What kind of cultural consumption patterns emerge in relation to leisure time spending and how do these change?

Researches focusing on this issue point out that young people from Romania because of the specific socio-historical background, some cultural and civilization factors (cultural and historical traditions: traditional male-female roles, religion, etc.) are slowing down the change of youth period (young people sustain a shortened youth stage built on late personal independence) (Gábor-Veres 2011; Voicu, 2008-2009 Bartis2009; Veress, 2011).

The empirical data sources are the surveys conducted at Peninsula Festival in Târgu Mureş between 2006-2012 and Electric Castle Festival Bontida/Cluj. In our opinion festivals provide a great opportunity to get to know about in the scenario of cultural and leisure consumption of youngsters, (Ercsei, 2007, 2009; Veres, 2007).

Our analysis showed that young people, coming from urban areas, mainly from municipalities, are students or have higher education degrees, their material situation is higher than the national average. They could be identified as the youngsters of the urban middle-class, characterized by a great level of personal autonomy and by a specific, varied and intensive, leisure time consumption, which is shown also by the comparison of the eight cultural consumption profiles identified in our analyzes. We can conclude that since 2005 festivals both the composition of the participants and the cultural consumption preferences changed.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The preference for the local/national styles decreased, and even the festivals with a traditional/local/national cultural offer ended or transformed to more global styles in cultural offers.

VERES, VALER* (Babes-Bolyai University Cluj / HAS - CSS Minority Research Institute, veresv@socasis.ubbcluj.ro)

Social Inequalities in Romania and the Educational Expansion

The goal of the paper is to find out the effect of educational expansion on social and educational inequalities, in intersection with the ethnic origin, gender and the type of locality (rural/urban) in Romania (1992 – 2011). Data sources: Romanian Census data (1992, 2002, 2011), and survey on Student population in Cluj Napoca (2015, held by Babes-Bolyai University, supported by Bolyai Scholarship of HAS).

For theoretical background, we used Breen and Goldthorpe (2001), who pointed out that the role of the parents' social status did not decrease in the process of achieving a status. Moreover, Shavit and Blossfeld (1993) showed that the occupational status of parents is henceforward decisive in their children's school performances.

According to our results, in 1992 Trasylvanian Hungarian and Roma minorities were strongly underrepresented in occupations more easily convertible on the market such as legal and economic occupations. By 2011, the employment and unemployment rate had levelled off both among Transylvanian Hungarians and the total population.

After the year 2000, following the turn of the century, the expansion of education has reached the level of other Central European countries. This expanded educational system has not proved successful in eliminating unequal access based on social origin with respect to the following three dimensions: the influence of the parents' educational level, the type of locality which carries significant differences as for the quality of life. The third dimension is the ethnicity. Despite an extending higher education market in the mother tongue, Hungarians are still lagging behind as far as schooling is concerned, although the rate of university graduates has doubled similarly to the national average (to 10%). On the national level, there is an enormous backlog affecting Roma communities, although there are more students who pursue university studies as previously.

Traditional-Modern Continuum of Leisure in the RURAL India

The present study is an attempt to analyze the gap that exists between traditional and modern leisure activities in rural India. All the societies have a hint of their traditional instincts in all sorts of modern activities. Leisure activities have an important role to play in the development of the society as an energy boost up,. Indian villagers perform various leisure activities either individually or collectively through the means of traditional institutions incorporating usage of traditional pattern. These activities have an important position in the rural settings in India. They act as a pillar to leisure activities in villages. Traditional leisure activities are performed in accordance with the environmental conditions. The development of modern techniques saw a transformation in leisure activities. However, between modernity and traditionalism, rural parts of india find themselves standing in a very conflicting situation. One could notice a sharp contrast between traditional and modern methodologies. The traditional pattern promoted togetherness, whereas modern methods gave more importance to individuality, lonesome leisure time, personal space etc. Traditional activities include 'Alha', 'mela', 'drama'/ (Nautanki; Nukkad Natak). Modern activities include watching films, substance abuse, listening to modern music. People who could afford to adopt new modern technologies started to modern leisure activities. Whereas, those who could not, found themselves in a continuum between traditional pattern and modern techniques. This resulted in the division of class between villagers. This is an analyses of gap created in rural india, which is due to their adoption of modern leisure time activities over traditional.

Traditional Leisure Activity V/S Occupation : Rural Women in India

This study will focus on how unemployed women in rural India spend their leisure time and contrasting it with those who take these traditional leisure activities as their occupation.

On one hand, women in rural India engage themselves into small scale domestic work which also contributes as a source of income to the family. After finishing their daily routine (household work) these uneducated women decorate their kachcha houses (mud house) by first putting a fresh layer of cow-dung on the walls/floor. Then they make intricate designs on these newly painted walls with a mixture of rice flour and water.

Other leisure time activities also include separating grains from husk and further storing them into large self-made mud vessels in order to prevent it from infestation by moths. **All these activities require great efforts but these women do it all while they put up a smile on their faces.**

On the other hand, there are those women who took up traditional leisure activity as their occupation. These activities include making baskets out of waste material (**dalia-making**), knitting mats, hand fans, modha making (authentic chairs), bindi, bangles, garlands, embroidery.

Urban women in India still go crazy about these works of art despite being a consumer of fashion brands like **ZARA** and **MANGO**.

Even though their work is admired and appreciated, these rural women with such artistic skills have been largely ignored by our society.

This study focuses on how to educate them and also discusses problems faced by these women. It will also focus on ways in which their working environment could be made more subtle and friendly instead of hostile and harsh. It will also include ways to put in efforts by the society and government schemes for the help of rural women.

Feminization of Old Age in India: Experiences of Subalternity in Urban Spaces

The demographic feature of 21st century has been the rise of the aged population, making them socially visible. However the concern is that an ageing world is also a feminized world. But this transition does not hold a very vivid future as the elderly women are the most vulnerable section of the population. They make up for the majority of the poor due to scarce access to education, property and employment opportunities. Widowhood often leaves them impoverished and victims of abuse.

Until recently ageing women have not been considered a subject requiring serious attention in India. Most of the studies on old age have adopted a gender neutral approach to the problems of ageing. It is an paradox that the feminist movement has marginally addressed this issue even though gender along with social, economic and political factors has a profound impact on how people age, thus making ageing a gendered experience. The question remains why ageing has not been taken up as a feminist issue in India. Why this marginalization of the elderly women? The aim of this paper is to bring forth the issue to the centre and give an insight into the reasons for their vulnerability.

The paper deliberates on the various perspectives of subalternity and takes a look into feminist framework for understanding ageing women's issue. Bringing the narratives and experiences of the elderly women from urban areas will help in drawing strategy to empower younger women within life cycle dynamics so that they experience a more socially dynamic and healthy ageing.

Gender , Agriculture and Sustainable Development in India : Women's Marginalization or Empowerment

In rural areas of almost all developing countries, women play a major role in household and community survival strategies and contribute significantly to the rural economy. In all cultures gender determines power and resources for male and female. Despite all efforts of best technology and human development, female power and resources are not translated into equality of opportunities and that is why it is lowest in rural areas of the developing world.

Rural women make up for the majority of the world's poor population and the female headed households figure among them as poorest. All these stifle rural development and progress in agriculture and threaten food security. Women make essential contributions to agricultural development yet face specific constraints that disadvantage them in relation to men. The constraints are mainly structural and may reinforce one another, creating a vicious circle of women's subordination and gender division of labour. Common expression of these constraints include restricted mobility, structural impediments, reduced social space etc. Men's moving out to urban areas to participate in monetary economy burden the women at home for taking care of land and its cultivation besides huge domestic responsibilities but however they enjoy little freedom in decision making process.

These cut across social, economic, political and cultural divides, and are created and sustained by social norms that in turn are reinforced by the *state*, through its *markets, household and community.* Women find it difficult to graduate from a role in subsistence agriculture to more prominent positions in market-based agriculture due to practical constraints. This paper addresses the ' complex' nature of gender marginalization in agriculture with globalization and tries to examine how participatory development can be achieved through case studies.

VERMA, VIDUSHI* (Delhi University, vidushiverma197@gmail.com)

The Sociology of VIDEO-Gaming: A Gamer's Perspective

Video gaming in the contemporary times is a deeply misinterpreted concept. Social scientists around the world have been concentrating on very specific issues: particularly against gaming. Gaming is responsible for violence as much as any other activity (crime shows on television, domestic violence at home or anything else.) The kind of competition youth is facing today, a life full of acute **stress** (getting a job, settling.) Gaming gives a **personal sense of achievement**, a hope that everyday real life failures can be dealt with positivism.

This study gives a detailed statistical analysis of how video games improve **hand-eye co-ordination**. An account of emergence of video-gaming as a mainstream commercial sector, a whole new market providing **free-lance job opportunities** to the youth and connecting them world-wide is also a highlight of this study.

 Addiction to anything is harmful. Gaming has its own share of disadvantages like laziness, poor eyesight, insomnia, inactivity.

Online multiplayer gaming (like Call of Duty) is extremely violent and reveals explicit content. Gamers use abusive language. A child of very young age getting exposed to this kind of a virtual world is dangerous to mental growth and it might have psychological effects on very small kids.

From an isolated leisure activity, in this techno-freak world gaming is now a major main-stream pastime. **LAN parties** with thousands of gamers sitting in a room playing World of Warcraft for two days straight or a **million dollar gaming competition** has made video-gaming the most popular pastime amongst the youth today. People make a living just by being gamers. It is making the concept of **indoor games and outdoor games** REDUNDANT. Social interaction on some level is decreasing day by day.

Thus gaming has its own share of pros and cons and this study gives an account from a gamers' angle.

Limits of Ontologies Constructing Sustainable Development

The notion of ontology is defined as knowledge of the social being . But it does not provide the conditions for socio genesis of this social being .We will apply this analytical questioning in the category of sustainable development, its genealogical changes. The concept of sustainable development is presented as a conditional ontology of the future and its risks, as an ontology of policies involving the construction of the future and the risks. The question is to overcome the limits of uncertainty on its object and its incomplete reasoning by a genealogical approach to the various constructions of sustainable development. between the changing relation between nature / culture (Descola).A genealogical approach enables to disentangle certainties and uncertainties in the constitution of object (Foucault, Derrida, Husserl).

a/ The theme of the environment is present in the years 1980/1990 as a mediation and educational ecology, ensuring compromises with institutions (Funabashi). His theoretical elaborations combine ontology of risks (environmental and social) and counter powers (Beck); The ecological citizenship promotes new relationships between coordination and deliberation (Dryzeck); Cb/ The thematic of Global Warming brings up a reassessment of the global public v common good, accompanied by multilateral negotiations between government and green capitalism. The couples between experts and environmental policies is overcomed by the difficult combination between political and economic. The dissolution of the object and the goal of sustainable development, can increase the uncertainty and criticism of sustainable development (Boissonade). The ontology of the common future is not a simple addition of the previous ontologies (Nature, Risk Counter-power). It involves a reconfiguration of the problem, of the related mentalities and cultures, of the tools and methods of the political responses. The reflexive analytical approach must include specific genealogies on the different stages of formation of the problem and its reconfiguration (Elias).

Reorganization of Time and Cultural Regimes during the Economic Crisis : How to Construct a Future

The relation between past and present, ie the duration of past in the present time has been a main focus of historian Koselleck so to enlight the horizon of expectation and the perceived time of experience, within the historical narrations. This "questioning" can be applied during the economic crisis, on the sociological relevance of the Zimberlo framework. Our socio anthropological approach focus on diversified groups concerned directly or indirectly by the process and effects of economic crisis. The socio anthropological approach consider the reorganization of time during the life cycle (active /passive professional, men/ women, settled migrant/ new migrant). The sociological question comes to balance the structuration of time and the multiple reorganization of time in life cycle. The winners of this new regime of acceleration are young educated people as high tech qualified. In crisis, fatalism could appear as the dominant feeling of time, as discourse of decline . Can be observed how people, household and social groups effects try to frame a future sustained by their own resource between positive past and negative past.

Diagnosis : Hedonism time can be distributed between past conforted regime (heritage) and winner of accelerated regime (IT Professional and finance professional). Fatalism concerned the disorganization of time without possibility to construct a future. The modern struggle concerns the large tension between the diverse reorganizations of time and the precarious construction of future, requiring access to some adequate ressources (education, public norms, private ressources).In this view we notice a strong reorganization of the regime of culture (perception, aspiration, enabling cultural practice) between the past informed regime (Halbwachs, Bourdieu) and the new accelerated regime based on network information. The past / present regime is disorganized for a network accelerated regime (Coleman, Castells, Rosa). It requires multifacet socio antropological analysis.

FRITSCH, NINA-SOPHIE (University of Vienna, Department of Sociology)

Labor Market Flexibilization and Low-Wage Employment in Germany, Austria and Switzerland: Between Transformative and Incremental Change?

The present paper concentrates on labor market flexibilization and growing low-wage employment in Germany, Austria and Switzerland. Besides time and country specific comparative analysis, we investigate what groups of people are confronted with particular risks of seeing their wages fall below the low-wage threshold using regression and decomposition techniques (data basis 1996-2013: GSOEP, EU-SILC, ECHP, SHP data).

We focus on these countries because they feature similar welfare arrangements and represent comparable logics of organization, stratification and societal integration, as they belong to the group of corporatist/etatist countries which show similar degrees of decommodification. They also show strong, historically grown economic and cultural ties, with a lively extent of mobility between their labor markets. But looking beneath the surface of those institutional similarities, one can observe proceeding differences over the past 15 years, as authors such as Trampusch (2010) and Haller (2015) have suggested. Whereas institutional change is characterized by a transformative pattern in Germany (i.e. simultaneous change across many institutional dimensions), institutional change has occurred in a self-preserving (incremental) manner in Austria and Switzerland (i.e. only in a few of these dimensions).

Our results show that the low-wage sectors have enlarged in all three countries. In Germany, this tendency has resulted in one of the highest low-wage rates across Europe. In turn, Austria has lost its exceptional position as a country with a weakly developed low-wage sector and Switzerland is placed between those cases. Moreover we can identify special risk groups facing *growing* low-wage risks over time (e.g. women, workers in lower occupational classes). Changes in the composition of the labor market have, in part, enhanced this trend (rising female employment), while counteracting it in other cases (rising highly qualified employment), In general, the changing composition of the labor market has cushioned a yet stronger increase in low-wage rates.

Overcoming Old Divisions: Winds of Change in the Italian Legal Professions

Where are the Italian legal professions heading? How are changing the relationships among the different legal professions? What are they trying to do to reaffirm their role in the society? The Italian legal professions – more than other occupations based on a complex set of practical skills and specialist knowledge – are living a period of profound change. For a variety of factors, the old ways to conceive and to exercise the legal professions are no longer capable of responding adequately to the needs of people, especially in terms of guarantee and protection of their rights. The operating difficulties of the Italian judicial system are accelerating these transformations. These problems have, in fact, a direct impact on the activity of all the professionals and, at the same time, they affect the social

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

credibility of the legal professions and the citizens' confidence in the legal system. The article will focus on the Italian case and, in particular, intends to present and critically discuss the phenomenon of the "Observatories of civil justice": interprofessional groups that have spontaneously developed in various Italian judicial offices, in order to define some common solutions to the courts' problems. The hypothesis at the basis of this paper is that the existence of the Observatories is a signal of an epochal change, which is developing in the Italian judicial system: the overcoming of the old divisions, especially between the two main "protagonists" of the jurisdiction – lawyers and judges. The paper bases its arguments on the results of a long period of empirical research, conducted with qualitative methods. The case, one of a kind, will be the occasion to analyse many issues under discussion within the broad debate of sociology of professional groups.

The Political Economy of Natural Disasters: A Qualitative Comparative Analysis of Disaster Capitalism

Disaster capitalism theory suggests that natural disasters can be exploited by global capitalist economic interests to induce nations to liberalize their economies through neoliberal policy. This paper bridges this burgeoning field with the sociological literature on global development to first ask the question of whether there is empirical support for this disaster capitalism theory. Finding cases where this phenomenon does exist, the paper then asks under what political and economic conditions are these neoliberal policy outcomes most likely to occur. Using a fuzzy-set qualitative comparative approach, the finding of this study indicate that a nation's level of democracy mediates the likelihood of receiving multilateral aid in the wake of a disaster, but nations that do experience large increases in multilateral aid are likely to experience increased trade openness regardless of level of democracy or of development. In essence, multilateral aid plays a critical role in determining economic policy outcomes following a disaster.

The Precarization of Migrants' Life: An Intersectional Analysis Based on the Italian Case

This paper explores the process of precarization of migrants' life engendered by the economic crisis, drawing on a longitudinal analysis based on 40 biographical interviews carried out in 2011 with Moroccan and Romanian women and men living in Italy and then reinterviewed in 2014-15. We study with an intersectional perspective the transformations of migrants' position in the occupational structure and their strategies to cope with the informalization and casualization of labour.

The economic crisis has different implications on migrants' labour careers. Men and women fired by manufacturing factories, find only short term and insecure jobs through temporary agencies or move back to informal work (i.e. street vendors, agriculture, domestic/care work). Furthermore, the male unemployment provokes the entrance in the labour market of a significant quota of women (mainly Moroccan), but they find work mostly in the informal economy.

Migrants adopt different strategies to face precarization. First, they cut their expenses and save money. Secondly, they acquire new skills attending training courses, in order to increase their employability. Third, they have more than one job at the same time. Fourth, one-earner couples turn to dual-earner couples. Finally, Moroccan migrants apply for the Italian citizenship, in order to move freely to other European countries where they could enjoy a richer welfare state.

This process of flexibilization, informalization and casualization of the labour market is producing important social transformations: it is increasing social inequalities between natives and migrants, since it is transforming migrant workers in working poors and pushing them back in the informal economy; it is increasing gender inequalities in the public space, given that women (mainly Romanian) return to be highly segregated in the domestic sector; but at the same time it is reducing gender inequalities within the family (mostly Moroccan), because both partners work.

In Search of Hybrid Professionalism in Italy: A First Attempt

The idea that a new professionalism is emerging is the basis for an international debate involving sociologists of professional groups and sociologists of organization. However, the breadth of the theoretical debate has not always resulted in empirical studies capable of measuring the existence and the degree of a hybrid professionalism alongside forms of traditional or organizational professionalism. With the aim to contribute to the construction of a tool for empirical verification, and starting from the "pillars" proposed by Julia Evetts in order to qualify occupational and organizational professionalism, we have tried to identify the pillars of hybrid professionalism by using existing literature. For each pillar we have then identified some items. The result is an instrument composed of 29 items and, on its basis, the degree of agreement and disagreement regarding the current representation of the medical profession in Italy was asked, using the Likert scale.

The *questionnaire was submitted to 198 physicians,* employed by the Italian NHS, *working in Marche region. They are* relatively *homogeneous in terms of age (average age: 57)* but heterogeneous in terms of their contractual level and organizational context: the group is composed of 144 hospital doctors, 19 physicians working in community services and 35 community paediatricians.

Three clusters appear to emerge from our statistical analysis: the most significant one combines characteristics of the hybrid model with some of the professional model and none of the organizational model; the second cluster presents many characteristics of the hybrid model, some of the traditional model and others of the organizational model. The third cluster does not acknowledge any items of the three identified models. Our results seem to raise many questions both at a methodological (validation of the tool) and at a theoretical level (how consistent are the hybrid model and the organizational model in Italian contexts?)

Control Beliefs and Religion: How Strong Are They in Environmental Stress Management? the Case of Atheistic Society

Many studies claim that involvement in religion is an important factor in maintaining well being and health in later life. Its impact has been followed especially among the subjective dimensions of quality of life on the one hand and the various, mainly social, aspects of religiosity on the other. Due to the high tendency to age in place, the quality of the living environment plays a crucial role in the perception of quality of life, both in the positive and negative sense. Some authors suggest that various aspects of the praxis of religiosity may act as a buffer against stress caused by the environmental press (such as the feelings of safety) and new socially driven risks. In our data, we show how the environmental press and other aspects we define as features of spatial ageism influence the quality of life of older people. In the paper we test whether the quality of life is enhanced by self-defined religiosity and whether is influenced by control beliefs (distinguishing the external, internal and transcendent locus of control).

We use a representative sample of the older Czech population, which adds the interesting context of one of the most atheistic country in the world, as a large proportion of the population, and across all age groups, considers itself to be non believers or atheist.

Our discussion cross-fertilises the issues of perceived quality of public spaces and neighbourhoods, religion and locus of control indicators and study of later life.

Incarceration and Social Security Benefits in Brazil: Children and Family Rights Perspective

Brazil created an "incarceration benefit" in 1960, to account for the financial impact of incarceration on family subsistence. The benefit is a right, and it is backed by the same principle that regulates the right to a death pension: ensuring the survival of dependents of a worker who has contributed to the social security system (Law 3.807 /1960). The Federal Constitution of 1988, for instance, through an amend enacted in 1998, establishes that only "low income" taxpayers are entitled to the incarceration benefit. "Low income" is defined in a specific annual directive for benefits assessment. In 2013, inmates who earned a monthly salary of up to R$ 971,78 (nine hundred seventy-one reals and eighty cents, equivalent to approximately US$ 245,00 in September 2015) were eligible to the benefit. Social security contributions are managed by the federal government and therefore the benefit to convicts' dependents is also federally regulated. Using government data sources and reviewing previous qualitative studies, this paper discuss the economic impact of incarceration on family organization, especially on children. Available statistical data are used to profile the Brazilian incarceration boom, convicts and their dependents, beneficiaries of social security in this case. We present an estimate of the coverage of the benefit in the last decade and the social security costs incurred. We also analyze the regional variations in access to the benefit, which could be explained in part by the characteristics of the convicts and by the irregularly distribution of formal employment over the Brazilian territory. The quantitative data were extracted the Brazilian Statistical Yearbooks, compiled by

The Job Search Experience: The Relevance of a New Study Object

Through a literature review of Sociology of Work, Sociology of Unemployment and Economic Sociology, this article aims to show the relevance of presenting job search as an object itself. This analytical relevance is based on the unemployment new features and the scarcity of studies on this subject. The second object of this text is to present some empirical findings of qualitative research realized in São Paulo, Brazil, especially those ones related to micro-sociological process of job search situation. Our theoretical approach refuses both the type of economic analysis that describes it as a mere rational behavior linking job seekers and employers, and the current sociological perspective that reduces it to a crucial variable on the measurement of the unemployment situation. We assume a different sociological point of view which approaches the search for a job as a social, moral and subjective experience; in this sense, it has to be analyzed taking into account its context, as a negotiated situation, and the job seeker perceptions, experiences and discourses. The empirical research took place during four years in the Barão de Itapetininga street, Sao Paulo downtown, the most important cluster of labor market intermediaries in São Paulo Metropolitan Region, which concentrates itself the most important segment of the Brazilian intermediation market. Ethnographic observation, interviews, analysis of documents and secondary data were the main sources in the fieldwork.

Normalising Xenophobia and Cosmopolitan Justice: The New Meaning of Populism in Europe

In recent years we witness the rise of far right racist movements across Europe. In some countries (e.g. Hungary; Denmark) far right wing governments were established whereas in others (e. g. Greece; Spain) radical left wing parties gained, or still struggle to settle for government power. Whereas arson attacks on (potential) asylum buildings have spread in Germany, in August 2015 an overwhelming civil support for refugees in Germany, Austria and in most other countries, occurred. Though national governments differ strongly on the issue of migration, asylum and integration, it seems that European civil societies respond uniquely by welcoming refugees despite being domestically more fractured and fragmented along the lines of xenophobia and cosmopolitan openness.

This paper, first, will discuss the notion of 21st century populism while reflecting conceptually on previous waves of historical populism in Europe, and the meaning of cosmopolitan city space, past and present. Second, it will look at some examples of recent xenophobic attacks in urban and rural areas of different countries, and the way local anti-racist counter movements respond to this. We argue that we have to reflect on a paradox process of 'normalisation' with respect to open societies that mulitiplies divergent populist positions towards mobility and migration, e.g. creating blurred boundaries between strangers and citizens while constructing new frontiers of difference, belonging and class.

VIJAYA, SWATI* (The Ohio State University, vijaya.1@osu.edu)

Gendered Mobility and Caste-Ed Morality: Exploring Migrant Trajectories of Women from Gounder Caste in Southern India

The wider contemporary mainstream migration scholarship continues to conceive women's mobility as governed by economic determinants. However, it is not only economics that has an important relationship to the cityward migration of women. Rather, the significance of women's mobility lies in the linkages between their migration, which is a process of adjustment, the changes in societal boundaries that provoke it, and the cultural consequences. My proposed paper probes precisely these socio-cultural process and impacts of women's migration. I wish to look into the new possibilities presented to young women of the Gounder caste who actively sought these new spaces of 'modern' employment by "new" cities which emerged in the past two decade in India following the structural reforms which led to liberalization of the economy.

The 'family' and the 'city' being the sending and receiving entities share a dialectical relationship with women's mobility. These structures not only impact the way Gounder women perceive themselves, but also how they transform and transgress gender and caste borders to accommodate their occupational migration.

However, this process of 'accommodation' is undergird by anxieties and the few transgression made in the due course have come to constitute a fear of "eroding community values" in the Gounder caste today. Given this backdrop, I intend to analyze the urban mechanisms of control and surveillance informed by caste moralities aimed at disciplining Gounder women in urban spaces.

The overarching aim in this context will be to analyze the dialectics of women's mobility and the city space informed by gender and caste norms. Thus, the paper will also throw light on the socio-cultural impact women's migration on native society. The proposed paper will attempt to form an understanding of gendered intersections between migration, city and caste, through the narratives derived out of my ethnographic study of Gounder women.

Building Social Cohesion in a Plurilingual Setting? a Longitudinal View to the Sociolinguistic Evolution of Adolescents in Catalonia

Adolescence is a crucial period in the development of individuals, the phase in which family-dependent children reconstruct their personalities, also in linguistic terms, in their transition towards young adulthood. Sociolinguistic changes during this period of life are salient in monolingual societies, where teenagers have often been reported to lead language change (Tagliamonte and D'Arcy 2009), but they are more remarkable in multilingual societies, where adolescents are identified as key agents of language shift (e.g., Cenoz 2008, DEPLC & SK 2014, Pauwels 2005, Veltman 1983).

In our presentation we will discuss the main results of a longitudinal, pure panel research that followed a sample of more than 1,000 schoolchildren from a variety of localities in Catalonia, a highly plurilingual social environment with a significant percentages of alloglot recent immigration. Questionnaires were administered to informants several times since the end of their primary education to the end of their compulsory education, in order to follow their individual and collective sociolinguistic evolution in respect to three bundles of sociolinguistic variables: *language practices* (LP) in a variety of domains (home, friends and classmates, school, and entertainment), *language confidence* (LC), and *language attitudes* (LA) towards Catalan and Castilian.

Results show that, whereas deep transformations can be detected in some of the variables analysed, especially LP, other —especially LC— remain much more stable in the course of the years. L1 reveals as a powerful predictor of LP, LC and LA, but in very different magnitudes. The position of adolescents vis-a-vis the different L1 is also very different, and a distinction appears between the two highly regarded official languages, and the non-official languages, which show clear signs of language shift. Finally, in spite of increased exposure to English, this language seems to be only relevant in some specific domains closely connected with the consumption of imported entertainment.

La Lutte Contre Les Violences De Genre En Espagne: à Dix Ans De La Loi Organique 1/2004, Quel Bilan ?

Depuis une dizaine d'années, l'Espagne a une des législations les plus avancées en matière de violences masculines contre les femmes, avec la *Loi Organique 1/2004 de mesures de protection intégrale contre la violence de genre*. Elle est considéré comme pionnière en Europe dans la lutte contre ces violences (Lombardo et Bustelo, 2009). La loi espagnole aborde le sujet des violences de genre de manière intégrale, transversale et multidisciplinaire, elle s'apparente le plus de la législation internationale. Elle est « *la plus proche de l'Union Europeenne concernant la manière d'encadrer le problème de la violence comme un problème de l'inegalité de genre* » (Bustelo et Lombardo, 2006). Plusieurs textes internationaux affirment que cette législation est un modèle à suivre (Nations Unies, 2010; ONU-Femmes, 2011). D'autres lois, comme la *Loi catalane 5/2008, du 24 avril, sur le droit des femmes à éradiquer la violence machiste*, ont renforcé le cadre juridique espagnol.

La promulgation de ces lois spécifiques d'inspiration féministe a été l'aboutissement de décennies de travail des associations d'accompagnement des victimes et du mouvement féministe. Mais, quels sont les résultats de ces lois après une décennie de leur promulgation ? Nous faisons le constat que ce cadre juridique a été ralenti par de multiples obstacles. Parmi ceux-ci: les difficultés multiples d'application (Bodelón (dir), 2012), la forte diminution de ressources investies dans le cadre des politiques d'austérité ; et les contradictions avec d'autres cadres légaux, comme le droit de la famille, avec des mesures, comme la garde partagée, qui se présentent neutres en matière de législation civile mais « qui ignorent ou minimisent les implications des violences envers les femmes » (Bodelón, 2012).

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Cette communication pensera ces obstacles et la manière de les dépasser, en lien avec les demandes du mouvement féministe espagnol, qui continue à être mobilisé contre les violences de genre.

Botanicas Unplugged: Latinos' Religious Healing and the Impact of the Immigrant Continuum

This paper aims to explore the multi-dimensional linkages between health and religion/spirituality among Latinos in New York City (NYC). Botanicas, which literally means botany, are local dispensaries that offer spiritual, healing, and religious goods and services to a mostly Latino and Caribbean population in NYC, as well as in many other US urban centers. Based on a long-term ethnographic study (2004-15) on botanicas, that included in-depth interviews with 84 Latino healers, this paper addresses their main beliefs and practices concerning mental health illness among vulnerable groups.

Most Latino healers support a multi-causal explanatory model of mental disease, that finds its main pillar on the combined effect of social stressors and divine *causas* (causes) as the source of their patients' suffering. Latino healers' main conceptual ideas regarding mental illness are informed by the "immigrant continuum," which refers to the deleterious impact of Latinos' post-migratory experiences (e.g., undocumented status, family conflicts and financial concerns) as the inner roots of their emotional suffering. The most frequent mental health issues mentioned by Latino healers — and treated at the botanicas— are depression and *nervios* (nervousness). These conditions are seen as the complementary sides of the "immigrant continuum," and are treated via natural medicines (e.g., herbs), informal counseling and religious treatments, such as praying and ritual cleansing.

 Towards the end, this paper develops the notion of "sociosoma" in order to further conceptualize botanicas' holistic explanatory model of mental health and disease. In the conclusions, this piece discusses the overall research and policy implications of this study, including the need for more sophisticated theoretical and methodological tools able to encompass Latinos' mental health beliefs and practices vis-à-vis their unmet needs.

Taming Class Conflict? Industrial Peace Policy and Workers' Strike in the Philippines from 2001 to Present

The strike has been considered the workers' most potent tool against exploitation and other forms of abuses committed against them by capitalists. It is a concretization of class conflict, a cathartic moment in a seemingly covert contradiction between classes inside a capitalist firm. Over the last two decades, official government data on workers' strikes in the Philippines show that the number of incidents significantly decreased from 94 strikes in 1995 alone to as low as one strike recorded in 2013.

The governments of both Presidents Gloria Macapagal-Arroyo and Benigno Aquino III have hailed this phenomenon as a reflection of industrial peace, achieved through social dialogue and the effective use of tripartite and multi-stakeholder mechanisms. Using data from documentation of independent labor groups and analysis of government policies, this paper will argue that the government's pursuit of industrial peace is anchored very minimally, if at all, on social dialogue or effective negotiation of conflicts between capitalists and workers. Rather, it is based upon relentless, systematic, and multi-faceted suppression of independent unions and conscious value-subjects. Contrary to the principle of social dialogue, Philippine labor policies, laws and use of state power to suppress workers freedom to organize or stage collective resistance only validate the necessarily antagonistic nature of contradictions between workers and capitalists.

The paper will further cite case studies and interviews with protesting workers to demonstrate various types and new forms of workers' collective resistance not previously reflected in official data, thus rendering a clearer picture of the persistence of working class struggle and its potential future directions.

Dancing Differences - an Intersectional Perspective on Argentine Tango

Argentine Tango has been a booming 'subculture' in Europe for roughly the past two decades. In my talk, by using an intersectional approach, I will analyze

how tango is discursively constructed as heterosexual, underclass and 'latin' at the same time and I will focus in how these constructions are partly subverted and creatively challenged on the dancefloor, i.e. in practice (using the concept of performative mimesis, informed by J. Butler). Further, I will discuss how the globalized subculture of Tango works as a space for ongoing negotiations regarding migration, especially in relation to Argentina - Germany; and how this is contrasted with tango-tourism (as studied e.g. by Davis 2015; Tornquist 2013).

Ante La Divergencia De Modelos De Financiación Universitaria En Europa. Un Estudio Sobre Factores Socioeconómicos y Permanencia Del Estudiantado En La Universidad

A pesar del ambicioso proyecto del Espacio Europeo de Educación Superior para la creación de puntos convergentes entre las instituciones universitarias, impulsado desde 1999, coexisten modelos marcadamente diferenciados de financiación universitaria: un primer modelo, que garantiza el carácter universal del acceso a la etapa universitaria mediante matrículas reducidas y financiadas desde los fondos públicos junto con un alto porcentaje de estudiantes becados (países escandinavos); un segundo modelo de universidades con tasas altas, pero con un alto porcentaje de estudiantado con ayudas (Gran Bretaña, Países Bajos); un tercer modelo de universidades con tasas relativamente bajas y con un bajo porcentaje de estudiantes con ayudas (España, Italia); un cuarto modelo con tasas muy altas y con porcentajes bajos de becas (universidades privadas). Ante este panorama divergente a escala europea, nos planteamos la importancia de la relación entre factores económicos y la permanencia del estudiantado en la universidad utilizando los resultados de una investigación en desarrollo sobre trayectorias, abandonos y cambios de titulación para el estudio de caso de la Universitat de València. El objetivo de esta investigación es diseñar y validar un sistema de alerta con capacidad predictiva sobre la permanencia del estudiantado a partir de un barómetro compuesto por varias encuestas online. A partir de una muestra de 2.459 sujetos, se constata la existencia de relaciones significativas entre distintas variables sociodemográficas y académicas previas al acceso a la universidad. Se ha interrogado específicamente sobre los factores económicos para determinar la significatividad en la decisión de seguir o no estudiando.

Las Transferencias Monetarias Condicionadas: Alivian La Pobreza?

En 1990 el Banco Mundial da un giro en las propuestas de lucha contra la pobreza, y se instrumentan los programas de transferencias monetarias condicionadas (Conditional Cash Transfers Programmes, CCT). El espíritu que animaba los anteriores programas para la superación de la pobreza, era el fomento del desarrollo económico. En la actualidad los programas actuales, son programas contra la reproducción intergeneracional de la pobreza, en tanto que su meta es trocar el círculo vicioso de la pobreza por uno virtuoso. Estos programas se basan en las transferencias de ingreso, se consideran instrumentos redistributivos y por ende, necesitan lineamientos económico-jurídicos que apoyen esa redistribución.

A nuestro juicio, estos programas de transferencias monetarias condicionadas son programas asistencialistas en tanto que no propician un estilo de desarrollo susceptible de cancelar la pobreza, en otras palabras no inciden en la transformación de las estructuras que originan la pobreza.

Además de seguir las recomendaciones del Consenso de Washington, los programas de transferencias monetarias condicionadas se insertan en la concepción de Milton Friedman (1912-2006), representante de la Segunda Escuela de Chicago que se inició en la década de 1960. Para Friedman, si el Estado ayuda a los pobres deberá hacerlo en metálico, pues así se establece claramente lo que esa ayuda le cuesta a la sociedad.

The Experience of a French Expat in a Mexican Factory : An Ethnographic Account of Workplace Transgressions and Multiple Realities

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

This ethnographic account of a managerial situation is a contribution to the new institutionalist studies of MNC based on the testimony of an expatriated French engineer in a Mexican factory. We try to make an in-depth analysis of the gap between what needed to be done in the Mexican context to make the factory profitable, and the good practices prescribed by the financial, technical, and legal services of corporate headquarters. Our analysis supports the theory of incompatible worlds (Lebenswelt) that multinational corporations often bring together. We highlight the translation-betrayals and deceptions that an expat has to accomplish, including whilst presenting the accounts, in order to avoid any obstacle caused by the incompatibilities that could jeopardise the factory's smooth operations. We emphasise the arrangements the engineer had to negotiate to avoid, for example, the well-intentioned paternalism of a powerful potentate or the "tax" payed to local police in the name of an exogenous conception of law and ethics.

VINSON, ALEXANDRA* (Northwestern University, alexandra.vinson@northwestern.edu)

Physician Teachers As the Link Between the Medical Profession and Its Members

Understanding the relationship between the institution/profession and the individual professional's behavior is a challenging issue. This is because the actions of professionals do not always align with the broad goals of the institutions they are embedded in. However, because professionals generally participate in a professional education or training program, it is reasonable to investigate the role of training in communicating institutional goals and standards to novice professionals. In the U.S. context, the medical profession provides a good case for examining this phenomenon because of the length and intensity of medical training and because of the continuing social transformation of American medicine. Drawing on four years of ethnographic research at a United States medical school, I show how practicing physicians integrate broad institutional goals with their personalized approaches to patient care as they teach first- and second-year medical students. I find that during class sessions practicing physicians articulate differences between the contemporary context of medical practice and the context in which they themselves were trained. Their teaching takes into account not only changes within the medical profession, but also changes in other stakeholders, such as patients. Insight into the perspectives of both practicing professionals and novice professionals will help us understand how professionals today balance the values of professional autonomy with the rise in corporate/managerial constraints on medical practice, as well as the implications these macro-level forces have for the conduct of patient care.

VINSON, ALEXANDRA* (Northwestern University, alexandra.vinson@northwestern.edu)

What Happens after Diagnosis?: Patient and Physician Roles in Negotiating a Treatment Plan

Several interactional processes take place during a medical encounter. First, a patient discloses pertinent information, and the physician elicits further information to investigate the patient's condition. Next, examination and testing are conducted. Then, a diagnosis is offered, which the patient may accept or reject. But what happens afterward? Classical models of physician-patient interaction assume that a physician gives the patient a course of treatment and that the patient does his/her best to carry out this course of treatment. But increasingly the diagnosis is of a chronic disease and the treatment plan is to modify one's lifestyle. Lifestyle change is notoriously difficult and represents a departure from the treatment of infectious disease and acute conditions. Lifestyle change is often "low-tech" and relies on the patient to change his or her daily activities to prevent a health condition that may not even exist yet, such as being in a high-risk category for developing a chronic disease. This paper investigates how physicians are trained to broach issues of lifestyle change with their patients and contextualizes this interactional process in the broader changes in healthcare organization in the United States. Drawing on four years of ethnographic research at a U.S. medical school, I show how faculty physicians teach medical students about the nature of lifestyle change, the responsibility of the physician to help the patient achieve lifestyle change, and the way interactions about lifestyle change have shifted to accommodate changes in the nature of patienthood over the past 60 years. I find that medical training teaches medical students that physicians and patients take on distinct roles during these conversations; physicians bring knowledge, while patients merely bring their preferences. This throws other standards of care, such as patient-centeredness, into relief as medical students are taught to care for chronic disease patients.

VITE PEREZ, MIGUEL ANGEL* (Universidad de Alicante, miguelviteperez@yahoo.com.mx)

México, Fragmentación Social y Violencia Zhacia Un Control Estatal Neoliberal?

El propósito de esta ponencia sería la elaboración de explicaciones sobre la forma en que el Estado mexicano ha sufrido una reconfiguración a través de mecanismos, basados en la violencia, coerción e impunidad. Este hecho contradice la siguiente creencia: la transición democrática del régimen político mexicano no tuvo sólo como fundamento las formas legales y partidistas de ejercicio del poder político; sino, que fue también resultado de la existencia de formas no legales de organizar la vida pública.

Por tal motivo, entender el papel del conflicto social sería relevante para poder analizar su influencia en la reproducción de la violencia, coerción e impunidad, en la conservación de parte de la elite política de las formas democráticas electorales, favorables sólo a la alternancia de los partidos políticos en los diferentes puestos de elección popular. Este proceso culminó con la alternancia en el poder presidencial en el año 2000.

En consecuencia, se buscaría, en un primer momento, analizar los elementos relevantes de los conceptos como fragmentación social, riesgo y violencia para construir interpretaciones sobre el conflicto social de una manera sociológica. En un segundo momento, se utilizarían para analizar el significado sociológico del conflicto social armado en Tierra Caliente (Michoacán).

Finalmente, los resultados del estudio permiten afirmar que el Estado mexicano ha desarrollado una política punitiva vinculada con la ideología de control social derivada del establecimiento de políticas económicas y sociales neoliberales.

Al mismo tiempo, el conflicto social armado protagonizado, por las llamadas autodefensas en Tierra Caliente, sufrió cambios cuando el gobierno mexicano transformó a sus participantes en policías rurales, legitimando la política punitiva entre las comunidades.

More Than Just "Friends"? the Role of Transnational Voluntary Kin Relationships on Ageing Domestic Workers' Access to Social Protection

The feminization of migration, led to an academic interest on female migrant domestic worker's transnational obligations as mothers and family members. Less emphasis, has been placed on their own needs in terms of care and social protection, particularly in their ageing life period. This contribution makes a case for assessing the role of **transnational voluntary kin relationships** on ageing-migrant-domestic-worker access to **social protection** . Transnational voluntary kin relationships are defined as family-type relationships, based not on blood or law association but rather on voluntary agreements. It's argued that migrants access to transnational voluntary kin relationships depends on their intersectional positioning and replace, overlap or complement traditional family support. These relationships are a social **capital** that facilitates access to social protection in the areas of labor, social security entitlement, housing and informal practical-symbolic care. Through the analysis emphasis is first placed on how migrants **intersectional** gender, class, ethnic, generational positioning within the welfare, gender, care, and migration-labor regimes of sending and receiving societies, determines their needs and access to such relationships. Subsequently, the role of two instrumental voluntary kin relationships in migrants access to social protection are explored, meaning: 1- Substitute Voluntary Kin that intervene when blood or law type family members are dead, underperformed their roles or there are ongoing conflicts, 2- Supplemental Voluntary Kin that intervene when traditional family members that reside within physical or non-physical proximity are unable to perform their roles. Data draws from the life-stories of 8 Peruvian-Colombian ageing migrant domestic workers residing in Brussels and 45 semi-structured interviews with their voluntary and traditional transnational kin residing in various geographical locations. This contributions aims to improve the knowledge on emerging nontraditional family support systems that help to alliviate the reproductive and productive needs of transnational ageing individuals in modern societies.

"Who Cares for Those Who Cared? Ethnography on Ageing Migrant Domestic Workers Negotiations for Social Protection "

How and through which practices do Ageing Migrant Domestic Workers negotiate their access to social protection across borders? How are these negotiations influenced both by their intersecting gender, race, class, generational standpoints and their transnational family relations? This contribution deals with these questions and focuses on the case of Peruvian and Colombian Ageing Migrant Domestic Workers in the city of Brussels. Such migrants share a paradoxical positioning as they contribute productively and reproductively to the development of their re-

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

ceiving and sending societies but experience a lack of formal and informal social protection on both sides. This analysis first maps through a moving ethnography the practices they use to negotiate their access to **Social Protection** in the areas of: 1- access to labor, 2- social security entitlement and portability, 4- housing and 3- informal symbolic-practical care. Secondly, it theorizes these practices as an assemblage of social protection that's simultaneously made out of transnational interpersonal relationships and formal support systems. Thirdly, building from the work of Amelina et al, (2012) **Transnational** and **Intersectional** lens are used to analyze how the effectiveness of such assemblage is simultaneously affected by these actor's gender, race, class and generational positioning within the global reproduction of labor as well as by their transnational family relations. Concluding, it's argued such assemblage of protection increases ageing migrants' life chances but reproduces and produces social- inequalities at the local, transnational and global level. This contribution provides a glance at how transnational needs for social protection are negotiated across borders. Furthermore, it's relevant in a context of increasing human mobility where inequalities in access to social protection emerge as a public transnational social question that is relevant both for academics and policy makers.

VIVIANI, LORENZO* (University of Pisa, lorenzo.viviani@unipi.it)

New Cleavages in Old Europe: Cartel Parties Vs Anti-Establishment Parties

The European political systems are affected by a long process of transformation of the actors of the traditional cleavage politics, in terms of identity and organization. The weakening of the ability of mainstream parties to represent the issues that come from new social groups has gradually fostered the rise by a sentiment of opposition to the political class and the traditional parties, which may takes the forms of apathy, increasing abstention at the elections, and the form of protest, encouraging the emergence of anti-establishment parties. Within this context, the paper deals with the relationship between the crisis of representative democracy in European political systems during twentieth century and the increasing politicization of the anti-political sentiment. It will therefore be themed the prospect of a new cleavage politics on the basis of social and economic processes that affects international European societies, and at the same time will be analyzed the ideological trends of the parties of the new populist right and of the new left populist. To understand the nature and the development of anti-establishment parties is necessary to investigate how these are bearers of a challenge to democracy itself, or how much they represent the light of the failure to redefine the contents and forms of political representation in European advanced democracies. In the first case the parties would be anti-establishment as the traditional anti-system parties described by Sartori (1976), in the second case they would express rather a selective rejection of the actors of traditional politics, placing itself at the "periphery" and not "outside" of representative democracy.

Community Fish Stock Management for Conservation and Cohesion: A Comparative Study Between Greece and Japan

The importance of sustainable fish stock management through the ecosystem and the participatory approaches is widely supported by contemporary science. The management of fisheries, based on the internal knowledge of the insular artisanal communities, which operate with traditional techniques and tools, is considered key to sustainable marine and coastal ecosystems worldwide. According to the participatory approach, the insular communities which rely on the targeted fish stock should play an active and central role in the process of regulating and protecting it. Adopting a system of community participation in the decision-making process would result in developing a more holistic and inclusive management scheme with improved outcomes for both conservation and community development, enhancing also the social capital within the community. In Japan, the local resource users are the principal decision makers and marine resource conservation is an integral part of resource use. Traditional management concepts are used for contemporary fish stock management, with central point the interaction between human activity and ecosystem management. These ecosystems maintain high productivity and biodiversity, coupled with human intervention. By contrast, in Greece, although there is extensive legislation on fisheries management, its enforcement is minimal. The marine habitats have been gradually deteriorating, resulting not only in the loss of a large proportion of fish stocks, but also in the reduction of the livelihoods of the local artisanal fishing communities. As the fishermen have minimal participation in the decision making processes, the management of the marine resources or the enforcement of the legislation, their needs and local knowledge are not being represented in the decision making process. This paper cross-examines a case study from each country (Shiretoko Peninsula, Japan and Lipsi Island, Greece) in order to determine the factors that

can create a good environment for sustainable co-management that supports local community resilience.

Sustainable Fisheries and Global Change: The Cases of Shiretoko Peninsula and Tokyo Bay, Japan

During the past 15 years, the general view of resources management, such as in the case of fisheries, has been experiencing a paradigm shift, moving from a classic case of the tragedy of the commons to a more holistic management approach, with emphasis on the role of the human factor within the system. It is now widely accepted that traditional fisheries management has proven unsuccessful, not only in ecological, but also in socioeconomic terms. During the past fifteen years, academic interest has turned to the local level, recognising its potential to turn this narrative shift from a theoretical approach into reality. It is widely known that there have been multiple cases of local communities which have initiated conservation activities in their respective areas of inhabitation, under different circumstances, but quite often with astounding results. This paper, through the cross-examination of a successful and a not so successful case, attempts to explore factors that contribute towards the fruition of the objectives set during the initiation of community initiatives. The first examined case is the Shiretoko World Natural Heritage Site, where local initiatives transformed the area into a conservation spot, which was later nominated as World Natural Heritage. This case is particularly interesting as it is all built upon the notion of stakeholder participation in the decision-making processes with extensive collaboration among the users' groups. The comparison is done with the Tokyo Bay case, where, despite the substantial efforts of the local fishermen, the marine environment did not manage to recover from the aftereffects of extensive land reclamation.

Quality of Life As Outcome of Interlocking Family and Work Trajectories. an Overview of Romanian Households in Precarious Prosperity

This paper addresses the topic of quality of life as framed by Romanian households whose members are living close to poverty threshold, while enjoying some (scarce) resources and opportunities to avoid slipping into poverty. Their quality of life is seen as the result of biographical decision-making and the shape of the ensuing life trajectories in the fields of family and employment. Gender and age cohort appear to play an important role in structuring these life trajectories that often lead to discontinuous employment histories especially for women, and late transitions to work and marital unions for men belonging to younger age cohorts. Drawing on the analysis of 50 interviews with household members from both rural and urban regions of Romania (25 in each community), the authors point to the opportunity of considering the quality of life as an outcome of past experiences and individuals' biographical work, rather than as a snapshot evaluation of the present status of research participants. The data stem from a comparative research undertaken within the frame of a Joint Romanian-Swiss research programme, grant no IZERZ0_141975.

Volunteering Among Migrants Aged 40 Years and Above in Germany

Volunteering contributes to successful ageing. On the societal level, older volunteers provide, for instance, social services which could not be financed by the welfare state. On the individual level, volunteering is expected to be beneficial for both, volunteers and recipients of support. This should hold true for migrants and non-migrants likewise. However, migrants seem to be less likely to participate than native citizens, although volunteering is found to correlate with well-being throughout the life-course and in old age. In Germany, about one in five inhabitants has immigrated or is a child of immigrants. Among the population 65 years and older, about one in ten has immigrated. The share of migrants is increasing rapidly, also as a result of the economic crisis.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

In respect to volunteering among migrants, two opposed hypotheses are discussed: (a) Among migrants volunteering rates should be lower than in the native population, due to deficient language skills or disadvantaged socio-economic status. (b) In contrast, it could be assumed, that among migrants volunteering rates should be higher, due to necessity to cope with challenges in the migration process and with the integration in the host country.

We deal with two research questions: Do the volunteering rates of the migrant and the non-migrant population differ in middle and late adulthood? How can differences in volunteering rates in migrants and non-migrants be explained? The analyses are based on the German Survey on Volunteering, a representative telephone survey of the population aged 14 and older. The results show that among the population in middle and late life migrants are less likely to volunteer than non-migrants in Germany. The differences can be partially attributed to the duration of stay at the place of residence. However, the group of migrants is very heterogeneous.

Creating New Modernities: A Study of Attitude of Pakistani Youth

Pakistan, with a population of 200 million inhabitants is the second largest Muslim country in the world with more than half of its population under the age of 25. Though still predominantly traditional and rural, the country is undergoing fast changes in terms of economics as well as culture and values. Modern technologies such as mobile phone and television access is pervasive while access to internet and 3G technologies are growing fast. Moreover, other forces of modernization, like rise in age at marriage, number of children getting education and rapid urbanization are also in place. These factors coupled with recent governmental policy of "enlightened moderation' have brought changes in values and culture of youth, pushing them towards creation of a modern identiy. But at the same time, while the youth grapples with a Muslim and Pakistani identity, they are also striving to sense of mdoernity which is inescapeable in this age of globalization, and reconcile the incompatibilities and inconsistancies the two shperes. While the forces of modernization present critical questions as how they should be embraced, there are another kind of "modernity" which used fundamental dictactes of religion and "traditions" as their source of inspiration. Pakistan is going through enormous changes geared towards a becoming a modern and moderate society but at the same time there are various social forces resisting that. The youth is striving to create a new identity within the new realities.

The present study proposes the study of attitudes and values Pakistani youth towards modernity, tradition and religion and how they make sense of these concepts. Focus group interviews will be conducted with 10 student groups currently studying in a large university in Islamabad. Analysis will be done on the basis of gender, location, socio economic status and ethnic group differentials.

Status of the Rights of Persons with Disabilities in Pakistan

Around five million (2.6%) people in Pakistan live with some kind of disability, according to statistics from a 2012 national survey. This is based on a definition that consideres only deaf/mute, physical handicap, mental disability and visual impairment. The number of people who are impacted due to disability is six times more than this. Thus calling for attention from government and civil society to create enabling environment for them. For example access to education, vocational training, employment, social paticipation, treatment and prevention. The rate of disability seems to be higher is Sindh province and in rural areas of the country. The most common form of disability is being "cripple" which is followed by being blind or having multiple disabilities.

This paper aims to review policies related to disable people in Pakistan and how the policies are being implemented. In particular focus of the paper will be policies to improve access to job and education for persons with disability. For this paper a local university will be used as a case study. The methodology of the study will include stock taking of current status of rights of disables in the university, official policy, physical access on campus, facilitation in classroom etc. In addition a baseline of current number of disable student/staff/faculty will be part of the study.

VOGL, JANNA* (Max Weber Center for Advanced Cultural and Social Studies, Erfurt, janna.vogl@uni-erfurt.de)

Violence and "Injustices" Against Women: Interventions of a Village Level Women's Meeting in Tamil Nadu, South India

NGOs in India have often been criticized from the angle of the current Indian "civil society" discourse as realizing governmental (welfare or development) politics in regard to their target groups, who are – in the Foucauldian sense – only seen as population groups, not proper citizens (e.g. Partha Chatterjee). In this scenario there is no scope for the question of local appropriations, realizations, and contestation of concepts such as women's rights or citizenship.

In asking how women who participate in women's rights NGOs programs utilize, contest, and adapt concepts, ideas, methods, and (access to) institutions which play a role in the NGO work, this paper looks upon NGOs from a different perspective. Qualitative interviews with founders, staff, and members of two NGOs focusing on "grassroots" women's life situations as well as ethnographic field research in their working areas in Chennai, South India and surrounding districts serve as basis to develop this perspective.

Referring to an informal but long-established women's meeting (sankam) in a Dalit village in the working area of one NGO, the paper asks: How and for what reasons do women from the sankam intervene in cases of violence or "injustices" against women and girls? Which cases are taken up, which cases not? Which conflicts arise between women in the sankam, between the sankam and families or the village public, between the sankam and the NGO, and between the sankam and the legal system? In answering these questions it will be possible to extract (different) understandings of delivering "justice" and achieving "women's rights". These different understandings as well as conflicts between various local orders and agendas lead to ambiguous positionings in the realm between institutional structures, e.g. the legal system, and the local context.

Health-Caregivers on the Global Labor Market: A Comparative Study of Japan's Economic Partnership Agreements and Germany's Triple Win Program

Japan and Germany are in the midst of substantial demographic changes with a combination of low birth rates and high life expectancies triggering population aging and population decline. The decline of the working age population is particularly pronounced and results in labor shortages in some industries. One of the business sectors most severely hit by Japan's and Germany's demographic developments is health-caregiving, where the mismatch of demand and supply is particularly pronounced: While an increasing number of elderly are in need of health-caregiving, the number of those who chose to enter the professions is on the decline. Recently and reluctantly both countries have jumped onto the bandwagon of international health-caregiver recruitment. They both do so via bilateral treaties signed with a number of nations in Southeast Asia respectively in Eastern Europe and North Africa; with the Philippines being the one sending country Japan and Germany alike are aiming to recruit from. Both migration schemes, however, have proven to be unattractive to potential employers and employees alike. By studying the underlying policy-making processes, this paper explores the factors that lead to the design of what can be called faulty programs. Differences and similarities in the policy-making process will be studied – and a special focus will be given to the supranational level – in order to highlight the diverging paths that lead to equally insufficient programs. Ultimately this paper aims at suggesting ways to avoid pitfalls of international labor migration schemes.

Gender Role Attitudes in Mediterranean Countries: Does a Common Pattern Really Exist?

Greece, Italy, Portugal and Spain are usually considered as a homogenous group in research focused on family and gender issues. According to the existing literature, the four countries, referred as 'Mediterranean countries', share a common family pattern characterized by patriarchal family values and preference for male breadwinner – woman homemaker family model. However, several factors challenge this assumption and call into question the true homogeneity of the attitudes towards family and gender roles in these four countries. There are several different factors that may lead to variation in family pattern and gender division of work in these countries, such as the main religious denomination (Orthodox in Greece and Catholic in the other three countries), the level of societal secularization, or family policies. The current paper investigates the homogeneity of the way in which gender roles are understood by the citizens of the four Mediterranean countries and the reliability of the scales used by Eurobarometer surveys to measure this concept. The paper uses data from Eurobarometer 2009, 2011, and 2014 that covers the four countries and tests for measurement invariance of the scales taping attitudes towards gender roles in both private and public area. The results of Multigroup Confirmatory Factor Analysis point out the existence of a common homogenous definiton of gender roles in public area, while in case of private area

denotes a presenting author. Abstracts are organized by first presenting author's last name.

the common pattern is missing. In case of the scale tapping attitudes towards gender roles in public area confirgral invariance and partial metric invariance are achieved. Configural invariance is not achieved for the scale measuring attitudes towards gender roles in private area. The results point out that the understanding of gender roles is not homogenous in the four Mediterranean countries and cross-countries comparisons based on survey data should be considered with caution.

Factors of Human Trafficking in Belarus, Moldova and Ukraine

Human trafficking is the third largest criminal industry in the world, exceeded only by the drug trade and the illegal arms industry (Obuah, 2006). According to the Trafficking in Persons Report, 27 million adults and children are in labour and sex trafficking around the world at any given time (U.S. Department of State, 2012).

GfK Ukraine conducted 4 waves of nationally representative surveys in Belarus, Moldova and Ukraine in 2006, 2008, 2011 and 2015 on labour migration and trafficking. Belarus shows stable indicators within 9 years. In Moldova in 2006-2011 the trend of increasing of illegal labour migration and trafficking rates was observed while in 2015 it changed into a positive trend of decreasing of the number of illegal labour migrants after the introduction of visa-free regime in 2014. In Ukraine the trend of increasing of illegal labour migration and trafficking rates is identified as of beginning 2015, after military conflicts start in spring 2014.

The paper suggests the model of factors influencing human trafficking rates in three aforementioned countries (labour migration rates, illegal labour migration rates, welfare and employment rates, awareness of the risks of human trafficking in particular situations, readiness to take risks etc).

Pre- and Post-War Ukraine

In 2014-2015 Ukraine has suffered the greatest shock within independence period. We lost 7% of our territory where about 14% of the population lived (more than 6,5 millions). The paper suggests the comparison of the results of all-Ukrainian surveys before March 2014 when the invasion of Crimea started and recent surveys as of August 2015 conducted on the territories of "post-war" Ukraine which are under Ukrainian government control. Among the key findings, it is revealed that "post-war" Ukrainian population demonstrates more trust to the authorities and social institutions, more optimistic views of state development; moreover, they became more civically active and more willing to contribute in country's development than before the military conflict. Basing on the survey results and indicators dynamics, the conclusion on the impact of military conflict on socio-political and economic orientations of the population are suggested.

Childhood Studies in South America: Research and Production in Childhood Sociology Perspective

Considering that the sociology of childhood has international production, and research from different countries has shown its studies in conferences and literature, little information about childhood studies has been found in South America. A brief literature review shows some texts, whose theoretical background is grounded for childhood studies. That seems to indicate the urgency for a broader knowledge about who, what and how childhood and children are investigated in South America's Spanish speaking countries. This study uses a theoretical background of contemporary research and the new social paradigm, which recognizes children as social actors and participants in the environment they live. The new paradigm formulated by James and Proud in the 90s suggests childhood as a social construction and considers the childhood as an analysis variable, such as class, gender, and ethnicity. This work aims to understand the theoretical background, the methodological approaches, the theme choices, as well as to enlarge childhood studies references from the sociological perspective. This is a step to: (1) establish a dialogue with the Brazilian research, trying to understand the South American group; (2) understand the diversity in childhood approaches; (3) establish contact with researchers in order to develop partnerships and, later, a South American network of studies on children. This research has qualitative nature, through the research of literature, that use the childhood sociology in South

America's Spanish speaking countries via internet, visits and interviews were made. As for the analysis, data collected from interview, visits and the published works about childhood in the sociology of childhood perspective are considered. With this study, it is expected to understand the concepts, directions, literature choices, the paths chosen for studies of childhood and the childhood discourse present in publications.

'Paper Work' – Uncovering Corporal 'Labour of Presence' of Peri-Urban Settlers in Mexico City.

This paper explores how social, material and administrative existence is 'made' through the living body in the peri-urban realm of Mexico City. In particular, it looks at the corporal effort that colonists of an informal settlement make in order to gain and sustain their membership in the social movement Antorcha Nacional, a movement that supports and organises the claims for housing and social urban integration of Mexico's poor.

Settlers and prospect members of the Antorcha settlement are bound to attend regular meetings as well as to actively participate in the political struggle of the organisation. Only by demonstrating their commitment they can sustain their claims on a piece of land to build their future. Yet their participation in these events is registered on what reveals itself as highly ephemeral, loose pieces of paper in the hands of a few leaders and coordinators of the organisation. Making it onto these lists, and staying on them, is an essential activity – arguably even more important than participating in the event itself – that is accomplished, to a great extend, precisely through the physical 'labour' of 'making presence'.

It was visual ethnography that allowed uncovering and analysing the dynamics and order of the interactions of such bodily 'paper work' taking place and time before and after each event of the organisation. Hence, this paper argues, that audio-visual methods are particularly helpful for revealing and understanding the role and agency of the body in material social practice. This is to say, that visual methods are highly effective also beyond the study of visual narratives, symbols and processes of visualisation: they provide responsive techniques for research on the living body and its agency in relation to society and the city.

VORHEYER, CLAUDIA* (University of Zurich, vorheyer@soziologie.uzh.ch)

Transnational Mobiles – Experiences and Biographical Costs of Perpetual Strangers

Mobility and migration are omnipresent in contemporary societies and (global) society. Predominantly idealised and glamorised by media and public discourse the „darker side of hypermobilty" as Cohen (2015) puts it, has been largely overlooked. The majority of sociological research, especially studies dedicated to transnational professionals and privileged, focus on the positive side of transnational mobility and migration, stressing for instance the open opportunity structures in the European context. However, much less attention has been paid to the downside in forms of potential risks, traps and biographical costs. The paper aims to present preliminary results of a qualitative, biographical-oriented study on privileged onward migrants who are conceptualised as perpetual strangers. These transnational mobile professionals and their families, which are moving frequently and voluntary in geographical, cultural and social space, can experience mobility and migration in their life courses in different ways. From a biographical oriented research point of view mobility and migration is either passed in the context of an institutional schedule model or followed intentional, they can initiate processes of suffering or processes of biographical transformation (of self-identity). On one hand border and boundary crossing extend options of action and widen the experience realm and social universe of individuals. On the other hand plurality and heterogeneity as well as uncertainty and unsteadiness, otherness and ambivalence become potential challenges. Drawing on narrative interviews it is possible to capture both sides of the coin, the gains and benefits as well as the difficulties and hardships. In particular, the paper gives special attention to the experienced social, emotional and professional biographical costs connected with the processes of repeated transnational migration and mobility, including question of feelings of belonging respectively not belonging due to such a nomadic life style.

On 'Perception Patterns': Framing Subjective and Objectified Risks in the Planning Process for (more) Resilient Cities

Environmental change and the city's climate reinforce one another; visible through an increase of diverse physical hazards like droughts, floods, heat and air pollution etc. (Hagen 2011: 312). Next to these, European cities are confronted with social challenges rooted in increasing social inequality, socio-cultural heterogenisation and a pluralisation of lifestyles (Heitmeyer/Anhut 2000). However, conventional understandings of risks and the related, specific vulnerabilities are seen as objectifiable or rather objectively evidenced. Thus, it is assumed that the targets for planning are unambiguous and indisputably defined. Instead, we argue that these targets are mainly defined by the most influential actors while the most vulnerable remain unconsidered. This has a negative impact on the overall resilience of the city. We assume that the integration of the subjective dimension of risks and (in)security potentially increases the "participative capacity" (Voss 2008) of the most vulnerable within security-related planning process for a resilient city. Exclusions from planning processes and deficient scopes for participation of urban residents are produced in the forefront via discourses and its dispositives (Foucault 1978) that eventually lead into social conflicts in a diverse urban population through perceived unequal access to security. On the other hand, these discourses can lead to self-exclusions of the 'objectively' most vulnerable, e.g. those who modify their own vulnerability as 'simply subjective' or 'self-inflicted'. These effects reproduce the relative social positions of the socially marginalized in medium- and in the long-term (Bourdieu 1987). Since actor-centred studies (e.g. Chamlee-Wright/Storr 2010) and research on institutional and governance structures for mitigating risk and disaster (e.g. Ahrens/Rudolph 2006) face each other unconnectedly in many cases, the subjective and objectified perception patterns will be brought together on the basis of an empirical investigation in two German mid-sized cities in order to advocate an advanced process for planning the resilient city.

Questions on the Work and the Sociology of Work from the Global South Perspective - the Experience of Former "Second World"

Stimulated by the context of exacerbation of systemic accumulation of capital crisis in world proportions after the historical turning point symbolized by tearing down the Berlin Wall, paper proposes to search for the answer to the following questions:

1)Have sociology of work "founding fathers" (Marx, Durkheim, Weber) transcended their small bourgeois European background by inaugurating three main theoretical, methodological and practical political research and policy strategies concerning conservation, reform or abolition of class division of human labor in worldwide or global proportions?

2) Is the process of so called globalization just a new word for classical violent re-colonization of material and human resources not only in former colonies of the former "Third World" but also in the former "Second World" of self-proclaimed really existing socialism, by financial oligarchy economically organized in IMF and WB, politically into Trilateral Comission and militarily into NATO, instigating wars and refugee crises ?

3) What lessons can be learned from the failure of the four decades long attempt to realize elimination of class division of labor through integral self-management of workers at the workplace and consumers in the communities in non-aligned Socialist Federative Republic of Yugoslavia?

4) Does "workers aristocracy" exist not only in the imperialist countries of the global North but also in the actually re-colonized Global South, making it difficult to self-organize worldwide resistance to violent re-colonization and privatization of all forms of common property?

5) Are the most prosperous countries in Global South (BRICS) becoming the new hegemonic center of the world system of capitalist economy?

The Concepts and Practices of Participation, Organizational Democracy and Self-Management in the Futures We Want

Paper investigates changing meaning and popularity of the main concepts constituting the name of ISA RC 10 on participation, organizational democracy and self-management, judged by the content analysis and frequency of their use in relevant sociological research, in the socio-historical context of a contradictory process of transition from proto-socialist state capitalism to full legal restoration of hierarchical and crisis ridden system of world capitalist economy, albeit dominated by emerging new hegemonic strong nation state(s) of the center, on the one hand, and contestation of this restoration in former Third, Second and First Worlds, through perpetual reemergence of social movements attempting to transcend production of exchange values for private profit by social production of use values for development of human capacities of each individual as condition for simultaneously economic, political, social and cultural freedom, equality and solidarity of all in humanized nature and naturalized humanity.

The main thesis of the paper is that the main difference between concepts and practices of participation of stakeholders in decision making and profits and integral self-management of producers at the work place and consumers in the community from local to global levels of social self-organization, presents orientation on conservation, reform or overcoming of class division of labor on rulers and ruled and its legal expression, private property.

Paper calls sociologists to self-reflection while answering the questions implied by the title of the 3rd ISA Forum: Who are "we"? What is "better future"? How does our socially structured value orientations on conservation, reform or radical transformation of class division of labor influence all phases of our research and practice of participation, organizational democracy and self-management, bringing about realization of self-fulfilling prophecies?

Is There a Way out? Cultural Capital and Educational Outcomes of Young People Who Grew up in Poverty

Despite the proclaimed policy calls for educational equity (see, for example, the 2013 Council of the European Union's conclusions on the social dimension of higher education), social reproduction of inequality through education remains a problem of many European societies. In fact, the current economic crisis in Europe and high levels of youth unemployment combined with the increasing commodification of higher education, often mean that individuals need ever higher academic qualifications in order to compete on the labour market full of young people with BA and MA degrees from various public and private institutions. This task is challenging in itself for individuals from less privileged backgrounds. But for young people who grew up in poverty this is sometimes almost an unsurmountable obstacle since, during their educational careers, they often lacked both the financial and structural resources, as well as cultural capital, to put them on the university track, and to give them access to jobs that can ensure their upward social mobility. In our research, we spotlight this vulnerable group of young Croatian people from poor family backgrounds. Based on a survey of young people coming from households on social welfare during their high school years, we examine factors that contributed to their successful and unsuccessful educational outcomes. In our analysis, we focus in particular on the role of cultural capital in its multiple operationalizations. We also examine how cultural capital interacts with other individual, family and social factors, especially among the individuals with more successful educational trajectories. Our results help identify factors that may serve to reduce social inequality by increasing chances of social mobility through education for the young people who grew up in poverty.

A Multilevel Test of Constrained Choices Theory: The Case of Tobacco Clean Air Restrictions

Social contexts have proven to be profound influences on health. According to Bird and Rieker's (2008) sociology of constrained choices, decisions and priorities concerning health are shaped by the contexts – including policy, community, and work/family – in which they are formulated. While each of these levels has received attention in the original and subsequent research, we contend the constrained choices theory provides a powerful multilevel framework for modeling health outcomes. We apply this framework to tobacco clean air restrictions, combining a database of all tobacco policies with the National Longitudinal Survey of Youth 1997 ($n=8,984$) from ages 19-31. Using multilevel panel models, we find that clean air policies lower the odds of past 30 day smoking (OR=0.788, $p<$.05) and dependence (OR=0.694, $p<$.05), while controlling for other policy, community, and individual-level constraints. We also find unique between- and within-person effects. The effect on any recent smoking has a within-person effect; that is, a clean air policy reduces a given person's odds of any smoking over time (OR=0.770, $p<$.05). By contrast, we see a between-person effect on daily pack smoking, such that policies distinguish between individuals who smoke at this level (OR=0.497,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

p<.05), but do not affect a specific person's use. Lastly, we find that clean air policies influence recent smoking for males (OR=0.627, *p*<.001) but not for females, supporting constrained choices theory's argument that gender is not and does not operate as a fundamental cause of health disparities. These results demonstrate that policies restricting public smoking influence tobacco use over time even in the face of more proximal constraints. In sum, we argue for the broad applicability of the theory of constrained choices beyond commonly cited findings regarding gender and biological influences; it is a powerful theoretical framework that permits the simultaneous consideration of multiple contextual influences on health-related decisions.

A Cross-National Comparison of the Patterns of Civic Participation: Worldwide Convergence, National Divergence, or Enduring Influences of Cultural Repertoire?

Recent studies on globalization and modularity predict that deepening globalization generates a great deal of uniformity of action forms worldwide, exemplified as expanding democratization and conventional forms of civic participation (e.g. voting, lobbying, petitioning, organizing interest groups). In contrast, researches on regime and contentious politics argue that patterns of civic participation differ considerably by country even in the era of globalization because political regime characteristics, such as state strength and degree of democracy, still affect civil actors' selection of action forms (i.e. violence—e.g. riots, civil wars—under weak authoritarian regimes; protests—e.g. strike, street demonstration, boycotting—under semi-democracies; conventional forms under strong democratic regimes). Are we witnessing a worldwide convergence or a national divergence? In addition to these contradictory hypotheses of worldwide convergence and national divergence, this paper presents a "cultural repertoire hypothesis" and argues that patterns of civic participation vary greatly by actor because actors' selection of action forms is dependent upon their familiarity with these forms based on their specific histories of contention. In a word, people cannot perform if they do not know how. This paper evaluates these three hypotheses by conducting a cross-national comparison of the patterns of civic participation using a data set of 10 million events worldwide, reported by Reuters, between 1990 and 2004. This data set includes a great deal of varieties in action forms, not just violence or protests but also conventional forms of political interaction, which provides us with an extraordinary opportunity to compare civic participation patterns across the world. A multilevel multinomial regression analysis will reveal how the participation patterns (conventional, protest, and violent) change by the main variables: (1) globalization index (the worldwide convergence hypothesis), (2) institutional regime characteristics (the national divergence hypothesis), and (3) actors' familiarity with forms of action (the cultural repertoire hypothesis).

Association Rule Analysis of the Repression-Dissent Dynamics

While civil violence is almost always countered by state violence, the opposite is not true. It is unclear whether state violence triggers or contains civil violence. Will those who have suffered from state repression pick up a weapon in anger or quiet down in fear and despair? A major stumbling block in the effort to tackle this problem of repression-dissent dynamics has been methodological. On one hand, small-N case studies, while good at revealing exact processes of interactions between state agents and social actors, cannot generalize the results beyond these cases. On the other, typical quantitative analyses of annual (monthly or weekly) event counts, while good at demonstrating general patterns, fail to detect interactive dynamics, as contentious interactions often happen in rapid sequence, sometimes within a matter of seconds, minutes, hours, and days.

This paper attempts to overcome such a methodological deadlock by using a data set of popular contention in Great Britain (BRIT) collected by Charles Tilly. Unlike most event data sets, BRIT records the information about detailed sequences of contentious interactions *within each event*. This provides scholars with an unprecedented opportunity to examine contentious dynamics quantitatively. This paper applies a new method, "association rule analysis," developed in the field of text mining of big data, to examine the repression-dissent dynamics. The method enables researchers to detect "rules of associations" or hidden patterns of contentious sequences in the form of probability statement (i.e. "the probability of police beating followed by students' rioting is 42 %"). This paper uncovers, among others, *state agents* who are more likely to trigger civil violence, *social actors* who are more likely to resort to violence after state repression, and *repression strategies* which tend to evoke strong civil resistance. The association rule analysis will advance theories and methodologies concerning the dynamics of social movements.

Arab Youth and the 'facebook Revolution': The Role of Social Media and Youth Culture

Due to the young people's use of social networking sites the events of the Arab spring have also been labelled the 'Facebook revolution'. The presentation will analyze if that label is appropriate and in which ways. Furthermore, it will investigate the role of youth culture in the Arab spring. The research presented is part of the FP7 project "ARABTRANS – Political and social transformations in the Arab world" (2013-2016), funded by the European Commission. The analysis is based on new empirical data from a large scale survey (N=2000 for each country) among seven countries (Algeria, Egypt, Iraq, Jordan, Libya, Morocco and Tunisia) focusing on political participation and the use of the Internet and of social networking sites.

Our analysis shows that most young people in the researched Arab countries aged 18 to 25 use the Internet as well as social networking sites, above all Facebook and Youtube. Online social networks seem to have contributed to the cause of the protesters in various ways: as an organizing tool, as a news source and as a public arena for building a community of like-minded activists. The young population uses them, above all, for getting informed about political news and for discussing politics, but also for learning about political events, and even for organizing political events. Our analysis further shows how youth culture seems to be a perfect tool for reaching and mobilizing the young population, especially when distributed through social media.

WAGNER, CHRISTIANE* (Instituto de Artes - UNICAMP, christiane.wagner@malix.univ-paris1.fr)

Poïésis Entre La Raison Et La Sensibilité

Face au phénomène de la puissance des images dans notre société contemporaine, il conviendrait de réfléchir à la participation de l'artiste par ses représentations qui servent à la convergence technologique pour leur art. Qu'est-ce que cela dans les conditions techniques du présent pour un art total par les nouveaux médiums de l'art ?

Jürgen Habermas dans son oeuvre *Théorie de l'agir communicationnel*, 1987, analyse les systèmes qui coexistent dans la société. Cette analyse traite de la reproduction matérielle, de la logique de la technologie dans le processus d'adaptation des technologies conformément aux objectifs, en maintenant des relations politiques, culturelles et économiques. À partir de la rationalité communicationnelle par une réflexion phénoménologique, Habermas développe un concept de rationalité, dans une pratique rationnelle de communication, qui signifie la résolution, l'évaluation discursive de chaque expression prétendue (*Geltungsansprüche*). Le discours ou l'argumentation sont la clé de l'instance d'un comportement rationnel. Habermas distingue le discours théorique, le discours pratique, la critique esthétique, que les médias reflètent pour que l'objectif de la communication puisse être accessible et pertinent. Donc, les arts, que cherchent-ils dans cette dimension de l'univers des apparences conditionnés aux formes pragmatiques pour réaliser leurs objectifs, moyennant le processus des nouveaux médiums ? Dans cette approche de la raison et de l'esthétique, il conviendrait d'analyser les nouveaux médiums de l'art, aujourd'hui, parce que nous ne sommes pas à la recherche d'une démystification, d'un éclaircissement (*Aufklärung*), mais de la légitimité de l'art depuis le début du XXI siècle, en ce sens, se référant à une poïésis entre la raison et la sensibilité.

Interdisciplinary Near-Peer Mentoring: A Future for Teaching in Higher Education

In the last few decades tertiary education institutions have experienced increasing pressure to accommodate not only more students, but also to address the criticism that traditional lecturing and note-taking teaching approaches do not promote in-depth learning, active participation or the development of creative problem solving skills. One response to these demands has been the use of peers or near-peers to assist in teaching and mentoring of fellow students. The aim of this paper is to present a case study of an interdisciplinary near-peer mentoring model in which Master's students in research psychology acted as mentors to urban planning students who were in the process of writing their final-year research reports. The overall purpose of the mentoring model was to improve the research and report-writing skills of the urban planning students and to give the psychology students experience in mentoring and general research supervision. Focus groups were conducted with both groups of students to determine their experiences of the model and where improvements could be made. Findings indicate that both groups benefitted from, as well as experienced challenges with, the model. Future directions for teaching in higher education using this model are indicated in the paper.

From Active Offer to Active Delivery: Increasing the Number of Bilingual Health and Social Care Professionals in Wales

My paper will address the Welsh language within the health and social care sector in Wales, specifically the importance of meeting patients' language needs and ways in which to address the deficit of Welsh-English bilingual professionals in the sector. Within Wales, Welsh is to be "treated no less favourably" (*Welsh Language (Wales) Measure*, 2011) than English. Yet, this is not always the case due to an historic power dynamic of inequality where Welsh was seen as lesser than English, thus not given priority. Additionally, there is a common belief that bilingual services are unnecessary, because Welsh-speakers speak English anyway. However, the literature contradicts this idea, illustrating the importance of communicating to patients through their own language. Consequently, the Welsh Government and Welsh Language Commissioner have formed policies/standards to help redress these barriers to bilingualism. Within health and social care, the policy *More than Just Words* (2012) recognizes the importance of language need through introducing the Active Offer. The Active Offer will take the onus off service-users requesting Welsh language services and will transfer the responsibility to service-providers to actively offer those services. The Welsh Language Standards will enforce these policies and additional mandates from 01/04/2016. However, there is a shortage of Welsh-English bilingual health and social care professionals, which leads to the question: how can the policy be realized and an Active Offer happen if there are not enough bilingual professionals to deliver it? Hence, there needs to be an increase of the bilingual infrastructure within the sector. How can this be done? Using interviews with key players within health and social care in Wales, this paper describes the importance of bilingualism within the sector and suggests solutions within the short, mid, and long-term to increase the number of bilingual professionals, thereby allowing the Active Offer to become Active Delivery.

WAHLBECK, OSTEN* (University of Helsinki, osten.wahlbeck@helsinki.fi)

Return Migration and Mixed Families: The Case of Finnish and Swedish Family Migration in a Transnational Context

The paper outlines the dynamics of transnational migration and social integration of Swedish citizens who have become part of the migration pattern of Finnish citizens returning to Finland. As result of intermarriages and family ties with Finnish migrants, these Swedish citizens have become part of the mobility and cross-border activities of the large post-war Finnish migrant group. Previous research has outlined the crucial importance of family ties in order to understand the development of both transnational migration and social integration. Yet, the involvement of people of non-migrant background in return migration has not been much studied. This paper provides an attempt to clearly delineate and conceptualise this specific family migration phenomenon, which also tends to be gender specific. Sweden and Finland provide a good case for studying the development of migration patterns, since there has been a full freedom of movement and the migration patterns are well documented. Although Finnish citizens dominate the migration flows in both directions, the number of Swedish migrants has steadily increased. Especially, we find an increasing number of Swedish males moving from Sweden to Finland. The paper provides some suggestions on why this specific migration pattern is dominated by male migrants. The paper describes results from 30 interviews with Swedish immigrants living in mixed families in Finland. The results indicate that the Finnish partner to a large extent has facilitated the integration into Finnish society. The paper argues that the dynamics of both the migration patterns and the social relationships in Finland largely depends on the social ties of the Finnish family member.

Intimization of Public

The dichotomy of public and private is regarded as the main attribute of well-organized western societies in late modernity. In the course of recent economic and technological developments -- particularly the digitalization and commodification of public mass communication -- the boundaries between public and private get blurry.

Our project "Intimization of the Public" (funded-by-Schweizer-Nationalfonds) proposes, that the changes in the relation of public and private lead to an intimization of the public sphere (Imhof 2011). We concur that social media is an integral part of this development, but are also convinced that it can only be analyzed within the scope of broader developments. Our research is based on three indicators: Extensification of personal relations, the loss of rationality in the public and the shift from trust in institutions/the social contract towards trust in specific persons. We are collecting data from television and print media for the timeframe 1962-2014 with the purpose of retracing the ongoing intimization of the public and the genesis of theme-specific publics. In addition we will analyze the use of social media.

With this in mind we will focus on 'our' understanding of intimization and describe our research design. In the second part we want to talk about 'how technology changes people's subjectivities', especially in which way intimization influences identity and the formation of the self. Within the quest for "gelingende Weltbeziehungen"(Rosa 2012) -- relations to the world, which are a prerequisites for human flourishing -- the subjects of late modernity are confronted with the problem of finding new rooms for self-affirmation. Here we will concentrate on the evaluation of qualitative interviews with facebook-users and non-users. The aim is to understand, whether the use of social media is in a sense liberating and consequential or if it is a new spin on the social imperative of self-perfection.

Rapport, Respect, and Dissonance: Studying the White POWER Movement in the United States

We examine the advantages and disadvantages of conducting field work with the highly stigmatized white power movement in the United States and ultimately argue that field work is important to achieve a more complete understanding of racist movements. Building rapport and trust is typically viewed as desirable in the relationship between researcher and those studied (Riecken in McCall and Simmons 1969:44). However how much rapport should one develop with highly stigmatized white power groups? At times, Simi (Sim and Futrell 2015:135) experienced internal dissonance when he outwardly portrayed himself as sympathetic in spite of deep personal feelings of opposition to racism. We consider the research technique of identifying certain shared concerns with those studied. For example, the racist populist movement members and researchers might both be critical of the power business leaders and transnational corporations wield. Perlstein's (1995) article "Sleeping with the Enemy: Academia Faces the Far Right" identified issues such as the researcher being perceived as complicit with one's subjects and giving the movement a sense of legitimacy. However Perlstein also suggested studying such movements fulfilled "a scholarly imperative" (p. 81). Is something being missed if social scientists do not extensively interview and observe white power movement supporters? We argue that in-depth analysis of the movement is more difficult if one does not interact with movement members. If one attends white power rallies, meetings or celebrations, one has a better grasp of how and why these events occur and what results from them. One could observe such events promoting not only group solidarity but potentially also revealing the conflicts among movement groups and members. Greater potential exists for high quality intensive examination of racist movements if one engages in face-to-face interaction with movement supporters.

How the Theory of Collective Consciousness Reveals Gaps and Dilemmas in International Gender Law

This paper applies the features and dynamics of collective consciousness to international gender law. Drawing on the work of George Herbert Mead, Walter Buckley, Norbert Wiley, Tom Burns and Erik Engdahl among others, collective consciousness is presented as more than shared knowledge and practices – it entails, in addition, mutual awareness and normative (emotional) charge of the knowledge, people and institutions that are the source of the shared experience. As such, collective consciousness of international gender law is grounded in a shared legal regime, specialized language, mutual communication, and reflectivity. The community of agents (including international organizations, courts, INGOs, international law scholars, and associations of international lawyers) share and experience consciousness of particular rights, agreements, discourses, institutions, and procedures.

It will be shown that some of the primary narratives of international gender law contain paradoxes, selectivity and bias, which are evident in duly established norms of equality (for instance, UN conventions and declarations). Conscientious efforts to establish gender equality and justice are compromised by the unconscious perpetuation of counter norms, often not articulated openly but tacitly; appearing in jokes, innuendo, body language, and pervasive archetypes of the masculine and feminine, for example the female victim and prostitute, and the dominating, insensitive, violent male. This unconscious material has the effect of downplaying the emotional needs of men, glorifying the public sphere and diminishing the significance of the private sphere.

Of particular interest in the paper are the omissions, exclusions and other distortions in international gender law, which our research has identified. Three major biases/gaps are:
1. Person Exclusion: Persons and subgroups may be excluded from the communication exchanges and shared collective experiences;
2. Knowledge/factual exclusion: Particular ideas, "facts," and "knowledge" may be selectively excluded from collective communication; and
3. Exclusion of particular emotions or emotional orientations from group life and expression.

Power of the Body in Representations of Laestadianism

This paper examines the power over and power of the body in representations of a conservative Christian religious movement, Laestadianism. Like many religious communities today, as they are increasingly affected by secular society's norms and practices, Laestadianism is under pressure to change. Laestadianism is being renegotiated within the community, as well as in public, the media, cultural products, and research. This paper discusses contemporary representations of Laestadianism from Finland and the United States: a film, a television series, a play, and a novel. In them, the complex ways in which lived religiousness is represented through bodily practices become tangible and discernible.

The paper claims that the body is central to the religious and social order of religious groups. Religious norms have a fundamental influence on the embodied subjectivity and everyday life of people in religious communities. The order of bodies in Laestadianism is deeply gendered; the conservative patriarchal social relations and norms control and shape female and male bodies in terms of sexuality and reproduction, dress, movement and being in-common. Still, inescapably, bodies also have an inherent transgressive potential. This paper argues that the perspective of the body is essential in order to make sense of the power relations, structures and dynamics of change within Laestadianism in particular but also within religious groups in more general.

Changing Socio-Technical Practices to Enable the Composting of Food Waste for Food Production

The modern landfill has remained the dominant method for managing food waste in developed countries and currently 97% of the food waste generated in the state of Victoria in Australia is sent to landfill. There food waste rots, emitting greenhouse gases and producing toxic leachate. Changes in the socio-technical landscape have led to increasing tensions about the unsustainability of the current food waste management regime of kerbside collection and landfill. Additionally, policy makers have realized that by sending food waste to landfill, they are literally throwing away the valuable economic and environmental resource of compost. While composting food waste has compelling environmental, health and economic arguments in its favour, transitioning from landfill to sustainable management of food waste involves transforming the entire socio-technical regime. This includes not only the landfill and waste collection industries, pricing structures, and the regulatory environment, but the the array of practices and consumer preferences associated with the management of food waste.

This paper presents the preliminary findings from an action research project that intervenes at a range of locations into residential and commercial practices around food waste management. Niche innovations of medium-scale on-site composting of household and commercial food waste have been introduced into different types of urban precinct, with the resulting compost used for growing food locally. The viability of these niche innovations is compared with the alternative of kerbside collection of food waste and offsite composting, where the resulting compost is used in agriculture.

Taking a case study approach, the research examines the socio-technical practices around the food waste separation and composting as well as around the use of the compost. The findings will inform reshaping of the future of urban food

waste management into a more environmentally sustainable one, that takes account of different dispositions towards the management of food waste.

It's All Local? Climate Change Adaptation Policies, Climate Action Groups and U.S. Local Governments

Since the 2009 United Nations Framework Convention on Climate Change in Copenhagen, Denmark protest events and collective actions against the human-generated global climate change have been on the rise. While recent research (Hadden, 2015) examines the rise in protest events and the spillover of tactics between global justice movements and climate actions, little research has been generated that traces out the relationship between climate action groups and other actors such as local governments within the US. Vasi (2006) asserts that local governments are vital to the anticipated policy changes climate change would bring, and are needed to be understood as key "battlegrounds" for climate change policy and its implementation. As the past ten years have shown, local governments already manage crises. Small local governments have engaged in incremental adaptation assessment and planning to protect energy and public infrastructure (IPCC 2014), but they do not have the resources to develop or sustain long-term adaptation measures (Carmin, Nadkarmi and Rhie, 2012; Homsby, 2014). That gap might be filled at least in part, by climate action groups that target local government officials to help obtain needed resources, target federal and state agencies on behalf of local government climate adaptation interests, and target citizens to engage in local government climate action planning. The purpose of our study will be to further investigate the dynamics between climate action groups and U.S. local governments, particularly in the development of climate change adaptation policy development. We examine two climate action groups as case studies of the broader climate movement and three local governments of small-size communities within the US as each population grapples with the consequences of climate change on their localities.

Telling It like It Is: Race Relations in Darwin, Australia –Survey Results

This paper reports on the survey stage of a three part Australian research project that sought to provide Aboriginal Australians with the opportunity to describe their own subjectivities and narratives of race relations. The research fills a large knowledge gap in that the views of White Australia on Aboriginal people are regularly canvassed, but little research exists on the views of Aboriginal people on Australian society and their place within it. The small proportionality of the Aboriginal and Torres Strait Islander population (2.5%) and the uneven discoursal space of White and Aboriginal Australians contribute to this dearth of Aboriginal perspectives. The research was undertaken in Darwin, the major city in the Northern Territory, where Aboriginal people make up 30 percent of the total population. The project was undertaken partnership with Larrakia Nation Aboriginal Corporation, the peak Aboriginal advocacy agency for the traditional landowners of the Greater Darwin area. To give voice to Aboriginal perspectives 400 Aboriginal people from the area were surveyed on their experience of, and attitudes towards, everyday race relations. The surveys were undertaken by an Aboriginal survey team over a period of 6 week October-November 2015. Sampling was stratified by age, gender, housing occupancy and employment status, to align with the Census 2011 socio-demographic profile of the Aboriginal population of Darwin. The results indicate that Darwin remains a largely segregated city with Aboriginal and White lives lived largely separate from each other and that racialized encounters remain an everyday experience for a majority of the Aboriginal population.

WANG, ANNE-CHIE* (National Taiwan university, anne0806@gmail.com)

Every Youth As Problematic: Identifying Mental Health Problems Among Juveniles through the School Guidance System

Due to economic growth rapidly in 1990s, the social structure of the Taiwan society has been changed radically. At the same time, juvenile crime rates also increased sharply. Some scholars have asserted that the social transformation

may cause juveniles to be "anomie", lacking moral guidance. Teenagers who have emotional distress tend to harm themselves or others such as committing to suicide or bullying others. In 2014, the Taiwan government established a school guidance system in order to address this issue more effectively. The system is based on the framework of clinical risk management. The objective of the research is to investigate the relationships between risks and mental health factor of high-risk students and to discuss the issue of "What juvenile behavior would be problematic concerning at-risk students?" The researcher interviewed ten school guidance teachers who participated in guidance work and counseling. Moreover, the researcher selected one counseling office at secondary school where she worked as volunteer for three months in order to understand the everyday practice of the counseling office and to investigate how the teachers identify and help at-risk students. The major result reveal that the social classification such as foreign-born Taiwanese, indigenous youth, single parent-hood, low-income family, domestic violence are easier to identify as the at-risk student. Also, student who has the behavior such as lying, bullying, impolite to teachers could be the indicator of the priority list of teacher guidance. In short, the findings indicate the types of the social orders that the Taiwanese society tends to sustain.

Risks in Vulnerable Ages: Identifying Metal Health Problems of at-Risk Student through the School Guidance System

Due to the youth mental problem rate growth rapidly in recent year, the Taiwan government approved the "Student Guidance and Counseling Act" in 2014 commanding schools to increase number of counselors and according to the three stage structure of preventive counseling to establish a risk reduction guidance system accessible to all students. The system is based on the framework of clinical risk management that needs to cooperate with social workers, psychologists and psychiatrists. Each discipline has different jurisdictions defining "At-risk". The research is concerned with the topic "What juvenile behavior would be problematic concerning at-risk students and how the guidance system treats the students' mental health problems after classifying them as "abnormal"." The first step of the research focused on the analysis of the manuals used by the counselors, guidebooks issued by the Ministry of Education etc. The study examines how these materials define "at-risk students" and what kind of intervention strategies these materials propose. Furthermore, the researcher selected one counseling office at secondary school where she worked as volunteer for three months in order to understand the everyday practice of the counseling office and to investigate how the teachers identify and help at-risk students. The major result reveal that the social classification such as foreign-born Taiwanese, indigenous youth, single parent-hood, low-income family, domestic violence are easier to identify as the at-risk student. Also, student who has the behavior such as lying, bullying, impolite to teachers could be the indicator of the priority list of teacher guidance. In short, the findings indicate the types of the social orders that the Taiwanese society tends to sustain.

Forecasting Models for the Numbers of Indigenous Graduate Students in the Context of Graduate Schools Expansion in Taiwan—Curvilinear Regression of the Ministry of Education's Statistics from 1998 to 2014

In Taiwan, 540,000 Indigenous People of 16 Austronesian ethnicities made up 2.28% of 2.3 million (major Chinese) populations. Their educational disadvantages have been improved since *Indigenous Education Law*was promulgated in 1998. In 2014, Indigenous students made up 2.11% of the undergraduates with additional protective enrolling numbers, while only 0.7% of the graduate students are Indigenous. Actually, the yearly numbers of Indigenous graduate students increased sharply from 18 to 1,239, while non-Indigenous numbers expanded 4.3 times from 43,000 to 185,000 from 1998 to 2009 and then have been scaled down 6.5% to 173,000 by the Ministry of Education ever since. This study hypothesized that with non-Indigenous graduate student numbers as forecasting variable and Indigenous numbers as criterion variables, the forecasting models would be "S-Curve" reflecting the scaling down. With methodology of data mining, the Ministry of Education's statistics was collected and analyzed with SPSS curvilinear regression models including Growth Model and S-Curve to test the hypothesis.

The findings are as followings: Generally, Growth Model is much more fitted (R^2=.953) and the forecasting formula is $y_{indigenous\ graduate\ student} = e^{(2.177+0.00002585*non-indigenous\ graduate\ student)}$. By variables of genders, birth registrations of Indigenous populous municipalities, and larger ethnicities of Amis and Paiwan, Growth Models also indicated the continuous increasing. It reflected Indigenous population growth rate (1.2%) is higher than that of non-indigenous (0.3%), due to numerous youths from

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.

mix-marriage families obtain or restore the statuary Indigenous identity with consanguinity. Besides, the coefficient of Growth Model of females' is higher than that of males' and females outnumbered males by 50 in recent 2 years, while non-Indigenous males outnumbered females by 20,000. Finally, by variables of smaller Puyuma, Bunun, and Truku ethnicities, S-Curve is much more fitted and the forecasting formula for Puyuma, for example, is $y_{puyuma\ graduate\ student} = e^{(6.893-611625.999/non-indigenous\ graduate\ student)}$, showing the numbers are slowing down.

WANG, FRANK* (Graduate Institute of Social Work, National Chengchi University, tywangster@gmail.com)

Deconstructing Care from below: 'Toona Tamu' As Resistance to Pathological Subjectivity for Indigenous Elders in Taiwan

Taiwanese government is launching a long term care insurance to cope with rapid aging population. However, current long term care system fails to meet the needs as well as to reflect the worldview of indigenous peoples in remote areas. An alliance to advocate on behalf of indigenous peoples has been formed to challenge current LTC policy and practices. This paper analyzes how IE is adopted by the alliance to work with indigenous communities in order to disrupt the ruling apparatus of LTC in which elders are constructed as frail and dependent and the care provider as professionally trained workers. Two strategies were applied to mobilize community for change. First, service statistics of LTC are collected and analyzed at the level of township, rather than county, in order to make the shortage of services visible to the community. Community members are invited to interpret the stories behind the service figures to map out the care system at work, especially the informal care work. Secondly, community workers are invited to present their daily work on elder care, which is in sharp contrast to current LTC. 'Toona Tamu', which means a land guided by elders' wisdom in the Kanakanavu tribe, is analyzed how elderly persons are empowered as heritage of culture rather than a frail dependent; relationship between the cared and the carer is reframed as inheritance of traditional knowledge with a collective mission to cultural revival, rather than individual physical care; elders, women and children are brought together as a community, rather than as divided client groups in needs of help; and most importantly, care/healing comes from deep spiritual connection with motherland, rather than professional knowledge/training. This activist process illustrates IE's potential for social change in its emphasis on the binary of institutional and everyday perspectives, which gives voices to indigenous experiences.

Role Trust: A Trust Strategy of Newcomers in the Cities

Over past 30 years China's urbanization has quickened. A large number of population have shift from rural to urban areas. During the process human relationships were reconstructed. Trust strategy was also changing from the special trust to the general trust with the increase in the time of staying in the cities. There is a transitional stage from special trust in traditional society to general trust in modern society. Role trust as a trust strategy was adopted in this stage by the newcomers. The strangers they meet were put on a category for the purpose of deciding if they would trust them.

The data of the research is from the Chinese Social Survey (CSS) of the Institute of Sociology, Chinese Academy of Social Sciences, a national random sample. The respondents were divided into five groups: peasants, floating people, migrant workers, internal migration and urban natives. The levels of general trust, special trust and the role trust were compared for different groups and impact factors to the strategy were analyzed.

Exploring the Social Compensation Patterns in Process of Developing Wind Energy in China

As one of the world's largest wind energy countries, the Chinese government has formulated a series of regulations and laws to encourage the development of wind power industry in the last decade. The relationship and mutual responsibility between the government and wind power companies was put in place by these laws and regulations, but the interaction between the wind power industry and the local residents was ignored or minimized to some extent. With perspective of time dimension, the life of local residents and the development of wind farms go forward hand in hand, and they are relationship with affecting and being affected. During the interaction process, the need to establish a comprehensive social compensation mechanism to mitigate the loss of "the victims" (both material and spiritual), then promote to achieve a harmony "energy sustainable communities". Based on the cases of wind power development in different rural area

of China, this paper contrasts the different patterns of social compensation in local contexts and targets on showing the interaction relationship between social compensation patterns and different degree of social acceptance of wind power. It discusses and analyzes of the social compensation mechanism of Chinese characteristics for wind power, and tries to explain the deep-seated institutional and social cultural reasons for the formation of these compensation patterns.

Re-Familialism or De-Familiamlism? the Social and Political Economy of Changing Childcare Diamond in Taiwan

East Asian countries present as exemplary cases of male breadwinner welfare model in the sense that childcare is always considered as family responsibility. However, an increase in female labor force participation as well as dramatic declining fertility rate simultaneous occurred during the past decades, thus posed challenges in most East Asian countries in general, and specifically for Taiwan, as the fertility rate is one of the lowest in the world recently. As a result, childcare policies have been undergone transformation and reconfiguration. Accordingly, whether these newly policy developments represent the ideal and institutional break with the male breadwinner model becomes the heated debate.

There are two major concerns in the paper: First, this paper aims to identify what are the major features of childcare expansion? What are the policy discourses and debates regarding the ideal role of state in terms of governing, funding, and provision? And what kinds of strategies government implement in order to creating a conducive environment for childbearing? Second, this paper uses the "care diamond theory" as analysis framework to further examine how the boundaries between the state, market, family, and community have been shifted in terms of sharing the responsibility for childcare? Finally, this paper aims to explore what are the major forces behind this policy transformation.

The preliminary results shows that, though with more financial investment and regulation from government, the structure of care provision, and caring ideology still remains unchanged. However, there is significant differences between infant and toddler care: the core feature of infant care is strong re-familiailsm and limited liberal de-familialism; as for toddler care, strong liberal de-familialism orientation. In terms of the changing role of government, though increasing intervention and investment in childcare, major strategy is subsidy-oriented, in the discourse of market mechanism and parental choice.

Chinese Migrants and Their Medicine in France (1976-2015) : Circulation of Knowledge in a Globalizad World

This communication aims to analyse the development of Chinese medicine in French society, in connection with Chinese immigration in France during the period 1976-2015. Several stakeholders are involved in this developement. At local scale, actors are CAM users, practitioners and public authorities in various fields of the French society. At global scale, actors are the Chinese state with his multiple interests, supra-state organizations and other players in global healthcare services market.

The communication mobilizes a number of qualitative methods (consultation of archives, ethnography, interviews, observations) and adopts a socio-historical approach. The fieldwork is done in Beijing and in Paris, in hospitals and paramedical fields. This communication is structured around two main research axes : 1) The social conditions, either cultural, economic and political, making the TCM's transnational circulation possible ; 2) The processus of reinterpretation – from the "top" and from the "bottom" – of TCM in France.

Neglected Motives behind Migration Processes

It is often taken for granted and "proved" in "pure statistics" ordinary shaping public discourses that people are rational when it comes to their decisions to go abroad. It is also believed that they carefully consider multiple and complex economic factors like: market opportunities, demand for labour, wage differentials across markets or possibilities of development before going to a foreign country. Autobiographical narrative interviews with transnational workers and educationally mobile individuals show, however, that in a considerable number of cases motives behind one's mobility are not of economic nature in the first place (hardly ever revealed by quantative methods). Therefore, the findings presented in this paper are based on an in-depth analysis of autobiographical narrative interviews with transnational workers and educationally mobile individuals who left their country of origin (local milieu and home) and live in another European country. These seem to prove that usually ignored, neglected or diminished in contemporary migration studies cause for mobility – i.e.: the escape motive – is a significant reason for mobility. Two different modalities of the motive will be explored and defined, i.e.: (1) the "escape from..." extended processes of suffering and (2) the "escape to..." in search for individuation and deeper self-understanding and self-awareness. Furthermore, an insight into empirical data illustrating both cases will be offered. Finally, an attempt will be made to consider some consequences of "escape from..." and "escape to..." for one's biographical work, identity as well as for creating some collective identifications.

Work Strain and Age Discrimination Among Older Employees – Identifying Challenges for Age-Friendly Work Places

Background:
Facing the challenge of an ageing workforce that has to sustain an increasing number of retirees, governments across Europe take measures to extend working life. At the same time, however, older employees are increasingly excluded from working life due to physical and psychological strain and corporate age stereotypes. From a sociological perspective, stressful experiences can be traced back to the surrounding social structures and people´s locations within them. On the macro level, these comprise i.a. class, gender and age; on the meso level, arrangements of statuses and roles and on the micro-level social relationships (Pearlin, 2010). Apart from these different contexts we can differentiate between stressors, stress mediators, and stress outcomes.

Methods:
A web survey was conducted among older employees (50+) and their managers in organisations in Austria, Germany, Romania and the Netherlands (n=1.250). Data comprises exposure to work-related stressors (i.e. time pressure, age discrimination), mediators (i.e. coping strategies, team support) and psychological and physiological long- and short-term stress outcomes. Based on the results a software system to create age-friendly workplaces is being developed.

Results & Conclusions:
Results show that older employees are exposed to both time-related and social stressors at the workplace and a high percentage expresses symptoms of physical and psychological stress. Positive social relationship at the workplace could buffer these stressors – however, stressors and stress mediators are significantly correlated and often create a 'triple whammy' effect (exposure to stressors, lack of social resources and restricted coping), thus increasing social inequalities within in the group of older adults. Beyond, data reveals that negative age stereotypes pose a major challenge for creating age-friendly workplaces. Age-friendly workplaces need new forms of leadership with sensitivity to hidden forms of age-discrimination.

WARCZOK, TOMASZ* (Pedagogical University of Cracow, tomaszwarczok@gmail.com)

Ideologies within the Ritual. Practical Classifications of Welfare Clients in Poland.

The paper is devoted to the informal classification of welfare clients. These classifications are done daily by the social workers employed in welfare centres in Poland. While these classifications are partly related to openly formulated assessments, in general they are contained within the ritual, embodied social practices and spatial arrangements. The context of interaction between social workers and their clients, as well as the seemingly neutral, administrative communications of the latter, ground the hierarchical division of the world into „normal", („the included"), and „abnormal", („the excluded"), together with the entire set of assumed attributions (poverty, helplessness, unemployment, laziness etc.). The clients are discretely, unconsciously „reminded" of which world they belong to and who they really are. The ideology (imperceptible impostition of the form of classification) functions here in a practical way, being contained in practice itself, thus making it unusually effective.

Clients demanding assistance, who do not meet the stringent institutional criteria and ones showing symbols of consumption (belonging to the „normal" world – cars, expensive mobile phones etc.) are particularly „problematic". By constituting interferences of the classification system (a clear division between the „included" and the „excluded") they are „dirt", „disorder" – as understood by Mary Douglas. They are subjected to special ritual procedures, specific tests (i.e. checking their „work ethos") which they usually are unable to pass. This reclassification gives rise to a new client distinction – the ones „deserving" and „undeserving" of help. This division is legitimate, as it is being realised in a practical, ritual, and non-discursive form – thus accepted as obvious.

The paper is based on several months of participant observation performed in one of the welfare centres in the south of Poland, and tens of interviews conducted with social workers employed in other centres.

WARDANA, AMIKA* (Yogyakarta State University, Indonesia, masmicko@gmail.com)

The Sacred Mobilisation: The Response of Islamic Organization to the Democratic Experimentation of Indonesia

The resurgence of Political Islam in Indonesia – opened since the wave of democracy in 1998 - has been either hindered or halted by the rather poor performance of Islamic-based political parties in the last three democratic elections (2004, 2009 and 2014) by winning only about a third of the total seats in the parliament. The development has urged Islamic social-religious organisations – traditionally as a major supporter of the parties – to engage in the political arena. Focusing on *Muhammadiyah* as one of the largest nationwide Islamic socio-religious organisation in the country, the article addresses the participation of its two regional/provincial offices – in Yogyakarta (Central Java) and South Sulawesi – in the senate-like *Dewan Perwakilan Daerah* (DPD or the Regional Representative Council) elections. The participation had turn up the socio-religious organisation into a political body thus mobilising resources and exploiting infra-structures to support the campaign of its candidates and urge the members to give a vote in the poll. The effort had been fruitful as the supported candidates got significant number of votes and won a seat particularly in the 2014 election. Aside from the result, the political activities had provided a new engine and cause for those two offices of *Muhammadiyah* to consolidate the organisation, re-affirm the membership and re-expand the territorial works competing against co-religionist bodies and others.

The Governance of Branching Points in Electricity Transitions: A Case Study from Germany on the Struggle over Capacity Markets

Following established idealtypes of energy transitions such as the typology by Geels and Schot (2007), the first phase of the German energy transition can be characterized as a substitution pathway:

- from a non-renewable to a renewable system
- from a centralized to a distributed system
- by the social broadening of the system (new entrants involved).

Key factor of the characteristic of this initial phase was the Renewable Energy Sources Act from 2000. However, since 2011 the hitherto pathway is increasingly put under pressure. Since the political decision of the nuclear phase-out in 2011, incumbent actors have finally realised that their future existence is threatened and they have started to develop strategies to delegitimise the current path (Kungl 2015; Wassermann et al. 2015). In addition, technical challenges put pressure on the hitherto pathway.

Those pressures have led to contradictory responses and suggestions concerning necessary political measures. Actors who want to keep to the substitution pathway call for new rules and policy measures to support necessary adjustments of infrastructures and a new market design. Actors who are in favour of altering the pathway want to adjust the regulative framework in order to slow down the expansion rate of renewables and call for new institutions that support increasingly unprofitable flexible power plants.

Hence, since 2011 there is a struggle over the question at what time and in which field exactly which kind of adjustments and/or supporting policies are adequate. The paper will analyse and explain the conflict in one of those fields – the struggle over capacity markets. By analysing the struggle, the paper will develop suggestions for focusing on uncertainty, experts reports, power and actor constellations in order to understand and explain socio-technical electricity transitions, especially at "branching points" – at highly uncertain situations where pathway changes are likely.

Specialization and Stratification of Women Lawyers in Japan

Since 2000, the number of women is rapidly increasing in Japan.

There were 2026 women lawyers in 2000 and 6336 in 2014, tripled in only 15years. The rate of women lawyers is not high (only 18%, even in 2014), but the rate of increasing ease

Since judicial reform in 2000s, the environment of practice of lawyers has been dramatically changing. In the past, typical lawyers were a solo - practitioner and took a various kind of job areas. Now, many lawyers have their own specialized fields and it and it propelled the stratification of lawyers. It has been said that many women lawyers work for women clients, especially in divorce cases and their income and the status among lawyers are relatively low. In fact, the survey of Japan Federation of Bar Association in 2010 suggests that many women lawyers engage in family affairs and the average income of women lawyers is much lower than that of men.

But, the picture is only a part of specialization of women lawyers.

What kind of specialized fields do women lawyers choose and how they could attain their status as specialized lawyers and their status among lawyers? Does the gender matters in those field? Do women lawyers work for women's rights in the fields?

I will focus on the women lawyers who are engaged in medical malpractice litigation, which is thought as one of the extremely specialized area and relatively many women lawyers.

Politics of Small Economic Incentives of Volunteers in Old Age: Using a Mixed Methods Approach

Backgrounds and aims: The purpose of this study was to examine whether small economic incentives can encourage volunteering in old age. Yokohama city in Japan established incentive program for the elderly to join volunteer in welfare facilities from 2010. The program is a part of preventive care policies and in order to reduction in social security budget. The program allows elderly residents to accumulate "volunteer points" which can be exchange for money by conducting volunteer activities at a nursing care facility or other locations. The program is based on the premise that economic incentives encourage elderly volunteers. However, nobody have evidence about the relation between small incentive and volunteering.

Materials and methods: For triangulation purposes, a mixed methods approach includes a collection of quantitative data using the questionnaire survey of 3,685 respondents and a semi-structured interviewing date of 21 elderly volunteers. Comparing a result of multinomial logistic regression to a semi-structured interview data, I show the elderly volunteers' minds and the meaning of economic small incentives for volunteering.

Results and implications: Small economic incentives have a statistically significant effect to participate as nursing care support volunteer. Particularly, male people with low income tend to be volunteer who began after the program start. However economic incentives of the program are a little (maximum about 75 USD per year). Analyzed interview data, the incentives do not function economically but function as a visible symbol of their activities. Through accumulating points, they can feel that their activities are meaningful. Therefore, functions of the points are not economically but the arts of volunteers' minds. That is, the small incentive is a leverage of social participation. Regarding policy implications, officials do not only emphasis economical aspects but pay attention to multi-dimensional aspects of volunteers' translation of points.

Childhood and Parenthood: Conceptualizing As Social Construction or Social Process?

Childhood and parenthood are social phenomena that cannot be understood separately but only in their complementary relatedness. Without parenthood there will be no childhood. And without childhood there is no parenthood.

To conceptualize childhood and parenthood as a social construction is nothing new. Another way to conceptualize childhood and parenthood could refer to process-sociology based on Norbert Elias. Then both phenomena would be described as long term social processes in generation chains – interwoven complementarily, institutionalized in certain types and orders of figurations and based on the interrelationship of sociogenesis and psychogenesis. The direction of the processes could be identified by analysing long term figurational changes, changes of power balances and habitus.

This paper compares both conceptualizations and their implications as well as their opportunities and limitations.

WATERSTRADT, DÉSIRÉE* (University of Education Karlsruhe, waterstradt@waterstradt.com)

Parenthood in the Society of Individuals: 'Helicopter Parents' As Prime Example of Individually Inescapable Blame Gossip.

To grant social stability and continuity in generation chains societies have to manage not only environmental but also social risks. Therefore they develop social standards of care for the next generation (generativity), including the development of a generative habitus as well as the formation of generative institutions. According to social changes these standards of generativity change over time, but always provide the foundation of individual generativity.

In the competition mechanism of globally integrating and differentiating societies a growing pressure of competition unfolds – not sparing generativity. The competitiveness of generativity can not only be observed on a global level, where organisations like the UN and the OECD foster competition comparing generative standards and outcomes. It can also be observed on and between all other institutional levels of societies like universities, schools, day care-centres or families.

Of course competition on generative standards can also be identified on the individual level. Experts compete between and inside their professions regarding generative standards, promoting professionalization, a professionalized self-image with a strong group charisma based on the 'minority of the best' and enhancing social coherence of professionalized positions and institutions.

On the other hand this professionalization of generative standards leads to a weakening parental image, classifying parents as unprofessional and unreliable laypersons with a growing group shame based on the 'minority of the worst' and weak social coherence. As a prime example of individualizing stigmatization the blame gossip term of 'helicopter parents' stands for a *pars pro toto-distortion*. It is individually inescapable for parents and shows the self-dynamics of individualization and professionalization regarding parenthood. Modern generativity seems to be institutionalized and habitualized, forming an established-outsider-figuration of competent generative professionals with limited responsibilities and parents as incompetent generative laypersons with unlimited personal responsibilities.

WATSON, JULIET* (RMIT University, juliet.watson@rmit.edu.au)

Homeless Bodies: The Gendered Embodiment of Survival

In the study of homelessness, the physical and material aspects of the body have largely been an absent presence. However, the body is now emerging as a key sociological theme in homelessness research due to greater recognition that homeless bodies inhabit and access space differently from bodies that are securely homed. Social power in the homeless sphere is produced and represented through the physical control of space. Within the context of homelessness, it is (certain) male bodies that carry the recognition of physical strength and power

denotes a presenting author. Abstracts are organized by first presenting author's last name.

that cannot be matched by female bodies. Physicality, therefore, contributes to the masculine domination of homeless spaces as well as reducing the social status, and increasing the vulnerability, of women within this sphere. Consequently, homelessness circumscribes women's use of, space primarily due to the presence of physical and sexual violence. This environment determines the parameters of what is possible and creates the options for material and emotional survival. The privation and marginalisation of homelessness mean that the body may be the only resource that is available to manage these conditions. In the homeless landscape it is (certain) male bodies that attain power and status due to their physical strength and authority, and this can prompt women to form and maintain bodily alliances with men because the male body can represent physical protection and a sense of belonging in an environment that is hostile to the female body. This qualitative research is based on interviews with homeless women aged 18-25 living in Melbourne, Australia, and highlights the active relations between bodies and the social world and demonstrates how bodies are sites of experience through which people respond to their socio-cultural context.

RC32-367.9

WATSON, JULIET* (RMIT University, juliet.watson@rmit.edu.au)

Young Women, Homelessness and Social Justice

Homelessness in advanced liberal democracies such as Australia is conventionally explained through dominant hegemonic concepts that fail to adequately represent the array of possible homeless experiences. It is crucial that these concepts are contested so that alternative experiences are recognised and subsequently reflected in social policy and resource distribution. Traditionally, homelessness research and policy have rendered young women invisible with the white adult male providing the basis for a non-gendered homeless subject. Therefore, it is vital to reflect on the importance of gender in relation to homelessness. Homelessness is not a gender-neutral phenomenon, yet, while (certain) men's experiences are privileged, the experiences, social processes and practices of women in all their diversity are missing.

In this paper, we focus on the role that social exclusion and the accompanying stigma plays in furthering the disadvantage for young homeless women and the barriers it creates in their struggle to overcome their marginalised circumstances. We do this, firstly, by analysing the interconnectivity between subjectivity and neoliberalism, and how expectations of smooth transitions to adulthood and postfeminist views of young women impact on experiences of homelessness. And secondly, we conceptualise this problematic dynamic through the work of feminist and political philosopher Iris Marion Young. In particular, we examine Young's critique of the reification of distributive justice as the dominant paradigm in social justice as well as her critique of impartiality and normalization in the construction of a social reality. We propose that a more socially just approach to homelessness needs to contest the associated stigma and look for solutions in plural notions of social justice that include issues of empowerment, self-respect and self-determination.

WATTS, ROB* (RMIT University, Rob.Watts@rmit.edu.au)
BESSANT, JUDITH (RMIT)

Ecologies of Meaning: Methods and Youth Politics

One unintended consequence of the increasing ubiquity of research informed by a globalisation theoretical frame has been a tendency to assume that local 'ecologies of meaning' no longer matter (Sassen 2015). We report on a research project that responds to the challenge of research on youth activism across a number of sites in ways that preserve a regard for the local. We situate the project within a tradition of comparative research, much of it reliant on quantitative approaches and assumptions eg., about the role of 'structural determinants' which we argue are highly problematic.

Drawing on Flyvbjerg's (2012) *phronetic* conception of 'social sciences' we firstly describe the way we have developed a number of ethnographic and qualitative methods for use in the transnational study. These include the use of focus groups, intensive one-on-one interviews, 'guided tours' of activist Facebook and other online sites (Gallante 2015), auto-ethnographic accounts by activists as well as content analysis of activist blogs and other sites (Picard 2015). Ferrer and Soler I Marti (2015) argue that this imbrication of methods reveals new kinds of political engagement. The paper shows how these approaches are used to achieve a 'deep description' (Geertz 1974) of youth politics as well as reveal the way various political imaginaries inform the political mobilisation of young people. We then argue that ethnographic and qualitative methods can be enriched using a figurational sociology (Elias 1999) or an ecological frame (Bateson 1971). These essentially conceptual propositions are then grounded in a case study showing how young people in different sites develop responses to common Austerity policies in diverse ways.

Stratégies De Survie Des Ménages Pauvres à Ouagadougou: Importance Du Réseau Relationnel Et Du Genre

Le réseau relationnel occupe une place centrale dans les stratégies de survie des ménages pauvres et très pauvres des zones urbaines en Afrique subsaharienne. Si son utilisation pour faire face aux conditions de vie médiocres et pour surmonter les crises auxquelles font face les ménages concernés a été documentée dans plusieurs contextes, y compris dans les zones périphériques de Ouagadougou, l'articulation avec le genre ainsi que le niveau d'ancrage des individus en milieu urbain demeure encore peu exploré en Afrique subsaharienne. L'article examine de façon approfondie les attitudes différenciées envers la pauvreté des hommes et des femmes nés en ville et celles de ceux nés en milieu rural afin d'en comprendre les implications en termes de stratégies de survie adoptées. Les données utilisées proviennent d'une enquête qualitative réalisée en 2011 sur la pauvreté au sein de quartiers périphériques de la ville de Ouagadougou. En tout, 22 entretiens semi-directifs réalisés avec des femmes et 35 avec des hommes chefs de ménage ou le représentant ont été analysés. Ces personnes ont été interrogées, entre autres questions, sur la perception qu'elles avaient de la pauvreté, leurs perspectives de promotion sociale ainsi que leurs stratégies de survie. Au sein des stratégies évoquées, le recours aux réseaux d'entraide (majoritairement informels) a été particulièrement questionné afin d'en comprendre le lien avec les perceptions exprimées. L'article montre ainsi différentes configurations d'utilisation des soutiens familiaux et extérieurs des hommes et des femmes en situation de pauvreté en milieu urbain africain.

A Research Review on Democratic Firms: Employee-Related and Societal Outcomes for Alternative Futures?

Visions for futures alternative to a 'post-democratic' erosion of economies and business organizations may benefit from research on both social success and failures of democratic enterprises. Menahem Rosner (1996) considered democratic enterprises as 'social laboratories' offering democratic decision making and democratic leadership as learning field for democratic engagement. Whereas several research reviews focussed upon only moderate forms employees' participation on the level of workplace autonomy or self-managed work groups, only little quantifying research exists on substantive democratic structures, where employees exercise influence over tactical or strategic decision-making (last review: Kruse, 2002). For that reason, descriptive scientific knowledge gained under conditions that rule over conventional capitalist enterprises will develop a 'normative power of the facts'. Although embedded into a capitalist market economy, researching democratic companies may allow to gain alternative knowledge about employee-related and societal outcomes of organizational behavior.

Hence, based on a typology of high participative enterprises (Unterrainer, Palgi et al., 2011; e.g. democratic reform enterprises, workers cooperatives, and basis-democratic employee-owned firms), we conducted an extensive literature search in social science data banks for studies between 1970 and 2015 including quantitative data. The results indicate that structurally anchored democracy is associated with an employee-supporting organizational climate. Further, mere employee ownership does not guarantee that corresponding workers perceive a high level of influence in tactical or strategic decisions. The latter depends also on the concrete system of democracy in the respective enterprise. Further, direct participation seems more frequently related to employees' work satisfaction, job involvement, and organizational commitment than their pure collective ownership status.

Mixed results support Pateman's (1970) spillover hypotheses suggesting that direct participation in democratic decision making more than a democratic structure alone positively influences workers' prosocial work behaviors and civic orientations toward societal or cosmopolitan issues. Fostering and hampering factors of those educative effects will be discussed.

Identity Signaling in a Trust Game: Group Membership, Stereotypes, and Charitable Giving

Trust is an important prerequisite for cooperation. In order to trust a stranger, people rely on cues that are supposed to inform them about a person's trustworthiness. Building on signaling theory, charitable giving was identified to be a reliable signal of trustworthiness. However, does the signal stay reliable and influential regardless of who displays it, and over time? A signaler's identity (e.g. being a Dutch national, a woman, an academic, etc.) may serve as a signal itself via group reputation and stereotypes. Furthermore, a signal might become less informative over time, since people learn if a person can in fact be trusted. In two experiments, we investigated in a five-round trust game whether charitable giving displayed by a male or female person (experiment 1; N = 246) and psychology or economics student (experiment 2; N = 131) effectively signals trustworthiness. In experiment 1 charitable giving let to more perceived trustworthiness, independent of the signaler's gender in all rounds of the trust game. We traced this back to an ambivalent gender stereotype that made gender identity a less informative signal. In experiment 2, we manipulated the stereotype about economics students. For the first round of the trust game we replicated the finding of experiment 1 that charitable giving lead to more perceived trustworthiness independent of a signaler's identity. For the remaining rounds of the trust game, however, we found an interaction effect of the participant's stereotype, a signaler's identity and charitable giving. Participants with a negative stereotype about economics students trusted a psychology student that displayed charitable giving more than an economics student that displayed charitable giving. This trust difference was most striking in the last round of the trust game, in which participants showed the "endgame effect" towards economics students, but not towards psychology students that displayed charitable giving.

The Discriminatory Power of a Photograph in the Job Market: A Field Experiment

Internationally, it is unusual or even illegal to attach photographs to job applications. In the German-speaking world, however, it is a common and expected practice across all sectors of the labor market to send a portrait photo when applying for a job. This provides employers and human resource developers who hold racial stereotypes with an opportunity to discriminate not only based on foreign names but also based on skin color and other visual clues of ethnicity. Our paper investigates whether such discrimination occurs and if so, to what extent. We present first results of a correspondence testing experiment in which applications of a number of fictional characters were sent in response to job advertisements in Austria. The applicants had comparable resumes and qualifications but differed in their names (native, Nigerian, Chinese) and in their enclosed portraits that depicted Caucasian, African and Asian models. For comparison, we also sent applications without photos. Attaching a photograph should increase the success rate of applicants because they provide the full set of application material expected by employers. However, photos also make the ethnic background of an applicant more visible than a foreign name and therefore can increase the level of discrimination. Based on regression analyses, we find that attaching a photograph leads to different effects depending on the ethnicity depicted. Thus, visual clues enhance discriminatory tendencies in this early stage of the application process for some groups – before decision-makers have met applicants in person for a job interview. Our results, therefore, provide important insights for those who argue for policies that prohibit the attachment of photos to job application documents.

WEICHT, BERNHARD* (University of Innsbruck, bernhard.weicht@uibk.ac.at)

Wanting to Die: Euthanasia Discourses and the Fear of Old Age and Dependency

Over the last decades questions of euthanasia and assisted dying are frequently discussed in various contexts. Ageing societies, increasing individualism and widespread secularization are often seen as driving forces for the rising interest in this controversial topic. In these debates legal questions usually intersect with moral and ethical considerations. In the Netherlands, for example, an initiative lobbies for the removal of terminal illness and unbearable suffering as criteria for the possibility of euthanasia. In other European countries euthanasia is discussed in relation to later stages of dementia, when people are not considered to be able to make life ending choices anymore.

While many of the analyses focus on legal and moral questions of choice, independence and autonomy, sociological and social gerontological perspectives are often lacking. What needs to be asked in particular is in how far these discourses on assisted dying draw on particular conceptions of old age, dependency and the end of life. In discussions people often express their unwillingness to live a life of *being a burden* and of being dependent on others. This sentiment might lead to a wish to die healthily without needing care, but it also enables or facilitates a discourse in which euthanasia is imagined and talked about.

This paper draws on a Critical Discourse Analysis, carried out with 3 case studies in different European countries. In particular the analysis uses public discourses in different national newspapers to identify the associations, connotations and constructions underlying the concept of assisted dying. The paper will discuss the question whether or not the idea of euthanasia can be linked to particular constructions of the 4th age: In how far do ideas of suffering, loneliness and lost independence feature in the contemplations about euthanasia? And likewise, which consequences for the meaning of old age arise from these debates?

Restructuration and Commodification of Linguistic Repertoires in a Moldovan-Italian Call Center

The term "commodification" of linguistic resources has been used in order to describe processes considered typical for "neoliberal economy" (Heller/ Duchêne 2013). In this view language is an instrument in the management of international networks, and a source of symbolic added value.

Adopting the point of view of the workers, we should additionally ask which significance the exploitation of linguistic resources as part of the work force has for linguistic biographies and the restructuration of linguistic repertoires. This could be a fruitful theoretical approach to combining micro processes of individual language elaboration (Maas 2008) and dynamic socioeconomic and linguistic relations.

In a case study I researched the exploration of L2-Italian-resources in a Call Center in the moldovan capital Chişinău. On the level of political economy and linguistic relations we can observe that mass (trans)migration of Moldovans to Italy (and back to Moldova) attracts outsourcing of communication services to Moldova. Linguistic relations are thus being shaped by the precarious economic situation of most Moldovans. While preconditions for being employed in this Call Center were relatively low, the job itself was very demanding, among others because of the specialised vocabulary. At the same time the job allows speakers with only basic knowledge to find access to the working process by the help of formulaic speech. In order to understand the connection between linguistic biographies and exploitation of work force adequately, I will present data from the training sessions in the Call Center reconstruct the employees' linguistic elaboration processes.

WELCH, VICKI* (UNIVERSITY OF STRATHCLYDE, VICKI.WELCH@STRATH.AC.UK)

Compulsory Supervision in Scotland; The Unique Case of Children Looked after at Home

Scotland's systems of childcare are unusual; a hearing involving three trained lay people makes decisions about children's care based on various reports, representations, and recommendations. Following hearing decisions, around 16,000 children in Scotland are subject to compulsory supervision and are thus 'looked after' by the state.

However, in Scotland approximately a third of these children are not removed from their families and remain at home on a Compulsory Supervision Order. Home supervision has been a feature of the Scottish system for more than forty years, however, little research has been conducted, and the purposes, methods, and outcomes of home supervision remain obscure.

In 2014/15 we conducted a mixed methods study to explore the views of people providing support and services to children on home supervision and to capture views from young people who have experienced this form of care. Among other things, we were interested to discover and describe the needs of these children and families and consider how these may differ from the needs of other looked after children. We also investigated what interventions and supports were

offered, and not offered, to these children. We reported the study under the title 'Overseen but often overlooked'.

In this presentation, I will outline key findings from the study and describe the subsequent policy and practice responses. I consider what these findings and responses tell us about whether children on home supervision are seen as 'troubled' or 'troubling', and how the locus of trouble is portrayed as the child, the family or something else. I ask 'What troubles need these children to be formally looked after by the state and yet do not require the child to be removed from their family?'

WELLER, ANJA* (TU Chemnitz, anwetuc@gmail.com)
BUCHER, JULIEN (TU Chemnitz)

Interactive Research in School – Visual Worlds of the Youth

The presentation discusses the levels of development of pupils in different stages of the educational system in an iconographic mode. The pupils attended the 7th, 9th and 11th class of a saxonian Gymnasium (thus their age ranged from 11 up to 19 years) and created a "Korpus" of nearly 200 pictures drawn in art lessons over a periode of two months. Each participant created two pictures about the topics given and instructed by us: "Ich und Chemnitz" – Myself and Chemnitz (the city were they went to school) and "Ich und Europa" – Myself and Europe. The "Korpus" demonstrates a bundled status quo of individual levels of education and the ability to self-reflect. It extracts the metaphoric and iconographic elements of their graphical answers and gives a glimpse of the variety of possibilities of an methodic visual sociology (of knowledge, information and imagination), that uses pictures not only as methodology (e.g.Geise/Lobinger 2013), but also as a method of interactive, communicative research (e.g. Wetton/McWhirter 1998), i.e. as products of an inner externalization.

The lecture presents graphical answers, rich in information about themselves and their understanding and interpretation, their hometown and Europe. It shows also the exemplary influence of an interactive visual research project, that takes place in an educational setting, which is connected in the specific modes of expression as well as in the content of the pictures.

Furthermore we combined the "graphic interviews" with subsequent workshops and discussions as well as public exhibitions. During the presentation the possibilities of interactive research and the utility for education and research likewise are addressed and we'll show, how the different actions aim at the three functions of good education (Biesta 2010), for example how the topic of the pictures addresses subjectification, socialization and qualification simultaneously.

WELZ, FRANK* (Innsbruck University, frank.welz@uibk.ac.at)

Global or Local Sociology? the Battlefields of Theories in a Historical-Comparative View

Global sociology does exist in two forms. First, it is often considered as a set of globally dominant, hegemonic theories. But in addition, second, it does also exist in the everyday practices in research and teaching of all sociologists. Usually *theory* aims to uncover the former; theoretical work then aims to construct or deconstruct the opposition between classical theory and its postcolonial critique or between one modernity and multiple modernities. In contrast to that, *historical epistemology* has to be concerned with the second form, the historical practices of concrete theory building in its historical and social contexts. It is obvious (for sociologists) that the actual freedom of choice in regard of the theoretical frame of reference of the individual sociologist is limited by her concrete embeddedness in her world of disciplinary paradigms, funding, scientific groups and communities etc. (to be uncovered, following Bourdieu, by reflexive sociology).

For practical reasons, my paper will combine both views on global sociology, the theoretical and the historical-epistemological one. ISA's 1998 survey on the sociological "book of the century" is well-known, having presented Weber, Mills and Merton as the top three authors. In contrast to the ISA ranking, my report will refer to a new empirical analysis (undertaken in collaboration with national associations of sociology), that does not assume one singular space of global sociology (of the English-speaking sociologists, as ISA did). On the contrary, my analysis will approach the battlefield of theories in the international arena as battlefields, that is from several different angles, comparing regions and national traditions of sociological analysis in its given practices.

WENTEN, KLARA-AYLIN* (Technical University Munich, Klara-Aylin.Wenten@tum.de)

The Future Is Unwritten... Time, Agency and Technological Development in Future Visions of Robots

In a time, characterized by inequality and growing uncertainties about the future of socio-technological development, robots have become an indispensable

matter of public concern. Central to their role is the question of mass unemployment and a new economic collapse, which results from automated labour. Scholars draw an explicit image of the future, where robots 'steal humans their jobs' and transform the role of human work.

In addition to pessimist visions, optimists depict robots as tools for citizen empowerment. Instead of creating greater inequality, such technology could equally contribute to autonomy in data control when being applied in, for instance, agriculture. Smaller groups are expected to overcome their dependence on authorities if robots become individually owned and utilised as productive forces.

It is striking that these visions engage with robots' up- and downsides of their social impact, while questions about their preconditions are left beyond dispute. Regarding the prevalence of robots in current debates, it is nonetheless important to engage with underlying assumptions of these visions. Therefore, this paper seeks to illuminate the reasons for their peculiarly different perspectives. Why are there contrasting visions of the future role of robots? And what are their implications for socio-technological change and the future role of work?

By drawing on Science & Technology Studies, these outlooks will be assessed according to accounts of agency and temporality. It will be demonstrated that they share restricted assumptions of agency and are underpinned by linear temporality. It will be argued that these presuppositions impact on the ways scholars conceive of the future of socio-technological development, influencing how the future of robots and labour is imagined to happen. Consequently, it is not only the role of robots that needs to be further discussed, but moreover the ways we deal with the future in general that require careful consideration.

WESTHEUSER, LINUS* (Humboldt-Universität zu Berlin, linus.westheuser@gmail.com)

Politics and the Conduct of Life - a Weberian Perspective on Young Antiracist Activists in Germany

Germany has recently seen a marked rise of antiracist movements, movements aiming to overcome domination based on symbolic classifications of 'race'. They are spearheaded by young activists both from racially dominated groups (refugees, migrants, Germans of color) and politically left white allies. These movements are noteworthy because they reflect a political renegotiation of the ethnocultural model of German nationhood (Brubaker) in the age of diversity. Yet despite their timeliness and common goals these movements have often been marred by internal conflicts. I want to make sense of these conflicts from the side of the actors' subjectivity using Max Weber's concept of the conduct of life (*Lebensführung*). Subjectivity is here envisioned as the navigation of clashing value spheres and institutional orders. What are the conflicts young antiracist activists encounter when fashioning a political conduct of life? Interviewing both activists of color and white allies with varying degrees of political involvement, I found that throughout the sample a solidaristic moral ethos strongly orients everyday life. Reshaping one's subjectivity is seen as a key site of political struggle. Conflict arises along three axes: 1. While activists of color experience politicization as a recentering of subjectivity clashing with dominant norms, white activists encounter decentering contradictions between position and positionings. In both cases tensions are addressed with conflicting strategies of political absolutization/relativization: Absolutization risks leading to a hyperreflexive monitoring of conduct described as crippling and exhausting; relativization may make activists turn to competing spheres like religion and private self-care. 2. Activists struggle over the competing normative rationalizations of an ethically unconditional 'politics of conviction' and a more utilitarian 'politics of responsibility'. 3. Conflicts arise over the rationalities of institutional configurations, especially the formal rationality introduced by professionalized activism. Seen through a Weberian lense, these conflicts become understandable as individual and collective challenges inherent to all politics.

WETZEL, DIETMAR* (University of Basel, wetzel@soz.unibe.ch)

Subjectivation As Process of Becoming a Subject – Transgressing Foucault with Butler

In a first step, my contribution focuses on the understanding of the subject and power by Michel Foucault that he developed towards the end of his life (especially in its now published lectures at the Collège de France). As it is known, the question of the subject for Foucault has always been connected to power and resistance against the state: "We have to promote new forms of subjectivity through the refusal of this kind of individuality which has been imposed on us for several centuries" (Foucault 1982: 212). A major criticism of this "analysis of the subject/power" has been developed by Judith Butler, mainly in "The Psychic Life of Power" (1997a) and also in "Excitable speech" (1997b). In the former she writes: "Power acts on the subject in at least two ways: first, as what makes the subject possible, the condition of its possibility and its formative occasion, and second, as what is taken up and reiterated in the subject's 'own' acting" (Butler 1997a: 14). After having shortly explained Butlers (with Freud) objections against a Foucauldian understanding of subject(ivation)/power, especially with regard to the psychological dimensions of

the constitution of the subject, I try to develop in a final step some parallels with the "meaning-constitution" individual subject (A. Schutz). The following questions will be addressed: (1) Where do the two approaches differ from one another, and b) how can they be linked together conceptually – especially when we try to give insights into the complex question of the constitution/construction of the (modern) subject.

WETZEL, DIETMAR* (University of Basel, wetzel@soz.unibe.ch)

Urban Life forms in a Future Perspective – Citizens' Participation and Inequalities in the Post-Political Age

For quite some time, urban sociology has been conceptualizing cities as places of tense mass society and infrastructural challenges, but also of a particular urban competence in coping with inequalities and insecurities. Due to the coexistence of multiple realities, people in the city are constantly required to negotiate conflicts and handle with discriminations (Lefebvre 2003; Mollenkopf/Castells 1991). Based on the recent critique of the post-political society by Jacques Rancière and others (Rancière 1998; Agamben et al. 2009), I argue in favour of an acknowledgement and even revitalisation of citizens' participation as part of deeply democratic mode of existence. One question is: Do the social movements that came up with the urban distortions, e.g. the Right to the City movement, provide an alternative to the mere 'participitainment' that is often granted by local governments and by the nation-state? Will there be a possibility for more justice through reducing social inequalities? Against the background of these issues, I discuss empirical findings of the research project VERSS ("Aspects of a just distribution of security in the city"). Principal aims of the project are to figure out how justice and security are produced and distributed throughout urban areas, and how people perceive and affect local security policy, e.g. the reshaping of public spaces. Therefore we conducted interviews with people who are involved in citizens' initiatives with a scope on justice and security. In my presentation I will discuss to what extent and under which conditions different kinds of citizens' participation affect the perception of (In-)Equality and how this structures urban life in a future perspective.

The Uncertain Possibilities and Necessary Risks in Participatory Visual Communication: Towards an Emergent Ethics of Contestation in Global-Local Policy Spaces

Sustainable change processes require that decision makers really listen to and work together with the most excluded groups over time. The practical challenge is that, by definition, the perspectives of excluded people are rarely articulated and often neglected, and even when they are given a space to be heard, there is a high level of risk involved in entering those spaces. To counteract these power relations, it is necessary to build both communicative capacities and deeper awareness in context, and receptive and inclusive spaces for external dialogue. Participatory visual processes provide a way to inhabit both the risk and hope of these moments simultaneously, and negotiate between the two through creativity.

This paper discusses the use of participatory visual processes to mediate between global policy makers and people living in poverty in the context of UN deliberations on a new global sustainable development framework. We start from the assumption that risk-taking is intrinsic to transforming the balance of social influence, in contrast to the conventional ethical urge to *do no harm*. Creative visual processes as a source of innovation always generate both hope for new possibilities and risks in terms of the dilemmas inherent in these processes. Recognizing this opens the opportunity to learn from practice experiences in context about how these tensions can be negotiated, and what this means for ethical research. We will consider digital storytelling and participatory video projects in South Africa, India and the Balkans to raise key critical questions about the balance between mutuality and critical transformation, the importance of iterative processes as an emergent ethical response to hope and the possibility of harm, the centrality of relationship building, and the need for flexible application of visual and creative methods in supporting particular social aims.

WHERRY, FREDERICK* (Yale University, frederick.wherry@yale.edu)

Relational Accounting: Extensions and Applications

This article extends (but goes beyond) Zelier's original concept of relational accounting. This development is necessary to arrest attempts to render these dynamics as a property of individuals unmoored from cultural structures. Relational accounting begins 1) upstream where identifiable codes and structured meaning systems shape the set of options, non-options, and their sense of being possible for the person engaged in action. Moral considerations embedded in these codes affect the geometric shape of the individual's decision tree, nearly collapsing some decision branches. 2) In mid-stream there are meaningful, ritually prescribed occasions altering accounting priorities. And 3) downstream people are managing relationships in specific sites where deals make more or less sense by virtue of the site's characteristics and the types of relationships being managed. Identifiable third parties sanction these understandings. The article concludes with concrete examples of relational accounting for luxury transactions and for high cost debt.

WIEMANN, ANNA* (University of Hamburg, fory048@studium.uni-hamburg.de)

From Disaster to Opportunity: Social Movement Organizations As Hope Agents

The magnitude 9.0 earthquake, the Tsunami and the nuclear disaster in March 2011 destroyed Japan's northeast region. Thousands of people died immediately, others lost their houses and businesses. Above that, the nuclear disaster produced thousands of radiation evacuees (Asanuma-Brice 2014). In one word: the situation since 3/11 is nothing but depressing.

And yet, in many parts of the Japanese society we observe new or reinforced social activity directed towards rebuilding the region, for a better governmental compensation for the victims and towards altering Japan's energy policy so that a similar nuclear accident may never happen again. But what is the driving force behind such social activity?

A possible answer to this puzzle is: hope. Hope researchers (e.g. Desroche 1979, Braithwaite 2004, Lueck 2007) have emphasized that hope is a phenomenon inseparably linked to such agency. Moreover, we can distinguish two levels of hope: individual and collective hope. While individual hope develops within an individual and in exchange with other individuals, collective hope can be defined as the result of a social dialogue between individuals sharing a vision for the future of the society as a whole. Courville and Piper (2004) point out that social movement organizations (SMOs) are important actors to transform individual into collective hope.

This presentation draws on the example of the Citizen's Commission on Nuclear Energy, an initiative which was formed by SMOs, engaged scholars, and activists in 2013 to produce a report with recommendations providing for a 'nuclear-free society'. Based on qualitative interviews and various secondary sources, the analysis will focus on the hope process which accompanied the building of the initiative and the writing of the report. Moreover, I point out how the initiative tries to broaden its scope by involving new people into the collective hope process envisaging social change.

RC47-540.14

WIEMANN, ANNA* (University of Hamburg, fory048@studium.uni-hamburg.de)

Media Strategies of Movement Actors in Times of Increasing Mass Media (Self)-Control: The Case of the Japanese Anti-Nuclear Movement Since the 2011 Fukushima Disaster

Since the Fukushima Nuclear Disaster in March 2011 Japanese journalists encounter increasing difficulties to report critically about disaster-related topics. They are specifically threatened by „[a]rrests, home searches, interrogation by the domestic intelligence agency and threats of judicial proceedings" (Reporters without Borders 2015). This and other government action created an atmosphere in which traditional mass media increasingly (self)-censor reports on sensitive topics.

For social movements, media represent an indispensable tool for "mobilization, validation, and scope enlargement" (Gamson and Wolfsfeld 1993: 116). Movements depend on being able to reach and mobilize a broad population. Media coverage of movement issues add credibility to their cause and thereby also strengthen their position of power in relation to opponents. But how do movement actors react if their position is weakened by limited access to mass me-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

dia? Can so far uncontrolled internet-based media replace coverage in traditional mass media?

Against this background, this presentation deals with the question of how Japanese anti-nuclear movement actors integrate internet-based media into their media strategies. Based on the analysis of 24 qualitative interviews with movement actors conducted in 2013 and 2014, I trace three narratives, namely, the movement-media interaction after the nuclear disaster, the actor's evaluation of the Japanese media landscape, and their reaction on the increasing (self)-censorship of the mass media. By doing so, it becomes clear that internet-based media have gained and are still gaining importance in the media strategies of movement actors in Japan. However, from their point of view, digital alternative media cannot entirely substitute traditional media, as large parts of the highly aged Japanese society still very much trust the latter. This indicates that the growing (self)-censorship of traditional media in parts successfully weakens the mobilization potential of the anti-nuclear movement in Japan.

WIESBOCK, LAURA* (University of Vienna, laura.wiesboeck@univie.ac.at)

Cross-Border Labour Commuting in the Central European Region: Emerging Patterns and Implications

This paper examines intra-European cross-border labour mobility, taking the Central European Region (Centrope) as an exemplary instance. Centrope covers large parts of Austria, Hungary, the Czech Republic and Slovakia. This region has a long history of cross-border mobility and social exchange, from Habsburg Monarchy to postwar period and after 1989. Several years after the fall of the Iron Curtain a process of European re-integration began which led to the accession of post-socialist countries into the EU. Since May 1st 2011 all citizens are given the freedom to seek employment according to their skills in Austria.

My aim is to portray current patterns of cross-border labour commuting and its implications through

(1) A longitudinal survey on commuters (N=1.345) and non-commuters (N=1.334) residing in the regions of the Czech Republic, Slovakia and Hungary bordering on Austria,

(2) 20 expert interviews with labour market experts, mayors and business owners in the border regions and

(3) 10 narrative interviews with cross-border commuters.

Mobility of labour is one of the main aims of the Centrope strategy 2013+. Yet the actual patterns and implications of mobility in this region have not sufficiently been subject to academic research so far. Literature on the impacts of labour mobility is predominantly focused on economic interests, e.g. the labour market outcomes, the influence on the wage-setting in the recipient local economy, the extent of remittances or the recruitment costs for low-skilled temporary workers. Favell (2008) has called for more micro level work on the human face of migration – the lives, experiences and networks of this new migration in Europe. Therefore I want to fill this gap.

The empirical data is gained in the course of the research project TRANSLAB, funded by the Vienna Science and Technology Fund WWTF (2012-2015) at the Department of Sociology, University of Vienna.

RC09-108.2

WIESBOCK, LAURA* (University of Vienna, laura.wiesboeck@univie.ac.at)

The Economic Crisis As a Driver of Cross-Border Labour Mobility? a Multi Method Study for the Case of the Central European Region.

This paper discusses labour mobility from the Czech Republic, Hungary and Slovakia to Austria during the period before and after the economic crisis of 2008/09. Building up on the TRANSLAB research project, I will illustrate various facets of the interregional labour market in the Central European Region (CENTROPE): How did the crisis affect economic and social inequalities between the subregions of CENTROPE? How did the crisis affect labour mobility from the border regions of the Czech Republic, Hungary and Slovakia to Austria? To what extent has the socio-economic composition of cross-border commuters and the mode of their labour market integration changed after 2008/09?

In order to answer these questions I draw upon a mixed method approach using (1) Eurostat regional macro-economic data, (2) National labour market statistics by the Austrian Unemployment Service, (3) A longitudinal survey on commuters (N=1.345) and non-commuters (N=1.334) residing in the regions of the Czech Republic, Slovakia and Hungary bordering on Austria and (4) 20 expert interviews with European Employment Services (EURES) employees, business owners and local political leaders in this region.

Empirically we will see that, due to the gradual opening of the Austrian labour market from 2004 to 2011, flows of cross-border commuters have steadily increased. Since 2009 the social composition of cross-border commuters has changed as well. We can observe an increasing number of workers seeking employment in Austria who are most vulnerable during the crisis: the young, the lowly educated and female workers. The expert interviews show that besides macro-economic conditions like wage level and unemployment rate and current political developments (e.g. in Hungary), meso and micro factors like transport infrastructure, urban structure in the border region, as well as family and personal relations, play an important role in affecting the flow of cross-border commuters.

German Society Between 'Open Doors' for Refugees and 'the End of Tolerance'? Representations of Migration in Contemporary Germany and the Rising Tide of Populist Nationalism, Anti-Immigration and Islamophobia

German Society between 'Open Doors' for refugees and 'The end of tolerance'?
This research paper's aim is two-fold. It will start with a broader discussion of representations of migration in contemporary German media and explore these in international and historical context.

It will then focus on the political agenda and ideological underpinnings of the German PEGIDA movement and examine these within a long tradition of populist nationalist and racist discourse in German history.

The paper reviews the rise and current political success of the right-wing populist German PEGIDA movement ('Patriotic Europeans Against the Islamization of the West') and examines its agenda between nationalism, anti-Immigration and anti-Islamism.

My research hereby identifies discursive intersectionalities of 'race', nationalism, religion and gender in Pegida's agitation and critically reflects on the group's self-representation in popular media - flanked by attempts to denounce critics as representing the 'Lying Press' [Luegenpresse], a term directly borrowed from German Nazi Propaganda of the 1930's and 1940's.

WIHSTUTZ, ANNE* (Protestamt University of Applied Sciences, Berlin (EHB), Wihstutz@eh-berlin.de)

Childhood in Hostile Grounds:Intersectional Perspectives on the Lives of Very Young Refugee Children in Mass Accommodation in Germany. Preliminary Findings.

With a growing number of refugees arriving in prosperous societies of the Global North, issues of migration gain salient importance in the public not only concerning accommoda-tion and provision but addressing questions of integration and cohesion (Newman & Clar-ke 2009). One of the characteristic features of ‚new' racism or everyday racism in Europe is the exclusionary discourse concerning migrants and refugees as ‚Others' (Delanty et al 2008). ‚Othering' occurs on all levels, in the media, institutions and everyday life encoun-ters. Closely related to everyday racism is structural institutional racism, which works through (not) granting access to relevant domains of society accordingly. While age dis-crimination is shared by all children due to the specific generational ordering of society (Bühler-Niederberger 2011), young children seeking asylum in Germany have their basic rights as stipulated by the CRC, cut by German asylum laws. Within the group of asylum seeking children age discrimination is intersecting with other dimensions of social inequali-ty. Informed by the ‚new' sociology of childhood the paper presents first findings of an on-going empirical study on everyday life of young refugee children aged under six years, ho-sted together with their parents in refugee mass accommodation in Germany. Based in ethnography, the findings are discussed in view of age discrimination intersecting with ethnicity, nationali-ty and disability on 3 levels: everyday routines, social and institutional practices, and law. The paper allows first insights into young children's own understanding and interpretations of their everyday life, their social relationships, movement in space and time, and self-positioning while residing in ‚total institutions' (Goffman 1961) for asylum seekers. In character of an outlook the paper asks how ANT (Latour 2005) could be made fruitful for analyzing ‚othering' processes in the ‚making' of children, especially the group of young asylum seeking children a very vulnerable group.

Economic Crisis and Ageing- Gendered Evidence from Poland

We explore the gendered consequences of the economic crisis on the ageing population considering the case of Poland. We embed our discussion in feminist perspectives on welfare states that approach gender as an important aspect of understanding the welfare state and focusing on the way gender relations are (re) produced by welfare policies, they discuss the welfare states' effects on gender relations with regards to the distribution of resources, social roles and power relations. We also align ourselves with feminist economics that advocates the focus on gender to understand the dynamic relationships between market economies and the everyday lives of men and women. This draws our attention to the contention that whatever happens to and with the economy affects differently the situation of men and women. In this paper, we analyse a panel data from a national representative survey in Poland (conducted since 2000 in waves every two years with a part of the panel sample and cross-section) to examine the differential impact of economic crisis on older men and women aged 50+ in four areas inspired by Active Ageing Index: employment, participation in society, independent and secure living, and the capacity and enabling environment for active ageing. Our results demonstrate the disadvantaged position of women across examined domains, and we identify women aged 65+ as a particularly disadvantaged group. Further, we problematize the findings that although employment rates have been increasing for women, since 2008 their situation across all other domains has been worsening. We discuss these results within the context of post-economic crisis ageing policies focusing on active ageing and labour market participation that tend to omit the relevance of gender differences. This paper is a joint endeavour between two active members of the COST Action on Ageism – a European research network devoted to challenging ageist practices.

Gender and Violence in the Experiences of Central American Women: Migration As a Coping Strategy?

Neoliberal reforms and economic crisis have strong impact on Central American post-civil war countries and contribute to increasing violent societies. Countries like Honduras and El Salvador have today one of the highest murder rates of the world. Gang violence and organized crime affect gender relations in a special way, endangering the lives of women and limiting their working opportunities. Under this conditions, migration becomes one of the most important strategies for social reproduction. Each year there is an increasing flow of women leaving Central America countries, looking for work opportunities abroad in order to sustain their families.

My paper is based on a field work- study in two Mexican border towns, Tijuana in the North and Tapachula on the Mexican South. It focuses on the experiences of women during transit migration through Mexico and on the strategies Central American women adopt in order to realize their migration projects. It takes into account how the different forms of violence in the origin, transit and destiny converge by reconstructing women's migration trajectories from a biographical perspective. This reconstruction challenges classical categories of migration studies and shows how social, structural and gendered violence affect women's migration projects and migrant's social networks. In reference to the model of analysis of Sarah Mahler and Patricia Pessar´s (2003) *"gendered geographies of power"* of the migration process, I want to show that migration itself is an answer to recurrent experiences of violence and an important aspect of women's agency in this specific context.

WILLERS, SUSANNE* (Universidad Nacional Autonoma de Mexico, susanne.tule@gmx.net)

The Effects of Violence on the Reproductive Strategies of Migrant Women from Central America in Transit through Mexico.

This paper focuses on the effects of different forms of violence on the reproductive strategies of Central American migrant women in transit to the United States. Each year there is an increasing number of women, many of them single mothers, leaving Central American countries like Honduras and El Salvador, strongly affected by social violence and economic crisis, in order to sustain their families. But, due to increasing migration control measures in Mexico and the US, and to the proliferation of organized crime, todays transit migration through Mexico has become a dangerous, expensive, time- demanding and more and more circular process. The interplay of this aspects affects the reproductive strategies of migrant women and their families in the transnational social field and the pos-sibilities of social networks to provide social capital and solidarity to its members. Experiences of deportation and violent assault are each time more common and jeopardize women's migration projects.

The paper is based on a field work- study in two Mexican border towns, Tijuana in the North and Tapachula on the Mexican South, spotlighting the migration processes and the experiences of violence of women from Honduras and El Salvador. By reconstructing migration and family trajectories of migrant women from a Life course perspective, it shows how migration policies, gender violence and inequalities in the places of origin, transit and destiny impact the reproductive strategies of migrant women in the transnational space of migration.

Visions of a Robot Future: Towards a Pragmatic Approach for Future Speculation.

The term "sociology of the future" has been used (Selin, 2008; Bell & Mau 1971; Adam, 2005) to describe the emerging field of study, which seeks to understand "future consciousness" (Selin, 2008:1878). By investigating the methodologies, theories and complexities of anticipation used in the study of Robotics and Autonomous systems (RAS), this presentation will introduce a paper which explored the sociology of the future and suggested some ways in which the field could strengthen its practice.

While the social sciences are comfortable studying past ideas about the future ('past futures'), our inability to collect 'proof' for any element of what is yet to come precludes any application of these theories to 'future futures' (Adam 2006). The future is epistemologically interesting because it exists only in our present consciousness, yet has great influence on the material world. 'Future visions' refer to what is yet to happen; these ideas only remain in the future until they reach fruition. The future is therefore epistemologically and ontologically uncertain.

This presentation will explore the findings from a paper, which takes up the notion of the future to investigate the discourse around RAS, to uncover the limitations of foresight. The paper examines the various beliefs and values arising from the RAS discourse, as well as surveying the underlying philosophies of practical futures approaches. The implications of this are discussed in terms of their potential to inform the improvement of speculative approaches to the future. I consider this case as a springboard to establishing a constitution for speculative foresight based on a set of new principals. I propose that the practice and its practitioners should uphold a standard set of ethics that form a written constitution for speculative foresight. This presentation will discuss the possibilities for forming a new constitution to guide the overhaul of foresight.

Research Context and the Production of Paradigms and Theories of Development.

This paper will examine the ways in which research context, particularly funding and evaluation, influences the production of paradigms and theories of development. Knowledge production in policy/practice-focused research institutions is a topic of growing international interest. However, there is limited work that considers specific intellectual fields across organisational contexts and across countries. The paper will focus on the field of international development, where major changes in government, private sector and private foundation funders have accompanied changes in the organisation of research institutions. The study considers how the positions, strategies and intellectual interventions of development research institutions are influenced by research context, especially research funding and evaluation. Based on fieldwork with three research contexts - universities, think tanks and bi/multilaterals - across the UK, US and Australia, the project uses three types of analyses: (i) case studies of 12 institutions (ii) quantitative evaluation of research outputs and (iii) discursive analysis of 72 semi-structured interviews. The project considers how research context affects the type of research that is pursued, disseminated, translated into policy or practice and ultimately transformed into the enduring theories and paradigms in the field, as well as how researchers and institutions position themselves in this context. Comparing across contexts and countries, my approach focuses on the ways diverse development research organisations must negotiate institutional alliances, economic constraints and intellectual resources in order to establish their reputation and symbolic capital. I argue that institutions create intellectual change by establishing their location within the 'spaces' between institutional contexts, positioning themselves through the voice of their experts in public interventions. Utilising insights from sociology of knowledge and sociology of intellectual interventions, the paper elaborates the challenges of knowledge production in the context of global political economic changes.

Democracy, Anocracy, and Autocracy: An Analysis of the Link Between Regime Type and Population Health in Africa

Objective There is an extensive literature analyzing the relationship between democracy and infant mortality, however findings are mixed. Some studies find a significant inverse relationship, while others conclude that no such relationship exists. We seek to take the debate in a new direction, overlooked in prior research, by providing a theoretical rational for and empirical evidence of a quadratic relationship, in which countries with components of both autocracy and democracy have higher infant mortality. *Methods* We test lagged, cross-sectional models on a sample of 47 Sub-Saharan African nations. *Results* We find that a quadratic model better explains cross-national variation in infant mortality than the linear alternative. Infant mortality tends to be higher in hybrid regimes, relative to both autocracies and democracies. Hybrids appear to be politically unstable, which may in part account for their greater infant mortality. *Conclusion* Hybrid regimes exist in precarious positions with detrimental consequences for population health.

Rural Pension Reform: What Can China Learn from Latin America?

Over the last five years, China has made substantial progress in developing its New Rural Pension System (NRPS). A major achievement has been the speed with which NRPS has been extended to all rural counties and to hundreds of millions of rural residents. The rapid expansion of this new program has been getting a great deal of international attention, particularly as a potential model for rural populations in other developing counties. However, it is also starting to become clear that NRPS is facing challenges, particularly with respect to benefit adequacy and future incentives for participation among younger workers. The primary goal of this article is to provide a critical review of what has already been achieved in China. We then consider some potential "lessons" for China based on related pension experience in several other countries, particularly those in Latin America. We conclude with a discussion of two promising reforms being discussed by some pension policy analysts seeking to improve the performance of NRPS in the years ahead. One is to transform the current contingent very modest social pension into a noncontingent and more generous social pension. The other is the replacement of the current voluntary funded defined contribution pillar with a voluntary matching defined contribution pay-as-you-go pillar.

Navigating Healthcare in a Public/Private System – the Inequalities of Choice

The notion of choice in healthcare is now so ubiquitous that the potential problems of choice are rarely discussed. Underpinning a dominant rhetoric of choice, evident in health policy, popular, and marketing discourses, are notions that all individuals have the same capacity to choose, that they value choice, and, further, that they will make the 'right' choices. However, our work, employing a Bourdieusian framework and drawing on concepts of capital, habitus and field, identifies choice as far from straightforward. In Australia and many other developed countries, the healthcare field comprises both public and private healthcare services, and there is significant contestation about what healthcare should be covered by public or private insurance. Moreover, individuals are unequally positioned in the social structure, and their beliefs, values, perceptions and knowledge intersect with their position. This makes for a complex set of processes through which individuals travel through, and navigate the healthcare system. In this paper we discuss the structuring of healthcare choice with a focus on the issue of private health insurance. Our Australian study, comprising interviews with 78 individuals who are, or have been, patients, examined the notion of health care choice – the choices that people perceive are available to them; and the choices they make. Our sample included participants with extensive resources to ensure that choice was available to them; as well as participants with few economic, social and cultural resources. We found that for those without the capacity to make choices, the dominance of a rhetoric of choice as desirable contributed to their perceptions of being marginalised within the healthcare system. Our research concludes that in systems where private options are privileged, there is an entrenchment of inequality.

WILSON, ANDREW* (University of Derby, a.f.wilson@derby.ac.uk)

Virtual Nations and Spiritual Nationalism: White Racist Symbolism in Trans-Territorial Digital Communities

There are a range of accounts of the application of ritual bricolage that celebrate its combinatory fluidity for its capacity to make space within traditional forms for progressive positions. The 'Ritual Reconstructed: Exploring LGBTQI Jewish identity' project makes a clear case for this approach. Nonetheless, this multivalency means that interventions into the spiritual realm from reactionary and politically extreme positions become possible.

This paper develops themes first examined in a micro-study of web-based cultural expressions by neo-fascist individuals (Wilson 2012). Whilst that initial study explored the appropriation and reinterpretation of symbolic forms associated with paganism(s) by white supremacist or neo-fascist groupuscules. What emerged was a tendency to reify a mythic version of 'the nation' that depended upon a reading of the nation which situated it within an eschatological framework. Thus the 'Aryan people' (as an abstract national identity for the disparate white power communities) are understood to be facing obliteration and advocates of white supremacy are afforded a heroic role in the survival of a people facing an historical 'end'. This perception of threat becomes mobilised as apocalyptic-conspiratorial rhetoric focussed on signifiers of global change (the 'New World Order') and/or changing value systems ('God hates fags'). The paper is intended to expand on these ideas and to map the recombined symbolic forms typically drawn upon by pan-Aryan racists within a theoretical framework informed by Walker Connor's concept of 'ethnonationalism' and Benedict Anderson's 'imagined communities'. It will be shown that the beliefs of so-called 'lone wolves' such as Anders Breivik and Dylann Roof are, in fact, wholly inkeeping with the rhetoric circulated within the dispersed digital pan-Aryan communites.

WILSON, SARAH* (University of Stirling, sarah.wilson@stir.ac.uk)

Exploring the Significance of Visual Culture in Young People's Attempts to Accomplish Everyday Life in Disadvantaged Circumstances and the Complexities of Representing and Politicising Such Private Circumstances Visually

The practices, rituals and materiality of everyday life have received much recent sociological attention. Miller (2010) argues that the self is constructed through material, including visual, culture. In contrast, the non-development or maintenance of such cultures may reflect a sense of disorientation or of the futility of engaging in the 'work of inhabitance' (Ahmed 2006) required to create live-able spaces in which to flourish. Drawing on a project examining 'belonging', and specifically on an excerpt from a filmed interview with one participant made at the end of the project to illustrate its findings, this paper will first explore the significance of both the use(s) and absence(s) of visual culture to young people's experience, understanding and imagination of their situations and future possibilities in small, ill-furnished flats in social housing after leaving state care. Second it will analyse this film as a modest attempt to highlight visually such experiences and imaginations *and* the links between such fragile living environments and political decision-making, identifying several complexities. First, although not made in a private space, the film may constitute the kind of exposure more often experienced by the marginalised (Ginsburg 2015). However, the non-anonymised interview also underlines aspects of a regime of governmentality, including ethical discourses, that are invested in the *non*-visibility of disadvantaged 'private' circumstances. Second, the participant's self-presentation inevitably draws on highly visible contemporary narratives that individualise disadvantage while obscuring social histories and the workings of power. Yet the interview discussion of the participant's own (accomplished) drawings and his sophisticated use of visual culture to think through his situation also foreground a 'complex' rather than passive or exclusively vulnerable personhood (Gordon 2008). As such, however momentarily, the film troubles prevalent social imaginations of disadvantage, while communicating something of the 'structure of feeling' (Williams 1977) of such circumstances.

WILSON, SARAH* (University of Stirling, sarah.wilson@stir.ac.uk)

Using Qualitative Secondary Analysis to Maintain a Critically Reflexive Approach to Research with 'Troubled' Families

This paper focuses on the way in which insitutional aspects of the research process, including disciplinary boundaries, the demands and approaches of funders and ethics committees, and broader political narratives emphasising the distinctiveness of 'troubled families' may contribute to the further stigmatisation of those considered to fall into such categories. The paper draws on the author's qualitative secondary analysis of data produced for a project on 'ordinary' young people's sibling and friendship relationships. This work was initially undertaken as preparation for a subsequent project with more 'vulnerable' young people who had spent time in state care. While initially conceived of as a means to develop her own conceptions of domestic space and to learn how other researchers had employed visual methods, this experience also interrogated asumptions sedimented over the course of a research career dominated by more 'applied' research with young people in difficult circumstances. For example, she identified a significant minority of situations and narratives in the analysed study which ressembled those highlighted in her previous work with more 'vulnerable' samples. This finding suggested therefore that such more difficult experiences may often be obscured in studies with ostensibly 'ordinary' families both by the lines of questioning thought 'appropriate' based on the initial characterisation of the sample, and the focus of subsequent publications on 'majority' findings. The author also re-considered her previous interpretations of common experiences and strategies discussed by members of more 'vulnerable' samples that tended to emphasise their more difficult circumstances, rather than appreciating the significant overlaps between such strategies and those employed in more 'ordinary' family lives. Most troublingly, she also identified instances where funders' requirements might have led her own research to re-produce negative future expectations of young people from more 'troubled' families, while implicitly reinforcing idealised perceptions of 'ordinary' family lives as 'trouble-free'.

WINCHESTER, DANIEL* (Purdue University, dwinches@purdue.edu)

A Pedagogy in the Passions: Fasting, Metaphor, and the Effects of Embodiment on Discursive Consciousness and Abstract Knowledge Acquisition

Sociologists of culture and cognition have demonstrated the centrality of embodiment to processes of enculturation, knowledge acquisition, and identity formation across a number of cases. Despite the notable advances made by these scholars, the tendency to equate embodied knowledge solely with "practical consciousness" or "habitus" has overlooked the profound ways that bodily experience also shapes social actors' discursive consciousness and their acquisition of more explicit and conceptually abstract modes of knowing. Drawing from an ethnographic study of fasting among contemporary converts to Eastern Orthodox Christianity in the United States, this article demonstrates how non-discursive experiences related to food, hunger, and appetite served as embodied metaphors for comprehending and identifying with more abstract religious concepts regarding the soul, sin, and the acquisition of religious virtue. Based on these findings, I argue for the broader significance of embodied metaphor theory for sociological studies of enculturation, cultural cognition, and identity formation more broadly.

WINCHESTER, DANIEL* (Purdue University, dwinches@purdue.edu)

Matters of Faith: Material Objects As Plot Devices in the Formations of Religious Subjects

What role do material objects play in the construction of religious persons? Drawing from an ethnographic investigation of the evolving relationships between a group of American Eastern Orthodox converts and their religious icons, this article develops an approach to this question that conceptualizes religious artifacts as "plot devices" in the formation of religious selves. Integrating insights from studies of material-sensory religious culture with narrative theories of identity, this article argues that material artifacts become significant to religious identity formation to the extent they act as resources for the configuration of a narrative structure in which transcendent or sacred others play a part. As the empirical details of this study demonstrate, attending to the interplay between the religious object's symbolic meanings (i.e., what it represents) and physical characteristics (how meanings are sensibly made *present* to social actors in embodied interaction) is of vital importance to explaining the role objects have in the religious emplotment of action and experience.

Paths to Justice in Poland

The paper discusses the outcomes of the first Polish study of access to justice and conflict resolution performed according to the guidelines of paths to justice methodology. It was completed in 2015 on a representative sample of 3500 persons and provided information on incidence of justiciable problems, frequency of lawyer use and informal means of resolving legal issues. The questionnaire also included wide range of questions measuring independent variables. The study found that in Polish population justiciable problems are reported relatively rarely and formal methods of resolving them are also fairly infrequent. The analysis also supports the view that the most important factor explaining usage of legal services is the nature of the case, not socioeconomic situation of the party, her beliefs or attitudes.

WINKLER, OLIVER* (Martin-Luther-University Halle-Wittenberg, oliver.winkler@soziologie.uni-halle.de)

Educational Reform, Delayed Education and Social Inequality in Germany

In Germany, over four decades various efforts can be observed to increase the openness in the educational system of Germany. A "side-line" of this reform is the creation of vertical mobility within the multi-tracking school system. In all federal states, the access possibilities for subsequent upper secondary education after having obtained a lower secondary degree have been improved. Such delayed education aimed to compensate for blocked opportunities after the first transition into the secondary school system. From a theoretical view, this upward mobility could be promoted through doubled institutional decision points targeting risk-averse social classes or via late 'realization processes' (*Bourdieu*). Another theoretical argument expects strong social status reproduction processes at these transition points. As a research strategy, I analyze transitions of intermediate school graduates right after completion and at later time points. Current research in this field has not focused on this particular population but rather in delayed education in general. Also, research concentrated strongly on inequality between families' educational background. Less attention has been spent on differences between subdivisions of social strata such as upper and lower middle class. Using data by the National Educational Panel Study, the results from the logit and survival models indicate that delayed education is initiated quicker among upper social classes compared to students from lower social strata. However, members of the middle subdivision of the middle class have the highest chances among all classes for immediate access into subsequent upper secondary education. Children from lower middle class and working class show the longest waiting times. Furthermore, delayed education is more often used by older cohorts. In general, the results confirm a successful opening-up of school structures in favor of risk-averse social classes. At later time points, however, these compensating patterns for blocked educational opportunities in the past become very rare.

WINKLER, OLIVER* (Martin-Luther-University Halle-Wittenberg, oliver.winkler@soziologie.uni-halle.de)

Occupational Classes of Immigrants in East-Germany

In Germany, it is well-known that there is a strong inequality concerning employment chances and occupational positions between the immigrant first and second generation and the non-immigrant population. Generally, these differences arise from depreciation of human capital due to the immigration process. In the long run and despite the "upgrading" of the German occupational structure, research has shown that immigrants remain in lower occupational classes. As this is true for 'labor' immigrants in West-Germany, the situation in East-Germany varies strongly. In the five 'new' federal states of the former GDR the immigrant population is differently composed with ethnic groups mainly originating from Poland, the former Soviet Union, Ukraine and Vietnam. Immigration in the GDR was mainly characterized by students or adults coming from socialist 'sister states' who received vocational training and qualification as well as contract workers. After reunification, ethnic German repatriates from the former SU and qualified immigrants came to East-Germany. Therefore, we expect less inequality in the occupational classes between immigrants and natives in East-Germany. Using data from the Scientific Use Files of the German Microcensus 1991-2011, results from multinomial regression models indicate similar chances for upper occupational classes between non-immigrants and first generation immigrants from Poland and former SU/Russian Federation even after controlling for qualification levels. Their descendants have even higher chances. However, this is not the case for first generation immigrants from Vietnam who face disadvantages. Furthermore, first generation immigrants from all of the studied ethnic groups are strongly overrepresented in the lower occupational classes compared to the non-immigrants. Over time, Vietnamese immigrants were the only group that managed to

reduce their risk for lower occupational positions and to access middle occupational classes. Concerning inequality, we can conclude that occupational class differences in East-Germany are not as severe compared to West-Germany.

WINOGRODZKA, DOMINIKA* (Jagiellonian University, dominika.winogrodzka@gmail.com)

Reflect and Discuss the New Dimension of Informal Work – on the Example of Student Internships

Student internships are the most common form of education-related collaboration between Polish academic institutions and employers (Agrotec, 2014). Next to participation in students research circle, membership in various organizations and voluntary work, these are one of the most popular activities that young people undertake to improve their chances on the labor market. In 2013, as much as 65% of them admitted to working as an intern during their studies (Jelonek et al., 2014).

In theory, the high quality of student internships is in the interest of all the parties involved. Simplifying, students hope to improve their knowledge, skills and competences required on the labor market; employers want to recruit well-groomed candidates, and academic institutions aim to provide high quality of education, which is also understood as preparing students to take up employment. In practice, it does not always look in that way – but why?

To what degree do student internships form a new dimension of informal work in contemporary societies? What are student experiences with internships? What are the hallmarks of a high quality student internship? How much are the standards set out in the Polish Apprenticeship and Internship Quality Framework followed by internship providers? Is there a need for improvement in the area of organizing student internships? What are the major challenges posed to academic institutions that face low quality internships? You will find an answer to these and other questions by listening to the presentation delivered by the speaker.

Young Middle-Class Activists in Lima, Peru: Hopes, Fears, and Civic Subjectivities.

This paper draws on a recent research project on political and civic discourses and practices among young middle-class people in Lima. It addresses their narratives of the city, hopes and fears for its future, and the civic subjectivities they constructed in response to these narratives.

Many participants identified political culture (including apathy, corruption, and a retreat into the private at the expense of the "public") as one of the city's most important problems. With a view to the future, many feared that "nothing might change", especially with respect to citizens' mindset. Accordingly, their hopes centred on the possibility of a collective civic and political awakening, which might bring about change. In particular, many drew hope and inspiration from recent youth-led protests and "capable people" in their own circles, who were involved in politics.

Faced with this situation, most saw themselves as responsible for helping to bring about change. However, the traditional political landscape did not provide attractive options for getting involved, as established parties were seen as hierarchical and discriminatory, ideologically backward, corrupt, and unable to make a change.

In response, they developed three broad strategies: while one group aimed to engage with politics through alternative "new" organizations, such as collectives and other small-scale groups, or even by founding their own party, others veered away from politics and instead hoped to make a change through private organizations, such as NGOs or social enterprises. A third group felt they could contribute most by working in government and improving its performance.

A unifying factor in the construction of these civic subjectivities was their recourse to professionalism: all three groups drew on their privileged position as an educational elite when constructing their role in society and their ability to make a change, a subjectivity that could be described as "professional citizenship".

WINTER, FRANKA* (Maynooth University, franka.winter@nuim.ie)

Young Middle-Class People Looking for Political Alternatives in Lima, Peru

This paper draws on a recent study of political and civic discourses and practices among young middle-class people in Lima, Peru.

It addresses their relationship with politics by discussing their perceptions of established political organizations (such as political parties and unions), their po-

litical utopias of ideal political organizations, and their attempts at doing politics differently in alternative political organizations.

Most of my participants were highly critical of established political parties, which they perceived as hierarchical, ideologically backward, corrupt, and unable to make a change. Several in particular highlighted dynamics of exclusion based on gender and age. In consequence, political parties were not an attractive option for most of my participants.

However, this disillusion did not translate into political alienation. To the contrary, many of my participants were very interested in politics. There was furthermore a strong feeling that young, educated people like themselves could be crucial agents of change, and many drew inspiration and hope from the "new generation" they belonged to.

Shunning traditional parties, many of my participants participated in (or even founded) alternative organizations, such as collectives or other small-scale groups. Some even even participated in local elections through these alternative organizations, but remained opposed to the idea of becoming a party. These alternative organizations were seen as "fundamentally different" from political parties and appealed to my informants for their different structure and political culture, which was often described as bottom-up, horizontal, inclusive, and coherent with respect to its values and moral integrity.

The paper concludes with some reflections on the limitations and trade-offs that come with these new political organizations, in particular whether they can overcome (or merely transform) exclusions in a highly unequal society.

WITTE, NICOLE* (University of Goettingen - Center of Methods in Social Sciences, nwitte@gwdg.de)

Express the Inexpressible - Sketches As Data for a Reconstructive Analysis

„There's almost no privacy in the camp." This statement of a refugee camp dweller in the Westbank was one the very few explicit references to the social 'density' and the confined space in the camps. Although rarely expressed this lack of 'space' was always co-present in the habitus of our interviewees as well as in their patterns of (inter-)action; e.g. their skill to navigate through dense crowded streets while talking. Asked about their perceptions and experiences of the narrow and crowded streets, the interviewees were not able to answer, because they hardly understand what they were asked for. Well-practised and part of their patterns of interpretation and interaction these actions could not be verbalized. This 'lack of verbalization' becomes even more obvious concerning material conditions; after a while you won't realize the bullet-holes in the walls of the neighbouring-house.

The sociological biographical research mainly focuses on reconstructing the genesis, reproduction and transformation of (conscious and unconscious) patterns of interpretation and interaction, mainly by hermeneutic analysis of (interview-)texts. In this regard the questions occur if the above mentioned parts of the environment of the actor could be verbalized in interviews in a sufficient and adequate way. And moreover it is worthwhile to think about how objects difficult or even impossible to be verbalized could become data (for reconstructive analytic methods).

In my talk I will present a method of data collection apart from interview-text as well as a method to analyze these data. Both were applied during my research in Israel and Palestine in the scope of a joint research project. For data collection we asked our Interviewees to sketch their 'space' to live. These sketches were analyzed in a hermeneutic and reconstructive manner to gain insight into relevant contexts of action and into cognitive representations of material and immaterial contexts.

WITTE, NICOLE* (University of Goettingen - Center of Methods in Social Sciences, nwitte@gwdg.de)

Palestinian Women in Haifa – Resistance As Biographical Work

In my talk I'll deal with the (collective) constructions of belonging of Palestinian Women in Haifa, Israel. From 2010 to 2014 I conducted narrative biographical interviews with these women in the scope of a joint research project funded by the GRF.

To label them as Palestinian women is due to the ongoing social construction of collective belongings and their fluid interrelations but also to the likewise socially constructed perceptions of the self and the others which are subject to a hegemonic (‚glocal') discursive field that demands to position oneself as 'Palestinian'. In my paper I want to focus on the adoption or rather construction of these belongings and images by the women, which are closely connected to (violent) resistance against Israel.

The women I interviewed have difficulties to meet the discursive demands of being Palestinian from several reasons in comparison to Palestinians living outside Israel, e.g. in the West Bank. Important elements of 'Palestinianess' are suffering from and (violent) resistance against Israel in the sense of the hegemonic discourse. The structural violence in the state of Israel the women suffer from

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

(institutional racism) does not 'matter' as much as suffering from occupation. Moreover the violent resistance against Israel (in terms of 'throwing stones') 'is' adolescent (and) male.

Therefore, the women don't perceive their self definitions and definitions by others as Palestinian as 'natural' or unquestioned. Throughout the courses of their lives they have 'learned' rather than 'experienced' these constructions. On the other hand other belongings (e.g. gender or religion) are always entangled with 'being' Palestinian. The auto-biographers are not just 'women' but 'Palestinian women'; their involvement in political action or (violent) resistance against Israel therefore serves a political, as well as the biographical aim to strengthen and maintain their collective belongings.

Forced Migration and Mobile Communication Technologies

People seeking asylum have become part of the daily news agenda and political intervention not only in Europe, Africa, and the Middle East but around the world, including East Asia. The topic of mobile technologies and forced migration has received academic attention for a while but only through the extensive media coverage on refugees in the summer of 2015 did the topic enter public discourse. Mobile technologies are central to forced migrants' lives as they are sources for economic survival, maintenance of transborder relationships, and navigation of flight routes (Leurs & Ponzanesi, 2014; Witteborn, 2015). Forced migrants have become connected migrants (Diminescu, 2008) as they use GPS for safe flight routes, Facebook to understand a place and its people, WhatsApp or WeChat for local communication, and social media to connect with family, find friends, archive flight experiences, or give advice to other displaced people (Papadopoulos, Stephenson, and Tsianos, 2008; Witteborn, 2012, 2014). This paper focuses on how asylum seekers and refugees engage with mobile technologies in Hong Kong as a space that is exemplary for arrested spatialities and temporalities. Asylum seekers in Hong Kong tend to spend several years in the city for their claim to be processed and then to be repatriated. Through personal interviews and observation of their mobile media practices, the study illustrates how asylum seekers and refugees use mobile technologies for sociocultural, political, and economic purposes, how they create virtual mobility, and connect Hong Kong as a transit space to global flows of information, goods, and people within (East) Asia and beyond. The theoretical base for the study is the autonomy of migration (e.g., Moulier-Boutang, 1993; Mezzadra, 2011) and how mobile technology practices arising from forced migration shape the social, political, and economic spaces of asylum seekers and refugees living in Hong Kong.

WOEHL, STEFANIE* (University of Applied Sciences BFI Vienna, stefanie.woehl@fh-vie.ac.at)

Gender Regimes Revisited in Times of Economic Crisis

This paper develops a gendered state-theoretical framework to show how capitalism as an economic system and the nation-state reproduce gendered hierarchies on multiple levels. With a focus on the symbolic masculine cultural order and its hegemonic political rationality of governing, the current economic crisis and its effects on gender regimes is discussed more specifically. With examples from case studies on new economic governance forms such as the Fiscal Compact and the 'Sixpack' within the European Union, the material effects of these policies and their symbolic meanings are highlighted. The paper therefore challenges the varieties of capitalism literature on gender, arguing that a broader framework of analysis is necessary to capture the intersectional dimensions of domination in capitalism for different subjects. It asks which institutions play a decicive role in changing gender relations and if the supranational level has gained momentum in changing gender regimes to a more uneequal set of affairs. In the European Union, the nation state seems to loose ground to a certain extent in this context.

Level of and Change in Cognitive Functioning Among Dutch Older Adults: Does Neighborhood Socioeconomic Status Matter?

Along with demographic changes, issues of age-related cognitive decline and impaired cognitive functioning have become more prevalent. In attempts to identify predictors of cognitive functioning (i.e. the abilities to attend, think, reason and to recall information) in older adults, researchers have looked into features of the residential neighborhood of older adults, especially neighborhood socioeconomic status. Yet, previous findings have been inconclusive due to cross-sectional designs of the majority of studies. Since a true contextual neighborhood effect requires differences in the strength of cognitive decline over time, this study goes beyond the cross-sectional examination of level differences in cognitive functioning and additionally investigates whether the socioeconomic status of a neighborhood also predicts the strength of decline in cognitive functioning over time. We argue that neighborhoods with a higher (vs. lower) socioeconomic status are more likely to provide experiences that are beneficial for cognitive functioning, especially opportunities for social, intellectual and physical activities.

Official statistics on neighborhood socioeconomic status were combined with data from the third, fourth and fifth wave of the Longitudinal Aging Study Amsterdam, covering a 6-year period. Using a structural equation modeling approach, linear growth curves of Mini Mental State Examination-assessments of older adults aged 57 to 88 years at baseline in 1995 were calculated. Individual socioeconomic characteristics were controlled to account for selection into neighborhoods.

Preliminary results suggest that the effect of neighborhood socioeconomic status depends on the degree of urbanity. While we did not find an effect of neighborhood socioeconomic status on the level of cognitive functioning in urban areas, it seems to make a difference in rural areas. Specifically, in rural areas, the level of older adults' cognitive functioning tends to be higher in neighborhoods with a higher (vs. lower) socioeconomic status. No association between neighborhood socioeconomic status and change in cognitive functioning was found.

Between Love and Anger: The Role of Emotions in the European Fathers' Rights Movements

The main goal of my paper is to present and analyze the role of emotions in European fathers' rights movement(s) belonging to the wider group of men's social movements. Fathers' rights groups, networks and organisations exist in all European countries and are one of the most recognizable and "powerful" phenomena among all European men's movements. However, in spite of the role of emotions in mobilization, activism and/or failure/success there is still a lack of comprehensive, comparative research on the European dimension of the movement. Therefore, in the presented paper I will attempt to answer the following questions:
1. What types of emotions are expressed and/or used by the activists of European father's right movements?
2. How dominant emotions influence on the character of the movements?
3. Are there any movements' "emotional strategies" and how do they impact on the movements' failures or successes?

The analysis will be developed on the basis of a) desk research and b) qualitative research on the contemporary European father's rights movements conducted between 2009 and 2011 with 16 members of dozen father's rights groups in Poland as well as on the ongoing research on European father's rights movements which has been conducted since Fall 2014 in Sweden and United Kingdom.

Swedish Physicians Working for International Help Organizations – on New Work Contexts, Knowledge and Reflexivity

What do Swedish physicians experience, teach and learn when they work abroad at international organizations like MSF/Doctors without Borders, the Red Cross, Operation Smile or the United Nations? How do they share their experiences with other medical professionals when they return to the Swedish workplace? My paper is based on an interview study with doctors who have returned to Sweden and it combines theories of knowledge with Pierre Bourdieu's concepts. I discuss how the physicians reflect on performing their professional role under unusual and at times difficult circumstances, encountering different medical, organisational and local subcultures and gaining and sharing practical and theoretical knowledge. The work abroad is often guided by acute requirements rather than accurate scheme. It puts the well-known, taken-for-granted medical practice into perspective. The Swedish doctors in the study talk about the sometimes tough, but educational adjustment to the new cultural and occupational context. Sometimes, they have to deal with disasters and extreme stress, and there are ethically complex issues when equipment or medicines are perceived as inadequate. In their very reflexive accounts, the doctors appreciate the valuable experience of saving or improving lives, making a difference with small means, as opposed to the overly organized Western medical care, but there are also critical reflections about the long-term benefits of this kind of contribution. The doctors are especially concerned about the post-colonial implications of working in the global south. When they return to a Swedish workplace, their experience is often met with a positive, but rather shallow interest and there is seldom any systemat-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ic arrangement for knowledge transfer or utilizing their experiences in the Swedish context. Neither is all knowledge regarded as relevant and valuable in the Swedish/Western medical and organizational reality.

Climbing up the Ladder. the Changing Role of Nurse Managers within the German Hospital Management.

While there is evidence that medical directors or physicians that become clinical directors face tensions between medical professionalism and managerial control (Kitchener 2000, Witman et al. 2010, Correia 2013) and thus have to manage institutional complexity (Blomgren/Waks 2015), relatively little is known about the orientations of nurse managers in hospitals. Based on in-depth interviews with nurse managers in German hospitals we analyzed their perspectives and symbolic constructions. Different to medical directors they don't perceive themselves in the dilemma between managerialism and professionalism (nurses) perspectives. As their aim is the well-functioning organization, their social orientation is more familiar with the managing director than the medical director. Furthermore nurse managers use parts of the nurse logic (e.g. the skills of organizing processes) to legitimize their manager's position and distance themselves from the so called "particularistic" behavior of physicians.

We use different theoretical approaches to make sense of the coherence of these instructive inner conceptions and the embeddedness in the hospital management. From an institutional-logics perspective (Thornton et al. 2012) nurse managers use the nurse perspective to stabilize their manager's position. Although they got socialized as nurses they distance themselves from their former domain and use the nurses semantic in an instrumental sense. From a field-level perspective (Fligstein/McAdam 2012) the organization could be understood as power struggles between different groups. Nurses are subordinated to physicians (e.g. their work is dependent from doctor's instructions) and the introduction of hospital's managers lead to a loss of power for physicians. From that angle, the growing identification of nurse managers with the general hospital management enables them to take influence not only in organizational but also in medical decisions.

WOLF, JULIAN* (Universitat Witten/Herdecke, julian.wolf@uni-wh.de)
MOLZBERGER, KASPAR (Universität Witten/Herdecke)

Emerging Identity- and Control-Based Arrangements Between Hospital Directors, Chief Physicians, Practitioners and Patients: The Case of the German Public Health Sector.

While the classic professional bureaucracy (Mintzberg 1983) was said to have relatively rigid boundaries, the contemporary field of hospitals is marked by increasing and tightening external network activities (Scott et al. 2000: 60). Due to rising economic pressure that German hospitals are facing, former stakeholders are no longer taken for granted. Specific patient groups (e.g. private patients or patients with more complex and therefore economically profitable diseases) and doctors in private practice who work close to the hospital are now becoming much more relevant. However, what kind of implications this has for the involved actors, in terms of the actual networking activities and identity constructions, remains unclear. In-depth-interviews with chief physicians and hospital directors were conducted to analyze what actual identity attributions and control arrangements (White 2008) are being deployed between hospital directors, chief physicians, practitioners and patients within the given network structure.

There are at least three results that shall be presented on occasion of the session:

1. Through joint control projects by hospital directors and chief physicians (e.g. legal acquisition of a private practice license for the respective chief physician) both manage to sustain their economical identity (as director) *and* professional autonomy (as physician).
2. Increasing networking activity between chief physicians and doctors in private practice may lead to "switching" of contexts which in turn leads to a change of identities. Some chief physicians perceiving themselves as network actors try to grasp the "logic" of the doctors in private practice in order to integrate it into their own actions.
3. Patients are commonly referred to as dependent and uninformed who therefore follow the advice of their doctors in private practice when it comes to select their hospital of choice. In some instances though patients are able to develop a kind of complaining power that influences the doctor's decisions.

WOLF, MARCUS* (University of Bremen, wolf.marcus@hotmail.de)

The Political Voice of Everyday Finance – Debtor and Creditor Organizations in Post-Crisis Financial Regulation

Debt and credit have been central motors of social change throughout the history of capitalism. In the course of the financialization of everyday life in the 20th century, conflicts from these new market spheres become visible in the political arena. In my contribution, I want to examine the activities of debtor and creditor organizations in the re-regulation of financial markets after the financial crisis of 2008.

Research on financialization and financial regulation leaves at least two major issues insufficiently addressed that deserve closer scrutiny. Firstly, scholars of financialization have yet to systematically consider the political repercussions of financialization, especially the effects of credit expansion and increasing indebtedness for both civil society and the political arena. Secondly, Scholarship on financial regulation, has for long underestimated the role of civil society actors. This is especially true for consumer debtor and creditor organizations. The former represent indebted individuals' claims with regard to 'predatory lending practices' or high household debt. Creditor organizations represent individuals holding assets in financial markets.

Taking the example of consumer organizations in financial markets, I will ask how the expansion of debt and credit in households has changed the ways in which civil society actors act in the regulatory field of global finance and why certain types of consumer organizations were included in reform discussions. Using the examples of two EU and two US consumer organizations, (Better Finance and BEUC for the EU; Consumer Action and NAIC for the US), I will analyze how former institutional outsiders took part in the shaping of new consumerist reform discourses and which parts of their suggestions were integrated into reforms.

My paper will thus contribute to a better understanding of the organizational dynamics of credit and debt in the political sphere.

Heating Practices and Non-Technical Energy Saving Potentials

Space heating of private households is usually described as technically or economically determined: Either – by architects – in terms of standard users with standardized heating needs. Or – by economists – in terms of rationally calculating individuals that make their choices according to changes in prices or income. We argue that these descriptions are both insufficient, since heating is embedded in habitualised patterns of everyday practice, which are rather stable over time (i.e. inelastic in respect to price and income changes) but different between households (i.e. not following a universal standard). These behavioral patterns are described as "habitus" in the sense of Bourdieu, i.e. as schemata of perception, classification and action.

Our quantitative data contains the actual energy use of 130 households as well as the calculated energy requirements of their apartments (which depends on physical insulation, size and location of the flats within the building). Combining these data, we can distinguish two factors determining energy consumption: "behavior of the household" versus "physical energy requirement of the flat", both with a rather high variation (VAR > 0.4).

Additionally we interviewed 50 of these households with standardized as well as open questions concerning their energy use, individual heating, and ventilation comfort. We then seek to explain the heating behavior with a special focus on heating comfort, need for fresh air, ease of handling, and frugality. Controls comprise technical knowledge, time spent in flat etc. On this basis organizational non-technical energy saving potentials should be identified. This may result in a more targeted moving of households with behaviorally induced high energy spending to better insulated flats – thus mitigating "fuel poverty" as well as climate change.

Toward Transnational Citizenship in East Asia: Taiwan, South Korea and China

This paper explores a new alternative way of conceptualizing the issue of migration in East Asia, base upon the large scale social transformation since 1990's - post- authoritarian transformation in Taiwan, post-socialist transformation in

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

mainland China, and neo-liberalization in South Korea. These large social events all linked with one another, and the case of overseas Chinese in South Korea entails this transnational inter-connection in East Asia. Citizenship in South Korea is blood-based by descent, thus overseas Chinese in South Korea hold Taiwanese passports with Chinese ethnicity though they wer born in South Korea. Their transnational multiplicity includes Shandong province as origin, South Korea as settlement and then birthplace, and Taiwanese for their membership. It is a very complex trifurcating citizenship which goes beyond the boundary of one single nation-state. They have become "strangers" in their own birthplace and have gone through the process of exclusion and marginalization. However, from 1990s, there have been some changes. First, Taiwan went through the major changes - it has brought the rise of independent Taiwanese identity. For overseas Chinese in South Korea, this means that Taiwan stops being a safe heaven for them since they lack "authenticity" as Taiwanse. Second, the opening up and the reform of PRC, and following normalization of the diplomatic relations with South Korea had opened new opportunities for them to be a bridge between PRC and South Korea. Third, the South Korean government initiated the relaxation of their rigid, discriminatory policies against them after 1997 IMF financial crises. These large scale social transformation in each country are socially interconnected cultural "events" in William Sewell's sense, challenging the old notion of national citizenship. This paper attempts to understand these transformations, and argues that migration should be understood within the context of the large scale social "events."

WONG, CATHERINE MEI LING* (The Cairns Institute, James Cook University, catherine.wongml@gmail.com)

Hybrid Risk Governance: Integrating Knowledge-Based and Value-Based Decision Making

Major industrial accidents like the Fukushima nuclear disaster show us that such events are often neither unprecedented nor unexpected. Disaster incubation occurs within organisational structures; risks are amplified when the public is not involved and informed; and the impacts often spread across industries, national boundaries and value systems. Risk management, therefore, demands more than technical risk assessment. It requires a participatory process to ensure 1) fair and equitable distribution of risks and benefits, and 2) incorporate the knowledge, values and interests of all stakeholders in decision-making. But what does this mean in practice? The speaker presents a Hybrid Risk Governance Framework as a format for multi-stakeholder engagement. This model offers a comprehensive set of procedures that corporations, policy makers, risk managers, etc. can use to navigate the participatory process at various stages of a project. Examples will be drawn from a case study of nuclear power in India after the Fukushima disaster.

Living Arrangement Preferences in Southeast Asian Modern Societies

Living arrangements in modern societies in Southeast Asia are undergoing significant changes. The decline in fertility, changing family structures, together with society's changing socio-economic conditions all play a role in the change in living arrangements. Against this backdrop, individual preferences regarding living arrangements play a key role in determining actual living arrangements. This study investigates living arrangement preferences of individuals in these Southeast Asian societies: Kuala Lumpur and Selengor in Malaysia, Bangkok Metropolis in Thailand, and Hanoi in Vietnam. Specifically, the study focuses on whether the respondent thinks it is desirable for three generations (older people, their married children, and grandchildren) to live together. The study employs the Comparative Asian Family Survey (CAFS) datasets collected in Kuala Lumpur and Selengor, Bangkok Metropolis, and Hanoi during 2010-2011. Each survey followed a multi-stage sampling approach. For the family survey in Kuala Lumpur and Selengor, information was collected from 1,883 respondents aged 18 and above. For the Bangkok family survey, 1,092 respondents aged 17 and above living in Bangkok Metropolis were interviewed. For the Hanoi family survey, data was collected from 1,219 respondents aged 18 years and older. Logistic regression analysis is employed, where the dependent variable is the answer to the question whether the respondent thinks it is desirable for three generations to live together. The main independent variables include gender, age, education, marital status, and number of children. Other control variables are also included. Age is divided into groups to demonstrate different values of people in different generations. Three separate regressions are run for each society. As each society is undergoing different stages of demographic transition, the similarities and differences in

the living arrangement preferences and their determinants are compared and contrasted.

WOOD, LISA* (Lancaster University, l.a.wood@lancaster.ac.uk)

"It's Not the Way We Do Things Here": The Meaning of Organisational Place When Work Goes on the Move

In this institutional ethnography of paramedic work, I explore how mobile work maintains organisational identity when the physical space in which the work takes place is continually changing. In opening up the often-invisible institutional relations and connections, I examine how the introduction of technologies (not just information or communication technologies but a more broader definition of the term) allows for increased remoteness on one hand and forms of proximate control and direction on the other. I argue that such technologies of belonging (or control) can take the form of plans or protocols (physical or virtual) or material elements such as uniform, that shape, influence and control but also facilitate, enable and authorize mobile work to take place.

Drawing on ethnographic 'work along' interviews with ambulance crews and ambulance control centre staff, the data is interrogated to elucidate these highly mobile working practices, specifically drawing out practices and technologies that bond work to places or organisations. Through focussing on the actual activities of paramedics as they are engaged in their work, the analysis describes the spaces in which this work takes place and the ways in which the work remains tethered to organisational bases and centres of control.

Modes of ordering, exposed through the institutional ethnography, are unpacked to reveal how mobile work practices are based upon existing and continuously redefined organisational arrangements that are carried and embodied by mobile workers. I argue that tacit processes of knowing and belonging cement mobile work practices. In order to maintain organisational identity during ever changing locations of mobile work, as typified by ambulance work, workers are required to continually perform, embody and represent material, social and technical connections and ties. These performances of order, through ordering, enable (and shape) the work that is subsequently done.

WORDEN, SANDY* (The University of Queensland, s.worden@uq.edu.au)

Assessing the Social Risk of Coal Mining Projects

'Risk' and 'uncertainty' are concepts that are embedded in global mining industry discourse. For many decades mining companies have routinely conducted risk assessments to identify and address project and operational risks. Through this experience a suite of evaluation processes and tools have developed across a range of disciplinary domains, including mine planning, production, workplace health and safety, environment and mainstream business. Social aspects have only recently been incorporated into project risk assessments in the mining industry. Social risk analysis is still in its infancy. Empirical analysis in this area is limited, particularly in the project environment (that is, the period before the project approval process when project proponents begin to conceptualise new mines or major expansions). This paper addresses that gap by considering how project teams grapple with social risk analysis in the techno-scientific risk framework. This framework lacks processes and tools specifically developed for analysing social factors. In addition, there are divergent views on what social risk actually means. How does all this affect the risk assessment process? In answering this question I draw on a series of in-depth interviews with 30 mining professionals from diverse organisational and disciplinary backgrounds working in the coal mining project environment. I argue that the risks that coal mining projects pose to individuals and social entities cannot be adequately understood nor addressed without greater consensus and clarity about the meaning of social risk, without appropriate tools, and without skilled and experienced social risk analysts. Furthermore, if project proponents do not expand their techno-scientific approach, a dissonance will remain between the project risk assessment outcomes and stakeholder perceptions of risk and their reactions to projects.

WORM, ARNE* (Center of Methods in Social Sciences, University of Goettingen, arneworm@t-online.de)

Constructions of Belonging As Stigma and/or Capital in Transnational Spaces - Biographies and Courses of Migration of Syrian Refugees in the Spanish-Moroccan Border Region.

Processes of migration are usually accompanied by changing images of the self, group belongings and perspectives on other groupings with various concerns (e.g. gender, religion, ethnicity, class). It can be viewed as an important achievement of a transnational theory to put this notion into the center of sociology of migration and thereby to (re-)consider the perspectives and agency of migrants.

Based on my PhD project on processes of (re-)grouping within the courses of migration and biographies of Syrian refugees – which is part of the DFG-funded research project "The Social Construction of Border Zones"– I want to discuss the benefits of combining a transnational perspective on migrants and migration with biographical and figurational theory. I want to show (1) how (illegalized) migration is intertwined with changing constructions of belonging and (2) and how these changes are embedded in (unequal) power relations (figurations) in the present and the past.

I will present examples from our fieldwork in the Spanish exclaves in Northern Africa, Ceuta and Melilla, and discuss that changing constructions of belonging are not just a by-product of transnational migration processes. These changes rather give us insights into the inherent logic of (illegalized) migration to the European Union where 'belonging' can either function as a resource/capital and/or a stigma/means of exclusion. To reconstruct these 'dynamics of belonging' as a part of crossing borders also means to transfer questions of agency and heteronomy, the power of (nation) states and actions of transcending this power, to an empirical level. To do this, I will argue, we have to pay attention to the complex *interrelation between life courses and the collective and family histories* of migrants as well as *their figurations with other groupings* before, during and after a migration project.

WORTHINGTON, LISA* (Western Sydney University, L.worthington@westernsydney.edu.au)

Digital Islam: In Search of Gender Equality Online

Muslims find it increasingly easy to bypass formally trained religious scholars online in the search for 'authentic Islam'. The discursive space of the Internet allows Muslims to create a new form of imagined community or a 're-imagined 'umma'. For progressive Muslims the Internet presents a space where gender equal visions of Islam can be both discussed and also encouraged in the offline world. In the case of progressive Islam we see that hybrid Internet spaces can facilitate, sometimes inadvertently, critical perspectives on Islam and can aid in the dissemination of alternative, more gender equal, religious knowledge. On the Internet the locus of the 'real Islam' and the identity of those who are permitted to speak for Islam becomes ambiguous. This paper intends to investigate the use of the Internet by progressive Muslim groups to create a space where like-minded Muslims can gather to share gender equal interpretations of Islam, support each other and sometimes worship in an online context. Data for this paper will be drawn from observations and qualitative interviews gathered during fieldwork in the United States in 2013 and also via Skype. This paper will argue that progressive Muslims are utilising the Internet to destabilise traditional Islamic authority structures in order to generate more gender equal interpretations and practices.

WOTHERSPOON, TERRY* (University of Saskatchewan, terry.wotherspoon@usask.ca)

Indigenous Education in Canada: Representation, Rights and Democratic Colonization

In Canada as in other white settler societies, formal education has a dual significance for indigenous populations. As a tool of colonization, schooling has contributed to the subordination of indigenous people and perspectives throughout much of the nation's history. However, education is also valued as a key entry point to foster opportunity and success in contemporary societies. In recent years, numerous educational reforms and initiatives across the nation, in conjunction with other significant social developments, have fostered renewed hope that many of these educational aspirations can be realized but the outcomes of these reforms remain mixed. This paper examines developments and discourses related to indigenous people's struggles to achieve objectives to have an education system framed in accordance with principles of cultural relevance and parental control. These are illustrated with reference to official policy documents and statements as well as public commentary on indigenous education issues represented in media websites. The analysis demonstrates how processes of "democratic colonialism," representing a particular form of what Bourdieu calls symbolic violence, contribute to decolonization and advancement of indigenous people's rights and status while at the same time posing barriers as indigenous people and their interests continue to be stigmatized and undermined in many important respects.

Gender Equality and Quality of Life in Older Age

Gender equality (GE) and quality of life (QoL) are rarely studied together. GE is usually studied with respect to people in reproductive age and the number of studies aiming at investigation of the impact that GE could have on QoL of older people is scarce. QoL as determined by ageing process is widely discussed in the literature. Positive ageing is defined as an ability to maintain social relationships, cognitive efficacy, social competence, personal control, etc. Among the dimensions of QoL most frequently mentioned by older people themselves there are social contacts within and outside the family, happiness, etc. It should be investigated if GE can be seen as potentially contributing to the higher QoL of older people and if older age is a period in life when individuals may strive for achieving greater GE in order to lead more satisfactory and healthy lives.

Within this context our study 'Gender equality and quality of life-how gender equality can contribute to development in Europe. A study of Poland and Norway' focuses on GE and QoL hypothesizing that GE is a major factor for improving both men and women's QoL.

In order to explore GE and its impact on QoL in older age we have conducted FGIs with older participants, asking them about their own experience with gender in/equality, costs and benefits of in/equality, areas of in/equality, QoL, social policies and their results on the lives of men and women, etc. The aim of the presentation is to discuss selected results of FGIs.

E-Movements and E-Mobilizations: A Twitter Analysis of Two Campaigns of the Anonymous Hacktivist Movement

By analyzing Twitter data related to two November 2014 protest campaigns of the Anonymous global social movement, this paper explores how and why movement actors used the public social media platform to help organize and communicate information. First, I address the question of *how* by quantitatively examining tweets which used hashtags and other terms specifically pertaining to one campaign, the Million Mask March. I identify four chronological phases (planning, situational, action, and aftermath) throughout the duration of the march. I also conduct a thematic qualitative analysis in order to see in greater detail what movement actors are saying during the peak hours of the march, from which I derive four categories of statements (rallying cries/solidarity, logistical, security/legal, and purpose). Second, I address the question of *why* by comparing Twitter activity from the Million Mask March with that of the second campaign, Operation KKK. This comparison illustrates some of the differences between e-mobilization and e-movement tactics. In doing so, I address a gap in social movement research identified by Earl & Kimport (2011). By comparing both an e-mobilization and e-movement campaign of the Anonymous movement, this paper aims to illustrate some of the subtle differences between the two and build a greater understanding of precisely how and to what extent the Internet is impacting social movement activism.

Narrating the Impact of Child Sexual Abuse on Adult Mental Health

In response to increasing societal concerns about the widespread sexual exploitation of children, Australia is currently undertaking a major public inquiry: the Royal Commission into Institutional Responses to Child Sexual Abuse (2013-17). Central to the evidence being gathered is the testimony of individuals who have experienced abuse in institutions. Typically, such testimony includes reflection on survivors' views of the long-term impact of child sexual abuse, notably, major psychosocial dysfunction. Drawing on witness statements tendered to the Royal Commission, this paper examines biographical accounts of mental health problems and their link to sexual abuse in childhood. It utilises testimony from more than twenty public hearings and over one hundred individual statements. The paper begins by considering the particularity of the context in which these biographical accounts were constructed – a major public inquiry – and in so doing, evaluates the methodological possibilities and limitations of using testimony from public inquiries as social science data. Employing a thematic analysis, it then considers these narrative accounts alongside evidence in the scholarly literature, particularly psychological studies, of the often profound and long-term impact of sexual abuse. Drawing on Jeffrey C. Alexander's theory of cultural trauma, the paper then examines how individual narratives are both shaped by, and also influence, broader societal understandings of the effects of child sexual abuse. The analysis illuminates how the construction of childhood trauma has been made possible by a cultural climate of increasing openness and disclosure on the one hand, and high levels of psychological literacy amongst the general population on the other. Finally, the paper makes some speculative observations on contemporary constructions of the impact of abuse and dominant narratives of trauma that have emerged in concert with major public inquiries, like the current Royal Commission in Australia, and similar inquiries globally.

Public Engagement with Risk in the Era of Resilience: Insights from Empirical Research

This paper explores community resilience policy in the UK as an engagement agenda which aims to collectively involve citizens in identifying, prioritising and preparing for risks. Drawing on qualitative research carried out in Swansea, UK, I explore the feasibility of achieving widespread public engagement with risk, and to what extent shared risk can be understood as a feature of community membership and therefore to provide the grounds for localised collective action. I also consider how everyday perceptions and experiences of risk compare to treatments of risk in official policy. The paper suggests that there are considerable differences between the risks which are prioritised by the research participants and those which are prioritised in local and national risk registers, with participants focusing on issues such as struggles with money and precarious work, rather than on the physical and security risks emphasised in risk registers. I also suggest that risks are distributed unequally across different groups, undermining the idea that geographical communities (which are the primary target of community resilience policy in the UK) necessarily have shared fates. Furthermore, I argue that different kinds of risk cannot be disentangled, and that it is necessary to understand the aggregated impact of different forms of chronic and acute crisis in order to understand how the capacity to cope with risk is distributed amongst different groups living in different places. Contemporary accounts of how people engage with, prepare for and understand particular risks are contextualised within a broader historical narrative of the experience of risk in the case study over time. In this sense, the role of previous experience in shaping contemporary attitudes towards risk is considered.   Some implications for the community resilience agenda are drawn out.

The Emotional Labor of Social Interactions in Digital Play: Negotiating Play Performances

This work examines the emotional labor employed by participants who engage in on-line gaming and the impact of such labor on their social relationships both within and outside the game. Given that on-line gaming, social media and the Internet in general are such a large part of global leisure, knowing how emotional labor is produced and how it impacts both participants and non-participants, is important when we make assertions of alienation from or engagement in the politics of everyday life. I argue that engaging in on-line public performances where failure and success are never assured brings into play a set of complex social negotiations, both between players as well as players and non-players. Interpreting a stranger's motivations for acting, negotiating with one's family and peers, responding to changing software configurations produced by gaming companies and grappling with language and cultural differences on a global basis, define just one set of issues which have to be negotiated for successful play, i.e. fun, to be had by all.

Given the anonymous nature of much of digital game playing, additional negotiations have to be performed often involving the supposed race, age, gender and sexuality of participants. Failed performances as well as successful ones can be the grounds from which intense discussions and heavily laden emotions are produced. This paper, drawing upon interview data and participant observations collected in the early 2000's on the players of the first person shooter game *Counter-Strike* and later in 2008-2011 with players of an MMORPG, *World of Warcraft,* looks at these negotiations and asks how they have changed over time. The paper concludes by raising questions of how our theories of alienation may miss these struggles of participants and non-participants alike and how we may recast such theories giving more active agency to fans and on-lookers alike.

Family Structure, Parent-Child Interaction, and the Subjective Well-Being of Children with Different Migration Experiences: A Comparative Study in Ghana and China

Ghana and China are two countries in Africa and East Asia which both experience significant migration flows. Despite the different nature between transnational and internal migration, the size and pattern of migration are comparable in these two countries. However, to date little is known of the well-being of children in the two contexts of migration, let alone the comparison with each other. This study aims to quantitatively analyse subjective well-being outcomes (health, happiness and life satisfaction) of children with different migration experiences: children who have been away and returned with one/both parents currently away; children who have been away and returned and currently live in non-migrant families; children who never migrated but have one or both parents currently away; and children who never migrated and live currently in non-migrant families. Particularly, it aims to investigate how children's well-being is associated with their different experiences of parental migration, family structure, and parent-child interaction, as well as how these associations differ between the two contexts of migration in Ghana and China. Data comes from two large scale surveys in Ghana (N = 2760) and China (N =5735) respectively. Findings of the research will inform the design of policy and service programs to improve the well-being of children living in different contexts of migration.

Human Rights Activist Women's Practice in Japan and Indonesia: A Comparative Analysis with Special Reference to Their Advocacy of Gender Equality

This study examines the similarities and differences of human rights activist women's practice in Japan and Indonesia as represented in what French sociologist Pierre Bourdieu refers to as "habitus" and "cultural capital." While the 1990 is often described as a "lost decade" for Japan in terms of its economy, it was in fact an extremely significant decade for the advancement of human rights and gender equality discourse in the country, where women were believed to hold the key to the country's revival after the burst of the bubble economy. The decade was equally important for the exaltation of human rights and gender equality discourse in Indonesia as since the onset of democratization in 1998 a great number of middle-class women have thrown themselves vigorously into activism to defend and promote human rights and gender equality. But beyond such a similarity, human rights issues addressed by Indonesian activist women are extremely diverse, including domestic violence, polygamy etc., and their activism to solve these problems invariably come face to face with religious authorities and political powers. In contrast, human rights activist women in Japan are more focused on legal battles to promote gender equality as many gender issues have been accommodated politically. By shedding lights on such similarities and differences, this study seeks to provide an integrative account of human rights activist women's practice in the two countries and understand the dynamic reinterpretation of human rights and gender equality presently going on in Asia.

Creativity in Natural Science Requires Ethical Balance Between Trust and Risk

Progress in Science and Technology is based on creativity, free and excellent education. We discuss factors which maintain creativity, namely keeping the balance between two social dilemmas. While grown overcapacities but also necessary resources in many research and higher education institutions were destroyed in the last two decades, now the calls for humanity and ethical principles are gaining popularity, such as work-life-balance, clear long-term perspectives for researchers, and society-driven ethical research development.

In this study we analyzed the career of Nobel laureates and other physics scientists in three stages, their early career, their period of success and the period after the laureate. The result is that the self-concept of some famous scientists differs essentially from that of a Homo economicus and some were mistreated by their scientific community.

As a result, ethical human resource management should maintain good conditions for creativity as expressed in these ten guidelines. 1) Maintaining diversity without overestimation of communication skills. 2) "Do the best for your student." 3) "A career is not a toy"; hidden research managers should avoid bending the psycho-landscape of applicants. 4) Secret top-down management should avoid unfairness in peer review, citations, providing positions. 5) Hunger-out strategy is unfair. 6) Overloaded work pressure kills creativity. 7) Disruptive progress in technology cannot be foreseen [1]. 8) Trust means over-estimation of tradition, maintains present structures, while risk means opportunity for new challenges. 9) Accepting plan-B yields to academic suicide. 10) The worst case scenario is no trust, no risk, no willingness, which means exclusions of the community.

Fast changing circumstances requires ethical control of progress in science, and should provide best environment for creativity. Trust can be accumulated by communication, embedding in teams and networks.

To See Is to Believe? the Visibility of Aesthetic-Plastic Surgery As a New Mode of Communitarization

The number of surgical cosmetic procedures has been constantly rising for years. Along with that, aesthetic-plastic surgery in everyday life becomes more visible. Patients are presented in media formats including dramatized before/after comparisons and plastic surgeons greet us from advertising posters and websites. The guiding question for my presentation is, which role plastic surgery plays in everyday life and how everyday actors (as non-surgicals) interpret this social practice of body manipulation within the context of its increased visibility. To answer this question, results from the research project „The optimized gender?" will be presented. The results are based on the interpretative analysis of several group discussions that were conducted with everyday actors.

Within the group discussions "visibility" was discussed especially regarding specific procedures. Thereby it became clear, that on the one hand the visibility of interventions (e.g. via scars or as „unnatural" results) were condemned. On the other hand the possibility of a missing visibility (e.g. missing scars or natural looking results) were interpreted as an invisible threat. This interpretation was based on the assumption that if aesthetic-plastic surgery is undetected (because not visible), it could lead to a normalization and therefor to new (beauty-)obligations. All in all, plastic surgery is constantly delegitimized regarding its core topic: beauty. Moreover, there are not only efforts of delegitimization but also of distinction: while patients were labelled as ‚unknowing', the everyday actors (as non-surgicals) presented themselves as ‚knowing' because of specific stocks of knowledge – e.g. that (bodily) individuality is a treasured good and that it is destroyed by surgical procedures. In line with Paul Rabinows concept of biosociality I want to discuss that the negotiation of aesthetic-plastic surgery is not just about distinct demarcation and exclusion but rather a new mode of communitarization based on the (non-)use of aesthetic-plastic surgery.

WYN, JOHANNA* (Youth Research Centre The University of Melbourne, johanna@unimelb.edu.au)

Generation Y Confronts Precarity

This paper addresses recent controversies about the uses of the concept of generation in youth studies. As academics and policy-makers alike characterise contemporary labour markets for youth as 'precarious', old debates within youth studies have emerged about how to acknowledge the impact of changing structural conditions on young people's lives, while simultaneously accounting for new subjectivities. Critics of the concept of social generation argue that a social generations approach washes out structural dimensions, such as class, gender and political economy (see for example France & Roberts, 2015; Côté, 2014). Drawing on the longitudinal data base of the Australian Life Patterns study, this paper shows how two generations of young Australians have navigated the gradual entrenchment of precarious work, against a backdrop of policy imperatives that emphasise investment in post-secondary education as a pathway to secure and fulfilling work. The formation of social generations (following Mannheim, 1952), occurs through the fundamental sociological process of interweaving structure and agency through time. The analysis draws on Bourdieu's conceptual tools of habitus and field to illuminate the formation of distinctive (generational) dispositions by young people as they read the 'new rules of the game' of precarious labour markets. In order to draw out the ways in which inequalities are reinscribed in changing times, this presentation focuses on the contradictory outcomes of these distinctive dispositions for both men and women as they make the transition from the field of education to the field of the labour market. The longitudinal perspective on the trajectories and decisions of men and women across the fields of education and work reveals how significant structural inequalities are 'papered over' through the embedding of highly individualised subjectivities that emphasise personal responsibility.

Fighting Corruption during Transformations in Poland: Determinants and Changes in Perception of Government Effectiveness

This paper analyses the perception of corruption level in Poland and public opinion on the effectiveness of government in fighting corruption, by using the longitudinal survey data (1988-2013). Corruption level is the subject of influence of global trends, such as changing economic conditions and particular socio-political context. However, not only corruption experience, but also perception of corruption in country are shaping development of a country. Being one of the most sensitive issues in public debate and important point of reference in political campaigns in post-socialist countries, fighting corruption level is the process accompanied with many hopes and expectations.

Poland, as the biggest Central-Eastern European country which has gone through the number of political, social and economic changes is a particularly interesting case for analysis. Rapid GDP growth, as well as the overall improvement on measures of democratization (ex. Freedom Houses), measures of quality of life and access to knowledge (ex. Human Development Index) - present Polish transformation as a story of success. How does it relate to the level of satisfaction with their government and evaluation of the effectiveness of its policies?

First, I present in the paper the prospective and retrospective evaluations of corruption level in Poland in the eyes of Polish citizens. Second, I highlight the dynamics of change in evaluation of the government in fighting corruption. Third, I investigate the characteristics of the group that is not satisfied with the current government effectiveness in fighting corruption, with the special attention to the relation of corruption and political trust. My analysis are mainly based on the Polish Panel Survey, but also use data from Life in Transition survey for comparing post-socialist countries.

Linking National Surveys, Administrative Records and Mass Media Content: Methodological Issues of Constructing the Harmonized Data-File.

This paper discusses the challenges of construction of the harmonized data-file that links data from three sources: national surveys, administrative records, and the media. The basis of the data-file comes from 22 well-known international survey projects containing questions on protest behavior. It consist of 1721 national surveys covering 132 countries. The data from administrative country-level records on population size, ethnic fractionalization, GDP and other characteristics, as well as media content (e.g. Reuters' event data on protest) are incorporated into the integrated data-file. From the methodological point of view, there are a number of challenges to overcome for reaching the aim of the project: building the integrated data-file. In the presentation we concentrate on proposed ways of linking data for multi-level analyses, with countries and years as macro-levels. We discuss data quality on both the micro- and macro-levels, and some aspects of secondary data usage of survey and non-survey data together. The logic of data linkage and data processing procedures are of general nature and can be applied to other comparative projects. The paper is a part of the project "Democratic Values and Protest Behavior: Data Harmonization, Measurement Comparability, and Multi-Level Modeling in Cross-National Perspective", financed by the Polish National Science Centre (2012/06/M/HS6/00322), located at the Polish Academy of Sciences and The Ohio University.

Who's Got the Biggest Humanitarianism: How Nations Soldier for Peace

The paper is based on my ongoing PhD research about Brazilian peacekeepers in MINUSTAH. I am interested in using the Brazilian experience as a case study for understanding the connections between guidelines conceived in a post-1325 context and the actual experience of soldiers on the field. One aspect of this that particularly called my attention during interviews I conducted both in Brasília and Port-au-Prince is how military peacekeeping works as a contested site of construction for Brazilian hegemonic masculinity. This understading of masculinity works as hegemonic for a Brazilian context, while at the same time seeing itself as subordinate globally.

The « Brazilian way » of the military, in this case, is being constantly compared with the military practices of other countries and with UN expectations and rules. Soldiers' and officers' own view of their practices interacts with a global hegemonic masculinity model present in militay peacekeeping guidelines, but also in projected representations of « other militaries », and it does so both as competitor and accomplice. This kind of « humanitarian competition », I would argue, can be used to discuss the foundations of peacekeeping as a model for managing international conflicts. Moreover, I hope the conclusions presented in the paper will serve to sustain my argument that gender as a critical tool for analyzing the practice of peacekeeping allows for a broder critique of the contemporary war system and the role the UN plays in it.

Understanding Marriage and Families in Social Transition in China and India: A Comparative Approach

Studies on family change yielded significant insights into marriage and the family over time, and how these changes redefined the boundary of family, its composition, the roles and the dynamics of relationships between the members in the family, and inter-family relationships in the society. Comparative studies of family change between countries have provided important understanding about the structural and cultural constants of family and the relevance of family in a global context. This study aims to understand how family as an institution changed in China and India, and factors that led to those transformations over the period through a critical analysis of studies using data drawn from Census data, National Survey Organisations such as NSSO, NFHS (India) and similar data sources from China (Census, China General Social Survey (CGSS), etc. This comparative study addresses questions – How have Chinese and Indian families changed in structure and form? Have Chinese and Indian peoples shifted their values from collective interests to individual interests? Have both China and India follow a similar path of changes in marriage and the family during the social transition?

Reconsidering the Relationships Between Racial Minority Immigrants and Aboriginal Peoples in the New Millennium: Findings and Evidence from Classic Immigration Countries

The new millennium has witnessed a rapid rising of racial minority immigrant population in classic immigration countries, such as Canada, Australia and New Zealand, as a result of the withdraw of racialized immigration policy in the middle of 1960s. Meanwhile, the aboriginals of these countries are leaving their isolated reserves and moving toward the urban, namely an ongoing urbanization of Aboriginals. Contacts between members of these two groups of people, which were once interrupted by the racialized immigration policy one hundred years ago, are getting more frequent now in those countries. The paper reviews the relevant literature on this topic from three classic immigration countries: Canada, Australia and New Zealand and answer the questions: what are the patterns of and key issues relevant to this relationship, given the sheer different cultural, political and socioeconomic status of these two groups in those countries? Is still there a triangle of relationships between racial minority immigrants, Aboriginal people and the mainstream society? Is the middlemen minority theory still applicable in this new context of mixed racial interactions?

Empirical Research Related to the Quality of Life in Chinese Urban Elderly People

With the in-depth development of China's reform and opening-up, providing for the aged and taking care of them have gradually become grave problems in the country. The traditional mode of healthcare for the aged has been weakened, and the social old-age pension is also facing a predicament of funds shortage. Therefore, the community-level old-age service is the China's expedient choice in the transitional period, while improving the old citizens' quality of life constitutes the essential objective in terms of addressing the aging problems. Based on the data from China General Social Survey (CGSS), this paper discussed in detail both the status quo of elderly people's life conditions and the influencing pathways of objective and subjective factors pertaining to their quality of life.

By means of statistical analysis, this study has shown that the old people's quality of life has been influenced by individual characteristics, family economic conditions, the degree of life richness and the crisis consciousness. The main conclusions are as follows: (1) Marital status, political status and pension insurance significantly affected the old people's sense of well-being; (2) Gender did not impose obvious effects upon quality of life, whilst higher education level did not guarantee the evident sense of well-being; (3) The family economic conditions of the old people markedly influenced their sense of life satisfaction; (4) There existed positive correlations between pairs of family economic conditions, the degree of life richness and the crisis consciousness; (5) The number of old people feeling strong sense of well-being was smaller than that of the aged who possessed the weak sense of well-being, which also reflected the fact that the status quo of elderly people's life quality is not as good as expected.

Creative Trajectories of Fashion Designers : An Exploration of Creative Workshops and Professional Strategies in Montreal Fashion

In the Garment and Fashion industry, the issue of interconnection between cultural and creative industries, and non-creative and non-cultural industries, has been debated for some time by various international organizations (UNESCO, UNCTAD, etc.). In the end, the scope of the new creative economy remains unclear and elusive (Bouquillion 2010) and some sectors such as fashion, are on the frontiers of two worlds, garment being more in industry, while Fashion is definitely in the creative world. In any case, this gives way to a transformation in careers, creative careers becoming more and more common in the Fashion part of the industry. In our research, we analyzed these new boundaryless careers, including the paradox and some tensions that arise from the confrontation of a creative activity and an entrepreneurship venture simultaneously in the context of a fashion designer's career. Our research is based on a literature review but also on three series of interviews with fashion designers and intermediary organizations done over the period of 2009 to 2014.We will concentrate mainly on the most recent interviews in our presentation, but will also use the previous ones as a background. The results show that the image of the designer has clearly changed in recent decades. Indeed, in light of the changes in the creative industries over the past 20 years, designers have had to adapt to this context, moving from the image of designing custom-fitted clothing to that of the combination of artist/entrepreneur. Today, the development of a new business model seems to be a major concern and confirms the need to remain creative and innovative and to select a specific niche in the fashion/garment sector.

Les Questions De L'action Dans Un Régime De Réputation: Le Designer De Mode à Montréal.

À partir de notre recherche sur le milieu des designers de mode à Montréal, nous mettons en évidence le construit social de leur reconnaissance culturelle et économique, dans un marché affecté par la mondialisation. Une sociologie de l'action nous permet de questionner des logiques d'actions en horizon incertain (Menger, 2009). La dynamique d'un *agir créatif* participe à la valorisation d'un savoir-faire, à la mise en scène des talents et opère dans la sphère culturelle par le biais de processus de médiatisation. L'agir marchand quant à lui représente l'autre versant des stratégies de carrière assurant la légitimation de la profession dans les mondes industriels de la mode locale, et ce, dans le contexte particulier d'une industrie en restructuration favorisant un ensemble de médiation. Dans le cadre de notre communication nous développons une typologie de trajectoires créatives en régime de réputation en croisant les niveaux d'analyse micro, méso et macrosociologique, il en résulte que plusieurs facteurs entrent en compte dans la reconnaissance des designers. Dans un premier temps, nous présentons la figure idéaltypique d'une profession interstitielle (Alandete, 2000) en empruntant au « paradoxe de Janus » (Latour, 2001), expression de la construction identitaire du métier. En second lieu, nous exposerons les différentes catégories de designers qui se répartissent autour de tensions existantes entre deux champs : le champ de la culture et le champ de l'économie, et qui relèvent de problématiques sociétales. Enfin, nous mettrons en valeur les fluctuations de carrière à partir de l'exploration des engagements dans un régime de réputation, entre un agir créatif-artistique et un agir marchand, entrepreneurial.

"Clean Energy" Vs. Environmental Justice: Local Community Struggles Against Hydropower Plants in Turkey

Rapid growth of emerging economies often sustained by large-scale infrastructure, energy and construction projects at high environmental costs. The turn to renewable/clean energy is presented as a way to mitigate the environmental costs and carbon emissions and supported by global environmental schemes such as carbon trading. However, "clean energy" projects, such as hydropower plants, could also cause ecological destruction and environmental injustice, especially in developing countries, which bypass environmental evaluation and public de-

liberation processes. Turkish example illustrates the case, where private companies are given extraordinary rights to "streamroller normal planning restrictions to meet the target of 4000 hydroelectric schemes by 2023" (the Guardian). This rush to build hydropower plants results in a multi-dimensional environmental injustice that encompasses ecological destruction, economic deprivation, social dispossession, cultural assimilation and political misrepresentation. This paper presents the case of local community struggles against hydropower plants in Turkey that reveals both the social and environmental costs of emerging economies and shortcomings of global environmental schemes. One central element here is the interplay of national and global processes in shaping the local environment. The paper adopts an action-theoretical perspective, which focuses on the "social labour" (Kurasawa 2007) of local community movements, which disclose the interdependence of logics of growth, environment and social reproduction and challenge the expansion of the former to despoil both the nature and the society. The case study is grounded on an extensive and comparative empirical research and establishes an interdisciplinary framework that brings environmental sociology, social movement studies and critical theory of justice together.

YAMADA, MIEKO* (Indiana University-Purdue University Fort Wayne, yamadam@ipfw.edu)

Focus on Local Diversity and Learn about Global Community: Incorporating Diversity and Social Justice into Japan's English Language Education

In a globalized era, people with different native languages increasingly use English and interact with each other. Concomitantly, varieties of ethnic and linguistic backgrounds among these speakers of English create multicultural and multilingual situations. Indeed, the importance of intercultural communiation becomes emphasized in the field of second/foreign language education. In Japan where English is taught as a Foreign Language (EFL), the development of English proficiency is one of the nation's strategies for responding to rapid globalization. If English proficiency is crucial for global communication, how do Japanese EFL learners foster their communication skills and learn about intercultural communication via English? This paper examines Japanese university students' experiences related to EFL classes at their elementary, junior high, and high schools by investigating how they perceive Japan's domestic diversity and understand the role of English learning/teaching within that context. Interviews with Japanese undergraduate and graduate students reveal how they reflect on their own experiences with diversity in their EFL classes and help to explore the role of EFL education in a globalizing Japan. Because social justice acknowledges diversity as part of human conditions, the discussion on diversity should be extended to social justice. By focusing on the issues of prejudice and discrimination within the domestic context, I argue that teaching about diversity and social justice be integrated into the EFL curricula in order to develop EFL learners' positive attitudes toward intercultural relationships and interactions. The rise of newcomers from both English-speaking and non-English-speaking countries has created ethnic and linguistic diversity in many places of Japan. Unless EFL learners pay attention to local diversity which consists of both English and non-English speakers living within Japan, they would not be able to acknowledge the diversity of members in a global community.

YAMADA, NOBUYUKI* (Komazawa University, jogoaya@ruby.plala.or.jp)

The Position of Labor in Civil Activism: The Labor Movement and the Classness of the Bersih Movement in Malaysia

Rapid industrialization in some developing countries can lead to the rise of various social movements. On the one hand, the cluster of manufacturing is likely to build the site for organizing and to activate the labor movement. On the other hand, the growth of the "affluent" middle class is also likely to build various NGOs and to vitalize civil activism. Malaysia is supposed to be one of these countries and to experience the vitalization of various social movements including the labor movement, particularly in globalization.

This paper addresses Malaysia as a case of *negative* relationship between the labor movement and civil activism. Malaysia has currently experienced the upsurge of various social movements, one of which is pursuing the reformation of the election system, which is called BERSIH, "clean" in Malay. The BERSIH movement mobilized a vast amount of people from all ethnicities and brought about the serious defeat of the ruling party alliance, the National Front at the general election in 2013.

The success of the BERSIH movement can be partly based on the mobilization of dissatisfaction of people from various ethnicities and classes including young "precariats". It means that the BERSIH movement can also be a class-based movement, and it can be, in a point of view, intimate with the labor movement. However, the labor movement has actually no position in BERSIH. This paper examines the causes of such a "silo" of the labor movement in Malaysia. Firstly, it reviews the history and current situation of the labor movement. Secondly, it also

examines the formation of civil society and the upsurge of the BERSIH movement. And thirdly this paper asserts that the institutional restrictions for the labor movement and the lack of leadership primarily prevent it from being associated with civil activism and that they can construct a "silo".

Institutional Expertise and Lay Responses to Soil Contamination: The Experience of Farmers in Fukushima

Contamination of the air, water and land by manmade disasters such as Minamata, Bikini Atoll, Bhopal, and Chernobyl has had a disproportionate impact on individuals and groups who are already economically, socially and environmentally marginalized. The perspectives of lay people offer insightful explanations of the aftermath of disaster (e.g., Fortun 2001; Johnston and Barker 2008; Kuchinskaya 2014; Walker, 2010), but such explanations are often contradicted and muted by the explanations provided by government officials and scientific establishments (Wynn 1992; Yamaguchi forthcoming). This suppression of perspectives takes place because the complex and asymmetrical relations among stakeholders determine what counts as a legitimate knowledge claim. When delving into the question of environmental governance and institutionalized expertise, it is pertinent to raise questions about the experiences of lay people, as it is in interactions with lay people that the informal norms, rules and practices of such institutions manifest most clearly, often with profound effects on the lives of people affected by disasters. This paper examines the politics of expertise pertaining to soil contamination by radioactive isotopes. The central question is how institutionalized expertise in the form of regulations, guidelines and laws is put into practice and how it comes into contact and conflict with lay perspectives. How is the safety of soil interpreted by different groups of people? Who has the authority to determine what is safe? How have lay people responded to the policies implemented by the institutionalized expert bodies and for what reasons? The paper uses data derived from interviews with growers whose farms are located within a 20 to 30 km radius of the Fukushima Dai-ichi Power Plant and from participant observations conducted for one year from June 2014. The paper articulates various ways in which the institutionalization of expert advice furthers the delegitimization of lay expertise.

Moving Beyond a Risk-Based Framing: UK Adolescents' Understanding of Sexuality, Healthy Development and Risky Behaviour

Introduction & Objectives

Adolescent sexuality is frequently associated with 'risk', while early pregnancy and sexually transmitted diseases are highlighted as 'negative' outcomes of sexual risk-taking behaviour. Children and adolescents are also framed as 'at risk' of sexual abuse and exploitation. This risk-based framing has impacted government policy and research priorities (Gillen, Guy and Banim, 2004:43). Meanwhile, there has been little exploration of what might constitute normal or healthy sexuality (McKee et al., 2010: 14-15).

The paper reports on an investigation of the perceptions of sexual behaviour and risk-taking among adolescents attending six secondary schools and one college offering access courses in England. We explored perceptions of risky and normal/healthy sexual behaviour

Methods

The Brook version of the Traffic Light Tool developed by Family Planning Queensland was used in focus-group workshops with nine small groups of adolescents in classroom settings with a teacher or learning mentor present. Ethical procedures were cleared at multiple levels. The focus group exercise involved participants considering 19 scenarios to reach a consensus on whether they were healthy (green), potentially risky (amber), or dangerous (red), first assuming the protagonist was aged between 13-15 and then aged 16-18. The discussion was taped, transcribed and analysed based on key themes. McKee et al's framework of 15 domains of healthy development was used to interpret the data (McKee, 2010).

Results

Regardless of the group, a consensus was more readily achieved with scenarios involving coercive, aggressive, humiliating behaviours or acts transgressing public/private boundaries. Meeting a consensus around behaviours that were consensual and pleasurable, or where behaviour was recognised as risky but 'normal', appeared to be more challenging. Consensus was more easily reached for the older age-group scenarios and more were frequently coded green.

Conclusion

The groups demonstrated a complex, ethical and will reasoned assessment of risk.

Girls generally were more articulate than boys.

Promoting Health, Promoting School Success: An Exploration of Healthy Schools Policy in Four Cultural Settings in the EU and Canada

Introduction and Objectives

Considerable research shows the reciprocal relationship between health and education. While schools are primarily concerned with education, it is now recognised that they are ideal places to carry out health promotion. There is a substantial body of evidence showing that school success is related to health. The less privileged a child or young person's background, the stronger the relationship.

This paper investigates the framing of policy around health promotion in schools in four different locations: France, the Canton of Vaud in Switzerland, and the provinces of Quebec and Ontario in Canada. It also explores how the shared concepts of 'healthy schools' and 'health promotion' are interpreted and implemented in these different cultural settings.

Methods

This paper is based on an analysis of related policy documentation and research literature, as well as expert interviews with key stakeholders involved in formulating and delivering health promotion in schools in the four locations, including those in the ministries of health and education, institutes of public health, boards of education and schools. Interviews were conducted in either French or English, transcribed and analysed on the basis of key themes identified in the literature.

Results

In all four study locations there was a mutually shared commitment to school health promotion among key stakeholders, with recent moves to further strengthen the policy framework. Understandings of health and the healthy person were clearly influenced by broader cultural agendas. While there was considerable task sharing among health and education agencies in each location, there were differing levels of tension at the school level between achieving more formal and measurable educational goals and the less clearly defined ones relating to health and wellbeing.

The study forms part of a larger Japan Society for the Promotion of Science funded project on EU and Canadian healthy schools policy and practice.

" the Place Where " I " Become a Subject " : The Emergence of the Contestation Movement in Post-2011 Japan and the Subjectivisation By Japanese Women

In Japan, the culture of street-level resistance has long been disregarded. However, since the nuclear catastrophe of Fukushima in 2011, people have started speaking out against the state, who they view to neglect the will and lives of its citizens. This new tendency for contestation has continued until present in the form of pacifist movements which have given birth to new social actors active in these demonstrations, primarily youth and women.

In today's protest rally, the figure of these actors has been remarkable and the role they have contributed to spreading the wave of opposition throughout the nation is particularly notable. These actors have hardly been considered as components of the main political and social sphere, yet their quest for their existence to be recognized in the cultural sphere, which has accumulated over the years, created a possible path through which their contestation could develop after 2011, thus awakening their citizenship. The emergence of young female actors in this movement was facilitated through the development of a "soft" female culture which came about through opposition to certain "feminist" ideals in defense of being "woman as I am" and also through resistance to the image of femininity imposed by the media and male discourse.

I seek to outline the emergence of the protest movement in Japan since 2011 through focusing on young female protesters, as well as the context of the political and social changes that have enabled the emergence of these actors in the public space. Through this, I demonstrate that this new tendency of young female actors is largely enabled through the evolution of femininity in Japan and elucidate the rupture and the continuity of the quest for a new subjectivity by Japanese women.

The Migration Industry in Contemporary Japan

Managing migration, both international and internal, has become one of the important political agenda in contemporary Japan. As for international migration, Japan has faced the continuous inflows of short-term, mid-term, and long-term migrants from overseas. On the one hand, Chinese, Taiwanese, Korean, Nikkei Brazilian and Peruvian permanent residents fought for to establish their own economic, social, and cultural infrastructures in Japanese society. On the other hand, as tourists from China, Korea, Taiwan, and Southeast Asian countries continue to surge, their money spending habits have changed the traditional customer service system of Japanese retailers, forcing the retailers to adapt to foreign customs. As for internal migration, since the mid-1950s, the metropolitan areas in Japan have been attracting the rural youth, who have sought better educational and economic opportunities than those available in their hometown. Currently, the Japan central and local governments attempt to decrease the number of urban residents by encouraging the youth and the elderly to relocate themselves to the rural areas. To effectively control population flows, the Japan central and local governments have established the international and internal migration systems, both of which appear to interact with one another. Nonetheless, little research has bee done to examine this linkage. Thus, the paper aims to answer the following research questions: (1) what are the similarities and dissimilarities between the international and internal migration industry systems?; (2)is the international migration industry interlinked with the internal migration industry? If so, how? If not, how does each maintain its area of activity or influence? (3) how does the Japan migration regime impact on the arrangement of international and internal migration industry? The examples are drawn from the cases in Japan. Through the case analysis, the paper argues the importance of incorporating the internal component to further unravel the mechanism of the migration industry.

Pitfalls in Appropriating Human Rights Discourses?: A Case Study of Tibetan Refugees in India (and Nepal)

This presentation explores problems which Tibetan refugees encounter when they appropriate human rights discourses. Central Tibetan Administration in Dharamsala, India, has been utilizing human rights discourses to describe Tibetan issues since the 1980s. Especially, it has been considering the situations in Tibet as lacking human rights for Tibetans, while positing their guest countries as providing more freedom. However, this dichotomy unintentionally dilutes the importance of Tibetans' voices in Nepal, which is bookended by India and China. Since the 2010s, situations surrounding Tibetans in Nepal have been getting more severe, and these situations such as forbiddance of social gatherings and forcible deportation to China by the Nepal government clearly show that they have not been provided with human rights. Moreover, we easily find Tibetans in Nepal who have been socially overlooked by both the Nepal government and CTA. Most of them are Tibetans who have been exiled from Tibet with difficulty. Unfortunately, these Tibetans cannot find any places to fit in Nepal because the Nepal government doesn't officially allow them to live as refugees in Nepal and CTA also has not issued a certificate for these Tibetan refugees due to lack of proper documentation to get this certificate. Ironically, CTA itself has failed to hear the voices from the weak and reinforced the lack of human rights to some Tibetans without the certificate. Dichotomy surrounding policy and human rights produced by CTA unintentionally removes chances for Tibetans' claims about their turmoil. These Tibetans find themselves in difficulty to voice their opinions because of this dichotomy. This presentation argues that these are situations caused by unintentional re-victimization by the dichotomy based on human rights discourses appropriated by CTA, and points out pitfalls in appropriating human rights discourses, which might lead to the oversimplification of the situations.

Signifiant without Signifie :Diagnostic Language and Illness Experience in Rare Disease Patients.

We have been interviewing rare disease patients since 2013 to investigate the impact of disease rareness on patients experience. Currently we interviewed 40 patients with rare disease or rare symptoms. One of our research focus is the impact of diagnosis on patients illness experience. Most of our interviewees were enthusiastic about obtaining diagnosis. Diagnosis exert great influence on patients biography. However, unlike the common chronic disease diagnosis most of the rare disease names received by patients contain no significant information as to the etiology, treatment and prognosis of the patients' conditions. This means they received the words with no referent. The diagnosis brings patients to nowhere. The disease name here is close to proper noun, like John, meaning just that he/she is a kind of human. Although the diagnosis brings the patients to nowhere, it has a significant impact on patients experience. To many patients John is a starting point, as if they were given a sign that should be deciphered themselves. Among numerous medical terminologies diagnostic terms occupy special positions because they have both esoteric and exoteric connotations. It is addressed both to medical professionals and patients. With this function in exoteric communication it can make a "human kind" from individual patients (Hacking 1995). Focusing on how patients narratives refer to their diagnosis experience we will show how the hollow diagnostic terms bring patients to specific "human kinds" without making any difference to their medical conditions.

20 Years Experiment in Stage Arts, Language and Gender Classes in Women Studies Department

Women studies department was established under the academic disciplines of educational sociology (esp. critical pedagogy), politics, literature and law in Ankara University 20 years before. Language and gender cources took part in the program from the beginning and the sociological point of wiev gave a big importance to language and gender relations. These courses were given by a theatre academic from stage art theory, literature, language theories and the relatioship between the social and lianguage disciplines. There has been hundreds of students from all disciplinles. Women studies department in Ankara University is both an academic and activist places. So, these hundreds of students got their transformations from these language and gender classes. So many small working groups, reading groups, theatre performances, feminist theatre festivals, syposiums presantations were born from these claess. so do so many books, poems and story written... "Silence language" was one of the heroin of these classses in Turkish classes as a Middle Asian/Mezopatomian/mediterranian/Islamic and plural religios, etnicities and languages country. this presantation is about the present the sosciological story of these transformations between the related parties of the lectures.

Patrilineal, Bilateral, or Individualized?: Changing Intergenerational Relationships in Japan

This study pays a special attention to an important dimension of intergenerational relationships for Asian families, namely patrilineal vs. bilateral relationships. The extent to which traditional patrilineal relationships weaken is closely related to modernization and women's empowerment. Therefore this study focuses on the intersection of gendered lineage, women's power, and family intergenerational relationships. Five hypotheses can be identified on how modernization and women's economic resources transform family intergenerational relationships. First, a "traditional norm" hypothesis argues that relationships biased towards the husband's parents will be maintained. Second, a "modernization" hypothesis argues that with the traditional norm weakening and women gaining economic power, bilateral relationships will prevail where adult children have almost equal relationships between the husband's and wife's parents. These two hypotheses presuppose that the husband and wife are one unified unit. In contrast, the third hypothesis of "individualized intergenerational relationships" argues that the husband and wife behave individualistically where the husband exchanges more support with *his own* parents and the wife does so with *her own* parents. Finally, the fourth hypothesis of "wife as a bilateral kin-keeper" argues that because individualization does not proceed to such a high extent for women, wives exchange support with the both sides of parents more often than husbands do. Analyses of data obtained from the 2008 National Family Research Japan reveal that results depends on who is a support giver. When *adult children give* support to their parents, the "individualized intergenerational relationships" hypothesis is supported. In contrast, when *parents give* support to their adult children, the "wife as a bilateral kin-keeper" hypothesis is supported regardless of wives economic resources. This suggests that Japanese adult children and their parents view intergenerational relationships in different manners. This results will be compared with the results for other East Asian countries, and the implications will be discussed.

What Makes Conducting Surrogacy Rationalized in the Modern Society? --from the Analysis of the History and Development

It has been discussed that surrogacy is the result of the development of bio-technology. This research refutes such a discourse by analyzing the history of surrogacy, focusing on East Asian practices.

As can be seen in the Bible, there are examples were the original practice of becoming pregnant and delivering babies in the service of others was widely conducted. This same practice was utilized in East Asia. Korea had a system called "*shiba-ji*" in which women lived in their own villages and became surrogate mothers, and their daughters did so as well. China had its practice called "*dian-qi*" in which a man rented another man's wife to have her give birth. Japan had a similar system called "*mekake-bouko*" in which a single woman would give birth while taking up living with a master in a domestic service role.

After these countries became influenced by western culture, these practices died down, because they were regarded as uncivilized. Nevertheless, in 1976, an American lawyer promoted the practice using a modern framework which reinterpreted surrogacy as a benefit of technologies, modern contractual relationship, and women's altruistic. This recasting of surrogacy would become popular in the other parts of the world later on.

The history shows the idea is not born from biotechnologies. Science technologies work as actors to accelerate surrogacy practices by meeting clients' preference to use more preferable eggs: either of the clients' or of someone else, and also, by expanding the market geographically through the development of transportation advancements and information technologies.

Therefore, the matters to be discussed about surrogacy are in the social structure: why this modern society easily allows to make a women's body available even under the concepts of human rights, when it is construed in a context of medicine - namely, it is the social structure of bio-politics.

Perceived and Just Salary Gaps Across Time. the Chilean Case.

Economic inequality has been at the top of the research agenda of the social sciences in recent years. Social movements demanding more redistribution, economic crises, and strong income concentration have drawn the attention of scholars, who have provided empirical evidence for the distribution of wealth among countries and across time. We certainly know more about inequality today than a few years ago. However, even if we know more about how wealth is distributed, there is limited research on how people perceive economic inequality and what they consider just.

This presentation aims to analyze economic inequality in Chile, one of the most unequal countries in the world, through income distribution. We use the perspective of the "observer" to study the relationship between perceptions and beliefs about inequality. The goal is to understand interindividual and intergroup variations, including the effect of structural and contextual variables, and their consequences on the behavior of social actors. We use data available from ISSP 1999, ISSP 2009, and COES 2014 databases, which have common key indicators of inequality beliefs and perceptions.

For date, studies have analyzed the relationship between perception and beliefs between 1999 and 2009, indicating that the amount of perceived inequality and inequality considered just is quite high in both years; both indexes are highly correlated and their relationship is stable over time [Castillo, 2012, Castillo et al., 2012]. This can be understood as a process of justification or naturalization of inequality. Nevertheless, since the social movements of 2011, it seems that Chilean's relationship with inequality has changed. A new public discussion has settled in Chilean society, presents on political reforms developed in 2014 and 2015. Thus, can we observe a change in the relationship between perceptions and beliefs of inequality across time? And what role are structural and contextual variables playing?

Chinese Migrant Workers with High Educational Backgrounds in Sweden

Sweden introduced a new immigration policy in 2008 that encourages labour immigration from countries outside EU. The new immigration policy has promoted a globalization of migration to Sweden. In earlier periods of labour immigration, the main share of migrants originated in European states, but after the immigration policy reform, the largest numbers of migrants instead comes from Thailand, India, and China.

This article is part of the research result on migrants from India and China in Sweden, with a specific focus on the Chinese young people in Sweden. Based on in-depth interviews of these young people from China, this article aims to explore their motives, experiences, dreams and difficulties in the processes of migration.

Among the young people discussed in this article, those who work in academics or high-tech companies either came to Sweden to study or got the opportunity to work in Sweden because of their previous network built up in international companies in China. Nevertheless, others who also have higher educational background either faced layoffs in high-tech companies and found that changes in immigration policy have limited their opportunities for searching for new jobs. Still others failed to find a job compatible with their professional background and ended up in the catering trade.

With a close analysis of these young people's experiences, this article intends to explore the impacts of Swedish immigration policy change on these Chinese young people's life as well as to link their choices in migration to local contexts in both China and Sweden and to global contexts. By doing so, this article aims to have further dialogue with migrant studies.

Motherhood Practices of Women Social Activists in Taiwan

Studies in social movements in Western countries discuss maternalism as a strategy to mobilize people in social protests or its limits to frame social movements. Moreover, previous research also examines the relationships between women's gender roles and their participation in social movements. Nevertheless, studies on social movement in Taiwan seldom discuss women's experiences in social movements, but they do mention maternalism in consumer movements or environment movements.

Following the micro-analysis of personal experiences and discussions of maternalism in social movement studies as well as feminist concern of women's role in social movement and debates in motherhood, this article intends to discuss motherhood practices of women social activists in Taiwan, as well as the relationships between their mother role and experiences in social movements. Based on in-depth interviews of women's experiences in social movements in Taiwan, I find that although care work in the private sphere do limit some women's participation in social movements, these women find strategies in time using or in creation of network support for combination of child care and participation in social movements. This article examines their mother role as 'motivation' or 'justification' for participating in social movements and argues how their sayings/practices of motherhood reconstruct the boundaries of the private/public and redefine the meanings of politics or social goods in Taiwan society. By so doing, this article intends to employ these women activists' motherhood practices and experiences in social movements to rethink feminist theories as well as social movement theories on motherhood, maternalism and women's role in civil society.

Influences of Government and Market Mechanisms on the Development of Teacher Education Institutions in Taiwan

This article first performed a brief review on the history of teacher education in Taiwan to understand the transition of teacher education policies and the evolution of teacher education institutions. Then it interpreted the development of teacher education in relevant and nonrelevant contexts. Finally, this article investigated the influences of government and market mechanisms on teacher education institutions.Through document review, this article presented that following the introduction of the amended Teacher Education Act in 1994, teacher education institutions operated under a diverse, reserve, open, and relaxed market-based system, and prosperity was consistent with market supply and demand. In addition, market-based logic was advantageous during this time, and government control of teacher education institutions was relaxed or nonexistent. However, control of teacher education returned to the government following amendment of the Teacher Education Act in 2002. Therefore, market mechanisms never substantially influenced the teacher education system in Taiwan.

Displacement in the Name of Development: Urbanization, Speculation, and Stratified Spatial Order in South Korea

Conventional development literature argues that South Korea is one of the most successful cases of rapid economic growth and urbanization. As a result of the post-war national developmental project, Korea's urbanization rate has reached 90%. Old, disorganized urban landscapes have been transformed into

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

highly modern, well-ordered environments in just a few decades. Informal settlements in the hearts of cities have been largely eliminated. Yet this seemingly progressive urban redevelopment process was riddled with violent and brutal scenes as the homes of the urban poor were demolished and ordinary homeowners were forcibly evicted in the name of modernization. Examining how the Korean authoritarian state promoted urban redevelopment projects, this paper seeks to address the following questions: What were the driving political and commercial forces behind the ruthless process of urban development and restructuring, and how did ordinary citizens respond to and negotiate with land policies? I argue that a pro-growth coalition between the authoritarian state and private real estate developers drove a process of speculative urbanization, which increasingly stratified urban space. This process involved dispossession and displacement on a large scale, with the less affluent being pushed to the outskirts of cities without proper compensation. The process of urban redevelopment and restructuring became a site of contestation, as people with differential access to resources attempted to extend, or defend, their own interests. Despite strong resistance by the urban poor against the demolition of their communities, the rights of ordinary residents and homeowners were often violated by the authoritarian state and real estate developers. Using archival data and interviews conducted in the summers of 2014 and 2015, this paper highlights how the national project of economic modernization became dominated by speculation and exclusion. In doing so, this paper aims to contribute to the critical understanding of development and urbanization in Korea.

Leisure and Happiness

No matter you admit or not, it's hard to deny that: leisure has a sacred mission, namely for the sake of happiness——lets the life full of happiness or happier, or embodies the happiness of life. But along with the increased leisure time, leisure styles and leisure activities, we surprisedly found that an increase in leisure was not proportional to the happiness index. What was the matter? Why the increase of leisure didn't bring lasting happiness, some even didn't bring happiness? Actually it was related to the essence of modern leisure. Regardless how detailed analysises on the elements of leisure or how perfect definitions of leisure modern leisure scholars have made, I think the most important is that we might have ignored a very important fact, that is modern leisure is the product of modern industrial revolution.The nature of modern industrial revolution in some extent is nothing but capitals ruling everything. As long as we make a relative analysis ,it will reveal that our leisure has changed a lot compared with traditional society, not only in form but also in nature. So we found such a great secret that leisure was kidnaped!

RC13-157.3

YANG, NAI* (Chinese National Academy of Arts, ynaiww@163.com)

Rescue Our Kidnaped Leisure

Leisure in our modern society was kidnaped. It was twisted, distorted and deformed. It got lost. It was robbed of its soul and became naked, vacuous and ugly. Who did that? How to rescue it? We may draw some wisdom from the well-known saying: firstly surviving, secondly well-being, thirdly developing. Luxun who said the words above explained furthermore: surviving is not just living and muddling along, well-being is not being luxurious and developing is also not indulging. So my argument is what leisure can bring for us if it couldn't make the world more beautiful ?

YANG, PHILIP* (Texas Woman's University, pyang@mail.twu.edu)

Changes in American Attitudes Toward Immigrant-Native Job Competition

It is often perceived that the American public has been concerned about immigrant-native job competition for at least the last two to three decades. Less is known about the changing attitudes of Americans in this regard. This paper examines changes in American attitudes toward competition of immigrants with the native-born and changes in the determinants of such attitudes, using data from General Social Surveys 1996, 2004, and 2014. It is found that the percentage of Americans who rejected the statement that "Immigrants take jobs away from people who were born in America" had actually increased from 28.4% in 1996 to 34.6% in 2004 and to 42.8% in 2014. Results of multiple regression reveal that nativity, education, race, and region were consistent predictors of attitudes toward immigrant-native job competition across the three points in time, but subjective

class standing and political party affiliation were significant predictors only in 2004 but not in the other years. The implications of findings are discussed.

Evolution of School Activities and Friendship Networks for College Students: Under Social Contexts of Different Gender Composition

In this paper we both study school activities of college students how to change through friendship networks, and whether we can find different transitional process under social contexts of different gender composition. When freshmen enter the university, they start to build up their own school activities including study-oriented dimension and social-oriented dimension, for example, going out with friends or discussing the study with friends. We examine the activities how to covariate with friendship networks. Besides, boys and girls show different ways to establish friendship relations. Girls desire more intimate relationship and homogenous group of friends, and boys sustain and make friends in joint activities to enlarge heterogeneous relations. If boys are more than girls in the class, the masculine context maybe can format social norms of gender belief to influence or moderate college students ' friendship networks and school activities, and vice versa. Our data are taken from 6 classes (including 2 all-girls, 2 all-boys, 2 mixed-gender) in the same semester in the same college, and in four-wave longitudinal tracking sources. Evolution processes are analyzed with a stochastic actor-based model (SIENA). Preliminarily, we found social contexts of different gender composition can moderate college students ' friendship networks and school activities. In all-boys classes, school activities will influence friendship selection but not friendship influence processes. In all-girls classes, school activities is not significant for both friendship selection and influence processes.

Transitional Identity of the New-Generation of Migration Workers and Its Characteristics

The large-scale flow of rural force into the cities has a history of over thirty years. As time marches on, the heterogeneity of the off-farm workers' identity has become obvious. The new generation of migration workers at the age about 26, numbers about 100,000,000 in China, and they often change jobs in different places with their identity showing some transitional features as follows: They are neither urban citizens nor farmers but in-between or marginalized by their transitional role. The paper discusses their identity and concludes that the identity dilemma of migration workers is more related to the institutional classification than their individual choice. The hierarchal structure of such classification plus their desire for a change of identity has produced their crisis.

Different Demands, Varying Responses: Local Government Responses to Strikes in China

Conventional wisdom says authoritarian local governments rely mainly on repression to handle the growing number of labor movements. Yet, the rapidly increasing intensity and scale of strikes have made it difficult for authoritarian local governments to rely solely on repression. As a result, authoritarian local politicians use fragmented strategies in dealing with workers' collective actions. When, then, do local authoritarian leaders use repression as opposed to toleration or negotiation as a way to deal with strikes? Why do they react differently to labor collective actions?

We argue authoritarian local governments' responses to strikes vary depending on the types of demands made in strikes. Based on the strike data available on China Labor Bulletin, this paper traces how Guangdong provincial government reacted to the strikes that arouse in Guangdong from 2011-2014. Using both statistical analyses and case studies, we will examine how the types of demands that workers made in the strikes have changed over time and how the local government's reaction to strikes have changed by the types of demands. We divide workers' demands in two types based on the relationship between workers' demands and their rights stipulated in labor laws: right-based demands and interest-based

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

demands. We anticipate a higher repressiveness (or less tolerance) of local government toward strikes with rights-based demands. Local governments are expected to be less tolerant to demands that challenge the government's effort to control labor movement through labor laws.

Examining how the local government's responses to strikes vary depending on the types of demands provides a useful empirical ground to examine the role of labor laws in China in protecting workers' right and interests.

YANG, YUNJEONG* (Hankuk University of Foreign Studies, yunyang@hufs.ac.kr)

Participation As a Keyword to Development: Learning from Past and Present Korean Practices

The keyword of the post 2015 global development discourse is sustainability and the issue of governance remains a key means of implementation. This study is a plea for (local people's) 'participation', which cannot be over-emphasised as the very core of the necessary governance for sustainable development. Participation, perceived as having an intrinsic and instrumental value, is now commonly understood as an essential component in any development process and this study argues that it should remain as such, despite its recent criticism and practical challenges.

The current study draws on my two previous researches, both based on a triangular methodology involving document and archive (for Case Study I) analysis and the author's field visits to conduct interviews with key persons concerned during 2014–2015. The first study (Case Study I) regards South Korea's earlier rural modernisation experiences during the 1970s. By contrasting two villages' within-village governance styles, I stress the importance of a community-driven development approach in making the village transformation from an underdeveloped to a modern village successful in a sustainable manner. The second study (Case Study II) draws on current Korean development cooperation practices, with an example of a Korean CSO working with a Cambodian village, and demonstrates the challenges experienced in obtaining the villagers' participation.

The current study, being a synthesis of the two case studies, by learning from both past and the present, serves to re-highlight the value of and need for a participatory approach for sustainability, and concludes that, despite practical challenges, such an approach should serve as a core mode of development cooperation practices. Only when people participate voluntarily and willingly, power relations can become more equitable, allowing participatory development to result in sustainable results.

Struggling Between "Conforming and Peace", or "Rejecting and Conflicts": Women Ageing in the Context of Gender/Family Norm Flux

In the future we want, women should no longer "struggle" in complying with the old gender norm, which distinguishes work and care spheres by gender. An epistemology approach on women and ageing, viewing age, gender, and culture together as interlocking sets of power relations, suggests an alternative perspective regarding women ageing to the prevalent double jeopardy thesis. Culture, however, should not be over-emphasized to the extent that diversity within the culture remains hidden, particularly in the context of changing gender/family norms in society.

This study is based on qualitative data from in-depth interviews with a dozen of women aged between late 50s and 60s in Korea, whose entire life could be summed up as an accumulated experience of either "conforming" or "rejecting" the socially accepted/acceptable gender/family norms in a family-oriented culture. Data was analysed sequentially, firstly adopting the Voice Centred Relational Method and secondly added by a synchronic thematic analysis using QSR NVivo 10.

Contrasts between women conforming to the norms and enjoying peace in close family relationships on the one hand, and women rejecting and handling family conflicts in later life on the other hand is surprisingly clear from the analysis. Some career women suffer from work-care conflicts and some others from husband's dropped authority due to unmet men's duty of breadwinning. After all, however, what matters most in determining the quality of family relationship in old age appears to be women's gender/family norm conformity. A third and "struggling" type in-between "conforming" and "rejecting" turns out to suffer most, hurting oneself both physically and psychologically.

The study contributes to advancing feminist social gerontology, discussing identity and power dynamics of women ageing in a family-oriented culture. Practical challenges towards gender equity in caring remain as questions to be addressed, both culturally and politically.

Immigration and ways of intervening its related issues in Iran

Immigration has a long history in Iranian society. Its emergence in a large scale and a social phenomenon was before Constitutional Revolution in 1906 and has continued up to the present time.

In its first wave, the majority of Iranian immigrants were intellectuals who generally chose European and North American countries to settle and beyond that workforce who basically selected neighboring countries as an opportunity to find a job and make a better life for themselves and their family members.

In mid 1953 after the coup against national state of Mohammad Mosadegh it found a new trend which was the result of conflicts in political arena at that period of time. The majority of this kind of immigrants opted Soviet Union as their destination which was a favorable place for pursuing their socialist thoughts.

Some two more mass immigrations can be found after aforementioned ones which have had a considerable effect on many aspects of Iranians' lives.

Immigration has not always ended in a positive result. Beyond its benefits it has had definitely many negative aspects generally as a result of cultural differences which can be addressed and intervened by the mean of Clinical Sociology.

The aim of this article is classifying immigration, especially to North America, and its specific issues related to Iranian cultural and social characteristics and presenting areas in which intervention can make an improvement in people's lives.

«Women›s Work» and Personal Well-Being: Thechnology of Exclusion in Postsoviet Russia

The presentation will aim to discuss features of post-soviet women's position in the labour market and the changes in their employment strategies during the last decade. Using date from the three waves longitudinal qualitative research, conducted from 1999 to 2010 in one of Russia's region among registered poor I argue that under the conditions of market service economy the ability of women to manage life situations with their work are reduced. I show that the transition of women in the market services sector does not improve wages, that their acceptance the norms of the "universal worker" does not guarantee high returns and does not compensate costs associated with the rejection of caring for others. The pattern of gendered exclusion, or the way of patriarchal domination is changing. In the Soviet era, a special state support for women stimulated their inclusion in the scope of employment and minimized the impact of sex differences on the working career. At the same time women were segregated in the sectors of social reproduction and their responsibility for maintaining the household were preserved. In market terms the special position of women between work and home becomes a resource for surviving and a source of profit.

Novelty, Strategy and Timing in Social Movements Research: Prefiguring the Futures We Want?

The question of what is 'new' in social movements is particularly loaded, due not only to a standard academic pursuit for understudied social phenomena, and for novel ideas, but also to normative concerns about political futures. The notion of prefigurative politics is accumulating traction in discussions of social movements for all these reasons, but the timing of its popularisation is poorly understood. Its intellectual antecedents are widely regarded to originate in anarchist thought, and the history of its application is bound up in the American new left, the alter-globalisation movement and the post-2011 protest wave. Recent work describes prefiguration increasingly not by way of contrast to political strategy, but as an alternative strategic orientation. As increasing numbers of movements appear to fit the description of being politically concerned by their means as well as their ends; of enacting or constructing alternative infrastructures and institutions; or of embodying the future they want in the present, both the question of what is new intellectually and what is distinctive in political terms become more important. The paper has three aims. The first is to review the conceptual trajectory of prefigurative politics and the movements and tactics it has been used to illuminate. The second is to evaluate prefigurative political 'strategy', broadly assessing its purported uses, reflecting on assumptions about strategy and movement success. The third aim is to reflect on why else the notion of prefigurative politics might have enjoyed particular recent purchase, arguing that its moment coincides with important rises in 'ethical' or 'critical' consumption, lifestyle environmentalism, and 'everyday politics', recent crisis in the political Left, and increasing scholarly interest in the peripheries of social movements.

The Epistemological and Ontological Foundation of Alvin Gouldner's Applied Sociology

From the earliest stage to the last stage, Alvin Gouldner's sociology was an applied sociology and Logos Armed. In 1950's he became a President of Society for the Study of Social Problem. He edited a book entitled *Applied Sociology* with S.M. Miller in 1968. He had been working on creating a reflexive apllied or clinical or practical sociology in his entire life. He always tried to make clear philosophical, epistemological, methodological and ontological foundation of his sociology.

In the first part, this paper will investigate the structure of his applied sociology in 50's and 60's by analyzing his articles, his edited book *Applied Sociology*and his critique of Howard Becker's sociology of social problems. This investigation will show that the most critical issue was around the relationship between the infrastructure (personal reality) of theory and theory itself.

In the second part, this paper will investigate and examine sources and structure of his reflexive sociology. (1) Romanticism-M. Weber, (2) K. Mannheim-R. Merton's sociology of knowledge, (3) Saint-Simon and technocracy, (4) American pragmatism, especially (5) C.S. Pierce's Philosophy of continuum and (6) G.H. Mead, and (7) Western Marxism's self-critique will be examined. Sources could be multiple. But this article will find that the most important sources are American pragmatism's idea of "personally real", the priority of practice, Pierce's philosophy of continum, theory is practice and G.H. Mead's theory of self.

In the third part, this paper will clarify epistemology and ontology of Gouldner's reflexive sociology. His ontology is clear. But his epistemology remained to be ambiguous. This paper will try to clarify his epistemology and its problems. The author would like to pay attention to psycho-analytic social theories which did not neglect emotion.

Finally this paper will briefly discuss about his sociology's implications to empirical research

Peasants' Demands of the Rural Public Cultural Service and Decision- Making Mechanism

The innovation of system of public cultural service plays an essential role in rural social innovation in the midland of China, where is a grain producing area. Based on the quantitative analysis through the survey data of rural culture construction in Hubei province, China, we investigated local peasants' demands and satisfaction of cultural activities and public cultural facilities. Besides, we analyzed the influencing factors of them. The research shows that the peasants' demands of culture activities and supply of public cultural facilities are dislocated. This conclusion is explained from the characteristics of the cultural activities and the public cultural facilities. The research enlightens decision-making mechanism of public cultural services in rural areas as follow: the decision mechanism of rural public cultural services should include peasants' demand expression mechanism. Not only to reflect their demands of quantity, but also to reflect their demands of quality.

Attempts to Govern Climate Policy through Emissions Targets and the Monitoring of Carbon Budgets: A Case-Study of Climate Monitoring in the UK

This paper arises from a current study of the sociology and politics of monitoring in the UK, where we compare monitoring practices, and the links between monitoring and policy, in a variety of policy areas. Here we focus on the monitoring of numbers in the climate case, using some findings from the corresponding migration example for analytic contrast. The key point of interest is that both policy areas are contentious and in both cases the phenomenon is countable. People and molecules are, in-principle, numerable. However, the practicalities and public policies of counting these entities turn out very differently.

In the climate case, though there are high-profile "sceptics", prominent foot-draggers in key posts, and variable amounts of public confidence in the mainstream scientific consensus, the actual business of inventorying emissions proceeds rather unproblematically. Emissions counting is bureaucratised ("black-boxed" in the popular STS terminology). There are few efforts to undo the black-box and deconstruct the numbers. By and large, counting is monopolised by official agencies and no-one else tries to out-count them. Any critiques of the numbers tend to come from policy experts in lobbying organisations (who argue – for example – that emissions implicated in imports are erroneously omitted from the UK totals).

By contrast, in other policy areas the very business of counting is politically contentious and a variety of actors is involved in generating claims about, and assessments of, numbers – ranging from lobbyists to journalists.

The paper develops this contrast in three ways. First we examine the systems for the numeration of the phenomenon. Second we investigate how the near-monopoly of counting by official bodies is maintained in the climate case. Lastly, we consider the role of counting in the constitution of policy controversies. We conclude by examining more general claims about monitoring and enumeration in contemporary governance.

Dehumanizing the "Other" in Conflict Situations: From an Evil Human to an Animal and Object

This paper is looking into discourse of Russian-speaking Israelis on Arab-Israeli and Russian-Ukrainian conflicts. Although these two conflicts have different historical antecedents, are influenced by different political forces and are geographically distant, both involve Russian-speaking Israelis directly and have created a split in the immigrant community. Discourses on both conflicts have similar elements in terms of topics discussed and arguments summoned since they are rooted in the Soviet past and values internalized even by members of the post-Soviet generation. Several motifs emerge in the analyzed material. The terms "fascists" and "Nazis" are used as the worst accusations and label the hostile *others* indiscriminately, whether they are Israeli right-wingers or Hamas militants, Ukrainian nationalists or supporters of Putin's policies. Conflict narratives abound in pejorative nicknames, which true to the folklore tradition, present the enemy as animals or insects that are treacherous, violent or lack basic intelligence. Extreme degree of enemy dehumanization is the use of metonymies reducing humans to objects. Narratives about hostile others are full of inconsistencies: on the one hand they reveal Eurocentrism; on the other they reveal an anti-European and anti-American stance and a clash with democratic values. Thus Europe (*Evropa* in Russian) is derided as "Gayropa" while the separatist Donetsk is dubbed "*Donbabwe*" (blending of Donetsk and Zimbabwe). To neutralize slurs, the targeted groups adopt them as part of their positive auto-stereotype. In all these cases neutral lexis is reappraised as evaluative and emotionally charged and reinforces persuasive strategies.

YEPES, LIDIA* (Universidad Autonoma de Barcelona, lidia.yepes@uab.cat)

Labour Trajectories of Young People: The Role of Social Networks

The objective is to analyze the relationship between trajectory of youngsters and social networks, in particular centred on social support as a strategy for job seekers to increase employability. Nowadays, in a moment especially difficult for young people, primarily affected by the economical and social crisis in Spain, the current research is focused on labour trajectories of young adults aged 20 to 34. Three elements have been identified which in interaction result in different patterns which we can analyse by establishing typologies. This can be linked with the increase of de-standardization and the importance of biographical elements to comprehend labour market pathways: the social background, the trajectory itself and, the personal network. Embedded in a life course perspective framework, the paper presents an exploratory analysis with the data collected by a mixed method surveys.

According with the research focus, labour trajectories are both conditioned by structural elements (such as the economy or institutions) and agency. One way to approach these limitations is by what we call 'accumulative advantatge or disadvantatge'. This approach argues that initial inequalities at the beginning of the trajectories tend to increase over time. The reason is the existence of a feedback process in which initial advantage's situations generate exponentially greater resources which make greater the difference between those with worse starting points. Therefore, the paper maintains as hypothesis that we will also find differences in the use of social support as a mechanism to enter in the labour market according to the social background the youngster have. Consequently, we can set up a typological comparison: as better starting position, the greater possibility to take more advantage of social networks likewise extend and used them. In this sense, the network is deviced as a reflection of your own trajectory in which both dimensions keep an interdependence relationship.

Remembrance on the Doorsteps of the Appropriated Armenian Property in Van

The ruins of the old city centre of Van, Turkey, built and occupied for thousands of years by the autochtone Armenian community who had perished with the Armenian Genocide 1915, looms in the background of the new "downtown" of the modern city. The ruins are uninhabited and isolated with fences and wires by the governorship. Similarly, the ancient Armenian monasteries in the rural area of Van that were plundered and appropriated during as well as after the genocide has fostered new Kurdish settlements nearby. The streets, hills and hidden corners of the centre and villages of Van contain a great number of such spots that can well be defined as *Gedenkorte* or *traumatische Orte* (Assmann 1999; cf. Celik & Dinc 2015).

This paper discusses the influences of the appropriated Armenian property in the urban / public spaces of the region and tracks the traces of the remembrance on the Armenian past — through these buildings — in the biographies of Kurdish people. The study is based on narrative interviews and ethnographical documents.

With the growing awareness in Kurdish society on the Armenian Genocide (Ibid.; Biner 2010) and on the participation of the ancestors (Gerlach 2010), the young generation challenges the denialist representation of the state and grandfathers posing the question "Why does an Armenian church stand in a village that is bereft of Armenians?". Moreover, the phenomena — interrelating the state oppression on Kurds with the Armenian Genocide - occurs in narratives. In this regard, this paper, centred around a comparative questioning — centre versus periphery and state (denialism) versus individual (remembrance) (Libaridian 2004), focuses on the complex relationship between remembrance and the place through social mnemonics (Olick 2008; Woolfson 2013). Different positions and remembrance regimes about the public spaces related to the genocide will be included in the discussion.

Rethinking the Common of the People through Social Movements: Turkish Cases

Social movements are gaining importance against the institutional and formal politics. Because of the deficiency of liberal democracies and representative systems, ordinary people try to create new spaces to speak and to intervene the decision-making process. The point of the paper is that social movements emerge as a constitutive space to create common of the people who living together. Turkish movements could not engage with the alter-globalization movement in the beginning of the 2000s but now they affected and inspired these kind of grass-root events especially in the post-2010 period, Turkish movement cases can be analyze these "second-wave of alter-globalization movements" that one of the main arguments of the paper.

With Hardt and Negri's word, social movements build "the common" to alternate the system, so the actions are indeed to search for the alternative way that is not experienced before. It was the class-struggle and revolution to hold together the movement in beginning of the century but nowadays the different demands and grievances are the topic of the political and struggles turned a kind of constellation.

These actions can be seen as searching of a new common of Turkish people outside of the established politics. In Bayat's terms, it can be titled as "becoming political" and because of shifting of human relations from passive network to active network. An also these are "prefigurative" movements that imagine a new society and politics beyond liberal democratic system. While democracy or individual liberation or participation concepts had not be main agenda of the Turkish movements during 1968 period. "The common" were presenting the national or patriotic emotions. But now Turkish movements are creating new common under the effect of the post-2010 global movements. The paper will be focused on more democracy demands of the latest movements in Turkey.

Getting Adapted? a Comparative Study of 'qualified' Turkish Return Migrants from Germany and the US

Due to the waves of migration from Turkey to Germany, Turks now form one of the largest minority groups living in Western Europe, which have migrated from outside of the EU region (Sirkeci 2002, p.9). As a consequence, starting from the first period of migration, Turkish migration to Germany has been a subject that social scientists have been intensively studying. However, most studies on Euro-Turks have focused on guest workers and there are limited studies which look at the case of qualified professionals from Turkey to Germany. The academic interest is limited not only in the migration of professionals to Germany but also in return migration. On the other hand, the history of Turkish migration to the US goes back to 1820s. Although its history dates back to 19th century, Turkish migration to the US has received very little scholarly attention. However, in the existing studies, in a different way from the German case, qualified professionals has been a major group that scholars concentrated on. Especially within the context of the discussions on brain drain, the reasons behind the migrants' decisions to migrate and their experiences as immigrants have been investigated. Yet, within the discussions on Turkish migration to the US, return migration has been insufficiently covered. The aim of this paper is to concentrate on return migration of Turkish qualified migrants from these two countries. Depending on in-depth interviews with return migrants, this paper reflects on the question of under what conditions qualified Turkish migrants return to Turkey. It also aims to understand to what extent and in what ways they get adapted to the Turkish context after returning. By comparing the experiences of these two groups, it will be explained to what extent the reasons behind return and adaptation forms are different in these two cases.

Knowledge Workers in Istanbul Practicing Self-Management

Knowledge work has been extensively studied by many management scholars since it was first used as a concept by the famous business guru Peter Drucker at the end of 1950s. Drucker and other researchers of the subject argued that new organizations depend on knowledge as their main factor of production. For these new organizations, they claimed, knowledge workers who can perform complex tasks due to their professional skills and knowledge are the most important "assets". Drucker argued that knowledge workers themselves define what the task is or should be; they are responsible for their own contribution to their companies. For him, knowledge workers, today, must be *their own chief executive officers*; they need to learn to *manage themselves*. How can we interpret the arguments of Drucker and other management scholars on knowledge workers from a critical social theory perspective and what are the implications of self-management for knowledge workers? Michel Foucault suggests that the principle of neoliberal governmental control is the reorganization of social relations around a notion of enterprise. The application of the enterprise form to social relations also includes a reconstruction of subjectivity; individuals are encouraged to view their identities as a type of enterprise. Individuals are controlled through individual autonomy and responsible self-management. If we read management scholars' suggestions to knowledge workers in this light, calls for self-management suggest a more intense control of knowledge workers. However, to what extent disciplining of knowledge workers takes place in the lived reality of these workers? Depending on in-depth interviews with twenty knowledge workers who are currently working in İstanbul, this paper will explain to what extent they practice self-management, and how they live through that kind of experience.

Using the Concrete Case "Bristol Is Open" to Explore the Future City in the Making

Technology plays a leading role in imagining and shaping our future cities, which is reflected in the current trend of Smart Cities. According to Living Lab Global, there are 557,000 local governments worldwide involved in smart-city innovation (Townsend, 2013:10). There are many research studies on Future Cities (Read et al, 2005; Brook, 2013; Dunn et al, 2014), but we still know little about the real-time socio-technical vision of the Future City in the making. Informed by Actor Network Theory(ANT) (Law, 1987), Future Studies (Bell, 1997; Adam and Groves, 2007) and expectation studies relating to Science and Technology Studies (STS) (Lente et al, 1998; Borup et al, 2006), this paper aims at filling this knowledge gap through an empirical case study of the project "Bristol is Open (BiO)". BiO is a smart city project launched by Bristol City Council and the University of Bristol. It aligns various old and new technologies, such as lampposts, Optical Fiber Network, Driverless Car, Software Defined Network (SDN), Super Computer, Internet of Things and Big Data, to experiment with the idea of "the world's first Open Programmable City"[1]. Similar to most technological innovations which seek to transfer models from one region and society to another, BiO also plans to mobilise its future city solutions to another context. This research will use the ethnographic technique of participant observation to follow a series of BiO related events, activities and webinars. The paper will shed light on the building process of BiO's heterogeneous network/ *prospective structure* (Law, 1987; Lente et al, 1998) and BiO's *moments of translation*(Callon, 1986). It seeks to understand better the role of engineers-sociologists/professional visioneers (Callon, 1987; McCray,

2012) in shaping the Future City Landscape. It also tries to understand better how citizen might participant in a high technology city innovation (Bell, 1997).

Colour Sisterhood: The Discursive Construction of an Imagined Community in Religious Humanitarian Practice

Drawing on feminist geography (McDowell 1993) and feminist critical discourse analysis (Lazar 2007; Walsh 2001) we examined how an imagined community was constructed in materials produced by an Australian megachurch's women's ministry, the *Colour Sisterhood*. A megachurch is a Protestant church with more than 25,000 attendees that is flourishing amidst decline in traditional churches in many developed societies such as Australia. Through text and image-based discourse, the shared, aspirational gendered identity of the sisterhood has particular spatial associations; it constructs a particular relationship between women and the 'imagined world' in its altruism practices. The construction is a positive one – women are invited to be part of a feminine community that is empowered, beautiful and can act to make a difference in the world. By mobilizing the language of sisterhood, this discourse foregrounds the inherent inequality between 'sisters'. The sisterhood call for women to be empowered to make a difference as there are "orphans to rescue", "sisters to come alongside with" and "nations to believe in" with a mandate that "places value upon humanity". Importantly the scope of this difference is conceptualized in global, rather than local, terms bolstered through the language of social justice and activism that tackle global humanitarian problems. Images of people from other ethnic groups appear as the targets of humanitarian efforts, in distant places, as 'spectacles of suffering' (Chouliaraki 2006). Western women from privileged classes position themselves as fully formed subjects against whom less privileged 'other' women are constructed as abject figures. Our study shows the complex power dynamics that underpin such a construction that operate to reinforce, rather than challenge, dominant gender and racial relations as well as those between developed and underdeveloped regions.

Neighbourhood Governance in Post-Socialist States: A Comparison Between Vietnam and China

The neighbourhood has a long tradition as an important arena of social control and political mobilization in countries in Asia. It has been particularly imperative amongst authoritative socialist regimes like China and Viet where main agents of the party state had been penetrated down to the grassroots. Notwithstanding state control in the economic arena has been much weakened when the countries transit further into capitalism, the party state has, arguably, been able to maintain robust authoritarian resilience in the social and political arenas. In China, residents' committees at the neighbourhood have been rejuvenated to take on new functions and hence created impetus in reclaiming the vacuum of social control at the grassroots caused by the dismantling of the work-unit system. Likewise in Vietnam, the local ward governments are able to sustain their authority and influence in the neighbourhood. Yet research in both Vietnam and China has revealed more perplex pictures of neighbourhood governance beyond what has been observed at the surface. In China, the quest for self-management by homeowners' associations, which has been empowered to take on the responsibility of neighbourhood management, has put the domination of residents' committee under constant challenge. Whereas in Vietnam, acts of individual residents in making more living space and extending the informal economy in the neighbourhood has pushed the ward officials from being an agent for grassroots control to be mediators between the state and the residents. This paper attempts to exploit the extensive data that have been collected by the authors in both China and Vietnam, via document review, surveys, indepth interviews and observations, in looking at the transformation of neighbourhood governance in the transitional economies in Asia. Through such windows, a new form of "negotiated authoritarianism" which has been manifested at the grassroots, can be systematically explored.

Advocacy Coalitions and Policy Outcomes: Explaining the Divergent Trajectories of Climate Policy in Finland and Sweden

It is often thought that the corporatist Nordic welfare states are exemplary in their environmental policies. While this does hold true for Sweden, Finland was labeled "a failing ecostate" by a recent study due to its regressive environmental policy performance, particularly in the policy domain of climate change. Two very similar Nordic corporatist polities end up with very different climate policy outcomes. What explains this difference?

This paper investigates the proposition, drawn from the Advocacy Coalition Framework that a key determinant of policy output is the network constellation of organized actors in the climate change policy domain, and the power relations between the different coalitions.

We use network analysis of original data from a survey of key organizations in climate policy in the two countries (N=192) to discern the advocacy coalitions in each country, and investigate their interconnectedness, perceived influence, resources and beliefs.

We find that in Finland, the network is dominated by the well-connected and resourceful Economy Coalition, consisting of business and labor peak organizations, the largest political parties and government bodies. The Ecology Coalition, consisting mostly of NGOs, is relatively isolated and weak. In Sweden, the Ecology Coalition is much more resourceful, and includes not only NGOs, but also influential research institutes, ministries and businesses. The Economy Coalition, in contrast, is relatively weak. We discuss to which extent the diverging policy outcomes can be explained by these differences in the policy networks, and to which extent other factors are at play.

Parenting and the Changing Landscape of Ageing and Reproduction

The average age of first time parents is rising across Western countries (e.g. it is over 28 yrs now for mothers in the UK) and, of more importance for this study, delayed parenting is also on the rise. In England and Wales, a fifth (20%) of babies born in 2012 had mothers aged 35 and over at the time of birth and about two-thirds (65%) had fathers aged 30 and over (*Office for National Statistics*, 2013). This trend has implications for future family structures and our perceptions of age-related milestones, in this case relating to reproduction, parenting (and grandparenting).

This paper reports findings from an initial stage of a study examining reproductive biographies at midlife (approximately after the age of 40). The data comprise semi-structured single interviews (each lasting about an hour) with 13 heterosexual couples and 2 individuals who became parents for the first time between the ages of 38-57 yrs, either naturally or via assisted reproduction. The interviews sought to elicit accounts of parenting experiences, discursive representations of lifespan and gender identities, and perceived advantages and disadvantages of parenting at midlife. From a Discourse Analytic perspective, the analysis focuses on age-identification strategies, processes of self-presentation as an older parent, and narratives of change and development into a parenting role at midlife. The findings relate to different dimensions of age(ing) and self identity. More specifically, the analysis yields details on strategies of membership categorisation and comparison with (former) self and others in the interviewees' talk.

Rational Choice Theory As Folk Psychology

It is common to regard analytical sociology (AS) as a version of rational choice (RCT) sociology. Given the historical connections between the two, this is not entirely surprising. However, when viewed from a more systematic perspective this is highly misleading. AS is based on a quite different view of the role of theory of action in sociological theorizing. This presentation aims to give a clear account of these differences. First, AS denies RCT any foundational role. AS does not claim that DBO (desire-belief-opportunity model) should have this foundational role. Instead it argues that there is no need for a foundational theory of action. For analytical sociologists, RCT is just one version of intentional folk psychology (FP). It does not have any special status, no matter what are its normative credentials. Similarly, DBO is just a simple version of FSP that analytical sociologists believe to be useful for many sociological purposes. Second, AS does not require that sociologists should always employ the same theory of action. Thus, while RCT may be highly useful for some purposes, there are many situations where models that pay more attention to details of human cognition are more apt in capturing the crucial facts. This more liberal view does not imply that AS is just an unprinci-

pled and opportunistic in theory of action. In contrast to many RCT theorists, AS takes seriously the requirements of realism. While in practice sociologists have to abstract away from many details of human psychology, AS requires empirical justification for those aspects that play a crucial role for the explanation that is advanced. In other words, AS has low tolerance for instrumentalist storytelling and this seriously constrains the use of any general theory of action, RCT included.

Risk and Resilience

Technical and social risk and resilience approaches seem to live their own lives even though there have been attempts to get them to complement each other (Renn 2008; Löstedt and Östberg 2009; Aven and Renn 2010). Endeavors to integrate technical and social aspects of risk may face practical problems. Yet, in order to maintain a fruitful dialogue between the technical and social risk fields, some basic understanding of what is going on in each other's fields is required. If scholars are aware about developments in different risk domains, better chances to dialogue, reflections and new insights into risks and resilience emerge.

This paper is explorative and deals with the originally non-sociological concepts - risk and resilience – which have become part of the social sciences' and environmental sociology's terminology. In the paper the recent developments of both concepts in sociological and non-sociological fields, such as technical risk domain and resilience engineering, are charted. The aim of the paper is to reflect upon whether and how the new developments in resilience engineering (such as focus on anticipation, socio-technical systems), technical risk domain (focus on uncertainties and endeavours to see beyond the probabilities) or social sciences (focus on governance and ethical and epistemological questions) could enhance fruitful dialogue between these otherwise relatively separated fields. Are there possibilities for fruitful cross-fertilization between social sciences and other disciplines as regards risk and resilience? What could a fruitful cross-fertilization entail? Or are these domains so different from each other in terms of ontology and epistemology that it is impossible to find bridges between them? Reflections upon the concepts of risk and resilience will be linked to concrete environmental challenges, such as natural hazards and nuclear accidents.

Revisiting Individualization in Chile. an Empirical Approach to the Life Course of Women

The theory of individualization emerges in the mid 1980s to account for the transformation of the structures of the industrial society in Western Europe and North America. In Chile, the theory of individualization has been widely used by social sciences since the late 1990s to comprehend the transformation of the identities and lives of individuals due to the structural and institutional reconfiguration of society in the past decades. Nevertheless, in spite of its intensive use, too little has been discussed on the limitations and advantages of this theoretical approach to account for the particularity of recent cultural and social transformations of individuals in Chile. This paper aims to revisit individualization in Chile by empirically analysing the transformation of the life course of Chilean women in education, work and family, and discussing the pertinence of the theory of individualization to interpret these changes. By doing this, this papers aims to contribute not only to a more accurate development of the theory of individualization in Chile, but also to a global discussion on the adequacy of the theory of individualization to interpret cultural and social transformations in local contexts outside the Western developed world.

Japanese Female Police Officers --- Forced Marginalization?

It has long been discussed that the career of female workers in male-dominant profession suffers in various ways; they suffer from work harassment; they underachieve to avoid being viewed as someone who is promoted because she is a woman; they feel alienated in a male-dominant professional culture; they are assigned 'female' task or position. Japanese female police officers make less than 7% of total and 1% of top 10% senior ranks (in Japan Chief Inspector or higher) are seemingly no exceptions to those. The presenter conducted questionnaire surveys with Japanese female officers (n=24) and male officers (n=50) in top 10% senior ranks in a local police force in a metropolitan area in 2015 to explore their career paths and career prospects, their evaluations on their own and opposite sex's professional abilities and strengths, their professional networks and some demographic attributes to understand the struggles of female police officers and the root causes of their struggles. Furthermore, to identify the Japanese-specific factors in the male-dominant environment surrounding Japanese female police officers, the survey result is compared with the questionnaire (translated into English from the Japanese version) survey (n=53) that the presenter conducted in the Republic of Philippines in 2014 with a help from co-presenter. The presenter will discuss the discrepancies between male and female police officers in the evaluations of their own professional ability and that of the opposite sex's, female police officers' early diversion from high-flyer's path and its causes to explore the depths of marginalization of female police officers, and on a side note, not-so-typical male police officers in Japan.

The Career Paths of Local Police Officers and Its Influence on Local Policies --- with a Reference to Those of Senior Female Officers

The Japanese police offers numerous training courses to its sworn officers and civilians at a national police academy, seven reginal police schools and 47 local police schools, ranging from entry trainings for probation officers to a course for officers who is to be promoted to a head of a small police station. However, there is no training course for the officers who aspire to be bureau heads and above, which are top management posts. For example, Tokyo Metropolitan Police has 102 police stations while there are as few as eight bureau heads posts above which are Chief Commissioner and Vice Chief of the force. Recently, it has become a standardized practice that a police officer who aims at ascension to those top posts in the local force has to be seconded to the National Police Agency, a non-operational regulatory agency in a central administration for two to three years. Subsequently, the number of secondments rose from 298 in 2002 to 826 in 2014. The presenter conducted questionnaire survey and face-to-face semi-constructed interviews with senior local police officers between 2009 and 2011 to explore their experience during the secondment and its influences on their understandings on their professional roles. Through the analysis of research results, it emerges that through secondment experiences senior local police officers have evolved into not so much as skilled police officers as super bureaucrats in the Weberian sense. They do not view themselves as police officers but rather administrative officials who live in a quasi-political world. This transition seems to have impacted on the relationship between local police forces and the National Police Agency, policing style, and police recruitment. The discussion touches upon the career paths of senior female police officers, who account for only 1 % of senior ranks.

Images of the Invisible and Visions for the Future: Photovoice Following the Great East Japan Disasters

This participatory action research project using PhotoVoice methodology centers on the photographs and narratives of the very women affected by the disasters of earthquake, tsunami, and nuclear accident that struck northern Japan in March 2011. Since June 2011, over 50 women across 8 localities have been taking photographs to illustrate their experiences, community conditions, and societal responses (or the lack thereof). In collaboration with local women's organizations, these participants were recruited; they represent diverse age and sociodemographic backgrounds. They continue to participate in small discussion groups to discuss their experiences, observations, and associated feelings and thoughts. At each group meeting, the photographers, interactively with other participants, discuss their photographs; these group discussions are recorded and transcribed. Following a series of these interactive discussions, individual participants choose photographs they wish to share outside, and create a voice (a short written message) for each of the selected photographs. The analysis of the photographic images and two types of narratives (group discussions and individual photographers' written messages/voices) allows for the examination of the nature and meaning of the damage and losses at the personal, family, community, and society levels. Photographs taken by the participants differ considerably from the publically captured images of grave damages to the built environment (e.g., destroyed buildings and bridges; nuclear explosion), which have been widely and repeatedly shown across major media outlets. Many photographs capture the effects of the disaster that are in and of themselves invisible (e.g., loss, radiation, a sense of community). In the face of unspeakable destruction and losses, participants' photographs and voices are filled with affections for their land, ocean, people, and community. Through photographs and narratives, they interrogate the societal responses that they consider damaging to the nature/habitat, and in turn articulate visions for the future.

Vulnerability to Gender-Based Violence: Socio-Cultural-Political (DE)Construction through Feminist Lenses

Following the 2011 Great East Japan Disasters, a national network of women's organizations conducted a research project on post-disaster gender-based violence. This represents a first systematic empirical study of this kind, and was carried out by a collaboration between university-based researchers and activists through the feminist perspective. Predicated on the promotion of gender sensitivity—a guiding principle of the nation's gender policies, governmental agencies have addressed gender-based violence following the disaster. Through the analysis of the survey research and the governmental responses, this paper examines the social construction of vulnerability to post-disaster gender-based violence, and seeks to identify pathways and mechanisms that need to be disrupted in order to de-construct such vulnerability.

Using informant survey/interview, data were collected on the type and nature of 83 unduplicated cases that took place following the disaster. The content analysis of these cases identified various societal factors associated with women's vulnerability to the risk of gender-based violence following the disaster, including economic/financial insecurity, gendered division of labor in both the public and domestic spheres, gender norms, and the objectification of women. Further analysis pointed to the various pathways through which the pre-disaster gender inequity predisposes women to the risk of gender-based violence in and after the disaster. Also identified are various socio-cultural-political mechanisms that exacerbated women's vulnerability to post-disaster gender-based violence, including certain provisions of social policies in general, and those specific to disaster response/relief. On the other hand, the content analysis of the governmental notices and reports elucidated a different conceptualization of women's vulnerability to post-disaster gender-based violence; these documents focused on individual and interpersonal strategies, calling women to take preventive measures such as not going out alone and avoid dark places. The paper concludes with an exploration of promising approaches to deconstruct women's vulnerability to gender-based violence in and after disasters.

Russian Engineers' Social Standing in an Age of Austerity

The dialogue around engineers has increased as concerns about the quality of engineering have been raised in Russia. Every modern industrial country needs technological expertise to be competitive in the global market, and it is critical to train engineers to provide that expertise. Modern Russia is one of the countries with the most engineering graduates. Higher engineering education in quantitative terms shows positive trends, but there are concerns and challenges for the quality of engineering and technical education. Russian higher education institutions that train engineers are not listed in any international rankings of the best universities. The situation was quite different at the Soviet time, when Soviet higher engineering education institutions were prestigious. This paper is dealing with how engineers in Russia have been affected by economic reforms, particularly by austerity policies, in their working conditions and in the content of their profession. An analysis of modern engineers' social status and their views on their low social standing have become one of the central issues in the ongoing project *'Russian Engineers: Development of the Profession in the Reforms'*. The interview research aims to investigate the background, work situation, and the attitudes and values of engineers in the lights of austerity policies. In the paper we shall present selected results of the interview research with engineers and show the main barriers and reasons that hinder young people from choosing the career of engineering or from persisting it. One of the main reasons is the decrease of the prestige of engineering in society and the lack of state support for professionalism in engineering.

Fertility of Ethnic Minorities in China

Modern China consists of a population with diverse social, cultural, religious and linguistic backgrounds. The uniqueness of these groups constitutes a mosaic of people who add to the ethnic diversity of the world's most populous country. According to the 2010 population census, over 90% consists of the Han people and the remainder are officially grouped into 56 "minority nationalities", ranging in size from just under 4,000 to about 17 million. The 12 largest minority groups (Zhuang, Manchu, Hui, Miao, Uygur, Yi, Tujia, Mongol, Tibetan, Pui, Dong and Yao) account for 85% of all ethnic groups combined. This paper will discuss the fertility differences among these minority groups and how they differ from the majority Han population. Various fertility measures, both direct and indirect, will be used along with data on certain socio-economic factors affecting fertility. Mainly data from the three most recent population censuses conducted in 1990, 2000 and 2010 will be used, however, data from earlier censuses of 1953, 1964 and 1982 will also be incorporated where available. Our preliminary findings indicate that despite the fact that officially the "one-child" policy applies only to the Han people and not to the ethnic minorities, many ethnic groups have been experiencing fertility declines.

Occupational Prospects, Life Trajectories and Transnationalism: The Case of Second Generation Albanian Students amidst the Greek Debt Crisis

The paper explores the changing predispositions and attitudes of second generation Albanian university students under the impact of severe economic crisis in Greece, and the ways in which these are correlated with re-definitions and innovative approaches for their present and future life conditions.   The findings of this qualitative research are compared to those of our earlier project (2005-2006), in order to reveal the impact of structural changes on the individuals choices and decisions of the second generation as these are shaped in the context of two (totally) different economic and social environments. We emphasize their dissimilar objectives, and the ways in which they affect (and are affected) by their life expectations, their projections of professional preferences, as well as their transnational perspectives of future migratory potentials. The comparative juxtaposition of the orientations of these young adults before and during the economic crisis under intensified conditions of insecurity and uncertainty, reveals quite clearly a radical change of attitudes, with re-adjustments and questioning their position in the host society as the children of immigrants. At the same time, our research attempts to uncover the ways in which male and female students with high human capital re-negotiate their ethnic identity and migrant status within a fluid, constantly reshaped economic, socio-political, globalized reality of immanent risk. With reduced access to opportunity structures in the host society due to the economic crisis, and limited future life-chances and prospects of upward social mobility, they start to reconsider their life trajectories, making necessary adaptations and embracing also alternative plans for return migration or transnational relocation.

Communication, Ethics, Empathy, Kaufmann's Comprehensive Interview and Feminist Methodology Applied to Longitudinal Study of Migrating Couples.

The longitudinal study of Par Migration Project is the task of sociological work package. The study is designed using feminist approach that let Respondents speak for themselves. According to it on one hand men and women involved in the study have total anonymity and right to leave the study in any moment they wish, on the other hand all Respondents may become involved in the project more and more each year of participation if they will. In presented paper we would like to share the process of recruitment procedure, correspondence challenges and creation of interviews calendar. Then I would like to present the approach shared by Researchers related to their training, need of empathy (Kaufmann 2010), the structure of the meeting at Respondents households, the drawing method they used and outcomes of interviews that have been done with them after each phase of the study. In the end I would like to describe the dynamics of the relation with Respondents, the task of their blogging and workshop method some of them went through. The study lasts three years. Each of 42 couples (21 in Norway and 21 in Poland) take part in 5 interviews (3 joint and 2 individual). They write 5-days blog every year. They take part in two psychological questionnaires studies. They participate in workshop for couples. They are being asked to express their needs or remarks or ideas for improvement whenever they want. Some of them will be also included as co-authors of reports and manuals. Such a complex and comprehensive study makes us believe we obtain as an accurate image of everyday-life practices and challenges Respondents deal with, as it is possible. This project is funded from Norway Grants in the Polish-Norwegian Research Programme operated by the National Centre for Research and Development.

Increasing Power Resources By Cross-Border, Cross-Organizational Cooperation? Synergies and Trade-Offs of Transnational Alliance

Between Trade Unions and Social Movements. the Case of Bangladesh

On key assumption of research on transnational labour rights activism is that the current context of globalization, the evolution of the global labour governance system and supply chains also provide new opportunities for workers and trade unions to jump scale and bridge spaces to tap into resources of labour rights organizations and social movements at places of consumption. The underlying assumption is that rescaling conflicts to locations where employers remain bound by institutional and normative frameworks allows trade unions to tap into additional resources, in particular into discursive normative power of social movements. This paper takes the case of Bangladesh to explore in how far the emerging Bangladeshi trade union movement is able to mobilize additional power sources to compensate their structural and associational weaknesses by going transnational and allying with international trade unions and social movements. Bangladesh is a specific case as after the Rana Plaza catastrophe international pressure and the development of new forms of transnational regulation significantly changes the domestic industrial relations landscape. Yet while international social movement networks such as the Clean Clothes Campaign together with global unions significantly contributed to the rise of new forms of regulation – most importantly the Bangladesh Accord on Fire and Safety – we know little on how their cooperation helps Bangladeshi trade unions to build organizational, structural or institutional capacities. The paper argues that allying with transnational labour rights organizations is crucial for domestic trade unions to build and increase different power sources with mutually reinforcing effects. Yet there are also trade-offs and unintended consequences resulting out of trans-boundary, trans-organizational cooperation which actually limit the ability to build certain capacities.

Measuring Scales of Contention By Using an Actor-Attribution Analysis. the Empirical Case of Global-Local Labour Rights Struggles

The paper presents a novel approach to the analysis of contentious claim making across different scales in the international discourse on labor rights enforcement. It explores the multi-facetted and multi-scalar nature of political discourse on working conditions using an actor-attribution analysis (AAA) approach. The actor attribution analysis is a novel discourse analytical approach based on content analysis tools from social movement studies, in particular protest event analysis, frame analysis and political claim analysis (note; this method was developed by Jochen Roose and Juergen Gerhards, modified and adapted by Jochen Roose, Maria Kousis, Moritz Sommer). Attributions of responsibility are the backbone of making sense in a political contention on the right way to regulate working conditions in global supply chains and AAA is a way to provide a structure for data without. In this paper we present AAA as a novel analytical approach which allows to systematically explore the public attribution of responsibilities, which pave the way to future decision-making on who should regulate what, why and how. We argue that this method provides an innovative tool to capture the interplay of actors and institutions located at different locations from the global to the local. Taking the example of the discourse on labour rights violations in Bangladesh after Rana Plaza we reconstruct the interrelations of actors from different scales, their scope of transnational claim and attribution making and the range of their addressees. This allows us to map the multi-scalar contested nature of global-local labour rights debates.

Actuality of Diagnostic Procedure and Risks Forecasting in the Ethno-Confessional Sphere

Historically, issues of ethnic and religious relations were highly relevant for the world community. Ethnic and religious conflicts on a global scale are no longer an internal affair of individual states; they often become a worldwide problem. According to historical experience of the last decades, activation of various ethnic and religious groups under certain conditions begins to pose a perceived threat for multi-ethnic states stability, freedom and human rights. The relevance of ethno-confessional relations research; diagnostics of risks in this area for the Russian Federation and its regions is primarily caused by multi-ethnic population, multiculturalism and active migration processes. Undoubtedly, nowadays problems of ethno-confessional relations have become high-priority in the structure of social transformations. Stability of the future of the Russian Federation largely depends on ability of the federal and regional authorities to achieve mutual understanding, solidarity and unity of different ethnic groups' representatives and religions living in the country.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The importance of people estimation of inter-confessional relations is caused by the fact that the people behavior in different social situations depends not so much on what is objectively real state of the social environment, but how this environment is perceived by social actors. Even the most superficial analysis of the empirical material regarding ethno-confessional relations allow to conclude that different social groups (regarding social, demographic, ethnic, religious, territorial characteristics) have different vision of ethno-confessional situation. There is no doubt that the approach to diagnosis of ethnic and religious conflict risks in ethno-confessional area must be considered fully and constructively.

Yamalo-Nenets Autonomous District is one of the most multi-ethnic regions of Russia. In 2013-2015, a study on «Diagnostic procedure and risks forecasting in the ethno-confessional sphere in YaNAD" was conducted in the district, its aim was to obtain sociological information regarding the status of ethnic and religious spheres.

Do Value Changes Explain Fertility Differences Across the MENA Region?

Middle East and Northern Africa is a rapidly growing and world-shaking region of the world, with unique cultural-religious situation and following its own path of modernization with diverse fertility transition. Its' population these days is approximately equal to that of European Union and is 5 times bigger than it was 60 years ago. Its' fertility level is second high in the world after Sub-Saharan Africa, but in the same time it experienced the greatest fertility decline in the world over the past 30 years. Some MENA countries like Turkey, Tunisia, Lebanon and Iran have fertility level close to 2 children per women or even lower, while women in other MENA countries – Oman, Yemen, Iraq, Jordan – still give birth to 3 or even 4 children on average. Countries of the MENA region have a lot of common in their past: Arab and Muslim culture, geographic conditions. For centuries, they were moving at very similar path, but now they happened to have rather diverse state of modernization, state of fertility level. Why did their paths diverge and what are the factors explaining this differences at individual and country level?

The paper focuses on MENA region fertility patterns and tries to explain the diversity between countries with similar traditional values and common dominating religion. Based on World Values Survey data for the two last waves authors pick up 16 MENA countries, analyze them using macro-level data and perform the regression analysis on the total number of children born. The results reveal that persons in MENA countries who have fewer children tend to have more egalitarian gender values, but the actual impact of various factors may significantly vary from country to country.

ZAKOTYANSKY, DMITRY* (LCSR, National Research University Higher School of Economics (HSE), davin2014@mail.ru)

Fertility in Societies That Have Passed Demographic Transition: Values As Indicator and Factor of Fertility

The work is devoted to studying the relationship between values and fertility in societies that have passed demographic transition. The author carries out a detailed analysis of the evolution of the theory of demographic transition and focuses on how the issue of values was addressed in works of Landry, Notestein, Caldwell, Coale, Lesthaeghe & Van de Kaa and other demographers. Further, he analyzes modern research in the field of fertility factors and concludes what role values may play as a factor and what theoretical connection may be between values and reproductive behavior. Then, the author formulates a hypothesis about the relationship between values and fertility, assuming that conservative values may indeed have significant causal effect on fertility intentions to have another child. These hypothesis and theoretical concepts were tested using European Social Survey of 2010 with key question "Do you plan to have a child within the next three years?" Second births were chosen because of the significant effect they have on reproduction of the European population and substantial differences in parity progression ratios among European countries. Logistic regression modelling included such control variables as age, marital status, education, health, income level, age of the first child, region of a country (Northern-Western Europe, Southern-Central Europe, Eastern Catholic Europe, Eastern Orthodox Europe). Additionally, an effect of trust to the state was theoretically studied, tested and taken into account. Results showed that, indeed, there is a connection between the values of tradition and reproductive behavior: more conservative women tend to have noticeably stronger intentions for having a second child. The results may look expected, but the methodology of the research along with theoretical basis gives us this time more reasonable grounds to state that values may indeed affect fertility and causality on individual level does exist.

ZAMORANO GALLEANO, HECTOR* (RC51, hlzamorano@yahoo.es)

Sociocybernetics: Designing Mathematical Models and Its Simulation As a Decision Support System.

Is it possible to make experiments within Social Sciences? Some would say "NO" because after the first experiment the social system learns and reacts differently. However, if we have a good model, we can experiment simulating the model. Into the organizations, the managers must take decisions in order to solve a problem, but sometimes they make it worse. This is because "the rapidly increasing difficulty of action and decision in such a complex and highly dynamic world". (HORNUNG)

To coop with this difficulty the human brain and their mental models are not enough. It would be necessary, first of all, to have the ability to see the world as a complex system, where everything is connected to everything.

System Dynamics is a method to enhance approaching to complex systems.

System Dynamics to deal with the complex systems into the organizations requires

1. tools to represent the mental models
2. formal models and simulation methods to test and design new   policies or to test our hypothesis without affecting the real system
3. to have a long term view of the consequences of our decisions

Cybernetics provides us a key concept: FEED FORWARD that will let us to work with "government" concept instead of "controlling".

This requires a circular – causality reasoning instead the linear reasoning.

"The art of system dynamics modeling is discovering and representing the feedback processes, which, along with stock and flow structures, time delays, and nonlinearities, determine the dynamics of a system." (STERMAN)

This kind of tools let us to create virtual worlds. Virtual Worlds "are formal models, simulations, or "microworlds" in which decision makers can refresh decision-making skills, conduct experiments, and play." (STERMAN)

Predictors and Impacts of Police Legitimacy in the City of São Paulo

Legitimacy of public safety and justice institutions, especially related to policing, has become an important question of analysis in recent years. With different formulations of legitimacy and trust in institutions, many authors have shown important empirical connections between institutional and political legitimacy, obedience to the law, procedural justice and cooperation with the police, among others, in different international contexts (Tyler and Jackson, 2013; Bottoms and Tankebe, 2012; Tyler, 1990). However, there are several questions in which there is no consensus and some limitations in the international literature, such as a more consistent operationalization of the concept of legitimacy and the development of more cross-cultural comparison of these dimensions (Eisner and Nivette, 2013).

This article seeks to develop, through a survey applied in the city of Sao Paulo in 2015, an analysis focused in finding out the predictors of police legitimacy and the impacts it has over some specific analytical dimensions related to the policing activities. This analysis is realized through an operationalization of the concept of police legitimacy based on some specific attributes related to the claim to rightful authority of the institution and that power is rightfully exercised: moral and legal alignment, obligation to obey the authority and the law and trust in the police. In order to analyze the predictors of police legitimacy an analytic model is developed, considering variables such as feeling of insecurity, individual morality, victimization, urban disorder and procedural justice. This model also considers some impacts of police legitimacy, especially over cooperation with the police, which is a key factor for the proper functioning of the institution. Results and implications of the study are discussed.

Spatializing Educational Inequalities. Spatial Econometric Models of Neighborhood Effects on Elementary Students' Mathematical Achievement in Zurich, Switzerland.

In the last 30 years we witnessed a wide range of research on neighborhood effects on various outcomes, such as people's health, labor market involvement or educational attainment (Jencks & Mayer 1990; Sampson et al. 2002; Galster 2012). However, the results of these studies differ considerably in both the direction and magnitude of the effects. On the one hand, this seems to be due to a lack of an adequate elaboration of the theoretical social mechanisms (Hedström 2005; Sharkey & Faber 2014). On the other hand, this undesirable situation can be explained – at least partially – by the applied methods (Galster & Hedman 2013). While the well-known challenges of an adequate modelling of the spatial scale of "neighborhood" (Lupton 2003), the presence of selection bias (Heckman 1979), and the inherent endogeneity (Manski 1993) have received some attention, the spatial dependence of observational units has been neglected completely. This dependence leads to a fundamental mismatch between our theoretical and our methodological framework, whereas the first assumes social interdependence and the latter statistical independence of observational units.

Using spatial econometric techniques (Ward & Gleditsch 2008; Elhorst 2014), the present contribution not only addresses the methodological challenges but also models the suggested social mechanisms – the adoption of norms and the social integration and interaction in the local context (Galster 2012) – directly. The results indicate heterogeneous neighborhood effects on elementary students' mathematical achievement in 6th grade. While students with a more fortunate social background benefit from socially advantaged and competitive peers, the more disadvantaged ones and especially boys are negatively affected by their presence in the local context. Taken together, the results suggest local social integration and interaction as the crucial mediating mechanisms and stress the relevance of local spaces for the reproduction and reinforcement of educational and social inequalities.

Towards to Better Understanding the Persistent Association Between SES and Health: The Intersections Between Fundamental Cause, Diffusion of Innovations and Cultural-Health Capital Theories

Fundamental Cause (FCT) is one of the most relevant theoretical contributions from medical sociology in the past twenty years (Link and Phelan, 1995). Most empirical tests of FCT have focused on how "flexible resources" play a critical role in the persistence of an inverse association between SES and health. In addition, another set of empirical papers have been testing how specific preventive innovations shape and reshape the association between SES and health in favor of higher SES. So, most empirical studies have focused on the mechanisms that reproduce health inequalities. A core proposition of FCT, namely that these mechanisms are replaced by new ones over time has received far less attention. We state that an intersection of three theories, namely FCT, Diffusion of Innovation and Cultural-Health Capital, helps to explain why the association between SES and health persist beyond extensive dissemination of preventive knowledge.

The objectives of our study are threefold: (a) to shed light on how new mechanisms emerge along different dissemination stages of preventive knowledge; (b) to test whether old mechanisms wane in importance in relation to this dissemination process, and (c) to discuss whether cultural-health capital is the "key flexible" resource that provides the ability to transfer others resources into good health.

We use data from two waves of the Spanish National Health Survey (2006-2007; 2011-2012) to explore this issue and test our hypotheses. We base our empirical analysis on health-care preventive practices with different rates of adoption by our target populations.

Result shows that the emergence and demise of the mechanisms is associated with the diffusion process of preventive health knowledge. Results also show that, during the subsequent stages of the diffusion process, (incorporated) cultural health capital gains relevance as a flexible resource that contributes to inequalities in preventive health care use.

Science Policy and Institutionalization of Science. Public Policies of Nanotechnology in Latin America, the Cases of Brazil and Peru.

Very little is known about how science policy is been implemented in Peru. We have some notion, however, that this country has not been performing well due to lack of resources and proper infrastructure. However, the general public, the government and the corporate sector have not been very interested in (or even ignore) science policy as a key asset for development. In this paper, we explore why this happens through what we call institutionalization of science. We state that this concept is closely related not only to the implementation of public policies, but also to the legitimacy of science and technology in the country. For this purpose, we will conduct a brief review of the core characteristics of public policies of nanotechnology in Latin America, including the experiences of Brazil, Mexico and Argentina. We will focus specially on Brazil, since it's the country that has invested the most in the region. Finally, we will point out what is happening in Peru, taking into account that despite not having enough resources to develop nanotechnology at a great scale, something can be done to escape the current situation. We state that, before designing and implementing public policies of science and technology (nanotechnology in this case), it's fundamental to study and analyze the degree of institutionalization of science and its legitimacy, which is expressed through scientific culture.

Methodological Pitfalls in Sociolinguistics, Exemplified By Statistical Analyses of Associations Between Stuttering and German Preschoolers' Sociolinguistic Characteristics

Empirical evidence generated by both uni- and multivariate statistical methods is subject to a certain variability of results depending on the consideration or non-consideration of a number of semi-obligatory rules of statistical analysis. Among other things, it is up to the researcher whether a Bonferroni-, Bonferroni-Holm or some other correction method should be applied to the probability values, whether missing data should be imputed, whether metric data should be z-transformed for a better comparability of different scales, whether exact or asymptotic probability values are reported, with or without respective effect sizes. Any manipulation of the data can result in a considerable variation of results including fluctuations of the p-values and effect sizes, which can be utilized for the so-called "p-hacking". Also, a very high inconsistency of results of classification trees, regressions, and some other multivariate tests represents a methodological challenge to researchers, especially in retrospective studies where the most relevant factors sometimes should be chosen from a wide range of available variables. These and some other issues are exemplified here on the basis of a sample collected in course of a large language assessment study in the German state of Hesse during the school enrolment examination (N = 746, 40% monolingual Germans, 60% bi/multilingual immigrants; 52% boys, 48% girls; age range 46-99 months, median 70). All children were tested with validated, well-known language tests such as AWST-R, S-ENS, and ETS 4-8. 36 stutterers and 712 non-stutterers were identified by means of questionnaires for parents. A link between stuttering and (a) language skills as well as (b) some sociolinguistic and demographic variables can be represented as very close or non-existent depending on chosen statistical methods (logit-loglinear analysis, linear-with-linear associations, regressions, classification trees, correlations, chi-square, or discriminant analysis) and on manipulations of the data such as missing-data imputation.

Once I Have a Family … Children's Constructions of Their Own Future Families in the Light of Their Present Family Forms

Existing research on children's depictions of their future families has primarily focused on gender aspects. In contrast, this study highlights children's family structures as an arena of differentiation. The research is based on qualitative interviews with 50 ten-year-old Austrian children and relies on a social constructionist approach. Results indicate considerable differences with regard to family structure: Children living in non-nuclear families emphasized their wish to correspond to the norm, presented less detailed ideas about future partnerships, ascribed more agency to children and constructed parental roles differently from those living in nuclear families. However, distinctions were less pronounced in terms of gender roles.

The Longue-Durée Impact of Religious Welfare: Secular Young Politicians in Mexico and Their Notions of Charity and the Common Good.

The Catholic Church in Latin America has played a welfare-provider role since its establishment as a hegemonic religion during colonial times (15th-18th centuries). Although post-independence secular reforms in the 19th and 20th centuries constrained more or less the Church's public jurisdiction and by extension its welfare supply, it is not rare, still today, to see orphanages, hospitals, shelters and a number of assistential organizations run by this Church or by lay practicing Catholics. To this historical ensemble of Catholic organizations, other Christian-minority churches have recently added their own, making Christian churches and organizations as a whole a rather quiet and selective, though ubiquitous and experienced, non-state provider of welfare services across Latin America. I will argue in this paper that both a genealogical view and a discursive-ideological focus that go beyond institutions *per se* can provide us with insightful knowledge of the *longue-durée* impact of religions on the meanings, understandings and practices of welfare beyond churches and religious organizations. Drawing on a genealogical analysis and data from semi-structured interviews to heads of political parties' youth wings in Mexico –a country where secular laws have been in place and zealously maintained since the 1850s– I will explain how in this Latin American country secular young politicians' conceptions of welfare are to varied degrees informed by Christian notions of charity and the common good.

The Search for an Adequate Denominator of the Current Social World: Theoretical Considerations of Providing Conceptual Labels to Contemporary Societies

A quite considerable number of diverse concepts, as, for instance, 'risk society', 'network society', or 'knowledge society', aiming at attaching a proper label to contemporary societies has emerged in recent decades. Numerous notions have been contrived with the objective to extract and underline key features of current societies and thus delineate their adequate depiction. In the first section of this paper an extensive inventorial list of distinct terms directed at articulating essential features of social world(s) nowadays is adumbrated. The central focus of this discussion is, indeed, given to the examination of theoretical assumptions in which certain conceptual labels have been anchored, and which preconditions ought to be fulfilled in order to assign a particular conceptual prefix to a current society. The denoted epistemological inquiry indicates that such a process of denomination suffers from severe drawbacks which primarily appear as paucity of proper theoretical elaboration and sufficient empirical foundation. Another discussed issue is the dis/continuity with previous forms of the social world and their corresponding conceptual designations, or with difficulties intertwined with the proposition that current societies represent entirely novel entities, accurately distinguishable from former types of society. Special emphasis is placed on scrutinizing theoretical assumptions of emergence of 'post-industrial society' and diverse akin concepts, as 'information society' or 'knowledge society'. By unfolding the flaws and stringent basement on which such terms have been rooted, an introduction of an authentic concept of 'creaft society' is advocated and exhaustively elaborated. In comparison to former terms, the leverage of the 'creaft society' concept is highlighted as it reflects the axial attributes of (most) advanced societies more pertinently. Finally, the immense relevance of proper labelling of actual phenomenology of contemporary societies is emphasized, since conceptual labels and terms inherently possess remarkable heuristic potentials and appreciably contribute to comprehending the social world we inhabit.

Time and Space in Daily Life Decision Processes - Concept and Research Method

In order to develop an approach for empirical research on shaping daily life, a link between the tendencies in societal structure we were interested in and individuals'agency was found in individuals' *concrete daily actions* with reference to *time and space*. The concept posits shaping of daily life as the stream of decisions each on the forthcoming activity in the day, day after day. Time and space are important in three respects: (1) Each particular decision occurs in a *particular place and at a particular time* where the concrete personal and environmental situation determines possibilities and constraints of what actually can be done. (2) The stream of activities is *continuous*. At each spatial-temporal life position, personal goals, intentions, needs and habits have to come in temporal line with present and anticipated future demands arising from the world. Thus the power balance between individual agency and societal structures is negotiated in each decision. (3) Many activities are distant in time, but interconnected over the time by a goal,

a project or a habit, thus connected not only by temporal ordering, but also by an *intrinsic temporal relation*.

Case analyses proceeded in three steps. (1) Using a "production system", every single decision was reconstructed in order to find out how and why the new activity came about. (2) These analyses were the basis for deriving characteristics of each person's environmental scope of activities as well as her or his capabilities, goals, intentions needs and habitualised means of deciding. (3) By comparing individual cases, general characteristics of the influence of more general societal features on individuals' lives were uncovered.

Thus in order to learn about societal features, research started out from actually available and localized facts in time and space.

Where It All Happened: Authenticity and Commemorative Religious Ritual

Authenticity has been a sociologically relevant concept at least since Walter Benjamin's seminal essay on the work of art in the era of mechanical reproduction. Although authenticity was thoroughly examined, particularly in the field of tourist studies, relatively few authors engaged with the role presumably authentic objects and sites play in the structure of religious rituals. Returning back to Benjamin's initial work and connecting it with Durkheimian strain of thinking about ritual as an integrative collective event, this paper hopes to offer a productive approach to the problem.

The paper draws on data acquired through collaborative fieldwork conducted during celebrations of 600th Anniversary of the Council of Constance (2014-2018) in Constance, Germany. The 2015 edition of the festival was entitled "The Year of Justice" in order to commemorate the death of Czech church reformer and Charles University rector Jan Hus (1369-1415) who was condemned as heretic at the Council and burned at the stake. Following his death, Hus' teachings inspired a militant reformist movement, the Hussites. In 19th century, however, Hus was reborn as a national icon, a source of pride and identity, and is still today referred to as "the greatest hero of Czech history."

Specifically, the paper analyzes the pinnacle of the festival – ecumenical mass celebrated on the date Hus was killed (July 6), which declaratively sought reconciliation and attracted broad audience from both Germany and Czech Republic. Among the most discussed and commented aspects of the mass was its location in the Constance's Minster, the exact building in which Hus was condemned to death. This claim of authenticity, of returning to the same place, later emerged as central to the meaning of the ceremony. The paper attempts to provide a sociologically pertinent rationale for both the use of the specific building and other, less conspicuously "authentic" objects.

Contested Issues. Public Conflicts in the German-Speaking Literary World

Conflicts and scandals around literary works and authors cannot be understood apart from the circumstances of their development. Differing interpretations and valuations don't necessarily end in public conflict. In order to explain the emergence of literary conflicts one has to grasp the particular social configuration and the prevalent grounds which account for the individual conviction that it is worth fighting over interpretations of literary works.

The presentation will focus on the literature in German speaking countries because this geographic space has not only a common language but also quite similar history and cultural heritage. The great variety of contested issues in this literary world that occurred in the last 20 years pushes me to search for some analytic criteria to formulate a typology of conflicts. Hence I regard three classification levels as the most significant: On the *normative level* I draw on the distinction between legal norms and moral standards of a social group. On the *pragmatic level* I focus on the form a controversy is carried on e.g. in a law-court, in mass-media and in political institutions. On a *teleological level* I regard all expressed or hidden intentions of parties involved in a conflict as significant for understanding their behaviour.

According to this classification structure I have identified five different types of conflicts:

1. Legal conflicts related to the *freedom of artistic expression against other rights*, such as the protection of the private sphere.
2. Conflicts that result from certain *tacit social expectations and demands* of writers.
3. Conflicts that burst when a literary work articulates *harsh criticism* to dominant beliefs of a social group.
4. Conflicts that reveal the *internal antagonism* within the literary world.
5. Conflicts that emerge from *stage-managed* scandals.

The analysis of public literary conflicts can be linked to a social analysis.

The Interplay of Various Forms of Artistic Knowing

The Interplay of Various Forms of Artistic Knowing

In my presentation I will elucidate the interplay of several forms of knowing in composing process in art music. As a general term, "knowing" includes tacit, embodied practical abilities. My aim is to move from the description of artistic practices to a deeper understanding of *artistic agency*.

The empirical material (interviews, working diaries, sketches, and videography) originates from a research project called "Tacit Knowing in Musical Composition Process". Using qualitative methods we accomplished five case studies to document composition processes from the beginning of the work up until the last rehearsal.

Composers in art music use in the creative process cognitive and material tools to form, try out and elaborate ideas that finally have to be written down in an appropriate way. Cognitive and material tools are used on the basis of practical experiences, situative sensual perceptions, embodied emotions and intuitive valuations, which are usually expressed in words like "I feel it fits". The configuration of all these aspects is efficacious and generative, i.e. it initiates and sustains artistic creative processes. Theoretical musical knowledge, beliefs including aesthetic ideas, knowledge of notational systems become actionable knowledge, because in the case of composing all these kinds of explicit knowledge are established in specific artistic paradigms (Nathalie Heinich) that shape the actual role of explicit knowledge. Furthermore, the vast sensory and practical experience of composers sustains an intelligent embodied mind that becomes manifest in skills and tacit understandings. Finally all the various forms of knowledge and knowing are bounded in a teleo-affective practice (Theodore Schatzki) that is related to the object of composer's efforts: the final artwork. My analysis of creative process combines an ethnographic approach with a conception of practical knowing based on the works of Ludwig Wittgenstein, John Dewey and Michal Polanyi.

Mobility, Transfer, and Other Challenges: Some Tips from the IT Professionals

Highly skilled migration and mass outflow of the IT professionals after the collapse of the Soviet Union put these engineers on the map of global technological market. Mythology about and nostalgia for the Soviet education take roots in a complex of different stages of the trainig system starting from an elementary school and extracurricula activities and finishing with the World contests and programming Olympiands. The talk presents some results of the study of Russian IT professionals placed in Russia and the UK based on biographical interviews. IT professionals usually mention their training when discussing factors of successful careers abroad. But what is also noticed is the recent negative tendency in the transformation of the whole system of technical training. The local barriers are relevant for the higher education institutions depending on available symbolic, social, material, and political resources. The IT sphere is leading in producing new projects as industry is highly concerned: the IT companies form demand and thus create new mechanisms for collaborations with HEIs by implementing specific training. Practical experience of the graduates from technical universities raises their global compatitive capacity and facilitates the international mobility resulting in internal and external migration. These professionals become recognised on the global level, where the flows of highly skilled migration acquire national treats. Compatriots being successful abroad turn their attention back to their home countries or away to the post-Soviet diaspora abroad. Shared cultural and educational background ease a knowledge transfer and connections to networks of technical specialists. HEIs remain sources for qualified personnel and potential partners thus confirming sacred status of alma-maters and education in general. Despite the negative estimates of the recent changes in the educational system, the nostalgic image of education and training keeps the process of professionalisation run for the post-Soviet technical specialists in a global community.

Online Worlds As Playground for Identity Building. What Is Virtual, What Real?

Online social networks function as space of designed and controlled self-presentation; nowhere else and never before it was possible to present so many different facets of the self in a better and more diverse way. Thus certain parts of the personality become visible – especially tailored and adjusted for the respective (expected) audiences. Since Erving Goffman and Zygmunt Bauman people are aware, that everyone in everyday life is an actor and embody roles and their attributions, which provide social prestige and market value in the consumer society. With the increasing importance of the Web 2.0 not only online virtual worlds (like gaming environments) but also social networks can function as new, alternative market places for self-representation. Thus more and more people "pimp" their appearance to gain higher social recognition inside the virtual settings with noticeable effects on the self in the "real" world.

Following the theory of the philosopher Robert Pfaller an avatar takes over in the virtual setting and the user delegates emotions and even the enjoyment and pleasure to the figure created by the user, often representing certain facets of his/her identity. The representation in the internet – in virtual worlds as well as in social networks – on the other hand enables its "creator" to live out interests, wishes, dreams or needs that cannot be acted out in the offline world due to cultural, economic, social or moral reasons.

Especially in cases where moral control prevents the acting out of feelings the virtual setting might become the space for the "real" self and reality is the room for creating the virtual adapted self.

Research conducted online in subcultures and with online gamers shows this online identity construction as escapist behaviour to flee the suppression but as opportunity to try out new things first virtually.

ZENTNER, MANFRED* (Donau-Universität Krems, manfred.zentner@donau-uni.ac.at)

The Influence of Social Networks on Decision Making for Education Pathways

The research project analyses differences regarding the influence of families and peer groups on decision making processes for further education pathways of young people with and without migration background at the end of mandatory schooling.

The Austrian education system is strongly differentiated: After four years of a common primary school the secondary education is conducted in two different forms, followed by opportunities for a dual vocational training, for middle and higher vocational, and for higher general schools. The OECD highlights the strong correlation between familial background of individuals and their educational achievement. Furthermore data of the Austrian education system and the labour market indicate that young people with a migration background are more likely a) to attend lower education, b) to end their educational career sooner and c) to be in the group of NEET than peers without such migration history.

Based on existing data an interpretation as well as a survey on support offers is done, furthermore young people's perception of the experienced influences were analysed (quantitative and qualitative).

While schools and support systems (e.g. social work, information, youth work) try to empower young migrants also to choose promising educational pathways for quite some time now, the success is still not very high. It seems that the social environment of young people is primarily responsible for these differences in decisions regarding the education and vocational career. The influence of the family on decision making is stronger among young people with migrant background, but at the same time the knowledge of existing possibilities for training and education is less pronounced in these families. Furthermore, peer groups play an important role in decision making, especially in those cases where the young people have no concrete individual career plans themselves.

Protest with a Safety Net: Rural-Urban Linkages and Migrant Labor Activism in China

Rural migrant workers have accounted for most of the labor protests in China, amounting to thousands every year. Scholars are puzzled by the fact that previously relatively docile Chinese migrant laborers have recently become a main force of labor activism. Existing studies either attributed it to the expansion of global capitalism, new generational characteristics, or to the promulgation of the new Labor Law. While acknowledging that these factors did play a role, this paper will argue and show that the protest surge has also been due to the improvement in rural economy in the recent decade. An analysis of protest data and the author's rich ethnographic observations reveal that an improved rural economy offers a potential source of income and employment for migrant workers and their families, and provides a safety net for their labor activism in the city. In other words, migrant workers could rely on the rural economy in their home towns to make a living if they are laid off for their radical behavior. The safety net thus empowers migrant workers in their struggles for higher pay and better conditions.

The rural-urban linkage in migrant labor activism has been largely overlooked in the scholarship but holds important theoretical and practical implications. Theoretically, it challenges the popular view that the rural economy, by subsidizing capitalist production in the city, would suppress migrant workers' wages and demobilize labor activism. At the practical level, it suggests that labor activists and organizations should take into account the rural-urban linkage in their strategy to mobilize migrant workers and their families.

Deprivation of Resources: Aged Care in China's Newly Urbanized Areas

This study explores the impact of China's rapid urbanization on the traditional family support system and older people's access to aged care resources in newly urbanized areas. Data were derived from 725 questionnaires and 42 semi-structured in-depth interviews recently conducted in a suburban area of Nanjing, China. A random sampling approach was used to recruit two sets of participants: those aged 60 and over and their younger counterparts (aged below 60).

Findings suggest that the fast urbanization in China had negative effects on the aged care of elderly residents in newly urbanized areas. At the familial level, urbanization altered people's traditional preference to inter-generational co-residence commonly seen in rural areas, causing a growing number of 'empty-nest' elderly. Strongly believing in filial piety, the older participants expressed a desire for seeing their children more often, and for receiving more hands-on care and financial support from them. In contrast, the younger generation reported difficulties to spend enough time with their parents and experienced a financial burden to support their parents and their own children at the same time. This mismatch between expectations and possibilities to care for family members reveals that the aged care function of the family fades away during the process of urbanization. However, institutionalized elderly support outside of the family (i.e. the state care system and/or community services) has not been established in these newly urbanized areas. Compared to residents living in long-established urban areas who are entitled to the contributory pension system and health care insurance, those 'new' urban residents tend to face a higher risk of old age poverty with little welfare benefits. Thus, this paper argues that the process of urbanization contributes to a twofold deprivation, enlarging inequality among people depending on aged care in China.

"Pengci" and Population Aging: Promotion of Healthy Aging Based on Social Network Theory

Pengci, a new Chinese vocabulary coming from the Beijing dialect, known as blackmailing or injury feigning, is used to describe an opportunistic behavior mostly practiced by the elders to obtain compensation through playing the role of the victim. It is often thought that the elders should be blame for Pengci, but we consider it as a kind of social problem resulted from insufficient support and attention of the elders with the ongoing process of population aging and should be addressed without delay.

Therefore, in the first place, in-depth reasons why the elders attempt to get money or compensation through Pengci are discussed in the standpoint of the elders. Then, from the perspective of Social Network Theory, features of the elders' social behaviors and interactions will be analyzed mainly from the aspects of social relations, social resources and social structures to explain the increasing lack of care and attention for the elders. Furthermore, based on the analysis, we will explore the measures to be implemented to help the elders obtain social support and promote healthy aging.

ZHANG, YINGCHAN* (Northeastern University, zhang.yingc@husky.neu.edu)

Tapping the Flow: The Global Circulation of Talent and Urban Development in China

An increasing number of U.S.-educated Chinese have recently returned to China. Chinese state-run media emphasize their prosperous outlook and the state's recognition of their importance for the country's transition to a knowledge economy. As Chinese cities compete for these returnees, little is known about the strategies that Chinese municipalities adopt to attract returnees, or the lived experiences of these targeted returnees over transnational space.

This paper examines how Chinese cities recruit U.S.-educated Chinese to stimulate urban development, and how these recruitment initiatives affect the migration decisions and reincorporation experiences of two types of skilled labor: entrepreneurs starting business projects in high-tech and advanced-service industries, and scientists/researchers leading innovation projects cosponsored by the governments and their Chinese home institutions. I conduct a case study of the city of Nanjing in Eastern China and utilize semi-structured interviews, ethnographic observation, and secondary analysis.

This paper argues these returnees occupy privileged economic and social positions and maintain fluid and ambiguous identities in Chinese society. Many returnees obtain recruitment packages in multiple cities to diversify their business operations, establish protective mechanism against market risks, and accumulate resources to move if one particular city does not work out. Ultimately, having secured American permanent residence or citizenship allows them to fall back on returning to America if business plans fail in China. In contrast to the short-term, quantifiable way the municipal government conceptualizes their contributions, returnees do not necessarily develop a sense of belonging to the city or its development but tie themselves to their specialized field of expertise, as they are mobile and their clients are all over the world.

This paper contributes to the session by comparing the experiences of professionals making different migration decisions and enhancing understanding of how flexible arrangements of time, space and labor facilitated by neoliberalism are articulated on the ground.

KULESHOVA, ANNA (The Monitoring of Public Opinion Journal, Moscow)

The Notion of Capitalism and the Reality of Contemporary Societies in the Fsu Countries.

This paper is an attempt to investigate the history and uses of the notion of capitalism viz. concurrent concepts of the economy and the market (market society). Drawing on the German tradition of the history of concepts (Begriffsgeschichte) developed by R. Koselleck and his co-authors, it proposes an argument that sociological concepts should be seen in context of the everyday languages of the time. This argument is illustrated by means of the two well-known cases from the conceptual history of the social sciences: Proudhon's definition of communism and Weberian definition of the territorial nation-state. Both were based in the shared understanding of the respective phenomena prevalent in the time, but were later made more analytically sharp and integrated into the structure of respective social theories. Building on these two cases, the history of the notion of capitalism is traced from its origins in Thackeray *The Newcomes* published in 1855. In the second part of the paper different classical approaches and definitions of capitalism are compared and constructed: capitalism in its various forms (Weber, Schumpeter, Braudel, world-system analysis), bourgeois mode of production (Marx), market society (Polanyi, Hayek, Keynes, Hirschmann) etc., including the recent attempts to disaggregate "capitalism" into complementary institutions (Varieties of capitalism, new economic sociology) or infrastructures and processes of "economization"/"marketization"(sociology of finance). In conclusion the author makes an attempt at developing a synthetic historically grounded definition of capitalism.

China's New Strategy of "Internet Plus" and Its Social Impacts

China recently unveiled its "Internet Plus" action plan, as an innovative solution to the decelerating economic growth and the bottleneck of tradition industry through advanced digitalization and massive entrepreneurship. The state-led strategy aims to further deepen the integration of the Internet with the economic and social sectors, making higher-level economy a main driving force of growth. However, this top-down action is not only an economic policy, but profoundly influences Chinese society socially and culturally. This paper intends to explore the social impacts of this internet-based innovation through big data and empirical studies in some Chinese metroplis (such as Beijing, Shenzhen, Shanghai, Nanjing, etc) , including the following concernings: 1) how the support of innovative entrepreneurship leads to new social mobility and social (in)equality? 2) how the consumption-oriented industry influences the social interactions both online and offline? 3) how the integration of crossover resource challenges the public service system and governance capacity?

Crimean Referendum on March 16, 2014 – Annexation or Striving for More Fair Living Conditions?

At the end of 2013 the anti-government protest movement under the name of Euromaidan broke out in Ukraine. In the course of development the protests were seen to be gradually spreading over the central and western parts of the country. As popularity of Euromaidan was growing, anti-protest movements called Anti-maidan were organised in eastern and southern parts of the country. Their main peculiarities were pro-governmental disposition and open condemnation of the public movement of Euromaidan and its participants.

Alongside with gradual radicalisation of protests in the centre of Kyiv, tensions were growing in the "opposite camp". The most famous solution of the "conflict of interests" was the referendum held in Crimea on March 16, 2014 in the course of which residents of the autonomous republic expressed their will to declare independence from Ukraine and join the Russian Federation.

Despite public condemnation of this referendum as well as refusal of the world community to recognise the legitimate nature of its results, processes of establishment of Russian laws, standards and regulations are going at full drive.

In connection with the foregoing, the social research aimed not only at trying to understand the main causes of such strong pro-Russian disposition, but also to analyse to what extent such disposition of the Crimean residents has remained the same upon expiration of the transitional period has been conducted. We try to understand actual causes of such drastic social and political changes within the Crimean territory, how much the residents are satisfied with such changes and how they assess the existing level of fairness of public relations in Crimea.

In other words, we try to understand what "change of the country of residence" means for the Crimeans: the annexation by Russia or striving for more fair living conditions?

Quality of Life and Life Satisfaction of Chinese People: An Empirical Analysis from 2006-2013

This research focuses on the quality of life and life satisfaction of Chinese people, from the perspective of wealth distribution. It firstly analyzed the income structure of China as research context. The urban and rural population was divided into four income groups - the high income group, the middle income group, the lower-middle income group and the low income group. The core part of research is to look at the trend of expenditure among urban and rural households to examine their quality of life, and to analyze the subjective dimension of quality of life - life satisfaction of urban population and its impact factors. The empirical analysis uses data from China Social Survey 2006-2013. It is found that the income structure of China is still the pyramid shape, with 70% of the urban population belonging to lower-middle and low income groups and a 'frozen-up' middle income group. It is very significant that the proportion of culture and entertainment expenditure is very low in both urban and rural families, indicating that the general quality of life among the population is unsatisfactory. Regression models show that income has significant impact on life satisfaction in China. Findings also emphasize social factors - measured by social security satisfaction, income equality evaluation and public service evaluation, and environmental factors - measured by satisfaction with local environment. This research generated helpful implications on class distinction and wealth distribution of China, and provided useful policy suggestions on how to improve people's objective and subjective well-being.

Unity in Diversity? New Working Class Under Regime of Precariousness

The aim of this paper is to present outcomes of five qualitative research conducted among the most unprivileged workers in two post-industrial cities in Poland and employees working on the peripheral labour market (Harvey 1991) in Warsaw (2013-2015). These workers are: long term unemployed who take part in low-paid trainings, internships (arranged by public institutions) and who are forced to take up odd jobs and jobs on the black market; next, seasonal workers and women that are full time mothers and housewives (23 individual in-depth interviews and 2 focus group interviews). Finally, employees who work in low-paid branches in public sector and private sector (10 individual in-depth interviews with cleaners, checkers, bodyguards and 20 individual in-depth interviews with people working in

call-center). Aforementioned workers seem to be characteristic for present capitalism (mass unemployment and expansion of service sector).

Although they seem to belong to different classes (post-industrial working class, middle class working in service sector), they are in different age and live in different conditions, most of them experience uncertainty and lack of sense of security regarding their position and situation on the labour market. Therefore, they can be named precariat (Standing 2011). However the term precariat is built on opposition to the concept of proletariat. Author of this paper regards aforementioned workers as contemporary working class who has undergone transformation (i.e. they usually work in service sector). The main aim of the paper is to present working conditions and analyse modes of controlling, managing and disciplining new working class by public institutions (Public Employment Services and social assistance) and employers (flexible contracts, low salaries etc.). On the other hand, I am going to present how new working class perceive its situation on the present labour market and analyse their modes of resistance (Foucault 1982) – individual and collective.

Work of the Unemployed? Exploitation of Marginalized Workers in Poland.

The aim of this paper is to present working conditions of the most marginalized workers in Poland. Although, the unemployed persons officially do not work, it turns out they often perform work offered by public institutions (Public Employment Services and social assistance organizations), like internships, trainings etc. Moreover, due to lack or very low financial support (benefits) they often enough are forced to work on the black market.

After the collapse of communist regime in Poland mass reduction in employment associated with dismantling of huge industry typical for socialist era have created large segment of society which permanently oscillate between short-term or informal jobs and unemployment (the formal level of unemployment during 25 years after transformation has been higher than 10%). During research conducted among the unemployed and beneficiaries of social assistance (2013-2014) in two post-industrial cities in Poland we found out that they usually were engaged in informal or short-term work. Conditions of that work are hard, level of exploitation seems to be very high and aforementioned workers seem to be the most vulnerable group on the labour market. Norms of labour code are not obeyed and the power of employers over workers is overwhelming: long working hours, no safety standards, cases of non payment for work. Despite of the fact that these workers are in touch with public institutions they are not protected from aforementioned abuses. Moreover, employers who breaks labour code are among these who receive support from public institutions.

Trapped Between Self-Understanding and Self-Denial - Dealing with the Diagnosis Dissociative Identity Disorder within the German Mental Health and Child Welfare System

In this paper I would like to point out how massively stressful biographical experiences such as sexual abuse, exploitation and neglect lead to a state of mental constitution that is diagnosed as dissociative identity disorder, previously known as multiple personality disorder.

My PhD project is based on a biographical-sociological approach. I conducted life stories of complex traumatised mothers, who are all patients of a traumaspecific psychiatric hospital and who suffered from various forms of abuse during their childhood. With the biographical-sociological perspective the social positioning, experiences of (self-)devaluation and social exclusion of highly mentally burdened victims of human rights abuses come into consideration.

With a focus on the German psychiatric system and by analysing biographical narratives I would like to provide insights on how trauma-specific psychiatric settings offer ways of support that contribute to processes of self-understanding after years of being a more or less 'misunderstood' patient of different kinds of psychiatric settings, e.g. locked psychiatric ward.

In contrast to these processes of self-understanding I will further point out the limits of this kind of empowerment and take experiences of mothers with dissociative identity disorder within child welfare system into consideration as well. I would like to illustrate that there is a lack of interdisciplinary knowledge and cooperation within and between these two institutionalised settings of support: Although, there are experiences of self-understanding within trauma-specific psychiatric settings, the German child welfare system contributes to processes of self-denial and experiences of social exclusion at the same time.

Sexual Identity As a Challenge for Professional Rationalities and Self-Understanding within the Profession. the Case of Lgbttiq Policing

Professional rationality in police is challenged in multiple ways by identities of the officers, their positioning within the political system, the authority, the personal identity of the individual officer, as well as the influences from the outside of the police: be it political, media discourses or citizen's perceptions of the policing.

We concentrate in our presentation on our empirical research on the LGBTTIQ police officers, who are active in LGBTTIQ organizations as police officers. The paper focuses on LGBTTIQ police officers in order to demonstrate, how sexual and gendered identities influence not only the working conditions of this group and the belonging to a specific organization, but make them a specific minority. The sexual identities of our interview partners intervene with their understanding of their profession and their specific role in the profession as LGBTTIQ persons. They discuss differently their understanding of their right within their working place, but also their responsibilities in cooperation within the authority and in their professional occupation. Their activities within the LGBTTIQ organizations partly results in the "forced" expertise, they are called to execute with respect to LGBTTIQ questions and crimes, which goes far beyond their professional knowledge. Still, the expectation of the expertise challenges them in their professional identity and professional responsibility. Further on, the sexual and gender identity is being permanently negotiated between the right to be visible as LGBTTIQ police officer and right to be a neutral part of the execute power, free from personal specifics and (sexual) identities.

The presentation asks, whether LGBTTIQ police officers develop a special professional identity due to their sexual identity and whether their professional identity influences the articulations of their sexual and gender identities?

ZIMMERMANN, BENEDICTE* (EHESS Paris, bzim@ehess.fr)

A Transnational Approach to Work: Methodological Issues

This contribution is based on an empirical case-study in French and German sites of different multinational groups. The project analyses, on the one hand, the interplay of multinationals' HRM policies with a variety of local factors (e.g. institutional, economic, social, cultural) and, on the other hand, how local workers deal with multinational policies and requirements.

It examines methodological issues pertaining to a transnational approach to work in the context of multinational firms. Categories, scales and experience are the three key words that guide this discussion. How do shared categories of action emerge – or not – in a transnational context? Which kind of translation processes, linguistic as well as social and political, are necessarily involved? To what degree does a firm grasp of these processes impinge on the analytical tools and categories of sociological reasoning itself?

Another set of questions is related to the scales of analysis. What exactly does transnational mean? Is it merely a supplementary scale of analysis? Of what does this scale concretely consist? Where is the locus for making observations regarding transnational issues? Transnational issues in matters of work present the challenge of addressing, within the same research parameters, a number of organizations, institutions and policies at different territorial levels (for example at the group level where policies and strategies are decided and at local sites where the work is performed); the challenge is furthermore to intertwine these levels with individual workers biographies, which are themselves impacted by various factors ranging from the personal to the environmental (e.g. organizational, cultural, social, educational). This brings into play the issue of individual and collective experience and the tension which exists between the rationales of transnational firms and that local embeddedness of human and social relations which goes to shaping the daily experience of work and life.

ZINN, JENS* (University of Melbourne, jzinn@unimelb.edu.au)

Living in the Anthropocene: From Risk Society to Risk-Taking Society

In 1986 Ulrich Beck published the "Risk Society" in Germany what should become one of the most influential sociological publications. He claims that we would no longer live in a society characterized by conflicts about the allocation of wealth but the allocation of risks. Western industrializing societies had experienced a fundamental shift from successfully managing modernization risks by science and insurance to increasingly dealing with unexpected side-effects of successful modernization which escape these modern technologies. While the theory originally focused on technological risks such as nuclear, chemical, and genetic risks, with adding terrorism and climate change the scope of the theory increased.

There is an observable transformation of the social environment as well. Pre-industrial societies were exposed to risks of nature such as natural catastrophes and infectious diseases. During modernization nature became increasingly exploited and mastered by science and technology. With ongoing modernization unexpected side-effects would come back on us in the form of new mega-risks such as climate change which cannot be managed by modern strategies. Instead new strategies such as precaution were required. The natural environment was considered as fundamentally endangered supporting a preventative perspective.

With the Anthropocene—this is the major hypothesis of the presentation—the natural environment is fundamentally shaped and transformed by humanity. Having been sensitized to unexpected side-effects of human activity during the risk society era we are now entering a risk-taking society era where nature is actively shaped and produced by decisions under uncertainty managing non-knowledge. Since the natural environment is no longer understood as a relative stable context but as to be actively shaped we can no longer deal with new technologies on the basis of precaution. Instead our natural environment is increasingly understood as requiring active engagement to secure human survival.

ZINN, JENS* (University of Melbourne, jzinn@unimelb.edu.au)

Using Corpus Linguistics for Sociological Research: Discourse-Semantic Changes of "Risk" in the New York Times, 1987-2014

The notion of risk has become pervasive in societal discourses and scholarly debate. From early work on risk and culture to the risk society, from governmentality theorists to modern systems theory all have built their work around the notion of risk and implicitly or explicitly refer to linguistic changes. Though this body of literature offers different explanations for the shift towards risk and its connection to social change, to date there has been no attempt to empirically examine their relative ability to explain this change in the communication of possible harm to advance theorizing.

The presentation will present a study on the discourse semantic shift towards risk utilising a corpus-based investigation of risk words in a number of US newspapers from 1987 to 2014. The study supports Mary Douglas's claim that the meaning of risk is shifting towards the negative end. There is also good evidence that risk is an increasingly common experience but characterised by decreasing individual control. Decreasing agency in risk processes supports assumptions that the individualisation of risk in the news is accompanied by the scandal of not being in control. Generalised worries about risk are more common. There is a tendency of average people (e.g. men, women or children) being reported as vulnerable while powerful people are presented as risk takers. In contrast to Beck's theorizing, the study shows the importance of risk in the health area. The risk society might be much more characterised by concerns about health issues such as civilisation illnesses rather than new mega risks.

The research shows how corpus based approaches can be used to test and develop sociological hypothesis on historical change in the realm of risk.

ZOCH, GUNDULA* (University of Bamberg, gundula.zoch@uni-bamberg.de)

Change in the Gender Division of Domestic Work after Mummy or Daddy Took Leave: An Examination of Alternative Explanations

This study investigates how the duration of child care leave which mothers and fathers took alone or jointly relates to changes in couples' division of housework and child care after postnatal labour market return in Germany. It explores whether take-up of child care related leave may impact the gender division of domestic work beyond the period of leave and examines three theoretical explanations: 1) development of domestic work skills, 2) bargaining power based on economic resources, and 3) adaptations under gender role or parenting identities.

Using data from the German Socio-Economic Panel (1992-2012) on 797 and 762 couples with a first or second birth, respectively, we applied OLS regression models with lagged dependent variables in combination with Heckman selection correction. The results suggested that dual-earner couples where mothers took longer leaves experienced a greater shift towards a gender-traditional division of domestic labour after childbirth even in the medium-term after labour market return. The linear relationship and stronger effects on the division of child care than for housework lent support to identity-based explanations. Paternal leave take-up, in particular if taken alone without the partner present, was associated with a more equal division of housework and child care after first births but not after second birth transitions. After a second birth, fathers who took simultaneous leave with their partners were found to increase their child care time more, possibly because they became more involved with the older sibling of the newborn. The relationship with the paternal leave duration was less clear. In terms of explaining the mechanisms for fathers, the findings provided greatest support for explanations relating to domestic skills development possibly in combination with changes in fathering identities.

ZOCH, GUNDULA* (Bamberg Graduate School of Social Science (BAGSS), gundula.zoch@uni-bamberg.de)

Day-Care Expansion and Changing Attitudes of Parents

Research on attitudes has dominantly focused on inter-cohort change. Thereby, gender, education, employment status, marital or family status but also the institutional setting have been revealed as major influences on gender role attitudes. However, evidence about attitude change over the life-course is scarce, in particular with respect to the institutional impact. Recent reforms of parental leave and child care policies in Germany indicate a paradigm shift in family policies which aimed at improving compatibility of employment and family care, speeding up maternal labour market return, and increasing paternal child care involvement. In line with this, recent research suggests an effect of changes in parental leave legislation on social norms and identity change for Germany. In line with this, the recent expansion of day-care slots for under-three-year-olds could be associated with an intra-cohort attitude change of parents.

Using this recent reform, we investigate whether an increase in state subsidized Early Childhood Education and Care facilities is associated with a change in gender role attitudes. Using data on mothers and fathers based on the German Family Panel pairfam (2008-2013) and annual administrative records on day-care provision on district level we apply fixed-effects panel models. Results indicate that the expansion of day-care is associated with less traditional attitudes towards maternal employment and marriage for West German mothers and East German fathers. However, findings for West German fathers seem to be more heterogeneous. For East German mothers, results suggest that once provision has increased beyond a certain threshold, there is no additional change in attitudes. In addition, more egalitarian attitudes towards maternal employment seem to be associated with maternal employment transitions mainly for West German parents. The results point to the importance of intra-cohort attitude change and the moderate relevance of the institutional setting in general and day-care in particular for gender role attitudes.

ZOHAR, GAL* (The Hebrew University of Jerusalem, gal.zohar@mail.huji.ac.il)

Contested Identities at a Global Hub: The Western Identity and the Legitimate Spectrum of the OECD Activation Policy Repertoire

The following research lays emphasis on sifting out of a spectrum of policy alternatives by following the OECD policy recommendations in a specific field - The Activation Policy - throughout the last three decades (1983-2012). The framing process of this policy, which seeks to make citizens active partners in an effort to return them to salaried employment, in the main by conditioning their eligibility for state assistance, did not take place in a vacuum but were constituted by the changing geopolitical context. More specifically, the collapse of the Cold-War world order was an epistemological rupture (coupure épistémologique) which burst out concealed American-European tensions under a common Western identity.

This new contestation on redefining the Western identity has been one of most constitutive forces behind the sifting-out of boundaries of possible activation policy repertoire. While this activation policy's repertoire gone through a few patterns of change – especially during the 1990s - this geopolitical contestation has been constituted the activation policy of the last two decades. In that sense, this employment related policy is not just a narrow social policy issue, but one that incorporate a broader geopolitical context.

Therefore, this research relies on institutional literature, particularly by focusing on the multiplicity of institutional logics and their long-term evolution processes. Nonetheless, In order to explain a multiplicity of logics, not as sporadic and disparate but as a holistic set – or repertoire – it is important to understand what binds them together. It is the well-developed literature of identity work that enables us to understand these underlying forces

Neo Tribes Mourning: Pashaei's Death in Iran

The unexpected death of young pop singer Morteza Pashaei in Nov. 2014 caused the unprecedented gathering of hundreds of thousands of people in many cities of Iran and particularly in Tehran. Different academic and non academics judgments and interpretations of this massive public presence were made in the media. Despite the fact that youths' sub cultural appropriations of the public space on different occasions (like religious rituals, sporting victories, presidential elections) is not unusual in Iran, but the very scale and speed by which this event was formed is no doubt unique. The community formed in the Pashaei's funeral is probably the first postmodern community in which mourning, sociabili-

ty and sub cultural displays are merged together. The sad stricken and emotional community of Pashaei's mourners was formed by the fans and the curious people that had tied their unique and personal identities in the metropolis (Tehran) to a neo tribe whose members sought to express their love and to discharge their emotions to a pop star. Drawing on my personal ethnographic observation of the funeral sessions held for Pashaei and the thematic analysis of the fans' materials (comments, notes, photos, videos) put in both the formal news sites and the social network sites, I aim to present a phenomenological analysis of this event. I will argue that unlike the radical political readings of the event explaining it simply as an oppositional move and a resistance to the culture politics of the system, this coming together is a celebration of the youth power and of the collective life. Employing the new media (like the Viber) has given Iranian youth the chance to form neo tribes by which they can make up for the limited venues they have access for self expressions and produce emotional energies needed in an uncertain world.

ZOLUBIENE, EIMANTE* (Kaunas University of Technology, eimante.zolubiene@gmail.com)

The Uses of Discourse Analysis in the Study of Risk: The Case of Risk Communication in Online News Media

Risk communication has grown into a major concern in the complex present societies which are struggling with a vast abundance of riskiness, rising from already familiar and newly emerging threats. This kind of communication creates preconditions for an emergence of the general risk discourse in news media which includes flows of information about different kinds of risks: political, economic, social, cultural, technological and environmental, as well as health. In this sense risk is understood not as something inherent in objects, events or processes themselves but as something constructed by the interplay of the media and other discourses. This paper seeks to outline the methodological framework for risk discourse analysis in news media. The characteristics of risk discourse in the field of news media will be discussed with reference to the ideas of Fairclough (1985, 1992, 1993), van Dijk (e.g., 1985, 1997, 2011), Laclau and Mouffe (Laclau 1990, 1993; Mouffe 1993, 2008) as well as Foucault (1969). The presentation will be provided with the empirical illustrations of the study based on the data taken from two the most popular online news websites in Lithuania (delfi.lt, lrytas.lt). The study results show that risk discourse exists as a general heterogeneous macro structure which brings together various discourses of more narrowly distinguished areas of risks. In this way risk gains a slightly different meaning in various discursive contexts. The discourse of risk is shaped by the voices of its participants, different strategies of risk narratives which are employed by newsmakers as well as by the contexts surrounding risk discourse. Through the risk discourse news media gain power to manipulate or even control a society, not always leading towards rational behavior.

Global Climate Change Risk and Millennium Development Goals Achievement: A Cross-National Comparative Study

In September 2015, world leaders affirmed the Sustainable Development Goals (SDG) making SDGs the defining narrative of the development process. Fifteen years ago, the Millennium Development Goals (MDGs) focused development efforts on quantifiable and time-bound targets addressing issues of extreme poverty, health, hunger, education, environmental sustainably, and global partnerships. While building upon the MDGs 2000-2015, the SDG expand the development narrative beyond basic human need to include issues of climate change directly. Even before the direct focus of the SDGs on climate change, MDGs were linked to climate change through social factors. Climate change risk and adaption interact with extreme poverty and hunger, child and maternal health, and access to safe drinking water and sanitation to limit adaption and resilience within populations. The purpose of this presentation is to explore the relationships between global climate change risk and millennium development goals achievement. A cross-national comparative analysis of non-OECD countries is conducted using the Climate Risk Index 1994-2013 and selected Millennium Development Goals Indicators 2000-2015. The indicators used are proportion of population living below $1.25 (PPP) per day, prevalence of underweight children less than 5 years of age, proportion of population using an improved drinking water source, and proportion of population using an improved sanitation facility. The results show where links between climate change risk and MDGs exist. The results will help researchers and practitioners understand the relationship between climate change risk and social indicators of development conditions that will need to be addressed to facilitate effective adaptation processes in response to climate change through the sustainable development goals.

Religious Legitimization and Social Change: From Ethnic to Ethical

The role of religion in much of the Central and Eastern Europe has been mainly concentrated around the nexus between the specific religion and specific nation / ethnic group during the 20th century. This nexus had been seen as crucial for both sides. While religion (Churches) saw the protection of a separate ethnic identity as an inseparable part of its historical mission, nations or ethnic groups regularly turned to religion as a powerful source of mythical foundations. Although this has been not specific to Central and Eastern Europe, communism, wars, and disintegration of multi-ethnic states reinforced these links in many countries of the region. Still, the situation has been gradually changing as Churches have become much more involved in public discussion by pointing to different ethical issues, particularly those connected with sexual morality and different gender issues, such as divorce, abortion, position of women in society and family, same-sex marriage, in-vitro fertilization, etc. Interestingly, the historical mission has been again emphasized (now in terms of protection of the natural order, tradition, family as the basis of society, fight against an immoral West...), while social groups focused on protection of "traditional ethical values" turn to religion as an important source of legitimization of their claims. The intention of the paper is to analyse this shift and in particular to analyse how religion has been used in the public discourse about ethical issues / controversies. The analysis will be mainly based on the Croatian experience but the comparative dimension will be added by analysing the situation in other Central and Eastern European countries.

ZUCKER, GREGORY* (Rutgers University, gregory.zucker@rutgers.edu)

The Alienated Political Activism of Occupy Wall Street

The series of global protests that began against dictatorships in the Middle East and have, more recently, led to anti-austerity movements throughout Europe have led many to speculate about the prospects for the revitalization of mass protest. Particularly with respect to the Occupy movement in the United States and anti-austerity movements in Europe, some commentators see these actions as marking the growth of a left that can combat neoliberalism. Focusing on Occupy, I wish to dispute such claims. I argue that Occupy's inability to sustain itself is symptomatic of how devastating the fragmentation of the left has become. Occupy was informed by conceptions of the free society and free individual that did more to illustrate the alienation of the individual from meaningful political action than lead to effective political action. This paper suggests that part of the failure of left movements to confront the ever-worsening effects of neo-liberalism rests on the fact that many of the activists attempt to envision new forms of community that are divorced from the reality of social embeddedness and the constraints this imposes on political strategy. Perhaps most problematic is the anarchist undercurrent that guides much of this conception of activism insofar as it posits a free-standing individual as independent of social ties. This search for a non-alienated or alienating form of politics that seeks to withdraw into a new communal space is itself an expression of a social alienation that threatens our capacity to confront exploitation. Occupy sought to combat the alienation wrought by neoliberalism with a form of political engagement that itself is a product of that alienation.

RC36-417.4

ZUCKER, GREGORY* (Rutgers University, gregory.zucker@rutgers.edu)

The Critique of Instrumental Reason As Alienated Reason

At the start of his tenure as head of the Institute for Social Research, Max Horkheimer famously drew the distinction between traditional and critical theory. Horkheimer and subsequent members of the Frankfurt School recognized the tendency for traditional theory to lead to instrumental reasoning. In its uncritical relation to the world, instrumental reasoning was another manifestation of the alienation that the members of the Frankfurt School saw permeating society. Instrumental reason functions to foreclose access to a deeper understanding of social structural and psychological conditions that exacerbate exploitation. As such, the critique of instrumental reason remained a core component of critical theory as a form of critique. Moreover, contrary to current dismissals of critical theory, members of the Frankfurt School attempted to develop novel methodologies to give the critique of instrumental a social scientific basis.

But the critique of instrumental reason has gone into decline. On the one hand, this is due to the work of some Frankfurt theorists themselves, notably Theodor Adorno and the conception of thinking in "constellations" that he drew from Walter Benjamin and has influenced post-structuralist appropriators of critical theory. On the other, this is due to the devastating attacks launched on the concept by second and third generation Frankfurt theorists. This paper argues against con-

temporary critical theorists for the ongoing validity of the critique of instrumental reason and, more importantly, that this critique should be informed by a conception of instrumental reason as alienated reason. It also defends the notion that such a critique can be founded on stable social scientific grounds and need not take the form of the kind post-structuctalist tendencies embraced by some readers of the late writings of Adorno.

ZUEV, ANDREY E.* (Eutoexpo AG, a_zuev@hotmail.com)

The Education and Vocational Training As Part of Modern Youth Lifestyle

For a long time the common and vocational education was an essential and integral component of a lifestyle of youth in the former USSR. Similar position has been established by the state and in the conditions of a homogeneous society has been extended in all social groups. It was supported both objective requirements of society development, and the state actions, including measures of non-economic character.

During last years of existence of the USSR and during enough long time period after its disintegration the relation of youth to education has changed to the worst. On the one hand, it has been defined by deterioration of an economic situation, change of priorities of development, occurrence of new possibilities of young men for the statement of own position in a society and in the youth environment, in particular. In conditionsy of destruction of old economic system and formation of market relations it began possible to provide to itself steady financial and a social status, without leaning on educational base. On the other hand, the withdrawal of young men from an education system had also the protest character rejecting imposed from the outside.

The relation of young men to education has started to change again only after crisis of 1998 when the large part of noneconomic enrichment possibilities in the country has been settled. The real workplaces demanding knowledge and vocational training, have started to be formed, in this connection education has started to come back in structure of a lifestyle of youth, to become fashionable and prestigious.

The dynamics of change of the youth relation is shown in paper on the basis of the data of economic-sociological researches spent with participation of the author, and also on the basis of the analysis of the data of bodies of employment and vocational training.

The "Bads" and "Goods" of E-Bike Mobility Development in China

The goal of this talk is to present some findings related to the ongoing project "Low Carbon Innovation in China", specifically to the prospects of e-bike use as a form of urban mobility in China. E-bikes in China are the most visible form of electric vehicles used for individual transportation. However the use of e-bikes in some big cities and their central districts (Beijing, Guangzhou, Shenzhen) has been strictly regulated or banned. E-bikes nevertheless remain a popular mode of mobility even in these cities: when used as private transport, when used for hire for short trips (e-bike rickshaws) and used as specialized delivery vehicles. In Shenzhen the ban of e-bikes has much to do with the city's and central government attempts to construct the image of Shenzhen as a high-tech innovation hub, where e-bikes are not associated with innovation and thus should be invisible. In Beijing the e-bike users are seen by the car-drivers as transportation for people with "low quality". The talk will discuss 1) various "bads" and "goods" of e-mobility as seen primarily by e-bike users and opponents to its use in Shenzhen, Shanghai and Beijing and 2) potential scenarios of e-bike mobility development in China.

Changes in Work Relations and Mobility in Northern Kazakhstan's Farm

In my paper I'll show how changes in property relations and subsequent changes in work relations shape mobility of workers in Northern Kazakhstan grain farm. The dissolution of USSR brought farming in Kazakhstan, its former "eastern granary", into deep crisis. Most of state farms ('sowhoz') disintegrated while only some of cooperative farm ('kolkhoz') survived, though faced financial problems for long. The economic crisis of the 1990s and concerns of Russian speaking inhabitants about living in Kazakh's national state created mass emigration from Northern Kazakhstan.

The former *kolkhoz* I conducted research is relatively successful economically and it's preservation and development stands in firm contrast to the general state of agriculture sector in Northern Kazakhstan. The privatization process resulting in acquisition majority of the shares by director put most of the workers – now

denotes a presenting author. Abstracts are organized by first presenting author's last name.

minor shareholders - in unfavorable position. Yet, because of general scarcity of trained agricultural workers in Kazakhstan the economic performance strongly depend on the ability to keep it's workforce. Farm's management uses variety of means to achieve this goal e.g. paying in kind, refusing to buy shares of those who want to migrate, funding a scholarship to secure somebody's return to the village and launching initiatives designed to strengthening inhabitants ties with the region. My aim is to show how current transformations are understood in peoples narrations and how they shape their sense of agency.

The basis of the paper is an analysis of biographical interviews with former members of four cooperatives (now merged into one company) made in northern Kazakhstan as well as in Poland, Russia and Germany.

Cultural Diversity As "Global Commons": A Look into the Case of Japan

Borrowing Donald Nonini's idea of the commons as "assemblages and ensembles of resources that human beings hold in common or in trust to use on behalf of themselves, other living human beings, and past and future generations of human beings, and which are essential to their biological, cultural, and social reproduction" (Nonini 2006), I argue that in an increasingly diversifying and globalized world, the idea of a "commons", or "global commons", should not only be limited to tangible resources but also to intangible ones (e.g. cultural diversity) that are created in the process of human mobility and interaction. These intangible resources are deemed essential in the lives of each individual and if utilized in concert with others, they become a valuable resource in the reproduction of future generations.

This study is an attempt to revisit the idea of a "global commons" in the context of increasing multiculturalism in Japan. While not considered a migration country, Japan is home to a diverse group of peoples that strive to co-exist within this island-nation. It cannot be denied that Japan's future will be in large part affected by changes in its social and cultural landscape, and the reproduction of the future generation within Japan will in no less be affected by the increasingly diversifying population.

For this exploratory study, I first look at how concepts such as cultural diversity and co-existence, are also in themselves commons and shared by the whole humanity. I next examine how diversity is considered more as a threat through the regulation of human movement between borders and within nation-states. Finally, I look at the case of Japan by focusing on Okinawa Prefecture's goal to build an equitable society and argue that multicultural understanding and co-existence are essential to the social and cultural growth and reproduction of Japan.

U.S. Labor Against the War, Iraqi Labor, and "inside/Outside" with the Ituc

The ITUC operates at levels far removed from rank and file activities of local unions. As a federation of national labor federations, the ITUC is insulated from the daily workings of its affiliates' affiliates. In the other direction, most union officers, to say nothing of members, have no idea what the ITUC is, or that it even exists.

Yet we know from rich experience that influencing nation-state labor policies requires an "inside-outside" strategy. "Inside" players at high levels of policy access are necessary to move legislatures or regulatory agencies. But "outside" players among ordinary people, organized in mass movements, are also necessary.

My presentation will focus on the experience of U.S. Labor Against the War (USLAW) in building on-the-ground support for labor reform legislation in Iraq. I propose to explore the inside-outside dynamics exemplified by USLAW's work in the U.S. and with the Iraqi labor movement, as it has unfolded parallel with, but not in direct communication with, ITUC activity. USLAW worked with the AFL-CIO's international affairs department and Solidarity Center, which provided indirect coordination with the ILO and ITUC. The presentation will offer insight into the dynamics of the "inside-outside" process when paired with ITUC efforts.

USLAW, formed in 2003 to oppose the U.S. war and occupation in Iraq, includes 170 locals, central labor councils, state federations, and other U.S. labor organizations. USLAW has established solidarity relations with the Iraqi labor movement. USLAW has helped to mobilize American and Iraqi workers in efforts to pass internationally recognized Iraqi labor laws. The ITUC also participated in this process, resulting in passage by the Iraqi parliament in September 2015 of a new labor law. Work continues to pass a trade union law that would allow collective bargaining by Iraqi public sector workers, the majority of the labor force.

Economic and Non-Economic Activities of Polish Retirees

As far as the average life span is concerned, Poles are catching up quickly with Western Europe. Thus, the number of older people is growing, and they have more years ahead. The public debate present in the Polish media mostly addresses economic aspects of these processes. Growing burdens for the state budget are discussed. For reasons of state finance, a reform was implemented in 2013 raising the retirement age. On the other hand, the issue of necessary changes in social policy – to keep up with the changing demographical situation – remains in the background, as a subject with far less exposure. Long-term national-level thinking about this matter is only just starting. One of its manifestations is the Governmental Program for the Social Activity of the Elderly for years 2014–2020, adopted in 2014.

A sound diagnosis of the current situation is a precondition for efficient action, and this paper is an attempt to contribute to such a diagnosis. It concentrates on selected kinds of activities of Polish retirees, especially on their (1) continued professional activity; (2) unpaid work for the benefit of other people and organizations; (3) social and political activity. The paper is based on data from the sixth wave of the Polish Panel Survey POLPAN, conducted in 2013. The analyses suggest that (1) slightly fewer than 20% of the investigated retirees were willing to continue their professional activity while being retired, out of whom fewer than a half were successful; (2) unpaid work by the retirees mostly represented their involvement on behalf of their families, rather than institutions or organizations; (3) even though the retirees voted in elections more often than those who lived off their work, and claimed a higher degree of interest in politics, their direct involvement in public affairs was relatively low.

Ideal of Love in Legal Policy. Evolutionary Perspective

The article analyzes the concept of the ideal of love, which was first proposed by Leon Petrażycki. The ideal of love in the works of Polish philosopher and sociologist of law serves as an axiom of practical reason, constituting an order of legal development that will lead to the universal cooperation, and not only between members of one society, but among all of humanity. The law was designed to accelerate the moral development of society, through appropriate impact on the psyche of people following rules, and at the same time it should educate them in the spirit of universal cooperation (morality). Modern research conducted in evolutionary science and primatology seems to confirm some assumptions underlying the ideal of love, but on the same time, they imposed severe restrictions on it. In the first part of the article the concept of the ideal of love is presented, including the role of law and legal policy, which should lead to its achievement. The second part of the article is devoted to the reviewing of the biological roots of morality (and law) and its evolution in the light of the work of Frans de Waal. The last part of the paper consists of the evaluation of Petrażycki's proposal, conducted from the perspective of evolutionary science and primatology.

ZYZIK, RADOSLAW* (Jesuit University Ignatianum, radek.zyzik@gmail.com)

Scientific Legal Policy and Behavioral Law and Economics. Petrazycki's Legacy

The aim of the paper is to discuss the relationship between scientific legal policy developed by Leon Petrażycki and the behavioral law and economics movement. To a certain extent behavioral economic analysis of law can be characterized as a legal policy which is based on the achievements of cognitive psychology and behavioral economics. Closer analysis of the assumptions of both disciplines will allow comparing the reconstructed assumptions, methods and objectives of each version of the legal policy. Classical definition of legal policy states that it is a legal discipline whose goal is scientific prediction of the consequences of newly enacted legal rules and also developing guidelines that will help to achieve the objectives set up by the legislator. On the other hand, the movement of behavioral law and economics in its basic analysis intends to answer the question of how to create and apply the law in order to achieve desired goals. However, there are differences. The behavioral law and economics movement can be characterized as a bottom-up strategy. It does not set a general, ambitious goals, but focuses on improving specific legal institutions across legal system using psychological and

economical insights. On the other hand, Petrażycki adopted a "top-down" strategy. He developed an ontology of law and after proposing a certain picture of law, and its relation to psychology, he developed a legal policy which an ultimate goal is a realization of the social ideal. Comparison these two visions of legal policy will allow assessment of their advantages and drawbacks.
