This study took a look at how 20 Taiwan college students, at the age of twenty or so, have seen themselves changed by the schooling that focused on competence and competition, among many others of course. To do that, biographic interviews have been made, with questions like 1) how do you evaluate your academic performances and make future study/career plans accordingly? And 2) what do you foresee yourself after another two years, 2016 to be specific? Based on the interview results, what and how students have had in competition-filled schools (all the way from junior high and senior high) would be delineated, and some moral significances of social class proposed.

The Television Policy about the Self-Control in Japan

In 2015 summer, in Japan security bill to convert post-war security arrangements under the Abe administration has been deliberated in the Diet. Demonstrations by people who are against it were done every day in front of the National Assembly. TV was self-control in reporting on demonstrations and bill. It is not limited to this; self-control has been carried out in broadly TV program representation of Japan. The purpose of this study is to consider the television policy about the self-control (self-regulation on the contents of television show) in Japan. The approach employed in this analysis is as follows. First, I analyze the conversion of television institution before and after the World War Ⅱ. Second, I analyze the policy making process about the Broadcast Law to point out that the most of influence on the TV program representation in television is not Broadcast Law, but is the self-control. From these analyses, it can be pointed out that the self-control is not autonomously, but is heteronomously. Third, I analyze why the heteronomous self-control has been established in Japan through a case study about a program of comfort women.

Not/All about Having Fun: Social Norms of Belonging Amongst College Students on Facebook

The purpose of my research is to reveal how college students in Taiwan interpret and negotiate the social norms regulating their online interpersonal relationships and belonging on Facebook.

Based in Taipei, Taiwan, this research applied a multi-sited approach and methods including in-person interviews and online observation to explore the struggle between belonging, privacy, emotion-expression and peer-surveillance on Facebook amongst Taiwanese college students, which exists under the surveillance of unseen audiences and the influence of mediated sociality. I refer to the conceptions of performance introduced by E. Goffman, distinction proposed by P. Bourdieu, and surveillance developed by M. Foucault as the primary theoretical frameworks in this research.

36 participants were recruited from the same department of two universities for analytical purposes, as they offer similarities and differences that make for an interesting comparison of dissimilarities not only in urban and rural areas but also in public and private universities.

My research reveals a potential cultural pedagogy of Facebook in higher-education practices in terms of obligated sociality and impression management. I suggest that young people face the pressure of their day-to-day practices on social network sites because it is not about fun—instead, it is about how to maintain their college student identity online regarding school work, friendship, emotion expression, and self-image. In this context, I examine how they interpret and negotiate with the norms—obligated sociality, un/certainty in keeping friendships and the rules of emotion expression, and emphasis on struggles and contradictions when they confront the norms. I argue that college students use metaphor as an expression of negative emotion to deal with the struggles between publicity, privacy and belonging.

Political Economy of Work and Employability. Educational Challenges, Boundaryless Careers and Youth

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The convergence of an aging society, lower birth rates, the knowledge economy, and professional labor mobility is introducing issues and opportunities for the higher education. Societies are approaching a norm of social politics organized around flexible labor markets and structural exclusion which alters the access to social inclusion through education and employment. There is an important interplay between education, social cohesion and local experiences of being young. The analysis of national education and employment policy is important in the context of a contemporary crisis of capital. The local communities, Taiwan accommodates global capital by opening up their markets and deregulating markets, takes active interest in the competition for the best brains, favours the way of life of mobile and well-educated people, and develops cosmopolitan outlook. The author addresses the rescaling processes affecting Taiwan in which youth are settling. The aim of this paper is to examine some key aspects of social change in Taiwan, which has undergone significant changes in its occupational structure, labor market, economy, and educational provision since the 1940s. The material of the paper draws on three levels. The first deals with the structural and institutional transformations, and some key aspects in its political economy, occupational structure, labor market, economy, and education. The second is concerned with occupational and social mobility patterns and trends, and their association with the changing role of education. Finally, this paper explores the microcosm of lived experiences of youth to gain an understanding of the social, political, and cultural factors that impinge on their occupational and social mobility outcomes and their relationship with education. This study uses elements from both the quantitative and the qualitative traditions in the study of education, youth and labor market.

Early Family and School Negative Experience and Later Life Development: A Prospective Study

Family corporal punishment/physical abuse and school victimization can have serious influences on one's development. Although studies have shown that these negative experiences have detrimental effects on adolescent development (e.g., delinquency and negative emotions), only a few studies take into account these two incidents simultaneously and how they interact to influence late adolescent and early adulthood outcomes. Furthermore, a life course perspective would expect that early negative experience (e.g., early adolescence) will influence later life stage (e.g., late adolescence), which in turn influences even later stage (e.g., early adulthood). This study employed a longitudinal Taiwanese sample to see how family corporal punishment (wave 1) and school victimization (wave 2 to wave 4) influences one's mental and behavioral outcome in late adolescence (wave 6) and the same outcome when these adolescents enter into early adulthood (wave 9). We found that only about 4.5% of students had been victimized in school; however, there were about 25% of subjects experience family corporal punishment (e.g., beating up with objects). Family corporal punishment was related to later school victimization, and both experiences were related to high school delinquency and delinquent peer association. Furthermore, these later outcomes were related to both external (e.g., smoking) and internal (e.g., depression) health in early adulthood.

Gender and Sustainability Issues in Tanzania and the Philippines

Sustainability is conceived as the integral or integrated efforts to sustain people's quality of life both for the present and future generations. This paper examines comparatively gender and sustainability issues in Tanzania and the Philippines and the forms of resistance that are taking place among women in these countries. It looks at issues of gendered structure of land ownership or access to land, the impact of structural adjustment policies on women, food sovereignty, the impact of mining on the environment and on livelihood of women and men, on youth, on families and indigenous communities.

Response to Neoliberal Globalization: The Philippine Experience

Alternative response/resistance to neoliberal policies in the Philippines is emerging not from the neoliberal state but from working class of women, men and youth. The concrete experiences of Filipino working class oppression and exploitation under neoliberal regimes and the emergence and persistence of the revolutionary Philippine movement offer several conceptual instances in which one can analyze strands of thought that invite new ways of thinking about social, economic, and political arrangements. First instance: how colonial and neocolonial capitalism has transformed working class men's and women's position in the national economy linked to the capitalist global economy and how it is contested. Second instance: how the current neoliberal regime perpetuates and reshape global capitalism in Philippine context and what strands of thought are articulated in the forms of resistance the Philippine movement engage in. Third instance: the ideological project that manufacture consent to neoliberalism. While the transnational capitalist class plays a central role in maintaining transnational capital or global capitalism, the ideological project of neoliberalism to manufacture consent to it cannot be glossed over. The Philippine neoliberal state uses the educational system, think tanks, and the military to maintain a neoliberal regime in the Philippines. But the movement has created as well counter-strategies to challenge the Philippine neoliberal state. Are there limited gains this dialectic has achieved?

LIPPERT, INGMAR* (IT University of Copenhagen, lippert@ems-research.org)

Erroneous Realities: Criticising Ontological Achievements

Drawing on ethnographic fieldwork in a transnational Fortune 50 company headquarters' environmental management team, this paper opens up a range of situations that took part in enacting the company's carbon footprint. Common to all these situations is that the environmental realities enacted have been categorised by some members as erroneous or as not good enough. Thus, in the unfolding of these enactments, members achieved to modalise particular realities as problematic, with the performative consequence of changing reality. Members' (first-order) critique played, therefore, a key role in shaping reality. These enactments of erroneous realities, the paper proposes, can be generatively analysed by drawing on the partially different, partially complementary sensibilities offered by Annemarie Mol's and Helen Verran's work. The paper uses ethnographic vignettes of the erroneous enactments to investigate the possibilities of a second-order critique that Mol and Verran's notions of ontological and ontic open up. In short, the paper studies members' (first-order) critiques of erroneous effects by employing two key scholars of the ontological turn whilst questioning how (and which) versions of second-order critique may be generated with these scholars' work. By focussing on the capacities and modes of critique, the paper questions the character of the political in these authors' versions of ontological and ontic politics. This comparison of the possibilities and modes of criticising within the field (first, order, infra-critique) as well as with these two authors intends to contribute to the identification and problematisation of the theoretical and political "mechanics" in the ontological turn.

Governments' Notion of a 'Shared Responsibility' for Post-Border Biosecurity Management: Australian Sheep Farmers' Perspective

Disease outbreaks are of concern to Australian governments because of the high economic costs associated with the time Australia will be removed from trading in the global market-place, as seen with overseas animal disease outbreaks. For this reason governments have adopted the notion of a shared responsibility into policy, which aligns with neoliberalist agendas, whereby biosecurity costs fall to the relevant actors across the biosecurity continuum, including farmers. Currently farmers' roles and increased responsibility for post-border biosecurity are not well articulated to them by governments. This means that for a shared

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

responsibility to have greater levels of success, an understanding of farmers' biosecurity practices is necessary.

From sheep farmers' perspective they have the lived experience of the withdrawal of publicly funded extension services, which shows they are on their own to manage. Regardless, farmers are busy everyday doing biosecurity to manage post-border risks, in order to be good farm managers, which simultaneously contributes to government recommended practices. Studies of other livestock industries depict farmers as having poor levels of on-farm biosecurity management. My study findings differ, and reveal from semi-structured interviews with sheep farmers who perceive that they manage biosecurity in much the same way as before changes to policy. This research is useful for policy makers whose interest is to see the success of a shared responsibility.

Eco-Power and Technocracy Today. Analysis of the Recent "Participatory Turn" in Belgian Nuclear Waste Management

Drawing on a 5 years of field work realized in the decisional space of Nuclear Waste Management in Belgium (Observation, interviews, documents analysis) this paper will present conclusions about the current transformations of technocratic decision making.

I analyze the genesis of the "participatory turn" observed in Belgium and more generally in Europe in Nuclear Waste Management (NWM) Decision Making (Lehtonen, 2010), (Barthe, 2006), and show that the different tools of participation that are used (consensus conferences, local partnerships...) are produced in international spaces of expertise (mostly within the NEA/OECD). The creation of these participatory tools draw mostly upon the mobilization of social scientists' expertise and, in consequence, can be interpreted as an extension of the technocratic form of government (or eco-power as Lascoumes put it (1994)) where nuclear engineer mobilize social science expertise to solve the "social problems" of NWM.

Knowledge, Tools of Governance and Organization – Analyzing the Institutionalization of the Belgian Space of Decision Surrounding Nuclear Waste Management

Drawing on 5 years field work realized in the decisional space of nuclear waste management (NWM) in Belgium (observations, interviews, documents analysis) this paper will analyze the emergence, mobilization and institutionalization of a new kind of expertise in NWM decision-making process: social science expertise.

In a first part the paper will present the concept of Space of Decision that was built to allow the analysis of the evolution and institutionalization of Belgian NWM decision-making through time (1915-2015). In analyzing the emergence of new organizations, new tools of governance and new knowledge over time, the concept of Space of Decision (SOD) allows us to understand decision making as a set of various practices that are conducted in different places and times and that are not *de facto* linked to national territories or national politics.

The second part of this paper will analyze the emergence of a new kind of knowledge in the Belgian NWM Space of Decision, the emergence, in the nineties, of social science expertise. This emergence is analyzed in regard to the development of two new tools of governance: participatory tools developed at national and local level, and transnational knowledge network (Martell 2012) aimed at exchanging expertise and experiences on social acceptability of NWM (e.g. the Forum for Stakeholder Confidence within the NEA/OECD).

This analysis will allow us to discuss the evolution of how experts exercise power through their capacity to give a certain shape to the Space of Decision or to guide the process of institutionalization of the SOD both at the transnational and the national level.

LITTLE, DANIEL* (University of Michigan-Dearborn, delittle@umich.edu)

Speciation of Research Frameworks in Sociology: Rational Choice Theory, Analytical Sociology and Other Actor-Centered Approaches

There are several approaches to the study of the social world that give priority to individuals in social settings. Rational choice theory (RCT) and game theory (Becker, Harsanyi), actor-centered sociology (ACS) and pragmatist theory (Goffman, Gross), analytical sociology (AS) (Hedstrom, Ylikoski), and agent-based models (ABM) (Axelrod, Manzo) all attempt to explain the social on the basis of assumptions about actors. It is tempting but misleading to see these as different formulations to the same basic approach. However, there are important differ-

ences. These approaches bring different assumptions about actors and about social explanation.

How are these similar approaches related? Are they "friend or foe" – competitors or cooperators? We might think of a research framework as consisting of a small set of "genes" (methodological and ontological assumptions), which then give rise to the "phenotype" of research products in the hands of groups of researchers. On this approach, AS and RCT share a number of genes in common, and they are open to borrowing additional elements in the future through research collaboration (inter-species contact). Analytical sociology and rational choice theory are closely related, and show promise of becoming more so in the future. But likewise, analytical sociology can become a more robust genotype for sociological research by adopting components from its ecological partner, actor-based sociology.

This paper will argue that analytical sociology has the intellectual breadth to encompass the core insights of RCT and ACS as distinct theories of the actor. The techniques of agent-based modeling are well suited to one key component of the AS model of explanation, the aggregative component (the rising strut of Coleman's boat), but less so to the descending macro-to-micro strut. Finally, it will be noted that ABM is not restricted to applications within rational choice theory but can incorporate pragmatist findings into its models as well.

Strategizing an Environmental Turn for Organized Labor

In the so-called growth-obsessed societies, such as those in the region of East Asia, how could it be possible to prod equally growth-minded labor movements into an environmental turn? This article examines historical precedents in this region to suggest a few possible directions. On the one hand, organized labor is not, and will not be, a monolithic entity but marked by a multitude of diverse interest and stratified positions in job hierarchy. From Japan's and Taiwan's experiences, unions of public-sector workers and of some service workers were more perceptive to the "zero-growth" ideas and often held opposite views against their manufacturing counterparts on nuclear and other environmental issues. As a consequence union federations were unable to break the stalemate and often refrained from making clear statements on major environmental controversies. While fighting head on with unions at the manufacturing sector on the "jobs versus livability" conundrum, environmental organizations also collaborated with non-manufacturing unions in an ad-hoc fashion. On the other hand, influences of traditional trade unions in Japan, Korea, and Taiwan have declined dramatically in recent years that organized labor risked being a marginalized, if not irrelevant, segment in the making of public policies. Major reorganization of union movements is desperately needed yet finds nowhere to start. We did find innovative alliance-making between workers, unionists and community activists on precarious work and rights for immigrant workers, yet whether such development impacted the existing union structures was not entirely clear. The post-Fukushima precarious workers provide a particularly interesting case in which an environmental element was added into the organizing drive and pushed us to ponder: while fixing environmental disasters here and there becomes a profitable industry, will successfully organizing workers in this industry change the power balance of public-sector and manufacturing unions and push union federations toward a pro-environment direction?

The Praxis Approach to Multicultural Teacher Education: A Case Study in Taiwan

The case of Taiwan is worth studying because it is genuinely a multicultural society in terms of ethnicity, culture, and politics. In its four-hundred year history, Taiwan has witnessed various cultural and political clashes between different ethnic groups and experienced monarchy, colonial government, dictatorship and finally, democracy. The entangled history and the recent waves of immigrants from South East Asia make Taiwan a special case in the world. However, multicultural education has different meanings to different people, from the dimension of celebrating diversity to promoting social justice. This paper aims to explore how a teacher educator shifted her teaching paradigm from technical, narrative to praxis approach to develop the pre-service teacher's multicultural consciousness. The content will focus on how we develop multicultural consciousness and critical praxis through action project and discourse. There are four parts of this paper: First, describing the development of multicultural education in Taiwan from a holistic perspective. Second, constructing a praxis approach to multicultural teacher education based on the theory of social justice. Third, exploring how the in-service teachers enhancing their multicultural consciousness and the ability to practice by participating in the empirical study of action research. Finally, reflecting on the praxis approach to multicultural teacher education and seeking the possibility of practice for other teacher education programs.

"Doing Privacy" in an Accelerating Society: A Sociological Perspective on How Wearable Technology Shapes People's Recognition and Practice

This paper mainly concerns the relationship between technology and privacy. It will focus on the idea that the development of science and technology to a great extent accompanies people's changing recognition of the concept of and the practices of privacy. Starting from Heidegger's viewpoint of the essence of (modern) technology, and from the observation of layperson's daily practices from ethnomethodological perspective, this research proposal will examine further how technology "enframes" people's understanding of privacy and accomplishing of the practices of it, based on the existing researches on privacy and with the example of wearable technologies. This proposal suggests the idea of "doing privacy" to describe a more dynamic and complex situation in which how people recognize and practice privacy. According to the vision offered to the users by technological developers, wearable technology relates not only to the users and developers, a broader areas should also cover the internet, new social media, big data analysis, data mining technologies, the internet of things, and so on. This vision attempts to present a world of interconnection, co-sharing, co-creation, and co-evolution. It is in this foreseeable future that emerges the question concerning technology and its relation to privacy. The goal of this research is to investigate how people's "doing privacy" is accomplished through using new technologies, whether voluntarily or not, and its implications to the world.

Analytical Sociology and Ethnomethodology: Social Ontology Reconsidered in the Cases of Secrecy and Routineness

Three terms will be appropriated in this research: ethnomethodology, analytical sociology, and social ontology. To some extent they are related and complementary. The attempted assumption is that social order may be better understood through not only social mechanisms theories, but also theories of daily practices. The analysis of daily practices presents us an order existed/implied in sociality or social interaction, that is , the idea of routineness. Routineness constitutes not just visible side of daily life, but also invisible one. The basic argument in this essay considering the idea of routineness as "being-supported-by-secrecy-in-daily-life" will be elaborated further through some empirical investigations. Of which two fields will be selected: how order is recovered on public transportations, and how and what kind of mobilization is achieved through the use of new social media such as Facebook, Twitter, or others. When considering a distinction of routineness and secrecy as two sides of a coin, this essay will demonstrate that on one hand the fact that certain kind of power generated by social institution (which is the main idea of social ontology) must not ignore the changing and becoming integrated characteristics of daily practices, the coin we will introduce here, and on the other hand, based on the assumption of this essay, the changing meaning of mobilization from offline (the presence of body) to online (the absence of body) in the use of more and more technologies can be understood differently if being put in the observation that power formed through routineness invisibly supported by secrecy operates not only virtually but also in/to the real world. And this will be a try through examining the daily practices of laymen in the sense of ethnomethodology and the theory of social ontology.

Brokered Education Mobility: Study Abroad Agencies and Student Migration in Asia

Every year millions of people move across national borders to study in overseas educational institutions. Student mobility has become one of the largest forms of human migration. At the same time, it is a structured and brokered mobility. Governments, schools and various private entrepreneurs participate in engineering, channeling and regulating student mobility. This migration industry is thriving in Asian countries such as China, Vietnam and Nepal. Based on interview data and government statistics, this presentation looks into the working of this industry that produces the different flows of students into Japan from China over the past three decades. I introduce the historical background as well as the changing organization and purposes of this industry; explain how they facilitate and process student migration; and analyze the causes for the needs of education brokers and the consequences of brokered education mobility on individual students, schools as well as both receiving and sending societies. I aim to show that international education, despite its idealized visions, is both a commodity and an efficient channel of labor import. These characteristics inevitably give rise to a flourishing migration industry.

LIZAMA, SCOTT* (City University of New York-Graduate Center, lizamascott@gmail.com)

A (Visual) Tale of Two Parks: Using Instagram Analysis to Examine the Public/Private Economics of Brooklyn Bridge Park

Powerful online image aggregators provide new methodological approaches for the visual sociologist and the study of social space. These aggregators use the Instagram application program interface (API) to collect an Instagram users image and metadata in an online "archive". API image collection has been used in large scale quantitative visual analysis using powerful algorithms to interpret social definitions of space from a humanities perspective (Manovich 2013) , but to this researchers knowledge no study has focused on analyzing smaller amounts of Instagram images at the critical socio-spatial level. This paper describes a qualitative approach to visual socio-spatial research that uses a combination of image, hashtag, geolocation, and user generated captioning as insight to the privately funded public space debate.

Using Brooklyn Bridge Park in Brooklyn, New York, as a case study this methodological paper describes a unique qualitative approach that capitalizes on understanding small amounts of digital images (250-1000) with the metadata that is provided with them. A visual socio-spatial analysis describes how to create user/space taxonomies, social interaction through spatial sequencing, and the transecting of public space using time-space sequencing. Building on the literature of cyborg urbanism (Gandy 2005, Swyngedouw 1996, 2006) these methodological categorizations are explained to demonstrate how visual qualitative analysis of Instagram images can critically inform the intersection of private funding and public space and make the public visible in private urban space funding.

LIZE, WENCESLAS* (University de Poitiers - GRESCO, wenceslas.lize@gmail.com)

The Role of Intermediaries of Artistic Work in the Rise of the "Entrepreneurial Regime" of Artistic Production. the Case of Popular Music in France

The diagnosis of a growth of market logic in the art worlds is not new but we observe a change of scale. Mounting economic interest affects both the organizational modes of artistic activities and the professional identity of artists and cultural intermediaries. This is what we would like to show from the analysis of the activity of intermediaries of artistic work in France and its influence on professional dispositions of artists. This activity is of particular interest since it is both the product and the vector of transformations of the artistic fields linked to the rise of neoliberal logics.

We will focus on the practices of intermediaries of artistic work in popular music: agents, managers and "tourneurs". The analysis is based on a survey combining quantitative and qualitative methods: mainly an online questionnaire with 189 managers, agents and "tourneurs", observations and twenty interviews with these intermediaries.

At the interface between artists and employers but also between art and commerce, they tend to act as market and management logics vectors. The survey shows how, taking aim the "career development" of artists, the work of these intermediaries promotes the development of a new regime of art, the "entrepreneurial regime"[1]. Contributing to the social production of artistic labor market, they also act in practice on the "professionalization" of artists by giving precedence to market rationality[2]and to the injunction to "self-enterprise". We thus conclude by questioning how these intermediaries prescribe a new posture of "artist entrepreneur".

Food Security and Environmental Risk Indigenous Community of Zinacantan

LA SEGURIDAD ALIMENTARIA Y LOS RIESGOS AMBIENTALES EN LA COMUNIDAD INDÍGENA DE ZINACANTÁN

La comunidad indígena de Zinacantán, Chiapas desde mediados de la década de los años ochenta abandonó el ancestral cultivo de maíz por el cultivo de flores en invernadero. Este proceso forma parte de las políticas públicas del gobierno mexicano que tiene como propósito insertar a los productores agrícolas en el mercado nacional e internacional. Esta comunidad ha vivido procesos internos de cambio social y cultural que han diversificado a los actores sociales al interior

de la comunidad indígena, pues a través de sus prácticas sociales y culturales se puede observar el cambio de paradigma que transita de la soberanía alimentaria basada en el cultivo del maíz, hacia la seguridad alimentaria que tiene como soporte el aumento del ingreso económico debido la intensificación de la producción de flores.

La comunidad indígena abandonó el cultivo del maíz, un cultivo de temporal que organizaba la vida social y religiosa de la comunidad. Con la instrumentación de la política de seguridad alimentaria, la dotación de un paquete tecnológico en base al invernadero provocó el aumento en la oferta de flores en los mercados regionales, ello ha provocado un cambio en el consumo de alimentos, un aumento en el uso de químicos para el combate a las plagas que afectan a las flores, el aumento en el uso de platicos, un aumento en el consumo de agua para el riego de las flores.

El tránsito hacia la seguridad alimentaria generó un cambio en la forma de vida y de producción de la comunidad indígena; ha aumentado la desigualdad social y también ha provocado una presión sobre los bienes naturales como el agua y los bosques que en la actualidad se han articulado a una producción orientada fundamentalmente al mercado.

The Problems of Private Violence: Engaging Domestic Violence Asylum Cases and the U.S. Violence Against Women Act

Over the past two decades, the United States has observed an increase in asylum cases made by women who are victims of domestic violence. These women make the case that they have suffered uniquely gendered persecution, and thus should be eligible for asylum under the "particular social group" clause of the asylum definition. Despite the proliferation of these cases, the U.S. has been slow to recognize gender as a ground for asylum, especially in domestic violence related cases. Previous scholarship suggests that this lack of incorporation results from the tension between the private nature of domestic violence and the requirement for a public display of persecution in the asylum context. In this paper, I explore how the national legislation of the Violence Against Women Act (VAWA) specifically hinders proper adjudication in domestic violence related asylum cases. Though VAWA has reduced the number of domestic violence cases domestically, I argue that the logic employed in this legislation reinforces the private, rather than the social, nature of domestic violence, creating inhospitable conditions for victims of domestic violence who apply for asylum. I draw on my dataset of all published appellate level domestic violence asylum cases in the United States, describing how the logic of VAWA filters into asylum adjudication, particularly in the interpretation of applicants' credibility. I ultimately argue that U.S. asylum practice will be incapable of effectively dealing with women's cases of domestic violence until VAWA more concretely addresses the social roots of violence against women.

To Have Fun for Sharing, to Share for Having Fun: Meanings and Practices of Leisure in Italy in a Time of Crisis

In the period between 2008 and 2015, Italy has undergone a severe economic crisis derived from an on-going process of low economic growth, employment shortage, new social urgencies. These phenomena have been accompanied by a significant (and in some ways extremely innovating) change in people's lifestyles and modes of consuming leisure time. As a matter of fact, a larger attention has been paid to the "quality" of leisure time, considered as a time to share, to create and re-discover authentic social relationships whose quality is precisely determined by the level of involvement in practices shared with one's own social circle.

The paper intends to offer some empirical evidence, taken from structural data concerning the use of leisure time in Italy, showing how the conceptualization of leisure time is changing in the light of these significant socio-economic changes.

Approach to the Representation of Palestinians and Israelis in the Spanish Online Newspapers

Spanish stereotypes towards Palestinians and Israelis are based, among other aspects, on the information that media broadcast of these two groups. A discourse analysis was performed in order to check how the representation of Palestinians and Israelis in the Spanish media is and what are the stereotypes that both representations come up to. The analyzed corpus consisted of all the news related to Palestinians and/or Israelis published in the digital edition of two of the most widely read newspapers in Spain: "El País" and "ABC", from February 1st, 2015 to July 31st, 2015. On one hand, the critical discourse analysis (CDA) was used to study the linguistic representation of Palestinians and Israelis and, on the other hand, the analysis of contingency tables to detect anomalies in the representation of both groups in newspapers. The following variables were analyzed: month, newspaper, amount of content, topic, and discursive representation of the actors. The analysis showed that the representation of the Palestinians and the Israelis had the following characteristics: greater representation of Israelis and a more passive and refusal one of the Palestinians. Regarding to the differences in the newspapers, the number of news and topics about them is similar in both newspapers but there are many differences in the representation of both groups. These representations contribute to create a simplistic stereotype about Palestinians and Israelis that make misunderstand the real relationship between the both groups. At the end, what is discussed is the role representation of Palestinians and Israelis into their conflictive relationships, which are widely different in media representation and reality.

Leisure and Happiness: Strategies to Enhance Subjective Wellbeing

The World Report on Happiness in 2015 chose seven variables to list countries on a happiest to unhappiest scale. They were: GDP per capita, social support, healthy life expectancy, freedom to make choices, perception of corruption and everything else. Leisure, as an independent concept, does not feature, although aspects can be found in more than one variable. This paper isolates leisure and illustrates its relationship to happiness. It will do so by differentiating the concepts. Happiness is a feeling. Leisure is an activity. Both phenomena are analysed as short and long-term. The relationship of income to happiness is discussed and a colour-coded map is presented to show "most happy" and "least happy" countries. Specific examples of countries are illustrated to show the relationship of income to happiness over several years. The similarities of happiness and leisure are discussed along the dimensions of feeling and activity. The paper analyses theories of the hedonic treadmill, social comparison and set point notion to show that a close relationship exists between leisure and happiness.

Unemployment and Leisure: The Marienthal Legacy

A sociological classic on unemployment was the study of a small Austrian town, Marienthal (Jahoda, Lazarsfeld and Zeisel, 1972). Written in 1933, the investigation aimed to provide an accurate picture of the psychological situation of an unemployed community. The authors used modern survey methods to study 478 families over a three-month period. A basic thesis emerged. The unemployed experienced lower expectations and activity, a disrupted sense of time, and a steady decline into apathy. Psychologically deprived and financially bankrupt, they tended to be lonely, and isolated, hopeless and passive, yet prone to bursts of violence. The authors of Marienthal had hoped that future researchers would not have the experience they had. History has shattered that optimism. In the 1990s a researcher (Lobo) used investigations to study late career unemployment with particular focus on self, family and lifestyles (Lobo and Parker, 1999). The study found that: self concept and identity of the unemployed was damaged; the unemployed experienced adverse health effects; the impact on the family was profound; being unemployed was very different from having increased leisure time; engaging in serious leisure compensated for loss of paid work; and lifestyles in unemployment seen as active, social, domestic and passive were psychologically beneficial. The impacts of unemployment in Marienthal (1933) and the late carrier study in the 1990s are juxtaposed to demonstrate the universality of job loss.

LOCKIE, STEWART* (James Cook University, stewart.lockie@jcu.edu.au)

Monsters, Time Travel and Environmental Sociology

Time is an omnipresent and yet largely under-theorized concept within sociology. On the one hand, time seems straightforward, one variable amongst many in the complex world of the social. And yet when we consider how time is implicated in processes of socio-ecological change things quickly get messy. Framing our

response to these processes in terms of sustainability results in the assignment of rights to future generations, attempts to calculate the risks of yet indeterminate environmental change, questions over how to value the future in light of uncertainty, and so on. Time is no longer a fixed, linear, independent variable but something far more interesting. This paper argues for an approach to the sociology of time that moves beyond the critique of modernity and which supports the quest for sustainability. It treats sustainability as a material force, an agent in its own right that mediates human relationships with ecosystem processes, natural resources and future generations. As a force that is the product of human action, but never entirely under our control, sustainability brings the future into the present while demanding that future be based on learning, deliberation and accountability. Anticipating and assembling positive social-ecological futures requires reflexive engagement with the technologies and projects through which humans attempt to capture the temporal dynamics of Earth-system processes. Environmental sociology is well placed both to unpack the techniques through which this occurs (e.g. climate modeling and scenario building) and to help rebuild them in ways that are more sensitive to the challenges of environmental justice and the realities of social practice.

LODDO, OLIMPIA* (University of Cagliari, olimpia.loddo@gmail.com)

From Dispositions to Obligations: Do Animals Have Obligations?

John R. Searle (2010) draws a distinction between dispositions and obligations. A disposition is a basic consistent tendency to behave in a particular way; an obligation presupposes the representation that a particular behavior is obligatory. According to Searle, both human and non-human animals can have dispositions. On the contrary, to have obligations is a characteristic of the humankind. In fact, in order to have obligations, are necessary complex linguistic abilities that animals lack. Other scholars support the thesis that the normative attitudes evolved earlier or independently of linguistic attitudes (e.g. Michael Tomasello 2009, Rodolfo Sacco 2015). The thesis that advanced linguistic abilities are necessary for being obliged and for feeling obliged is debatable. According to the ethologist Franz de Waal (2014), the non-human primates can "correct deviations from an ideal state", so, even if they do not understand what an obligation is, they seem to be able to understand that a behavior is obligatory. Do animals have obligations? The goal of the paper is to clarify this question and to analyze the relationship between being obliged and having high-order cognitive functioning involving complex linguistic ability and abstract thinking.

Paris, London, Stockholm, When the Crisis Is Social

Paris, 2005. London, 2011. Stockholm, 2013. Three different times, countries and social models, but the same dynamic: a man belonging to a minority is shot and killed by the police - that symbolizes the authority and the State - causing the explosion of protests and riots. There are three permanents elements through we can analyze and explain these riots: A) the place, suburbs. A persistent center-periphery cleavage, often improved by gentrification process B) the involvement of migrants (or people of migrant origin), resulting from an incomplete integration process even in "more used" to foreigners ex-colonial countries like UK and France C) rioters' age, under 30, that is reflected also in the use of social media and technologies for riots organizations. Rioters are mainly a part of population that live in a sort of "limbo": they are not in work nor in education, not foreign nor citizen of the country where they live (at last they do not feel to be), conditions feeding feelings of anger and exclusion ready to explode at the first chance. These episodes suggest that the economical crisis is undermining social cohesion, enlarging the cleavages between insiders and outsiders of society, center and periphery, youth and not youth, migrants and old-residents. A dangerous outcome resulting in all the worlds of welfare (Esping Andersen): social democratic Sweden, liberal United Kingdom and corporative France.

Rethinking Youth Work Socialization. the Role of Employment and Educational Policies in Italy

The long-lasting European economic crisis have worsened the already difficult school-work transition. In the southern European countries, the reduction in youth labour participation is not associated with an increase in time spent in education and training and young people often experience a sort of break in the path towards job roles and adult life, as the increasing number of Neets in the EU witness. Even the idea of work socialization weaken and youngsters remain alone self-managing his/her life career between education and work, family and personal project, loading up on his/her shoulders the burden of their own "auto-socialization". At the same time, employment and educational policies, aiming at promoting youth activation and employability, do not seem capable to grasp both the structural inequalities affecting the work and education fields and the group heterogeneity in terms of gender, age, ethnicity, health, human capital, etc. Moreover, the European key-indicators of youth social exclusion are made of "stiff categories" (Neet, Esl etc.), inadequate to take into account life trajectories increasingly individualized, discontinuous and uncertain; hence the difficulty to design policies capable to support the youth multiple transitions, making them sustainable across the lifespan, considering their different membership and personal and family traits.

Within this framework, the paper focuses on the European policies for youth employment and their implementation in Italy, investigating to which extent the Youth Guarantee Program mediate the youth integration in the labour market influencing life paths, contributing to shape and change meanings and forms of work socialization. The paper will propose an analysis based on secondary data (official reports) and qualitative data (interviews with the main policy actors involved in YG), also in order to identify strength and weakness of measures enacted by educational institutions and employment services, and to suggest future perspectives of intervention and improvement.

LOEBACH, PETER* (Weber State University, peterloebach@weber.edu)

Livelihoods, Precarious Work and Disaster Vulnerability: Nicaragua and Hurricane Mitch

In the interdisciplinary study of hazards vulnerability, examination of how livelihoods operate as determinants of vulnerability is only a very recent line of inquiry. Few quantitative works have been produced. This study contributes to this area by examining the recovery outcomes of Nicaraguan households impacted by the Hurricane Mitch event of 1998, as predicted by predominant livelihood profiles. An emphasized point of livelihood differentiation in this study is ownership of productive means, a central element of vulnerability according to the sociological theory of work precarity. This study utilizes panel data available for Nicaragua from the Living Standards and Measurement Survey, extending over a 10 year period, preceding and following the Hurricane Mitch event. Hierarchical agglomerative clustering is used to generate predominant household livelihood profiles. To examine how these livelihood categories associate with resilience, random effects longitudinal regression is utilized to regress change in ownership of household assets on household livelihood categories, a variable that designates households having experienced damage from the disaster, and interaction effects of the disaster variable with each livelihood category variable. Findings reveal uneven outcomes by livelihood, with households reliant upon agricultural wage employment unable to achieve the recovery outcomes of households reliant upon other livelihoods. These results indicate that in the context of natural disasters, reliance on wage employment is especially problematic for those whose livelihoods are reliant on the intrinsically sensitive to environmental disruptions, agricultural sector.

LOECKENHOFF, HELMUT K.* (-, Loeckenhoff.HellK@gmx.de)

On (Socio-) Semio- Cybernetics of Life

The evolution point of view may distinguish two kinds of information. Very roughly, thermodynamic information lies at the base of any matter, any existent unit. Created by and derived from energy rich molecules (free energy) thermodynamic information constitutes the energetic funds of any life in the scaffolds of local order. Catalysing their own synthesis, autocatalytic systems indicate the origin of cybernetic information. Cybernetic information fosters self-referent and ever more complex open systems developing into autopoietic systems. On the (physical) base of thermodynamics and on statistical mechanics, cybernetic information leads and drives the evolution of life from simple coded molecules to higher consciousness and mental artefacts. (J.S. Avery 2012)

Cybernetic information generates transfers and evolves meaning: what a situation, potential, an action, a decision within action and option space may mean for survival, procreation and development of the actual system. In essence, any cybernetic information implies semio-cybernetics, syntax and semiosis. In a generalized sense, cybernetic information and in particular socio-cybernetics rest on semio-cybernetics, the cybernetics of meaning.

Approaches to understand evolution corroborate. For example, a set of transdisciplinary models will begin with the potentiality field governed by principles. The rules of physic, statistics and free energy let spontaneously 'materialize' matter. Mutual relations and interaction foster systems and system dynamics. System dynamics and evolution driven by complexity dynamics closely intertwine

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and mutually enhance with semiosis dynamics. With growing complexity of the social system, semio-cybernetics increasingly determine socio-cybernetics by the impact and the evolvement of meaning.

The attempt presupposes fundamental stances to be aligned. It opens approaches deeper to understand socio-cybernetics in theory, modelling and actual practice. Both need to be explored, confirmed and differentiated.

Violencia Estructural, Marcos De Interpretación y Acción Colectiva En México

En los últimos 9 años los procesos políticos en México han estado influidos fuertemente por la política de "combate al crimen organizado", que se ha sustentado en la violencia de Estado y ha desencadenado diversas formas de violencia social. Ambos tipos de violencia tienen profundas raíces en procesos histórico-culturales de larga duración que han contribuido a dar forma a las subjetividades de la población, influyendo fuertemente en la acción social. Su emergencia ha puesto en evidencia una profunda crisis institucional producto de la corrupción que históricamente ha permitido el desarrollo y fortalecimiento de poderes fácticos. Éstos han infiltrado y en algunos casos incluso feudalizado las instituciones públicas, penetrando de manera creciente los procesos de elección popular. Para ello aprovechan recursos objetivos y subjetivos, así como prácticas ya existentes en la sociedad, destacando las que históricamente han sustentado la desigualdad y las diferentes formas de injusticia social. Así, las principales víctimas han sido los sectores de la población históricamente más desfavorecidos, activistas, defensores de los derechos humanos y periodistas. Analizaré la manera como las organizaciones civiles han orientado sus actividades a la defensa de los derechos humanos como último reducto. Recurriré a dos vectores analíticos que se intersecan: uno enfatiza en elementos político-culturales y el otro en la crisis institucional. Tomaré como punto de intersección de ambos vectores el marco de guerra "creado" (como un marco de comprensión e interpretativo) por el ex presidente Felipe Calderón, que desencadenó el actual *continuum* de violencia. Relacionaré los conceptos de "marcos", vida precaria, desarrollo humano y lo que denomino "matriz histórico-cultural". Analizaré la manera como las organizaciones confrontan las claves de interpretación que dan sentido al marco de guerra, recurriendo al discurso de los derechos humanos y en torno a él articulan sus estrategias de acción para conseguir la normalidad democrática.

Digital Literacy in Russian Regions Digital Literacy in Russian Regions Digital Literacy in Russian Regions

In 2015 the Department of Communication, Media and Design of the National Research University "Higher School of Economics" in collaboration with non-profit organization ROCIT conducted research aimed to construct the Index of Digital Literacy in Russian Regions. Theoretical framework of this research includes publications by P. Gilster, J. Hartley, H. Jenkins, etc. The most close research projects include the Canadian's Centre for Digital and Media Literacy 'MediaSmarts', the Fund "Modern Poland" and research group of G. Soldatova (Moscow State University). The index is based on two main statistical sources: special all-Russian representative 18+ survey (n=1600) conducted by research company WCIOM and Internet audience measurement projects by TNS Russia. It consists of three parts: - digital consumption (includes such parameters, as desktop and mobile Internet penetration, level of online news consumption, etc.); - digital competence (includes such parameters, as competence in Internet search, competence in the usage of online social networks, competence in online financial operations, etc.); - digital security (includes such parameters, as attitude to software piracy, ability to secure personal information, level of communication culture in social networks, etc.). The proposed report will be focused on the methodology of the research as well as on some achieved results.

LOMBARD, NANCY* (Glasgow Caledonian University, nancy.lombard@gcu.ac.uk)

Children, Young People and Violence Against Women: Using Temporal Frameworks to Destabilise Gender and Heterosexuality

My research looks at the attitudes of primary school children to men's violence against women revealing worrying attitudes to violence but also to gender equality. Young people justify men's violence against women using gender stereotypes and a rigid understanding of adult relationships framed by heterosexuality and marriage. They often blame women for the violence directly or see the violence as a consequence of the woman not fulfilling 'her role'. This is in contrast to how young girls view themselves now. Currently they hold ambitions and feel, presently, there were few restrictions to achieving their goals. They see this as changing dramatically however when they are married and have children.

This paper argues that gender is not a process of becoming (in the same way that childhood is not), but age refracts how gender is experienced, anticipated and reproduced by the young people themselves. The dimension of age (and in particular their lived experience of childhood) impacts upon how they experience gender now and how they anticipate it in the future. I contend that temporality is a useful conceptual framework with which to understand heterosexuality (and gender identities) because it too is fluid and in a constant state of movement and flux, rather than a static, constant entity. As such, it is also a useful tool to help destabilise the rigidity of the heterosexual framework. Therefore it is critical to engage with the transitory nature of gender, as an ongoing process rather than in terms of a precursor to adulthood identity. By introducing the dynamic concept of 'transitions'; there is more fluidity in how young people are able to construct and define their own gendered identities, rather than adhering to adultist (heterosexualised) frameworks which are imperative when working on preventive strategies.

LOMBARDI, LIA* (University of Milan, rosalia.lombardi@unimi.it)

Health and Well-Being of Immigrant People in Lombardy. Lifestyles and Economic Crisis

With reference to the ISMU Foundation survey realized in September-October 2014 on a sample of 4,000 immigrants in Lombardy, the paper analyzes the data pertaining to some attitudes of care, both with respect to the changes due to the economic crisis and to the lifestyles (tobacco use, diet, physical activity, disease prevention). The study is based on crossing the main variables with some socio-demographic indicators such as gender, age, education, income, years of immigration.

Among the most significant results from the interviews, we point out that:

1. more than 30% of respondents have changed their practices and care strategies, including the renunciation of care, due to the economic italian crisis;

2. care strategies are highly influenced by structural variables such as gender, level of education, income, length of migration, while religious beliefs and geographical origins seem to be related to cultural variables;

3. the results relating to the practices of disease prevention are also very important: the percentage of immigrants in Lombardy that accesses to prevention programs is still very low (about half compared to Italian citizens) and is distributed in a different way with respect to citizenship and geographical origin;

4. The results of this analysis can be also considered as indicators of "inclusion" of the immigrant people in Lombardy and of their chance to access to healthcare and social services.

LOMBARDINILO, ANDREA* (University "Gabriele d'Annunzio" of Chieti-Pescara, andrea.lombardinilo@unich.it)

Towards a Society of Innovation. Mcluhan and the Medial Symbolism

This proposal has a theoretical and hermeneutic perspective: it aims at investigating the role that symbolism gains in McLuhan's sociological research, pointing out how the study of medial innovation and the examination of the literary tradition is fundamental to understand, specifically, the developments of communication and of cultural studies in their complexity.

The study revolves around the function of innovation as interpretative key of future in the study of symbolism carried out by McLuhan, since it's exactly in this artistic movement that the sociologist finds the opportunity to delete the representative practices (irrational and linear) of the modern man, shaped by the reticular sensory of metropolis. Consequently, it will be possible to suppose, by exploiting McLuhan, an interpretative model of the society of communicative innovation.

Exploiting the paradigms of McLuhan's social symbolism and thanks to the recent scientific studies dedicated to the Canadian sociologist, the analysis of McLuhan's interpretation of symbolist writers will show a penetration inside the fractures of communicative models, underlining that the linear connection of events is swept away from daily life, declined according to the communicative instances of the interactive society.

In particular, it will be possible to analyze some of the myths and symbols of the information society, whose social impact is tied to the popular capacities of electric media. This aspect is fundamental to understand the role of communicative innovation in McLuhan, inherited by the study of Ezra Pound and T.S. Eliot. Today, as well as for the past, writers are asked to interpret medial fluctuations of modernity, according to an endless exegetic responsibility, based on the projective capability of expressive innovation.

Modeling Homophily: A Computational Test of Merton and Lazarsfeld's Thought Experiment and Its Extension.

This paper focuses on the results of a computational experiment conducted with an agent-based model grounded on Merton and Lazarsfeld's homophily theory. In "Friendship as a social process" the authors described homophily as "a tendency for friendship to form between those who are alike in some designated respects", considering both status homophily and value homophily. In that essay, two causal micro-mechanisms were presented to account for the observed macro-patterns of value homophily: selection and adjustment. Such theory was a pioneering attempt to show how macro-consequences originate from individual preferences and the two micro mechanisms have played a pivotal role in the history of research on social influence and dynamic networks. Lazarsfeld developed a thought experiment to explain how homophily emerges, supposing 800 social actors linked together by 400 social ties. Using NetLogo language, we formalize and simulate an agent-based model in order to dynamically generate the process suggested in that work. Therefore, we simulate four scenarios to stress the original theory. The first scenario is from our previous formalization of Lazarsfeld's thought experiment and his description of the system of action. Here, we introduce counterfactual hypotheses formulated by the authors concerning the above-mentioned causal mechanisms. In the second scenario, agents are assumed to interact in a dynamic network more complex than the one conceived by the authors. In the further two scenarios, on the basis of Blau's theory of social structure, we introduce two hypotheses concerning the impact of status homophily and actor's social position on selection and adjustment. Reading the simulation results through the four-fold typology of social ties proposed by Lazarsfeld, we can clearly recognize four macro patterns generated from the micro level by the interactions between individual agents.

Consumption of Conventional and Non-Conventional Medicines in an Italian Province: Between Socio-Demographic Factors and Health Beliefs

Background: Many studies have investigated the factors that condition the consumption of medicines. As regards demographic characteristics, there is a large body of research that focuses on how the consumption of conventional and non-conventional medicines is correlated with socio-demographic factors and status of health. In regard to this debate, this paper reports an analysis carried out on the influence of between socio-demographic factors and health beliefs on the frequency of use of the three types of medicine: conventional prescription medicines; conventional non-prescription medicines – also known as over-the-counter medicines; and non-conventional medicines.

Method: The study was carried out through a questionnaire consisting of 42 closed-ended questions on the following topic areas: socio-demographic aspects (gender, age, educational qualifications, municipality of residence, civil status, and profession), consumption of medicines (type, therapeutic indication, frequency and method of administration, the occurrence of possible side-effects, suspension and the reasons for it, and self-medication practices), other aspects associated with the administration of medicines (satisfaction with healthcare professionals, the meaning given to the concept of health, and the use of the Internet as a source of healthcare information). The questionnaire was filled by a purposive sample of 4,074 inhabitants of the province of Mantova. Logical regressions were run to identify the variables influencing frequency of use.

Results: The consumption frequency of various types of medicines was associated not only with demographic aspects (such as gender, age, and education level), but also with everyday treatment strategies (such as self-medication habits and the use of information available on the Internet) and health beliefs.

Conclusion: The consumption of conventional and non-conventional medicines is guided by two principal therapeutic attitudes, one aimed at removing all pathological aspects from everyday life, and the other at contextualizing all health problems within a broader spiritual and philosophical search.

Dis/Acknowledging Military Violence: Women Soldiers Testify Against the Occupation

The paper explores the link between women's military participation and their political voice, using the Israeli case of Women Breaking the Silence (WBS). WBS is a collection of testimonies from Israeli women veterans who served in the Occupied Palestinian Territories (OPT). The testimonies express the voices of women who are not victims, but rather complicit to one degree or another in acts of victimization. As such, they provide a unique case of women's antiwar protest, which is based on a new symbolic legitimacy of women's political discourse.

In analyzing WBS testimonies, we found that the women soldiers offer a critical gendered voice based on their direct experiences in the OPT and their military professional skills, yet at the same time, they expressed lack of certainty in their military knowledge. We argue that the ongoing tension between knowing and not knowing constitutes the meta-narrative that organizes the women's testimonies, and stems mostly from the women's dual positioning in the military, as "outsiders within". For women soldiers, therefore, the challenge of giving testimony lies in overcoming the gendered silencing mechanisms underlying their position in a hyper- masculine organization. From this uneasy standpoint, they criticize Israeli militarism, yet compared to men soldiers, the women's testimonies serve less as a means of self-rehabilitation, and more as ethical and political statements. Thus, the women's testimonies are a political and a feminist act at the same time: They protest the occupation while offering a new politics of gender and knowledge.

Relatos Digitales Personales Como Estrategia De Investigación Interdisciplinaria De Sociedades En Conflicto

El contar historias personales es un mecanismo humano esencial de relación social, de autorrepresentación, de identidad y de comprensión de lo que sucede en el entorno. Las tecnologías de información y comunicación, con Internet y los relatos digitales amateur y multimediales, han dinamizado las formas y el alcance de la expresión individual, y ello ha influido en las maneras de percibir y entender la propia realidad y la de los grupos sociales en los que se participa.

Con el objetivo de usar los relatos digitales personales como una estrategia de doble vía, educativa y periodística, se realizó en Bojayá (Chocó, Colombia), una experiencia de investigación-acción interdisciplinaria, con personas que han vivido de forma directa el conflicto armado colombiano, en la que narraron apartes de sus vidas, antes, durante y después de hechos violentos. Posteriormente, sus relatos fueron sometidos, por el equipo periodístico, a un proceso de edición audiovisual para darlos a conocer en Internet, y por otro, a uno de análisis cualitativo para identificar en ellos las opiniones e imaginarios sobre las causas del conflicto armado, sus consecuencias, los factores que lo han incrementado y las propuestas de solución. Esto no solo sirvió para interpretar la realidad del conflicto con quienes lo han vivido de forma cercana, sino también para repensar la propuesta metodológica para trabajar este tipo de relatos con finalidades educativas, en contextos informales y de pobreza.

Governing the Post-Communist Body: Transnational Pressure, State Apparatuses, and Local Social Movements

How do strong authoritarian governments respond to increasing transnational pressure and domestic activism to comply with global standards? This article seeks to understand the innovation in Chinese local governments' strategies in coping with transnational advocacy networks and the unintended consequences of such innovation by focusing on the case of public health. Since the early 2000s, health departments have been facing strong challenges from international organizations and local advocacy groups to change socialist infectious disease control and allow local communities to participate in policy-making. Contradictory to the existing literature, local health authorities did not passively accepted or object to global models. Instead, as argued in this article, they embraced formal standards symbolically but decoupled them from the actual routines of organizational operation.

Drawing on ethnographic and archival data collected in Beijing and Shanghai between 2012 and 2013, this article demonstrates how local health authorities carefully created and maintained gaps between formal procedures and actual

organizational practices by engaging with local communities in health intervention programs. Decoupling enabled health departments to gain external legitimacy and obtain international grants while also sustaining the internal flexibility with which they can address practical bureaucratic considerations. But over time, the interactions between individual health officials and local advocacy groups changed power dynamics inside health departments and eventually led community organizations to become indispensable tools in governing infectious disease. This article grounds the discussion of contested process of policy reform in a detailed case study by identifying the mechanisms through which governmental organizations embrace or resist fundamental new institutional pressure.

The Multiple Expressions of State Informalization in Employment. the Case of Young Workers in Argentina.

This paper examines multiple dimensions of state informalization in the field of youth employment in Argentina. Informalization is perceived in at least four expressions. First, in its most obvious form: informal employment (that is without protection or stability). This type of work structures the labor market and is challenging for the majority of young female and male workers, especially for the most disadvantaged youth. Second, informality coexists within formal and protected employment. The state has difficulty to control this type of informalization, which is often illegal, due to its opacity or invisibility. Third, informalization exists in the ambiguity of state programs for youth employment (training, grants, and social inclusion programs). Some of these programs contribute to blur the boundaries of what constitutes as work, or what distinguishes formal from informal employment. Finally, informal situations come from unexpected effects of employment formalization policies. Moreover, different expressions of informality in the field of employment have contrasting effects on young workers' employment dispositions with consequences for their future careers: the internalization of inequalities; ignorance of their social rights; feelings of injustice; engagement in community projects; individual job searches, etc. These points will be illustrated drawing on qualitative and longitudinal research on the careers of young workers in Argentina.

Rival Narratives of Autonomy in American Film: Auteur Martin Scorsese and Experimental Film

After World War II, American film developed a vibrant world of filmmaking outside the Hollywood Studio System. This world was made up of distinct genre communities dedicated to different ideals of *autonomous* filmmaking. This essay looks at the *public stories* of two such genre communities: *experimental film* and *independent film*, with an emphasis on Martin Scorsese as an icon of independent film. It reveals how these communities articulated what Pierre Bourdieu considers incommensurate cultural distinctions of a *pure aesthetic* and an *aesthetic of the real*. These genre communities articulated fundamental social class distinctions in these aesthetics as well as in their genre ideals and public stories. These communities also oriented their autonomy and rebellion against distinct cultural institutions, criteria of judgement, and audiences. These two public stories reveal the structured meaningful activities in the last half of the twentieth century that shaped distinct genre communities in the subfield of autonomous film in the United States and how artists and others approached the creation and appreciation of film. The aesthetics and orientations of film genre communities in the postwar period reveal a broader field of autonomy than envisioned by Bourdieu in his theory of the "autonomization" of art fields. Autonomous filmmakers in postwar American film ranged from directors of drive-in pulp movies to creators of avant-garde experimental film. Auteurs like Martin Scorsese and their aesthetic of the real found a niche in the middle brow world of commercial independent film.

Democratization of the Brazilian Criminal Justice System (CJS)? an Analysis Abaut the Perception of Female Participation in Drug Trafficking Crime in Montes Claros, Minas Gerais, Brazil.

This study analyzes the dynamics of drug trafficking crime processing in the region of Montes Claros (MG - Brazil), questioning who the subjects labeled for this offense and the (in) ability of the criminal justice system agencies in the locality perceive women as an active subject of this offense. To this end, it was used as primary data 4487 Occurrence records made by the military police between January 2009 and December 2014 and their consequences in criminal proceedings until July 2015. The methodology used was the orthodox longitudinal, which identifies the conversion of police record in process and check the extent to which gender inequality and other social variables can be determinant (s) of the forwarding of the crime to the Judiciary. The results showed a greater tendency of criminal subjection of men, who are more likely to classification by police as traffickers, and showed a greater tendency of the male group be appointed as main responsible for the crime during the records. In addition, women are more often fined by police as the crime co-authors, or less involvement in crime, which despite more prone to minor records, they have equal chances to men being processed in court, pointing to the weight of sex in the police phase, but not in submission to the court stage.

Between the Global and the National Culture: The Double Social Structure of Listening Music Habits

Current research in cultural stratification is divided between two basic methodological and theoretical approaches. On the one hand, we have the "cultural capital paradigm" that relies on national arts participation and cultural taste surveys as its primary empirical source. On the other hand, we have the "global culture paradigm" which argues that consumption practices must be located in a transnational context that entails a complex network of global flows, including the emergence of a highly structured "world culture" that transcends the usual political and geographical boundaries. That is, the cultural capital paradigm is interested in local differences in stratification whereas in the global culture paradigm the socio-structural determination of cultural choices recedes in importance.

We claim that behind both paradigms there is a struggle between local and global hierarchies of value that can be identify in the Europeans music listening habits. We use the 2001 Euro barometer dataset, which contains the music listening habits of Europeans living in15 European nation-states. The data generation process is modeled as a multilevel mixture factor model in order to uncover the structure of the Europeans music listening habits and simultaneously cluster European nation-states according to their music listening habits. We let the mean value of each indicator as well as the individuals' factor score to vary randomly.

We found that music listening habits can be classified into two independent hierarchies of values: one of global contemporary music and another of local high/folk hierarchy. The former is associated to individuals' age and the later to their education and income. Finally we found three clusters of nation-states that differ in the listening habits of their citizens giving support to the double stratification process thesis.

Young People's Leisure Patterns: Testing Social Age, Social Gender and Linguistic Capital Hypotheses

In this research we are interested in uncovering young people leisure patterns to study whether they are structured by the age and gender as the youth culture thesis proposes or its relation to young people leisure patterns is mediated by a set of social position indicators as the sociology of culture predicts. Were the former the case found, then no young people leisure policy would be necessary, but in the latter case, we would need a young people's leisure policy in order to try to balance the variations in leisure patterns related to young people different social positions.

Our data came from the 2012 Catalan Young People's Survey, EJC12. The interviewees were asked about the leisure activities they participated in by choosing between a list of 32 activities as well as a set of sociodemographic indicators. We applied MCA to the set of leisure activities to uncover the leisure habits of Young people. Then we clustered them to identify their patterns of leisure and finally we used a multilevel model to test the social age, social gender and linguistic capital hypotheses.

We found that leisure practices could be classified in 3 habitus: doing leisure activities, cultural activities and social/entertainment activities. Young people combine the three leisure habitus differently, forming 4 patterns of leisure: a social, an omnivorous, an entertainment, and a religious pattern. The association of leisure patterns with the indicators social position suggests that when we take into account the mediating role of social position, the main effects of age, gender, and linguistic practices vanish, as predicted by the three hypotheses proposed.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

That is, young people leisure practices are socially differentiated with young immigrants forming a vulnerable group that should be the focus of youth leisure policy.

Movimientos Societales Indígenas y Resistencias Comunitarias En América Del Sur: Más Allá De Los Gobiernos "Progresistas", Una Mirada Desde Una 'Epistemología Del Sur'

Los diversos conflictos socioterritoriales que tienen lugar en distintos países de América del Sur tendrían una connotación particularmente paradójica en la región Andino-amazónica, en particular en países como Bolivia o Ecuador, donde los gobiernos denominados "progresistas radicales" pese al carácter plurinacional de sus Estados establecido constitucionalmente hace unos años, en la actualidad mostrarían señales de re-centralización y restauración del Estado y de monopolio de la política, así como dinámicas de neo-colonización interna del territorio, principalmente a partir de modelos económicos 'neoextractivistas' y 'neodesarrollistas' y con perfiles políticos 'neopopulistas', lo que a su vez supondría estar retrocediendo en los mandatos de transformación plurinacional, descolonización y de "post-desarrollo" presentes en sus constituciones y en los imaginarios de cambio propuestos en sus horizontes estatales y societales. Asimismo, movimientos de matriz comunitaria indígena parecen re-constituir hoy, nuevamente, núcleos socioterritoriales de impugnación y resistencia comunitaria y local, frente a tendencias y políticas neodesarrollistas y neoextractivistas de parte de dichos gobiernos "progresistas" y frente a esquemas monológicos desde el Estado, disputando sentidos societales de transformación estatal y societal. Se propone un abordaje crítico de los actuales procesos sociopolíticos en la región andino-amazónica, a través de una 'epistemología del Sur' (Santos, 2008) y de la categoría de 'movimientos societales' (Tapia, 2008), a partir del análisis de algunos conflictos socio-ambientales y movimientos socioterritoriales en Bolivia y Ecuador; donde se disputarían imaginarios en torno a la plurinacionalidad y el llamado Buen Vivir/Vivir Bien como imaginarios de post-desarrollo. Conflictos y movimientos socioterritoriales donde pueblos y organizaciones indígenas estarían en fuerte tensión y disputa con visiones de desarrollo económico-territoriales de parte de los actuales gobiernos de ambos países y que habrían puesto en fuerte cuestión la orientación de estos "procesos de cambio" y los horizontes de transformación societal en la región.

Violence As System: A Case Study of Migrant Disappearances in Oaxaca

Violence is a complex phenomenon. It affects individuals, groups and institutions on three levels: interpersonal, intergroup, and institutional. Violence is not only a behaviour involving physical force. It can be cause and consequence; sometimes it is a requirement or a way of understanding, for instance, markets and states. Violent acts are interpreted according to social meanings. The performance analysis of violence phenomena has different theoretical underpinnings within sociological theory. There is a wide range of literature and authors. Here we study a violent case: the disappearance of "undocumented" Oaxacan migrants and the effects on their families, from a sociocybernetical approach.

A missing person is a tragedy for any family. Different types of disappearance happen in dictatorships, authoritarian states and also in violent societies and failed states, like Mexico. We take into account the effects that it has on the families of the disappeared, their communities and civil society. The mistrust in state institutions and the consequences of a failed state system require system theory concepts to explain them. We propose a second order observation process to consider the complexity of these enforced disappearances and to describe the functions, elements and structures operating in the migrant system. We present a case study in Oaxaca to illustrate the problem. We use participant observation and interviews, from a process of support to families of missing migrants.

The paper is divided into five sections including introduction and conclusions. Firstly, it examines the phenomenon of disappearances from a general perspective. Secondly, migration in Mexico and the scene of the disappearances. Thirdly, through the case study, the effects that these disappearances have on families are displayed. The result is a typology of family archetypes and a theoretical framework to explain violence as a system.

Professional Ethics and Scientific Research: Conceptions from Researchers Members of the National Researchers System (SNI) in a Mexican Private University

French philosopher Edgar Morin says: "Modern science was founded on the disjunction between judgement of fact and judgement of value, meaning, one side, knowledge, and on the other, ethics..." (2006, p. 27) in a way that scientific research was considered axiologically neutral, without ethical implications, because ethics was considered a subjective element; while scientific knowledge was assumed to be objective.

This separation produced, according to the same author, the "privatization of ethics" which was left to an intimate scope of people, that produced a "weakening of responsibility and solidarity". This issue imposed a big distance between individual life based on ethics, and society life that was apparently sustained exclusively on science and technology perceived as completely independent from any ethical consideration.

This historical process of modernity produced in the epistemological scope, a separation of the subject who knows according to his own knowledge and in the social scope a lack of unity between knowledge generated by researchers and the concrete life of persons and communities.

From the crisis of modernity it has been raised by some thinkers such as the same Morin or Canadian philosopher Bernard Lonergan (1999) that knowledge is a complex process inseparable from ethical dimension and that all production of knowledge from researchers – and especially those in the fields of Education and Social Sciences – has an axiological and ethical implication. This work presents the partial results of an investigation made with researchers members of the National Researchers System (SNI) about their conceptions on ethics in the field of research.

Keywords.
Professional ethics, scientific research, judgement of fact, judgement of value.

Comparative Analysis of Labor Market Segmentation Between Argentina and Spain

The perspective of labour market segmentation, from different theoretical models (Neo-institutionalists, Marxists, Cambridge School, and Orthodox approach) has proposed a structural explanation about how labour markets works. With different theoretical foundations and proposals for operationalizing, labour market is conceptualized from a multidimensional perspective of factors that affect the configuration of various segments of work and employment.

Starting from a non-orthodox perspective we present results of a research which combine two international projects: an Argentinian Project from CONICET Institution and a European Project (INCASI: International Network for Comparative Analysis of Social Inequalities between Europe and Latin America) from European Commission. We have three main objectives: the construction of a model of analysis for comparative study of Spain and Argentina's cases; to propose a methodology for measuring labour market segmentation using multivariate techniques, and to analyse, in a comparative perspective, the labour market in each country seeking, in particular, to echo the debate on the devaluation of qualifications: is it gives more in Argentina or Spain?

We work with the official data from the Labour Force Survey in the case of Spain and the Permanent Household Survey in the case of Argentina, referring to 2014. Our methodological approach, we call structural and articulated typology, has a design of analysis where multiple correspondence analysis and cluster analysis are combined.

Despite the different levels of development and socio-economic and historical realities of both countries, the results allow us to state that Argentina and Spain share the same general logic of structuring the labour market in terms of segmentation. Additionally, regarding the alleged devaluation of qualifications in Argentina, we would have to question it. In any case it is higher in Spain and focuses on the youngest persons in the initial stage of the employment trajectories.

Non-State Actors and Migration Control in Spain. a Migration Industry Perspective.

Until recently research on controlling irregular migration flows has been heavily biased toward what can be defined as an excessive state determinism that obviates the role of non-state institutions and organizations in this sphere of action. Although this state determinism (state-centric approach) has been academically contested by research that has focused on reactive actions and resistance by immigrants to migration control (migrant-centric approach), the state-centric approach has obviated the role that other non-state actors play in the sphere of migration control. The objective of this paper is to analyze and define the ways that have been adopted to control irregular immigration to Spain over the past decade by employing an approach that transcends and complements the state-centric/migrant-centric approaches by incorporating non-state actors to the analysis (a polycentric approach). The analysis of the role of non-state organizations in controlling irregular immigration in Spain will be carried out with a focus on what has come to be refered to as "Migration Industry", a concept that has gained a great deal of attention in migration studies as an analytical perspective that incorporates intermediate actors. Focusing on the analysis of the Spanish case, and on the so called "Control Industry and Rescue Industry", the paper will explore the role of private companies, NGO´s and other non-state actors as agents which facilitate and constrain irregular migration flows to Spain and influence the shaping of border and internal control policies and flows.

Local Services, Vulnerabilities and Responses in the EU Migrant Crisis in Germany

The effects of the still on-going EU migrant crisis in Germany can – with some limitations – be analyzed with respect to local services in crisis situations. Even though the term disaster is misleading in a way and some important differences remain, the shortage of local services as well as the different responses resemble disaster situations.

Allen Barton's (1969: 38) definition of disaster being a collective stress situation in which "many members of a social system fail to receive expected conditions of life from the system", takes the failure of basic services to the centre stage. During the EU migrant crisis basic local services such as sheltering, food provisions, medical assistance of refugees usually provided by local authorities were at large limited or even disrupted.

Although a formal state of emergency wasn't declared at any time, informal structures and protocols of disaster management, including foreign assistance and disaster logistics, were needed in order to provide local services. Furthermore other well-known features of disaster situations are to be found: emergent citizen groups (Stallings 1985; Scanlon 1998) as well as emergent organizations and networks (EMON) in unknown quantities took care about those services that weren't provided anymore by the municipalities or disaster aid organizations.

As Germany does not have many long-term disasters, the case of the EU migrant crisis provides important reflective insights about the state of preparedness of local services in times of disasters and crisis in Germany. The presentation will take a closer look at the differences and similarities of the EU migrant crisis situation in Germany and "conventional" disaster situations.

LORENZ, STEPHAN* (Friedrich Schiller University Jena, Stephan.Lorenz@uni-jena.de)

Growth Critique and Ecological Democratization

Although the critique of growth was a founding subject of the early environmental movements and debates environmental sociology has not elaborated growth criticism as a core concept. Therefore, the new emerging of 'growth' as an important topic hand in hand with a degrowth movement highlights the ongoing urgency of the subject as well as the sociological failure. In my paper I will propose a sociological understanding of the ecological criticism. In general growth critique will be determined as arguing against self-increasing dynamics in modern societies, i.e. against dynamics which are out of control and just reproducing means

without achieving human (social and ecological) ends. For an ecological growth critique these dynamics need to be specified. Here we especially find the critique of science and technology in the industrial society (e.g. Beck, Latour) and also the critique of consumerism in the affluent society (e.g. Baudrillard, Bauman, Beck).

Having outlined the conceptualization of ecological critique the paper will also propose corresponding conceptual means of overcoming the destructive consequences of growth. What I, therefore, call ecological democratization basically draws on the political ecology of Latour ('Politics of Nature') but will be broader grounded in theory, i.e. in pragmatism (cf. Dewey, Latour, Boltanski, Sennett) and procedural democracy (Habermas, Latour). With respect to the specified ecological criticism a related concept also needs to focus especially on the democratization of technology and consumption. As a result 'ecological democratization' should provide a helpful framework of critical analyses in the field of environmental sociology. Moreover, it can provide procedural advice to account for ecological problems fairly by showing who and what should be included in what way in dealing with problems.

LORINI, GIUSEPPE* (Universita' degli Studi di Cagliari, lorini@unica.it)

Towards an Ethology of Normativity

Three philosophers who have deeply investigated our economic, social and political reality as Friederich August von Hayek, Robert Nozick and John Searle drew a new image of human beings that goes against the classical image of "purpose-seeking animals". According to them, human beings are primarily "rule-following animals", i.e. animals having the ability to follow rules. But, if human beings are rule-following animals, are they the only animals that have this ability to act in the light of rules? A negative unexpected answer to this question comes from the researches on non-human primates' morality conducted by the Ducht ethologist Frans de Waal and the theory of mute law proposed by the Italian jurist and anthropologist Rodolfo Sacco. The paper aims to discuss the question set out above, starting from these two theoretical proposals.

Visions As Socio-Epistemic Practices – a Concept to Analyse the Effects of Visions

Technology Assessment is increasingly confronted with practices that create, influence and instrumentalise sociotechnical visions of the future. These visions and practices of „visioneering" seem to have a constitutive role for innovation and transformation processes involving very heterogeneous technologies. Research in STS revealed insights into the efficacy of visions in such processes, but mainly in a retrospective manner. It is analytically difficult to investigate what exactly visions enable and effect in the specific practices and processes in the present. A focus on the normative implications and the scientific and technical feasibility of visionary ideas as in recent Vision Assessment is not enough for this. Increasingly analyses and orientation are sought after which show the efficacy of visions in processes because of new and enabling technologies (e.g. nanotechnology) and the great transformations (e.g. energy, climate change). This needs analytical approaches that transcend the usual text interpretations.

The contribution develops a theoretical-methodological concept to make such effects of visions analysable. In it, visions are conceptualised as socio-epistemic practices that are constitutive in social processes because they enable productions of new knowledge and new sociotechnical arrangements. Based on different examples – such as smart grid, Big Data and open source digital fabrication – the contribution proposes a typology which enables an assessment of the efficacy of visions in practices in different fields and phases of innovation and transformation processes. This concept shall enable the production of knowledge for TA practices, e.g. policy advice, about the efficacy of visions in processes which other established approaches with their focus on visionary ideas beyond their contexts of practice cannot deliver. Furthermore, through the perspective of the concept even TA becomes visible for reflection as a socio-epistemic practice in processes which influences visions.

Dynamics of Cooperation Between Professional Groups : The Case of Complex Tasks in High Risks Organization

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

This communication aims at explaining the dynamics of cooperation between various professional groups for the resolution of complex tasks which require skills distributed in various segments of the organization. The communication analyze organizations created by the actors to realize complex tasks and the type of skills and links created in these temporary forms. It will highlight the organizational forms created by actors of different groups professionals and the logics and social dynamics (trust, recognition, gift) which favor their cooperation. Examples stemming from the realization of interventions of maintenance within a complex and high risks organization will be mobilized.

The management of the organization imposes the construction of a structure project and the actors create other forms of organization within this structure to favor their cooperation. If technical competences are essential to project's success, the construction of a network which one can mobilize for putting in relation the relevant actors according to the situation seems essential in practice. The construction and the remaining of this network rest on several elements: they lean on relational skills; its solidity is put to the test by the exchanges, gifts and recognitions which take place between its members; they join in a long time and lean on collective learnings.

The communication is built in three phases. At first, it highlights how the actors acquire the technical skills within their respective professional group and the underlying social processes in this acquisition. Secondly, the communication will analyze the modalities of meeting of these various actors in the same project and will highlight the temporary organizations invented by them to work together, as well as the social dynamics which live in them. Finally, in a last time, the communication will attempt to show how the social skills and the created links are reinvested for a later project.

Epistemological Conversations with the South: New Conceptual Models of Intercultural Higher Education in Latin America

Sociology of education has revealed to be a suitable covering umbrella for intercultural education issues in that it deals with educational programmes, at all levels, in contemporary diverse societies by underlining a growing awareness of equity. The tug-of-war between homogeneous and heterogeneous globalization has confronted the 'marketization' of most universities with the 'inter-culturalization' of some. Albeit with different societal visions and, consequently, aims in mind, both have pushed toward the transnational mobility of ideas and knowledge workers, both teachers and students, and the increasing opportunities for knowledge exchange. This paper will introduce the topic of intercultural universities in Latin America, by starting with the discussion of a few founding principles such as 'interculturalid(e)', and its correlates, from a South-North-South postcolonial perspective, based both in Europe and the Americas.

An intercultural approach to university curricula, both in classical as well as in indigenous higher education institutions, pressuposes, on the theoretical side, new study plans according to new conceptual frameworks and, eventually, an 'ecology of knowledges' and the testing of different rationalities which are nonetheless well placed in critical and complex thinking. Such a vision of university wisdom encompasses a different institutional structure allowing for experimental knowledge and communitarian practice, that is, extension programes that challenge the modernist idea of university, without jeopardizing it.

This paper will discuss the ideological and epistemological issues put forward above as well as present various practical examples being undertaken in Latin America, e.g. in Bolivia, both documental and experiential, which emerged from the RIAIPE3 project (2010-2013, ALFA Programme, funded by the European Commission, http://www.riaipe-alfa.eu/index.php/en)

The Influence of Gender, Age, SES Background and VET Qualification Entry Level on Undergraduate Academic Performance at an Australian University

With the changing face of higher education across the globe more diverse pathways are being taken to university undergraduate programs by socially diversified cohorts of students. Australia, while being a smaller player on the world stage, is recognized as one of the first countries to expand their higher education sector in an attempt to widen access to those groups that had hitherto been underrepresented. Most recently Australian government policies have been directing universities to incorporate non-traditional entry pathways that are theoretically widening participation to include students coming from specific groups including those from a low social economic background. In particular, over the last seven years funds have been offered to several Australian universities to establish credit transfer pathways between vocational educational & training (VET) institutions and universities. Many universities that have taken up the VET pathway initiatives have been those that traditionally had already been recruiting a wider section of the community. Interestingly, however, at least one elite university has also taken the step of establishing many such pathways. This study, being part a much larger investigation on student persistence, assesses how students making use of these newly established VET pathways perform during their first semester of university studies at an elite Australian university where these students are very much a minority group. This session reports on several quantitative analyses investigating how four socially sensitive variables: gender, age, social economic background and vocational qualification entry level are interplaying upon their influence on academic performance. Of interest is whether or not these pathways can perform their intended function of helping to redress social inequalities often prevalent in traditionally selective universities.

New Brunswick Seniors Classed As ALC Patients

This paper is based on analysis of the experiences of seniors classed as Alternate Level Care (ALC) patients in New Brunswick, Canada. ALC patients, derisively referred to as 'bed blockers,' are those who occupy acute care hospital beds while waiting to be discharged home or to care in alternate settings. Our objective in this research was to study the home support needs of seniors classed as ALC patients in New Brunswick. We recruited research participants (6 men and 11 women) through the New Brunswick health authorities Réseau de Santé Vitalité and the Horizon Health Network and used semi-structured interviewing as our primary method of data collection. Participants' ages ranged from 65 to 99 with most falling between 75 and 99 years of age. 9 identified as Francophone, 6 Anglophone, 1 as both English and French speaking, and 1 who claimed neither French nor English as first language. The central findings from our research are that there is a need for comprehensive and coordinated home support, extra mural health care, and respite services that would allow seniors to return home from hospital or would prevent them from becoming ALC patients. Population aging is an acute problem in New Brunswick where the proportion of the population over 65 had already reached 18% by 2014 (CBC 2014). Thus this paper contributes to addressing the policy challenges presented by an aging population and to the issue of ALC patients in this province.

Eating Politics: Gastro-Diplomacy and Sensory Encounters

While scholarly attention on food and the senses have been on the rise in the last few decades, an area of inquiry pertaining to the political life of sensation and foodways remains fairly nascent in extant debates. This paper focuses on how foodways and the realm of politics, both within and between nations, play out in everyday encounters of culinary experiences and political behaviour. It engages with the sensuous features of food consumption by politicians that come to bear on inter-national identities as well as local politics, thereby illustrating the pertinent role that food plays in political-social encounters. Examples will be drawn both from instances of gastro-diplomacy (Rockower 2012) where leaders from different nations consume local fare, as well as the recent Singapore General Elections 2015 where particular dishes have been singled out during the political rally period. The discussion will then be geared towards developing a political life of sensation (cf. Howes & Classen 2014; Panagia 2009).

LOWTON, KAREN* (University of Sussex, k.lowton@sussex.ac.uk)

Understanding Successful Ageing for the 'new' Ageing Populations: The Case of Cystic Fibrosis

In the UK, as in other developed countries, many people now survive complex health conditions that were understood historically to be fatal conditions of early or mid-life. These improvements in longevity are due largely to a better understanding of disease processes, successive innovations in medical treatment, and changes in societal acceptance of 'difference'. One example of these 'new' ageing populations is those with cystic fibrosis, where life expectancy has risen steadily from under one year when it was first described in the medical literature in 1938, to a predicted fifty years for those born in the early 21st century. Not only does this condition, its treatment, and patient experience challenge the idea of a 'natu-

ral' life course, as successive interventions eradicate an otherwise inevitable early death, but they also destabilise conventional notions of ageing and old age, with for example young women experiencing urinary incontinence, osteoporosis and CF-related diabetes. Yet again, cystic fibrosis not only challenges societal notions of what is 'normal', with employment, relationships, and parenthood achievable for an increasing number of people with this still life-shortening condition and daily burden of care, but also what is achievable, for example further life extension and eradication of disease through personalised genetic-based medicine.

This paper seeks to understand further the 'new' ageing populations and their relevance to the natural, normal and pathological in the contemporary sociologies of ageing and health. It uses the case of living with cystic fibrosis in contemporary social life to critique the utility of a theory of 'successful ageing' from gerontological, biomedical, and psychosocial perspectives.

Patterns of Relocation and Livelihood Change of Aboriginal and Han Chinese Communities after Typhoon Morakot in Taiwan

To avoid the reproduction of the future disaster, the strategy of relocation is commonly adopted for impacted community. However, hasty post-disaster relocation may cause critical livelihood problems, especially for an ecosystem-dependent community. Compared with individual household relocation, community relocation needs enormous resources and has complex decision processes, therefore, institutions such as governments and/or NGOs usually play important roles. The majority of research literatures related to relocation focus on cases in developing countries. In order to broaden the theoretical and practical understanding of relocation, livelihood change, and institution-driven recovery, more research on cases in developed countries is needed.

Typhoon Morakot hit Taiwan in 2009, leaving over six thousand dwellings damaged or under unsafe condition. The majority of the impacted residents were aboriginal people with ecosystem-dependent livelihoods, and 28% of the impacted residents are Han Chinese, the ethnic majority in Taiwan. In order to speed up overall housing recovery, institution-driven approach was adopted. Governments collaborated with NGOs to provide four thousand "free permanent housing" units in 33 relocation sites. Six years later, some communities have rebuilt their livelihood and cultural identity successfully, but some are still struggling for their lives.

This study uses in-depth interview and focus group to collect data of livelihood change from six "free permanent housing" relocation communities with different ethnicity and physical environment characteristics. In addition, 6-year panel data are also employed in examining the gross livelihood change. This study mainly identifies and interprets livelihood recovery patterns at community level of the study cases, but also briefly narrates the difference of cultural impacts among aboriginal- and Han Chinese-majority communities. The findings of this study can provide insights for improving post-disaster relocation and livelihood programs to promote resilient community.

Cadre Parents and Their Entrepreneurial Children? the Dual-Track Intergenerational Reproduction of State and Market Elites in China: 1978-2010

Abstracts: This article aims to explore since China's market transformation, how parents' advantaged occupations have been influencing the hazard rate of their children's status attainment in four certain elite positions (administrative elite, technocratic elite, entrepreneurial elite, andmanagerial elite), and whether these patterns have shown varieties during three different historical times from 1978-1992, 1993-2002, to 2003 - 2010. Based on merged data from CSS 2006 and 2011, by using event history analysis, we find that although parent's advantaged position has a persistent effect for children's status attainment, its function in general still does not break the 'dual trajectory reproduction model' that state eli te and market elite tend to reproduce itself without revolving access; it is only after 2003 when individuals whose parents are state elites shows more likelihood to become market managerial elites. We explains these findings, and further reveals that, by using mechanism analysis, the mechanisms that produce this ongoing structural reproduction, however, have been constantly changing in different historical times, especially for the increasingly diversified market elites. These changing mechanisms have been reflecting the macro transformation of China's sociopolitical and economic environment in the past thirty decades.

Problem Gambling and Social Stratification in Italy

Considering the international literature on gambling and problem gambling, the aim of this study is to test the hypothesis that excessive gambling - pointing out a problem gambling (PG) profile - is more prevalent among sections of the population with a lower socio-economic status. In particular, theoretical approaches to *social stratification of gambling* - maintaining that propensity to gamble would be higher among individuals of lower social strata - will be extended to problem gamblers.

In this research, *gambling behaviour* is defined by using one of the most popular screening tools, the Canadian Problem Gambling Index (CPGI), a structured questionnaire exploring focal gambling issues, in order to distinguish and classify behaviour of social, low risk, moderate risk and problem gambling.

In order to give an answer to the research question *(What is the association between socio-economic status and gambling behaviour?)* the data emerging from the *Italian Population Survey on Alcohol and other Drugs* (IPSAD) will be analysed. The IPSAD survey, conducted in three waves (2008, 2011 and 2014) by the Italian *National Research Council* (CNR), is a prevalence study on alcohol, other psychoactive legal/illegal substances and risk-taking behaviours in the general population (the residents in Italy between 15 and 74 years of age). It follows the guidelines provided by the *European Monitoring Centre for Drug and Drug Abuse* (EMCDDA). The writer has the opportunity to rely on the collected data (roughly 10,000 respondents) to develop an analysis by using multivariate statistics.

Italian Lesson Learned and How Words Can Save Us: A Resilient Communication Model for Future Disaster Planning

Italy has always been stricken by disasters and its population is continuously at risk. The Italian socio-cultural background offers a lively image of the importance of words and their impact on national disaster risk reduction policies and their local practices. The lingual substance affects the interpretation and the conceptualization of a disaster and its phases in a particular way.

Specifically, three Italian case studies - the Italian earthquakes occurring in Umbria, 1997; Molise, 2002; and Abruzzo, 2009 - and two workshops managed by the Regional School of Civil Protection – Lombardia Region, will be considered for a resilient communication model aimed at reframing and enhancing risk communication, disaster planning and disaster risk reduction.

The interesting issue emerging from these studies was the differences in meaning and interpretation of terminology, referring to the same words such as disaster, vulnerability, and resilience, and their impact on disaster management. These case studies depict the relevance of confrontation, dialogues and narratives for a possible common understanding of the same words between different social and professional cultures applicable to civil protection volunteers, emergency professionals, politicians, experts, ordinary people, and victims. The two workshops were conceived within two diverse operational contexts. The first was conducted to provide the Italian adaptation and translation of a UN game, "Riskland" and it was worthwhile in understanding the interpretation of words by civil protection volunteers and children.

The second workshop was aimed at improving the communication skills and relational competences for the civil protection volunteer as witnesses of disaster management and rescue activities.

The three case studies and the two workshops gave a fundamental contribution in order to develop a resilient communication model for future disaster planning and to understand the role of words and their cultural meaning for the community at risk, the local, regional and national emergency stakeholders.

LUCKA, DARIA* (Jagiellonian University, Institute of Sociology, daria.lucka@uj.edu.pl)

The Moral Revival of Communities: Possibilities and Problems. the Communitarian Approach

Communitarianism is a political philosophy and a social movement, which has been developing mostly in the United States since the 1980s. Locating itself between the traditional liberal and conservative approaches, communitarianism looks for a balance between what is individual, and what is communal; between individual freedom and social order.

One of the basic postulates of communitarianism is the revival of moral culture of communities. Communitarians advocate for a value-oriented organization of society, focused on the common good. Therefore, they strongly oppose the

Kantian tradition of value-free, neutral perspective, as well as the vision of an unencumbered self freely deciding about his/her values.

In the paper, a critical analysis of the communitarian approach to moral culture will be presented. The following questions will be addressed: How to formulate and establish a moral culture within a community? Is it possible to reach an axiological consensus in a modern, pluralistic society? How to avoid community's oppressiveness with regard to people's values and behavior? What are the conflict-resolution procedures?

What Possibilities for Hope at the Points of Energy Production and Consumption?

Throughout history there have been dreams, visions and hopes for a utopian world. This paper argues that hope is is an ontological reality, emergent from the unfinishedness of the world. From this premise, the paper seeks to explore manifestations of hope at the points of production and consumption, specifically within the energy sector in Lephalale, Limpopo. The construction of Medupi coal power station is heralded as "creating a better life for all" and contributing to the creation of the "first post-apartheid town" through this mega-project (Brown, 2015). However, workers at the point of production of energy at coal power stations in Lephalale have regularly taken action against the working conditions they are forced to endure. Global issues regarding the nature of energy production and consumption and the consequent implications for the sustainability of the planet also confront workers. How does this affect imaginings of the future of work in the sector? Furthermore, many community members surrounding coal power stations are typically unemployed and unable to access electricity due to unaffordability. Communities face devastation of the water, land and air that they use, destroying the possibility of dignified lives. In this context, what possibilities open up for individual aspirations and collective hopes? The site is indicative of many of the stark contradictions of post-apartheid South Africa. Through ethnographic research methods, this paper seeks to explore the ambiguities of hope and utopianism, and the lack thereof, at the interconnections between workers and communities.

Coping with New and Complex Caring Demands: Health Workforce Policies and Practices in Norwegian Care Services

Like in many countries, also the resource - rich, Norwegian health care services face challenges regarding both the supply and distribution of competent staff. Recent health care reforms aimed at redistributing tasks between state and local government have increased local demands for skilled health workers to cope with more complex tasks. The use of skill mix strategies in primary health care has so far been limited. A range of other strategies are, however, suggested by central and local government and tried out in services to meet the demands of higher skills and more integrated services.

This paper explores the recent national policies regarding reinforcing professional competencies in primary health care for the elderly, as well as the local policies of seven Norwegian municipalities of different size and geographical location. The analysis is based on a study of national and local health workforce policies and plans, as well as interviews with managers at different levels in the local care services.

How are the main challenges defined on different levels and in various local settings, and what kind of competence and professionalism are asked for? What are the central measures for coping with the changing demands?

New roles for nurses and new divisions of labor between nurses and other health care staff are key elements of the new health workforce strategies. Our analysis suggests that policies and recruitment practices on the one hand asks for broader competencies and interprofessional skills, in order to strengthen the integration of services for patients with increasingly complex needs. On the other hand, there is a strong tendency for the larger municipalities in our study to aim at recruiting specialized health care professionals, in particular nurses with special education, in order to cope with the new responsibilities for complex health care tasks in primary health services.

Interviews Based on Family Drawings - Capturing Cultural Conceptions

Confronted with the task to study cultural-normative conceptions ("leitbilder") of the family and of family-related issues (e.g. what is a "normal" number of chil-

dren), we have developed a qualitative approach, consisting of a drawing, a subsequent semi-structured interview as well as a content analysis of drawings and interviews. We have recruited n=101 participants (16+) in Germany in early 2015 in a quota sample. Each participant has been sent a kit by mail that included coloured pencils, paper and the instruction to draw a "real" family. Participants also were asked to fill out a short standard questionnaire regarding their basic socio-demographic characteristics, so that the composition of the sample could be monitored and basic comparisons between social groups were enabled. Each drawing then was interpreted in itself by a small group of researchers in an ad hoc interpretation. The interpretations were recorded and transformed into questions in an interview guide. In the semi-structured interview (by phone), participants were, at first, asked to describe their basic thoughts and intentions when reading the instructions and starting to draw. This description served to consider to what degree the drawing actually represented a cultural conception or rather the participant's personal family situation. The participants then were asked about each detail of their drawing to confirm or correct the preceding ad hoc interpretations. In as much as participants were open to describe own nonreflective stereotypes, their self-interpretation was taken as accurate interpretation of the drawing. In as much as they seemed to filter their answers and report "politically correct" perceptions, the ad hoc interpretation was taken as a probable interpretation. This way, the participant's personal conception was captured of how a "real" family "usually" looks like. In a summarising interpretation of motifs that were found in more than one drawing, collectively shared cultural conceptions were measured.

The Diverse Paths of Individualisation in East Asian Societies: Findings from the Fifth (2005-2009) and Sixth Wave (2010 – 2014) of World Values Survey

Neo-modernisation theory (Inglehart and Welzel 2005, Welzel 2013) argues that there is a global trend of increasing 'emancipative values', associated with the process of individualisation. This phenomenon is a result of the rise of post-industrialism, following a chronological development from agrarian, industrial, to post-industrial societies. This paper argues that this view is inadequate for understanding the process of individualisation in the advanced East Asian economies, where many people have experienced such a socio-economic transformation in less than a generation since the post-war years. Their process of individualisation is highly influenced by their modernity projects, which aim to modernise the societies through rapid integration into the global division of labour (Castells 1992).

Using the personal value instrument tool developed by Schwartz (2007) and indicators of emancipative values developed by Welzel (2013), this paper measures the level of individualism and civicness, as well as different aspects of 'emancipative values', based on data from the fifth (2005-2009) and sixth wave (2010 – 2014) of the World Values Survey. The findings suggest that diverse paths of individualisation can be identified in East Asian and Western societies and also among societies within the East Asian region. This paper analyses the impact of modernisation and how it shapes the changing state-family-individual relationships, resulting in diverse paths of individualisation in East Asian societies. The analysis points to the need to develop new typologies of individualisation and new indicators which are able to capture the complexity of the development in different societies and how these modernisation projects are manifested in personal attitudes and values towards private relationship with family and friends and collective life in economic production and political participation under different local circumstances in an increasing globalised world.

LUI, WING SHEK ADRIAN* (Macquarie University, wing-shek.lui@students.mq.edu.au)

The Impact of Economic Structure and Solidarity Mechanism on the Rise of 'Emancipative Values': Lessons Learnt from Analysing Historical Trends Using Data from World Values Survey

Welzel's evolutionary theory of emancipation (2013) argues that there is a general global trend towards a rise in 'emancipative values', which are essential for democratisation and the maintenance of liberal democratic political institutions. However, an analysis on historical trends in East Asian and Western societies based on data from all six waves of World Values Survey data suggests a slightly different picture. While there is a general global trend towards the rise of two domains of emancipative values: 'equality' and 'choice', a volatile pattern can be found in the other two domains: 'autonomy' and 'voice'.

This paper attempts to explain these diverse patterns by re-examining the key assumption of Inglehart and Welzel (2005) and Welzel (2013) that the rise of 'emancipative values' is driven by the change in socio-economic structures from agricultural, industrial to post-industrial societies. Post-industrial societies, in particular, encourage 'emancipative values' due to the increasing economic needs to communicate with people, process information and create new ideas. Apart from

analysing the impact of this macro-level socio-economic factor, this paper also examines possible influences from cultural heritages and solidarity mechanisms, including associations in civil societies and social welfare arrangements, which allow values to spread among members in a given society. The findings from this analysis provide insights for refining Welzel's evolutionary theory of emancipation and the measurement tools that can be used to measure 'emancipative values' for a better understanding of this phenomenon.

Refugees Doing Biography. Intercultural and Multilingual Interview Settings Enriching Data

The paper is based on biographic interviews with Chechens, who were granted asylum in Austria more than three years ago, and perceives escape as a first fracture in their employment trajectories as it is related to breaking off employment and education in the country of origin. The asylum procedure marks a second caesura as it brings exclusion from the labor market. For the context of this session two aspects of the PhD-project are highlighted:

The language of the interview brings challenges but also chances for the future development of biographical research. Due to my fluent knowledge of Russian the interviewees could choose and even switch the language. The translation requires effort and the involvement of a professional translator for passages selected for sequential analyses, but also enriches data: Interviewees fluent in German switched to Russian when delicate issues as e.g. dishonor connected to their ethnic background were tackled.

The paper takes into account intercultural aspects concerning the biographical self-presentation towards a non-migrant vis-à-vis. Clearly, the data – and as a result the practices of doing biography – would differ greatly if the interviewer were a co-ethnic. Female interviewees used self-thematization for a counterstatement of the image of the suppressed Muslim woman – still reproduced within biographic research. They showed me photos of themselves – which were included as artefacts in situational maps in the research process – to explain to me the point in their biography when they decided to wear a headscarf, stressing that they were not raised in a religious way and could not resort to religious knowledge within the family. The interviewees used parts of their narration for self-presentations as well-integrated migrants or argumentative defenses regarding religious practices – e.g. explaining that arranged marriage is rejected by Islam but practiced by Chechens who cling to traditional norms.

Collective Memory As a "Weapon of the Weak": The Constuction of the Collective Memory of the 68 Generation in Turkey

There is a rich literature on the 60s and youth movements in the 1960s in the West but it seems important to study that period in different geographies in order to see the bigger picture as well as to better comprehend the different colors of the youth movements all around the globe. The study of the 1968 generation in Turkey offers a very interesting case since the 68 in Turkey was experienced in extremes leading to the political polarization and political violence in late sixties and seventies. The response of the "establishment" to the 68 generation in Turkey was the military intervention, military coup of 12 March 1971. At the end of the military regime, almost all leaders of the 68 generation were killed either in executions, operations or torture cells. With the end of the 12 March military regime and the declaration of amnesty in 1974, the surviving members of the 68 generation were all released from prisons. Since the leaders of the movement were killed, it was the time of "apostles" using Gün Zileli's words (2002) and there was a fragmentalization of the movement continuing the "struggle" even more strongly joined by the members of the 78 generation. Thus, social movements continued to rise and the result was the military coup of September 12, 1980 leading Turkey into an authoritarian military regime.

This paper discusses how the 68 student movement in Turkey, after its "defeat" by the political regime used literature (mainly biographies, autobiographies but also novels and poems) as a "weapon of the weak" and achieved to construct the generation's collective memory. In that sense, they did not only re-construct and re-present the past but also created the myth of the 68 generation in Turkey.

Not the Future,Not the Past Only the Present... the Case Study of Young Activists in Turkey

The dominant paradigm of political participation of young people in Turkey since the 1980s defining youth as a silent and apolitical, disengaged category was suddenly replaced by a paradigm of engaged and political youth with the Occupy Gezi Movement in May-June 2013. This occupy movement and the high percentage of its participants being students and young professionals surprised the commentators. It is important to note, however, that even before the Gezi Park movement, there were instances like protests against the internet censorship and high school students' protests demonstrating that this is not an apathetic generation. Based on ethnographic research, it is argued that there are common characteristics between these movements of young activists: unlike traditional political movements, they are preoccupied with the present (not the past or the future). The discourse of the young activists on the other hand draw substance from everyday life and popular culture and use humour actively. This paper aims to discuss how the young activists in Turkey chooses to create a new "politics" focusing on the present.

Power without Representation in a Transnational Governance Network: The Coherence and Closeness of the Trilateral Commission

Transnational governance networks usually claim to represent at least an important part of the global public opinion. In the absence of institutions that sustain and guarantee this claim, they must constitute themselves and act in accordance with two opposing principles: coherence and openness. Both their legitimacy and efficacy depend on their ability to strike an appropriate balance between those principles. To analyze the practical challenges that derive from this need, this paper focuses on the Trilateral Commission (TC). A network-like think tank, bringing together leaders of several influential think tanks and outstanding personalities from business corporations, political organizations, academic institutions and media firms, the Trilateral Commission has been an important player in the transnational arena. Focusing on its membership and the agenda of its annual meetings, our analysis shows that the TC is highly coherent but excessively endogamous: rather than reflecting the diversity of the global public opinion, it only reunites an exclusive group of pro-US leaders, members of transnational corporations and partisans of free trade. Thus, the TC is a coherent but closed network, very powerful but scarcely representative. Ironically, a network that promotes the use of "soft power" in the international arena—a power founded on opinion, rather than on force and material interests— heavily depends on the hard power of established hierarchies.

Interactions of Population Trends with the Social, Economic and Natural Environment

Methods of multi-dimensional demographic analysis have been used to reconstruct and project populations by age, sex and level of educational attainment for most countries of the world for 1970-2060. These new data with age-specific education detail allow new statistical assessments of the social and economic consequences of changing age and education structures. The studies show that for a range of different outcomes - including economic growth - changes in age structure matter but improvements in educational attainment are even more important. Broad based education also turns out to be one of the key determinants of improved health and survival, to help reduce vulnerability to natural disasters and, thus, enhance adaptive capacities to already unavoidable climate change and even to strengthen the quality of institutions and a move towards democracy. The components of demographic changes (fertility, mortality, migration and education) are also influenced by social, economic and environmental factors. But there is a distinct time lag through which e.g. improvements in education take decades to improve the human capital of the adult population. These time lags can be used to study the causalities in these complex interactions between population trends and the environment. These insights have recently been operationalized through a set of broadly agreed global level scenarios that are being used by Integrated Assessment and climate modeling groups around the world. These so-called SSPs (Shared Socioeconomic Pathways) quantify different possible trends in future mitigative and adaptive capacities of societies with respect to climate change. These SSPs have been calculated for all countries in the world up to 2100 with the multi-dimensional population projections by age, sex and

level of education forming the "human core" of the scenarios which also include economic growth, technology, and quality of institutions. The lecture will illustrate the results for the world and selected countries.

The Effect of Increasing Human Capital on Increasing Life Expectancy: A Demographic Decomposition

Drastic reductions in mortality, which started in the middle of the 18th century, led to tremendous increases in life expectancy particularly in industrialized countries. Most of these changes were due to the shift in cause-specific-mortality patterns from communicable diseases at younger ages to non-communicable conditions more prevalent at advanced ages, as aptly described in the 'epidemiologic transition theory'. Recently, the potentials of human longevity were further extended by the so-called 'cardiovascular revolution' that started in the 1970s and launched a new period of decreasing mortality. Evidence relates these improvements to new medical advancements, such as developments in screening, prevention, and treatment of cardiovascular diseases. Moreover, advances in healthy lifestyles reduced mortality and have been leading to further improvements of survival chances. Coinciding with these trends, the populations experienced significant increases in human capital in terms of education level. These shifts in populations' education levels are also relevant for understanding the observed trends in life expectancy because a great deal of research revealed the strong influences of socioeconomic resources on various health outcomes. We will demonstrate that the increase in human capital itself was in fact a strong contributor to the rising levels of life expectancy, in addition to the direct effect of decreasing mortality. This finding is in line with the theoretical heterogeneity approach, which states that mortality levels and differences in mortality are strongly influenced by the specific risk group composition of populations. Ultimately, it fuels the expectation of continuing increases of life expectancy which caused intensive debates among demographers and split the community into optimists and pessimists. Obviously, these results have several important policy implications for all populations of the world, in particular for today's threshold countries and several populations of the global south where education levels are projected to increase even stronger than in the industrialized world.

LYBECK, ERIC ROYAL* (University of Exeter, e.lybeck@exeter.ac.uk)

Comparative-Historical Sociology As Professional Practice

The once dominant comparative and historical approach in sociology has been replaced by methods which extract, collate and re-label data from the immediate present. Without comparing these data with other civilizational patterns, other regions or other periods, sociology reflects contemporary values without sufficient reflection. As Calhoun argued, the (no longer) recent flourishing of historical sociology in American sociology was 'domesticated' into a refined 'Millian' method. In Britain, the promise Abrams identified during the structuration turn evaporated in the jetstream of planes headed towards California. What explains this contemporary dustbowl of historical sociology? This paper suggests: the gradual disinvestment of the discipline in professional utility and professional practice since the 1970s at least, with the trend, however, originating in the interwar period. The history of the interrelationship between legal science, that is, jurisprudence, and social science in both Germany and the United States suggests that social scientists emerged as adjunct researchers working for a more dominant profession of jurists. Comparative history was the method jurists employed to harmonize conflicts of laws, especially during unification and within recently colonized territories, such as Alsace-Lorraine after 1871. The first generation of social scientists in America drew on their training in German faculties of Law, establishing faculties of political science, economics and sociology across the Atlantic. Subsequent academic effort to professionalize these disciplines as pure 'science' meant withdrawl from the original practical concerns. This history of the decline of comparative-historical sociology suggests that social scientists would have greater utility and more input in policy and public affairs if we demonstrated our professional capacity to explain a wide range of phenomena inaccessible to more 'involved' participants mired in the ripcurrent of the contemporary. Historical-comparison

LYCHKOVSKA, OKSANA* (Odessa I.I. Mechnikov National University, lychkovska@mail.ru)

Pouvoirs Contemporains Et Deux Types Du Journalisme Dans L'espace Médiatique Et Politique Ukrainien

Le but principal de cette proposition est d'examiner l'ambiguïté des rôles et des avantages des médias traditionnels et des médias sociaux dans le processus de la rénovation de l'espace socio-politique ukrainien, et notamment de révéler et d'opposer deux types du journalisme : les journalistes traditionnels, « conseillers » et « vendeurs » du contenu politique et les producteurs des médias sociaux, des éditions en lignes, des bloggers qui deviennent de « fondateurs d'une nouvelle opinion publique », en contribuant à l'apparition de l'activisme politique. Les médias traditionnels permettent aux protagonistes de la politique de se donner une représentation à travers leurs positions médiatiques. C'est donc un jeu ou chacun des acteurs essaie d'anticiper les demandes et les orientations de l'autre. Et cela assure le rôle des « conseillers » en communication, comme d'anciens journalistes qui sont capables de parler à la presse ou à la télé et de "vendre" le discours de l'homme politique qu'ils conseillent et représentent. Les médias sociaux, et tout l'ensemble des nouvelles formes de la communication associant les producteurs de contenu avec leurs consommateurs, permettent à chaque lecteur/souscripteur du blog non seulement d'exercer les fonctions du commentateur, du reporter, du photocorrespondant ou du rédacteur, mais se manifester comme un joueur à part entière du processus politique. Ainsi, des célèbres bloggers et des journalistes des éditions en lignes cessent d'être des simples « médiateurs », même fameux, à l'intérieur des enjeux politiques ukrainiens, mais deviennent les députés étant à la tête des listes des partis politiques, aussi bien qu'ils contribuent à la fondation d'un nouveau type des communautés de masse capables à transformer le contexte politique d'une manière révolutionnaire. Les tendances mentionnées seront analysées non seulement au niveau théorique, mais en évoquant les spécificités discursives empiriques propres à la réalité médiatique et socio-politique ukrainienne.

LYNCH, ANDREW* (University of Sydney, aplynch002@gmail.com)

Catholicism and Post-Secularism: Contesting Secularism in (Post) Modern Conditions

If former phases of modernity have been characterised by debates about secularization, the present is being shaped by discussions about post-secularism. Post-secularism, the resurgence of religion in political and social life, is an important paradigm through which debates about the role of religion in the modern world are being considered. Catholicism, a global church of over 1.2 billion members, is intertwined with the social transformations that have challenged the processes of secularization. It continues to be intricately enmeshed in debates about religious and secular forms of thought and social practice in contemporary society.

This paper examines the impact that post-secularism is having on the Catholic Church. After critically interrogating the idea of post-secularism as a theoretical perspective, the paper will consider research (Pace 2013) that suggests that although the resurgence of religion and the emergence of a post-secular phase have drawn attention to the limits of the secularization thesis, the onset of post-secularism will not mean a return to an idealized past for religious institutions, and a number of new challenges present themselves as churches and religious groups negotiate the changing contours of social life in late modernity. Theories of multiple secularities (Wohlrab-Sahr and Burchardt, 2012; 2013) will also be considered in this light. The paper will then assess the Catholic Church's response to secularism as it seeks to position itself in post-secular times, through an analysis of the political theology of Johannes Baptist Metz and the holding of Vatican II. New strategies by the Catholic Church to engage with the contemporary post-secular world will also be considered. The discussion will draw on the work of Charles Taylor and Jürgen Habermas, among others, to assess the contribution that the Catholic Church has made to religious dialogue in a post-secular context, and the interplay between religious thought and postmodern secular reason.

New Managerialism As the Organizational Form of Neoliberalism

This paper argues that new managerialism is not a neutral management strategy; it is a political project, borne out of a radical change in the 'spirit of capitalism' (Boltanksi and Chiapello, 2005). Drawing on extensive empirical research on primary, secondary and higher education in Ireland (Lynch, Grummell and Devine, *New Managerialism in Education,* 2015), this paper shows how managerialism was the mode of governance used by the Irish State to promote neo-liberal economic and social policies since the 1990s. The new managerial project was framed as one of 'modernisation', but the practices were not just 'modernist', they were distinctly political in terms of the values and mores incorporated into systems of governance, regulation and accountability.

New managerialism comprised three strategic elements: a narrative of strategic change, an organisational form inculcating market values and practices into public sector organisations, and a set of control technologies premised on measurement, calculation, and disregard for the relational caring self. It focused on outputs over inputs, instituting a language of competition, choice and customers over cooperation, care and citizenship. What were framed as 'purely technical' or 'operational' changes in public sector organisations, have in fact been major cultural and valuational shifts in the organisation of public sector work, changes that are, in certain ways, highly gendered.

As the implementation of managerialism across educational sectors has been quite different, not least due to the variable power and resistance of trade unions (Grummell and Lynch, 2015), the paper will highlight the complex interface between, the state, capital and the professions in the implementation of the new managerial project.

Precarity, Gender, and Care: A View from the Neoliberal Academy

Based on over fifty in-depth interviews with women across higher education in Ireland, this paper explores how women are affected by the neoliberal reforms of higher education and the interplay of precarity, care and gender. Neoliberalism has had destructive effects on academic labour, and a generation of young scholars who enter the job-market with minimum income but under maximum pressure for visibility are faced with flexibility and recurrent migration. While much of the research on gender in academia have focused on tenured staff and senior management (Acker 2006; O'Connor 2014), there has been relatively little reflection on the new divisions between an ever tinier elite of permanent academics and a reserve army of workers with short, low paid, hyper-flexible contracts. This phenomenon is not exclusive to women, yet women are over-represented in part-time and fixed-term appointments, in a societal context in which women remain the default carers and care work is systematically undermined.

Our data shows that a 'split career track' has emerged among academic women: while some are pressed to seek serial employment abroad severing social and professional ties at a given locality, others opt out of transnational mobility but remain trapped into zero-hour teaching and precarious research arrangements. Those who seek to balance care responsibilities with an academic career, do so in the context of ever-declining welfare regimes at home Those who seek transnational mobility as the new 'ideal', face a trajectory that is hostile to care of dependent others, and requires them to sacrifice locality and the familiar commitments in return for loneliness and growing lack of care for the self. The appearance of this 'split career track' reflects a 'care ceiling' (Lynch 2010) that ignores the lived reality of workers for whom the creation and maintenance of affective bonds are central to development and wellbeing.

LYNG, STEPHEN* (Carthage College, slyng@carthage.edu)

The New Subjectivities of Risk

Although Erving Goffman's contributions to the sociological study of the self, emotions, deviance, and social interaction are widely recognized, his effort to provide a sociological account of voluntary risk taking—activities he classified as "action"—has not received the same attention as other parts of his scholarly corpus. While Goffman's study of action anticipated the expansion of volitional risk taking in Western societies in recent decades, his concept now competes with a newer conceptualization of risk taking—Stephen Lyng's notion of "edgework." In this paper, the action and edgework perspectives are assessed in relation to the growing uncertainties and reflexivities that characterize the era of "late modernity." It is argued that the action and edgework concepts capture two distinct levels of reflexivity, "aesthetic" and "hermeneutic" respectively, and that both forms of reflexivity co-exist in volitional risk-taking activities. By conceptualizing action as a form of aesthetic reflexivity, it is possible to view volitional risk-taking activities as reservoirs of performative, mimetic resources for dealing with the structurally-based risks and uncertainties of the late modern social world. By contrast, the edgework concept calls attention to a deeper level hermeneutic reflexivity, in which individuals are able to separate themselves from the congealed subjectiv-

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

ities of their culturally constructed bodies. Understanding volitional risk taking in terms of aesthetic and hermeneutic reflexivity allows us to fully appreciate the "heighten reflexivity" that characterizes the late modern era.

Using Arts Practice to Research Young People's Orientations to the Future

The future eludes us, in everyday life and as researchers. Yet our orientations to the future matter a great deal for how we 'assemble' the past in the present, inhabit the present, and for our modes of present-future navigation. Ann Mische calls for greater sociological attention to the 'imaginative horizons' in which the 'multiple plans and possibilities' of human action are envisaged, including 'the future images that inform social practices' (Mische, 2009: 696). Yet this is no easy task. In the project we present here, we discuss research which sought to both reveal and stimulate the future orientations of young people in verbal and non-verbal forms using arts practice. In *Imagine Sheppey* (ESRC grant no ES/K002686/1, 2013-14), a collaboration between sociologists, artists (the collective, *Tea*) and the young project participants, we sought to explore the future in a participatory, experimental, and performative way. In a series of animated arts-based workshops we created temporary installations using found or made objects and did improvised performances. We documented this process visually, material which was used to make a short video, and as the basis for elicitation in focus groups with a wider group of young people. In this presentation, we will show and discuss extracts of the project video and images used in focus group discussion. Based on the symbolic language of the performances and the interactional dimensions of the activities documented, we can offer interpretations of some of the moments and images produced, in relation to ideas of 'reach' and value for instance, but we cannot make strong claims about the young people's orientations from them alone. We critically reflect on the opportunities as well as the limitations of arts-based methods for the production of sociological understandings.

Aesthetic Upgrading of Urban Environments: The Case of Urban Sculptures in the Post-Soviet Societies

After the decade of the Soviet Union, a search for a new urban space filling began. After the "cartoon-like aesthetics" of Tseretelly, which were widespread in Moscow (Grant 2001), a boom of urban sculpture began on the post-Soviet space. These sculptures were initiated at different levels (local authorities, private firms and companies, local social movements) and were mostly used not to commemorate any historic events (such as wars, revolutions, liberation of the peoples, etc.) or real people (politicians, artists, writers, saints, and so on), but to different performative events, mythic characters and symbols connected with local places, fairy-tale characters, etc. Thus, they can be called as "non-commemorative" monuments. I hypothesize that, contrary to "traditional" monuments, such urban sculpture is aimed at creation of different interactions with audience (Jackson and Herranz 2002, 18) than worship. I will analyze the cases in Russia, Ukraine, and Belarus.

Providing a theoretical framework and a typology of such monuments (taking into account the objects depicted, the kind of aesthetics involved, as well as the actors involved in the process of their creation), I will dwell on how these new monuments are perceived by the audience, how they change the urban environment, what kinds of interactions and rituals they create. Such methods as analysis of self-made photos by the audience, ethnography observations of a number of select cases, discourse analysis (Keller 2005) of mass media, social networks, online travel guides created by users, and the collectively developed online sources will be applied. Of special interest will be to compare these kinds of urban monuments to Western European traditions.

Emotionalization of Protest: A Case of Russia

Emotionalization can be considered a key factor, though largely neglected, to understanding the protest movement in Russia in December 2011-summer 2013. The movement was initially caused by the falsification evidence of the election procedures published online after the State Duma elections in December 2011 (Oates 2013). It was emotions that can be seen as a basis of in terms of Gofman „celebrative social occasions". It can be claimed that such emotions as laughter and excitement contributed to high involvement of youth and creative class representatives (Florida 2002) in the protest movement. Protest activities could be characterized by elements of carnival culture after Bakhtin which could be seen at posters, chants, clothing, facial expressions, as well blogging following the protest demonstrations. One of success evidence of the movement was the rise of election observers' movement in Russia which is influential till now. However, emotionalization contributed not only to the success, but also to the decline of the protest movement: the key goals of the protest movement were mostly not reached, within the year and a half institutional context changed a lot. These factors, on the one hand, caused disappointment and pessimism, on the other, increased the feeling of powerlessness. The protest movements became considerably fewer in number and lost their carnivalistic character, whereas the emotional displays became less visible.

In the analysis, I will concentrate on different kinds of emotions, their transformation within the structuring social context of the protest activities. I will take into account the institutional context, public spaces, public discourses, and other factors framing the protest movement and its activities.

Ethnic Network and Labor Brokerage in the Temporary Employment System in Contemporary China

China has been witnessing the largest labor migration in history. This fact has been attracting broad academic concern, however, ethnic minority labor migrants are generally ignored in the existing studies, which leaves the special dynamics of ethnic minority migration that differ from Han laborers with little concern. This paper focuses on ethnic Yi labor migrants who migrated from Liangshan autonomous region to the Pearl River Delta area of China, and work in the temporary employment system in electronic manufactures.

It is commonly assumed that social networks, including ethnic and native-place networks, mitigates the effects exploitation of individual workers. Some other research suggests that the original social network may disguise exploitation of labor migrants. The case of ethnic Yi labor migrants shows that ethnic identity neither directly facilitates the collective rights of labors nor the exploitation by capitalist. Instead, a particular ethnic Yi intermediate brokerage system is embedded in the ethnic network, and increases the vulnerability and exploitation of temporary Yi workers.

Based on seven-months of ethnographic fieldwork in both the hometown of the ethnic Yi migrants and the receiving city, this paper illustrates three aspects of the dynamics and complexity of the formation of the Yi labor brokerage system. Firstly, the market for temporary labor opens up opportunities for Yi labor brokerage. Secondly, Yi brokers manipulate the brokerage system by utilizing the ethnic solidarity and reciprocity in their hometown, which in turn brings Yi workers in a controlled and exploitative condition. Thirdly, Yi workers paradoxically perceive the brokerage system based on their ethnic network as protection, providing them with the possibly of free mobility in the temporary labor market.

Vejez y Vivienda. Casa De Retiro Auto-Sustentable Proyecto De Investigación Interdisciplinaria Sobre Un Problema Complejo

En el proyecto de investigación interdisciplinaria de Vejez y Envejecimiento del CEIIH-UNAM, se desarrolla este sobre Vejez y vivienda: una Casa de Retiro ecológica y auto-sustentable y auto-regulada (Bertalanffy 1968). El objetivo de este trabajo es contribuir a la reflexión de la problemática de la vivienda en la vejez como un problema complejo, desde una perspectiva sistémica. Metodológicamente se trabajaron entrevistas a profundidad, una encuesta exploratoria y un estudio de la oferta de casas para adultos mayores en la ciudad de México. El documento está estructurado en cuatro partes. Inicio con un estudio realizado en México sobre la realidad de vivienda de para la vejez. Sigo con los resultados de un diagnóstico sobre lo que ofrecen las casas de retiro y los costos econòmicos. Los resultados de la investigación interdisciplinaria nos llevan a proponer el modelo de la Casa de Retiro auto-sustentable, auto-referente, auto-gestiva, y construido como un sistema complejo adaptivo y la auto-regulado (Buckley 1998), a partir del concepto de sustentabilidad de desarrollo sustentable y auto-determinado planteado por Amartya Sen (2002) y por Víctor Toledo (2004). Posteriormente se presenta el Modelo de Planeación para vivir la vejez como toda una empresa colectiva y entre amigos, la forma ecológica y sustentable para vivir con calidad de vida (salud, bienestar física, mental, emocional) en la etapa de adultos mayores produciendo sus propio alimentos y utilizando racionalmente los recursos naturales de la zona y sus propios recursos culturales, econòmicos y sociales. Finalmente se presenta la aplicación de este modelo en LaGuancha, una casa de retiro, constituida por un grupo intrdisciplinario de adultos mayores, que desean vivir en armonía, en paz y con respeto al compartir sus próximos años y en la etapa de retiro y vejez, en un lugar creado con su trabajo.

Crisis of Legitimacy: Revisiting the Years before Pinochet's Military Coup

In 1973, Pinochet's coup d'etat in Chile dramatically changed the life in this society and, during the 70's, authoritarian regimes dominated nations throughout most of Latin America. It was the response to a crisis of the existing system of domination. Throughout the 20th century, the reproduction of the system had been based on the capacity of the dominant classes to share power with the lower classes through contention strategies, but this had broken down at the end of the 60's, producing a crisis of legitimacy of this "hegemony without domination", using the expression of Chilean Social Sciences National Prize Winner, T. Moulian (2006). In what ways can comparative-historical sociology learn from this? We hold the view that, in regard to legitimacy, according to Beetham (1991:39), "social science may only appreciate its importance from the experience of situations where it is absent or under challenge".

Using experience and knowledge we have at the present, we will reanalyze the period's crisis of legitimacy, on the basis of surveys applied in 1969-1970 by the Chilean sociologist E. Hamuy. In first place, we will methodologically analyze the statistical representativeness and the validity of these surveys. Second and foremost, we will present previously unexamined sociological-statistical results of those surveys, which will allow a discussion the problems, challenges, expectations and discourses associated to the the social representations of (in)justice and the legitimacy of order. Subsequently we will explore their socioeconomic determinants. Finally, we will distinguish decisive processes from side aspects, discussing the concepts of legitimacy and crisis of legitimacy, yesterday and today.

BAROZET, EMMANUELLE (Universidad de Chile)

Social Inequalities in Chile: What Influences What Is Considered (un)Just?

Placing emphasis on perceptions and beliefs about inequality from an empirical point of view, we will present results of a research about how Chileans classify people in society, and what is their appreciation about inequalities between social classes from their vision of social justice. The research aims to establish what people consider just or unjust about the established order, in their own daily lives, beyond the pre-established discourses and at a low level of reflexivity, on the basis of a game of classifications (Mac-Clure, Barozet, 2015). We will analyze these results discussing sociological theories, the approaches and empirical studies about social justice in Latin American sociology and recent comparative surveys at an international level.

For this purpose, we analyse results of a survey statistically representative at a national level (N = 2,200), using a set of cards (vignettes) which characterize real persons in society (n = 33), each of which includes a photo of the person and data about his/her education, employment, income and place of residence. This work is framed in an international comparison, based on contributions from a European team, which has applied similar research methods in several countries of the European Union (Penissat et al., 2015). We will present the first results of the survey, discussing the role and the nature of the judgments about distributive justice and procedural justice in regard to class differences in society. Which principles of justice are used to justify what is considered just or unjust about the differences between the social classes that are perceived by individuals, will lead us to explore in first place their determinants and finally, their consequences on the legitimacy of social order.

MACALUSO, MARILENA* (Universita' degli Studi di Palermo, marilena.macaluso@unipa.it)

Moving from an Online Petition to an Informal Network of Artist-Activists: Protest and Participation in Palermo

This paper will concern with the new forms of political participation starting from the study of the case of the online petition against the public sponsorship by the local municipality (Comune di Palermo) of the exposition by Hermann Nitsch known as an exponent of Viennese Actionism. The online petition (posted on Change.org and spreading on the social networks) that in short time has almost collected 70.500 signatures can represent an interesting example of online mobilisation and above all a case of creation – as unexpected effect – of an a non-profit informal network of artists able to create new forms of solidarity, mutualism and resistance against the progressive colonization not only of politics, but also of art by the economy, profit and market. In spite of the failure of the initial aim of the petition (the cancellation of the show evaluated by the petition's promoters and signers violating the Universal Declaration of Animal Rights – Unesco 1978), more than 100 local and national artists have organized (meeting online on the social network and than creating the new website Incontemporanea.org as hub) a series of expositions and performances in Palermo. In order to encourage other painters, photographers, sculptors, dancers, street artists, creative talents and simple artisans to work together for the town and to fostering a different idea of art.

In particular, on the one hand, this article will examine the online petition as a form of bottom-up reaction to a missing top-down public engagement in the local cultural policy-making process (in a meso-perspective), and on the other hand the article will study the political, organizational and communicative features of the informal network above-mentioned, using participant observation (on and

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

offline) and in-depth interviews of artist-activists and privileged testimonies (in a micro-perspective).

MACAMO, ELISIO* (University of Basel, elisio.macamo@unibas.ch)

Attractiveness and Destruction: Polanyi and the Ambivalence of Products of Modernity

In the scholarly debates modernity is discussed as an historical era with specific structures, as an analytic category or as a project. Depending on the specific approach modernity is linked to concepts as enlightenment, capitalism and/or democracy to name just the most important ones. In everyday life a different perception of modernity is more important. The simple question is which achievements are offered by modernity. This might be ideas and ideologies but there is a wide disagreement on which ideologies are to prefer. Much more consensus could be found with regard to industrially produced goods like cars, communication devices (mobile phones, radio, TV) or weapons. However, these are linked to specific modes of production; processes of organization, know-how and infrastructure. They may be labeled as "products of modernity".

But these products are linked to basic structures of modernity which are according to Giddens industrialized production, capitalism, state structures and bureaucratic structures of surveillance and control. Whereas this modernity functions in democratic as well as in authoritarian systems it implies in any case a radical change for pre-modern structures in production and society. In this sense the so-called "Islamic State" is as modern as the USA. This radical change has been analyzed by Polanyi in his "Great Transformation" and criticized by James Scott in "Seeing like state". A theory of modernity has to meet the challenge to offer a conceptual framework that marks the communalities of modern societies and includes at the same time their diversity and captures the ambiguity of "products of modernity".

MACCULLOCH, ANGUS* (Lancaster University, a.macculloch@lancaster.ac.uk)

Leniency in Antitrust: Risk, Reward, Deterrence & Justice

Leniency policy has become a central tool in antitrust enforcement against cartels. Leniency regimes encourage cartel members to blow the whistle on cartel activity, by increasing the risk of cartel detection, by rewarding the first cartel member to blow the whistle with the reward of immunity from enforcement proceedings, be they civil or criminal in nature. Some European States have moved to criminalise cartel activity in order to increase deterrence and the risks associated with cartel activity, and therefore also increase the rewards associated with a successful leniency application. Criminal penalties apply to individual cartelists and are in addition to significant financial penalties for the companies involved. The theory that underlies the operation of antitrust leniency policies is the classic game theory analysis of the prisoners' dilemma, where the dominant strategy is confession, particularly where there is a risk that another party may also have an incentive to confess. The paper examines challenges to the classic prisoners' dilemma analysis in criminal proceedings, where concerns about the award of immunity to an equally 'guilty' party create new problems in the prosecution of the other cartelists; especially where convictions require findings on moral questions such as dishonesty. Are judges and juries more hesitant to convict or severely punish cartelists where equally culpable, or arguably more culpable, parties have escaped sanction through the operation of leniency? Is this an example of a sense of fairness or equality in criminal justice threatening the amoral calculation of game theory?

MACDONALD, ROBERT* (Dublin Institute of Technology, robertj_macdonald@hotmail.com)

Local Differences in a Global Movement: The Failure of Occupy Dame Street to Resonate with the Irish Community.

This paper examines Occupy Dame Street, the Irish manifestation of the global occupy movement, and its failure to resonate with local publics. While many ask how modern global waves of contention are constituted, little is asked of the local experience of these transnational movements. Less is asked regarding community perceptions of these emerging groups. In 2011 the Occupy movement grabbed global media attention with the rapid mobilisation of encampments around the world. Some utilised this media attention, others failed to capitalise on this source of pubic information. These encampments were interconnected but neither homogeneous nor homologous. This paper will argue that modern waves of contention are profoundly shaped by specific local socio-historical conditions. For Occupy Dame Street, for example, both Irelands political culture and mainstream media informed public perceptions of Irish Occupy activists. Occupy Dame Street

struggled to raise their profile, failing to gain greater public endorsement. The anti-institutional logic of the Irish protestors also served to widen the gap between themselves and potential audiences and collaborators from civil society. Occupy Dame Street failed to successfully connect with local political concerns and was unsuccessful in its media campaign. While modern movements may mobilise into 'transnational' waves of contention, the actions, public reception and, ultimately, success or failure of their local manifestations are shaped profoundly by specific, local socio-historical contexts.

Under the Eyes of Big Brother: Risks and Uncertainties in Using Facebook As a Plataform of Political Activism

What are the risks of Facebook use by social movements and citizens? What is the risk of political action if it occurs under surveillance? How to act face a growing predictability of a system that monitors all actions and relationships of its users? In recent years there has been a growing use of Web 2.0 for political debate, dissemination of ideas and coordination of political action. In this context, Facebook has been the most significant public space for political articulation on the internet. It has been used as a tool for the political actions and a basis for organizing protests. However, Facebook is a private and controlled space, whose business is based on collecting private information from users, profiling, mapping and analysis of social relations networks. Its data collection does not miss any information entered or chat typed by users. In addition, the platform encourages the user to add new informations and confirm others. Facebook Platform also have sophisticated tools for facial recognition and data processing. Thus the company gets a complete history of the life of every citizen as well as their interests, values and social relationships, enabling multidimensional analyzes and detailed individual profiles. In this paper, we analyze the company's history, the cooperation with PRISM, the positioning in favor of CISPA, the relationship between the US diplomacy, the Internet.org program and the use of algorithms for prioritization of content that are read by users. This paper aims to discuss and reflect on the consequences of using Facebook for political action.

Apparitions and Catholic Devotionality

Apparitions of virgins, saints, and angels have been important sources of devotion, such as pilgrimages and other forms of mobilization among Catholics since the Middle Ages. Even if this phenomenon is relatively marginal in the overall picture of global Catholicism, it occurs even today and attracts and motivates a significant number of followers (the latest now in 2010, 2015, even if not officially approved). These events have a polysemic character, social, religious, political, national, even mediumistic– allowing for religious devotions that do not have to be limited or confined to established beliefs or church canons and rituals.

Typically, the lack of scriptural or theological foundation (like the scarce presence of the Virgin in the testaments) that could be considered problematic from some perspective, it is not. It becomes an advantage and beyond the point, since the focus in many of these mobilizations is ritual performance and intense experiences rather than sharing of beliefs beyond the particular saint or virgin (i.e. beliefs concerning sacraments, particular sins etc.)

The article will explain the power of these apparitions among some groups of Catholics and the ways in which normal Catholics may and do become mobilized as well.

El Impacto Del Conflicto Armado En Los Movimientos Sociales: Una Aproximación Desde Los Estudios De La Guerra Civil.

La relación entre conflicto armado y movimientos sociales normalmente ha sido un fenómeno analizado desde la represión del Estado contra los movimientos sociales (Donatella, 1995). Sin embargo, existe una pluralidad de problemáticas que surgen a partir de esta relación, planteadas tanto desde el campo de la teoría de los movimientos sociales, y más recientemente desde los estudios de la guerra civil. De aquí, se plantean tres vías:

La primera vía se enfoca en lo que Elizabeth Wood (2003) denomina la acción colectiva insurgente. Aquí, la relación entre el conflicto armado y el movimiento social da lugar a la pregunta sobre el por qué se participa en un movimiento in-

denotes a presenting author. Abstracts are organized by first presenting author's last name.

surgente dados los altos riesgos a los cuales se exponen los participantes. (Hazen, 2009; Goodwin, 2012)

Un segundo grupo de preguntas están dirigidas hacia la generación de movimientos sociales o acciones colectivas en el marco del conflicto armado, cuestión que se ha denominado acciones colectivas de alto riesgo u acciones de resistencia frente a los actores armados. (García, 2005; Hincapié, 2004; Peñaranda, 2011)

Finalmente, una vía aún poco explorada dentro de este espectro de problemáticas en torno al conflicto armado y la movilización social, viene enfocada hacia la pregunta por las relaciones actores armados y población civil. De ahí, desde los teóricos de los estudios de la guerra civil, que plantean los intereses de los actores armados por construir órdenes sociales en medio del enfrentamiento bélico (Crowley, 1987; Mampilly, 2007; Arjona, 2010), y en cierta medida, la intervención del actor armado en la regulación de los asuntos civiles, surge la pregunta sobre su comportamiento frente a un actor social, que en muchas ocasiones puede ser determinante en la sociedad local, y se convierte en un actor igualmente estratégico para los intereses políticos y militares del actor armado, como son los movimientos sociales.

MACHURA, STEFAN* (Bangor University, s.machura@bangor.ac.uk)

Language Diversity and Social Cohesion: The Support of Police in North West Wales

North west Wales is an area of the United Kingdom where the majority speaks Welsh as first language. Welsh nationalism and speaking the language are connected in complicated ways. With Wales being granted more political powers by London and a policy to support the use of the Celtic language, tensions between English and Welsh speakers have risen. Public institutions and private businesses are bound to support the local language. The police are one of the state agencies affected but needing cooperation of members of all groups. Police cars and uniforms are marked in Welsh and jobs require knowledge of Welsh. We were interested in how language and identity politics play out for the institution. In two consecutive years, we have measured factors that could influence trust in the police, like media, personal experience, and various demographic factors, but with a special emphasis on aspects of Welsh language use and nationalism.

The first questionnaire study with undergraduate students at Bangor University showed that those students who prefer to speak Welsh in a variety of daily situations, e.g. with family, the family doctor and in shops, also had less trust in the *UK police*. This result stands even when taking into account other factors. The follow up study, addressing North Walians in various community groups, further investigates the issues but this time focuses on trust in *North Wales Police*. Preference to speak Welsh comes up as strongest factor for support of the *local* force. Tellingly, respondents expressing positive feelings for the English flag tended to distrust the local Welsh police. Trust in the police thus reflects issues of language and identity politics. Our study, however, suggests ways how an institution can actively address these issues and bridge the divide.

RC12-155.4

MACHURA, STEFAN* (Bangor University, s.machura@bangor.ac.uk)

The Prestige of German Lawyers

The prestige of lawyers forms an object of prime interest for sociologists of law. It affects lawyers' ability to interact properly with clients and authorities, including the courts. The paper deals with the prestige of German lawyers on a number of key levels:
 • In popular legal culture
 • In opinion polls
 • How they are viewed by judges and lay judges
 • Which factors influence lawyer prestige.

For the last two aspects, the paper draws on results of own empirical studies.

On balance, the TV and film portray lawyers mainly as trustworthy and competent. Judges seem to rate lawyers by their performance in interacting with the court. Opinion polls show a reasonable level of trust in lawyers. In a telephone survey by the author, slightly negative effects of court and lawyer movies have been found. Personal experience with lawyers tended to also have a small negative impact on perceived trustworthiness of judges. The paper closes with reflections on the importance of professional ethics.

The Case for Open and Collaborative Science

THE CASE FOR OPEN AND COLLABORATIVE SCIENCE

The paper stems from research currently in progress on experiences being observed in the production of knowledge within the framework of Open and Collaborative Science (OCS), and its possible impacts on development. It involves identifying, characterizing, and analyzing the main institutional, social and cultural issues involved in facing the challenges to sustainable development in the Ubatuba community in the state of São Paulo, Brazil, considering the diverse perspectives and interests of local stakeholders: a) scientific research groups from diverse fields and institutions; b) local agents potentially interested in the scientific processes and their outcomes (from civil society and government); and c) open knowledge and free digital culture advocates.

The project's main research problem is to identify and understand how these issues affect positively and/or negatively the adoption of OCS as a potential tool to face local development challenges.

By open science, we mean not only open access to information and scientific publication as well as higher porosity between scientific and nonscientific knowledge, but also open and collaborative production of science within the scientific community.

The hypothesis is that by partnering with organized civil society and adopting a view of scientific diffusion based on the open sharing of information, OCS practices could assert the social relevance of scientific production through a positive impact on public and institutional deliberation on local issues.

The project´s methodology is based on an action-research approach organized along two axes – practical learning and critical research -- which means that research tools are being developed by interacting with and receiving input from the local communities integrated with their empowerment and participation in different research phases: definition of relevant issues; data collection; and appropriation of research methods and techniques.

History of the Interdisciplinary Post-Graduate Specialization Course on Children and Youth Social Issues in Buenos Aires University Argentina

History of the Interdisciplinary Post-Graduate Specialization Course on Children and Youth Social Issues in Buenos Aires University Argentina

This course was created in the University of Buenos Aires by resolution C.S. 1646/91 within the update programes approved by resolution C.S. 1336/87. Among the foundations for its creation we evoked the need to deepen the scientific knowledge and reach a high academic training level; searching for a comprehensive understanding of the children and youth issues through interdiscipline. Its main recipients were professionals interested in specializing on planning and intervention.

The aim of this paper is to present preliminary results concerning a research proyect whose general objective is to rebuilt the history of the Specialization Course on Children and Youth Social Issues as a way to know the institutional meaning and the implications of this interdisciplinar post graduate training experience in: a) the field of the academic studies regarding childhood; b) in the area of intervention and formulation of policies destined to children and youth population in Argentina; and c) in the guiding and development of the graduates' professional careers.

MACRO, DAVID* (Utrecht University, d.a.macro@uu.nl)

From Institutions to Networks to Organizational Outcomes: The Case of Open Source Innovation

That institutions and networks shape organizational outcomes is commonly accepted, but an integrative framework is still lacking. This research investigates how institutions can shape acquired (social) resources of innovative organizations, and how institutions and resources consequently shape organizational outcomes. A general theory is outlined that focuses on institutions that restrict the communication between actors across organizations, and may consequently impact the flow of innovative information.

Opposing direct and indirect effects of institutions are expected. Private investment models of innovation on the one hand suggest that restrictive institutions protect the (private) investments of organizational members against free-riding behavior, and consequently predict that restrictive institutions yield more beneficial organizational outcomes. Network models of innovation on the other hand suggest that restrictive institutions inhibit access to potentially relevant social resources, and therefore impact organizational outcomes negatively.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Open Source Software (OSS) development communities provide an interesting case to study the aforementioned relations. In OSS development teams, software is distributed via licenses that differ in the degree to which innovative information can flow across projects. A composite dataset derived from a large repository of active Open Source Software is analyzed. This unique dataset contains organizational-level indicators of OSS project-performance, as well as indicators of social resources and licensing practices. Structural equation modeling (SEM) procedures are used to test the proposed relations, and to compare the model against alternative models.

Results confirm the expected relations. A direct effect of licenses on outcomes was found, but also a negative indirect effect: projects with more restrictive licenses showed less brokerage value and consequently performed poorer. Subsequent exploratory analyses revealed differential effects of licensing and networks at different stages in the project's life course, and for different types of projects. This suggests that both endogenous and exogenous factors can moderate the optimal degree of restrictiveness, which warrants further research.

MACRO, DAVID* (Utrecht University, d.a.macro@uu.nl)

Measuring Social Motives: The Reliability and Validity of Parametric Estimates Derived from Dictator Game Choices.

Dictator Games (DG) are generally considered the prototypical instrument to measure social motives. This study evaluates the psychometric properties of a parametric procedure that aims to efficiently derive social motives from multi-player DG choice-data. Batteries of multiplayer DGs were designed to capture motives regarding three distinct social consequences, namely the welfare of others, the inequality between self and others, and the inequality between others.

Three experiments were conducted; all measured social motives with DGs, followed-up by measures of constructs relevant for validation. Data were analyzed via Bayesian simultaneous equation procedures where motives were modeled as (latent) parameters in a multidimensional IRT-model, estimated jointly with relevant validation parameters. Reliability was assessed via population-, person-, and item-level estimates of precision. Internal validity was investigated by comparing the fit of the assumed utility model against the fit of alternative models; content validity was investigated via a two-stage procedure where DG subjects rated previously answered items on relevant characteristics; construct validity was investigated by relating motives to plausible correlates such as self-reported altruism, psychopathy, empathy, generalized trust, and risk-preference.

Results showed adequate precision in population-level estimates of motives, but exploratory analyses revealed (not surprisingly) that individual-level precision in particular was highly influenced by sample-size; this warrants further investigation on how to determine the optimal within- and between-subject samples size for a desired level of precision. Results support the internal validity of the utility model, as well as the content validity of DG-items. Modest correlations between motives and expected correlates were found, which establishes construct validity. Although these findings are promising, caution is advised in interpreting social motives as personality traits. First, the stability of social motives needs additional investigation; second, exploratory analyses suggest that both individual and situational factors mediate the expression of social motives; thus the etiology of social motives in general needs further elucidation.

MACZKA, KRZYSZTOF* (Adam Mickiewicz University, krzysztof.maczka@amu.edu.pl)

The Reception of Participation. Gaps in Existing Knowledge.

The phenomenon of social participation has been the focus of a global debate for the last 25 years. This has been enabled by the fact that public policies techniques, such as participatory budgeting, deliberative pool, now tend to move easily around the world. The existing analyses of participation often focus on the reception of participation from the point of view of initiators (local government), while only limited body of knowledge exists concerning the reception of participation from the citizens' perspective.

The main aim of this paper is to present: 1) results of a literature review on current knowledge on reception of participation from citizens' perspective which identified new existing gap, 2) research plan to provide insights on identified knowledge gaps.

Considering the literature review three hypothesis were formulated:

1. The use of participatory activities by local government does not improve the quality of decision making

2. The use of participatory activities decreases the level of trust to local governments

3. The use of participatory activities decreases the citizens sense of agency

Qualitative, comparative, multiple-case study approach will be applied in the research. The purposeful case study areas selection will be implemented. It will be based on typology of four historical regions of Poland and the administrative division of municipalities in Poland, three types of municipalities (12 municipalities in total).

The case study analysis will apply two techniques of data collection: 1) desk research of available data pertaining to a particular case in terms of participation and 2) in-depth interviews with practitioners dealing with social consultation in the area and with key stakeholders' representatives.

The results of the research may offer guidelines for local government to improve participatory activities (social consultations).

Migration in Southern Europe: The Peripheral Incorporation in Crisis

The purpose of this paper is to present the results of a comparative research conducted in Campania (Italy) and Extremadura (Spain) on migratory flows, the processes of social integration, and the policies toward immigrants. In these low-developed regions, the presence of immigrants may be understood through the concept of peripheral incorporation, or subordinate integration, coined by Avallone (2013). This means that, basically, local societies accept economic and social exchanges with immigrants to the extent that the foreign population increases their resilience to economic globalization and the policies of retrenchment in social services and welfare benefits, which in these regions seem already to be narrow and ineffective. The survey, conducted in 2014 mainly through interviews with key informants, highlighted the beginning of a crisis in this kind of social integration of immigrants, as a result of recent changes in migratory flows, in the local labor market, and in the systems of public policy.

Ageing, Identity and the Materialities of Wound Care

The study of material culture explores how inanimate objects work and how they are worked with in carrying out social functions, regulating social relations and giving symbolic meaning to human activity. Drawing on data generated in semi-structured interviews with patients exploring outcomes and impacts of undergoing treatment for leg and foot ulcers undertaken as part of a UK National Institute for Health Research funded study, this paper explores the use of footwear, bandaging and hosiery, not only in clinical functional terms, as a treatment supporting or hindering healing, but also as part of the means by which older people receiving treatment for two of the most common complex, chronic wounds, leg ulcers and foot ulcers, negotiate and understand their embodied selves in everyday life. The paper discusses some of the ways in which footwear, hosiery and bandaging play a role in controlling the boundaries between the private (wounded and potentially socially unacceptable smelly, leaky, embodied), self and the public presentation of the ageing self.

Aging Unequally in the United States: A Life-Course Study of the Health Effects of Employment Trajectories

While pension reforms have addressed financial issues associated with aging populations by extending paid work activity into late life, less attention has been devoted to the non-monetary effects of active aging policies. Using a life course approach, that is, looking at trajectories and transitions in context, this study hypothesizes that detrimental health transitions in old age arise from precarious employment trajectories. To test this hypothesis, we use 1992 to 2014 data from the Health and Retirement Study, a nationally representative, biennial panel survey of approximately 12,000 older Americans and their spouses. In order to construct employment trajectories we considered labor force statuses between age 60 and 70. Health transitions are measured with objective and subjective indicators, including mortality and changes in self-rated health, depressive symptomatology, limitations to perform activities of daily living, and chronic diseases. We used sequence analysis to make up types of employment trajectories and employed discrete time models with Heckman corrections to estimate their effect on older adults' health. Preliminary results suggest that continuous full-time employment during the adulthood improve health statuses in old-age. By contrast, part-time jobs and interrupted careers have detrimental health effects.

Impacts of Sociodemographic Factors on the Type of Regional Dialects Usage in Contemporary Japan

During the past few decades, attitude to regional dialects among Japanese is believed to have shifted toward positive, i.e. they now tend to use more regional dialects depending on situations in daily life, rather than always speaking in common language (lingua franca). Under these recent language climates, however, types of basic types of dialects usage in contemporary Japan is not well investigated and the typology is still to be scrutinized. In addition preceding studies have not fully discussed the impact of sociodemographic factors other than age, gender and geographic area on these types. In order to fill these critical gap in Japanese contemporary dialectology, we carried out a Web-based survey on an opt-in panel with a sample size of more than 10,000 Japanese individuals in 2015. Based on this survey, we will try to identify several types of regional dialects (and common language) usage in daily life, and to analyze the impact of sociodemographic factors on the membership to these types. The statistical method used is latent class analysis with or without covariates.

Preliminary analyses suggest that we can assume more number of classes than the previous studies with smaller sample size have identified, and a few sociodemographic variables, such as "living in their land of origin or not", may play a key role for describing the nature of these typology. We also discuss whether cultural capital has impact on the regional dialects usage or not.

MAESTRI, GAJA* (Durham University, ga.maestri@gmail.com)

Resistance in Times of Crisis: How Austerity Generates New Strategies and Solidarities Against Roma Residential Segregation in Rome

In Rome, several thousand Roma live either in informal settlements or in authorised camps run by the municipality of Rome. The latter are often built in the periphery of the city, and are harshly criticised for constituting a form of ethnic segregation and discrimination. Despite these criticisms, this form of residential segregation still persists. Furthermore, the recent economic recession and austerity politics are putting a strain on Roma integration policies. The increase in social tensions and unrests, the rise of populist parties and of anti-immigration (and anti-Roma) attitudes do not facilitate the inclusion of the Roma minority. What effects are these dynamics having on the marginalisation of the Roma and on the capacity of pro-Roma associations to argue for the development of new integration policies?

Drawing on in-depth interviews with members and activists of associations and movements, as well as with institutional actors, the paper investigates how the economic crisis and austerity politics affect the strategies of pro-Roma NGOs and movements that fight for Roma access to housing in Rome. More precisely, it shows how post-crisis austerity does not only create obstacles to Roma mobilisation and inclusion, but can also become a new resource for action. The paper focuses on two strategies using the crisis as a frame and base for contesting the segregation of the Roma: the first is to highlight the costs of the policies of authorised settlements and evictions, and the second is to mobilise a new form of solidarity based on the housing crisis, mainly through the squatting movement.

RC48-559.12

MAESTRI, GAJA* (Durham University, ga.maestri@gmail.com)

Unsuccessful Pro-Roma Political Mobilisation: A Relational Explanation of the Opposition to the Roma Segregation in Rome

In Italy several thousand Roma live in segregated camps set up by local municipalities. This situation is especially harsh in Rome, where from the beginning of the 1990s the local administration has created camps in which, as of today, more than 6,000 Roma live. Despite during these years several associations have repeatedly criticised these camps for constituting a form of ethnic segregation and discrimination, this policy has persisted and pro-Roma mobilisations fell short of achieving their goal of closing down these camps. Studies on the persistence of the Roma camps in Rome, as well as scholarship on imposed residential segregation, tend to focus separately either on top-down production and legitimation of segregating policies or on bottom-up forms of resistance. Yet, these two levels of analysis are rarely investigated relationally, hence failing to fully account for the reasons of unsuccessful pro-Roma mobilisations against the camps.

In order to overcome these limitations, this presentation proposes to adopt a relational perspective on mobilisation. Drawing on a series of interviews with members of pro-Roma associations and social movements, as well as with institutional actors, the paper aims to illustrate the mechanisms through which the policy of the Roma camps and the reactions of policymakers and politicians have worked as constraints to mobilisation and subsequent policy change. More precisely, the paper focuses on three main types of constraints: the ambiguous legal status of the camps, the involvement of third sector sub-contractors in the camps management, and the adoption of schemes for the political participation of camp residents to policy decision-making. I argue that adopting this relational approach fruitfully contributes to the explanation of the current failure of political mobilisations against the camps as well as to a deeper understanding of the recent strategies put in place by movements to overcome these obstacles.

The Italian Social Innovation of Consumer Purchasing Groups: An Empirical Evaluation of Its Social Impact

Social innovation has increasingly become a key concept in European Social Policy, because it is considered to be one of the most effective tools to overcome the long-term consequences of the economic crisis and of the current austerity paradigm. However, despite the numerous studies on the matter, just few scholars have focused their analysis on the effective capacity of social innovation experiences in reducing the socio-economic marginalisation of their target groups.

Stemming from a theoretical model that has as its main reference the capability approach (Sen, 1985; 1987; 1992; 1998; 1999; 2009), the 7th Framework EU project CRESSI (www.sbs.ox.ac.uk/faculty-research/research-projects/cressi) has investigated the experience of Consumer Purchasing Groups in Italy and their role in reducing the marginalization of small and micro farms in the country. It has analysed the impact of social innovation within six different life dimensions (related to nature-technology-culture-economy-security-politics). These dimensions are meant to be relevant for the construction and maintenance of 'social power' (Mann 1986, 1993, 2012a, 2912b; Heiskala, 2014). Further, the theoretical framework includes the investigation of socio-structural factors, which in economic sociology have been deemed to be 'irreducible' (Beckert, 2010) for the study of changing and innovative societies. We focus on actor networks, institutions and cognitive frames and how they interrelate with the social innovation process. The study provides new insights on consumer purchasing groups. These have so far been widely studied with reference to their capacity to empower consumers in terms of political and economical participation. Our focus on suppliers, instead, provides new evidence on the social impact that this Italian social innovation is producing.

The paper will present preliminary results, stemming from 30 semi-structured interviews with social innovators and a survey with beneficiaries in Italy (about 2000 interviews).

Crowd Is the Street: Revitalizing Affective City-Space in Baixo Centro

In 2011, some residents of São Paulo felt that the city was 'closing down' and advocating public policies they considered 'far from humane'. Many of these residents were living or socializing in Baixo Centro (BxC, "Low Center" in English) area, which encompasses five neighborhoods of the city. Due the attractiveness of its central location, the area had increasingly become a target for real estate speculation. This had brought about 'cleansing processes' that have included the eviction of drug users that under the discursive guise of "Operation Crackland" (Cracolândia). Faced with these forms of policy enforcement, Baixo Centro Festival came into being. Thus in 2012, activist residents formed gatherings to prove that that region was "alive" and not in need of the aforementioned policy-based restructuring.

Borrowing from various movements of public street occupation, this public activism organized to become BxC, or a "collaborative, horizontal, independent and auto-managed street festival conducted by an open network of producers

denotes a presenting author. Abstracts are organized by first presenting author's last name.

interested in reframing that region of São Paulo downtown area, around the Minhocão viaduct mostly known as "Big Worm" (Baixo Centro 2014). Initially, BxC actualized as more than 100 cultural activities during one week funded by on-line crowdsourcing campaigns. Since then the movement has splintered into two additional annual events as well as numerous other independent interventions throughout the year. Many of the participants have become part of other forms of collective action with numerous overlapping causes, such as popular housing as cultural heritage to public gardens. These collectives are emergent; they overlap, collaborate, oppose, and criticize each other while simultaneously reconnecting. Through creative imitation (Tarde 1903) across time and space, they continuously develop countervailing actions that have the potential to renegotiate the affective disposition and reappropriation of city-space. This paper presents early findings of the on-going research on this renegotiation process.

Policies and Practices of Housing Energy Retrofit in Northern Italian Cities

The paper focuses on policies and practices of energy retrofit in the city of Bozen, in Northern Italy. Among Italian cities Bozen is characterized by a special sensitivity to environmental issues and by the search for a urban development limiting the environmental impact of the capital city on the Alpine surroundings. In particular, in order to promote the energy upgrading of existing private buildings in the capital city three main types of policy tools have been adopted by the province and by the municipality. These include regulatory instruments, centered around the role played by energy certification, which in the city is compulsory for any important retrofit intervention and is undertaken by a nationally renowned provincial agency. In addition, volumetric incentives aimed at stimulating the construction sector and bounded to the achievement of certified high energy standards have been adopted. Finally the municipality is also taking part in EU co-funded projects addressing the retrofit of both private and public buildings. In spite of this variety of policy tools, in the city the number of renovated buildings is very low. A social practices approach can help to understand this shortcoming. On this basis in my contribution the socio-technical process of energy retrofit implemented in some cases of multi-apartment buildings will be analysed. The aim is to uncover the role that social practices and dynamics have in mediating effects of policy tools and in conditioning their efficacy.

Transformation of Citizenship? Direct Participation within Urban Planning Projects

New and direct forms of citizen participation are being tested in urban planning projects. Within these processes the participants expect to be more involved, which leads to a concept of citizenship with a higher focus on political co-determination and proximity to political decision makers. Additionally, urban planning projects involve discussions around the reshaping of public spaces which are increasingly proving to be culturally sought after and of central importance for the common good of democratically organized communities. Informal forms of citizen participation in large urban planning projects represent a focal point of various normative perceptions of participation, democracy and urban life.

In my paper I will discuss the initial results from an ongoing research project which focuses on the expectations of citizens who are involved in these forms of participation. In this process the differing yet typical citizen understandings and perceptions of democratic decision-making will be applied. The reconstruction of these concepts of citizenship is interview-based. By comparing projects in Germany and Switzerland it will be possible to find out how the influence of institutional requirements can be weighted when attempting to answer the question according to specific normative patterns. Their comparison will facilitate the reconstruction of differences in the traditional interpretations of democracy and freedom in the context of the growth in importance of cities, their rapid development and the search for new patterns of adequate problem-solving.

Fluctuations and Paradoxes in Family Policy in Post-Revolutionary Iran

The Iranian post-Revolutionary Constitution values family as the main and 'holy' social institution which builds the fundamental unit and cornerstone of the society. Successive governments have claimed to arrange their efforts in line with this vital principle of the Iranian Islamic welfare system. However, various prag-matic drivers (including socio-cultural changes in family and gender roles) have caused fluctuations and paradoxes to occur within the family policy of the country. Adopting a socio-historical perspective, the present paper addresses these fluctuations and paradoxes which includes inter alia: the paradox between activating head of household women and promoting the care giver role of women; the paradox between promoting male breadwinner model of family (and welfare) and the increasing entry of women into the labor force; the paradox between family planning and birth control due to pragmatic problems and ideological principles which promote fertility; The challenge of encouraging young people for early marriage while social changes (such as constant increase in the age of first marriage and childbirth, high and rising unemployment, more tolerant attitudes toward premarital relationship, and increase in single person households) occur in the opposite direction.

Coopérer Sur Les Activités Support à La Création Artistique Du Spectacle Vivant Pour Réduire L'incertitude Des Parcours Et Des Organisations : Le Cas De Metalunet

Pour P.-M. Menger, les solutions que des créateurs se donnent pour réduire l'incertitude de leur parcours reposent notamment sur la coopération dans la réalisation d'activités indispensables à leurs créations individuelles et collectives. Il est alors question de « collectifs », de « lieux » ou autres « espaces », créés par des artistes pour mutualiser des activités de production, réalisation, diffusion, surtout pour mettre en commun des ressources et solutionner ensemble la question de la viabilité économique de leurs créations. Ces modes d'association devaient surtout leur permettre de répondre à la commande publique qui les conduisait à élargir leurs activités de création à de la co production, et, de plus en plus, de la médiation culturelle, voire de la formation. Les questions soulevées à ce sujet, en France, au début des années 2000, notamment autour du rapport Lextrait, demeurent.

Mais, les créateurs sont désormais face à un nouveau contexte économique et politique : le financement public pour la culture se réduit, à commencer par celui de la création artistique, et ils doivent trouver de nouvelles voies de valorisation économique.

Ma recherche explore ces expériences. Elle porte, notamment, sur un collectif du spectacle vivant et des arts de la rue, implanté depuis plus de 20 ans à Lille, France : Metalu. L'expérience consiste en la création, au sein de ce collectif, mais sans se substituer à lui, d'une coopérative, Metalunet, permettant à plusieurs d'entre eux de mutualiser certaines de leurs activités, de valoriser des systèmes d'exploitation en open source mis au point pour réaliser leurs installations artistiques, d'en faire la base de propositions pour accompagner d'autres projets artistiques, des parcours pédagogiques pour des artistes en formation ou même des jeunes dans leurs parcours scolaires.

Il s'agira alors de mieux comprendre ces parcours de créateurs, artistes singuliers et coopérateurs.

Production Networks and Varieties of Institutional Change: Earnings Inequality in Post-Socialism Revisited.

During this talk, we synthesize three common themes in the post-socialist development literature—Globalization, Privatization and Europeanization—to motivate a reexamination of earnings inequality during post-socialist transition. First, we argue the integration of transition countries into globalized production networks (GPNs) increases inequality independently of foreign direct investment (FDI). Second we argue that EU integration hastened the transition away from Soviet era labor market practices among acceding transition countries, and that this should exacerbate the impacts of private markets and world-economic integration on inequality. We then present the resutls of an analyses of earnings inequality among 18 transition countries from 1990 to 2009, which suggest that both globalization and privatization increase inequality, but have stronger effects in EU member transition countries. Using a counterfactual analysis, we also show that, holding observed levels of private market expansion and world economic integration constant, inequality would have increased less dramatically in the absence of EU integration.

Social Innovation, Social Alternatives and the Public Intervention: What Do We Really Need to Improve the Future of Water Access in Emerging Contexts?

Water and sanitation services (WSS) represent a critical sector in the existing capital system. They conceive a basic human need, which each one of modern Social Democracies should grant to their population. On the other hand, especially in emerging and developing countries, WSS are unequally distributed and often commercialized according to market logics, being not universalized. International governmental institutions (ex. IDB, WB) stress the importance of socio-technical innovation for WSS. Notwithstanding, at the local level, in different national contexts, traditional or communitarian models are able to provide water access, even if precarious, to those social groups which are not provided by the public service. Innovation is a fundamental condition of capitalistic system existence and growth, being at the base of competitiveness that drives the liberal market. Though, existing bottom up practices, which also work for free, and are external to market logics, can represent a good alternative to costly large infrastructures. The following paper aims to confront the complex issue of water access, while focusing on a specific emerging context, the town of *Queimados* in the Rio de Janeiro Metropolitan Region (Brazil). The study presents and discusses partial results of a three years long research project, funded by the European Union Seventh Framework Programme, named DESAFIO. The Queimados case was shaped as a qualitative study and drew upon the content analysis of semi-structured interviews and field-notes collected during a one-year long field research. While defending the potential of informal and communitarian solutions to water access, the study also show the limits and risks related to these precarious systems when the governments are absents. It concludes problematizing the role of this solution as a real alternative to the pubic intervention when the goal is the WSS democratization.

MAINO, CLAUDIO* (Universite de Paris 5 (Descartes), claudiomaino@gmail.com)

Towards a History of Depression and the Neoliberal Man

After the return to democracy a WHO study revealed that the prevalence of depression among primary care patients in Chile, was the second highest in the world. This led to several epidemiological evaluations and they showed that this disease ranked second among the top 15 Disability-Adjusted Life Year (DALY) among women, accounts for over 70% of sick leaves and located Chile, between OECD countries, as the second region with the highest increase in its suicide rate, surpassed only by South Korea. This data contrasts with the unquestionable success in the implementation of the neoliberal model, where it appears that Chile has the highest GDP per capita in South America with $18,419, being registered as one of the top ten economies in the liberalized world according to the "Heritage Foundation". How is that being the material and economic development best than ever, Chileans declare themselves as less happy, commit more suicide and are more depressed? I propose here, from a comparative perspective, some notes of the social history of depression in Chile in the light of what was known as the laboratory of the neoliberal model that differs from what Kitanaka, Ehrenberg and others have exposed about Japan, Europe and the United States with regard to this disease. The relationship between pathological expressions and economic transformation of a country like Chile, can bring up a truth contrast about this crossroads in northern countries, particularly in Europe.

Working Family Carers in Austria: Tensions Between Institutional Frameworks and Lifeworld Realities

As in Europe in general, about 80% of care for the elderly or for people with disabilities in Austria are provided by unpaid informal family carers. Almost every second of them is in employment; a pattern that is following an upward trend. However, the Austrian long-term care (LTC) regime is still predominately relying on a model based on a not employed female carer and a male breadwinner. The main public care provision, the long-term care benefit, introduced in 1993, builds explicitly on the availability of unpaid or cheap family carers. Regulations put in place in the following decades also encouraged family carers to give up employment in order to provide care. The implementation of a short paid leave and a part-time model for family carers in 2014 is a first attempt to address the combination of paid work and family care, but the (expected) impact is limited.

Meanwhile, demographic trends, changes in family structures, geographic mobility and the increasing female labour market participation (including a longer stay of women in the labour market due to pension reforms) challenge the informal care potential. Hence, this situation leads to mismatches and increasing tensions between the Austrian LTC regime and the actual needs and resources of a growing number of employed family carers.

Against this background, the submitted contribution aims to present findings of an ongoing research project that investigates how employed family carers are trying to bridge the gap between the existing care regime framework and the everyday requirements of care provision. The transdisciplinary project links policy analyses with qualitative empirical case studies of selected care constellations. While focusing on the example of the Austrian case, it addresses a challenge many welfare states are currently facing.

MAKINEN, JUHA* (National Defence University of Finland, juha.makinen@mil.fi)

Revolution in Educational Affairs at the Finnish National Defence University?

In this paper the formative intervention conducted since 2000 at the Finnish National Defence University (FNDU) will be reflected on. In other words, this period covers the FNDU's application of the principles crystallised in the European Bologna Process. Consequently, in the triple-hermeneutic inquiry process, prevalent basic cultural assumptions, paradoxes and problems were identified, but even more interestingly, for the aims of the paper, a few key educational questions were put forward for the future.

Every soldier is expected to be a leader and a manager of violence, as well as being a teacher and an educator. It follows that every teacher and manager at the FNDU has deal with key educational questions. Such educational questions resemble sticking points for the actors involved in continuously reproducing and potentially revolutionising the social systems, for example of the FNDU, in the continuity of praxis.

Changing Roles of Women in Social Movements – a Case Study of Bolivian Water War and Gas War

Why did women not play an important role on the Water War in Bolivia? There had been no successful movements in Bolivia until the New Economic Policy was issued in 1985 because Bolivian government had effectively repressed protests on natural resources. However, Water War (2000), anti-privatization movement of public water sector, drastically changed this situation. Water War further provided a momentum for marginalized people such as women, indigenous people, and farmers to participate in protests, and women came to play significant roles in the Gas War (2000), opposition movement of the export plan of natural gas, which took place right after Water War. Both protests gained successful outcomes.

However, in spite of similar situations, both protests show different role of women; although Water War was successful and mobilized numerous citizens, the role of women were unmarked, while their significant presence was spotlighted in Gas War. Previous researches have pointed out that vigorous activities of women in Gas War was due to the fact that Bolivian women started to participate in political activities from the 1990s. But why was women's role prominent in Gas War alone? This paper, in this regard, explains why women could not play an important role in Water War in spite of the similar situation to Gas War.

This paper hypothesizes that the internal reform of the movement organization in Gas War promoted women's participation. Leading groups of Gas War made an effort to empower women leaders in the groups according to the Popular Participation Law (1994). I reveal the process of changing policies of movement organization of Gas War by using fieldwork data obtained from 2009 to 2014. By discourse analysis of the statement of organization, I verify how they focus on the women and why women's leader in Water War could not appear.

Government As an Active Target: Multi-Agent Simulation of the Water War in Cochabamba, Bolivia

How crucial were the Bolivian government's strategic decisions for the success of the "Water War," a movement against privatization of public water sector in Cochabamba? Given its historical significance as "the first successful movement in Bolivia," scholars have tried to identify the reasons of the success.

A weakness of the literature is that a disproportionate amount of attention has been paid to the movement organization's strategies while the government's strategies have not been analyzed systematically. This paper argues that the government should be treated as an "active target" and

a central strategic player because the government's strategies would affect the movement's decisions and trajectories. It has been difficult to conduct such a relational analysis of movement-government interaction because, first, the information about the government's decision making is often lacking, second and more importantly, it is problematic to demonstrate the probable effect of the strategic choices *unused in reality*.

This paper attempts to overcome the difficulty by implementing a counterfactual analysis of strategic interaction between the movement and the government using the Multi-Agent Simulation (MAS), a computational technique to experiment social interaction.

There are two players in my model, the Bolivian government and the movement organization. Depending on the agents' strategic preferences and their decision sequences, the movement either increase or decrease in power. This study first reproduces virtually the actual interactive processes of the Water War based on the data from my fieldwork from 2009 from 2014 including interviews, newspapers, statements of movement organizations, and official governmental documents. Then, it runs counterfactual models by changing the government's strategic preferences and choices to find out if the outcome of the movement changes.

This paper contributes to the literature by giving the targets a more central place and treating the government as an active target in shaping the fate of social movements.

Treatment for Democracy? the Case of Social Clinics in Greece

Together with the severe measures imposed due to the economic crisis, anti-austerity movements arose in many South European countries, and especially in Greece. As the crisis was deepening, wages and pensions were falling sharply, collective labor agreements were removed, the privatization of public services was figuring as the only alternative and the official unemployment rates have been reaching more than 25%. Going a step beyond from their traditional repertoire of actions, social movements in Greece took an active role by trying to substitute specific services which until recently were provided from the welfare state. Social cooperatives, collective kitchens and markets without middlemen are just few examples of solidarity structures that can be seen as products of the broader anti-austerity campaign. One of the most salient cases is the one of social clinics. Started from a solidarians' and doctors' initiative in 2011, social clinics have spread all over Greece providing health care services to uninsured citizens and migrants under the framework of direct democracy and social solidarity. As part of my PhD thesis, this paper aims to analyze how the development of social clinics is connected with the transformation of Greek movements' repertoire of action and organizational structure towards a more hands-on approach during the times of crisis. In particular, through fieldwork research in the coming spring in Athens and Thessaloniki, and especially by applying qualitative, semi-structured interviews and document analysis in a number of social clinics, this paper will try to explore the organization of social clinics and the way they operate, focusing on their nodal role in the network of social solidarity and anti-austerity campaign.

MALDONADO, KARINA* (Humboldt University of Berlin, kary_mmariscal@hotmail.com)

Innovations in Education. the Role of Innovations in Education and Society in São Paulo, Brazil

The main objectives of this paper are to analyze the emergence of Innovation in Education in the center and a periphery area of São Paulo to reckon the elements that may characterize an Innovation in Education and identify the main actors involved in the process.

With the purpose to provide a better comprehension of the sociological and educational phenomenon of innovations in contemporary societies since innovation has been mainly denoted with technological changes (Rey and Tancredi, 2010; Zapf, 1991, 1989; Schumpeter, 1949); but also, to recognize the gaps in the system of education that innovators try to attend.

The theoretical framework is based on the concepts of Innovation as: new forms of organization (Mumford 2002; Zapf, 1989; Kesselring and Leitner, 2008; Huberman, 1973); better solutions for problems (Cels, Nauta, Jong, 2012; Neumeier, 2012; Howaldt and Schwarz, 2010; Hochgerner, 2009); improved ways of social relations (Moulaert, 2005; Mumford 2002); and change in the distribution of local power (Hämäläinen, Heiskala 2007; Moulaert et. al. 2005; Vera, 2010).

Methodology consist on a qualitative two-case-study conducted through 22 semi-structured in-depth interviews to managers and coordinators of an NGO, to administrators and teachers of a primary school, as well as the Regional Ministry of Education.

Initiatives on innovation in Education in São Paulo mainly respond to state omissions; and the case studies shows that whereas innovations among the NGO construct their major social capital among governmental agencies, schools inno-

vations do it through community. Initiatives on innovation have differentiated nature, even though most of them are oriented to innovate in their context, they pursue in a less amount deeper changes.

The significance of this paper contributes to explore innovations not only as a sociological phenomenon, but also as an educational one, what also demands innovative methods in the study of these social initiatives and its motivations.

MALICK, MIRA* (Waseda University, lequin@ruri.waseda.jp)

Good Craft, Bad Craft: Music, Leisure and Labour in Japan

In Japan, crafting a finely tuned skill in a leisure activity through practice, repetition and continuous improvement has long been associated with positive qualities such as responsibility, diligence and creativity. Individuals who display excellence in such pursuits were thought to be able to apply these qualities to other endeavors and areas of life. How one *leisured*, in this sense, said much about how one approached life. Such people made desirable students, spouses and in several industries, workers.

The post-war 'economic miracle' saw the birth of a plethora of new markets and consumer items. This economic prosperity enabled many families to afford new leisure possibilities and to provide leisure opportunities for their children, such as sports, new as well as traditional forms of arts and crafts and of course, music lessons. This paper examines what happens when economic affluence and taking a craft seriously, the otherwise positive indicators for the accumulation and maintenance of cultural capital, combine to produce socially an 'undesirable' result: the rock musician.

Through the analysis of narratives of what it means to choose to prosume subculturally categorized (or relegated) genres of rock music as labour or as a form of serious leisure, I will attempt to highlight some of the contradictions and points of contention over the role of leisure in contemporary Japan.

Access to Civil Amenities of Dalits in Eastern Uttar Pradesh: The Poverty Question or Social Exclusion

The fundamental concern of poverty studies is lack of resources or capabilities to participate fully in a society. Sociologists believe that poverty statistics are meaningful social indicators of basic needs. Their interests in poverty studies center around the ideas of the 'culture' of poverty and the effects of 'place' on poverty. Role of culture, power, social structure, and other factors largely out of control of the individual are the main forces which sociologists use to explain poverty. The basic working hypothesis is that individuals are strongly influenced by the physical and cultural context in which they live. Mostly the physical and cultural settings start with the housing and civil amenities surrounding it. Poor housing is of 'deprivations in human development such as average number of rooms; average number of habitable rooms; and average number of people occupying a room'. Consequently, 'housing or shelter is one of the essential prerequisites for human development. Access to safe drinking water, toilet and electricity are the three main household amenities that closely influence human productivity, performance, efficiency and the overall quality of life, and are closely associated with health outcomes'. That's why the need to provide adequate, suitable and equitable housing has remained a major priority of every government and is one of the effective means to alleviate poverty too.

Based on empirical data the paper discusses the housing condition, access to safe drinking water, toilet facilities and sources of energy in Dalit households in eastern Uttar Pradesh. It also highlights the crowding of living spaces by cross-tabulating the size of households by the availability of rooms in every house. Further it is explained that how access to housing and household amenities as the indicators of poverty and social exclusion.

MALIK, BIBHUTI* (Department of Sociology, Babasaheb Bhimrao Ambedkar University, Lucknow, Uttar Pradesh, bbmalik57@gmail.com)

Poverty, Lean Period of Food Availability and Scarcity: A Case of Dalits of Eastern Uttar Pradesh, India

Dalits in India have a history of suffering, deprivation and destitution which prevails even in the modern, democratic and globalized world despite several efforts by the government through its policies and programmes. The issue of Dalits and their caste based exclusion is widely debated. Mostly it is viewed from structural *vis a vis* functional and dialectical perspectives. Here it is amenable that, the structural reality around which other substantive form of deprivation; educational backwardness; economic disadvantage and political negligence are forth with. For

them basic facilities such as housing, drinking water, food availability, education, and health services are inaccessible; reflecting the intensity of their deprivation and magnitude of poverty. Food is the prime concern for human being for active and healthy life. A human or any living being can live without luxury, but cannot survive without food. Hunger is man's first and most tenacious enemy, can dived communities into fed, and unfed rich and poor. A society or nation, just cannot flourish without food security.

With this backdrop the argument in this paper is of three fold: (i) The level of food availability, lean period and the question of food security of Dalits, (ii) the provisions of government for providing food security and other safeguards to fulfill the minimum level of subsistence (iii) the operational successiveness of these programmes.

Socio- Legal Analysis of Status for Child Marriages in India

Her tiny feet move towards the untold dark road, she looks back to hold on to her father's hand, but it slips away like the sand. To her realization, her father had written her name with the same hand amidst the dark and thundering clouds.

These lines put forth the agony of a little girl's heart when her own father gives her away at a tender age. 'Child marriage' a word which is contradictory in many ways. How is it possible to imagine marriage for a child? Marriage is a sacred relation with responsibilities that many adults also fail sometimes to handle, how is it possible for her tiny shoulder to carry a responsibility that will become like a collar around her neck? How is it possible for her mind and body to understand the demands and sacrifice a marriage asks for?A UNICEF report suggests that child marriage is the most common way of sexual abuse and exploitation of girls.

This paper aims to understand the driving force behind this social evil, even in the 21st century, the factors that are responsible for the rise of child marriages in India. It aims to understand the ambiguity of Indian laws and argues for making child marriage as void marriages. Indian law needs to change its outlook and should consider child marriage as a heinous crime. The Prohibition of Child Marriage Act, 2006 needs to declare all child marriages as null and void. Child marriages must be seen as violation of human body, mind and violation of life overall. The law cannot limit its voice to marriages done by force, threat, kidnapping and should also consider the fact that a child is being ripped away from her innocence and her fundamental rights such as life, liberty, right to live with dignity and equality.

Eugen Ehrlich's Notion about Justice and Concepts of Justice in Brazil and Ukraine

Eugen Ehrlich (1862-1922) conceived the idea of justice in aspects of social statics and social dynamics. According to social static, every right is just an expression of the facts of the existing law. For social dynamics, otherwise, the legal precept not only keeps the existing, but also constitutes society instrument to regulate relations in the associations according to their interests. The great driving forces of this dynamic are the individualism and the community idea. Judicial decisions and interventions by the authorities have the responsibility to change or eliminate the facts of existing law and thus to move society in a certain direction. For the individualism every man/woman is an end in himself/herself. The individualism's ideal of justice focuses on the individual and his/her property. The community idea has as a starting point the immense internal contradiction of the individualism, because the individualism has some of the greatest inequalities, especially in relation to goods, despite the effort to treat people with equality. According to Ehrlich the social idea of justice did not eliminate the individualism's ideal of justice, but materialized it. What are the conceptions of justice that inform judicial decisions in Brazil and Ukraine? What kind of idea of justice do we have in Brazil and Ukraine? Is the individualism or the community idea prevailing? Do these conceptions of justice change the quality of justice in context of complexity and diversity of modern societies? Does the collectivized litigation reinforce the ideal of justice of the individualism or of the community idea? The paper is based on review of literature, documents and data from the perspectives of two very different countries, Brazil and Ukraine, and is also cooperation between Curitiba and Chernivtsi, the home of Ehrlich.

Applied Knowledge Model Systems As Actor-Networks

The concept of 'Knowledge Model Systems' is developed as an extension of ANT (Actor–Network Theory) directed specifically towards applied knowledge contexts. The obduracy of systems (natural and human) is subject to a transformation into active network nodes interacting equivalently to human actor sites through demand and response input output. Methodology: Comparative analysis between shipbuilding knowledge models under traditional shipwrighting for sail and emergent modern naval architecture of the nineteenth century. No other case reflects as well the difference between indigenous and modern knowledge systems, and the potential impact of modern research techniques. Testing: Irrigation systems as in Middle East *quanat* systems, Iberian medieval structures under alternative Muslim to Christian dominance, and water control bureaucracy in Imperial Rome, act as test systems for the extended concept. *Network resilience* under insult, measured by *network connectivity* provides a quality assessment standard. Only in this way will it be possible to comprehensively scrutinise the potential effects of planed changes impacting systems both modern and traditional.

MALLICK, SAMBIT* (Indian Institute of Technology Guwahati, sambit@iitg.ernet.in)

Weakening Powerloom Industry and Allied Technology Factors: A Sociological Study of Siminoi Powerloom Cluster in Odisha

Debates on science and technology (S&T) in independent India have largely taken place around changes in S&T policy, the role of the State in distinguishable phases ranging from the strong promotion of S&T, pursuit of self-reliance and the dominant role of the state sector under the Nehruvian State to the ongoing phase of State withdrawal, attenuated emphases on self-reliance and indigenous research, and heightened influence of foreign governments and multinational corporations on public policy including in S&T. This analysis has considerable validity in organized industry and is the main current of scientific research in institutions and universities. However, there has been continuity rather than change in the broad area of livelihoods and habitat of rural and petty producers such as agricultural labour, artisans and other off-farm workers and the self-employed in manufacturing, construction or related sectors, and perhaps including the peasantry as well. This huge and persistent systemic chasm in the S&T ecosystem in India has, along with other structural biases and institutional failings, contributed to the now chronic deprivation of these sections, steep decline in the economic weight of their occupations and activities, their disconnect from the development mainstream, and a loss of hope in the future. The powerloom sector in Odisha located in the eastern region of India is no exception to such distress. The purpose of the study is not to reflect upon the demarcation problem (demarcation between two conflicting knowledge systems), but to find out the impediments contributing to the plight of powerloom sector in textile industry in Odisha. In-depth personal interviews with various stakeholders ranging from powerloom weavers, middlemen, cooperative societies, management to government officials indicate how the political construal of authority and expertise leads to a lack of democratic participation in the policymaking processes of this particular industry.

Social Reproduction and the Transnational Migration Strategies of Immigrant Families in Canada

Based on empirical data from a SSHRC funded research project[1], this paper examines the migration experience of highly educated Chinese and Indian immigrant women to Canada who were professionals in their home country. In particular, the paper investigates how these immigrant women utilized transnational migration strategies to accomplish the work of social reproduction. It argues that

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the work of social reproduction is a gendered process, mediated by institutional policies and practices, as well as the individual woman's agency. It demonstrates that within a household, gender ideology influences the work of social reproduction and the transnational strategies deployed to accomplish this task.

Immigrant families have been utilizing transnational practices to maintain family relationships, and to accomplish social reproduction, not only in contemporary society, and also in historical periods. For example, between 1886 and 1947, many poor Chinese men worked as indentured laborers in Canada, while their wives and children remained in China due to racialized Canadian immigration policy which barred them from entering the country. As a result, separate spheres of production and reproduction evolved in these families.

In the context of the current climate of globalization and neoliberalism, some immigrant families experience unemployment and underemployment, and downward mobility. The difficulties in procuring affordable childcare services and in juggling the contradictory demands of paid work, household work have prompted some immigrant families to resolve to transnational strategies to accomplish the work of social reproduction, such as sending children back to their home country to be cared for by family members.

[i] The data for this paper is derived from a project entitled "Transnational Migration Trajectories of Immigrant Women Professionals in Canada: Strategies of Work and Family", supported by a SSHRC research grant to Guida Man as Principal Investigator, and Tania Das Gupta, Kiran Mirchandani, and Roxana Ng as Co-investigators.

Factors Associated with Choice of Home, Public or Private Sector Delivery in Eastern Nepal

Background and Objectives: Safe delivery location is an important factor to reduce the maternal mortality. As there are several barriers for women to deliver in a health facility, the reasons for choosing a place for childbirth have to be elicited. This study assessed the factors that are associated with the choice of delivery location from a client's perspective in Eastern Nepal.

Materials and Methods: A community based comparative cross-sectional study was conducted among 420 ever- married females between ages of 15 to 49 years. Data were abstracted from the most recent delivery from 140 mothers in each wing using a validated questionnaire. Anderson's Behavior Model for health service utilization was the conceptual framework used. Multinomial logistic regression was conducted to determine the association of predisposing, enabling and need factors for use of home, public or private sector delivery.

Results: Out of the total 420 women, prior planning (73.6%) and prior arrangements (83.6%) to delivery location was seen the most in Public sector delivery. The odds for delivering in a public facility was higher (OR 4.5, 95% CI 1.97-10.43) than home delivery in terms of prior arrangements to delivery. Women with birth order 2 or less were more likely to deliver in private institution (OR 9.040, 95% CI 2.293- 35.634) and with the literacy of the spouse (OR 6.709, 95% CI 1.808- 24.892) compared to public. Decision making for site made by the husband alone had higher odds in delivering in public (OR 17.17, 95% CI 5.604-52.603) compared to the respondent herself and other members of the family.

Conclusion: Literacy, parity, prior arrangements and decision making are factors that play an important role in choice of safe delivery site. Attention to these aspects is therefore needed.

Complexity and the Viable System Model: A Proposal

Stafford Beer intended with the viable system model to create a model of human organization that could be applied to any known institution. His intuition was that social systems tended towards the maintaining of their identity and organization in light of a changing environment; that is, their viability. This model is comprised of five interacting subsystems; systems 1, 2 and 3 are concerned with the day to day operations- the "here and now"- while systems 3, 4 and 5 are in charge of policy- the "there and then" that helps to secure viability on a long term.

Two striking features of this model are the fact that it can be used on both private and public organizations and the fact that it is recursive, as viable systems contain others of its kind that can be modeled using an isomorphic description, i.e. another viable system model. However, there are shortcomings on the original model, such as the lack of elaboration of what constitutes an environment; also, the perception of variety seems too unified, it does not take into account subjectivity from the subsystems.

Many of these aspects were corrected by Espejo, a close collaborator of Beer; he adds complexity management to the model and improves it a great deal, however, he changes the core model and makes it more rigid. For this paper I will review existing literature on the model and I will retake Beer's original model and adding some of Espejo's improvements, I will further adapt VSM by adding: a) network theory and dominant coalition theory to both the relevant environment and the composition of the VSM, b) subjectivity in the perception of variety and c)organizational states in the perception of variety (homeostasis as low variety, dynamic equilibrium as changing varietal states and hypercomplexity as untenable variety).

MANCINI, LETIZIA* (University of Milan - Italy, letizia.mancini@unimi.it)

MGF Entre Derecho y Sociedad

La intervención examina la cuestión de las MGF desde un punto de vista sociológico-jurídico. Sin embargo, la sociología del derecho sugiere que es necesario ir más allá de la letra de la ley, investigando los significados detrás de las prácticas que seguidas a nivel social aunque contrarias a la ley; y también analizando no sólo las funciones manifiestas de las leyes, sino también latentes (Merton). No hay duda que las intervenciones sobre los genitales femeninos reconducibles a las mutilaciones según la clasificación de l'OMS, desarrollen funciones esenciales por la vida de las mujeres; son rituales (van Gennap) que marcan la transición de la niñez a la adultez, identificando el proceso de diferenciación de género. Las MGF tienen importantes implicaciones en la vida social y emocional de las mujeres y esto es obviamente uno de los nodos más importantes en la lucha por su abolición. Sin embargo sería profundamente erróneo suponer que las MGF como hábitos arraigados, no pueden ser modificados, incluso ser abandonados. Muchas investigaciones han enseñado el papel fundamental de las mujeres en la conservación, como en el abandono, de esas prácticas. Esto es fundamental para identificar las estrategias más eficaces para erradicarlas. La legislación italiana, que en el 2006 ha previsto el crimen específico, es un ejemplo eficaz para pensar en términos más generales acerca de la efectividad y los riesgos del recurso al derecho penal en la lucha contra las MGF. En diez años en Italia ha sido registrado sólo un juicio, concluido con la absolución. No hay evidencia empírica que la explícita previsión de este crimen produzca efectos disuasivos. El caso italiano enseña como sea más fácil golpear 'simbólicamente' culturas otras, dando vida a un recorrido reservado a las inmigradas y a su cuerpo, antes que prever instrumentos de tutela efectiva y eficaz de las mujeres.

MANCINI, LETIZIA* (University of Milan - Italy, letizia.mancini@unimi.it)

Si El Rom Es Gitano, Nómada y Extranjero. Percepción Social, Discriminación y El Papel Del Derecho

'Extranjero' no es sólo alguien que no es ciudadano legalmente, si no también quien se percibe como diferente a nivel social.

La percepción social no sólo tiene un impacto en las relaciones entre personas, si no tambien puede influir en la política pública y producir importantes efectos en términos de reconocimiento y disfrute de los derechos. Teniendo en cuenta este supuesto, la intervención examina, en una perspectiva sociológica, un caso particular, lo de la gente de etnia *rom*, a menudo ciudadanos de los Estados en que ellos residen, pero siempre percibidos como extranjeros.

Gitano (zíngaro, zigano, gipsy), nombres inventados por gente que no es *rom*; *nómada*, un estilo de vida residual; *extranjero*, aunque a menudo sean ciudadanos: estos términos se producen no sólo en los discursos públicos, sino también en discursos políticos y en documentos legales, favoreciendo, en muchos países europeos, políticas de discriminación, segregación y exclusión de las personas *rom* que se encuentran en condiciones de marginación social y económica.

Mirando al contexto europeo y aportando ejemplos significativos, voy a reflexionar sobre el papel que juega o puede jugar el derecho: fomentar estereotipos sobre los *rom*, y, por lo contrario, ser instrumento de defensa y promoción de los derechos de los más débiles.

New Communication Technologies, Virtuality and Deterritorialised Public Spheres : How Delocalisation Affects National Identities. a Review of the Methodological Nationalism through an Analysis of the Global Political Participation

"New communication technologies, virtuality and *deterritorialised* public spheres : how *delocalisation* affects national identities. A review of the methodological nationalism through an analysis of the global political participation".

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In a global context where socio-political structures are increasingly transnationalised, the national perspective seems more and more inadequate. From Max Weber to Jürgen Habermas, concepts such as identity, citizenship and their deep relationship to nation-state and national territory remained close to a sort of inflexible "iron wire cage", unable to clearly qualify multiple identifications related to symbolic socio-political and cultural links supported by virtuality. Virtuality as a concept is therefore used here to define a body of moral, political, cultural and economic ties supported by values, feelings, emotions and individual interests, and enhancing distant socio-political and cultural actions within a transnational social space, which will give a sort of visibility to a global political participation. Considered from a social and cultural construction of space's perspective, *virtuality* and propounded *deterritorialised* public spheres challenge the methodological nationalism approach of identity and public sphere.

However, if it is clear that methodological nationalism has largely influenced research on citizenship and political participation as proven by the parallels between nationalist theorists and their conceptualisation of citizenship and identity, a shift towards *virtuality* or *virtual public spheres* should be *new objects* of observation as they not only consider the importance of new communication technologies and their impact to the perception of space and time, but also, allow the association of the "inside" and "outside" as well as a bridge where there existed "dichotomy" and "exclusive" analysis of political participation.

The aim of our proposal will therefore consist in demonstrating how far, and concretely how, is a conceptual and methodological upgrade necessary. Its starting point will be a previous empirical study we realised a few years ago (2006-2010).

MANKKI, LAURA* (University of Jyvaskyla, laura.a.mankki@jyu.fi)

Paradoxes of Feminization of Labor Migration in Finland and Italy: An Intersectional Reading

This article focuses on migrant women involvement in the host country labor market, with a focus on the service sector. The research draws from 20 biographical interviews with Estonian and Albanian migrant women respectively in Finland and Italy. The article intersects with migration studies, gender studies and employment relations literature.

The aim of the paper is to understand how labor market segmentation is reproduced and how migrant's gender; ethnicity and age become the factor to keep/find the job and consequently help restructure and deregulate the labour market. Moreover we ask how the feminisation of labor migration, triggered by the economic crises, neoliberalism and austerity policies, affects the service sector and the working migrant women in two different labor market, migration and gender equality regimes such as Finland and Italy.

Migrant women do experience forms of equality and empowerment through work. However, especially in times of crises, they are one of the most vulnerable groups to suffer austerity measures and worsening of working conditions. In our study we find that working migrant women struggle between emancipation through work and exploitation through segmentation. Their migration stories tell us that the empowering experiences of entering the labour force overlaps with the precarious working conditions they find themselves such as discrimination and exploitation by working in low paid jobs and often in the underground economy.

We argue that through intersectional lens; using intersectionality as an analytical and methodological tool we are able to follow the paths that govern these migrants' lives in the labour market. Even though migrant experiences enables us to understand the motives, opportunities and contrains of their migration and labor market involvement we conclude that there are power structures and institutional level practices that needs to be read more often with an intersectional approach.

No Escape from Ideology? Comparing Imaginaries of Global Development in the Former Soviet Periphery

This paper aims at further extending and refining perspectives that are critical of the teleological and constructed nature of ideas about development, transformation and globalization, as well as the outcomes that such ideas have produced throughout history. We venture to inquire how people in the former Soviet periphery make sense of the transformation they have undergone since the breakdown of socialism. Drawing on sociological and socio-psychological perspectives on postsocialist societies, we discuss and use the concept of the 'imaginary West'. The latter has fundamentally shaped the way in which people came to understand postsocialist reforms, democratization and integration into the global econ-

omy. By drawing on fieldwork data from Bulgaria and Kyrgyzstan we will show how the 'imaginary West' is a frame of reference through which people identify with Western liberal values, or, on the other hand, adhere to 'non-Western' values, which are seen to appreciate tradition and cultural heritage. Both Bulgaria and Kyrgyzstan lie in the periphery of the EU and the former Soviet Union, respectively, with Bulgaria at the crossroads between allegiance to its old brethren and the newly embraced path of European integration. The empirical picture we draw suggests that people's ideological and moral orientation is inevitably embedded in the discourses of the old, imperial 'centres' and perpetuates the binary of 'Western vs. non-Western' values. Furthermore, these orientations also seem to adopt and reproduce orientalist stereotypes and colonial thinking. We also, however, identify further individual positionings that cannot be fitted into this ideological binary. These seem to provide a way forward as they envisage independence and emancipation vis-a-vis external economic conditionality, political hegemonies and Western epistemic dominance. We conclude, however, that it is questionable whether these positionings develop enough momentum to be framed as viable alternatives to bipolar geopolitical and capitalist-developmental ideological mappings of the world.

MANOLOVA, POLINA* (University of Birmingham, pxm264@bham.ac.uk)

'I Didn't Expect It to be so Hard'. Expectations and Realities of Life in the West.

The increasing popularity of the UK as one of the most preferred migration destinations amongst Bulgarians is in contrast to the hostility with which migrants are met in British society and the precarious working and living conditions they often experience. This paper aims to explain the paradox of popularity despite hostility and the contrast between expectations and reality by exploring the role of the Western imaginary as providing continuous motivation for people's migration projects. It is suggested that Bulgarian migrations to England are informed by an imaginary of the West, which can be seen as a part of a modern social imaginary process in which more and more people are convinced that life *there* will be better than *here*. The appropriation and application of different aspects of this imaginary are carried out in accordance to individual subjectivities and the different capitals at one's disposal. By following a group of Bulgarian migrants on their way to the UK, this paper aims to account for the often experienced gap between such an idealized imaginary and the actual experiences of life in the West, as migrants struggle with various hurdles and precarity in their new lives abroad. As the realization that it is hard to 'make it' there settles in, people are caught in a constant process of redefining and reconsidering their migration projects in accordance to their changing circumstances. Return home, even when desired, is often not a viable option as migrants fear the insecurity of life in Bulgaria and the loss of social prestige which is often part of 'unsuccessful migrations'. Thus in a process of constant re-examination and re-negotiation of migration plans, the West does not lose its pre-invested meaning and is thus uncritically reproduced in the practice of migration.

Professionalisation of Russian Preschool Educators: Changes and Perspectives

The main aim of this paper is to present a discussion of a recent research on professionalisation of early educators undertook in three large Russian cities in 2013-2014. First, we interviewed experts: heads of public and private preschool educational institutions and trade unions leaders. Second, we studied the views and attitudes of rank-and-file early educators in a quantitative questionnaire survey of 779 respondents. The research indicated that the social standing of early educators started to decline in the 1990s. This negative tendency continues to this day. Early educators are attributed a relatively low and inconsistent status and a low authority. The situation was quite different in the Soviet period when preschool educators actually monopolised the function of education and upbringing, sometimes displacing the family. It was the time when preschool educators were considered to be a part of the intelligentsia distributing the central values of the society. Their knowledge-base was scientifically grounded, ideologically covered and sanctioned by the state. To date the state tries to stimulate early educators' professionalism through the imposed changes in the knowledge-base of the profession The recent state reforms are now likely to have the most critical influence on the professionalisation of preschool teachers, as the role of professional associations is confined to trade-union matters. The state may improve the remuneration of preschool teachers and establish higher standards for preschool education. The Professional standards developed by the Ministry of Education and Science may revise the accreditation process introducing higher educational

and personal requirements for applicants. Fine-tuning of the overall knowledge base of early childhood educators may help to raise the level of professionalism and facilitate changes within the education field. In order to professionalise from within early educators should understand and accept the responsibility to become politically aware and to act as advocates for themselves.

The Governance of Multi-Ethnic Neighborhoods Characterized By High Social Conflict: The Case of the Piave Street's Area in Mestre (Venice, Italy)

The paper is based on a research work lasted three years that focused on some Italian neighborhoods adjacent to the railway stations and therefore more affected by an increased presence and visibility of immigrants and socially excluded people in public spaces and by phenomena of urban conflict. In particular it will be here analyzed the case of the "Piave neighborhood" in Mestre, belonging to the Venice municipality.

First, some contextual data on the Piave neighborhood and on the elements of conflict between different social groups will be reported. These conflicts have caused the establishment of "citizens' committees" that involve autochthonous residents and shops owners protesting against what they perceive as the degradation of their neighborhood.

Second, the intervention that the municipality of Venice has promoted in the Piave neighborhood to address these conflicts will be analyzed. This is an interesting and innovative intervention in the Italian context, in which the municipality, through its own service of street educators and community leaders, has promoted the activation of a group of neighborhood residents who work in collaboration with municipal social workers to increase social cohesion and intercultural dialogue and to improve the image of the neighborhood. Both the strengths and weaknesses of this intervention will be highlighted.

Rural India in the Digital Age

The rapid spread of information and communications technologies (ICT) is changing the way economic and social development occurs in most countries. New ICT-related tools are making institutions and markets more productive; enhance skills and learning; improve governance at all levels and make these easier for the poor to access services and make their voices heard. Since Independence, the government in India has implemented several rural development programmes. But they have not made any remarkable improvement in the living conditions of people. It can be mainly because the impact of ICT in rural areas is very limited, despite its penetration into every corner of modern life. ICT infrastructure is more profitable and therefore easier to develop in urban areas, thus, further broadening the gap between the urban and the rural access to ICT. India is a country of multiple divides as social and economic divides already exists in the country and now with the emergence of new ICTs new divisions are shaped on the basis of many factors involved in its use and access.

This paper discuss about the ways of use of different ICTs by the rural people. Also it presents their preference to the ICTs on the basis of their use and user friendly nature of ICT. The question is attempted in a comparative perspective with reference to two villages of different social and demographic composition, located at equal distance from the district headquarters at the Gurgaon city of Gurgaon Development Block in Gurgaon district of the State of Haryana in India.

Imputaci"N De Datos De Ingresos EN Encuestas a Hogares. La Experiencia De La Encuesta Anual De Hogares (EAH) De La Dirección General De Estadistica Y Censos De La Ciudad De Buenos Aires De Argentina

Entre los principales objetivos de la Encuesta Anual de Hogares de la Ciudad de Buenos Aires (Argentina) se encuentra la estimación del ingreso personal y del ingreso de los hogares con el propósito principal de medir indicadores de las condiciones de vida de los hogares de la Ciudad de Buenos Aires, como la insuficiencia de ingresos para acceder a una canasta de bienes y servicios básicos y la distribución del ingreso.

La incompletitud de la base de datos por falta de respuesta es un problema que afecta a todo tipo de relevamiento y de acuerdo a su magnitud y estructura

puede incidir en los resultados de los indicadores a medir. En la EAH se identifican los dos tipos habituales de no respuesta: total o global, cuando los hogares no responden la encuesta en su totalidad y no respuesta parcial o al ítem, cuando la falta información es en alguna variable, por ejemplo los ingresos individuales de los miembros del hogar.

Para la no respuesta parcial de ingresos se procedió a imputar la información faltante a los efectos de evitar sesgos en las estimaciones de los indicadores, utilizando para ello procedimientos de imputación de datos faltantes basados exclusivamente en información relevada por la propia encuesta.

Se probaron varios métodos de imputación y finalmente se optó por imputar los ingresos a nivel de fuente de ingreso, seleccionando donantes con el método hot-deck jerárquico, dentro de clases de imputación construidas utilizando árboles de regresión y regresiones categóricas.

El objetivo de este artículo es presentar los métodos de imputación alternativos evaluados en la experiencia de la EAH 2014 y, la calidad de las estimaciones obtenidas en los indicadores de insuficiencia de ingresos y distribución del ingreso obtenida con cada una de ellas y los motivos por los cuales se adoptó el método finalmente utilizado.

Sport, Health and Subjective Wellbeing in Cross-National Comparison

Do regular exercising and a physically active lifestyle contribute to subjective wellbeing? Previous research suggests that regular participation in sport does not only provide immediate pleasure to athletes and everyday sportspersons but also translates into better health and a lasting sense of wellbeing. In this presentation I am challenging the universality of this and similar claims by examining the significance of sport participation to health and happiness in a cross-culturally comparative perspective. My analysis is drawing on data from the International Social Survey Program 2007 (34 countries and almost 50,000 respondents) which featured a particular module with questions on sports and leisure. In a first step I will present the cross-national spread of the impact of sport participation on health and wellbeing, and in a second step I will control for the effect of socio-demographic and socio-economic factors in selected countries. I will also ask the data if a particular form of sport participation affects overall happiness and if that pattern is constant throughout the sample.

The Fab Labs in Italy: New Local Collective Goods for Development

The Fab Labs are small workshops, open to the public, that offer tools and services for digital manufacturing, thus promoting social and economic innovation. For these reasons they can be considered "local collective goods": they are created as part of the sharing economy and they are able to generate external economies, tangible and intangible, useful for development.

The rapid proliferation of FabLabs occurred in recent years all over the world (564), should be placed in this context. They function with mechanisms typical of the "sharing economy": they provide a space with machineries that would not be available to individual users and small enterprises, and have two main goals: a) education, that is the diffusion of the digital fabrication culture; b) development, that is the promotion of innovation and entrepreneurialism. They operate connecting local resources to global networks and markets.

The objective of the article, therefore, is to explore the Fab Labs, with particular reference to the Italian situation. Italy is, indeed, a particularly interesting case, because while the official indicators describe the economy as not very innovative, it shows a surprising development of the Fab Labs. The purpose of this article, therefore, is to explore the Fab Lab from this perspective, having two objectives. The first is descriptive: we intend to reconstruct the geography and the characteristics of these workshops in Italy. We want to understand where, when and how they were born, and also what they do and what kind of links they have with local economies. The second goal is more explanatory: we intend to provide some hypotheses on the reasons behind their particular proliferation in the Italian context.

Predicting Juvenile Delinquency in Austria: A Test of Different Theoretical Approaches

   *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Criminal acts committed by youths remain a contested issue in most Europe. This paper sheds empirical light on the situation in Austria based on data from the third round of the International Self-Report Delinquency Survey (ISRD3) which includes a random sample of students from grade 7 to 9. In this contribution multivariate analysis predicting juvenile delinquency in Austria are shown. Hereby we include key risk factors related to domains such as personality, family, school, peers and leisure time activities. By this means, an assessment of the relative predictive strength of theoretical concepts such as self-control, morality, social control, social learning, and routine activities is given. Conclusions will be drawn with view to possible domains for prevention.

Paths to Social Justice in South Africa – a Critical Examination.

Social justice as a concept and an ideal has been a subject of intense debate and analysis which culminated in some wider consensus on what social justice entails i.e. equality of rights (social, political, cultural and economic rights) whereby all members of the society enjoy equitable access to resources and opportunities in order to live fulfilling lives. Within the South African context, the anti-apartheid and liberation movement pioneered the struggle for social justice in a society that was racially divided and marked by socio-economic and political inequalities that took race-class form. The end of apartheid thus witnessed new efforts by the state, through both policy and legislation, to bring redress to these historical racially-defined injustices and inequalities. While these efforts brought some visible progressive changes towards redress, they however also had unintended consequences. They led to new forms of inequalities compounded by a syndrome best described as the impact of the past on the present attributed largely to apartheid legacies. This was met with new forms of resistance and mobilisation for social justice led by civil society-based social movements. This paper examines the effectiveness of these divergent efforts at bringing social justice by the state on the one hand, and civil society-based social movements, on the other.

Youth Theory in South Africa – an Indigenous African Perspective

While there is a general lack of development of social theory within African scholarship, which tends to rely heavily on borrowing and creative adaptation of theories developed from elsewhere, and notably from the Western scholarly discourses; this does not however suggest the absence of theory within indigenous African knowledge systems. This paper shall demonstrate, and in similar tradition as previous efforts by few African scholars such as Mbiti (1969), Akiwowo (1986), Gyekye (1987), that there are rich theoretical and conceptual insights within the indigenous African culture-based proverbs, poetry, folk lore and legends. It would be observed that youth theory in South Africa's indigenous African communities lies within the indigenous African cultural practices and linguistic expressions, and especially proverbs and idiomatic expressions. The paper provides an analytical discussion of such proverbs and idioms in order to decipher their rich theoretical content and insights on young persons and their role and significance as an important social category within African communities of South Africa. It would extend this further by also citing examples from the unique past and present political experiences in South Africa which attest to the continued relevance of these theories.

An Un/Prepared Workplace? Rethinking the Social Relations of Work in Culturally and Racially Diverse Workplaces in Australia

The integration of highly skilled migrants into the Australian workforce continues to be perceived (from a government perspective) as largely unproblematic – for the migrant or the employing agency. Yet interestingly, current analyses of skilled migrant experiences are deficit-driven and preoccupied with issues such as English language competency, transferability of overseas education and labour force integration. In this paper we report findings from our study on how skilled black African migrants in Australia forge social and professional identities within their transnational, cross- cultural existences, which suggest a more complex contradiction: places of work that are not prepared for the black skilled African

migrant's contribution, knowledge and experience or for their colour. The findings not only revealed workplaces constituted as hostile to skilled black African migrants but one which also makes ineffective use of their skills and knowledge (obtained overseas), thus negating the economic investment in their initial recruitment. We argue therefore, that current analyses and theorisations of skilled migration deal with the migrant in abstraction, neglecting interrogations of the part that social relations of work play in the skilled migrants' transition to work. Drawing on findings from our study, we propose that what needs to be theorised ontologically and epistemologically for culturally and racially diverse organisations, are the effects of everyday incivilities, everyday racism and ignorance of the effects of race and ethnicity on those who are othered, on all of the social relations of work in these organisations. In the end, the nuanced analyses presented in this paper are significant for informing a much-needed shift in focus; from migrant-focussed orientation and adaptation programs to workplace–focussed assessment and analyses. Such a focus will maximise workplace preparation for the inclusion of highly skilled migrants and the achievement of optimum productivity and skills utilisation from highly skilled migrant workers.

MARAMBIO-TAPIA, ALEJANDRO* (University of Manchester, alejandro.marambio-tapia@manchester.ac.uk)

Living in Debt: Households Narratives in the Chilean Credit Retail-Led Expansion

This paper tries to address how Chilean households are dealing with the retail-led "democratisation" of credit that the neoliberal Chilean society has experienced from 15 years ago. Credit is seen here as a bundle of practices (banking credit cards, store cards, small loans, consumer credit, student loans, borrowing clubs, deferred payment shopping), and tied to other practices related, as household budgeting. These practices are set in everyday lives of households, rather than in consumption "fever" or in another accounts based on the idea of a sovereign consumer, or consumption as self-identity tool. The value of a practices perspective is investigate how practices can portray individual and household's different knowledge, skills, meanings, valuation, and eventually agency, when they manage their domestic finances by using credit and deal with debt issues.

Credit expansion has had a broader impact in how socio-economic relationships have been negotiated and assessed in Chilean society. From this data emerge moral beliefs about when and how to use credit; survivor narratives to and thanks to credit; diverse perceptions about how society works and how the collective and the individual must be understood in society; personal and familiar narratives of social mobility with a changing and unprecedented view of poverty and middle class aspirations; a process of re-shaping of the subjective experience and social assessment of economic inequalities; accounts of opposed rationalities between debtors and lenders, and between credit users and financial education providers; and an ambivalent moral assessment about credit itself.

This paper relies on data collected in 2015 from 40 in-depth interviews with Chilean head of households from lower and lower-middle income groups, and also in statistical analysis which allows to deploy overall trends regarding debt, credit and microfinances. I pay special attention to the "post-industrial working class" and "micro-entrepreneurs", the last groups entering the credit expansion.

Negotiating the Role of Heirloom Rice in Food Security: Narratives of the Contested Views of the Ifugaos in the Philippines

The Philippine Ifugao communities, for many years, were admired for its sustainable agricultural practices. Its Rice Terraces was declared by UNESCO as a World Heritage Site in 1996. However, in 2001 it was put under the World Heritage Committee's danger list because of its degraded conditions caused by various factors including exploitation of natural resources and abandonment of rice terraces. Rehabilitation efforts have been done by various sectors to restore its condition as well as address the food requirements of a growing population in Ifugao. Concepcion, Samar and Collado (2010) noted that the increasing demand for food security has created scenario that even the World Heritage Site like the Ifugao Rice Terraces are explored to support the food security programs of the country. They further added that these shifts in the use of the Ifugao Rice Terraces encouraged farmers to abandon traditional rice farming practices and shift to modern farming, which consequently results to degradation of the Ifugao Rice Terraces. This paper critically examines the contested views of the Ifugaos on the role of traditional rice or heirloom rice in food security. It tries to surface how programs run by the government and non-government organizations (NGOs) addressing food security and rural poverty affects the indigenous knowledge and culture of the Ifugaos that is believed to revolve around or are deeply anchored on rice farming. Views and reflections of the Ifugaos and other stakeholders were analyzed using thematic analysis. Programs on food security and other poverty alleviation pro-

grams were documented and analyzed. Results of this study will provide a critical understanding of how to negotiate the contested views of the Ifugaos and provide the various sectors including the government and NGOs knowledge on how to critically analyze past and existing food security programs.

MARCHANT, ALEXANDRE* (Université Paris X Nanterre, alexandre.marchant@free.fr)

The "Mandala" Psychonautist Experience in Paris in the 1960s-1970s.

In the 1960s, the LSD was the new trendy psychoactive drug spreading in the Western world, presented as an exceptional mean to reach the depth of the mind and an upper level of reality. The most famous advocators were the US writers Timothy Leary or Ken Kesey. But they have inspired also other experiences abroad. This paper will focus on the sensory experience promoted by a collective of artists named Mandala, set in Paris in 1967. Founded by French poets and writers like Jean-François Bizot, Gérard Rutten or Alain Dister, who used to participate also in some cultural manifestations at the Paris Museum of Modern Arts or the American cultural center, the collective published some books like *Le Dossier LSD* (1967, 1974), valorizing the use of hallucinogens, following in that way the elitist tradition of the "artificial paradises" inherited from former authors like Charles Baudelaire or Henri Michaux. The group will be dissolved in the second part of the 1970s but has incarnated for a while the spirit of the French psychedelic movement.

The paper will present the project of these authors and the way they advocated the use of LSD, referring themselves to the US poets of the beatnik and counter-cultural movements. But it will also, from a semiotic point of view, analyze what were the signs, visual forms or synesthetic sensations associated with these promoted mind-altering experiences, related in the various texts published by Mandala. It will finally, based on that example, in a historical perspective, think about the link between drugs, sensory experiences and Western modern popular culture.

Factorial Surveys in Social Psychology: The Role of Ideological Issues in Friendship

Our report is based on the survey experiments conducted in 2015-2016 in one of the leading universities in Ukraine, Taras Shevchenko National University of Kyiv. Our motivation is to understand the place of ideological issues within fundamental social relations, usually driven by non-ideological mechanisms, during the period of rapid social changes in Ukraine. Theoretical background of the report lies in social capital perspective revised by Ted Mouw (Mouw, 2006) and theory of rational choice (Peter Blau). We have included both prescribed and acquired characteristics in the vignette dimensions, namely gender, age, region, language, attitude to Euromaidan, attitude to studies at the university and spending free time. Preliminary results of our pilot study showed the importance of factor of attitude to Euromaidan in building friendship, as well as the relationship between the attitude to Euromaidan and a language of communication of a potential friend. We will focus on wider results of our survey and their consequences for the society.

C189: A Tool for States or for Paid Domestic Workers? Examples from Ecuador and India

On 16 June 2011, amidst the clapping and singing of dozens of domestic workers gathering in Geneva from all over the world, the ILO has passed the Convention n. 189 concerning Decent Work for Domestic Workers. This is a truly historical step for the legal and social protection of this labour sector at the international level. The C189 is the most evident sign of the fact that today paid domestic work is considered a policy issue by several global actors, from both the institutional and the non-governamental side. UN-Women, OIM, GFMD, FRA can be numbered amongst the first, whilst the International Domestic Workers Federation (IDWF) launched in 2009 is in the latter. In the words of ILO representatives, the involvement of IDWF has been fundamental to foster States' positive involvment on this issue. Since 2011, already 16 States have signed the Convention and they are going to adjust their labour laws accordingly.

However, when one gets closer to the local level, the relationship between social movements, States and international organizations is not that clear cut. The

example of Ecuador and India will show two opposite ways in which States and grassroots organizations have reciprocally positioned themselves around this issue. The international campaign for C189 will be seen as a tool that has been differently be taken up by institutional and non-institutional actors to pursue the own political agendas, and their strategies of alliance/separation from other relevant actors. For both country cases, the presentation will be based on material from ethnographic fieldwork (in Quito and New Delhi) and on the analysis of policy documents from different local and international stakeholders. This study is part of a larger project currently in-progress.

" but I Cannot Touch Her" : Relational Loss and the Use of Technology in South African Emigrant Families

Much of the migration literature focuses on the experiences of and challenges to emigrants and their families, but, by comparison, little attention has been paid to the psychological effects of emigration on family and friends left behind.

However, emigration is never an individual event with its impact far-reaching, affecting more than the emigrating individual or family. Transnational perspectives acknowledge that family relations extend across time and distance recognizing the experiences of those left behind.

In this paper I will use the South African phenomenon of emigration as a context within which to explore migration and its impact on family life especially on the elderly left behind. Historically, the country has been characterized by migration trends often linked to specific political events. More recently we are seeing a so-called "brain-drain" with many leaving because of political and economic uncertainty, and growing levels of crime and violence.

Consequently many older people find themselves with reduced family support with children living very far from them. They may experience emotional ambivalence regarding their children's departure as well as deep feelings of loss. The possibility of future visits may often be thwarted by distance and financial constraints, since many South African emigrants choose distant destination countries that are difficult and expensive to reach. This may be experienced as a further obstacle to maintaining long-term connections. Furthermore, the burden of care of elderly parents may rest on remaining family members adding strain to family relationships.

Recent research on migration is examining the multiple ways in which families negotiate the physical absence of loved ones and maintain relationships through the use technology. In this paper I will focus on how the use technology is experienced by ageing South Africans affected by emigration and whether this type of interaction is sufficient to maintain meaningful and supportive family relationships

TRAJBER, RACHEL (CEMADEN - Brazilian Early Warning and Monitoring Center for Natural Disasters)

People-Centered Early Warning System: Barriers, Bridges and Windows of Opportunity

Most literature criticizes the usual view of Early Warning System (EWS) as a linear model with a top-down approach whose technological aspects receive more attention than human aspects. It is argued that EWS should be used for risk prevention, promotion of resilience and vulnerability reduction, rather than be triggered only when hazards appears. In the paper we observe barriers and bridges to promote people-centered early warning system in Brazil. First, we point out the socioeconomic, scientific and political barriers involved in this process. Second, we analyze some bridges to reduce them, based on some experiences of networking through an educational project on Disaster Risk Reduction and Early Warning System. Then, we stated some experiences to promote a risk prevention network, involving diverse social actors through empowering principles, such as the 'youth educates youth' and 'one generation learns from another'. In these experiences, we identified some lessons to institutional reflexivity of Brazilian Early Warning and Monitoring Center for Natural Disasters (CEMADEN), São Paulo State University (UNESP) and Ministry of Education. Policymakers need to reduce the gap between federal and local government to find ways to translate words into action, adjusting EWS for multiple audiences and contexts. A heterogeneous blend of knowledge and practice reveals some windows of opportunity to deal with multiple vulnerabilities and uncertaintity.

MARCU, OANA* (Universita Cattolica del Sacro Cuore, oana.marcu@unicatt.it)

Whose Voice Is Critical? Research with Roma, Between Discourses of Tradition and Everyday Feminist Struggles

Romanian Roma women often talk about the rules of behaviour appropriate for men and for women as cultural aspects, specific to their own ethnic group. For adults as for youth, being Roma means thinking and acting according to profound differences between men and women, the latter being in a disadvantaged position in the family and community hierarchy.

In order to ensure that norms are respected or to punish those who transgress them, there are systems of control: shame, gossip, reputation, prestige in the bridal market or the community trials. Parents and other family members teach, monitor and sometimes punish girls, prescribing precise limits to their freedom and acceptable social paths for them. The prestige of the entire community and of the family depends on the respect of these norms, reified as "tradition".

While conducting ethnography in the intersectionality framework and with the PAR approach, I felt divided between the imperative of respecting and reflecting participants' points of view and criticizing some of the mechanisms that perpetuate gender inequality, from my own standpoint. How could a researcher conduct feminist research when participants did not seem to want gender arrangements to be questioned?

In order to solve this conflict, I started by distinguishing between everyday, enacted criticism that Roma women inavertedly made of gender norms and the official discourse regarding culture and ethnicity, emphasising gender and ethnic difference. Differentiating between the accounts of the younger and those of the elder, between those of women and of men also helped in building a more complex image of gender dynamics. With the participated research phase, in which young people explored affective relationships by interviewing their peers, their point of view emerged more clearly, and it was possible to tackle, in group discussions, their experience of the conflicts between tradition and new lifestyles.

MARDER, NANCY* (Chicago-Kent College of Law, nmarder@kentlaw.edu)

In Their Own Words: Women Judges' Reflections on Gender and Judging

In the United States, the number of women who are judges still lags far behind the number of men who are judges, but women judges are reflecting, speaking, and writing about gender and judging in growing numbers. Women judges, whether they are state or federal court judges, and whether they sit on trial courts, appellate courts, or even the U.S. Supreme Court, are no longer reticent about drawing attention to themselves or to their views on gender. They no longer feel that they must keep a low profile and just blend in with their male colleagues. Instead, they are giving speeches, participating in televised panel discussions, and writing law review articles and books, in which they examine the implications of gender and judging, including whether women judges reach different results, run their courtrooms in different ways, and carry out leadership roles differently than their male colleagues. Women judges are expressing their views in sufficient numbers that there are a diversity of views and no single "woman judge's" perspective prevails.

This paper examines women judges' reflections on judging and gender by looking to their own words, as they appear in writing and speeches. The paper identifies their points of agreement and disagreement--from Supreme Court Justice Sonia Sotomayor's view that "a wise Latina woman with the richness of her experiences would more often than not reach a better conclusion than a white male who hasn't lived that life" to retired Supreme Court Justice O'Connor's view that "a wise old woman and wise old man will reach the same conclusion» in deciding cases. Now that women judges are assuming leadership roles as chief judges in growing numbers, this paper also explores their views on gender, judging, and leadership, as they have explained them in interviews and writing.

MAREE, CLAIRE* (University of Melbourne, cmaree@unimelb.edu.au)

'i'm a Girl': Impact Captioning, Identities and Language Ideologies in Audiovisual Media

The use of text-on-screen is ubiquitous in Japanese television. Like subtitles, impact-captions occur simultaneously with the speech-on-screen. However, unlike intralingual subtitles such as closed captions that provide textual information in substitution for audio information for hearing-impaired viewers, impact-captions represent arbitrarily selected utterances added to a broadcast package in the post-production process. This paper employs a critical multimodal approach to analyse the act of writing text onto the screen. I examine both textual and visual

imagery projected onto the screen, and consider the ways in which contemporary media is 'employed to perpetuate or challenge prevailing sociocultural beliefs, stereotypes and norms' (Djonov & Zhao 2014: 2). Observations from fieldwork conducted in editing studios is combined with a micro-analysis of commercial television broadcasts 2014-2015 to illustrate how the visualisation and textualisation of selected spoken dialogue relies heavily on normative tropes. Through the use of font types, colour, animation, graphics and symbols, an interpretation of the speech is layered onto the visual image. Text and graphics are manipulated to frame personalities as belonging to distinctive identity categories: for example as feminine or masculine, queer or straight, Japanese or non-Japanese-ness. Inscription of text-on-screen is governed by directorial intent to shape how viewers understand, negotiate and engage with language in the context of digital media (Gerow, 2010: 121; Park, 2009: 550, 556-557). Writing text-onto-the-screen, therefore, emerges as a critical site whereby identity and language ideologies (Irvine and Gal 2000, Kroskrity 2000, Silverstein 1979, Woolard and Schieffelin 1994) are inscribed visually through the social act of writing (Sebba, 2007). Through entextualisation, discourse is extracted from the context in which it originated and re-formed into texts which can be circulated (Park & Bucholtz, 2009; 486) the identities they index consumed as contemporary cultural artifacts.

MAREE, CLAIRE* (University of Melbourne, cmaree@unimelb.edu.au)

Debuting into the Scene: Women Narrating Queer Time and Space

The mid-nineties also saw writers and activists use the phrase *gyōkai debyū* in Japanese queer community magazines. *Gyōkai* literal means 'industry' and is used to refer to the 'scene'. *Debyū* originates in the English 'to debut' and refers to the first time one goes to a lesbian/gay/queer event as a self-identified lesbian woman, gay man and bisexual woman/man. Used in articles, *manga* and personal histories in the emerging 1990s lesbian and bisexual women's press, *gyōkai debyū* and its abbreviated form *debyū* (debut) is a key term in lesbian negotiation of coercive heterosexism in the Japanese context. While "gyōkai debyū" refers to entering the queer community as a self-identified queer, publications in Japanese also contain sections that reflect on instances of "coming out" to friends and families. Through an analysis of *manga* and coming out stories published 1990-201, I argue that although 'debut' narratives and 'coming out' narratives recount very different experiences, they are both stories of moving into 'unknown time'. In the case of 'debuting', the unknown is narrated as being already that which is familiar. In the case of 'coming out', the narrating and sharing) of unknown time allows for a recovery of the familiar. These moments are linked to memories that jar significantly with normative lifetime trajectories, while at the same time, the telling of these memories as "unknown time" enables the narrators to be reformed into the normative discourses of family time.

Healthcare in the Society of the Internet: A Multi-Site Case Study of the Introduction of M-Health Technologies for HIV Care

Social theorists recognise that the introduction of the computer and Internet technologies as new media of communication will bring about fundamental changes within the societal structure and culture. Within the healthcare domain, a new branch of sociological research is investigating the various ways in which digital technologies are employed and how they affect experiences (of health and illness), practices (of self-care and treatment) and structures (of care provision).

Contributing to this field of research, this study investigates the development and implementation of a mobile health (mHealth) platform to enable self-management of HIV in patients in five clinical sites across the European Union. The platform will provide users with web based and mobile device applications which interface securely with relevant medical data and facilitate remote access to key healthcare providers. In the first study phase, presented here, twenty group discussions and twenty individual interviews with patients and clinicians are carried out 1) to explore their experiences, competences and perspectives regarding mHealth technologies, 2) to assess the potential of the mHealth platform for HIV self-management and treatment, and 3) to investigate the concerns and challenges that will affect the implementation and adoption of the mHealth platform across the five clinical sites.

By an in-depth analysis of the empirical data gathered and informed by theories of society (Niklas Luhmann and Dirk Baecker), this presentation attempts to trace transformations of healthcare, triggered by the introduction of Internet technologies, in relation to social roles (e.g. expectations of, or towards clinicians and patients), interactions (e.g. ir/relevance of face-to-face consultations), organizations (e.g. re-spatialsation and re-temporalisation of care), and the boundaries between societal subsystems (e.g. ambiguous jurisdictions between the highly

regulated medical domain and the less regulated technology sector and market economy).

The Importance of Parental Happiness for Understanding Low Fertility

Understanding how having children influences parents' subjective well-being ("happiness") has great potential to explain fertility behavior. This is especially important in low fertility societies, where births are usually anticipated and parents update their desired number of children after having a first. We examine how happiness trajectories of new parents can help explain why so many people stop at having only one child and how important parental happiness trajectories are for fertility behavior at the population level. This presentation will highlight important determinants of parental happiness, such as socioeconomic status, partnership context, and parity. We discuss important consequences of parental happiness at critical periods such as the transition to parenthood and how policies can shape parental well-being. Analysis of longitudinal data from Germany and the United Kingdom shed light on these dynamics on two low fertility settings.

Transforming Genders: Subjectivity and the Struggle for Recognition of Transgender People

This research aimed to investigate the search and guarantee of transsexual rights in Brazil in comparison with European (France, Spain, Portugal) and Latin American (Argentina, Chile) countries.

In order to do so, it makes use of both carnivalized and queer epistemologies (Warat; Butler, Colling, Preciado) in an effort to recover subjectivity in science (Feyerabend and González-Rey) so as to understand the links between queer theory/ transfeminism and Law. Questionnaires and interviews were conducted to get closer and to give visibility to the reality of these marginalized identities.

Considering transsexuality as a differentiation between sexual pleasures and body parts (Soley-Beltran) and also its gender performativity and vulnerability (Butler), it was observed that the movements claim for: facilitation of both name and sex changes in the civil registry; access to the transition process; depathologization of the trans identity; and respect of gender identity in every social context, such as family and the job market. There is no identity gender law in need of approval in Brazil and neither in France nor Chile, while there's already legal grounding in Argentina and Spain.

It was noted that, in these countries, the legislative changes occurred after a change in the jurists' own "theoretical common sense", who started to listen to the subjects of rights, becomings and desires. On the other hand, the demands that are still not met, such as the Brazilian law of gender's identity, are demonstrations of the treatment given to transsexuals as abject bodies. Even though the concept of woman has been extended to comprehend transwomen, there's still sociolinguistic resistance. In this regard, alterity and education are pointed as ways of deconstruction of oppressive paradigms.

All changes, even being slow, show themselves as subversions of socially constructed standards of an imaginary that excludes queer, in a revolution of alterity of the waratian transmodernity.

Are Hipster Tomatoes Socially Innovative? Forms of Urban Agriculture and Its Potential of Social Innovation

This paper works about in what extent different forms of Urban Agriculture (UA) contain potential of social innovation (SI). In order to achieve this main goal, this paper analyzes and compares the performance of several cases of seven types of UA experiences in Barcelona with a qualitative approach. The building of UA as sociological problem has been nourished by the interest on different focuses (community gardens, alternative food networks, food sovereignty, food self-provision, etc.) shaping a range of theoretical nuances. I use a typology of UA forms based on organizational features, scale of production, orientation, function and other aspects. That includes from the newest collective trends to more traditional forms of food production within city boundaries. I look for articulating mechanisms of social innovation through urban agriculture practice. I consider something as socially innovative when social, power and economic relations are re-defined inside the city in terms of mobilization and processes oriented towards the improving of social relation, governance structures and collective empowerment. The embeddedness into the urban grid is the main difference between rural and urban agriculture, from an ecological and social perspective. This embedding defines the interdependence conditions between ecological and social processes and draws the scenario where SI takes place. UA usually is an expression of the individual and collective right to decide and feel the city as the dwellers want. My main hypothesis is that the value of UA as a vector of SI lies in its social features instead of technical characteristics. I pay special attention on UA's role as a polanyian protective counter-movement and a de-alienating force.

Singing Group: Ludic As Part of Rehabilitation

The graduation of most health professionals does not take into consideration the educational and humanistic perspectives. However, it is believed that through a more human action the hospitals and other institutions focused on health promotion and rehabilitation may be able to produce knowledge, health and improvement of life's quality for people involved in hospitals and other health facilities. The present study is part of a wider research which aims to investigate the relations between the ludic component and the rehabilitation process, treatment and health promotion provided by a group of volunteers and professionals working on a singing group of a public health institution in Florianópolis (Santa Catarina, southern Brazil). Therefore, this study is configured as a field research, presenting itself as descriptive and exploratory, with qualitative approach and it was approved by the Ethics Committee. The participants were responsible for the group, the assisted patients and their families. For data collection it was used as instruments an array of systematic observation and semi-structured interviews. Subsequently, categories will be developed for content analysis. It could be seen, with the preliminary data collected, that the visit made weekly to patients by group of social workers, nurses, volunteers, and others who went to the houses of people with illnesses to play music instruments and sing songs, has contributed to those patients recovery process. A fact that is evident in every word, smile, hug, gaze of gratitude for the work that have been done, both by patients and family. In addition, it was reported by the groups responsible, in performing this activity, they felt in a constant healing process. In this perspective, it emphasizes the importance to reevaluate the educational process of professionals related to health area, in light of the need to value the humanization of therapeutic initiatives.

Meanings of Being "Poor": The Bolsa Família Case

Meanings of being "poor": the *Bolsa Família* case

This paper aims at analyzing the social meanings of "poverty" and "being-poor identity" among a group of players taking part in the Brazilian programme *Bolsa Família*: institutional agents (social workers, health workers, nurses and teachers), neighbours (non-beneficiaries) and beneficiaries themselves. Through participant observation and 70 in-depth interviews with residents of the outskirts of Rio de Janeiro city, we've noticed that although the programme has a strictly monetary definition of what it is being "poor," the notions of "poverty" locally conceived are much more complex and based on different criteria when classifying others.

These criteria are not restricted to strictly economic evaluation. On the contrary, they are built up under the aegis of symbolic frontiers (Lamont et al, 2002) and moral perceptions of poverty. As an analytical tool, we made up seven ideal types for defining "poor" and "poverty": "I" x "the poor"; "poor" x "pauper"; "apa-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

thetic poor" x "diligent poor"; "dependent poor" x "autonomous poor"; "humble poor" x "snobbish poor"; "neat poor" x "dirty poor"; "material poverty" x "spiritual poverty".

These "poor" typifications are presented in two different categories: consumism and attitudes towards life. Surprisingly, it seems that institutional players tend to define poverty associated with attitudes, while beneficiaries seem to falter between those two definitions, at times assessing "the poor" by their behavior, at other times by their financial condition.

The Role of Employee Participation in Carbon Emission Reduction in the Workplace: The Case of Australia

This paper addresses a research gap on the role of employee participation in motivating workplace climate change mitigation activities. Drawing upon a survey of 682 Australian employers and an analysis of 1280 enterprise agreements, we find strong associations between organisational activities for the reduction of carbon emissions and employee participation in motivating, developing and/or implementing these measures. Engagement with emissions reduction at the workplace level is more likely where employee participation has a substantive role involving deeper and wider influence in organisational decision-making. This is especially the case when a range of approaches, including collective bargaining through trade unions, are utilised. Reflecting extant research on employee participation, the present study confirms the importance of the concepts of depth and scope in evaluating the extent to which employee participation is substantive, and that different forms of participation have mutually reinforcing impacts over workplace decisions to reduce carbon emissions. The findings presented suggest that the form of participation may be less important than the way in which it is implemented and the degree of substantive influence which employees have in practice.

MARKOFF, JOHN* (University of Pittsburgh, jm2@pitt.edu)

Visions of Past and Future in the Past, Present, and Future (if any) of Democracy

In the course of revolutionary upheavals on both sides of the Atlantic at the end of the 18th century, people began to use the term "democracy" for the new institutions and practices being brought into existence. It was a term that evoked a distant past, a collection of practices being enacted in the present, and a future that inspired hope in some and fear in others. Significant aspects of the subsequent history of democracy can be understood as responses to the recurrent propensity of democratic political life to generate hopeful and fearful futures and innovative efforts to realize or prevent those futures. Such efforts have intermittently but very importantly redefined democracy since the 1780s.

There are some implications for the scholarly study of democracy, an important agenda for political sociology. We need to do more than ask why it is that countries vary in the degree to which their political institutions resemble those of other countries currently held to be democratic ones, important as that question is. We need to be thinking about the ways in which new institutions and practices may come into existence that will, again, redefine democracy.

Promises of Technical Fixes: Geoengineering Justifications of Defensive Spatio-Temporal Fixes

The term 'technical fix' is frequently used by academics and activists to describe the application of a technological solution to a social problem, where a reductive problem definition leads to only a partial and superficial solution. However, the term is often used without much analytical precision. This paper uses the case of geoengineering to develop a critical, theoretically grounded conceptualisation of the term. We draw on notions of technological promises and black boxing from Science and Technology Studies, and spatio-temporal fixes and innovation regimes from Marxian political economy.

We map the promises of geoengineering as proposed solutions to the problem of climate change since the 1960s, including notably the rapid rise and subsequent slow-down of interest and investment in CCS in the 1990s and 2000s, and

the more recent growth of interest in technologies like sulphate aerosol injection and ocean fertilisation – and their uptake, or lack of it, in climate policy over time. To analyse the fit with innovation regimes, this historical review pays particular attention to articulations of the role of markets and the state in delivering and implementing these innovations, as well as the time-horizons envisaged. Geoengineering promises are compared with ideal-typical neoliberal and liberal innovation regimes, and the fit with the evolving actual political regimes is discussed.

The analysis suggests that geoengineering has fit badly with the neoliberal innovation regime of the last few decades. Moreover, the recent relative weakening of neoliberal framings of geoengineering might indicate a limit of the neoliberal political regime.

Technical fixes correspond to defensive spatio-temporal fixes, which, whilst creating new opportunities for investment and entrepreneurship, aim primarily to defend investments already undertaken. Defining the use of technical fix promises as attempted justifications of new defensive spatio-temporal fixes, provides a theoretical foundation for the concept, and gives it a stronger critical edge.

Collectors As Curators in Public Arts Institutions? Aesthetics and Market Values in Contemporary Art Worlds

This paper examines transformations in public discourse about the autonomy and authority of museum professionals in state-funded arts institutions, focusing on recent shifts in attitudes about the power of influential art collectors to shape recognition processes in contemporary art worlds. In the 20th century national and international museum associations worked to enhance the power and status of art experts by insisting on a clear demarcation between aesthetic or 'scientific' judgements and economic forces. As Pierre Bourdieu and others have observed this nominal 'disinterestedness' served to create belief in the value of art as symbolic goods (which in turn enhanced their economic worth). Of course controversies did arise about the power of patrons. However when controversies arose about the aesthetic worth of particular artists or artistic genres, the autonomy of curators and other art experts, and their purported distance from market forces was a justification for support for new art forms. The paper examines transformations over the past two decades of attitudes towards the participation of art collectors in public arts institutions through selected case studies of influential traveling exhibitions. It begins with an analysis of debates about conflict of interest in the case of UK-based advertising entrepreneur Charles Saatchi's participation in the 'Sensation' exhibition (1997-2000) featuring works from his own collection. It traces transformations in the public representations of collectors' influence on the content of museum exhibitions, as exemplified by the prominent role accorded by Japanese art museums to Taiwan-based Pierre Tie Min Chen, head of an international electronics enterprise, in the framing and curation of a 2014-15 traveling exhibition. The paper concludes with a reflection on the changing roles and status of representatives of market forces in public arts institutions and in the social construction of contemporary art worlds more generally.

Environmental Risk Perceptions over Time and Across National Contexts: A Comparative, Multilevel Study

Environmental issues and perceptions are increasingly recognized as topics of importance to a global audience. A growing number of scholars in the social sciences seek to describe trends in public opinion about environmental concerns cross-nationally using a variety of measures and analytical techniques. This research examines public opinion on the environment in cross-national context using three waves of the International Social Survey Program (ISSP) Environment data (1993, 2000, and 2010).   I use multilevel structural equation modeling to 1) construct a latent variable of environmental risk perception across the three waves of the survey for samples of 20, 26 and 36 countries and 2) examine the individual-level and country-level predictors of environmental risk perception across the countries in these three waves of data. At the individual level, age, gender, urban residence and knowledge affect risk perception. At the national level, environmental conditions and political factors affect environmental risk perceptions. Results from cross-level interactions for age and knowledge affirm complex relations between the predictors, countries, and time. Particular attention is given to how this investigation offers insights and directions for future research regarding how environmental issues and opinions are linked over time and varying scales.

MARQUART-PYATT, SANDRA* (Michigan State University, marqua41@msu.edu)

Understanding Environmental Sustainability in Postsocialist Countries over Time

Although achieving sustainability remains a key goal of development, precisely how these processes take shape can vary across places. This makes a regional focus important, as it can provide insights that are not shown in global or macro-comparative investigations. This paper investigates the ecological footprint, one measure of environmental sustainability, and its subcomponents—cropland, grazing land, built up land, carbon uptake, fishing, forest—over time with focus on postsocialist countries in Central and Eastern Europe. Expectations from development frameworks, environmental impact perspectives, and structural human ecology approaches are incorporated into an investigation of key factors driving national-level environmental sustainability in 14 countries from 1992 to 2011. The discussion centers on the roles of changing democratic political structures, demographic attributes, and national and regional economic features including inequality as key factors affecting ecological footprints in these countries. In accordance with prior work, results for the different subcomponents of the footprint reveal some differences regarding structural driving forces. Findings are discussed with attention to comparison with worldwide trends, to policy implications regarding the postsocialist context, and to further academic study.

Trends in Employment and HRM Practices: The Influence of New Technologies

Organisational flexibility and innovation have become ubiquitous in post-modern societies. Rapid technology change and, more specifically the use of new information and communication technologies, have had a strong influence on social and organisational change. Although technology itself is not the only factor of change, the adoption of new technologies has had a relevant on different levels, both macro and micro. For example, the adoption of new technologies and/or the increase of automation has led to a reduction of jobs in more traditional fields and to the emergence of new professional jobs. At the organizational level it has led to the adoption of new work organization models as well as to the introduction of more advanced and/or strategic HRM practices.

Based on the assumption that the organisational changes are shaped by different socioeconomic and cultural factors, the aims of this presentation were to identify and discuss the internal and external factors that shape organizational changes in firms in Portugal, and the influence of these changes in HRM practices. Centering our discussion on two levels of analysis - macro and micro – our aims were carried out using documentary analysis and case study methodology. The former mostly to analyse the demographic changes on employment and the latter to analyse HRM practices in firms linked to technology-intensive sectors.

Our main findings show a tendency to reduce job posts, but on the other hand, the demographic pressure makes the workers hard to replace, which has reflections in the employment/unemployment rate. At an organisational level there is a tendency to adopt more flexible organisational structures combined with more advanced in HRM practices Some of this practices can include factors as flexible work forms, functional flexibility, education and training, and organisational policies.

Marijuana Decriminalization in Uruguay: Challenges and Opportunities Related to Preventing Adolescent Drug Use

In 2013, Uruguay became the first country to decriminalize marijuana and involve the national government in marijuana cultivation (certifying growers), distribution (through pharmacies) and adult user registration. Critics argued that decriminalization will normalize drug use for children and adults, erode norms discouraging drug use, undermine social cohesion, and lead to greater marijuana experimentation and use among adolescents. Because experimental marijuana use begins around ages 14-15, piloting a culturally-grounded substance use prevention in a country that recently decriminalized marijuana may be the first step in understanding how to prevent or reduce adolescent marijuana use in this globally expanding decriminalized/legalized context. To accomplish this, a linguistically adapted version of the U.S.-based *keepin' it REAL (kiR)* substance use prevention program was pilot tested in two middle schools in Montevideo, Uruguay. Randomized into a treatment, *kiR*, (N=58) and control (N=96) condition, students (mean age = 12.4) completed a pre-test prior to implementation and post-test immediately after. Changes in marijuana measures (last 30-day amounts and frequency) were examined with paired t-tests, baseline adjusted regression models with full information maximum likelihood adjustments for attrition, and Cohen's *d* effect sizes. Students in the control group reported significant increases in amount and frequency of marijuana use from pretest to post-test while these measures declined among students receiving *kiR.* Differences between the control and intervention schools were statistically significant, and achieved medium effect sizes (*d*=.31, .32). The results indicate that *kiR* can be an effective tool in teaching drug resistance strategies and reducing marijuana use among adolescents in a country where marijuana use is decriminalized. Although these results cannot be generalized due to the small sample size and the unique characteristics of the schools and neighborhood, they provide sufficient evidence to continue exploring the impact of decriminalization, marijuana use, and the impact *kiR* can make.

MARSIGLIA, FLAVIO* (Southwest Interdisciplinary Research Center, Arizona State University, marsiglia@asu.edu)

Translating Effective Drug Use Prevention Approaches for Societies in Transition: Lessons from Latin America in Cultural Program Adaptation

In recent decades a steadily advancing "science of prevention" has spurred the development of a lengthening list of evidence-based interventions designed to reduce risk behaviors and promote better health among vulnerable populations. A growing body of evidence from longitudinal randomized controlled trials in the United States, Canada and Europe has identified key program elements that improve outcomes for at-risk children and families. Still, many Type II translational research challenges remain in efforts to bring prevention programs—mostly created for developed countries in highly controlled settings—into new international settings. The challenges include aligning the prevention programs with diverse sociocultural, historical and structural contexts, differing definitions and priorities regarding behavioral health and prevention strategies, and varying systems and infrastructure for delivering prevention. Drawing from our experience in adapting and testing the U.S. middle school-based drug prevention program "*keepin' it REAL*" for use in Mexico, Guatemala, and Uruguay, this presentation will review strategies for assessing local needs and institutional capacity for school-based drug prevention programs, methods for cultural adaptation, and lessons learned in dissemination. Implementation of evidence based prevention programs in international settings is far more than a technical matter. The more daunting and fundamental challenges include gaining an understanding of social, cultural and historical factors influencing youth drug use; how educational, social and service systems operate to address it; and the factors determining community readiness for prevention efforts and their uptake. Our cultural adaptation approach includes systematic methods for determining how to transform the intervention model to be more valid within particular ecological contexts by modifying elements of the intervention, without compromising its effectiveness, in order to enhance the fit between the intervention and community cultural values, preferences, and norms.

MARTIN, CLAUDE* (CNRS, claude.martin@ehesp.fr)

A Southern Trajectory for the Work-Care Arrangements, Family and Care Policies

In our contribution, we first revisit the 1990s discussion concerning a southern welfare State model. What could be the main lessons of the 2008 financial crisis for this discussion? Then we propose to focus on one of the characteristics of Southern configuration underlined in the nineties: the central role of the family as a source of protection against risks and vulnerability, or a social bumper. The question nowadays is not only the transfer of responsibility for social problems from the state, or even local authorities, to the family in a shedding process but the careful investigation of, first, the transformation of the family itself in the meantime and also of the emergence of new social risks which are challenging caring capacities of our societies. Families have transformed substantially in all European countries, particularly due to the increasing number of women in the labor market, but also as Luis Moreno and Pau Mari-Klose (2013) argue, due to the succession of generations which radically transform social expectations and practices. This revolution of the gender division of labor hugely modifies the question of care, caring task, care workers, respective roles of formal and informal carers, etc. This variable plays a crucial role in understanding simultaneously the process of change and the capacity of resilience of welfare systems in the South but also in many other nations and in particular in France, which can be also considered as a southern European country.

Where Are Brazilian Sociologists in the Geopolitics of Knowledge?

In the last decade, Brazilian scientists have been both compelled and stimulated for internationalization by public funding agencies. Resources for translation, research, formation and conferences abroad, as well as exigencies for publishing foreign scholars and papers in English in local journals are the most noticeable. In this paper, we would analyse how these policies impact on sociologist working in graduate programs in Brazil. By classifying and analysing Lattes curricula, I will present a map of what, how and where sociologist have been publishing and researching, and how this is related to international networks and collaborative research. Special attention will be given to the presence of women in international projects and publications, showing that female sociologists have been gaining more space and relevance, specially in institutional positions (such as Brazilian Sociological Association or the ISA), but still remaining underrepresented in core sociological debates. Results will show that Brazilian Sociology is a semi-peripheral academia, in Farid Alatas terms, and this position also reflects on gender division of labor in Brazilian Sociology.

Visual Representations of Digital Connectivities in Everyday Life

This paper draws on data from the empirical study *Photographing Everyday Life: Ageing, Lived Experiences, Time and Space* funded by the ESRC, UK. The focus of the project was to explore the significance of the ordinary and day-to-day and focus on the everyday meanings, lived experiences, practical activities, and social contexts in which people in mid to later life live their daily lives. The research involved a diverse sample of 62 women and men aged 50 years and over who took photographs of their different daily routines to create a weekly visual diary. This diary was then explored through in-depth photo-elicitation interviews to make visible the rhythms, patterns and meanings that underlie habitual and routinised everyday worlds. The data was analysed using the software Atlas Ti. The analysis highlighted: (1) the increasing importance of digital connectivities and the ways in which people in mid to later life actively engage (and resist) technologies of communication in their daily lives; (2) the significance of embodied co-presence and the immediacy of shared space and/or time; and (3) how narratives surrounding engagement (or not) with digital technologies both challenge and reinforce ideas about ageing (and youth) in complex and, at times, contradictory ways. Exploring the routines, meanings, and patterns that underpin everyday life has enabled us to make visible how people build, maintain and experience their social and virtual connections, and the ways in which digital devices and information technologies are being incorporated into (and resisted) within daily life.

Visual Representations of Health, Risk and the Body in Everyday Life

Health practices are performed, understood and embodied within the context of the daily lives of people as they grow older. There is however limited research into the ways health, risk and the body are lived and experienced when situated within everyday life. This paper draws on data from the study 'Photographing Everyday Life: Ageing, Lived Experiences, Time and Space' funded by the ESRC. The focus of the project was to explore the significance of the ordinary and day-to-day and focus on the everyday meanings, lived experiences, practical activities, and social contexts in which people in mid to later life live their daily lives. The research involved a diverse sample of 62 women and men aged 50 years and over who took photographs of their different daily routines to create a weekly visual diary. This diary was then explored through in-depth photo-elicitation interviews to make visible the rhythms, patterns and meanings that underlie habitual and routinised everyday worlds. The data was analysed using the software Atlas Ti. The analysis highlighted: (1) the role of food practices to the organisation of daily life and how participants draw on wider discourses of health, risk and the body; (2) the embodied performance and visual representation of being 'active'; and (3) the incorporation of health practices into daily life, such as, taking medication, supplements, and visits to health practitioners. The paper will conclude by exploring the significance of these discourses around health, risk and the body in relation to debates on the medicalisation of everyday life.

Challenges in the Professionalization of Care: An Analysis from the Perspective of Southern Spain

As ILO points out, the care of persons has turned into an important source of employment in most of the modernized countries. However, given the lack of visibility and recognition of care work, both in the political sphere and in the home environment, questions regarding its possible monetization and the existing barriers to its professionalization are being brought up.

The physical, emotional and moral aspects that care holds have a lot to do with these difficulties. Based on the investigation conducted by the authors in Andalusia within the project "Geographies of care work. The implications of its privatization on employment creation" financed by RDI National Plan, this paper aims to delve into the challenges that care work professionalization presents to gender equality.

Considerations regarding the results of the analysis of the qualitative research carried on, that had as starting point the interviews conducted with paid carers and relatives, will be presented, arguing that both the impact of the economic crisis set off from 2007 onwards and the implementation of the Personal Autonomy and Care for Dependent Persons Law (2006) have questioned one of the pillars that sustain the Law in its origin, i.e. the proposal to professionalize and turn care work into a decent job.

'towards the Development of a Composite Index for Consumerism'

Towards the Development of a Composite Index for Consumerism
This report presents the results of the composite European Consumerism Index (ECI). The study is part of the project "*La Calidad Social en Europa. Diseño y Construcción de Índices Compuestos para la Medición y Monitorización de la Calidad de las Sociedades Europeas*" ("Social Quality in Europe. The Design and Construction of Composite Indices to Measure and Monitor Quality in European Societies") (CSO2012-35032)", a continuation of the work begun with the Statistical Institute of Andalusia on the research project "*Puesta en marcha del nuevo sistema de indicadores sociales de Andalucía y elaboración de un análisis de la situación social de la población andaluza*" ("The Implementation of the New Andalusia Social Indicator System and Analysis of the Social Situation of the Andalusian Population") (SI-046/08)". In this case, an indicator system was devised to compare consumption in Andalusia, Spain and the European Union.

Consumption is not a purely economic question. The term consumerism, which evolved during the 1970s refers to demand aimed at modifying market exchange relationships, verging on the sovereignty of the consumer. The goal of the index is to develop a methodological tool to measure the percentage of consumers who currently reflect on the purchasing process –including searches for information about how a product is created– and who assert their rights and are concerned about the possible repercussions for society inherent in their act of purchasing. This approach to the act of consumption is clearly connected to the quality and welfare of the citizenry.

Information is presented about the development of the index and the results of its application in European Union countries, which are associated with different structural variables. The main idea is to investigate whether consumerism is particularly developed in societies with post-materialist values or whether the matter is unrelated.

'Ways of Knowing' about Aging, Old Age and Transitions in Later Life: Insights from Social Media

Social media provide important outlets for altering or reinforcing dominant narratives of aging and old age. This presentation considers how 'ways of knowing' about aging, old age and selected life course transitions are (re)framed and transformed through the digital technologies of communications involving social media, and related aspects of social connectivity and social networks. In the discussing 'ways of knowing' about aging and old age in general, several forms of digital media are considered: websites, blogs, Reddit AMA (Ask Me Anything), and Instagrams. Representative depictions of aging and old age in each social media format are considered.

The presentation also focuses on one selected lifecourse transition: to widowhood in later life. Social media provide outlets for expression among those whose widowhood is considered 'off-time' or in other ways 'disenfranchised'. But social media also transform the experience of widowhood, enabling the visual depiction (and wide distribution) of portrayals of self in widowhood. The case of an 87-year old widow in the USA and her one million (plus) Instagram followers is illustrative here.

Inter-generational access to new media provides opportunities for images and portrayals of aging that profoundly challenge the dominant public narrative of deficit and decrement in the fourth age, and of misery, decline and isolation with widowhood in later life. Such representations challenge and reinforce ideas about aging in complex and contradictory ways. Such issues as the creation of 'personas', of archetypical representations vs. deliberately exaggerated 'types' of aging and old age, and the role of (younger) others in facilitating the technology and nature of old age representation, are addressed.

MARTINEZ, CARLOS* (Universidad Nacional Autónoma de México, arturo.martinez@flacso.edu.mx)

El Aleteo De Una Mariposa En La Política Mexicana. El Efecto No Intencional Del Movimiento LGBT En La Estructura De Los Partidos Políticos.

Recientemente tres de los partidos más importantes de la Ciudad de México han creado comisiones de Diversidad Sexual con la finalidad de generar vínculos con la sociedad civil, establecer propuestas que se discutan en la Asamblea Legislativa, y dar seguimiento y formación en el tema al interior de sus órganos partidistas. Este cambio organizacional, sucede a pesar de que ni las demandas del movimiento, ni episodios de contención o disputas se han enfocado a generar cambios en las estructuras partidistas. El objetivo de esta ponencia es analizar un efecto no intencional del movimiento en los partidos políticos de la Ciudad de México: 'el aleteo de una mariposa en la política'. Mediante el uso de la teoría organizacional neoinstitucional, la teoría de los movimientos sociales y el ajuste de agenda, se considera que ciertos actores partidistas tradujeron o difundieron el marco de acción y discursivo de diversidad sexual proveniente del movimiento LGBT adecuándolo a la agenda e ideología partidistas -funcionando como emprendedores institucionales- para gestionar y promover la creación de las comisiones en cada partido. A pesar de las oposiciones internas, esta posibilidad ocurre bajo la construcción discursiva al interior de los partidos sobre un tema de agenda pública en donde movimiento y gobierno local han colaborado, resultando necesario tomar acciones respectivas para la atracción del voto de las poblaciones LGBT. Se reconocen el proceso de los efectos no intencionales del movimiento LGBT mediante entrevistas semi-estructuradas con los promotores de las comisiones en los partidos Morena, PRI, PRD, y activistas del movimiento; así como el análisis de la agenda de los partidos vinculada con el tema de diversidad sexual plasmada en diferentes momentos clave como son plataformas electorales, la discusión de iniciativa de ley de matrimonio igualitario, y la presentación de las comisiones.

Happiness As a Governmental Dispositive in Neoliberal Societies: The Case of Latin American and Mexican Contexts

During the last decade there has been a rapid proliferation of scientific and cultural discourses about "happiness" as a key concept to define social development and subjective well-being. Such discourses are present in social contexts as diverse as health sciences, mass media, public policy and organizational culture. This paper discusses the way in which the notion of "happiness" may be playing an important role in the production and regulation of new forms of subjectivity well suited to the ethos of contemporary neoliberal capitalism. Drawing on a foucauldian theoretical perspective, this paper analyzes the particular modes in which the widespread appeal and stimulation to happiness produces specific psychological models and promotes specific forms of relation of individuals with themselves. Specifically, the paper focuses on how these discourses have been received and operate in the Latin American geopolitical context with special emphasis on the Mexican context. Finally, the paper concludes examining the relationship between this form of governmentality over subjectivity and the reproduction of sociopolitical inequality and domination in the discussed contexts.

Positive Psychology and the Construction of the Neoliberal Subject: A Critical Approach Towards "Happinness" and "Resilience" Discourses

As has been widely documented, the discipline of psychology and the so called "psy sciences" have played a key role in producing the psychological individual of modernity. The knowledge produced from these disciplines and the academic discourses they put into circulation do not merely describe psychological phenomena but also contribute to the management of social conduct in specific cultural contexts. In recent years, we have witnessed the proliferation of particular types of psychological discourses related to the so-called "positive psychology". This branch of psychology aims to reformulate the understanding of psychological well-being in terms of personal enterprise. This paper discusses how these academic discourses take a turn with respect to the traditional modern conception of the psychological subject and increasingly direct behavior in various social areas such as public policy, organizational culture, mental health and self-help literature. In the context of these discourses, "happiness" and "resilience" are identified as key concepts for shaping new subjectivities that are in tune with the current neo-liberal socioeconomic system. Finally, the paper concludes by discussing how academic discourses related to "positive psychology" are consistent with a neo-liberal rationality for governing subjectivity, by promoting specific psychological models and forms of relationship of individuals with themselves.

Taking Advantage of the Context: The Manifold Roles of Catholic Chaplains in Public Institutions in Spain

This paper analyses the reconfiguration of the roles of Catholic chaplains in public institutions in Spain at the crossroads of secularisation, religious diversification and the deficiencies in the welfare system. We argue that Catholic chaplains refashion their roles by strategically taking advantage of the contextual opportunities provided by public institutions. This allows them to reinforce their position within the institutions and retain their legitimacy. We have identified four main roles that chaplains play in hospitals and prisons, which are basically those of being a) chaplains *sensu stricto* offering religious care and counselling; b) social service providers filling the gaps in the welfare system; c) experts on religious diversity issues addressing the religious illiteracy of secular organisations' staff; and ultimately d) jacks-of-all-trades solving a number of accidental and intractable issues coming up in the everyday functioning of such institutions. However, this redefinition and adaptation of their roles and tasks is not always done smoothly. Along with the adjustment to the conditions of secular organisations and to the growing presence of religious minorities, subtle resistances emerge. The paper is based on qualitative empirical research done in 8 prisons and 6 hospitals in Spain between 2011 and 2014.

The Multiplication of Elder Care Strategies in Migrant Indigenous Mexican Families

This paper shows how international male migration has modified traditional elder care arrangements in indigenous sending communities in Mexico. Traditionally the sons (and daughters in law) were the principal source of support for older people; sons (and daughters in law) reside, provide and care for elder parents who compensate the cooperation of male offspring by transferring them land and/or the house. Since the 90´s, the loss of land value and the permanent migration of the sons (and their wives) have eroded this traditional intergenerational cooperation strategy.

Based on systematic literature review (120 ethnographies and case studies), this paper shows a typology of 4 different elder care strategies to deal with migration: 1) traditional strategies; while migrated son provides economically for his elder parents, his wife would stay and care for her parents in law; 2) reallocation strategies: daughters, who were excluded from previous arrangements, stay with their parents and replaced their brother and sister in-law and they become legitimate heirs; 3) diversification strategies: despite that family land has lost value, sons and daughters cooperate with their parents based on filial piety and not taking into account main future compensations 4) breakout strategies: intergenerational cooperation cannot be reorganized because the descendants are not able or do not want to develop new mechanisms. This (no) strategy is mainly explained by extreme poverty of parents or the failure of the migration project of the sons.

The findings suggest that the factors behind these distinct patterns of parent-child care strategies are related to migration status, income options and the division of labor along gender lines but also with previous cultural norms, that are context specific, and they may not be intuitive to researcher.

Being Muslims in Italy: New Opportunities and Old Challenges

This study analyses whether Italian Muslims are considered to be a threat by Italian society. It attempts to verify the major lines of conflict in the relationship between Islam and the Italian society, by tradition culturally connected to Catholicism. The study investigates different patterns of relationship between Catholic Italians and Muslim Italians in different Italian regions on the base of the national survey "La nuova religiosità in Italia" [The new religiosity in Italy] (2007). By research data we detect regions with a high potential for conflicts and regions where we observe more acceptance of Islam as well as better basis for societal cohesion and cooperation.

Enhancing the Ethical Turn in Prevention and Healthcare Services for Mental Healthcare and HIV-Positive Patients

HIV prevention and healthcare is quite different from mental healthcare because HIV is heavily distributed to the poor Global Southern hemisphere communities whereas mental healthcare issues are significantly more evenly distributed, geographically, culturally and socially. In that sense, what they have in common is not so much social conditioning as communicative patterns. This paper, explores six factors which can enhance prevention and healthcare services for mental healthcare and HIV-positive patients across the Globe, namely, intercultural communication, reciprocal adaptation, hybrid cultures, local traditions of co-existence, future moral concerns, and emotive-cognitive shifters such as re-contextualization, art and states of awe. Intercultural communication skills provide openness for otherness, which enhances ability for adaptive and creative solutions. Reciprocal adaptation is a communicative mechanism, which assures natural alignment of cognitive structures and behaviors (Martinovski 2010). Promotion of hybrid cultures (Dona 2010) such as those in Rwanda enhance communicative flexibility and skills in conflict resolution. Adoption of local traditions of relation to cultural tolerance and otherness are useful resource for better healthcare services. Moral concerns have more effect when projected in the future than when imposed on the present (Agerström 2009) thus development of such promotes better both future and present care. Finally, re-contextualization in conversation, artistic and other states of awe function as emotive-cognitive shifters of attention, which promote integration and openness towards larger contexts, new views and solutions. If applied, these six factors enhance the ethical turn in healthcare services and their acceptance independent of social and cultural differences by balancing the negative effects of the global patriarchal order, dehumanization procedures and implantations of a third party (Martinovski and Linn 2014).

MARTINS, JO. M.* (Macquarie University, jmartins@tpg.com.au)

Changes in Ethnic Composition and Fertility of the Australian Population

The rate of population growth in Australia at 1.6% p.a. in 2011 was well above the average for OECD industrialised countries. Most of this growth is due to migration as fertility has declined since 1961 to below replacement level in 2011. Migration led to an increase in the proportion of the foreign-born in the population from 20% in the 1971 census to 26% in the 2011 census. This reflects the growing importance of migration in Australia's population growth but also points to possible changes in its ethnic composition. An examination of the country of origin of the Australian population in 1971 shows that 9 out of the 12 top countries of origin of migrants were in Europe but only 5 out of 12 were in Europe in 2011. China and India that were minor countries of origin in 1971 became the third and fourth largest countries of origin of migrants in 2011. A relevant question is whether the change in the ethnic composition of the Australian population had an impact on fertility in the period 1971-2011. To throw light into this issue, this paper contains an analysis of the fertility levels of Australian-born mothers as well as those of foreign-born mothers in 1971 and 2011. Differences are examined on cross-sectional and longitudinal bases. The paper also contains a complementary standardised analysis of number of children of mothers born in different world regions using the experience of Australian-born mothers as the standard in 2011. In aggregate terms, the average TFR of foreign-born mothers in 2011 (1.8) was below but close the mean for Australian-born mothers (1.9). The results of the analysis show trends and change from a longitudinal perspective. It also identifies convergence with the experience of Australian-born mothers as well as prevailing deviations from a cross-sectional perspective.

Pro-Active Social Movement in Uncertain Social Issue of Sustainability: A Case Study of Citizen Cooperative in Japan

This research aim to discuss the possibility and necessity of interpretation between global environmental discourse and other values. The authors will clarify the strategy to promote awareness and action for sustainable society based on a case study of citizens' proactive social movements before and after Fukushima disaster in 2011 in Japan.

After the disaster, there are various social movements in the fields of energy and sustainable society. The activity begins at first with anti-nuclear demonstration, which is followed by some proactive movements such as renewable energy projects and green electricity. Many of community energy projects have succeeded in economic independence and citizen participation. We focus on incentives of participant so that we can clarify the effect of diverse values in social movements

Method of Data Collection and Result

Based on two mailed questionnaire surveys; one is for investors of community renewable energy projects(2001 to 2011), the other is for member of citizens' cooperative concerning green electricity, we have asked their incentive for participation.

Renewable energy survey shows three incentives, environment, economic, and community. The structure is consistent and more people have come to participate in because the variety of values attracts them more. Same facts are observed also in the green electricity survey. Conjoint analysis shows that the most preferred factor is not the amount of renewable energy, nor the type of ownership, but the membership.

Concluding Remarks

In conclusion, it is stated that diversity of values are more effective than one single strong value such as economic value or environmental, when we are to promote awareness and action for sustainable society.

Climate change and sustainability has surely become a key political issue in this century. However, we cannot avoid uncertainty which brings many social actors lack of actuality. To overcome this dilemma, various bridgework and translation would be necessary.

MARX, PAUL* (University of Southern Denmark, marx@sam.sdu.dk)

Occupational Unemployment and Party Choice

There is a growing literature linking labour-market precariousness and political preferences. Occupational unemployment rate (OUR) has become an important variable. It is used as an indicator of labour-market risk and is argued to foster support for redistribution and left parties. While this argument appears straightforward, there is little reflection on potential theoretical and methodological drawbacks of using OUR as a predictor of political preferences. In the proposed article, I identify two such issues.

First, using OUR is based on the assumption that occupations are 'neutral' categories for statistical purposes. However, besides differing in their risk profile, occupations provide distinct social settings with an impact on political preferences in their own right. Hence, occupational political culture may bias OUR as a measure of labour-market risk. Second, little consideration is given to the question which model of party choice theoretically links OUR to party preferences. Implicitly, political economy applications draw on the spatial model. However, unemployment is also a key variable in studies of economic (performance) voting and recently OUR has indeed been used to predict economic voting. Reconciling political economy and economic voting theories, I argue that OUR can be linked to at least two motives: punishing the government *and* supporting redistribution. Both motives can reinforce each other (if the right is in power) or cancel each other out (if the left is in power).

The two issues can be addressed by using panel data, which allow a) eliminating unobserved heterogeneity and b) tracing respondents' party preferences over electoral contexts (left or right incumbency). I therefore use data from the British Household Panel Survey (1993-2008) and fixed-effect logistic regression to study how within-case variation in OUR affects support for Labour or economic voting (against incumbent). External validity of the findings is assessed with comparative data from the European Social Survey.

Youth Actors Cooperation Essential to Improve School Advice Services and Ease the School-to-Work Process

Successful school to work transition and integration is the labour market is a dilemma for most contemporary young people. In addition, the youth face a number of intrinsic and contextual inequalities before and during their process of transition.

This presentation is based on an on-going empirical study conducted in Finland. It investigates the perspectives of youth workers on the implications of being young today and collaborating with youth researchers. The study also involves youth researchers. Four workshops were conducted with youth workers and youth researchers. Twenty-two participants took part in the workshops. This practice-oriented project seeks at 1) encouraging more collaboration between youth workers and youth researchers in order to 2) find more effective solutions and tools to ease young people's transition into adulthood.

The first stage of the study revealed that both youth researchers and youth workers seek solutions to assist young people, but rarely engage in cooperative work. Both are experts in their own sector and could easily collaborate in order to support the youth more adequately in their school-to-work process. Both are also aware that the current career advice services in schools are mostly obsolete and promote old models of transition to working life that are no longer adapted to young people's current requirements and socio-economic context. Such traditional model also contributes to perpetuating inequalities, and to widening the winner-loser divide. The career advice services require upgrading to the current societal structure, and to be more sensitive to young people's needs by providing concrete tools for the youth to navigate through the world, not only career-wise, but also in terms of other areas of life.

Revising such a large service however requires discussions with and cooperation from all youth actors, including school representatives and youth policy makers. That is the next stage of this study.

The Spatial Basis of Labour Agency: The Case of a Strike at a South African Open Cast Mine in 2012

The last seven years has witnessed a spike in industrial unrest and conflict across most sectors of the South African economy. The mining sector for instance experienced a lot of labour conflict which often culminated itself in different forms of violence as epitomised by the Marikana shooting. Low wages, poor working conditions and confrontational wage negotiations have been cited as the causes and drivers of this violence. But how do we explain and provide reasons for the use of such violence from a labour geography standpoint? This paper presents findings from a commissioned study carried out for an open cast mine from December 2012 to March 2013 in South Africa. Survey questionnaires were administered to selected mineworkers together with in-depth and focus group interviews in collecting worker responses on why they had gone on a wildcat strike among other issues. It is argued that labour uses agency by drawing from different sources of power in articulating its demands and interests with varied levels of success and failure. In other words, workers in times of conflict make use of structural, associational, logistical and symbolic power in making their claims. However, when these methods fail to bring positive results, they resort to use of different forms of violence. Furthermore, the use of violence by South African mining labour force is not a new phenomenon but one that is historically entrenched in society and its intensification is due to changing micro and macro socio-political and economic conditions stressing South Africa's industrial relations system.

MASLAUSKAITE, AUSRA* (Vytautas Magnus University, a.maslauskaite@smf.vdu.lt)

Non-Resident Fathers' Involvement in Child Rearing: Role of Policies and Resources

The aim of the paper is to analyze how the involvement of non-resident fathers in childrearing after union dissolution is structured by the social, legal policies and socio-economic resources of fathers in Lithuania. The paper is based on the "Fathering after divorce in Lithuania" survey data (N=1500) conducted in 2015.

A lot of studies prove that frequency and quality of personal contact with father is beneficial to the child's well-being in the post-divorce families (Amato, Gilbreth 1999) and economic support provided by fathers improves the overall living conditions of children (Amato, 2005). Nevertheless, a great deal of research proves that many non-resident fathers have low levels of personal contacts and provide little or no economic support for their children although the most recent studies demonstrate the cohort change in the non-resident fathers' involvement behaviour and show the increase in the contact frequency (Kelly 2007; Amato, Meyers, Emery 2009) and child support (Grall 2006).

Even though the research on the non-resident fathers' involvement in childrearing is well examined in the USA and some European countries, the research evidence is very scarce for the countries of Central and Eastern Europe. Lithuania represents one of them and is among the countries of the region with very high divorce rates. As in many countries, the majority of children after divorce live with mothers, meanwhile the shared custody is still rather the exceptional praxis in Lithuania. Although the child maintenance legislation went through several significant developments after 1990, with the redefinition of the forms and minimum amount of child maintenance (Sagatys, 2011), some advancement in the child support enforcement system (the establishment of the Children's Maintenance Fund), high unemployment, poor employment, large grey economy, and very intense outmigration are significant constrains for the implementation of adequate child support in the post-divorce families.

MASLOVSKIY, MIKHAIL* (Sociological Institute of Russian Academy of Sciences, maslovski@mail.ru)

Russian Modernization: Successive Failed Modernities?

The idea of different versions of modernity which succeded one another has been elaborated by Peter Wagner. However, Wagner's analysis deals with European societies and new societies founded by European settlers. These cases include modifications of European cultural and institutional patterns rather than alternative projects of modernity. It is questionable if this approach could be applied to those societies whose trajectories of development were radically different from the 'Atlantic world'. Unlike Wagner, Johann Arnason focuses on two non-western modernizing patterns represented by the failed Soviet model and the Japanese civilization. Arnason discusses the imperial modernization in pre-revolutionary Russia and offers a comparative analysis of imperial revolutions and 'entangled communisms' in Russia and China. He devotes considerable attention to the formation, dynamics and crises of communist modernity in the USSR and other countries. Arnason also elaborates the concept of alternating modernities which he applies in particular to the history of Czechoslovakia. From his viewpoint, the Soviet model could be seen not as a deviation from the only road to modernity but as a specific form of modern society although it proved to be unsustainable in the long run. Arnason considers a peculiar combination of limited success and long-term failure of Soviet modernity on the economic, political and cultural levels. His general conclusion is that the crisis of the late 1980s had a much longer prehistory and a global dimension. At the same time the question remains whether the concept of failed modernity can also be applied to post-communist Russia that is re-asserting its distinctiveness from western liberal modernity. Apparently it is too early to make any definite conclusion on this issue. But it can be argued that the formation of any kind of alternative form of modernity is hardly possible in contemporary Russian society.

The Role of Politics in Multiple-Modernizations Process

The modernization process is generally presented as the result of a primarily social evolutions resulting from economic factors. The paper aims to present a reflection, on the opposite, considering the political factor as The primary factor, the economic being one of its only consequences. The relative autonomy of politics toward economics may bring to give the political factors the main explanatory role in the modernization process. The question of the emerging countries in the 20 century will be taken as the main example of this type of evolution. This model would explain the alternatives modernizations.

Transnational Biographies Across the Desert and the Sea: Migrants' Memories of Mediterranean Crossings

The dramatic rise of irregular migration between the two banks of the Mediterranean and from Syria and Afghanistan to the closest edges of Europe has recently re-acquired strong visibility in the public debate due to the enormous flows of refugees attempting to cross European borders in extremely dangerous conditions and the growing amount of migrants en-route who have died during the past few months.

Narratives that migrants interviewed relate, reconstructing their transnational journeys across the desert and the sea, naming places, events, feelings they went through during one of the most traumatic experiences of their life, cannot be disconnected from the shock that these memories still provoke and the feeling of disorientation that they induce in those who collect their tragic stories. Traumatic accounts given by refugees, by those who escaped from conflicts and persecutions, and by so-called *clandestine* exiles often recall the memories of those who survived the most notorious massacres of the twentieth century. Violence, humiliation and suffering that people experience on their journeys to Europe, not only require a critical synthesis of the historical and social matrices and asymmetrical power structures which contribute to produce the status of *clandestinity* and which have made the Mediterranean Sea a maritime cemetery. They also *force* social scientist to consider that complex social phenomena, such as irregular migration, lie within an intricate web of relationships and dynamics that cannot be properly investigated and governed without an adequate understanding of the subjective biographical experience.

Based on the outcomes of field research on the topic, this paper aims at addressing some crucial methodological issues involved in doing research adopting the tools of biographical narrations and life histories in the field of traumatic migratory experiences, trying to overcome widespread social representations of migrants as pure and naked victims of events.

Legal Status and Working Conditions of Mexican and Central American Immigrants in the United States: A Multilevel Analysis

In this paper, we analyze how individual legal status and the concentration of undocumented workers in a labor market affect the wages and working conditions experienced by Mexicans and Central American immigrants in the United States. The analysis relies on data from the Mexican Migration Project covering respondents' last trip to the United States, combined with recent annual estimates of undocumented migrants by state and metropolitan area. It estimates regression models to examine how an individual's undocumented status and the relative share of undocumented in the metropolitan area affects real wages, hours worked, tax withholding, how job was obtained, the likelihood of cash payment, and the likelihood of enclave employment, holding constant the effects of personal characteristics such as age, gender, marital status, education, English ability, occupation, cumulative U.S. experience, and number of prior U.S. trips. Results indicate that a precarious legal status undermines the wages and working conditions of Latino immigrants in the United States, and that the effect is heightened in labor markets where undocumented migrants are more numerous.

Neighborhood Disadvantage and Telomere Length: Results from the Fragile Families Study

In this paper we test whether cumulative exposure to neighborhood disadvantage reduces telomere length and explains racial differences in morbidity and mortality. Telomeres are repetitive nucleotide sequences located on chromosome ends that protect genetic material from deterioration. Telomeres prematurely shorten under high stress levels, foreshadowing future poor health. Using data from the latest wave of the Fragile Families Study, we regressed telomere length (TL) for mothers on two indicators of neighborhood disadvantage developed by Sampson and Wodke et al, controlling for mother's age, education, marital status, birthplace, and BMI as well as household income, household composition, and family structure. Holding constant the effect of these variables we found that cumulative disadvantage had a significant and powerful negative effect on mothers' TL no matter which indicator of neighborhood disadvantage we used. The effect was especially pronounced among African Americans; after introducing neighborhood disadvantage into models, we no longer find a significant black-white gap in telomere length. The effect was especially pronounced among African Americans; after introducing neighborhood disadvantage into models, we no longer find a significant black-white gap in telomere length. Pooling mothers' and childrens' data, we found similar results. Our results suggest telomere shortening is a key mechanism by which social structure is internalized and neighborhood disadvantage may explain persistent racial differences in mortality and morbidity. For African Americans, in particular, neighborhood disadvantage is concentrated by the interaction of racial segregation, class segregation, and high rates of poverty, which combine to expose them to a uniquely harsh and stressful residential environment, which over time leads to the shortening of telomeres, which leads to premature aging and poor health in later years, thereby explaining persistent racial differentials in mortality and morbidity that do not disappear when socioeconomic status is controlled.

Interreligious Dialogue and Peace in the Balkans: Past Challenges and Future Opportunities

Sociologically interpreted, tolerance is patience, accepting other people's beliefs, allowing the validity of principles which do not belong to one self, and yet they have to be recognized in the spirit of civil freedom and public opinion. Tolerance is an accepted deviation from one's own beliefs. Interreligious tolerance may be the most difficult task especially of the present. To accept something we are unfamiliar with, something which deviates from our tradition, customs and habits, is indeed a challenge. Of course, if it does not develop into religious fanaticism and extremism. Certain organizations or groups which are directed against the peace process in the Balkans and other regions in the world, continue to use terrorist tactics and methods in an attempt to destabilize the delicate balance of peace. Religion is able to mobilize social groups who strive for power and influence in the globalized society where they feel marginalized or consider the globalized society as some kind of threat. This is the reason why identity crisis makes religious fundamentalism the most prevalent and most controversial ideology of modern time. The Balkan Peninsula is a place where different religions meet. Interestingly, despite the fact that all these religions are essentially similar to one another, being derived from a common ancient basis in Judaism and all preaching peace as an ideal, the Balkans have always been considered among the most conflicting regions in the world. These religions are also very collectivistic. They claim that their adherents make a special and morally superior community. Connections with them easily become a sign of political or national loyalty. Moreover, if the Abraham religions become factors in politics, they, because of their uncompromising positions, essentially lead to a constant conflict with the religious others.

Bilingual Education (Portuguese-Cape Verdean) and Language and Education Policies in Portugal

The bilingual education project "Bilingual Class", and the subsequent project "Multilingual School", implemented in two schools of the 1st and 2nd cycle of basic education (2008-2013) by the Institute of Theoretical and Computational Linguistics (current CELGA/ILTEC), were pioneers in Portuguese Schools, involving students of Portuguese and immigrant backgrounds, mainly Cape Verdean. In addition to the teaching of (and in) Cape Verdean creole, and Portuguese, focus was given to the development of the students' implicit and explicit linguistic conscience and positive linguistic attitudes, including their families and the school community.

Research encompassed linguistic, sociolinguistic and school effects. The aim now is to continue the previous research by engaging in a new fieldwork, to improve the understanding of these students' sociolinguistic reality, currently attending lower secondary education. The fact that immigrant background students from African Countries of Portuguese Official Language have systematically shown weaker school achievement compared either to pupils of non-immigrant origin or those of other immigrant origins, questions the efficiency of linguistic and educational policies, especially when there's a seeming proximity between the Portuguese and minority languages, like the Cape Verdean creole. This longitudinal study, intending to evaluate the impact of an early bilingual education, is therefore especially relevant.

For this paper, we focus on the macro scale of the ongoing research, analyzing the social and historical dynamics of Portuguese language policies, to contextualize the aforementioned projects. Firstly, we identify the main lines of education policies, concerning linguistic diversity and teaching of *Portuguese as a Second Language*. Secondly, we relate these tendencies with the impact of the two mentioned interventions and the current educational policies deriving from an economic crisis context. In an interdisciplinary approach (sociological and sociolinguistic), the aim is to contribute to the acknowledgement of linguistic diversity in Portuguese policies, and on effective citizen-centered approaches to such complexity.

Sociology in 21st Century: Value-Detached Science or Morally Inspired Search for Just Society?

Michael Burawoy's 2004 Presidential address to ASA, in which he argued for the institutionalization of public sociology, provoked major debate within the sociological community about the proper tasks of sociology. On the one side of the debate stood those who call for an activist sociology directly engaged in supporting social movements and groups opposing the existing social hierarchies and status quo. In their view, public irrelevance of sociology is the consequence of the many sociologists' refusal to get involved with moral issues and use their professional knowledge in promoting social justice, economic equality, human rights or, simply, the better world. On the other side of the debate stood proponents of the scientific sociology who claim that the discipline can regain and preserve its public respectability only if it abides to the rigorous, value-detached inquiry of social phenomenon and abstain from making judgments about desirability of the particular social project.

This distinction between an allegedly uncritical, scientific sociology and the critical, activist sociology is untenable. Sociology should be both the impartial inquiry of human social behavior and socially engaged activity oriented towards a betterment of society. Therefore, the real issue is not whether sociologists should be interested in social justice or committed to detached scientific research but whether they can offer us the guide for understanding our present condition. The problem with the both sides engaged in the debate is that they stick to this false dilemma and neglect the great tradition of the sociological diagnosis of the times. In developing my argument I will rely on the work of two great sociologists – Peter Berger and Karl Mannheim – who thought us not only how to do sociology but also how to use it in order to achieve the better and more just society.

Time and Knowledge-Building: How Knowledge Practices in Education Embody Temporal Principles

Cumulatively building knowledge is temporal: selecting and augmenting established knowledge to provide a basis for future changes in that knowledge. Yet, while sociological research of education is exploring students' subjective experiences of temporalities, those expressed by knowledge practices themseves remains undertheorized and neglected. In this paper we draw on a rapidly growing approach that offers a conceptual toolkit for analysing the organizing principles of knowledge practices: Legitimation Code Theory. Drawing on the concepts of 'temporal codes', we explore how the organizing principles of time expressed in classroom discourse plays a role in enabling and constraining knowledge-building. Temporal codes explore whether the knowledge expressed is from the past, present or future ('temporal position') and how that knowledge is oriented towards the past, present or future ('temporal orientation'). Together these reveal different temporal codes embodied by discourse. We enact these concepts in analyses of History classrooms in Australian secondary schooling. Specifically, we explore classes in Year 7 (first year of secondary school) from two schools with contrasting student demographics of socio-economic status. Lessons across an entire unit of study (about 6 hours) were recorded and analysed, revealing how students receive differential degrees of access to temporal codes in classroom discourse and their effect on the forms of knowledge being expressed. In summary, students at the lower socio-economic school remained locked in an eternal present in which past knowledge and future knowledge were sealed off, constraining possibilities for building knowledge. In contrast, students at the higher socio-economic school engaged with a range of temporal codes in such a way that past knowledge was renovated and returns to develop present knowledge were anticipated. We conclude by discussing the substantive implications of the concepts for understanding the nature of knowledge-building and their potential practical application in curriculum, pedagogy and assessment.

Public Policy, Social Rights and Social Justice: Higher Education in the Brazil of the 2000s

The Brazilian Federal Constitution of 1988 created a system of social protection inspired in the principles of universality, welfare and citizenship. In the years 1990's, however, the country faced neoliberal policies that distanced the country from the social goals inserted in its Constitution. In the beginning of the new century, especially with the election of President Lula for the Federal Government (2003-2010) – inserted in a shift to left-wing governments throughout the Latin-American region -, the State gained an active role in expanding access to rights for the population, which reflected in improvements in social indicators. Although the role of the State changed significantly in the 2000's in Brazil, public policies in guaranteeing constitutional social rights in the Brazil of the beginning of the century did have as partner the private sector. We will then seek to briefly analyze a specific set of policies during the 2000s in Brazil in accessing higher education and to give information on the arrangement having as partner the private sector and finds that: i) Was there more equality in accessing rights, given that the Brazilian society is very unequal?; ii) Is the access to this right highly conditioned to labor income?; iii) Is there decrease in the regional differences in access to those rights?; iv) Is quality or focus affected by interests mediating the access to this right? Nonetheless, we hope to further develop those questions in PhD Thesis, to be presented in 2019.

Exploring a Public/Private Nexus of Health Care Provision: Ideas, Regulatory Frameworks, and Adaptability

The background of this paper is that dichotomy of public/private does not work well in analyzing, and even describing, healthcare provision in Japan. The Japanese healthcare system uses market mechanisms in providing health services: varieties of providers compete each other under a statutory health insurance system that decides fees or "prices" of services. Those providers consist of varieties of entities with different control by the government, including individual physicians, medical corporations, health insurance bodies, consumer cooperatives, agricultural cooperatives, the Red Cross Society, and local and national governments. Designated providers, including private ones, have been remarkably categorized as "pseudo-public". They are responsible for making efforts to achieve regional health policies and eligible for applying for ling-fenced subsidies. This makes distinction between "public" and "private" vague. The distinctive vagueness have been maintained by the government.

This paper consists of two parts. First it analyzes why the government introduced the concept "pseudo-public" by considering historical development of the health system. This question will be analyzed with the following the two accompanied questions: why those private and "pseudo-public" providers were not absorbed into the government sector; and why local and national government did not expanded their provision to the extent that "pseudo-public" providers would not be necessary. In answering them, the paper considers ideas of "public" and "private", historical development of regulatory frameworks on healthcare, and adaptability of healthcare markets.

Second, the paper analyzes recent transformation in which public/private distinction has become clearer, where local and national governments' ownership of providers decrease and regulatory frameworks on the healthcare markets are

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

modified. What external pressures, e.g. pressures for cost containments, have changed ideas, regulatory frameworks, and adaptability will be examined.

Finally, the paper critically considers the three concepts used in analysis and gives perspectives for future research.

Mediated Work Place and Work Styles As Second Offline: The Case Study of Coworking Space in Shibuya, Japan

This research explores the second offline world in terms of various workplaces and work styles such as coworking spaces, and nomad work based on ethnographic fieldwork in Shibuya Area.

Shibuya in Japan, known as a youthful town, has gained attention in recent years as a city that is exploring and implementing new workplaces and styles. The development of mobile and social media has no doubt promoted the trend of working from any location.

Rather, this trend represents a new world: 'second offline'. In this realm, the development and spread of mobile and social media have led to offline spaces, with locations being superimposed by online information.

Business has underscored the principles of connection, collaboration, and innovation in recent years. Furthermore, efforts have been made to design workplaces that foster these values. This has been made possible by an offline world that holds new beliefs due to the overlap between online and offline, which has occurred in response to mobile and social media; that is to say, second offline.

If we describe workplaces using Tuan's terms, then we can consider PCs and the (early) Web to be 'linking media' that transcend physical zones and connect workplaces, as is the case with telework. In contrast, we can consider mobile and social media to be 'superimposing media', which indicates a restructuring and upgrade of workplaces from a new perspective, as with nomad work and coworking spaces.

Labor Markets for Transnational Corporations: Nationalized and Localized Space in Global Context

Transnational corporations' role in globalization is significant since their operations now stretch across national borders, influencing global production processes and the international division of labor (Giddens 2013). When trying to conceptualize the privatization of international labor recruitment, we need to consider the role of these corporations as one of the main actors of migration industry. Sassen(1988) described how the investment flows of US transnational corporations to Third World accelerate the labor flows from Third World to the US. This paper, in contrast, focuses on the reverse-oriented flow of white-collar workers triggered by the offshore of transnational corporations. Transnational corporations not only draw labor migrants to their home countries, but also pull home countries' white-collar workers to their investment destinations. Based on the case study of Japanese migrants hired by Japanese transnational corporations in Shanghai, this paper examines the significant features of the migration system of white-collar workers' reverse-oriented mobility. And it shows how transnational corporations and recruitment agencies arrange the migratory flows and how the transnational labor markets' prosperities affect the migrants' experiences.

The international labor recruitment systems are privatized both in South-North mobility and in North-South mobility, though they have differences in some respects. Three main features of the migration system of the case are (1)low cost of international migration, (2)relatively small role of network and the rebuilding of it in the process of migration, and (3)relocation of the workforce mobility in the short term. The first two points derives from the patterns of flow direction of migration and the last point is related to the properties of the specific labor market. Migrant workers will enter new transnational labor markets formulated for the transnational corporations. They struggle with fluidity and liquidity of the transformed labor market, which are nationalized at base but localized by the surroundings.

Social Determinants of Health Anxiety after the Fukushima Nuclear Accident: Child and Maternal Health Study.

Background: Four years have passed since the Fukushima nuclear accident. While memories of the accident fade away, mothers of young children in Fukushima Prefecture still feel anxiety about their child's and their own health. However, mother's health anxiety and its chronological change have not been studied. Therefore, child-support programs associated with radioactive contamination remain inadequate. This study examines mother's health anxiety and its social determinants.

Methods: The survey targeted 3-years children (born in 2008) and their mother who lived in *Nakadori* 9 municipalities of Fukushima Prefecture. This panel survey was conducted three times from 2013 (N=1,026).

Results: We classified the respondents according to trajectories of health anxiety. *Resistance or Resilience* (initially moderate or severe anxiety followed by a sharp decrease: 18.5%), *Recovery* (initially moderate or severe anxiety followed by a gradual decrease: 24.2%), and *Chronic Dysfunction* (moderate or severe and stable anxiety: 53.7%). We found that lower SES (education and spouse's occupation) was associated with chronic health anxiety.

MATTHEWMAN, STEVE* (University of Auckland, s.matthewman@auckland.ac.nz)

Electricity and Urban Vulnerability: A Sociology of Power

Sociology seeks to make sense of group life in modernity. As such it has largely concerned itself with the metropolitan experience. Much ink has been spilt on the new ways of being and seeing that urban living affords. Much less ink has been spilt on the critical infrastructures which make all of this possible. In the broad historical scheme of things these socio-technical systems which frame our existence are absolutely novel; they are also getting frailer. We will consider some of the implications of this with reference to a single element of the urban infrastructure: electrical power generation. Without electricity modern life is unimaginable. We assume an uninterrupted power supply. In the future this assumption will be sorely tested. The paper predicts that current power blackouts are mere dress rehearsals for the future in which they will appear with greater frequency and severity. Increasing numbers of blackouts are anticipated due to growing uncertainties in supply and growing certainties in demand. Supply will become ever more precarious because of peak oil, political instability, infrastructural neglect, global warming and the shift to renewable energy resources. Demand will become stronger because of population growth, rising levels of affluence and the consumer "addictions" which accompany this. Having challenged the myth of infinite energy the presentation will close with some thoughts about how we might build resilience and offset vulnerability by thinking about sustainable energies.

Political Economy and Everyday Disaster

Despite all of the good work done on Disaster Risk Reduction, we still find ourselves in a disaster glut. All available evidence suggests that disasters are increasing in frequency, scale, cost and severity. Strangely, at the height of their necessity, sociologists of disaster find themselves on the intellectual periphery. In particular, they cite a lack of conceptual clarity for their marginality. Theorisations of disaster have remained unchanged across the last half century. Disasters are typically seen as spectacular events that are concentrated in time and space. They stop normal social functions. In other words, our definitions of disaster have remained static across the period we now refer to as the Great Acceleration. Yet arguably this time period has witnessed the greatest changes in all of human history. This paper advances a new definition of disaster: large scale damage to life and living systems. It does so as a way of thinking critically about the root causes of the Great Acceleration, and by extension of the production of most of today's vulnerabilities, like environmental degradation and unparalleled wealth disparities. In other words it offers an extension of Naomi Klein's (2007) disaster capitalism thesis by considering the ways in which normally operating capitalism itself constitutes an "everyday disaster". Particular emphasis will be given to the ways in which neoliberal policies create and profit from disaster, and how we might remedy this.

Professionalizing Protest: A Comparative Analysis of Advocacy Organizations in Serbia and China

This paper synthesizes two discrete periods of ethnographic research in domestic non-governmental advocacy organizations in Belgrade, Serbia and Kunming, China. Specifically, it compares their structure: how these groups perceive the construction of their organization and the strategies they use, and of peer

organizations in the field; and funding/donors: how these groups remain sustainable and from what sources of funding; how search for funding determines mission goals; Signs of growing domestic philanthropy of these groups; Moving beyond observations of the oft-noted proliferation of non-governmental organizations in many post-socialist spaces and state efforts to rein them in, this paper will argue 1) that the permanent institutional precarity of these groups in both geographic locations is due to a now globally pervasive neoliberal logic, one that has marketized charity in both senses of providing service and/or money; 2) a shared socialist legacy has meant that the work that these organizations engage in and their appeals to donors revolve around specific values about forms of social welfare, civic participation and the state's role in social life that are being reshaped according to this same logic; 3) as the NGO becomes the institutional form of choice or necessity for those who want to engage in either service or advocacy projects, this has significant implications for the possibilities and forms of protest.

New Young Rural Elite? Young People with University Education and Their Motivations and Ways of Life in the Polish Countryside.

From the historical perspective, after year 1989, the Polish rural areas and their inhabitants entered the period of significant social, economic and cultural changes, including disagrarization of employment and significant improvement of basic local infrastructure. Still, does it mean that rural areas could be perceived by younger generations as an attractive place to live and develop their professional and life careers? Traditionally, especially those young people, who decided to study, were convinced that only the city can provide them with satisfactory life opportunities. However, the recent studies show that about 30.0% of university graduates of rural origin return to their villages (Wasielewski 2012). Apart from that, since 2000, we observe in Poland a positive balance of migration from cities to rural areas. In this context, it is reasonable to ask what happens to those young people, who, having earned the university diploma, decide to return to their villages, or, not being of rural origin, want to settle in the rural areas. Why have they made such choice and what are its consequences? The presentation focuses on the male and female inhabitants of the rural areas (of both rural and urban origin) with university education - "young adults", who usually are at stage of making critical life decisions. The main aim is to analyze the motivations behind their decisions to live in the rural areas, their perception of their localities and the definition of own role in local communities – to what extent do they engage on behalf of their village? The presentation is based on the representative quantitative study of young rural inhabitants aged 25-34 conducted in 2015 in Poland. First results show that young inhabitants of the rural areas with university education constitute a significant resource in terms of their cultural and - potentially – economic and social capital.

Paternal Leave and Part-Time-Work. Challenges and Future Perspectives

Based on my previous research results on caring fathers on parental leave and challenges met by their partners (Mauerer 2013, 2015) I will, in this presentation, focus on interviews with managers in private and public enterprises on long-term paternal part-time work after paternity leave.

Whereas women's part-time work is widely spread in Europe, paternal part-time work is hardly discussed as a gender mainstreaming tool at the working place. European data show a huge gender employment gap at the expense of women caused by parenthood.

In my qualitative research on "Parental part-time work and gender work-life-balance in selected companies" I analyse the situation of fathers in Austria working part-time, combined with an international data analysis of parents working part-time. I conduct guided interviews with (personal) managers in the private and public sector on the career development of part-time-working employees, focussing on the situation of fathers. Although there are few data on this specific issue, I analyse the fathers' situation in comparison to maternal part-time work, which is common in European member states (Eurostat 2014). The interview questions focus on specific tasks of employees in different branches working part-time, working-time conditions and contracts, career development during and after part-time work, and last but not least: working-time demands in leading positions.

I analyse these qualitative data co-reflecting quantitative (inter)national data on gender employment rates and research on gender at the working place (a.o. Eydal/ Rostgaard 2014; Fagan/ Norman 2013; Wetterer 2014).

Methods: Guided interviews with managers of private and public companies, personal managers and fathers working part-time; quantitative data analysis on parental leave in Europe.

Finally, I present qualitative research data on fathers on parental leave and part-time work focussing on gender at the workplace and family arrangements based on the theoretical framework of feminist theories, gender and family studies (O'Brien/ Wall 2015).

MAUNGANIDZE, FARAI* (University of KwaZulu Natal, maunganidzef@gmail.com)

'We Play the Music, You Dance'. Perceptions of Engineering Professionals to New Managerialism and Its Implications on Work Organisation.

There is scarcity of empirical work in the human resources management and sociology of work literature on changes in the engineering profession and its impact on work processes, especially in Southern Africa. This paper's aim is to address this gap by arguing that human resource practitioners need to be more familiar with the engineers' perceptions on new managerialism which is a product of the changing environment. These reconfigurations are exerting pressure on organisations to be more efficient and transparent in their operations. This qualitative study adopted a grounded theory approach in order to understand and appreciate arguments as directly experienced by the actors themselves, professional engineers. Data were collected from interviews and documents. Purposive sampling was used to come up with a sample of seven engineers. Documents were collected from academic institutions, the professional body as well as from other sources such as conferences and summits of different relevant stakeholders. The findings of the study have revealed that engineers are not comfortable reporting to a manager who does not have an engineering profession. In order to indirectly deal with the notion of new managerialism, the study has revealed that some engineers have resorted to enrol for some business and management related programmes such as Masters in Business Administration. It was also interesting to note that some engineers highlighted that the notion of new managerialism allowed them a reduction in supervision because their managers (non engineers) would be unaware of the details of the profession. Such a scenario, thereby allowed incomplete and shoddy work because the managers who are non-engineers may not be in a position to properly supervise the expert engineer. New managerialism is there in the engineering profession, engineers themselves do not approve of it; they see it as encroaching on their professional autonomy and professional standards of work.

Liberation Ideology of Phule,Periyar and Ambedkar:a Study of Dalit Feminist Understanding

Abstract
The history of social reform movement and women's movement are well known as the struggle for liberation and upliftment of women. In these movements, the social reformers and feminists have focused on issues of caste-Hindu women or women in general. The issues of Dalit women did not come to the forefront in these movements. Similarly, in the century long Dalit movement also the substantive issues of Dalit women were not addressed sufficiently and their plight remained the same. The issues of Dalit women have not been seriously taken up neither by the political leaders nor by the intellectuals of today. However, in the liberation of Dalit women, few social revolutionaries like Phule. Periyar and Ambedkar remained in the forefront in analyzing issues related to Dalit women and advocating for their liberation as during their times, women were enslaved to many social evils of the Hindu society. In their endeavors, these thinkers have provided both ideological and material basis for the betterment of social, economic and political status of Dalit women.

Until then, Dalit women were voiceless for centuries together; these thinkers for the first time provided a space for analysis and articulation of Dalit women's issues that emboldened them to fight for their rights. The establishment of Dalit women's own autonomous and separate organizations during 1990s to fight for their own issues is the consequence of the ideological contribution made by these thinkers. The purpose of the study is to analyze the liberation ideology of Phule, Periyar and Ambedkar. The broad objective of this study is to see how Dalit women have perceived the ideology of Phule, Periyar and Ambedkar to mobilize themselves. It will further focus on the emergence of Dalit women's movement and the challenges which they are facing in contemporary society.

Critical Theory of Alienated Labor in Japan

The increasing acceleration of globalization has negatively effected the alienation of human labor. In Japan, the change from regular employees to non-regular employees has been caused by japanese "Shin-jiyuusyugi"（what is called neoliberalism）. As a result, the low pay and long hours spreads fast and broadly. The accumulation and concentration of wealth in the high-income class has occurred.

Critical Theory of Society could deal with this problem.This presentation focuses especially on Herbert Marcuse(1898-1979). He is known as one of the key persons of the first generation of Critical Theorists. "Neue Quellen zur Grundlegung des Historischen Materialismus"(1932) is the pioneering work on interpretation of"Economic and Philosophic Manuscripts of 1844", which is written by Karl Marx. Marcuse's paper is concerned with the liberation from alienated labor. He thinks that labor overcomes economic production through comprehending "Dasein" ontologically.

It is true that his unique understanding of labor is regarded as utopian notion. In additon, he is interested in Fourier's Utopian Socialism（See *Eros and Civilization*）. In *Eros and Civilization*(1955) or *One-Dimensional Man*(1964), Marcuse seems to be "technological determinist". The progress of technology decreases labor time and makes conditions for qualitative change of labor.

However, it is important to reconsider the essence of human labor and to imagine civilization without repression, "performance principle". Therefore, the author attempts to reconstruct Marcuse's critical theory of society, focusing on his acceptance of Marx's theory of alienation and genealogy of utopian socialism and to analyse contemporary japanese society, focusing on labor problems and pathology. Considering context from 1930s to the present day, the presentation contributes to this session not only from non-Western perspective but also from universal sociological theory.

MAY, TRISTAN* (EMLYON Business School, may@em-lyon.com)

While My Guitar Gently Weeps: Iconic Guitarists and Their Organizational Turnaround

This study investigates the role of iconic guitarists in the transformation of the electric guitar manufacturing industry during the 60s and 70s. This unusually revelatory setting highlights how cultural, only loosely corporately affiliated, high status actors co-created industry identities and stratifications.

In the 60s, confronted with the social movements and its aesthetic anti-schools, the guitar industry underwent pivotal changes. The guitar heroes of the time pushed the electric guitar away from its neat image in country, surf, and Broadway music, and redefined it as the roaring and liberating symbol of rock music.

The manufacturers tried to keep distance to the emerging tendencies, and avoided direct associations with, let alone endorsement of, the uprising generation of rock guitarists at first. However, they could not bypass the identity cues of these rebellious guitarists in the long run. Nowadays the same manufacturers substantially base their identity claims around these, now iconic, guitarists. Even more, they reinvent their history using strategically the visuals of these icons performing on their branded instruments.

By analyzing the network of top guitarists and their impact on peers and consequent generations of top guitarists in terms of equipment and aesthetic influence, I propose that iconic guitarists and their choices of guitar equipment have been crucial for the specific models popularity and organizations economic success. In fact two organizations established dominant market positions and acquired minor competitors - despite decreasing quality and absence of innovation since the early 60s. Their front men guitar models remain the same ones played by the most influential guitarists of the late 60s while all newer models and modifications could not establish. These findings suggest spillovers in status from the iconic guitarist towards both, his guitar model and guitar manufacturer, and emphasize the icons impact in the shaping of the field, organization, and product level.

Is Sustainability Stuck in a Vicious Circle?

The first decade of the 21st century increased the impression that humanity is far off from finding viable solutions to current sustainability problems. The price we pay for our ability to identify the obstacles to a consistent and effective sustainability policy is the impression that these obstacles may be insurmountable. There can be no doubt that the current level of resource use cannot be sustained in the future without putting the biophysical foundations of future generations at risk. Levers with which to slow the growth of and eventually decrease resource use are urgently needed but have yet to be identified. Despite a better understanding of trade-offs and synergies between different forms of resource use, economic wealth, and social wellbeing, consensus on how to define, prioritize, and attain the according targets and goals has yet to be reached. This must include a consideration of the distribution of benefits and burdens associated with current and targeted future patterns of resource use. From the theory of social ecology comes the concept of social metabolism which we argue offers crucial insights into understanding current and possible future resource use patterns. The associated tool box contains the method of material flow accounting through which metabolism can be quantified. We will demonstrate how the 'biophysicality' of human societies is linked to their social, political, and economic dimensions. We can thereby demonstrate that the social metabolism approach allows us to explore levers for ecological, economic, and social sustainability.

Postcolonial Pedagogy in Practice

Inspired by the lecture of Raewyn Connells "Southern Theory", I started to held a seminar entitled "Southern Perspectives - Southern Actions" in the winter term 2010/2011 at the Department of Sociology at the University of Vienna. As a young scholar and PhD student interested in postcolonial, global issues I tried to follow some of Connells advices in practice: including sociological theories written by African, Latin-American and Asian scholars and addressing some of the major effects of colonialism, especially eurocentrism in present-day social theory. Connells contribution to the "decolonization" of sociology by discussing its history and presenting the wide variety of social theories emerging out of the global South became an important starting point for the whole class. Connell showed clearly that there is so much unrecognized but rich material which can be used fruitfully in "postcolonial", "global" sociology classes. However, Connell did not address the equally important question *how* to teach Postcolonial Sociology. As Maureen McNeil points it out: "[in general] much critical theory is rather vague about specific pedagogic activities" (qtd in Heble 148). In this paper I want to share my reflections and experiences linked to the growing and vivid, but also often neglected discussion on postcolonial pedagogy in higher education (see Andreotti 2011, Arnove 2013). I argue that it is not sufficient to get other kinds of texts into the classroom, but that we – as postcolonial teachers – have to open a democratized field of discussion where the role of the teacher and the role of the student can be easily exchanged. I will give examples showing that this means also: reflecting on personal roles, values and prejudices, learning to listen to each other, learning to take decisions collectively without putting pressure, reflecting on a responsible exercise of power.

Heat Vulnerabilities in Urban Migrant Communities: A Mixed-Methods Study from Vienna

Background:
Climate change is projected to further increase heat waves in number, intensity and duration in the 21st century. Among the urban population certain groups are more affected and exposed to heat than others. Persons with migrant background are considered to be at high risk during heat waves due to the intersection of several risk factors like health condition, socio-economic status and residential area. Despite growing importance in health promotion and prevention, little research exists on the intersectionality of risk factors, particularly in Austria. The interdisciplinary research project "Vulnerability of and adaption strategies for migrant groups in urban heat environments (EthniCityHeat)" aims to fill this gap.

Methods:
The methodological design consists of:
(1) two explorative case studies based on participant observation and in-depth interviews,
(2) 15 in-depth interviews with stakeholders,
(3) 20 problem-centred interviews with persons with Turkish migrant background and
(4) two standardised face-to-face surveys (n=800).

Results & Conclusions:
The case studies reveal crucial inequalities in heat-related vulnerabilities with respect to
• socio-economic status (poverty, heat-exposed manual labour, inflexible working hours)
• residential area (densely populated, disadvantaged urban areas, heat islands, limited action scope further restrained by a lack of language skills) and
• health (physical and psychological health condition, medication, restricted access to healthcare system due to a lack of knowledge and language skills).
Accordingly, survey results indicate that particularly elderly with migrant background suffer from heat stress. Qualitative analysis indicates a lack of risk awareness in regard to heat (waves) in Vienna among both stakeholders and persons with Turkish background themselves. We conclude that heat warning systems need to take the perceptions of vulnerable groups into account. Additionally, long term response systems need to tackle infrastructural and social inequalities in order to foster adaption capacity.

Towards a 'Science of Colour': Health, Law, and Aboriginal Child Removal in Australia

This paper documents the first decades of the work of the Aboriginal Protection Board in Victoria, Australia in the mid-nineteenth century as it oversees mission stations established to gather Aboriginal peoples and give protection from settler violence. It examines the social and historical conditions for the emergence of a 'science' of racial differences through a number of shifting official versions of the 'Aboriginal problem', including Aboriginal morality, mortality and morbidity. The functioning of 'governmentalised knowledges' in the production of categories of persons based on race is highlighted in the State's oversight of child removal and Aboriginal incarceration.

MCCARTHY, JANE* (Open University, Jane.McCarthy@open.ac.uk)

Troubling Families: Who's Troubled and Why? Approaches to Inter-Cultural Dialogue.

In the contemporary global world, expectations of, and direct interventions in, family lives are shaped by diverse actors, including politicians, policy makers, professionals, journalists, lobby groups, kinship and friendship networks, and family members themselves, in a range of settings, from international legislation, public media and debates, to localised face to face interactions. Who is troubled by particular family interactions and issues, and on what grounds, brings to the fore, not only structural issues of power and of varied knowledge claims from child development and brain science to psychiatric diagnoses, but also a range of assumptions and un-explicated value judgements, themselves often obscured within knowledge claims. At the same time, whether a particular family 'trouble', while troubling, is seen as relatively unremarkable and expectable, or as reprehensible and unacceptable, is shaped by cultural norms of what a life 'should be' and might be expected to be. In this paper, I will address the difficult terrain between 'normal' family troubles, and troubling families that may be deemed, by some, to call for interventions on behalf of their more vulnerable members. In particular, I will consider the existential dimensions of what may be found to be 'troubling', and whether it is possible to articulate any general frameworks or principles for inter-cultural dialogue, towards determining the 'facts' and the values underpinning any particular view of 'troubling families'. My discussion will include contributions from sociology, anthropology, international law, and the feminist ethics of care.

Inequality and Care Worker Supply in OECD Countries

Paid care workers are often seen as filling a deficit, i.e. reduced capacity for care provision in families as a consequence of more women entering the paid workforce. Migrant care workers are thought to fill an additional deficit – in that fewer domestic workers are available to meet care needs. And care needs in the more developed countries (MDCs) for young, old and disabled are increasing with enhanced longevity and more women in the paid labour force. In this paper, one in a series from this project, we look closely at the role inequality plays in the potential **supply** of care workers. Relying on data from the Standardized World Income Inequality Database, the World Bank the OECD Health Statistics database, we ask with an array of measures, whether and how economic polarization is likely to lead to an increase in numbers of potential care workers in OECD countries. We focus on, and control for, youth unemployment, duration of unemployment, educational status as well as both market inequality and net inequality post-taxes and transfers. Our dependent variable is density of personal care workers per 1000 population. We find that net inequality is significantly correlated with care worker numbers/supply, but market inequality is not. It was theorized that educational levels beyond high school might negatively relate to care worker numbers, under the presumption that those individuals with more education might choose other careers for social mobility. We found, however, care work may represent a viable option for social mobility that sidesteps tertiary education. Not surprisingly, these relationships are stronger for women than for men.

MCDONALD, KEVIN* (Middlesex Univesity, k.mcdonald@mdx.ac.uk)

#Radicalisation: Social Media and the Mutation of Humanitarianism

Much of the debate around contemporary terrorism remains framed in the 'political violence' versus 'extremism' paradigm that emerged as a structuring principle within post 9/11 terrorism studies. Within this, the concept of radicalisation plays a key role, intellectually unifying a diverse range of practices, while separating these practices from other forms of violence, such as hate killings or school shootings. This paper presents research undertaken around the use of social media by western supporters of Islamic State, and highlights themes that point beyond this opposition. In particular these social media communications highlight the sensory dimensions at the centre of what has emerged as a key path into the support of terrorism, namely a mutation of humanitarianism. This mutation 'works' through networked intimacy and prosthetic memory; the changing significance of visual experience and its role in fan cultures; the grammar of hidden and revealed that is associated with the mask; and the place of strangeness and displacement in emerging scapes of affect – in particular associated with imaginaries of extreme violence and migration. Understanding this mutation is not only critical to understanding contemporary radicalisation, it highlights critical transformations at work in the field of digital action and culture.

MCGHEE, DEREK* (University of Southampton, dpm1@soton.ac.uk)

From Privileged to Thwarted Stakeholders - Polish Migrants' Perceptions of the Scottish Independence Referendum 2014 and the UK General Election in 2015.

Scotland in 2014 and 2015 provides an ideal context for examining the tensions surrounding EU-citizenship political rights (as established in the Maastricht Treaty of 1993) from the perspective of EU migrants living outside of their state of citizenship. In this paper we focus on the perspective of Polish migrants in Scotland (Poles are Scotland's largest foreign-born migrant group). We argue that the contrast between Polish Migrants' full enfranchisement in the Scottish Independence Referendum (EU-migrants were permitted to vote in this sub-national referenda) in 2014 to being disenfranchised from the UK General Election in 2015 (EU migrants are not permitted to vote in national or general elections or national referenda) is a significant site for observing the articulation of migrant political subjectivities and the constitution of citizenship(s). Our participants' citizenship is constituted in terms of both subjective (horizontal) and also formal (vertical) registers of citizenship with regard to: (a) justifying their political rights in terms of their current and future stake and contribution in the UK; (b) their frustrations with regards to anti-migration rhetoric and the limitations of EU political rights (e.g. being disenfranchised from general elections and national referenda such as the Brexit Referendum); and for some, (c) their plans for applying for British citizenship in the context of the UK's EU membership uncertainty.

This paper is based on qualitative research funded under the Economic and Social Research Council Centre for Population Change. We conducted two stages of individual interviews with Polish migrants (between 21 and 63 years living in Glasgow and Edinburgh), the first stage before the Scottish Independence Referendum in 2014 and the second stage, with a sample of stage one interviewees before the UK General Election in 2015.

MCGOVERN, PAULINE* (University of Greenwich, p.mcgovern@greenwich.ac.uk)

Small Voluntary Organisations in the 'Age of Neoliberalism': Bourdieusian Reflections on Their Opportunities and Challenges

This presentation explores the effects of UK public policy on small voluntary organisations. In recent years, UK governments have outsourced some health and social care services to private and not for profit organisations. In order to encourage social entrepreneurship in voluntary organisations, there have been changes in the way such organisations are defined in state rhetoric, loan schemes for conversion have been introduced and the legislative framework has been changed to allow not for profit organisations to raise capped shares and for social investors to gain tax benefits. For small voluntary organisations that have to change their organisational structure and professionalise to engage in social enterprise, there is the potential for mission drift and failure.

I present findings from case studies of two small voluntary, mutual support organisations for people with heart disease. Both entered into cross-sector partnerships to gain external funding and other resources. The leaders viewed such partnerships instrumentally. They were willing to engage in an exchange – expanding into new geographical areas in return for external funding - and they were even willing to promise to expand knowing it would be extremely difficult, to gain further funding. They were, however, unwilling to sacrifice their core mission in return for external funding and other resources.

I conclude that present UK policy has costs and benefits for small voluntary organisations that seek external funding. Some will fail because of the pressures put upon them but there is scope for such organisations to play the neoliberal 'game' whilst resisting powerful forces that seek to control their development. Their reserves of social capital makes it possible for them to remain people-orientated and in control of their individual identity in the face of pressure from more powerful organisations.

The Committee on World Food Security As a Locus of Social Innovation? Framing the Concept of "Connecting Smallholders to Markets".

Efforts to develop theoretical frameworks for understanding how sustainable agri-food networks develop need to consider the institutional, discursive and structural constraints that corporate-led global agri-food systems and the policies that empower them impose on embedded modalities of food provisioning. The contested political nature of the confrontation between the two approaches has to be recognized. In order to address such issues as knowledge production and circulation or the contradiction between adaptation to local situations and wide-scale diffusion it is necessary to explore the horizontal and vertical networking practiced by the proponents of sustainable food provision as well as the multiscalar nature of their strategies,.

The reformed UN Committee on World Food Security is an interesting observation point in this regard as the only global food policy forum in which organizations directly representing those most engaged in developing solutions to unsustainable food provision are full participants rather than observers. Since 2010 it has served as an arena for bringing about significant changes in the way in which discourse about food security is framed. The CFS has officially acknowledged that small-scale producers are the main investors in agriculture and produce some 70 % of the food consumed in the world, contradicting the normalizing discourse that large-scale industrial agriculture is the only hope for feeding the world's growing population. It is now engaged in deconstructing The Market by recognizing that all markets are not the same and that not all are beneficial for small-scale producers and local economies, and by exploring the divergent visions of what is implied by the concept of "connecting smallholders to markets". This paper will analyse the dynamics at work in and around this arena and draw lessons to contribute to the on-going debate on social innovation in food and agriculture.

MCKEON, NORA* (Rome 3 University, nora.mckeon@fastwebnet.it)

The Network of Peasant and Agricultural Producers' Organizations of West Africa (ROPPA) and the Global Food Sovereignty Movement

The differentiated nature of the patterns of agricultural development that have characterized West Africa and Eastern/ Southern Africa has had significant impacts on the emergence of rural dissent movements in these areas. In Eastern and Southern Africa large-scale commercial commodity producers wield the dominant power connected with the agricultural world, even though small-scale family farmers are far more numerous and account for most of the food consumed locally. The commodity producers' organizations are fully inserted into a logic of global value chains and liberalized markets and link up globally with the commercial farmer organizations of the West thrugh networks like the World Farmers' Organization. In West Africa, on the contrary, small-scale family farming has remained the dominant mode of agricultural production, even where important export commodities like cotton are concerned. Over the past three decades rural people have been able to overcome their traditional voiceless-ness and to build significant movements of popular dissent and political pressure vis-à-vis national and sub-regional authorities like the Economic Community of West African States (ECOWAS). They are also present in global arena, where they ally with other exponents of the global food sovereignty movement that constitutes a challenge to the dominant corporate-controlled agri-food system.

At the same time, studies of popular dissent in Sub-Saharan Africa continue to suffer from the language divides introduced by the colonial powers. The history and the dynamics of rural mobilization in French-speaking West Africa are not sufficiently well known in the dominantly English literature of social movements and popular protest. This paper will contribute to bridging the gap by analyzing the trajectory of the West African movement and the challenges it faces today. Particular attention will be paid to the movement's efforts to build alliances with other actors in West Africa and globally.

Transnational Legal Indicators in Legal Advice

Transnational legal indicators are flourishing. They are developing prominently in business law fields such as finance and banking law, tax law, contract law and corporate law, but also in others such human rights, labour law, dispute resolution and judicial management. In each of these fields, indicators seek to assess the quality and performance of rules, institutions and processes, and make this data available to decision makers. They allow users to keep track of the evolution of legal systems or parts thereof over time, and to make business decisions on this basis. In parallel, legal counsels are increasingly expected to rely on empirical evidence when advising businesses. In this regard, despite their shortcomings, legal indicators constitute a readily available source of data which can be integrated in legal advice. However, although there is growing academic interest in the mechanics of legal indicators and their normative effects, little is known about the ways in which they could be exploited for real-life business decisions and for advising on such decisions. This paper aims to fill this void by providing evidence of how legal indicators are actually perceived and used by legal counsels. We will present the results of a wide survey of law firms and legal departments of businesses which is currently under way. Aside from shedding light on current uses and perceptions, analysis of these results will give useful insights about the effects of legal indicators in a wider normative environment but also about how these indicators may be improved upon in order to better respond to the needs of their users.

Does Sport Participation Foster Civic Engagement? Conflicting Findings from Self-Reported and Official Voting Data

Promoted as a wholesome, character-building activity, many Americans ascribe to the belief that youth sport molds children into engaged citizens and future leaders. However, many sport scholars question whether empirical associations between sport and a number of positive outcomes can be attributed to socialization effects or differential selection into sport. More specifically, research on the relationship between sport and civic engagement has been limited, highlighting a need to further interrogate this claim. The present study uses longitudinal cohort data from the Youth Development Study (YDS) to examine whether high school sport participation is associated with young adult voter turnout. The YDS began in 1988 with a sample of ninth graders in the St. Paul, Minnesota public school system. Thus, I measure the effect of high school sport participation (1988-1991) on the odds of voting in the 2000 U.S. Presidential election, when most respondents were 26 years old. Though voter participation among young adults across the nation is low compared to older adults, Minnesota boasts one of the highest voter turnout rates in the United States. Net of controls for demographic, background, and young adult characteristics, sport participants are 2.5 times as likely as non-participants to report voting in the 2000 U.S. Presidential election. Consistent with past research (Braddock, Hua, and Dawkins 2007), young adult educational attainment is a strong mediator of this relationship, accounting for approximately 23% of the total effect of sport on self-reported voting. When YDS data is matched with official voting records from the Minnesota Secretary of State's office, however, the effect of sport participation is not statistically significant, suggesting that sport participants may be more likely than their peers to overreport voting behaviors. These conflicting findings are discussed in the context of social desirability bias and current debates surrounding selectivity versus socialization.

Interrogating the Durability of Gender Stereotypes and Representation Among University Faculty in Cross-National Perspective

A great deal of recent research has demonstrated the durability of occupational sex segregation and inequality in the science, technology, engineering, and mathematics (STEM) fields, among others. Assumptions grounded in gender stereotypes, typically treating them as static and broadly applicable, have played an important role in framing this research and interpreting related findings. While addressing related questions regarding occupational sex segregation and differentiation in general, we focus on the gendered positions, structures, and dynamics in academia, especially given that it is the "training ground" for the STEM workforce and arguably operates largely to define and determine professional roles and relationships. More to the point, we consider how assumptions attached to gender stereotypes are reflected – or not – in faculty representations and professional life chances and trajectories. In doing so, we interrogate and challenge some of the basic assumptions attending studies of STEM occupational determinants with the aim of providing a more detailed and encompassing understanding of the relationships in question. We offer a two-phased analysis involving both horizontal and vertical examinations of related issues. First, we provide a cross-national analysis that engages world polity and cultural institutionalist perspectives on gender relations across STEM fields. In particular, we employ the index of gender dissimilarity to map the extent of differentiation in occupational outcomes among men and women. Second, we look to selected countries and to institutional and disciplinary delineations to provide a more detailed and finer grained analysis. We consider contextually relevant factors, in terms of constraints and enablers, across different levels and units of analysis. Moreover, we look especially to policy and programmatic efforts that address women's participation in STEM.

The Politics of Profit in Swedish Social Services: Investigating the Strategies of the Private Providers' Interest Group

A striking development in Swedish social services in recent years has been the significant growth of the for-profit private sector. Further, within the private sector, a handful of large, internationally-owned corporations has emerged, and achieved sizeable market shares in most social service fields (Hartman 2011). In addition to its increased role in service provision, the for-profit care sector has also become 'a formidable power bloc in Swedish politics' (Svallfors 2015). However, although—or perhaps because—the growth of for-profit social services has been so rapid, it has become politically contested in vigorous public debate about the appropriateness of profit-making and taking from publicly funded welfare services. This paper examines how organised interests in the private care sector have sought to influence public perceptions and public policies on eldercare. We use critical discourse analysis to explore the actors, frames and claims mobilised by the employer organisation for private providers, Vårdföretagarna, in its research, lobbying and outreach activities. We show how these actors, frames and claims are used to 'mobilize potential adherents and constituents, to garner bystander support, and to demobilize antagonists' (Snow & Benford 1988). They do so by drawing on social movement language and strategies, and by positioning private provision, private ownership and profit-making as essential to the future of 'modern', high-quality and diverse eldercare in Sweden.

MEARS, ROBERT* (Bath Spa University, r.mears@bathspa.ac.uk)

'rude and Ignorant People' ; Stigmatising Minority Language in the Formation of the United Kingdom

The paper takes an historical approach to understanding the dynamics of UK nation-state formation and the role of a minority language in a centralising, linguistically homogenising nation-state. Sociologists have used Goffman's concept of stigma to understand how shame and an inferior status may be internalised with particular consequences for social groups. Wacquant has described 'discourses of vilification' and a' blemish of place' surrounding spatialized inequality. The paper begins with an account of the legislative process which incorporated Wales into the emerging UK in the sixteenth century, and the role that the persistence of the minority language plays in the characterisation of the 'outsider' group. In official documents spanning two centuries, the minority language is associated with 'backwardness', ignorance, squalor, licentiousness, etc. The negative associations are so compelling that action is required to eradicate it. In the words of one offical document, 'Great discord variance, debate, division, murmur and sedition hath grown possible because the people of the same domain have and do daily use a speech nothing like, nor consonant to the natural mother tongue used within this realm.' The paper reviews legislative and parliamentary documents that explore the consequences of the persistence of a minority language in the context of a rapidly centralising, linguistically homogenising nation-state. Such documents also purport to tackle the 'problem' of a minority language and its unwanted persistence into the era of modernity. The dominant discourse sur-

rounding the minority/majority languages serves to promote the English tongue as associated with 'civilisation' and a host of desirable traits. As Elias comments with reference to insider-outsider group dynamics more generally, 'Everywhere group charisma attributed to oneself and group disgrace attributed to outsiders are complementary phenomenon.' The paper concludes with a brief summary of the condition of the Welsh language in the UK up to the present.

Las Tic Como Herramienta De Comunicación y Participación Ciudadana En Los Partidos Políticos Españoles. Regeneración Democrática o Marketing Político?

Son muchos los estudios que señalan que los partidos políticos han utilizado las TIC más que para procurar un debate interno entre los líderes y los ciudadanos, para aumentar la afiliación, recaudar recursos económicos, ofrecer información de arriba abajo sobre las propuestas y actividades del partido, especialmente en elecciones (Ward, Gibson y Nixon, 2003; Cuhna, Martín, Newell y Ramiro, 2003). Pero ante la desafección hacia las instituciones democráticas, los partidos políticos están obligados a emplear las TIC para buscar nuevas formas de comunicación y participación ciudadana en aras de una regeneración democrática que les permita recuperar la legitimidad pérdida. De ahí, que los partidos estén usando las TIC para conectar con los ciudadanos y hacerles más participes de las decisiones que adoptan. Un canal bireccional que favorecen la interacción entre los actores que participan en el intercambio político: ciudadanos, políticos y partido. Tal es así, que los partidos están impulsando procesos de elecciones primarias; foros de participación para tomar medidas de gobierno; blogs, whatshapp, twitter y redes sociales donde los ciudadanos trasmiten directamente a los candidatos sus quejas y sugerencias, etc, y todo gracias a las TIC.

Llegados a este punto, habría que preguntarse ¿si los partidos están generando mecanismos para fomentar una verdadera "regeneración democrática", que implique una mayor comunicación y participación ciudadana? Por tal motivo, en esta ponencia se aborda las medidas que están adoptando los partidos utilizando las TIC en aras de la regeneración democrática. Esto permite exponer cuáles están siendo las mismas y qué partidos las están adoptando y por qué, y el alcance que tienen de acuerdo a su propósito. Sea como sea, estamos ante un nuevo panorama político y comunicativo que conviene ser analizado meticulosamente. Las TIC supone una gran oportunidad para superar las instituciones representativas e institucionalizar las nuevas formas de democracia directa.

To Marry or Not to Marry: Financial Aspects of Cohabitation Couples in Russia

The present study refers to the intimate relationships in sociology particularly the practice of cohabitation. In modern Russia the cohabitation becomes more and more common among young and middle-aged people. There are several explanations for this phenomenon: the second demographic transition, the changing values of the society, the marriage market by Becker or the influence of the previous partnership. The secondary data is represented by GGS database ("Generations and Gender"), includes information about he changes of relationships between generations and gender over the time. It is a panel data in Russia with three waves in 2004, 2007 and 2011 years. The general purpose of this study is to identify the key factors, which may influence the decision to applied in this intention by cohabitating couples to marry or to separate. The regression and correlation analysis may serve the purposes of the present inquiry. The anticipated results are likely to determine which influence implementation of intentions to marry or to separate and help to design two models for young and middle-aged people separately. These findings suggested that the cohabitation it is not only a preparation for official marriage, imply that cohabitation for young people it is a new format of relationships, because youth young people can't afford the full economic freedom for high-grade household; cohabitation for middle-aged people it is a comfortable union without official confirmation, because particular union helpful for partners, which have had in the past unhappy marriage. The analysis of the current situation shows that the Institute of marriage and family has changed. It is possible to present some evidence of the fact that today in Russia the institution of marriage loses its relevance.

Smuggling of Migrants from India to Europe Particularly U.K : Issues of Concern

Smuggling and irregular migration of individuals across the globe in violation of the established laws of respective countries is a grave problem. India is not the exception. During the last few decades especially with the initiation of liberalization reforms, the menace of illegal immigration is emerging at an alarming scale. Although there are no specific figures of the migrants available; both push and pull factors are at work in this process. Lack of employment opportunities at home, rising aspirations for a better life stimulated by the forces of globalization and the attraction of real or imaginary opportunities for high earnings in developed countries especially the European countries have fuelled this flow.

Unscrupulous intermediaries such as travel agents and brokers have exploited the aspirant migrants and encouraged them to take life thr4eatening risks on their journeys, often using forged travel documents. Many of them have faced tragic consequences. Some of the migrants have also sold their lands and others properties tp pay travel agents and brokers. Thus, the present paper will provide insights to understand the process and issues of illegal migration and their consequences. The paper is based on the observation and field work carried out in the part of Punjab and Haryana (two north-Indian states), where the phenomenon of migration in foreign land is visible to a greater extent. The paper may be an important contribution to understand the trans-national co-operation and to fight against illegal immigration and promoting legal immigration.

How the Private Sector of Educational Training Is Shaping the Future of Education in China

Research on education in China focuses primarily on institutional education and inequalities caused by national policies and class divisions. Few studies have paid attention to a rapidly expanding and potentially extremely influential area of educational consumption in China, i.e. educational training in the private market. The author argues that the consumption of education in the private sector will create even bigger inequalities among the student population in accordance with their consumption capacity in the area of education. This paper is based on case studies of 5 private educational agencies in Beijing. It attempts to link the provsion of educational goods by the private sector to larger structural changes in the domain of education consumption. It hopes to shed light on how the sources of inequality of educational attainment is now shaped by the force of the private education training market, who is more willing to use the most up-to-date technologies and experiment with the most innovative teaching techniques.

Exploring Child-Focussed Welfare Provision By Evangelical Christians

Based in extensive ethnographic fieldwork in the Mexican-American border zone, this presentation looks closely at the substitution of child-focussed welfare services by evangelical Christians. More specifically, it focuses on residential care homes for children and young people that are established and run by US-based religious congregations. Particular attention shall be paid to the values inherent to this kind of carework and the way they are communicated and endorsed as well as the aims and goals informing it. Drawing on the example of one specific

care home it will be examined whether and, if so, in which way critique of the system is expressed.

What's the Problem with Complexity

Institutional theory increasingly focuses on institutional pluralism in terms of tensions, challenges, conflicts and problems. The central theoretical concept in the newer discussion is that of *institutional complexity*. The literature quickly developed a specific and quite narrow perspective on institutional pluralism, which is strongly reminiscent of the presumed dead *contingency theory*. The paper proposes a fresh perspective on this fundamental issue by drawing on both classical and contemporary organization theory and by productively addressing two downsides of the complexity literature: (a) the reduction of organizational activity to "responses" and (b) the reduction of heterogeneity to a "challenge" or a "problem".

What's the problem with "organizational responses"?

Environments do not simply happen to organizations. Instead, one needs to look at (a) how organizations choose their environment, (b) how organizations (try to) shape their environment, (c) how organizations make sense of and enact their environment.

What's the problem with heterogeneity as a problem?

(a) Heterogeneity is not only a problem, rather heterogeneity is often a resource. Even more fundamentally: organizations are always situated in heterogeneous environments. Many of them are quite successful. Dealing with institutional heterogeneity is the raison d'être of many organizations. In a sense one can even say that heterogeneity is what organizations are made for, dealing with heterogeneity is what organizing is all about.

(b) The idea of pluralism is highly institutionalized in many fields. Many arrangements that enable or ensure pluralism are highly institutionalized. So are many arrangements that help mediating tensions between institutional demands. Institutionalized patterns of organizing are often already compromises.

(c) When we are interested in the problematic aspects of heterogeneity, we need to understand the precise structure of the problem. Here we propose a basic framework by spelling out some fundamental problem dimensions.

The Pluralization of Resources for Balancing Working and Family Lives and Grandparents Childcare in Spain

In recent years, grandparental childcare has been instrumental to Spanish parents' ability to engage in paid work. At the same time, the use of formal childcare services and parental leave-taking have also intensified. This study aimed to identify the factors associated with daily grandparental childcare. The sample covered the 2 304 parents with at least one child under 13 interviewed on the occasion of the Survey on the use of parental leave in Spain, 2012. Two types of factors were analysed: (1) individual characteristics; and (2) prevailing circumstances. The findings showed that families with higher incomes resorted less frequently to grandparental childcare. In contrast, such care was an essential resource when both parents were unemployed and for lone-parent families. In two-parent families, formal childcare services, paid domestic work and parental leaves were associated with less frequent grandparental involvement in childcare. Overall, the findings suggest that more diversified deployment of the available resources may contribute to reducing grandparental childcare.

Formas y Repertorios De La Violencia En La Microrregión Lagunar Del Istmo De Tehuantepec

El trabajo que se presenta, forma parte de una investigación doctoral en marcha que tiene entre sus principales objetivos, comprender la reconfiguración de subjetividades a partir de las experiencias de violencia vinculadas a procesos de conflictividad por la tierra y la naturaleza en territorios indígenas en México. Esta investigación se enfoca en los casos vividos recientemente en la localidad ikoot (huave) de San Dionisio del Mar y la binnizá (zapoteca) de Juchitán de Zaragoza, ambas ubicadas en la microrregión lagunar del Istmo de Tehuantepec, Oaxaca, México.

Si bien la investigación tiene en la ecología política uno de sus principales sustentos teóricos, pues permite comprender los procesos de resignificación de los territorios indígenas en las sociedades contemporáneas a la luz de la "capitalización de la naturaleza" y la "ecologización de la economía", el enfoque principal para la investigación es el de la sociología interpretativa sobre la violencia.

De tal forma, la ponencia se interesa por reconstruir la microrregión lagunar como un marco-sociohistórico a fin de identificar formas y repertorios de la violencia que a lo largo de diversos momentos históricos han tenido presencia en ella en relación a la conflictividad por la tierra y la naturaleza. Esto implica la identificación de relaciones, procesos, sujetos y actores de la violencia que han intervenido en cada uno de estos momentos y desde los cuales es posible establecer un puente con las formas y repertorios que (re) emergen en los procesos de conflictividad contemporáneos. Finalmente, señalará algunos hallazgos preliminares del análisis comparativo entre las experiencias de violencia y procesos de subjetivación de estas formas y repertorios en los casos de estudio.

Centralidad Del Trabajo En México. Una Revisión Desde La Encuesta Mundial De Valores.

La centralidad del trabajo en la vida se ha conformado en un item de investigación sumamente revisado desde la sociología latinoamericana a nivel teórico y empírico cualitativo. Sin embargo el análisis del tema poco se aborda desde la mirada cuantitativa y a partir de lo que la Encuesta Mundial de Valores a aportado a la discusión desde la primera mitad de la década de los 90, del siglo anterior. Por lo tanto proponemos una revisión puntual para el caso de México en su comportamiento longitudinal para revisar la centralidad del trabajo y su relación con variables personales (edad, sexo, escolaridad, etc), variables estructurales (salario, posición laboral, tipo de empleo, etc.) e ideológicas (Clase social subjetiva, inclinación política, religión, etc); y también desde la postura postmaterialista de R. Inglehart.

Urban Development through the Prism of Race

This paper revisits the intersection between race and class, specifically as it applies to the political economy of urban development in the United States in the so-called era of racial, ethnic, and class neutrality or inclusiveness. While race relations clearly intersect with those of class, the paper shows the intentional separation of the two and the wielding of discourses about race (but not class) operate as a strategic means for local elites and governments to shape metropolitan change. The driving force of upscale urban development in U.S. cities, particularly, centers squarely on class divisions but urban development is imagined, worked out, legitimated and reconciled in an urban politics that relies on the deployment of racialized discourses of colorblindness, inclusivity and diversity. This is not to deny or downplay the significance of racial division and animus to urban development but rather to argue the opposite: the preoccupation with race so clearly resonates in the American mindset that it serves as a reliable ideological means to influence the political economic development of the city. Drawing on case studies, the question is whether this racialized strategy of urban development is unique to the U.S. The paper also examines how minorities are placed in the position of combatting socioeconomic and spatial inequalities, including displacement, on racial terms set by white elites. This tactic of filtering the uneven production of metropolitan space through the prism of race leads to an ongoing and everyday situation of double-exploitation, in which urban minorities struggle to overcome the political economic costs of gentrification and other forms of urban development but also confront racial discourses that depict development as contributing to racial diversity and enhancing inclusiveness. This double-bind has lasting implications for local organized efforts at effective collective action to address and mobilize against the costs of urban development.

Intersections in Palestinian Educated Mother's Lives in Israel

Palestinian society in Israel is currently undergoing contradictory processes of secularism and religious reinforcement, rising education and employment rates, and at the same time rising unemployment and poverty rates, processes of convergence alongside processes of migration, and an encounter with the secular parts of Jewish society in Israel.

Despite changes, researchers claim that the ideal Palestinian-Israeli family is still an extended patrilineal and patrilocal family. Since lifestyle and future are embedded within systems of familial authority and relations, individuals tend to

meet accepted behavioral norms. Relationships typically require individuals to suppress personal needs and prioritize the family collective. The social and extended family contexts permeate virtually every aspect of life, leaving the nuclear family unit without autonomy.

In this lecture I shall focus on **educated Muslim mothers living in rural localities**. The women are educated and work in jobs with a sustaining income but at the same time this strength functions as a blocking mechanism against radical change, and preserves the existing gendered order. In the lecture I will throw light on their family relations, their gender relations and their involvement in the decision-making processes in their families and on their ambitions.

This paper based on a qualitative study I conducted with Palestinian-Israeli mothers, based on a feminist worldview and using intersectional-analysis.

The paper emphasize the ways they remain trapped and torn between a secular society and secular media, that preaches every person's right to fulfill their life, and community life that annihilates their right to shape their nuclear family and their personal aspirations. And it illustrates the contradictory trends taking place in Muslim society; conservative trends alongside trends of renewal and empowerment.

This study can contribute to ethnographic thinking on Muslim women experience living as a minority in western societies.

The Right to Adequate Housing – Palestinian-Single Mothers in Israel

In the last three decades, the Palestinian society in Israel has been undergoing changes in different spheres. Trends of change and preservation have been evolving simultaneously. Part of the changes in the familial sphere is a rise in the percentage of single-parent families as a result of divorce or widowhood.

In this paper I will focus on the issue of housing in relation to Palestinian-Israeli single-mothers, and I will conduct a gender analysis of their available housing options and their realization of the right to adequate housing. A critical analysis from the perspective of Gender-Mainstreaming on the right to adequate housing, as manifested in the case of these women, creates a prism for examining additional spheres of life that relate to them and their children.

The paper is based on qualitative research I conducted among Palestinian-Israeli single-mothers, divorced/separated and widows, which dealt with their situation and their experiences, and examined their status in their families and communities. The data was collected through in-depth semi-structured interviews, and was analyzed out of a commitment to the principles of feminist research. The issue of housing turned out to be a central theme in many interviews.

Since the policy used in Israel over the years has led to discrimination against minority groups. In this paper I will present a link to international human-rights discourse that might be used as an effective tool of political action against such discrimination.

Findings show a lack of governmental solutions, the women are forced into oppressive familial arrangements while struggling to obtain autonomous space for themselves and their children. Their transparency and the deep hardship they face in all matters pertaining to housing, may – in extreme cases – be manifested in a threat to their lives.

CALLEGARI, JOSE* (Programa de Pós-graduação em Sociologia e Direito, calegantonio@yahoo.com.br)

Procedural Narrative: Speech and Ruling

This paper deals with the narrative in the Brazilian procedural law. The discourse developed in the process follows a logical structure with twofold objective: state the facts in court and form the judicial conviction.

We assume that the narrative structure suffers some differentiation according to the procedural rule adopted and the institutional environment of the litigation. Thus, the Criminal Procedure Code has a different narrative structure of that established in the Code of Civil Procedure, since the first takes care of crimes and the second of civil illicit. Likewise, the institutional environment where they develop the accounts is differentiated.

The combination of these elements requires fluency of the narrator in the culture of the juridical institutions. This «cultural fluency» is developed both in a technical learning in law schools as well in the context of recurrent practical situations in the professional experience (MELLO, 2012). In Brazil, usually the narrator is a lawyer representing the parties, once the principle of the Brazilian legal system is the jus postulandi.

Thus, the narrative of the litigant parties received by the judge is a tangle of arguments whose complexity is gradually reduced until he is able to render its decision.

Faced with this, the judge has to assume a radical doubt of the Cartesian type, once he is putted in a tension between contradictory arguments where both assume to be the truth.

In addition to this Cartesian reduction it›s also supposed that the judge operates with a type of reduction in a Luhmanian sense. This is because the necessity of reduction of complexity of the narrative presented by the litigants in strict legal terms for clarification of the facts in juridical terms.

Finally, there is a fundamental pathway to the narrative and the reductionist procedure of judge: a discursive ethics.

Global Union Networks: The Brazilian Recent Experience

In the globalization context, networking organization has become an influential idea as a possible path for renewing social movements. The widespread access to information technologies supposedly allowed a more agile, democratic and horizontal organization, which is also potentially more adapted to the conditions of a global capitalism. Trade unionism is not exempt to these developments. The purpose of the paper is to present how the union networks are organized in practice in transnationals operating in Brazil. The union networks organize workers within the same transnational company spread over in different production units around the globe. Today, these networks constitute a more or less homogenous and consolidated union strategy in the country. The research tried to address the following issues: the specificity of the union networks in the Brazilian context; the expectations of the social actors in relation to this policy; the impact of international coordination for local organization and, furthermore, to ascertain to what extent the general optimist view is confirmed in practice. The research consists of 34 semi-structured interviews with unionists separated into two groups: leaders of national and international unions that formulate the policy of the networks, on the one hand, and those responsible for the networks on the shop floor. Documentary analysis was also utilized. Fourteen major transnational corporations operating in Brazil were chosen in the chemical and metalwork sectors. The paper covers the specificities, potentialities, and challenges of those union networks. How has the participation of Brazilian unions in international networks improved its position towards the company? How networks can react to the restructuring process? What is the relationship of the network with subcontracted workers? How do the networks influence the structure of the national organization of trade unions? Finally, we made a balance sheet showing the main difficulties for union networks in Brazil.

Arbitrage, Uncertainty and the New Ethos of Capitalism

This paper examines the arbitrageur as a figure who both embodies the new ethos of uncertainty rather than risk management central to 'financialised' capitalism, and exemplifies the issues of deceit and innovation raised by those who now personify the 'devotion to the calling of making money'. We begin by providing a brief background to financial 'abstraction' in the economy, and the issues of dissimulation with which this has been associated, before suggesting that engaging creatively with Weber's writings can help us identify uncertainty as key to the character of contemporary financial decision-making. It is against this background that we analyse the arbitrageur as an ideal-type personality who embodies a newly abstract approach to capitalism. This approach betrays an ambivalent relationship with deceit, yet can also be associated with an ethics of managing the uncertain through an innovative commitment to overcoming limits that has consequences for human life in general.

Extreme Events, Catastrophes and the Racialisation of the Exploited: The Real Nature of the State

The project analyses how extreme events reveal the political work involved in positioning disposable groups and individuals outside nation-States imaginaries. Having as case studies the Barh Mukti Abhiyaan grassroots movement and the National Dalit Watch in India, the objective is to propose an analytic approach, based on an ecology of knowledges and counter-hegemonic human rights struggles, that consolidates civic epistemologies pertaining to disasters and catastrophes. These civic epistemologies emerge from the accumulated experiences of local and excluded populations that support their actions in mutual help, solidarity and the construction of disaster communities that develop the ability to resist, to recover and to re-establish bonds, livings and their inhabited places.

The analysis is proposed having as background the changing role of States in disaster management promoted by international agencies that consolidate disas-

ter capitalism, of which India is a case after the enactment of the Disaster Management Act of 2005.

Upper Middle Class Reproduction in Santiago: How to Reproduce Privilege in a Context of Increasing Wealth.

Using statistical data to plot global cities but also the level of neighbourhood (Burrows 2013), recent research has mapped capital's spatial segregation and inequality reproduction patterns (Dorling 2014; Piketty 2014). Drawing on mixed methods data, coming from in depth interviews of upper middle class families in Santiago de Chile, as well as georeferenced data on construction permits, this paper explores the (old and new) strategies of social reproduction of this group within a context of change in which those in traditionally privileged positions experience the pressures of upwards social mobility and growth of wealth. Competences such as residential and educational choice have been key aspects among this group (Savage et al, 2005; Crozier and Reay, 2011). Given the pressures of the housing and educational markets, this paper explores the extent to which the upper middle class can deploy these competences (Boltanski, 1991) in order to maintain their class position (Hamnett and Butler, 2011).

This paper assesses whether this group is following the Bourdieusian distinction dynamic (Savage et al, 1992; Butler, 2001; Skeggs, 2004; Ruppert, 2006), or if they are actually facing new obstacles and thus creating newer reproduction strategies and boundary work such as those described as based on the "fear of falling", "declining fortunes", "age of anxiety" (Ehreinrich, 1989; Newman, 1993) or concerted cultivation (Lareau, 2002; Lareau, 2014).

Brazilian Drums in Portugal: Migration and Identities

The presence of Brazilian migrants in Portugal has been expressive for decades. Although the migration flow has been diminishing for the last years, due to the economic crisis in 2008, Brazilians in Portugal are 25% of all foreign residents, totaling around 104,000 people (2013). Some research has been done around the images and stereotypes produced by the contact with local population. The image of aliveness, a party-like character and sympathy has been projected over Brazilian population. These positive images are obviously not one-sided; they live with less positive stereotypes. But the positive images are projected and reinforced also by cultural consumption (specially of soap operas and popular music) and participation in Brazilian cultural expressions, such as *capoeira* and percussion groups. One of these percussion groups is *Batucada Radical*, founded in Porto, in 1997.

Based on field research and qualitative interviews, this paper aims to analyse two aspects of the engagement with Brazilian music through the case study of *Batucada Radical*. The first aspect is how images and stereotypes about Brazilian people are contested and reinforced through the presentation of the group in terms of the choices concerning rhythm and performance. The second aspect, less explored by the literature about music and migration, is more concerned with the meanings attributed by the host population (Portuguese people) involved in the activities of the group. Two main sets of meanings emerged during the research and are going to be explored: the long term connection with Brazilian culture; the search for more rooted identities facing the transnational meanings and identities promoted by the globalization processes.

Becoming a Young Entrepreneur in the UK and in Portugal

Promoting youth entrepreneurship has become a central EU strategy in addressing youth under and unemployment. Underling these policies is a narrative which suggests that securing a participation in the world of work depends on the individual's competence and initiative – i.e. on building up an *entrepreneurial self* and engaging in entrepreneurial actions. Hence, attempts to promote youth entrepreneurship have been occurring under a cultural milieu that identifies young people as the main agents of responsibility for their professional futures (Bauman, 2001). Despite the numerous programmes developed to promote youth entrepreneurship, few studies have explored the experiences of young entrepreneurs and what the process of entrepreneurship means in different socioeconomic and cultural contexts. Indeed, statistics indicate that entrepreneurial intentions and activity vary significantly across European countries and that youth self-employment is more prominent in countries with high levels of NEETs (Eurostat, 2013). This finding suggests that both the motivations driving young people into ventures and the outcomes of entrepreneurship differs with context. However, the analysis of entrepreneurship in cultural terms has remained elusive. In this study we aimed to overcome this gap by analysing entrepreneurship as a cultural practice that is embedded in the experiences of young entrepreneurs and the forms they are compelled to take responsibility for their futures. This study uses analysis of biographical narratives of young people's ventures (N=24) in two economically and culturally distinct countries: Portugal and the UK. Our interviewees reveal that establishing a business provided young people with a sense of control over their lives. More than financial opportunity, young people emphasized their need to exercise agency over a labour market that they perceived (and experienced) as instable and precarious. The presentation will discuss cultural differences regarding the processes of becoming a young entrepreneur in both countries and their implications for policies supporting entrepreneurship.

Identification, Rescue, and Social Intervention with the Victims of Trafficking for Sexual Exploitation in Spain

The aim of this paper is to describe the needs and difficult to identify, rescue and intervention with victims of trafficking for sexual exploitation in Spain. 52 open questionnaires to NGOs working with victims of trafficking in Spain were collected and 22 interviews to victims of trafficking. The results show that: 1) Most people who were trafficked are women, and that a significant section of them came into Spain and in Europe as minors. 2) An important sector of women coming from Latin America, by existing ties with Spanish culture and Spanish language. Some of these women knew that they will came to Spain to work as prostitutes, but they were tricked in the conditions they will have. 3) Another group comes from Eastern Europe, especially Romania; they were very young women coming deceived by a love relationship until they reached Spain and then they were distributed in different brothels in the country. 4) Other women came from sub-Saharan Africa, with different routes of entry in Spain. These women had the worst conditions during all the way arrival until Spain, with aggressions and continuing violations. 5) The last group come from Asia, especially China, it was a difficult group to detect and identify. 6) women were not unaware of being victims of a crime, except in cases of conditions of abuse (continuous maltreatment and rape); 7) the rescue must do so with caution to not put your life in danger; 8) women requires refuge, protection, safety and to meeting basic needs; 9) when the rescue have been achieved, women have to decide whether to return home or benefit from a program of social integration in host country. 10) The key elements of social intervention are empowerment, resilience, and trauma-focused intervention.

70 Years after Auschwitz: Revisiting Night and Fog (Alain Resnais)

This communications aims to analyze the seminal documentary film of Alain Resnais, *Nuit et Bruillard*, about the Auschwitz concentration and extermination camp in Poland.

Night and Fog was held in 1955, with 32 minutes long, in the concentration and extermination camp of Auschwitz, Poland, on the occasion of the tenth anniversary of the camp liberation at the end of World War II. The film features an innovative narrative, articulating film material made in the camp with archive im-

ages of the same camp shot during its operation during the war. The images are accompanied by a poetic text by French writer Jean Cayrol, who was a member of the French Resistance deported to the Mauthausen camp in 1943, which refers to torture, humiliation, terror and extermination, on a daily basis, related to the "rational technique" of the killing machine created by the Nazis during that period.

The main concern is to analyze the relationships established by the film in its constructive aspects highlighting the ways they are used in order to establish the relationship between cinema and society, by a close look to a documentary of one of the most tragic moments in the history of the twentieth century, through a detailed analysis of its narrative, its composition, its options to allude meanings, its silences.

Why Democracy Cannot be Dropped in Bombs from B52s at 30,000 Feet: The Social Bases of Democracy Revisited

Alex Law and Eric Royal Lybeck have recently edited a book entitles *Sociological Amnesia* (Farnham: Ashgate, 2015), showing how the discipline of sociology has a well-developed capacity to forget earlier sociologists and – more importantly – their valuable ideas and findings. So it is not entirely surprising if high-level public officials, few of whom are sociologists, remain in still greater ignorance. The case in point here is the rich body of theory, findings and debate on the question of the social foundations of political democracy. This body of literature can be traced back at least to Alexis de Tocqueville, but research in the field was especially vigorous in the quarter-century after the Second World War, having been stimulated by need to understand the collapse of the Weimar Republic and the rise of Nazism, as well as similar movements elsewhere. The literature was especially well synthesised in William Kornhauser's *The Politics of Mass Society* (London: Routledge & Kegan Paul, 1959). In this paper, I shall revisit Kornhauser's book, and ask whether, if the earlier understanding of the social bases of democracy had not been forgotten (or wilfully dismissed), American foreign policy disasters – notably the invasion of Iraq – might not have happened.

MEO, ANALIA* (University of Warwick, analiameo@conicet.gov.ar)

"I Love My Students": Teachers' Work Identities, Emotions and Inequalities in the City of Buenos Aires (Argentina)

During the last decade and a half, there has been a wide range of educational policies targeted at effectively including young people in secondary schools. This education level is compulsory in the City of Buenos Aires since 2002 and in Argentina since 2006. Despite different national and provincial policy initiatives, the democratization of the access to this educational level has been accompanied by persistent levels of drop out and educational failure. This paper examines interviews with teachers and field notes produced in different research projects carried out between 2012 and 2015 in two secondary schools in the City. Although these schools were created in different socio-institutional and policy contexts, they both aim at including students who have been "outside of secondary schooling" and belong to "poor" or "vulnerable families". They also have authorities and teachers committed to promote students´ educational "inclusion". Despite major differences in their academic organisation, size and institutional histories, there is a convergence of many teachers´ narratives around the personalisation of teaching, the recognition of students as "individuals" and the identification of "affect" as central aspects of their work identities. This paper looks at how "love" and "affect" have become a key aspect of many teachers´ identities. These sentiments are entangled with teachers´ and authorities´ concerns with promoting what I would call "a good life", which refers to specific ways of interacting with others captured by the word "respect". Following Sayer (2005), moral sentiments and emotions are useful to an examination of experiences of inequalities and symbolic domination. They are spontaneous evaluative judgements about how people are treated, and should be treated, by others. This paper explores how "love" is reworking the emotional geographies (Hargreaves 2001) of secondary school teaching and how it relates to the role of schooling in the production or challenge to social inequalities.

The Offshore Human Resource Management in the Case of Transnational and Cross-Border Companies.

It is observed in the border areas a double process: the first is a transnationalization of productive lands and the second is a casualization of industrial sectors with a connection to the commercial sector. This double process has developed since the 60s in Mexico, with a circulation of this model in the 80s in South America, Asia, North Africa, Eastern Europe and consolidation in the 2000s in the Middle East. The development of border areas has involved productive management particularly management of labor, the primary will of these spaces was not only capture a transnational diffusion capacity of goods was mostly used hand cheaper labor. Being the center of these companies thought these companies' entrepreneurs with a substitution of working tools for labor. In this article we introduce the development of policies of human resources management in this context of globalization.

Skilled Migrants in the German Labour Market – What Is the Companies' Perspective?

This paper focus the integration-chances of skilled workers in the German Labour Market in context of the demographic change, the anticipated shortage of skilled labour as well as new legal regulations entered into force in Germany in 2012.

Successful labour market integration depends to a great extent on the companies. With the so called Federal Recognition Act, the German Government published in April 2012 a legal claim to standardise procedures for the evaluation of foreign vocational qualifications. This should support both, the companies by ensuring the transparency of foreign diploma and consequently the immigrants by increasing their integration-chances.

In this regard, we analyse recruiting strategies of German firms in different industries when it comes to hiring skilled immigrants. To investigate the chances of immigrants, it is necessary to isolate the different influencing factors that are all suspected to lead to a successful recruitment.

But it is quite difficult to isolate the effects by means of quantitative sociological surveys, because treatment and control variables cannot be randomly varied as in an experiment. We therefore introduce a vignette study (factorial survey) during an online-interview. In this way, we present decision makers in companies several descriptions of applicants. The relevancy of specific characteristics of an applicant is judged by varying the description in the vignettes that are presented to the respondent. We can therefore control how nationality, vocational degree, language skills, etc. of the foreign applicants influence their hiring and – related therewith – their integration chances. Additionally, we focus on the influence of the experiences with the Recognition Act and of occupation specific skill shortages in Germany.

We implement this stratified random online-survey in more than 2000 companies in Germany. Based on this strong evidence we are able to present new data to inform about possible discriminations in the recruitment processes of companies.

Anti-Deportation Protest in Austria, Germany, and Switzerland

Deportation has become a central element of immigration control, particularly of rejected asylum seekers. While it helps maintain state sovereignty over borders, deportation often contravenes the spirit of human rights legislation. Despite its coercive nature and common use, for a long time deportation has been a 'non-issue' in public discourse, implemented without public opposition or publicity at all. Increasingly, however, deportations are met with feelings of unease and moral outrage – at least in certain sections of society –, manifesting itself in various forms of protest against deportation. This paper uses a systematic analysis of news reports of anti-deportation protests in Austria, Switzerland, and Germany (1993–2013) to examine differences in protest volume, protest actors, protest forms, and demands. A difference is drawn between *altruistic* movements that act on behalf of others to assist social change and *aspiring* movements that aim for social change. Preliminary findings indicate the volume and nature of protest varies across countries and has changed over time. The volume of protest is increasing in Austria and decreasing in Germany. In Austria and Switzerland, grassroots actors are increasingly important. At the same time, the focus in Austria is on preventing individual deportations, while in Switzerland protestors typically seek policy changes. Correlates for difference in the volume and kind of protest are presented, and it is argued that the protest movements in the three countries are of a different kind.

Youth's Emotional Attachment to Mobile Phones

Ever since new technologies were introduced in different areas of youth's daily life, they have been penetrating different spaces and times, routines and practices. Mobile phones have become essential tools through which young people communicate, exchange, play and develop more and more activities each day. Therefore, the sociological importance of these technological tools in everyday life is increasing.

As part of my postdoctoral research project, in this paper I am going to explore the current daily relationship young people have with mobile phones, paying special attention to the emotional side of this relationship. I will argue that youth's emotional attachment to mobile phones is decisive to understand how mobile phones are socially integrated and taken for granted in their everyday live.

In this sense, I will explore the different emotional dynamics produced when using mobile phones, considering two dimensions: the more direct attachment to the device itself and the baste amount of communicative options enabled through the tool.

Based on quantitative (online survey) and qualitative (semi structured interviews) fieldwork, I will complement the more theoretical proposal with the empirical analysis of youth's emotional attachment to mobile phones in the context of the Basque Country (Spain).

Challenging Gender Orders: Some Clues to (Re)Think Transgender Identities

The study of *trans*lives says much about how differentiation processes operate in binary gender order (re)definitions. Transgressions, variations and gender transitions – whether in performative or discursive terms – allow us to question precisely how order rejection/challenge might often result in the reinforcement or amplification of established distinctions. However, is the emerging mutability of traditional gender substantive enough to produce a transformation of the center?

Assuming that identity is *constituted performativity*, an effect which manifests itself in an arrangement of differences (Derrida,1988; Butler,2004), we seek to understand how far the identifications mobilized by twenty trans individuals – interviewed in the framework of the ERC funded project *TRANSRIGHTS*(http://transrightseurope.com) – contribute to overcome the social construction of gender outside the male/female opposition.

Interaction with the heteronormative order, its binary and dualistic apparatus, is not univocal. There are diverse positions and speeches – often ambivalent – in explaining how and why gender differences are performed (and desired). In some trajectories gender transgression is a permanent building process of borders; in others it is more like a walkway, a transitional point required for the achievement of civic and social recognition. Typically, the importance of being recognized, its association with body materiality and the need of using normative masculinity and femininity references confines the construction of gender outside traditionally defined borders.

Nevertheless, the link between phenomenological dimensions (appearance and bodily performances) and political dimensions (strategic and categorical essentialism) – more latent in some paths than in others – is important for understanding political representation and gender citizenship rights. The analysis conducted provides clues for the (re)cognition of identity politics' limits. The warrant of gender rights requires us to think of ways to overcome the use of essentialist categories, which precisely set and constrain the subjects that identity politics seeks to represent and release (Butler,1990).

END-Trafficking: Research and Policies for Overcoming Sex Trafficking of Youth in Today's World.

Data at European level shows that 56% of registered trafficking victims were aged between 12 and 25 years old, being the 17% of them minors (EUROSTAT, 2015). Indeed, the *EU Strategy towards the Eradication of Trafficking in Human Beings 2012–2016* considers children and young adults trafficking victims as particularly vulnerable groups. The concern for preventing and combating this phenomenon is growing among the main authorities at international level as well as within the scientific community which is evidenced by the inclusion of this priority in some of the most important European research programmes. The literature review on trafficking for sexual exploitation mainly focus on the conditions and elements re-

lated to the system, as the global and deeper problems that cause the trafficking of young girls for sexual purposes. Nevertheless, scientific literature also points to social relations and interactions as pivotal elements in the entry of youths into sex trafficking networks. *Therefore contributing to create safe public spaces for youth* is also crucial for combating trafficking for sexual exploitation. In this regard, this paper gathers the main results achieved in the project *END-TRAFFICKING: Changes and social innovations for the prevention and reduction of trafficking of women for sexual exploitation* (2014-2016) funded by The Ministry of Economy and Competitiveness from the Spanish Government. END-TRAFFICKING provides evidence-based strategies and recommendations for preventing sex trafficking among young girls through the analysis of life trajectories of young women and girls victims and/or potential victims of trafficking with particular emphasis in the role of social networks, friendships, peers and social interactions. The findings resulting from the project *contribute to theories and practice knowledge around creating safety for youth* and attempt to have social and political impact in order to combat sex trafficking of youth.

MERRON, JAMES* (University of Basel, j.merron@stud.unibas.ch)

Uncaptured Modernities and the "Pure Exteriority" of Technology and Engineering

Gilles Deleuze and Félix Guattari employ the concept of *assemblage* to inspire a new way of approaching entities, asking not "what is a thing?" but rather "*what is a thing capable of turning in to?*". More ambitious scholars have proposed a *theory* of assemblage to deepen understandings about science and technology. For the purpose of this paper, I make use of "mobile concepts" such as the 'war machine' through which a distinction between major (royal science) and minor (nomad science) is maintained. In this sense "engineering" builds upon either a striated or a smooth space. I use this line of thinking to account for the assemblages and *entities-in-becoming* involved in the following going-concerns: the wars on terror, climate change, drugs, invasive species, poaching, poverty and disease. A repertoire of new concepts and terminologies gives form to entities that elude capture within a single concept, metaphor, or grand narrative (including modernity). This "pure exteriority" of concepts has scope to elaborate on categories like "technology" and "engineering" that find their articulation outside of the centres in which they were formulated, i.e. Euro-America. As such this paper is contextualized within data emerging out of ethnographic research on the use of green technologies in mediating social relationships in South Africa.

MERZ, CHRISTINA* (Karlsruhe Institute of Technology (KIT), christina.merz@kit.edu)

Hot Spot Societies: The Urban Space As a "Projection Screen" for Data-Driven Crime Prevention and Law Enforcement

In times of Big Data, crime prevention is entering a new era – and the urban space is considered as playing a prominent role, here. While the idea of spatial crime prevention is certainly not new, it seems that a new approach finds its way into law enforcement: Predictive Policing. There, the urban space becomes a "projection screen" for a form of crime prevention that is no longer based on the mere extrapolation of past offenses or on (criminological) research findings about the emergence of crime. Rather, correlations of various, independent data sets and promises of complete objectivity are in the centre of this approach.

Although not clearly defined, Predictive Policing is often associated with software products that use complex algorithms to predict when and where next crime incidents will happen. Typically, the predictions point to small spatial areas in order to direct the police to the (future) crime scene. Predictive Policing does not neglect criminological theory but rather focuses on a particular set of theories such as the near repeat hypothesis or routine activity theory.

Within the presentation, Predictive Policing serves as an entry point for starting a discussion about the changing role of urban space and locality in crime prevention. Hopes and fears about data-driven crime prevention and policing will be presented and it will be asked if "a new rationality of crime control" (Garland, 2000) comes up when data correlations are used to predict hot spot areas instead of following more classical approaches of regarding spatial characteristics as crime promotive or preventive. This does also ultimately lead to the question about the role of criminology in times when some promote the rise of a more (big) data-driven crime science.

MESA, DIEGO* (Catholic University in Milan, diego.mesa@unicatt.it)

The Impact of Youth Guarantee Programme in Italy

After financial crisis of 2008, difficulties about transition from school to work are increased for many young europeans, primarily in southern countries, where a weak welfare state is combined with a weak labour market. These countries - especially Greece, Spain, Portugal and Italy – are characterized by high youth unemployment rates and high levels of NEETs (young people Not in Employment, Education or Training). In this context, European institutions developed guidelines and programmes to improve the employability and social inclusion of young people. One of the most important, from a political and budgetary viewpoint, is the Youth Guarantee (YG), dedicated to (re-) engage the NEETs in education, in vocational courses or in the labour market. I present the italian application of YG, Garanzia Giovani, as main misure of Active Labour Market Policies (ALMPs) for youth in Italy. I compare different regional planes and strategies and discuss differences between governance models, actors involved, actions and outcomes of youth who joined the program. I describe the advantages and the limits of applicability in a southern context of a Nordic model of ALMPs. Of course these actions are not enough by themselves to reduce uncertainty and insecurity in youth employment, but they could serve only if they are inserted in a renewed framework that invests in training policies, integrated systems of lifelong career orientation and policies for job creation. I argue that to develop a better strategy of ALMPs for youth in Italy it is necessary include also municipalities, territorial networks and involve the same young people in the evaluation and co-definition of the measures.

Beyond the "Black Atlantic": (En)Gendering Blackness and Building Bridges at African Diaspora Film Festivals

In the context of current discussions of ethno-racial representations in the North American public sphere, the "African diaspora", as a globalized notion of Blackness, has served to establish transnational connections and harness a powerful collective identity for various marginalized minority groups and individuals. The "Black Lives Matter" social justice movement has embodied such affirmation to recognize the contributions of "Black people". But discourses about who is included in (and excluded from) this community has yet to be examined, beyond the recognition of a shared Black culture created through processes of globalization. Film narratives directed by African diasporic filmmakers, and selected at festivals gathering the African diaspora community, offer a unique platform to look at representations of minority/majority social relations in the North American context. Drawing on critical analyses of Paul Gilroy's "Black Atlantic", I will provide an analysis of film festivals as alternative public spheres where gender and race are being (re)imagined. My objective is to better understand the co-construction of social relations of power such as gender and class within the African Diaspora, beyond the dominant narrative of a collective experience of postcolonial memories. I will thus illustrate processes of staging and performing the "African Diaspora" at two international film festivals showcasing the cultural production and contributions of this community – The Montreal International Black Film Festival (created in 2005) and the New York African Diaspora International Film Festival (created in 1993). This paper will conclude with preliminary findings based on data collected in the first phase of my research, with a discourse analysis of the role and place of women filmmakers in all written documentation produced by the festivals since their foundation.

MESJASZ, CZESLAW* (Cracow University of Economics, mesjaszc@uek.krakow.pl)

Complexity of Social Systems in the Era of Information Overload

Increasing amount of information in modern society has brought about numerous unpredicted and unpredictable consequences. One of them is changing meaning of complexity applied in description and analysis of phenomena at all levels of societal hierarchy. A survey of definitions of complexity of social systems allows to identify two approaches. First, "hard" complexity associated with mathematical modelling of non-linear phenomena, dynamical systems, etc. Second, "soft" complexity, which is either based upon analogies and metaphors deriving from the "hard" complexity, or which is associated with qualitative indigenous ideas of complexity of social systems, e.g. Luhmann. It may be concluded that complexity reflects subjective perception of the world and of the observer herself/himself – "complexity is in the eyes of the beholder" and social systems can be treated as self-reflexive "complexities of complexities".

The interpretation of complexity of social systems as a consequence of insufficient capability of information processing by an observer obtains a new weight in the time of exponentially increasing amount of information stored and transmitted in modern society.

The aim of the paper is to provide at least partial answers to the following questions:

1. What types of barriers of perception and understanding of social systems by individual observers result from increased amount of information?

2. What are the consequences of information asymmetry in social systems resulting from the increasing amount of information?
3. What are the new phenomena associated with reflexivity and self-reflexivity of social systems which are resulting from rapidly increasing amount of information?

MESNARD, PAULINE* (University of Lausanne, pauline.mesnard@unil.ch)

A Qualitative Approach of Fourth Agers' Experiences of Long-Term Care: Comparing France, Switzerland and Sweden.

Questioning the reality of the fourth age implies that one addresses first the issues of the social and political contexts in which it was recently created. This new/last life stage indeed represents a target of eldercare policies to differentiate between older care consumers and third agers characterized by their capacity to achieve "active ageing". I argue that what makes the fourth age "real" are the experiences of the relationship of dependency between care receivers and society. It is not so much a matter of determining a numerical threshold when "entering" the fourth age as of considering a social position in relation to society. "Active aging" as an ideology of autonomy makes the study of the "patterns" of dependency in old age crucial to understand the social meaning of the fourth age. This contribution aims at providing a critical sociological insight into the way fourth agers deal with the issues of long-term care by investigating the relationship of dependency that "structure" eldercare networks. The comparative study between several cultural contexts reveals the normative content of this specific relationship. The different types of regulation of that particular tie show that the social meanings of the fourth age vary according to several factors such as national solidarity regimes, familial cultures and individual economic and social resources. Using a comprehensive approach, the contribution focuses on the everyday experiences of older people in long-term care living at home across three European countries. A qualitative survey has been conducted in France, Switzerland and Sweden to study how fourth agers negotiate their autonomy in everyday life with their carers. In sum, this contribution is an attempt to understand what characterizes the identity of fourth agers in several cultural contexts focusing on the collective regulation and subjective meaning of the relationship of dependency.

Sociology of Space and Urban Boundaries. Embodiment through Communitarian Education.

This paper presents the research output of a critical ethnographic study in Portugal - Urban Boundaries project[1], which was carried out with 'invisible communities' in the outskirts of Lisbon Metropolitan area. The study required the development of an interdisciplinary research on the concept of space, in order to attend the needs from three different cultural groups. The research project includes members of each group, cooperating in order to attend each one's main goals: (i) the Academic group focuses on the necessity of an emancipatory educational policy and practice; (ii) the Bairro group is centred on the urge of having water supply in their territory; (iii) the Fishing group is working on strengthening their social voice.

The concept of Space is reconstructed by an interdisciplinary view, in which Situationality (Freire, 1970), Curriculum Trivium (D'Ambrosio, 2006), Act (Žižek, 2008), Topology (Balibar, [2002] 2011), and Communitarian Education (Mesquita et al., 2011) supply a theoretical toolkit for a collective critical analysis and local intervention. In that sense, the Curriculum Trivium is used for the understanding, recognition, and empowerment of the communities through local educational processes, as fundamental paraphernalia of survival. The concept of Topology is used as an analytic layer in the process of development in diversity - understanding the diversity of spatial and territorial experiences and claims in the project by multiple representations (descriptions, narratives, poems, photographs, paintings, among other). The concept of Act is used to argue the encounter of the three involved communities and the collective recognition of their own Situationality - materially and symbolically speaking. The concept of Communitarian Education allows the knowledge of the construction of the local educative practices and the local embodied questions of knowledge, power, affection, and local human identity.

From the Religious Question to Christian and Secualr Convictions

In how far the intensity of the religious question, i.e. the question with regard to origin and destination of one's life and of the world, is correlated with the choice of Christian or secular convictions is investigated with the German ALL-BUS 2012. The intensity of the religious question is measured by the frequency of thinking about the *meaning* of life, of talking about *religion*, and of thinking about *belief*. It is expected that the meaning question is correlated with neither Christian nor secular convictions – openness hypothesis; while the religion and the belief question correlate positively with Christian, and negatively with secular convictions – differentiation hypothesis. Christian convictions are measured by theistic/deistic world views and by figurative as well as conceptual beliefs; secular convictions are measured by naturalistic and existentialist world-views. The meaning question as well as the religion and the belief question correlate positively with Christian convictions and negatively with secular convictions. However, when the positive impact of the religion and the belief question upon Christian convictions and their negative impact upon secular convictions is controlled for in regressions, the meaning question has no longer an impact upon Christian and secular convictions while the positive impact of the religion and the belief question on Christian conviction and their negative impact on secular convictions remain. Then, the openness and the differentiation hypotheses are confirmed. The intensity of the religious question can be regarded as a starting point for the choice of religious, Christian and secular, convictions.

Silencing of Memories – Interactions Between Memory, Discourse and Social Changes

In my PhD project I analyse the silencing and resurgence of memory of the resettlers to show the deep impact of discourses on the constitution of a collective and individual memory. This analysis is based on biographical-narrative interviews with Germans, who were relocated after WWII. The discourse of 'flight and expulsion' differed in West and East Germany. In Western Germany it was highly debated and created a myth of victimhood (materialised in organisations, memorials, films).

In contrast, the so-called resettlers in the GDR were assimilated into the socialist society. I am focussing on these resettlers in the eastern part of Germany and explore the transformation of individual and collective memory corresponding to hegemonic discourses of 'flight and expulsion' and social change.

Since 1950 the recollection of 'flight and expulsion' vanished as a topic from the public, the expellees were neglected and integrated into the antifascist foundation myth of the GDR. Resettlers that had contacts to the West, were excluded from the discourse of the GDR and considered as so called 'revisionists'. Thus the figure of the expellee did not (longer) exist in the new socialist society and was furthermore silenced in individual memory.

Throughout the process of social transformation in 1989, new opportunities of recollection arose. But also the post-1989-discourse about the 'flight and expulsion' was dominated – by the federation of the expellees. The shifted frame of remembrance enabled the East Germans to recollect former tabooed experiences of flight and expulsion. But it also canonized them and neglected narrations of experiences of 40 years in a socialist system – with all its problems and possibilities.

Again, the individual memory of the everyday woman became invisible in the public (space) or had to subordinate under hegemonic discourses.

Children without Childhood

This paper asserts that childhood is a cultural and social construction, constructed by modern society. Furthermore it gives an overview of the conceptualization of childhood from medieval times to the new postmodern age where childhood and its innocence and has been replaced by Kinderculture, the hurried childhood and loss of childhood. An overview of conceptualization of children from being a mini-adult in medieval times; to the birth of the notion of childhood in the 1600s; to the child-centered ideology during the early period of capitalism; to the modern notion of childhood with its own autonomy during enlightenment; to the following period – the contradiction between conditions of the poor and middle class notion of childhood, leading to the initiation of legal protection for children; to the emergence of the new genre of child-oriented literature in the late 19th century; to the concept of childhood as a time of fun and happiness with the market economy making children´s toys accessible; and finally In the century of childhood in the 2oth century, bringing in state intervention in health and compulsory schooling. The last decades of the 20th century brought in lamentation of the loss of childhood and innocence. Due to the influence of new media technology and loosening of adult control, has brought in the dilemma of the postmodern childhood and the onset of Kinder-culture. Some critical reflections are raised in the end about the contradiction in discourses on childhood in the North and South; and conceptualization, methods and practices needed for recovering childhood.

Shared Services Implementation and Its Impact on Employees

The purpose of shared services centre is to centrally provide specific services in an organization whereas those services had previously been administered in more than one of organization's parts. Actually, the centre is an embodiment of the fully-fledged (albeit polymorphous) management concept of shared services which is today among senior managers in multinational companies very popular and which consists of centralization, autonomization and standardization of all support processes to one or a few points. This concept is based on the one hand on economically rational arguments of economies of scale, economies of specialization and wage arbitrage but on the other hand it draws a support also from highly aestheticized vision of global business services model as of an instrument how to transform the corporation into "a giant which can dance" (I paraphrase the name of book *When Giants Learn to Dance* by Rosabeth Moss Kanter).

I claim that the implementation of shared services has a lot of not necessarily unintended but in any case not explicitly formulated consequences. I argue that the shared services concept serves as an instrument to disintegrate the organization and its activities in order to transform them and reintegrate again in the form of supply chain. However, the latter form of organization substantially differentiates from the previous one by several features, mainly by its emphasis on supplier-client nature of relationship which has serious impacts on employees and work in terms of increased pressure and insecurity and lower job quality and satisfaction. Work organization in the shared services centre and in its client departments is different, however, what is even more important is that it is possible to observe changes within client departments. The work content tends to be more specialized but less specific .The performance is increasingly controlled by the combination of quantitative and qualitative indicators.

MICHAEL, MAUREEN* (University of Stirling, m.k.michael@stir.ac.uk)

Swapping Jerseys: Professional Education and Materialities of Faith

In my early career as an educator, highly visible objects and rituals of faith shaped my professional practices of curriculum, pedagogy and assessment. Morning prayers and intercessions preceded the register; crucifixes and statues directed the beginnings and endings of lessons; school assemblies mimicked the ritual of the mass with readings, sermons and hymns; and the content of lessons were often informed by periods of religious observance (e.g. Lent and Advent). Less visible objects also shaped my professional practices. Football jerseys worn under school sweatshirts, insignia rings on fingers, and tunes whistled in corridors – these were all cause for reprimand, persuasion or distraction. These pieces of material culture were not just provocative expressions of faith and identity but a highly politicised aesthetic that challenged concepts of 'the good professional'. The curricular project 'Swapping Jerseys' was devised as an arts-based collaboration to explore issues of sectarianism then prevalent in Glasgow's east end. My participation in that project had a profound effect on my faith identity and related professional practices in education.

Many years later, and in the relatively secular environment of a modern university, I realise that my everyday professional practices are no longer visibly characterised by materialities of faith. Subsequently, the faith-based aspect of 'good professional' no longer has a material presence. In realising this absence I appre-

ciate the ways in faith-based material practices continue to influence my research and teaching in professional education.

This 'paper' brings together photographs and collages in a visual narrative of professional education that foregrounds materialities of faith and schooling. Law's (2004) concepts of presence, manifest absence and othering are brought together with the visual art technique of collage to analyse the ways in which visual representations of faith and 'professional' shape, and are shaped by, practices of curriculum, pedagogy and assessment.

Unrepresented: Gender Negotiations and the Movement to Organize Migrant Farm Workers in the United States

Despite strides toward equality, gender disparities remain rife within the labor movement. Labor organizations are often structured around the needs of workers as men, and gender dynamics within organizations often systematically overlook the needs of women. Using the Farm Labor Organizing Committee (FLOC) as a case study, this paper draws on ethnographic data collected from January 2013 – May 2014, and shows how organizations often use framing processes to position migrant farm workers as a uniformly exploited group, inadvertently overlooking the unique needs of migrant farm worker women. While much of the extant literature in the field of social movements accounts for the ways organizations utilize framing processes in order to foster a collective identity among actors, this paper identifies the ways in which organizations themselves risk becoming a site of precariousness when the cultivated collective identity lacks nuance and is overly essentialist, creating an exclusionary environment for actors whose identities fall outside of the collective framework. Migrant farm workers are precarious workers, and migrant farm worker women are particularly vulnerable. This paper shows how the framing processes which create a collective identity among migrant workers simultaneously overlook the unique struggles faced by migrant farm worker women. Through a masculinist discourse, a gendered allocation of resources, and a lack of attention paid to sexual harassment, the labor movement inadvertently places the rights of women in a secondary category.

Capturing Feminist Transgression through Cultural Production: A Comparative Analysis of Italian and Québécois Feminisms in the 1970s

Culture and politics sustain each other despite the tension and contradictions emerging from political movements, feminism included. Means of cultural production (journals, films, radio programing, publishing houses, visual arts, and exhibitions) are the traces left behind in the history of movements and we are not in the "company of strangers" when the dual notion of "politics" and "arts" appear side by side. This presentation intends to revisit moments in the recent history of contemporary feminism when political art was at the core of discourses and practices. Culture is a terrain for feminist struggles which was particularly visible in the 1970s when a diversity of cultural expression abounded, voicing feminist revolutionary messages. The presentation looks at two types of feminisms which have never been compared before: Québécois (Canada) and Italian feminisms. Looking at the 1970s, two interrelated phases appear clearly: the first phase was characterised by both the tension and the power of attraction between politics and the numerous counter-cultural manifestations created by feminism; the second phase was characterized by the increasing marginalization of cultural production within various movements, including feminism. To understand the later phase and how the marginalization of culture happened towards the end of the 1970s, I will look at the process of displacement of culture within feminism. I suggest that this displacement was perhaps consciously initiated by some feminists themselves who, out of a desire to get recognition and funding, aimed to produce the kind productions required by mainstream cultural institutions. The presentation will explore how the marginalization of culture from politics was accompanied by another sort of dissociation, one that de-linked the individual from the collective that had contributed to shaping women's identity as a political subject while feminism, as a political movement, fell into latency at the turn of 1980s.

Intersections Between National and Global, Public and Private Sites of Discursive Production: Private Non Profit Institutes of Culture and the Agenda of Diversity in Contemporary Brazil

Nonprofit organizations have been part of an international order of discourse since the 20th century. Nowadays this phenomenon recrudesces in a more complex transnational scale. Powerful private foundations are playing a growing role in the current multiplication of global governance regimes. They are defining world problems and shaping public agendas around the planet. This process is worldwide, but it occurs differently depending on the specificity of the local and national realities. The paper to be presented analyses the agency of Brazilian private nonprofit cultural organizations, their close and ambiguous relations with public power in Brazil and also their connections and kinship with transnational discursive agencies, such as UNESCO. The Brazilian cultural "institutes" are often a branch of powerful companies in the finance and energy sectors. Nevertheless, they have been sharing responsibilities with public government as if they were spokesmen of public interest. Part of their nonconsensual legitimacy comes from the fact that they enunciate and enact global discourses, as the discourse of diversity. Since the Brazilian Ministry of Culture has recently elected diversity as its main value (in an attempt to meet global standards enunciated by UNESCO - but also for local reasons), such private agencies gain discursive/practical power. For instance, a particular private institute is in charge of building a national encompassing database of the Brazilian cultural and artistic expressions. Diversity is named, shaped and constructed as such in this process. The same institute carries some important programs to foster art in Brazil and considerable amount of the funding for its activities is public money (tax breaks). Through the analysis of the discourse of these agents the paper seeks to bring lights to the discursive disputes and convergences between private and public, national and global players around the global and often conservative discourse of diversity.

Nonprofit Organizations of Culture in Contemporary Brazil: Ambiguous Relations with the State and Adjacency to Founding Companies

After the collapse of the socialist alternative and the crisis of the Fordist regime of accumulation, the "third sector" was praised as a good option in between the State and the Market. Since the 1980's, civil society organizations have grown around the world and the same happened in Brazil, where the process had a particular feature consisting in the end of a thirty-year long dictatorship. The civil society was urgently needed to foster democracy in the country. In this conjuncture, large companies in the sectors of finance, mining and energy launched nonprofit organizations, many of them in the field of culture. Their uprise follows the inception of laws stimulating private donation to artistic and cultural initiatives through tax breaks. The two main laws, called Rouanet Law and Audiovisual Law, allow individuals and legal entities to deduct a percentage of the tax due to donate to art and culture. The bigger the company the more it can "donate", which has led to the concentration of the donations in some large corporations that seek to "invest" in well-known artists and events, as a marketing strategy. In the case of a cultural institute founded and sponsored by a bank, for instance, there are strong bonds between the nonprofit organization and the founding company, even though they claim independence. It happens that banks are the largest donors and their nonprofit organizations are the biggest beneficiaries of the laws incentivizing culture. As they control a considerable budget passing through the public rule, their increasing role in the shaping of public policies is an example of the transformation of economic capital in public power. The paper will focus on the private and public agency of the cultural nonprofit organizations, their close and ambiguous relations with the State and their adjacency to their founding companies.

Political Alienation in Post-Communist Countries - a Sign of Social Anomie?

Participation in political processes is one of the core social activities establishing an individial as an active and engaged member of the society. Several studies have documented the political alienation of the citizens of post-communist countries. According to Korzeniowski (1994), Skarżyńska and Chmielewski (1995), the roots of political alienation can be found in the communist system, which allowed little space for meaningful and efficient political participation. Right after the fall of the Communist system political alienation decreased, however, the experiences of transition - hyperinflation, detoriating situation in the labor market, rapidly rising levels of poverty and economic insecurity – brought political alienation to a level higher than in the 1980s (Korzeniowski 1994; Skarżyńska and Chmielewski

1995; Mieriņa and Cers 2015). Many felt disappointed with the new system and frustrated with the slow pace of improvements. And even today, after twenty years of democratization post-communist countries still form a distinct cluster characterized by widespread political alienation among their citizens, especially young people (Mierina 2014).

Some of the indicators of political alienation (Seeman 1959; Roberts 1987) mirror those discussed in the literature on social anomie. This paper tries to link these concepts in order to better understand if political alienation can be seen as just one of the manifestations of anomie in general. If so, this might imply a need to revise our understanding of the roots of political alientation, thus providing better insight into the mechanisms behind social and political attitudes in post-communist countries.

MIGUEL, LUIS* (Universidade de Brasilia, luisfelipemiguel@gmail.com)

Participación y Representación En El Debate Brasileño

La ponencia aborda el vaciamiento, en el debate brasileño de las últimas décadas, del ideal de democracia participativa. Mientras que las formulaciones originales, de los años 1960 y 1970, indican la necesidad de aumentar las oportunidades para la gestión democrática colectiva en la vida cotidiana, especialmente en los locales de trabajo, los modelos en las siguientes décadas aceptan la circunscripción de las prácticas democráticas al Estado. Los "presupuestos participativos", que se iniciaron en muchas ciudades de Brasil a partir de finales del siglo XX, marcan el punto de inflexión en dirección a un foco restricto al Estado. En movimiento paralelo, la crítica de las instituciones representativas y la pasividad política que promueven se ha dejado de lado, en favor de una percepción de que la diferencia entre participación y representación está prácticamente anulada. Por lo tanto, se pierde el radicalismo de la crítica a los límites de las democracias liberales.

Organizational and Regional Determinants of Health Care Organizations' Efficiency: The Case of Infant Mortality and Community Health Centres in Indonesia

The number of studies on determinants of organizational efficiency have increased recently, but insights in the efficiency of health centre organizations and its determinants are relatively scarce, also in Indonesia. The Indonesian government has invested substantially in the national health care system as a way to improve health outcomes, such as reduced infant mortality rates. Especially Community Health Centres are pivotal in this process, since they are the first layer of health care services in Indonesia: they provide the first contact point for patients. The Indonesian government has granted CHCs autonomy to plan their own budgets and activities, based on local health care needs. Moreover, the government has more than doubled the budget for the CHCs in the past year. However, these investments have only marginally contributed to reduced infant mortality rates. This leads to the question how efficient CHCs are in converting their input (in terms of money and staff) into output (in terms of for example infant vaccination, prenatal care and hygiene promotion) that is assumed to contribute to improved health outcomes. Recognizing that reduced infant mortality rates are also related to well-known individual and household factors such as education and income, this paper focuses specifically on the efficiency of CHCs in Indonesia by comparing CHCs in various local governments. In addition, we explore both regional and organizational explanations of differences in efficiency in these CHCs. We first estimate the technical efficiency of 600 CHCs in Indonesia by using data envelopment analysis (DEA) and then examine the correlation of these CHCs technical efficiency to (1) regional characteristics (urban versus rural; Java versus non Java) and to 2) organizational characteristics (organizational size, professional staff intensity, and the functioning of the laboratory unit).

Under the Umbrella?: A Socio-Historical Analysis of Umbrella Organisations for Rare Diseases

This paper addresses the questions of what roles so-called umbrella organisations play in governance of health and medicine and on what basis they are able to do so by historically examining the establishment and development of some such organisations in the field of rare diseases, such as NORD, Genetic Alliance, Genetic Alliance UK and Eurordis. There has been growing attention to rare diseases in the domains of public health policy and biomedical sciences over the last twenty years and also a proliferation of individual disease organisations to act on behalf of patients and their families. At the same time, a number of umbrella organisations have been established to represent these organisations in national and international decision-making processes. Whereas individual disease organisations usually have a coherent patient community to represent, however, umbrella organisations represent a broad range of communities and their attempt to characterise and group their members using the idea of 'rareness' has been criticised (e.g. Rabeharisoa et al., 2015). This raises the question of how representative and legitimate their voices are, and ultimately that of whether their participation should count as a form of patient participation. The historical analysis of umbrella organisations in the field of rare diseases demonstrates that they were established as a response to a particular circumstance that patients and/or their families found themselves in at a particular point in history. Their initial success(es) then allowed them to build their capability in other areas and to be seen as a useful contact point by policymakers and health and medical professionals. Analysing their history comparatively, I explore in this paper the issues of representativeness and legitimacy of umbrella organisations and examines whether their active participation in governance of health and medicine ought to be considered as an emergent form of patient participation.

Confectionery Trade Cards and Visual Culture of Russia at the Turn of XIX-XX Centuries.

Confectionery Trade Card is an important part of visual culture and everyday life of Russia at the turn of XIX-XX centuries. It was a kind of advertising strategy. An illustrated card was inserted into the box of chocolate. A person who collected a series of 12 cards (i.e. who bought 12 boxes of chocolate) got a prize from the factory. The picture on the card was connected with geography, ethnography, history and etc. The image tended to be narrative. There was also a text describing the image on the flip side of the card. It seemed to us possible to compare confectionery trade cards with a visual encyclopedia. The cards conveyed scientific knowledge to those who were not able to read. A census indicated that only about 20 percent of the population could be considered literate people. In fact, the number was larger. Nevertheless the visual presentation of scientific knowledge was very significant. The confectionery trade cards were part of this knowledge popularization strategy. The analysis of series of confectionery cards allows answering some important questions. Which scientific fields were reflected in that visual encyclopedia? Whose scientific point of view did they represent? Which stereotypes in scientific knowledge perception did they shape? This report is a case study. It deals with the analysis of certain series of confectionery trade cards. The conclusion allows determining the place of confectionery trade cards in the visual culture of Russia at the turn of XIX-XX centuries. The comparison with other examples of printed production of that time enables to distinguish certain features of the visual way of scientific knowledge popularization.

The Types of Communities in the Structure of Innovative Society

Innovative development of the society depends on two factors: innovative potential and the level of its implementability at present. Innovative potential is a person's ability to use resources to create innovations. The implementability level is how innovations influence upon the life of the Society. Depending on the combination of these factors, it is possible to distinguish some types of communities:
1) Innovative engine has high value of both factors. Such community is a pioneer of innovative development
2) Copy-paste community does not have a high innovative potential, but is able for fast perception and adaptation of innovations. Such community follows the innovative engine
3) Latecomer has a high innovative potential, but a low implementability level. In such communities innovations play minor role in people's lives. But ideas, generated in this community, can actively spread in other types of communities
4) Stark community has a low value of both factors. Such communities develop due to extensive factors, innovations are not generated inside, but imported outside.
5) Imitator is a community, where it is impossible to determine the correct value of factors because of closure and opacity. As a rule, such communities emulate innovative activity. But this actions result in consumption of resources and don't attract significant changes in people's lives. The prevalence of a certain type of community determines the level of social innovative development. Structure, in which the first type predominates, is the most competitive in the world economy. The structures with predominating second and third types of communities can go up to innovative engine (in good condi-

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

tions). Structures with dominating stark communities find themselves at the periphery of world economy development, and the gap will get wider over the time. There are various opinions on the expansion of imitators in the social structure therefore this problem can be analysed later.

MILKMAN, RUTH* (CUNY Graduate Center, rmmilkman@gmail.com)

"Low Wage Worker Organizing and Advocacy in the U.S.a.: Comparing Domestic Workers and Day Laborers"

Building on the rich secondary literature on domestic and day laborer organization and advocacy in the U.S.A., this paper compares and contrasts the two cases. They share many common features: both are ill-suited to conventional forms of unionism; both focus on occupations primarily held by recent immigrants, many of them unauthorized; both involve entry-level jobs at the bottom of the labor market, although internally stratified with positions that vary in desirability and pay; and both have been the focus of extensive advocacy and organizing at both the local and national level for the past two decades. Yet there are also important points of contrast. The most obvious is that women make up the vast majority of domestic workers while men predominate among day laborers — although this is not always reflected in the leadership of their organizations. Another striking difference is that while domestic labor is largely hidden from public view, taking place primarily in private households, day laborers are regularly on display on street corners and in other highly visible spaces. This paper explores the ways in which these similarities and differences affect the collective action repertoires of day laborers and domestic workers.

Domains of Quality of Life and Subjective Wellbeing in Mexico

The paper is based on a national survey made in 2014, applied to 1300 adults (aged 18 years old or more). It will present the results of the association between three dimensions that imply different domains of quality of life and subjective wellbeing, measured as life satisfaction. The studied dimensions will be the following: socioeconomic, relational goods, and quality of the social environment. In the first dimension, domains such as income, education, employment and social security, will be analyzed. In the second, sociability or relational goods will be studied. Finally, in the third dimension, security, housing satisfaction, and public services will be analyzed. The aim of the paper is to determine which of those dimensions has a greater association with subjective wellbeing, and to point out which domain is the most important in determining such subjective wellbeing for the Mexican case

Social Capital and Rational Choice in a Non Political Association

The paper will present the results of an ethnographical research made during 2013-2014 in a non political association (a sport club) in Mexico City. It will analyze how cooperation dynamics are produced in three levels: a) at the micro level, it is focused on the formation of bondings within close groups and networks; b) at the meso level, it will analyze the possibilities of cooperation and formation of social capital between networks, and therefore, the formation of bridges; and c) at the macro level of the association will analyze, taking into account the previous levels, the coordination of actions to address common problems. The paper will show that nevertheless – according to Coleman – it is rational to cooperate with others, the risk to advance trust does not bring the same outcome at the three levels. In fact, the relationship between social capital and strategic decisions vary according to the level. That variation is due to some extent by the degree of networks closure, by the extent of trust (including the association itself), and by the decision making institutional design of the association. Therefore, in each of the three levels there are different incentives to cooperate and different costs for desertion

The Possible Consequences of the Electoral Reform in the Italian Political System

The recent Italian electoral reform, named "*Italicum*", so as it is conceived, will surely produce relevant structural effects, first of all on the Italian party system, and then, probably during some more time, on the entire political system.

The paper wants to bring into effect, after a short exposition concerning the main details making the reform, an analysis of the possible scenarios which it could set up. To this end, the paper will be structured in the following way: at first, it will be done a short reconstruction about how the previous electoral reforms have progressively transformed the Italian political system till now-a-day, starting from the first electoral reform in 1993 ("*Mattarellum*").

Subsequently, the present assets and functioning of the political system will be described: what are the right aspects and ones which should need some improvement?

On the basis of these reflections it will be proposed a sort of simulation about what could happen to the party system, and the political one, when the electoral reform will be completely operative, and we will try to drawing some conclusions about its efficacy or less in achieving the result, its approval by the present Government majority is determined to reach.

MILLER, DEMOND* (Rowan University, millerd@rowan.edu)

Eco-Masculinity and the Aftermath of Catastrophic Events: Masculinity and the Role of Livelihood Security

In the social scientific literature, few attempts have been made to understand the relationship between man (the masculine) and nature. There are few social scientific studies that explore how men perceive their relationship to the physical environment and how the environment can help shape and define masculinity. The studies that do exist explicitly detail the nature of men who self-define their masculinity by the type of outdoor activities, behaviors, and work they perform. This paper argues a need to understand the relationships between men and the physical environment in the aftermath of disasters. A new, more nuanced understanding is proposed of traditional masculine gender roles, which has historically viewed men as exploiter and extractor. The objective of this chapter is to examine the unique contribution that masculinity has in understanding how men relate to and understand their physical environment in the aftermath of disaster and how masculinity contributes to an understanding of how men live "as one" *vis–à–vis* their environment as not only extractor, for his livelihood, but also as its protector and defender. Using recent disasters along the Gulf Coast of the United States as case studies to draw conclusions regarding the dual nuanced nature of man to his environment, this chapter contributes to the disaster literature by asserting the argument for the inclusion of an eco-masculine perspective in disaster studies by briefly presenting an overview of some of the issues and concludes with exploring how ecomasculinity is well-suited to address diminishing vulnerabilities to catastrophic events among men and vulnerabilities within social organizations.

MILLER, KRISTIN* (University of California, Santa Cruz, krmomill@ucsc.edu)

From the Dust of This World: The Dystopian Imaginary and the Anthropocene

In keeping with the Third ISA Forum's theme of the "Futures We Want," I would like to submit an abstract for an interdisciplinary and multimedia project on speculative realism and catastrophism read within the logic of the Anthropocene.

In the past two decades, there has been an ever-rising tide of scholarship on the climate crisis, as well as consideration of humanity's role in shifting terrestrial ecosystems., and possibly our own apocalyptic end. Simultaneously, there has been a dramatic increase in the production and consumption of speculative and dystopic science fiction film and literature. For this presentation, I intend to interrogate both the logic of the Anthropocene and a human-driven "sixth extinction," as well as the visual tropes of catastrophe and social disorder that serve as the pop-cultural framework through which these theoretical and scientific concepts are increasingly filtered.

In order to attempt to sustain any aspect of the current environment, or warn about its destruction, one must also be envisioning a particular sort of future. I argue the prevalence of dystopian and nihilistic filmic visions has a significant role to play in imagining, as some recent titles would have it, living *In the Dust of This Planet* or *Racing Extinction*. Fictional accounts of dystopia and catastrophe are not merely reflections of ecological worry, but may have material impacts on how communities conceive of themselves, and shape their social and physical environments towards an uncertain future. Because of this, it is vital that they be critiqued more thoroughly, to gain an understanding of why so much time is being spent on envisioning the futures that we *don't* want, rather than the ones we do.

Systemic Risk: Increased Technological Hazards and Current Regulatory Frameworks in the U.S.

Three recent case studies --- a deadly explosion at a fertilizer company that all but leveled a small town, a mysterious fire at a chemical company near a residential area, and drinking water contamination from oil fracturing --- are examined to highlight weaknesses in the current regulatory structure that may benefit businesses in the short term but have serious, and frequent, ramifications for residents and the environment. Drawing on Miller, Antonio, and Bonanno (2011), Lakoff (2010), Perrow (2008, 2007), and Beck (2007) this paper explores how the current regulatory context embodies the contradictory goals of facilitating business growth and protecting people and places. The lack of zoning restrictions, little oversight of hazardous chemical storage, and the ability to preserve trade secrets even when response crews are attempting to extinguish the flames, contribute to increased technological hazards. All three incidents discussed here occurred in Texas, a state that is particularly contrary to regulation, and therefore serves as a cautionary tale to other regions favoring economic development at all costs, even to the detriment of public safety.

MILLER-BELAND, DANIELLE* (Concordia University, d.millerbel@gmail.com)

The Social Effects of Methylmercury Contamination in the English-Wabigoon River System.

Methylmercury is a known toxic metal compound found in the environment, and while it can be produced naturally, most cases of largescale contaminations are caused by anthropogenic causes, ranging anywhere from factory production to mining. The biological effects of methylmercury have been well documented, as it targets the nervous system, causing neurological damages, as well as affecting internal organs of those exposed to it. It also causes neurological and physical defects to children who were exposed to it in the womb meaning it has a multi-generational longevity in its biological impact.

While the biological effects are understood, correlations between that and the social effects due to poisoning are not always drawn upon when looking at intervention procedures while addressing the contamination. By demonstrating how different social factors, such as stigmatisation, corporate responsibility, social welfare resources, government intervention, and economic issues are influenced by the long-term recovery process of a large-scale methylmercury contamination, there can be a better understanding of how mercury poisoning impacts social well-being.

By using the example of the English-Wabigoon River system in Northern Ontario, Canada, which was discovered to have elevated levels of methylmercury in 1970 caused by Dryden Pulp and Paper Co., a paper mill factory located north of two Native communities, White Dog and Grassy Narrows, (and who are still to this day experiencing effects from the contamination), this paper will demonstrate how the biological effects of a large scale mercury contamination has a direct impact on the social well-being of the communities and how it influences the long-term recovery process. This will allow for further discussion on how procedures should be implemented during mecury contamination as well as discussion on the experiences the Native communities went through when moving forward through this environmental disaster.

Distribution, Recognition, Representation and Contribution - Social Justice at Micro and Macro Levels in Alternative Education Programs

Injustice and inequality are thrown into sharp relief when examining the experiences of young people who are disenfranchised from the right to an education. In Australia, where (in common with most developed countries) completion of upper secondary education has become the new minimum standard, young people who do not complete school are squarely in that disenfranchised group. At the micro-level, this paper analyses these young people's experiences of (in)justice. At the macro-level, we examine (in)justice from the viewpoint of the alternative education programs (AEPs) that provide educational opportunities for these students – and which themselves are located at the margins of the education system.

Our analytical lens combines Fraser's framework of distribution, recognition and representation with Sayer's notion of contributive justice. Distribution focuses on the economic dimension of justice: e.g. providing breakfast and transport subsidies for students (at micro level) and funding and sustainability of AEPs at

macro level). Recognition addresses the cultural dimension and involves valuing of differences: recognising young people's strengths (micro) as well as the strengths and innovations of AEPs (macro). Representation, the political dimension, requires that people have the opportunity to make representations on matters that impact on them: enabling 'youth voice' and 'agency' (micro) and input from AEPs into policy decisions (macro). Finally, we adopt Sayer's qualitative understanding of 'contributive justice' and its relationship to 'meaningful work': relevance and authenticity of the curriculum (micro) and the role AEPs are expected and enabled to play in the education of young Australians (macro).

These two sets of analyses draw attention to the multiple injustices associated with disenfranchisement from schooling and the disruption of a young person's education trajectory. While AEPs provide the context for our research, the paper examines the implications for traditional schools and how they might better meet the diverse needs of young people.

Reconstructing Rituals: Using Bricolage to (Re)Negotiate Faith Based Rituals with the Jewish Lesbian, Gay, Bisexual, Transgender Queer and Intersex Community

In Judaism, as with a number of other major religions, there are hetero-normative expectations present in cultural and religious life. These can create exclusion and a sense of detachment from ritual and practice (Schneer & Aviv, 2002; Alpert, 1997) whereby some Lesbian, Gay, Bisexual, Transgender, Queer and Intersex (LGBTQI) Jewish people perceive themselves as 'doubly other' (Rose & Balka, 1989) and experience a sense of cultural loss, ritual exclusion and discrimination in key ritual settings. This problem is particularly acute for Trans-Jews who report that they can be confined to a 'limbo' situation, even in contexts where lesbian and gay co-religionists are accepted as full members of a congregation (see Dzmura, 2011).

In response to this, from 2014 to 2015 members of the UK Jewish LGBTQI community were involved in *Ritual Reconstructed*, an Arts and Humanities Research Council UK funded project. *Ritual Reconstructed* encouraged participants to use bricolage to (re)create faith rituals and merge their core Jewish and queer identities by using personally meaningful objects alongside film, art, storytelling and music.

Using Mary's (2005) definition of bricolage as a dialogue between 'meaningful material that one borrows' and 'incarnated forms one inherits' and Savastano's (2007) argument that that LGBTQI people have been forced to create their own sacred or alternative myths to create a new way of bringing together queer and their spiritual identities, this paper explores the Jewish LGBTQI community as bricoleur and analyses how they have (re)created their own ritual identities through through film, photographs and material artefacts.

MILSTEIN, DENISE* (Sociology, denicham@gmail.com)

Trials in Tierra Del Fuego

This paper examines the emergence of innovation and the articulation of future projects based on participatory action research in *Ensayos*, a collaborative program that brings together artists and scientists in the Tierra del Fuego archipelago of the sub-Antarctic. Over the past five years, the collaboration has grown into an international, multidisciplinary community devoted to engaging with the political ecology of the region. Several projects, both artistic and scientific, pursue common research questions, themes and concerns through overlapping collaborations. These address issues of sustainability for human and non-human populations in Tierra del Fuego, the conflict between the built environment and the protection of wilderness, the transformation of the ecosystem as a result of invasive species, and the impact of migration on indigenous populations. Innovative approaches, both for art and science, have emerged consistently as a result of the interactions between *Ensayos* participants. The paper describes the participatory action research process itself, and thereby reveals the patterns whereby both innovation and future oriented thinking emerge within the group. Based on oral history interviews and ethnographic observation, we create social networks, both conceptual and narrative, meant to highlight relations within the group. Together with a sculptor from *Ensayos,* we design a three dimensional representation of these networks and engage participants in building the physical networks over the ceiling of an exhibition space, and reflecting critically on the structure. The process reveals the dynamics of innovation in these uncommon interactions, as well as the research projects and artistic results that they yield.

MILSTEIN, DENISE* (Columbia University,
denicham@gmail.com)

Views on Building a New Park in Brooklyn

This paper explores the relationship between the creation of a new urban park and the diverse communities of a coastal neighborhood in Brooklyn, New York. The Brooklyn Navy Yard has, throughout its existence, been closed to the public. Over the past decade, and as a result of collaboration between environmental advocates, community organizations, private interest, and the pressures of gentrification, a continuous greenway has been under construction along the Brooklyn waterfront. Along the greenway is the Naval Cemetery Landscape, a space within the Navy Yard now in the process of becoming a new park. The ground breaking for the park took place in the fall of 2015, and the park is slated to open in the spring of 2016. Landscape architects and horticultural engineers have designed the space to sustain native plants, and the meadow at the center of the park is meant to offer a space of respite from the built environment. A series of projects surrounding the creation of the park attempt to engage the local community in its development, including educational programs for high school students or horticultural training for formerly homeless individuals living in subsidized housing communities. The glimpse of wilderness the Naval Cemetery Landscape will offer looks very different from the variety of vantage points that surround it. Ethnographic research with the organizers of the park, educators, and the communities around it reveals the complex, idiosyncratic and contradictory ways in which nature is understood, guarded, advocated for, sustained and destroyed in urban environments. The contrast between the goals of city planners and activists and the outlook of the community reveals the challenges, both conceptual and organizational, to integrating new green spaces to the urban fabric. The paper explores the frontiers between socio-economic, racial and ethnic groups that shape urban planning and its outcomes.

Emotions and Ethics through Vegan Movement

Why are human-animal relation and vegan movement ignored in Sociology? Social thought has tended to emphasize the idea that animals are outside the human boundary and the notion of "animals-as-other" is reflected in many walks of life: the worst is the acceptance of animals as a source of food. Escaping to a relationship of closeness, humanity has suppressed the emotional connection that accompanies the killing of another creature and mystifying perceptions about animals, we deny the identification with them and empathy. However, vegan movement has an emotional dimension that extends beyond diet to preclude the human use of any animal-based products; particular attention will be focused on the dimension of emotions and ethics which are the main driving force for those who decide to opt for veganism.

What justifies the relevance of this analysis is the perspective of the adoption of veganism as a driving force that leads social actors to question what is "taken for granted" and their emotions towards animals and other humans. Vegans literally embody the resistance to the assertiveness of meatist culture and also lead to a reflection on the consumption of animals: the movement promotes new meanings of food and of the relationship between humans and animals, making humans closer to compassion and empathy. The meaning of vegan movement is associated with the rejection of the speciesist privilege and the construction of new habits, to collaboration and participation, to the shaping of empathy-based social networks.

Vegans are like a deconstructed social movement still maintaining a powerful, unifying ideology which deserves recognition and attention. It does not have any specific opponent but it is based on solidarity and it is able to act with forms of participation and collective action aiming at radical change. With the present research, we will try to give them voice.

Spirituality As a Panacea for the Ecological Crisis in Kashmir Region, India

Environment has remained deeply embedded within the socio-cultural aspects of Kashmiri Community since time immemorial. Kashmirscape - the unique blend of picturesque landscape, perennial clean water streams and lakes, lush-green vegetation and various seasons with changing hues - has always been associated with the sacred. The rituals, its celebrations, its religion, its culture, all have derived inspirations from the natural settings. However, the region is going through the worst phase of its ecological crisis. The reasons range from the increase in population to the detachment of religion/spirituality from nature. The social prac-

tices have changed due to changes in attitudes towards environment, which had been deeply rooted in the spiritual practices of the community.

The study hypothesizes that the age old tradition of spirituality within the Kashmiri Community is panacea for the current ecological crisis in the region. This paper, therefore, aims at bringing out the relationship between the ecology and the spirituality within the valley. Also the current ecological crisis, through which this fragile eco-setting is going, has been analyzed and the need for revival of the old traditions of sacred ecology is explored. As such, exploratory and descriptive methods are utilized, along with the narrative analysis. Narratives have been collected through in-depth interviews of the septuagenarian and octogenarian members of the Kashmiri community.

Preliminary analysis points towards the dramatic change in environmental practices due to changes in the spiritual and religious practices within the community. The paper ends with a note that spiritual ecology needs to be revived in the region to protect its fragile environment from the current crisis and for its sustainability for a longer period in future.

MIRANDA, DANIEL* (P. Catholic University of Chile,
damiranda@gmail.com)

Unequal Background on Citizenship Participation: The Role of Civic Knowledge and Political Interest.

Evidence has shown consistently that the resources are related to participation, in example, people with more education, income and/or political/civic knowledge have more chances to participate (Schlozman, Verba & Brady, 2012). Another dimension that has evidence about the relation with participation is political interest, considered as an indicator of political engagement. Nevertheless, these antecedents' shows two research gaps: it is mainly based on the formal ways of participation typically labeled as political participation and the social background, political/civic knowledge and attitudes are treated separately.

The aim of this paper is to assess the influence of the socioeconomic background, civic knowledge and political interest on students citizenship participation using different participation ways that are defined here under the umbrella of citizenship: It involves a *civil dimension*, which refers to the relationships with the community and informal or civil associations; as well as a *civic dimension,* that refers to the relationships with formal institutions and the political system, such as voting and membership to political parties.

The combination of these three approaches would help bridging the referred research gap. In that sense the main questions proposed in order to guide the research are: to what extent socioeconomic background impact on the different types of participation? to what extent civic knowledge impact on the different types of participation? The civic knowledge play a role of mediator in the relation between socioeconomic backgrounds and participation? And finally, to what extent the political interest moderate that mediation process?

Using a Chilean representative sample students that participated in the International Civic and Citizenship Study, preliminary results shows a mediated moderation process. Those with more political interest shows a stronger relation between socioeconomic background and civic knowledge and a stronger relation between civic knowledge and participation. Nevertheless this process varies between types of participation.

Youth Citizenship Participation: An Empirical Test of a Conceptual Model

On the citizenship participation issue the academic literature has put the focus on the political participation based on a generalized diagnostic, that is: the declining of voting turnout (Blais & Rubenson, 2013) and the socioeconomic bias (Scholzman, Verba & Brady, 2012) as threat of representativeness in democratic systems. Nevertheless, these diagnostic it is focused on the formal ways of participation typically labeled as political participation. This political disaffection of the younger cohorts contrasts with the increasing of youth participation in public demonstrations, demanding a series of civil and social rights (Marien, et.al, 2010). The consideration of other ways of participation have receive less attention and conceptualize and measure a broad citizenship participation it is challenge to capture the ways in which young people get involved in public life.

This paper encompasses different participation ways that are defined here under the umbrella of citizenship in youth population. It involves a *civil dimension*, which refers to the relationships with the community and informal or civil associations; as well as a *civic dimension,* that refers to the relationships with formal institutions and the political system, such as voting and membership to political parties.

Both sides of the phenomenon make the notion of citizenship as a more appropriate concept to encompass the dimensions of political socialization in younger cohorts. Second, in order to advance the empirical implications of this conceptual distinction, the paper estimates a measurement model of the citizenship concept,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

using a multigroup confirmatory factor analysis with the purpose of evaluate the citizenship conceptual model with a representative sample of 8th grade students in 35 countries (n=130.000 students) that participated in the International Civic and Citizenship Study. Finally, the present paper evaluate the measurement invariance levels to assure that the measured construct between countries are the same, in order to improve the comparability.

Roma Youth Mobilization in Spain. Public Policies, Supranational Agencies and Youth Identity Frames

Since the early 90s, international agencies, public policies and Romani leaders increasingly acknowledged the need to invest in Roma youth explicitly, in order to mitigate the numerous deficits, challenges and problems faced by Romani youngsters. This led to the crystallization of "Roma youth" as a specific target group in domestic and international policies and programmes, far too often perceiving the youth as passive beneficiaries. However, the youth are "agents of change, not simple subjects to change" (Ginwright, Noguera, and Cammarota, 2006). Over time, and as universal youth-targeted policies and Roma-youth specific programmes began to bear its fruits, Roma youth gradually emerged as self-conscious stakeholders, demanding their place at the policy table and within the structures of Romani ethnic mobilization. In Spain, Roma youth mobilisation is a highly fragmented analytical unit throughout a wide range of organisational structures and interest orientations.

While literature on ethnic mobilisations pays more attention to *mobilizing structures* (Doug McAdam et al., 1996) than to individual actors, our contribution aims to bring also this element into its focus. This paper will explore the interplay between public policies, programmes of supranational organisations and agencies, Romani rights recognition on the one hand, and Roma ethnic mobilization in Spain on the other, paying special attention to the individual trajectories of Spanish Roma youth within the mobilisation processes, and the impact of participating in ethnic mobilisation, in terms of shifting youth "identity frames" and of sociocultural change.

Data, used for the analysis, stem from two ongoing research projects, in which data collection was made through in-depth interviews and non-participatory observations. The main units of analysis included young Spanish Roma men and women as well as Spanish Roma and pro-Roma NGOs.

MIRSHAK, NADIM* (University of Manchester, nadim.mirshak@manchester.ac.uk)

Egyptian Civil Society and (Political) Education: Opportunities for Resilient Authoritarianism, or Prospects for a "Radical" Educational Movement?

As we approach the fifth anniversary of the Arab "uprisings", the demands for bread, freedom and social justice are yet to be attained. This failure to fulfil the demands of the Egyptian people necessitates taking a more nuanced and critical approach in order to help us understand why such "uprisings" have failed, at least temporarily. Discussions concerning revolutionary transitions and democratic social change can never be complete without an elaborate consideration of the role education could play in aiding, and inhibiting such social change. After 2011, the importance of "political" education and the development of "critical consciousness" have come to the fore of many discussions and debates. However, looking closely at the "non-formal" educational movement in Egypt (i.e. that located within Egyptian civil society), will reveal a deeper struggle ensuing between the State and a number of progressive civil society organisations (CSOs). Such a struggle manifests itself in the State's strategies to subdue CSOs and their educational initiatives, as well as the CSOs' own efforts to evade, and resist such oppressive State tactics. Through adopting a Gramscian framework that encourages viewing civil society as a terrain of hegemonic struggle, and of potential political education, I will firstly analyse how authoritarianism has been relatively resilient through utilising a combination of "soft" and "hard" repressive methods, as well as co-opting CSOs and intellectuals. Secondly, I will then explore how despite such impediments, a number of CSOs are finding ways to resist the authoritarian system by utilising methods that enable their educational initiatives to bypass and function under these restrictions. Such an analysis will highlight the importance of viewing the nature of authoritarianism and State-(civil) society relations through a more distinctive and critical manner.

Individuality,Individualism and Individualization,a Deliberating about Iran

What distinguishes today life in human societies from life in pre-modern societies is the humans' power of choice for making decision about their own lives. Due to the various aspects of individualism and its Janus-like behavior, usually there is a concern about the developing countries, since they are moving from collectivism to individualism,that individualism may appear in a wrong way and selfishness or egoism becomes the substitute of responsibility. Furthermore the relation of structural determination (Such as family, ethnicity, religion ...) and individualism in different societies is so important. In a society like Iran, people do not leave their families after reaching the legal age. They will have the support and of course the control and domination of their family forever. The relation of an individual and their ethnicity is also a specific one and the faith of an individual impresses their dignity and individuality differently. It has a different appearance in small and big cities. Therefore we could say in total that a kind of individuality has appeared in Iran that considers the family as an important component; that's why it is different with the European common pattern that insists on individuality. Moreover when we consider individuality as a modern issue and individualization as a postmodern characteristic in developing countries and their resulting conflicts,a specific problematic brings up that demands a serious study. This paper is going to discuss the mentioned issues. It studies individualism, individuality and individualization in Iran society specially Tehran.

MIRZAIE, AYATOLLAH* (The Institute for Humanities and Cultural Studies (IHCS), Sayatmir@yahoo.com)

Nationalism Among Iranian University Students

This research has surveyed the nationalistic approaches using a questionnaire among a sample of Iranian students from the six ethnic backgrounds (*Balouch, Turk, Persian, Arab, Kurd* and *Lur*). The findings revealed that Iranian students have diverse approaches towards (ancient, religious, civil and state) nationalisms and ethnicism on the basis of background of ethnicity. The finding of this research indicates a very strong approach of Iranian ethnic students towards civil dimension of nationalism in proportion to other approaches. This means that this very strong approach of the students towards the civil dimension of the nationalism lies beyond independent and background variables (ethnicity, religion and the like). Therefore, the most general nationalistic approach among Iranian students is civil approach. This finding is not only strongly observed within the whole research sample, but also it is observed among the students of all the six Iranian ethnic backgrounds. The findings also reveal that other Iranian nationalism approaches (ancient, religious and state) and ethnicism in relation with background variables (ethnicism, religion and the like) are representatives of difference. However, there are strength and weakness in terms of both type of the approach and the degrees of the approach among the students of six ethnic backgrounds. Therefore, it may be concluded that the prevalent nationalistic approaches among Iranian students are: civil, ancient and religious. On the basis of this observation, we are not faced with a unitary nationalistic approach among Iranian students. This finding verifies empirically the views of Smith, Gilbert and Hutchinson based on diversity of nationalistic approaches.

Keywords: nationalism, Iranian nationalism, ancient nationalism, religious nationalism, civil nationalism, ethnic nationalism

MIRZAMOSTAFA, SEDDIGHEH* (University of Mazandaran, smirzamostafa@gmail.com)

Hajj and Distinction in Iran

This article introduces represent of Hajj in Tehran. Hajj is the most important religious ritual for Muslim's society and is an annual Islamic pilgrimage to Mekka, and a mandatory religious duty for Muslims that must be carried out at least once in their lifetime by all adult Muslims who capable of undertaking the journey, and can support their family during that time. In this ritual, in specific days of a year, Muslims should gather in Mecca and do their rituals and worship there.

Every year about sixty thousands of Iranians attend in Hajj. When they return, there is a special ceremony to welcome them that include installing banners and posters and illuminate in the streets. A person who has returned from Mecca should invite the whole family and friends to dinner party called «Valimeh».

In fact, the event was going to be a ritual that in a symbolic manner helps people to liberate from material and financial attachments, and decrease the distinction and differentiation from other Muslims, as soon as they come back to their countries, the ritual itself becomes a mean for social and economic distinction and ostentation.

Bourdieu's work on status distinctions suggests the need to examine the ways cultural capital operates in the intimate realm of social reproduction to reproduce stratified class societies; his classic work, Distinction, opens with a call to examine the culture and status distinctions of everyday life (Bourdieu 1984, p. 1). In this article, we use Bourdieu's notion to explain this rituals in Tehran.

Using visual analysis, this study investigated banners and ceremonies of returning hajjis. Our investigations reveal that how socio- economic status of hajjis represent and reproduce by observable religious symbols in Iran.

MIRZAMOSTAFA, SEDDIGHEH* (University of Mazandaran, smirzamostafa@gmail.com)

Selective Representation of Religion in the City

In this study we have attempted to have sociological analysis of selective representation of religious in Tehran with theories of M.Halbwachs and P.Ricoeur.

Halbwachs showed the relationship between different groups and space. He studied the space as a fact that carries memory of groups.

Ricoeur studied memory by showing the relationship between Memory and Forgetting by using narratives. Narratives can be constructed in a way that can be a source of wound healing and sad memories or can exacerbate them.

At any situation that there is a emphasize on the special memories, the more memory will be deleted and removed. With this approach, we started to study of representation of collective memory and selective representation of religious in Tehran, and Valieasr Street was chosen. Valieasr Street is the most important street in Tehran which connects north of city to south.

The following indicators were used for the study: 1-Naming 2-Advertisement 3-change of place. According to these indicators, policies that make people to remember and forgot, and resistance of social groups against it have been studied.

I have concluded that what we see in Tehran as a source of remembering and our memory is extremely selective. In this version of religion that city provides for us, many trends, events and social groups have been removed and what remains is narrow segment of religion that narrated by a small group of people so, this narration is not acceptable for all of citizens.

MISANE, AGITA* (Advanced Social and Political Research Institute, University of Latvia, agitami@gmail.com)

Anomie, Anomia and Anomy - Distinct Concepts and Distinct Research Approaches? a View from Latvia.

Drawing on the preliminary findings of the research project „Social value orientations and social renewal" from the University of Latvia, this paper will discuss the practical applicability of the concepts anomie, anomia and anomy to sociological research of a particular society. The project applies mixed methods approach to the research of value orientations and social norms of the Latvian society with particular reference to the impact of mass media and Soviet regime on their genesis, and the spread of social anomie. Further, it is intended to analyze how value orientations influence social behavior, including forms of political participation, the evolution of family models and citizens' reproductive behavior. We have found the distinction of *anomia* (individual state of subjective feeling of meaninglessness and atomization, disappointment with one's situation in the society, and concerns of insecure personal future) and *anomie* (a state of society where social institutions provide insufficient moral guidance and normative regulation to the members of society) useful. We would argue that these two phenomena require different methodological approaches to research. Social surveys (Srole's scale, e.a.) prove helpful to the measurement of *anomia* while a combination of qualitative and quantitative methods need to be applied to *anomie* research. Several indicators of *anomie* will be discussed, in particular, reactions to normlessness epitomized by growth of nationalism, neoconservatism and Soviet nostalgia.

Futures in Contention: Projective Deliberation and Transformative Politics in the Global Arena.

As a sociologist of culture and politics, my work focuses on "projectivity" – the imaginative engagement with future possibilities – as a core component of human agency. While there has been much attention to collective memory in cultural and political sociology, there has been less scholarly work on the role of imagined futures in social and historical change. My work points to a "sociology of the future"

by examining how future projections – often tenuous and uncertain – shape and are shaped by social processes. Drawing upon pragmatist and phenomenological theory, I focus on the communicative processes by which actors continually reassess future possibilities in the face of past and current experiences. I ask how the human capacity to imagine the future (a) is shaped by social context, cultural understandings and historical forces; and (b) has the capacity to intervene in – and sometimes reconfigure – political and social trajectories. In this light, I discuss my current research on the role of future-oriented deliberations in social and political interventions across global networks focusing on development, peacebuilding and environmental sustainability. Techniques for strategic forecasting, participatory scenario planning and alternative futures visioning have traveled across social sectors, ranging from corporate and military venues to inter-governmental agencies, transnational INGO forums, local community workshops and the global justice movement. Yet these practices have received little critical scholarly attention. I examine the transnational networks, deliberative practices, and policy influences of these new forms of futures thinking, contributing to our understanding of the role of the future imaginary in historical process.

Neo-Liberalism and the Liberal-Democratic Public Sphere

Neo-Liberalism and the Liberal-Democratic Public Sphere
Vessela Misheva

The paper examines the compatibility of economic and political liberalism to public-mindedness. It argues that such analyses normally omit the fact that not all entrepreneurial activity, that is associated today with neo-liberal imperative of rational economic behavior, is dominated by the principle of competition. More concretely, the neo-liberal rationality will be compared to liberal-democratic rationality in respect to the type of entrepreneurship they encourage and promote.

The discussion will be focused on the possibility of a liberal-democratic public sphere as a political body of public minded social entrepreneurs whose interests include cooperation in a joint act with the purpose of creating social value and public good. A distinction will be provided in this regard between economic profit and socio-psychological profit which then will be discussed in the context of the main principles of cooperation and symbolic interaction as characteristic for the liberal-democratic public sphere. The discussion will be supported by the analysis of the rise and fall of one exemplary public sphere located in Chicago with a lively liberal democratic discourse around the turn of the XXth century, known as Hull-House.

Self Governance and Watershed Development Programme a Case from Eastern India

To sustain the dryland agriculture watershed development programme is implemented by the Government of India (GOI) and various State Governments. To endure these programme lots of emphasis are given on self-governance and community participation. However, in spite of all these initiation still it has failed to achieve the desired result. Lot of variation are observed in case of community participation. Under this background, the present study has carried out in a Jharbandhali micro-watershed located in Balangir district of western Odisha, eastern India. Broadly, the objective of the study is to figure out the level of community participation in watershed programme. The sociological and anthropological techniques are used to fulfil the objective of the present study. The overall empirical findings of the study show that the Watershed Committee (WC) and User Groups (UGs) created during the watershed are mainly dominated by male, rich, head reach and upper caste farmers. On the other hand the participation of women, landless and marginal community is not higher. Their participation is quite less because of lack of awareness, political interference and non-closeness with the PIA. Considering the importance of their participation in watershed activities the participatory institutions must meet the emerging challenges. Participation can be improved by regular training and capacity buildings programmes, conflict management and appropriate awareness activities.

MISKOLCI, RICHARD* (UFSCar - Federal University of Sao Carlos, ufscar7@gmail.com)

Digital Media and Visibility Regimes: New Connections Between Homosexualities, Politics and Technology

The dissemination of commercial internet that started in the mid 1990's has created a impact on personal and intimate lives, particularly for those that found on digital media a safe way to express desire for same sex people creating secret love and sexual relations without risking the exposure on heterosexist/homophobic public spaces. Digital media increased conditions for people to find love partners, socialize, exchange experiences and organize themselves politically. At the same time, these new communication technologies induced subjects to perform their desire in socially more acceptable ways introducing them to a new visibility regime in which social representations spread by the market promote, among other aspects, gender conformism. Based on ethnographic research conducted in São Paulo, Brazil, and in San Francisco, U.S., this paper analyzes the relation between the use of digital media and the creation of a new sexuality regime concerning sexuality and gender. Special attention is dedicated to the emergence of a new political grammar of recognition and claim for rights that brings to the present the feminist statement that the personal is political.

MISRA, RAJESH* (University of Lucknow, rajeshsocio@gmail.com)

Mass Mobilizations, Contestations and the Contingent Future in a Plural Polity

Many contemporary societies are undergoing socio-political struggles and concomitant upheavals, ranging from micro to macro and local to national levels, and impacting the social structures and political systems, sometimes creatively and sometimes randomly. These mobilizations have been described and analysed in great depth and details in different social sciences, nevertheless, the role and impact of people's struggles, in shaping the circumstances and future, needs to be explicated conceptually and theoretically. A variety of issues and questions have to be dealt with to analyse the unmaking and making of society and polity at a higher level of abstraction. The explanation of collective actors, collective actions, unleashed social processes and social-future need to have the heuristic capacity to transcend the context of the origins of mass mobilizations. Locating in the empirical context of progressive and conservative mobilizations over the last four decades in the largest Indian province (210 million populace), Uttar Pradesh, this paper attempts to investigate the nature and dynamics of issues, organizations and ideologies with a view to appraise the consequences of mass mobilizations in terms of mass mentality, socio-political beliefs, normative patterns, social divides, integrative and disintegrative processes, and the social milieu embedded with contests. On the basis of findings, it may be argued that all the consequences are 'fields' of democratization as well as contestations for political interests and identities comprising diverse narratives. This seeming paradox has to be explained, conceptually and logically, in terms of dialectical interactionism: people versus the state, the secular politics versus the communal politics, and the progressive ideologies versus the conservative ideologies. The argument of the paper is that people's struggles and mobilizations as collective agencies have their distinct accounts, but are interlinked in an order coexistence as well as in an order of succession, nonetheless, resulting in a contingent future.

RC52-594.1

MISRA, RAJESH* (University of Lucknow, rajeshsocio@gmail.com)

Privatization, 'Knowledge Workers' and Growing Inequalities in Globalizing India

Globalizing India is marked by two interlinked processes of socioeconomic transformation, privatization and liberalization. The swift rise of 'knowledge workers' in India is indicative of the nature of social change in the aftermath of globalization, privatization of education particularly the privatization of higher education. An empirical study of higher education teachers in an urban setting reveals increasing income inequalities, the concomitant status inconsistency and power disparities, leading to the growth of utterly unequal 'closures' within a profession. It has been argued that the rise of internal stratification within a profession provides a critical challenge to an idealistic model of inclusive professionalism. The findings can further be explained in terms of feminization and proletarianization of professions. The commercial interests of the educational organizations, the unprofessional orientations of owners, the precarious contractual conditions of work are taken rather suitable for women, as also are responsible for knowledge professionals to plunge into the proletarian status – economically, socially and politically. An assessment of data and studies reveals that different levels of education sectors are marked by disparities and exploitation within which the two sections of the educational professionals in India, the privileged and the deprived, have been intensifying with serious implications for the existence of 'knowledge workers' as a profession and also for the quality of education. The emphasis of the paper is also on the understanding of the dimensions of exclusivity within a profession in terms of the interface of global versus local structural conditions and the nature and types of socioeconomic organization of the education system in India. The heuristic efficacy of the present work may be in extending the 'socio-logic' of professionalization in different sectors of socioeconomic life, which is not

only conditioned by a matrix of globalization, privatization and liberalization but also by a historically specific socio-demographic location.

Pacification and Other Occupation Police Tactics in an Integrated Area of Public Security in Rio De Janeiro

The research focuses on the territory of the Second Integrated Area of Public Security (Áreas Integrada de Segurança Pública - AISP 2) located in the south zone of Rio de Janeiro, comprising the neighborhoods of Catete, Cosme Velho, Flamengo, Gloria, Laranjeiras, Botafogo, Humaitá and Urca. The AISP 2 is characterized by having three kinds of military police which has been operating inside favelas: National Public Security Force (Força Nacional de Segurança Pública - FNSP), which has been in Santo Amaro community since 2012; the Pacifying Police Unit of Santa Marta (Unidade de Polícia Pacificadora - UPP), first UPP planned in 2008 and subordinated to the Pacification Police Coordination (Coordenação de Polícia Pacificadora - CPP); and the Second Military Police Battalion (Batalhão de Polícia Militar - 2nd BPM). The study aims to understand the relationship established between law enforcement officials and residents of the affected areas by the police occupation. Informal interviews with some locals and policemen were conducted to identify some types of conflict, analyzing the tense relationship established between both. Also the techniques of direct observation and collective discussions were utilized in community meetings such as the "community cafes" in the favelas and the Security Community Council (Conselho Comunitário de Segurança) at the AISP 2. The results indicate that despite the lack of contact between the agents of FNSP, UPP Santa Marta and the 2nd BPM, there is much similarity in their approach and relationship established with the locals. It follows a slightly varied militarized structure leading to some questionable community policing activities.

RC45-522.1

MISUMI, KAZUTO* (Kyushu University, kmisumi@scs.kyushu-u.ac.jp)

Trust in Community and Free Rider

Trust is believed to contribute on escape from the free rider problem. However, considering the discussion based on threshold models of social dilemmas, if we assume that an actor's cognitive threshold for cooperating is related with trust, it is possible to say that trust should enhance free rider. This is because an actor will be more likely to stay as a free rider (namely, to have a high threshold) when they trust in community for its ability to provide public goods. Trust of this kind is close to trust in abstract systems, and as Giddens suggests, it is based on trust in interpersonal relationships. Then, we need to explore how trust in community and general trust are related to each other, and how these two kinds of trust determine people's cooperative behaviors. Considering the case of residential community and utilizing survey data, in this study we make an empirical approach to these questions. At first, by conducting principal component analysis for the variables like neighborhood evaluations and trust at the municipality levels, we extract two components: trust in community and residential attachment. We additionally extract two components through the similar analysis for the variables relevant to participation in community events; voluntary participation and free riding participation. (The latter indicates participation only in joyful events.) Multiple-regression analysis shows while trust in community strongly determines voluntary participation, it also enhances free riding participation. In both cases, the effects of general trust seem to be observed in the effect of trust in community. Thus our results suggest that general trust and trust in community are not necessarily complementary to each other in order to enhance community participation, and that trust in community could strengthen both cooperation and free riding at the same time. We will further discuss the meaning these paradoxical results imply.

The Problem of Legitimacy in Japan's Political System: A Luhmannian Perspective

Within Japanese politics the ruling LDP administration, led by Abe Shinzo, has been at the forefront of numerous controversial policy decisions regarding the military and nuclear power. Public dissatisfaction with such policies has led to the Abe administration's approval rating slipping to 38.5% by September 2015, its lowest level since Abe took office in December 2012. Yet the support rating of the largest opposition party, the DPJ, is only 4.9%, making them a statistical factor rather than a potential electoral challenger. This is not an anomalous result and

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

reflects the underlying reality of LDP political domination, with the party having held power almost unbroken since 1955. This lack of viable political plurality in the face of sliding ratings for the Abe administration raises the issue of political legitimacy. Japan's lack of an effective political opposition through which public opinion can enter into the political system also raises the question as to whether Japan's political system can truly be considered democratic.

In this paper I wish to take a Luhmannian reading of the Japanese political system, focusing on Luhmann's assertion that the binary coding of the political system is government/opposition and that political legitimacy is created through this coding. Through an analysis of Luhmann's political theory I shall track the development of Japan's democratic development, focusing on its initial emergence during the Meiji restoration and its reform during the SCAP administration led by the Americans post-war. By then focusing on the political realities of modern Japan, I shall critique Japan's political system from a Luhmannian perspective. I shall then consider whether such a reading offers any novel approaches for political development.

An Exploration of the Literature on the Sex Work Industry and the Case for Labour Rights for Commercial Sex Workers in Jamaica

An exploration of the literature on the sex work industry locates it as one which is lucrative at global regional and national levels, there is some indication that technology, primarily the internet helped this growth, though data is limited, and that there is a thriving tourism sex economy in Jamaica. In general the literature speaks around gender roles, survival strategies, cuts across race, class, ethnicity, youth, and age. It also highlights the perception of many that there is an inherent immorality in sex work which arguably has shaped the old laws of prostitution in the Caribbean.

The aim of this presentation is to further clarify and explore the definitions of sex work, the various classifications of sex workers, and the implications of labour rights for commercial sex workers in Jamaica. The literature highlights several points of debate in this regard which include but are not limited to: legality vs. illegality, why the issue should be explored if it's illegal, the possible ways the individuals and the country can benefit if it were to be regulated among other things and the question of whether sex workers are demeaned or empowered.

Labour Rights for Commercial Sex Workers in Jamaica: Implications for Social Policy and Development.

Commercial Sex Work presents an important area for social policy and development. The activity is considered illegal, unethical and immoral but nonetheless, continues among the younger females in the country. Female Commercial Sex Workers have been identified as a vulnerable group because of the risk of: sex trafficking, HIV and the illegal drug trade and abuse. These multiple forms of vulnerability, pose challenges for development & have implications for social policy, which need to be clearly defined. The Absence of a social policy framework for CSWs presents challenges for national development goals and human rights' commitments. An expanded social policy framework linked to gender equality, human rights and the ILO's Decent Work Agenda, is likely to enable CSWs to have access to social protection, labour rights, and reduce the risk of poverty and harm that sex workers grapple with.

The aim of this paper is to present the rationale, objectives, conceptual and theoretical frameworks, examine the main paradigm that guides the methodological approach and to look at the general research design of the study. Additionally, some of the preliminary findings will be explored in an effort to provide empirical evidence that will re-ignite the debate that will hopefully view sex workers as 'citizens' and as a part of the larger development plan of the country.

People's Police or Police's People ? : An Appraisal of Police-Public Collaboration By the Populace of Bhubaneswar, India.

In an endeavor to encourage improved police-public relationship, the police in India is taking serious concern to launch initiatives for safer societies through joint collaboration of the police and the people. Police-public relationship in India has been distant and strained as the police carries the colonial legacy of being repressive and authoritative. Further, there is a deep-set inhibition in the minds of the people about political interference and dominance in policing. Moreover, Community Policing in India took a late start off and still now operates at the level of a few programmes and not as a philosophy embedded in the minds of the police or the people. To win over the trust and cooperation of the people, it is important to have a *'people's police'* and at the same time to ensure public involvement we need to have an empowered *'police's people'*. The present study is an appraisal by the people of Bhubaneswar, the capital of the eastern Indian state of Odisha about the nature of police-public relationship in the city.

A developing city, Bhubaneswar is showing rapid increase in inflow of people mainly students and professionals from different parts of India. The police in Bhubaneswar has undertaken the uphill task of initiating community policing in the recent past to bond with the society and thereby build healthy sustainable communities. Greater public safety and secure social environment can be reared if and only if, the police empower the people of Bhubaneswar through collaborative policing. This study assesses the views of the people of Bhubaneswar about the police and the involvement of the people and the police in community services. It evaluates the awareness and interest of the people about community policing in Bhubaneswar and explores the role of ICTs in making the collaborative efforts thriving.

Do Hashtags Always Trigger Large-Scale Demonstrations? -a Case Study of the Chilean Student Movement from 2012 to 2014-

Why do some hashtags on Twitter trigger large-scale demonstrations while others do not? Since a huge surge of student movements in Chile in 2011, claiming for higher education of free tuition, SNS (Social Networking Service) has been a pivotal tool for Chilean student leaders and organizations. In particular, since 2012, student organizations have attempted to mobilize student participants through the use and diffusion of one common "hashtag (#)" for each movement on Twitter, such as #Yomarchoel25 for the demonstration on April 25, 2012, or #TodosXLaEducación on August 28, 2012. Recent studies on Chilean student movements have emphasized the significance of Twitter for mobilization. In reality, however, a high degree of diffusion of a hashtag for mobilization does not always lead to a large-scale demonstration. For instance, although #Yomarchoel25 diffused ten times more than #TodosXLaEducación, the actual scale of the former demonstration was a quarter of that of the latter. This implies that hashtags are not necessarily effective in mobilization. Under what conditions does the diffusion of hashtags lead to large-scale demonstrations?

Fifteen demonstrations from 2012 to 2014 called by the CONFECH, the most influential student organization, which hashtags were used for mobilization, will be shed light on in this paper. Based on both quantitative and the discourse analysis, the following two conditions under which the diffusion of hashtags leads to large-scale demonstrations will be scrutinized in this paper; (1)Influential users such as student leaders or organizations with a considerable number of followers, not only repeat slogans of the movement but also show purposes of each demonstration, (2)Potential participants in a demonstration use hashtags not only to spread claims of the movements but also to express their will to participate in them. This paper will contribute to reconsidering the effectiveness of hashtags for mobilization and the possibility of future hashtag activism.

Exploration of Political Identity Emergence on the Internet

This project is to uncover how people in a Reddit thread construct and negotiate their political identity during the discussion about the result of the UK general election 2015. According to Goffman's identity theory (1969), identity emerges through act in a given context. Since the Internet has grown rapidly, it is worth to explore how people would act in an online anonymous context. Drawing from Goffman's identity theory, the project conceptualises political identity as a stance to an event and explores its emergence in an online anonymous forum. The study therefore focuses on a thread discussing their reason of voting for the Conservative Party in the last general election in Reddit, a popular online anonymous discussion board in English. As an analytical method, this project employs Gee's discourse analytical framework to explore the online discussion, with particular focuses on identity, politics, and connection in the interaction. The analysis revealed that people attempt to defend and justify their voting behaviour in the election with structuring their comments in a similar style to academic writing. However, the analysis also found there are some comments which do not follow such a well-organised structure but they are much similar to conversational style. These results suggest that anonymity of the Internet might influence on a way of users' identity construction and allow co-existence of two contrasting organisation in their comment writing.

Tojisha/Peer Membership Categories and Sequential Order in Tojisha Kenkyu Sessions for People with Mental Illness

This paper examines how *tojisha*/peer membership categories are collaboratively used in the interaction of *tojisha kenkyu*sessions for people with mental illness. It apples membership category analysis (Hester & Eglin 2004) and sequential order (Schegloff 2008) in ethnomethodology and conversation analysis.

Tojisha kenkyu began as a peer-support group session for people with mental illness in a Bethel community in Japan. *Tojisha kenkyu* means "research (*kenkyu*) by the affected parties/members (*tojisha*)," or self-directed research (Nakamura 2013). Video data of *tojisha kenkyu* were taken from outpatient hospital sessions over a period of four months. Each session was held once a week for ninety minutes. Participants include seven *tojisha*members and two facilitators who were hospital social workers.

We focus on some of their procedures, or steps (Nakamura 2013:174), and explicate how participants categorize each other in the *tojisha kenkyu* interaction. One procedure is to differentiate between "the problem" and "the person as problem presenter." The person, who is considered to have a problem, is categorized as a problem presenter/struggler. The other procedure is to create a self-diagnosis. The problem presenter is categorized as a researcher who can create a self-diagnosis. Other participants, including facilitators, are categorized as (co)researchers, but the presenter has priority access to the problems and has the right to answer questions from other participants. In this way, the problem presenter shifts his/her self-categorization from a mentally ill person to a researcher and *tojisha* member. In these sequences, other participants, even facilitators, are also categorized as tojisha co-members. We use transcripts of video data to show how these *tojisha*/peer members and other categories are collaboratively used in the sequences of *tojisha* kenkyu sessions. This study shows how *tojisha kenkyu* is an alternative way to have understand people with and without mental illness, and to highlight the social relationships in mental health.

Where Is My Father?...........the Association Between Single Female Headedness and Teenage Pregnancy in South Africa

Introduction
The question of teenage pregnancy remains a global health and social challenge. Consequently, studies have emerged identifying the predictors of the phenomenon. However, these have focused on individual-level factors and the association of single female headedness has received little attention in the South African context. This study aimed to investigate the independent association of single female headedness at both household- and community-levels.

Methods
A sample of 25,492 female adolescents was obtained from the 2011, 2012 and 2013 General Household Surveys (GHS). These data were analyzed using descriptive statistics and multilevel binary logistic regression in the MLWiN programme.

Results
Findings showed that female single headedness increased the average odds of teenage pregnancy at household level (OR=1.42). Likewise, medium levels and high levels of single female headedness within municipalities were associated with increasing the average odds of teenage pregnancy [OR=1.11 and 1.23, respectively]. This may be linked to sex composition of single female headed households as 88% of such households possessed males within them and teenage pregnancy was highly associated with sex composition. It is possible that due to household paternal absence a teenage female may be vulnerable to sexual abuse by resident men, thereby increasing her chances of pregnancy. Reporting the abuse to the single female head may not solve the matter due to constraints put on her by gender and culture dynamics. This leads to such behaviour continuing within households and residents being aware yet silent about it until a young female becomes pregnant.

Conclusions
Therefore, it is necessary for government to support and target such households early to prevent teenage childbearing and related risks. Participatory creative yet educational programmes involving single mothers and their children from an early age could possibly benefit both mother and child.

National and International Discourses on Ageing

The subject of the presentations are discourses about (active) ageing policies in UE and Poland. Namely the connections, intersections and contradictions between national and supranational definitions of ageing policies' problems and their solutions. Researchers points two important for this subject issues. One is the assimilation of West European and World trends such as transformations in welfare states or of particular social policy paradigms like active social policy. (Grewiński 2006, Rymsza 2007) Another issue when one considers the mixture of national (Polish) and international (EU) policies is a "problem of two speeds social policies" (Rymsza 2007). The notion refers to incompatibility and lack of communication between policy departments working with national and EU founds and programs, what results in contradictory policies' aims and dispersion of EU projects activities. For both claims can be found proofs, however it seemed to be more useful to look at the state as an aggregate or assemblage of diverse institutions, actors and capabilities which function differently in various moments in history and in different places. (Sassen 2006) That is as organization that do not have fix borders or teleological aims. The way of thinking about nation-state as open and complex institution proposed by Sassen is highly useful for analysis of a mixture of Polish and EU policies that can be found in documents about ageing and allows to omit a trap of onesided thinking about the contemporary political field: as divide into separate nation states or absolutely globalized, whatever means this notion. The proposed paper is an attempt to such "open" interpretation of discourses about ageing produced by actors on inter-, intra-, and national level.

Risk and Fear in the Disocurses about Ageing

While analysing the text about ageing what seems surprising is that they do not show - or at least it is not the most important what sociologist can see there - the fear of getting older and less able risk. Although the imaginations of disabled, painful senility exists, there are others that seems to be more interesting for investigating the images of futere that we (don't) want. One of them are individually "oriented" fears that in modern culture becoming risks: of lonelines, dependancy, etc. The others are the cultural or socially "oriented" as they refer to the vsions of social structure and bonds of the society. In this sense the disocurses on (implicit) risk can be interpreted as narrations showing possible fears of the future in unstable and unknown yet society that are sometimes more felt that counsciously articulated. The presentations will analyse such visions of future risk/risk of the future on the example of disocurses on ageing.

Beyond Micro and Macro: Is There Anything to Gain from Ethnomethodology?

Considering the traditional sociological tension of micro- and macro-level, as well as allegedly unjustified nature of such dichotomy, one should not overlook the ambitious and radical attempt to overcome (or dismiss) the micro/macro duality, namely the ethnomethodological sociology. Ethnomethodology is usually misunderstood and refused precisely because its substantial incompatibility with other ways of "doing" and "thinking" sociology. The project of ethnomethodology, although strictly empirical in nature, is built upon specific epistemological and methodological foundations. The main *epistemological* puzzler of ethnomethodology grows from its programmatic modesty and immediacy, for all the necessary knowledge is not to be produced (by the experts in sociology) but it is already and readily there (in the social reality). The *method*, then, is a "bare" identification and description achieved through detailed observation. To achieve this goal, some inevitable conceptual steps have to be taken. There is the presupposed trichotomy of social actors (members), settings (situations) and activities (interaction). The central conceptual instrument, however, in ethnomethodological transgression of the micro/macro duality, seems to be the "respecification". This concept is employed to transpose the issues of "macro" dimension into the immediately observable social practices of members of society. Respecification is a process by which the social structure, perceived as an objective phenomenon, manifests itself in the commonplace and routine activities of the members of society. My conclusion is that ethnomethodology remains an inspirational approach to the practice of sociology, in that it stays true to the phenomena and to the observable orientations of social actors in real world. Nevertheless, to answer the question in the title: it is perhaps impossible to "gain" anything from ethnomethodology (apart from doing ethnomethodology itself); because taking out some of its elements into different strands and contexts of sociology leads—inescapably, by the nature of things—to fundamental distortion and impairment of these elements.

A Comparative Study of Erasmus Students in Three Different European Contexts

This paper presents the results of a comparative study conducted among university students carrying out a mobility experience within the Erasmus programme. The aim of the study is to compare views and expectations of Erasmus students in three very different European contexts: Oulu (Finland), Bucarest (Romania) and Lleida (Catalonia, Spain). The reason why these three settings have been chosen is that they illustrate what we could consider rather representative contexts in Europe, thus exemplifying a northern European country and an Eastern European country, both with national languages that have very little prominence in the international language market, and a Southern European country with a strong and highly appealing language (Spanish), with the particularity that the particular context where the study is conducted is a bilingual area where another much less popular language is spoken (Catalan).

The methodology used in the study is a combination of quantitative data (a survey) and qualitative data (an in-depth questionnaire), as well as a language test, which inlcudes both a written and an oral part.

The questionnaire consisted of several Likert-scale (1-5) questions dealing with the following broad topics: citizenship and identity issues, language knowledge and attitudes, interculturality, personal growth, imagined identities and the effects on employability related to the mobility experience.

Interviews were centred on the same topics, with participants being allowed freedom to elaborate their own discourses to account for their expectations and experiences related to their stay in another European country.

The results are still being analysed by now, but differences are expected to be found in the three different settings both in the qualitative and quantitative data.

Constrained Choice, Perinatal Health, and Intimate Partner Victimization (IPV)

IPV research has been guided by the presumption that pregnancy increases women's risk of victimization as well as their economic, social and legal ties to their partners, thereby narrowing their options for health and safety. More contextual understandings of how IPV originates and alters, before, during and after pregnancy, is largely missing from current literature. Our paper examines IPV throughout the perinatal period and expands notions of women's well-being and health choices. Data come from qualitative semi-structured interviews with a subsample of 330 women who participated in a community based longitudinal study on maternal health in the USA. The study included IPV screening questions to which 64 (19%) answered positively for lifetime incidence. Forty of these women completed interviews with us, during which 27 reported IPV specifically during the perinatal period. It was here that we focused our phenomenological-based analysis.

Our findings affirm that the dynamics of IPV exist in relationships prior to pregnancy, whether or not the parties involved recognize the maltreatment as abuse. However how women perceive their relationships, as well as how visible they may be to others, are of relevance for identification and intervention. First, pregnancy may be a tangible precursor to IPV - abuse dynamics exist in the relationship prior to pregnancy, but are not overtly recognized by the victim until she becomes pregnant. Second, pregnancy may be an aggravator of already recognized IPV - women know they are in abusive relationships and pregnancy works to affirm this recognition. Third, pregnancy may serve as a temporary mitigator of IPV - women recognize they're being abused but feel that the abuse stops or lessons during pregnancy. Such findings elucidate applications of constrained choice theory within high-risk perinatal contexts, and subsequent best practices with women with limited options within extreme health risk scenarios.

Development Projects As Systems of Continuous Meaning Negotiation and Translation: Gender Equality from India to the Bill and Melinda Gates Foundation

This paper explores how ideas and practices manifested in a development project are continuously negotiated, reconfigured and made sense of as they move up and down through the many layers of a development organization. The paper builds a theoretical framework that lets us understand development projects as systems of continuous meaning negotiation and translation at several organizational tiers. The notion of 'system' connotes how development projects are like a Russian doll set of nested organizations and organizational levels that depend on each other, and among whom translation processes continue to shape the project and the relation between policy and practice. Building on multi-sited ethnographic field work the paper explores an empirical case of how a development project on women's access to land in India is made sense of as it continuously journeys through different organizational levels. It finds that despite the natural difference in formal authority that sees more material power concentrated in head offices than with local implementing agencies, ideational power flows in complex ways that allows for influence at all levels. This has consequences for translation processes and leads us to understand that development policies or projects may be transformed between every organizational level as they are made sense of by different actors. By infusing similar practices with different meanings, values, and interests, development projects are essentially (re)produced and (re)configured up and down along the organizational chain, with consequences far beyond only the ideational, in the end even shaping our perceptions of outcomes and thus the social construction of success or failure of interventions.

Blurred Boundaries? System/Environment Interactions in a Multinational Consulting Firm in Mumbai/India

This paper illustrates on the example of a multinational corporation in Mumbai the interplay between the social system organization (Niklas Luhmann) and its environment. On the one hand the company established its boundaries sharply through strict rules of organizational membership, outgoing communication to clients, or symbolic acts of differentiation in elaborated access procedures. This boundary was furthermore iterated daily through the interaction with the 'freelancers', who were assigned a dedicated area in one of the office locations, which served as an interaction membrane. In contrast to these dividing lines, however, stand the relationships with contractors, who contributed substantially to the organization's value chain, worked alongside "the real employees" on identical job profiles and question how these boundaries are existent in daily work practice. Furthermore had the firm established "campus recruitment" partnerships with the higher education system in India. These allowed for the company to exhibited recruitment sessions directly at the MBA schools, which in return advertised this partnership as a selling point for their program. As several of the employees state, the existence of these partnerships had triggered the decision for a specific business school years before they actually came "on payroll" of the company. But there is another twist to that relationship: the official university ranking of the respective Business School furthermore determined the level of the job the company offered at the institution, i.e. the higher the ranking the higher/prestigious/well paid the job. This multi-sited ethnographic research was conducted as part of an ongoing PhD project in organizational anthropology over the duration of 12 months in 2013/14 at the three offices of a multinational consulting company in Mumbai (India) with a total of approximately 800 employees of various hierarchy levels and designations.

MOERIKE, FRAUKE* (Heidelberg University, Frauke.moerike@gmail.com)

Multi-Sited Ethnographic Fieldwork in Complex Organizations: On the Quest for the "Employees' Points of View" Across Three Offices of a Multinational Consulting Firm in Mumbai/India

This paper is a reflection on fieldwork carried out for a PhD project in the area of organizational anthropology. The multi-sited research took place over the duration of 12 months in 2013/14 at the three offices of a multinational consulting company in Mumbai (India) with a total of approximately 800 employees of various hierarchy levels and designations. The objective is firstly to give an account on how ethnographic fieldwork methods had to be adapted to fit to the corporate world, an environment of highly specialized experts of commercial topics. Here "participant observation" has to cater for the the fast-changing and diverse settings of a consulting firm, for the employees' changing workload situations and multiple communication channels, including virtual communication. Similarly, interviewing strategy was developed around the constant hunt for a share of the actor's time, a highly precious and protected resource at work, and to balance out potential notions of company politics. Secondly this paper aims to discuss the key assumption of multi sited ethnographic research: that the trans-local relationships are as relevant as the ones within each office itself, making such a study through the discovery and analysis of such "ties, linkages and relationships different to a mere comparison of localities" (Hannerz 2003) and therefore providing for a potential framework to grasp the perceptions of the "global" in such organizations.

(De)Constructing Euro-American Anthropocentrism in Mainstream and Alternative Media: A Case Study on Two Multimodal Climate Change Frames

Climate change is *the* problem of the 21st century. However, its future developments largely depend on our conceptions and engagement, which are, among others, influenced by (visual) media frames (Graber, 1988; 1996). Climate change appears to be the subject of lively debate in 'Western' society, including mainstream media. Nevertheless, most of the seemingly differential viewpoints can be situated, on a deeper level, within the same hegemonic sphere, highlighting liberalism, competitiveness and development (Pepermans & Maeseele, 2014). 'Western' man depicts himself, for instance, as superior vis-à-vis nature and other groups. Yet, this dominant thinking lies at the origin of many socio-environmental problems. Non-hegemonic values, like collaboration or moderation, are usually silenced (e.g., Dryzek, 1997). Alternative media, however, are more likely to reproduce the latter (Harcup, 2014).Little research has addressed the visual – let alone multimodal – (sub)frames of climate change (e.g., O'Neill, 2013), particularly in alternative media. Therefore, conducting a multimodal qualitative framing analysis we discuss the visual realization of the Environmental Justice (EJ) (the disproportionate suffering in 'the South') and the Circle of Life (CoL) (man's impact on the Earth system) frames. Our corpus encompasses three mainstream northern Belgian newspapers and one alternative website (February 2012 – February 2014; n=739) (Kress & Van Leeuwen, 2006; Van Gorp, 2006). Our results illustrate that the mainstream EJ frame and the mainstream CoL frame are similar. Both decontextualize the problems, zooming in on individual causes or consequences or situating ('Western') man above the victims. Icons as the polar bear or the 'suffering child' illustrate this. Contrariwise, the alternative view does contextualize. Emphasizing equality, it encourages deeper levels of engagement. The depictions of victim-agents, for instance, highlight responsibilities beyond the emission of GHG. Summarizing, our analysis demonstrates exactly how the narrative of (Euro-American) Anthropocentrism keeps shaping our imaginaries, although being challenged by emerging counter-hegemonic visualizations.

"a Female Precariat? the Middle East and North Africa in Comparative Perspective"

The Middle East and North Africa region (MENA) is not usually included in global studies of development, globalization, or changing class structures. A decade ago, the present author asked: What difference has the neoliberal policy shift made for women in the labor force? The answer was that although women's labor market shares had not increased significantly, precarious and irregular forms of work were on the rise. MENA women have the lowest labor force participation rates of any region; most of the labor force consists of educated women in the professions; working class women in particular are "missing" from labor force statistics; in many countries a not-negligible part of the small female labor force is classified as "unpaid family labor"; and the highest unemployment rates are female. The paper examines the various dimensions of the "female precariat" in MENA – highlighting variations across oil, non-oil, and mixed economies – and ends with policies for women's economic citizenship.

"Development, Social Transformation, and Gender Relations: A Comparative Analysis of Iran and Tunisia"

"Development, social transformation, and gender relations: A comparative analysis of Iran and Tunisia"
Iran and Tunisia are part of the region known as the Middle East and North Africa (MENA) but over the decades have pursued very different development strategies. Iran's oil-led development strategy is contrasted with the smaller and more open economy in Tunisia. In addition, since Iran's 1979 revolution, the polities in the two countries have diverged even more – in Iran's case, a theocratic republic was established while in Tunisia a Western-oriented republic has prevailed, even after its January 2011 political revolution. In both cases, modernization and economic development have led to the growth of an educated female middle class with aspirations for greater participation and rights, but the capacity for women's mobilizations for legal and policy reforms has been far more limited in Iran than in Tunisia, the result of (a) the nature of the development strategies in place and the role of the respective countries in the world-economy; (b) the different polities; and (c) the different gender regimes. Drawing on world-systems, world-polity, and feminist conceptual frameworks, the paper examines and contrasts the evolution of development, social transformation, and gender relations in the two

countries. Empirical data will also be presented to compare and contrast the two cases.

A Critical Investigation of Well-Being on Migrant Populations: A Composited Approach

With the rise of international migration worldwide, there has been an increased focus within immigration literature on well-being of immigrant populations. Due to the nebulous operationalization of the concept of well-being, the composited categorization of multi-ethnic/cultural subject samples, as well as the lack of sociohistorical consideration within the literature, there have been mixed findings in regards to the overall well-being of immigrant populations as well as the resiliency factors associated with well-being. There has been much debate in regards to classical assimilation theories and their application to the shifting immigration trends within host countries today. Much of the literature does not take newly resettled populations' pre-migration and specific cultural population factors, as well as post migration environments into consideration when analyzing these relationships. Many times immigrants from diverse backgrounds and push factors (e.g., refugees, immigrants) tend to be composited into one subject sample. A case study, examining the resiliency factors associated with recently resettled Bhutanese/Nepali refugee youth's (N=119) residing in the US, will be utilized to help explain the need for more compartmentalized studies examining specific migrant populations' resiliency factors, as well as the need for the development of more targeted support interventions for specific populations.

Bhutanese Refugee Adolescents' Academic Adjustment: The Role of Acculturation and Familial Social Capital

According to the United Nations High Commission for Refugees (UNHCR) there are approximately 51.2 million refugees who have been forcibly displaced worldwide as a result of conflict, persecution, generalized violence, or human rights violations; the highest recorded level since WW11. Half of which are children under the age of 18, who have lived in limbo for years with very little formal school education. Education, along with the appropriate approaches in educating resettled refugee populations, have become a main area of concern as well as controversy within the field. There is still much uncertainty surrounding best practices within host nations, especially in regards to acculturation and its relationship to academic achievement within newly incoming non-European immigrant populations. The current study has attempted to add to the existing literature, by examining the relationship between recently resettled Bhutanese refugee youths' acculturation as well as familial social capital factors on their academic adjustment. Moreover, the study had further attempted to examine if there is a potential additive relationship between familial social capital and academic adjustment, over and above the effects of acculturation. The sample consisted of 119 Bhutanese refugee adolescents between the ages of 11-22 residing in a Mid-Atlantic community within the US. A hierarchical multiple regression suggested that years in the US, parent education, ethnic identity, and familial social capital all were positively related to Bhutanese adolescents' school adjustment; however, when familial social capital was added to the model the relationship between ethnic identity and academic achievement became insignificant, indicating that the relationship of familial social capital is a significant additive predictor of academic achievement over and above ethnic identity. This study highlights the importance of familial social capital factors, above acculturation identity, in predicting Bhutanese Refugees' academic adjustment upon resettlement. Important implications for practice and research will be discussed.

The Mandatory Evaluation of Adequacy of Basic Social Security in Finland

In 2010, an internationally exceptional piece of legislation entered into force in Finland. The Ministry of Social Affairs and Health have to commission every fourth year an evaluation of the development of the adequacy of basic social security from an independent evaluation group. Basic security is the non-contributory in-

come protection for those outside labor markets and earnings related benefits. The evaluation coverages the entire income package of low income households and the factors that influence on the adequacy of these incomes.

The first evaluation report was published in 2011. The main results were that the disposable incomes of households living on basic security are inadequate to meet the minimum reference budget and have shrunk against average earnings in 1990-2011. The second evaluation report was released in 2015, and first time also in English. The main results were that the level of basic social security has improved both in real terms and compared to the wages in 2011–2015, but it is not adequate to cover reasonable minimum costs determined in reference budgets. Also, reforms in benefit and tax legislation have decreased the income inequalities and the poverty risk.

The third evaluation of the adequacy of basic social security will be published 2019. In here we present some of the improvements planned to be included into the third evaluation report, for example nowcasted poverty rates and counterfactual social policy alternatives.

Social Cohesion and Language Policy in South Africa

Social cohesion may be conceptualised as the degree of social integration and inclusion in communities and society at large, and the extent to which mutual interconnection and solidarity finds expression among communities and societies.

In terms of this characterisation, a populace is cohesive to the extent that the discriminations, inequities, marginalisations based on gender,ethnicity, class, language, nationality, age, disability or any other distinctions that provoke division, suspicion and conflict, are diminished and/or purged in a planned and persistent manner - this with community members and citizens as active participants, working together for the attainment of shared goals, devised and agreed upon to improve the living conditions of all.

South Africa is a still a divided country despite concerted and vigorous legislative efforts to unify and build a free, non-racial and non-sexist society. One of the instruments used to divide South Africans during the apartheid era was the language policy.

The article examines the relationship between social cohesion and language policy during the build up to the new political dispensation that South Africa experienced in 1994. Focus will also be on the new language policy that emerged in South Africa during the post-apartheid period and how this in turn impacted on social cohesion.

The article aims to investigate the impact of language policy on our ideologically and racially polarised society and whether this has had a deleterious or constructive impact on social cohesion in South Africa.

Empirically, the article's scholarly treatise will be on theoretical and national discourses shaped and diffused within the civil and political realms of the broader South African community.

Labour Migration in Contemporary South Africa and Its Negative Effect on the Livelihoods of Families in the North West Province

Internal labour migration is a historical livelihood strategy for mostly African household as they attempt to address unemployment and everyday survival. Through interviews with 20 members of families in Madibeng in the North West Province, South Africa, this paper shows that even though labour migration is an important avenue for household livelihoods it has negative effects on already existing livelihoods and especially on the composition and well-being of families. Migration creates multiple challenges for households and families. For some, migration means children growing with absent fathers and in some cases absent mothers for long stretches of time. Grandparents especially grandmothers end up taking up more responsibility for the survival of families or migrants. Again, children in such families are often faced with long periods of residential instability as they are moved from one household to another, child headed households, child labour etc. (Chuong, 2012:43). This is a problem that contributes to an unstable and volatile society. In other cases labour migration means the family left behind faces higher levels of poverty and thus has to find other livelihood strategies while still waiting for remittances.

Uncertainty and Policy Disconnections in the Experiences of Young Adults Enrolled in High School Vocational and Technical Education Programs in Canada

Over the past two decades, governments and key decision-makers in the fields of education and work in Canada have expressed important concerns about access to and success in vocational education and training (VET) programs at the secondary level. In many ways, and reflecting a neo-liberal policy agenda, these programs are seen as closely connected to the labour market and an efficient way of facilitating transitions to work, regardless of the quality of jobs and working conditions that VET graduates obtain. Despite the concerns and the efforts made to reinvigorate technical education, a strong bias against the value of this type of education persists and many students face uncertainty before and throughout their studies. This paper presents the results of a study that examined how young adults (aged 18 to 35) in these programs deal with personal, familial, relational, school and work challenges. From a critical life course perspective the paper focusses on how their sense of uncertainty in the face of the labour market, marks their work and school transitions leading into and within these programs. To counter this uncertainty, young people develop strategies relying on various types of formal and informal support (government assistance, psychosocial intervention, career counselling, help from family and friends) which are gender specific in certain instances. The analysis is founded on 90 semi-structured interviews conducted in five vocational training centers in the provinces of Quebec and Ontario. Ultimately, on the basis of student experiences, the paper questions the underlying objectives of VET policies and institutions in Canada and shows that young people's transitions need to be more adequately supported throughout VET programs.

MOLITOR, VERENA* (Bielefeld University, verena.molitor@uni-bielefeld.de)

Authority Belonging, Intersectionality and Gendered Rights: Lgbttiq Police Officers Between Executing Power, Right Claims and Discriminations

Since some decades LGBTTIQ police officers in different countries are organised in unions, fighting discrimination and changing the image of police as a homophobic institution. Research so far has been concentrating on the questions of discrimination, diversity management, perceptions of gender within the "police culture", the expectations and exclusions LGBTTIQ-officers are confronted with.

The paper focuses on LGBTTIQ police officers in order to demonstrate, how sexual and gendered identities influence not only the working conditions of this group, but make them a specific minority. The presentation asks, whether LGBTTIQ police officers be considered a marginalised group, claiming specific rights, relevant for their profession?

Being part of the executive power, their exclusion experiences become less visible, the fight for their rights seems to be less dramatic, compared to many other groups (for example LGBTTIQ refugees, suffering intersectional exclusions). Can this specific privileged position, which makes them invisible in their discrimination experiences, be considered from the standing point of the intersectionality? For example, gender/sexual identity combined with identity as police officer produce specific intersectional constellations: because of the gender stereotypes lesbian women are partly less discriminated at the working place, comparing to heterosexual woman, while gay man and transsexual persons are being discriminated and excluded. Another example of intersectionality would be that LGBTTIQ-officers fight for their rights goes beyond the non-discrimination at the working place; earlier research demonstrated that homophobia at the military and police professions might cause life-threatening situations, as LGBTTIQ officers might be less covered by the colleagues in conflict situations. In this sense the belonging to authority might be considered dangerous for the representatives of sexual minorities, and make them to specific group.

MOLLER, SEBASTIAN* (University of Bremen, smoeller@uni-bremen.de)

Municipal Debt and the Derivative Market: Interest Rate Swaps As an Emerging Social Relationship Between Local Authorities and Transnational Finance

Over the last decade, municipalities in different countries have become highly connected with global finance through a wide range of innovative financial products including bonds, foreign currency loans and derivatives. Such products are more than simply technical alternatives or supplements to traditional municipal finance. They connect local institutions and trajectories with rules, performances, and rationalities of global financial markets and thus constitute an emerging social relationship. This emerging relation both drives the orientation of local governance towards financial market logics and is in itself a manifestation of the overall financialization of politics and society. While sovereign debt on the nation-

al level is at the heart of current debates in political economy, municipal finance so far plays only a marginal role in the literature. Particularly, the engagement of local governments in the derivative market merits closer academic scrutiny. Understanding how interest rate swaps constitute the relationship between a local treasury and a transnational bank allows understanding the interactions between public and private actors and their underlying motives, mutual dependencies, and the spread of financial market logics and ideas more generally. The paper therefore addresses the following empirical and conceptual questions:

1. What are the motives/reasons of municipal governments' derivative purchases?
2. How can the relationship between local authorities and transnational service firms be characterized?
3. What is the role of personal networks in constituting the relationships between municipal government and financial markets?
4. What institutional, political and ideational implications can follow from an interest swap deal at the local level?

Those questions will be examined for the case of Linz (Austria). Moreover, findings will be compared with preliminary evidence from other European countries in order to explore commonalities that go beyond idiosyncratic properties of that case.

MOLNAR, VIRAG* (The New School for Social Research, molnarv@newschool.edu)

Civil Society and the Right-Wing Radicalization of the Public Sphere in Hungary

The paper argues that contrary to the widely held view that traces the recent rise of populism in Hungary and Eastern Europe to a weak civil society, the past decade has witnessed a surge of civil society activism. But rather than working exclusively toward strengthening and complementing liberal political institutions, civil society has also provided fertile soil to the spread of right-wing populism, radicalism, and xenophobia. Moreover, the paper suggests that civil society organizations have played an important role in the right-wing radicalization of contemporary Hungarian politics. Conservative civic groups have been instrumental in reinvigorating the symbolic vocabulary of a mythic nationalism that was widespread at the turn of the nineteenth and twentieth century as well as in the 1930s. The resurrection and accompanying commodification of nationalist, irredentist, and anti-Semitic symbols and paraphernalia (e.g., greater Hungary car stickers) have been a major vehicle for increasing the public visibility and political impact of these groups. These civic organizations have also been very adept at using new media to create an alternative public sphere. The paper shows through case studies of specific organizations ("Goyim Riders", the "kuruc.info" online news portal, and foreign currency debtor organizations) how this seemingly anachronistic symbolic repertoire has found new resonance in contemporary Hungarian public life.

MOLNAR, VIRAG* (The New School for Social Research, molnarv@newschool.edu)

Street Art and the Changing Urban Public Sphere

The paper examines street art as a lens into the workings of the contemporary public sphere to capture changing uses of urban public spaces and shifting conceptions of social order in the city. It explores why we witness an explosion in the popularity of street art at the time when urban public space is shrinking and control over its use has tightened considerably through zero-tolerance policing, growing surveillance, privatization, and gentrification. It also maps the multiple ways in which street art is being turned into a commodity (e.g., its sale as artwork, its use in advertising, product design, and city branding schemes) to improve our understanding of the commercialization of counter-cultural practices. Finally, it shows how significant developments in digital media (e.g., spread of mobile telecommunications devices, photo sharing, blogging and social networking sites) have created a new ecology for the documentation, sharing, and global dissemination of "ephemeral" street art, which in turn has greatly complicated its commercialization, reception and social impact. The analysis compares the street art scene in New York, Berlin, and Budapest, building on interviews, fieldwork, art blogs, Internet discussion groups, and photo-sharing sites.

MONDON-NAVAZO, MATHILDE* (Universidade Federal do Rio Grande do Sul (UFRGS) / Universite Sorbonne Nouvelle - Paris 3, mathilde.mondon@wanadoo.fr)

Los Trabajadores Autónomos Económicamente Dependientes En Francia y Brasil: Diferencias y Semejanzas

Las medidas de flexibilización del mercado de trabajo, en Francia y Brasil, favorecieron el desarrollo de una categoría hibrida de trabajadores: los que llamamos Trabajadores Autónomos Económicamente Dependientes (TAEDs). Son jurídicamente autónomos pero dependen económicamente de un único cliente para la mayoría de sus ingresos. Ya que esta categoría cuestiona la oposición clásica entre empleo asalariado y trabajo autónomo, pareció interesante comparar sus condiciones de emergencia así como las trayectorias de los TAEDs en una "sociedad salarial" (Castel, 1995) y en un país caracterizado por una "salarización restringida" (Mathias, 1987).

El análisis de cuarenta entrevistas realizadas con TAEDs franceses y brasileños del sector de Tecnologías de la Información (TI) posibilitó la formulación de varias hipótesis. Primero, la emergencia de esta forma de trabajo hibrida responde a lógicas distintas, en Francia y en Brasil, según las especificidades de los mercados de trabajo locales: la situación de TAED es generalmente impuesta a los profesionales brasileños por su cliente para eludir los derechos laborales mientras que los entrevistados franceses optan por la posición de TAED como forma de inserción perene, para escaparse de la influencia de las empresas de prestación de servicios.

Sin embargo, seria reductor oponer los TAEDs brasileños precarizados frente a los TAEDs franceses queriendo emanciparse del marco salarial, ya que la heterogeneidad interna de los dos grupos es muy grande en términos de aspiraciones y posiciones en el mercado de trabajo. El análisis de las trayectorias de los entrevistados posibilita superar esta oposición binaria ya que, con el paso del tiempo, ambas posiciones se acercan: primero obligados por su cliente a tornarse autónomos, varios entrevistados brasileños terminan por considerar la situación de TAED más ventajosa y la utilizan para construir un verdadero proyecto empresarial. Mientras que algunos entrevistados franceses que preferían la posición de TAED eligen volver a ser asalariados.

MONDON-NAVAZO, MATHILDE* (Universidade Federal do Rio Grande do Sul (UFRGS) / Universite Sorbonne Nouvelle - Paris 3, mathilde.mondon@wanadoo.fr)

Une Analyse Des Trajectoires De Professionnels Créatifs En Termes De Mobilisation De Ressources : Les Travailleurs Indépendants Économiquement Dépendants Du Secteur De Technologies De L'information

L'analyse de quarante entretiens réalisés en France et au Brésil avec des développeurs et *webdesigners* révèle de nombreuses similitudes entre les parcours de ces travailleurs qualifiés du secteur des Technologies de l'Information (TI) et ceux des artistes étudiés par Menger (2002) : les enquêtes mobilisent les registres de la passion et de la vocation et leur engagement se traduit par des pratiques d'auto-formation et la réalisation de projets non rémunérés. Comme dans les milieux artistiques, les autodidactes sont nombreux et le modèle d'organisation prédominant est celui du travail par projet.

Les professionnels interrogés sont confrontés à une incertitude radicale puisque, dans un contexte d'individualisation des relations d'emploi, ils se trouvent - ou se sont trouvés - dans la situation de Travailleur Indépendant Economiquement dépendant (TIED), associant une dépendance économique vis-à-vis de leur donneur d'ordre principal à une indépendance juridique qui les exclut des protections du droit du travail. Pour garantir une certaine continuité de revenus et orienter leur parcours dans la direction souhaitée, les TIED doivent mobiliser des ressources de plusieurs types (Sen, 2000) : les ressources sociales (réseaux de contacts) et professionnelles (compétences techniques reconnues) jouent un rôle fondamental dans le parcours des enquêtés comme dans celui des artistes mais, à la différence de ces derniers, les professionnels de TI bénéficient d'un rapport favorable entre offre et demande de travail qui limite les périodes de latence entre deux occupations.

Les processus d'accumulation de ressources font écho aux travaux de Menger (2002) sur les artistes, et l'on observe de grandes inégalités parmi les enquêtés en termes de détention de ressources ou de capacité à les mobiliser : au Brésil comme en France, le groupe des professionnels interrogés est ainsi caractérisé par une grande hétérogénéité, tant en ce qui concerne le niveau de rémunération que la fréquence ou la durée des périodes de latence.

Identidad y Representación En La Inserción Del Segmento LGBT En El Mercado Laboral Formal Brasileño: Una Mirada Contemporánea

Los cambios recientes en el mundo de trabajo, observados en los últimos treinta años, produciran en Brasil una reconfiguración del mercado de trabajo y, por tanto, han exigido una redefinición del papel del Estado en la regulación del capital / trabajo, mientras que también genera reflexos en el desempeño de la judicatura.

Este artículo tiene como objetivo, en primer lugar, entender la visión de los trabajadores LGBT acerca de su inclusión en el mercado laboral formal, tratando de comprender sus representaciones sobre la efectividad de los derechos laborales que pertenecen a la dimensión de los derechos sociales. En segundo lugar, investigará las diversas formas de inserción del segmento LGBT en el mercado formal de trabajo y las diferentes formas utilizadas por este para la extracción de valor de esta parte de la clase obrera. Por fin, realizará un análisis crítico de la actividad judicial del trabajo en relación con la adjudicación de reclamaciones concernientes a la inclusión de los trabajadores LGBT en el mercado formal de trabajo, con énfasis en la intimidación de que probablemente experimentaron.

Buscamos de esta manera, desentrañar cuál es el papel de la actividad judicial en el contexto actual, analizar cómo se interpretan los conflictos derivados del ejercicio de determinada orientación sexual y frente al magistrado laboral.

El método de investigación és bibliográfico y de trabajo de campo con las personas involucradas.

Por lo tanto, esperamos contribuir al debate sobre la integración en el mercado laboral, la eficacia de los derechos sociales y las identidades, cuestiones que no pueden ser pasados por alto por la teoría social y la teoría jurídica.

Creencias Estudiantiles Sobre Cómo El Pensamiento Mejora La Convivencia Humana

La presente investigación tuvo como objetivo el análisis de las creencias que estudiantes universitarios tienen con relación al desarrollo de distintas formas de pensamiento como medio para mejorar la convivencia social. La relación con los otros se expresa en el diálogo el cual supone el respeto a la pluralidad de las diversas formas de mirar, pensar y sentir el mundo. Las distintas formas del pensamiento como el estratégico, el creativo, el crítico o el argumentativo favorecen el debate, el cuestionamiento, la credibilidad, llegar a consensos o la reestructuración conceptual cuando las razones de los otros son más potentes. La relevancia de la investigación, reside en la necesidad de promover las relaciones con los otros para una convivencia digna alejada de la violencia que impera en grandes sectores económicos y sociales. Es una investigación cualitativa, de tipo fenomenológico. La investigación se realizó con estudiantes de licenciatura de la Universidad Nacional Autónoma de México. La entrevista fue el instrumento para conocer representaciones, concepciones o creencias de los alumnos sobre cómo el desarrollo del pensamiento contribuye a la convivencia social. La búsqueda de datos se centró en los siguientes aspectos: en descubrir qué conceptos tienen los estudiantes de lo que es el pensamiento estratégico, lo que implica el pensar a pensar, el pensamiento creativo, el pensamiento crítico y el pensamiento argumentativo; se indagó cómo suponen que estos tipos de pensamiento favorecen la convivencia y el dialogo; se investigó si consideran que sus profesores promueven en ellos la construcción de distintas maneras de pensamiento. El análisis de los datos dio cuenta de la riqueza y la debilidad de sus concepciones sobre diferentes formas de pensar y sobre cómo el *pensar*, puede favorecer la convivencia socio afectiva, así como las creencias sobre la calidad de la promoción del pensamiento por parte de los profesores.

MONTAGUT, TERESA* (University of Barcelona, montagut@ub.edu)

Civil Society and Local Government

Recently (May 2015), municipal elections were held in Spain. The results of these elections can mean a major change in the management of local politics.

As a result of citizenship discontent with the management of the crisis and the distrust in the traditional political parties system, most major Spanish cities are now governed by political activists through coalitions formed between some social movements and traditional parties.

The paper aims to study the first year of the municipal government in the city of Barcelona and the changes that may have been generated in terms of participation, new social policies or the possible political intervention in the economic life of the city. Both from the area of administration of previous governments and from initiatives that have emerged from organized civil society, new programs have been implemented that began to draw up a publicprivate partnership in the governance of the city. However, the new scenario poses some doubts about the stability of the government in the hands of people who came from social activism and the academia. Can these initiatives be the beginning of a process of social change? It seems that we are at the end of a political period in which there is a great power of economics.

The study aims to identify the institutional processes that have been generated in the first year of municipal government by the coalition "Barcelona en Comú" which won the local elections. By identifying what are the difficulties they have faced to carry out theirs new policies within the logical working of public administration, the paper will analyze the possibilities of this suggested quick change.

The work will be based on a qualitative study using different sources. The material will be analyzed and processed using the qualitative software Atlas.ti.

New Forms of Solidarism and Communalism

The economic and financial crisis, occurred in the last years, seems apparently changing the capitalist paradigm that, protagonist of the story in the nineties, now appears under indictment. To conspicuous consumption and individualistic needs is going to be replaced a system based on cooperation, sharing, and on the gift. The mythology that in recent decades has been built on the values as freedom of action, individual capacity and personal economic success, often looks overtaken by different theories such as those on the common good and on degrowth, claiming direct participation of the citizens in collective decisions, use of resources, and the implementation of new economic models.

(Re)Defining Sustainable Food Discourses in Philippine Cosmopolitan Spaces

Sustainable agrifood in the Philippines has grown remarkably in the last five years. One manifestation is the rapidly growing number of civil society groups and agrifood establishments, supposedly in accord with the global resistance to 'unhealthy' and 'unsustainable' agri-industries and fast food chains. Yet, alongside this movement are the tensions and disconnects manifesting between the 'sustainable' agrifood establishments and their consumers.

As such, contestation in the agrifood sustainability discourse in the Philippines reflects the tensions not just between the socio-environmental organizations and the dominant conventional agrifood industry, but also between the burgeoning 'sustainable' food production and retail networks and its consumer base. Drawing from more than a year of field research in Metro Manila, it was evident that both 'sustainable' food establishments and consumers are being influenced by discourses, movements, and trends from North America and Western Europe, but in disparate ways. Proprietors of agrifood establishments derive their meanings of 'sustainable' food mostly from the Western conceptions of 'slow food,' 'organic,' 'farm-to-table' and 'local.' These ideas are entangled with subtle advocacies of indigenous peoples rights, smallholder farmer support, and nationalism. Consumers, on the other hand, conflate the meaning of 'sustainable' food mainly with health and are motivated by the desire to satisfy their cosmopolitan palate (or the desire to try "something new"), which are primarily informed by trends in social media and food blogs in North America. These contested meanings have created an uneasy response among 'sustainable' agrifood establishments to redefine their identities in order to accommodate cosmopolitan consumer demands, often resulting in contradictory expressions of what it means to be 'sustainable.'

This paper endeavors to address a general lacuna in the literature on our understanding of contested sustainable food discourses as reproduced beyond the Western European and North American contexts.

Food Insecurity and the Green Economy Project in Ancestral Domains in the Philippines

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Food security remains to be one of the priorities of rural development efforts in the global South. Such initiative is particularly pronounced in the era of 'green economy,' where emphasis is given to the inclusion of marginalized populations in the continued 'sustainable' growth of rural economies. At present, rural 'green economy' projects (such as 'low-carbon' cash crop production and market-based conservation) promote the eradication of chronic hunger and malnutrition among smallholder farmers. However, many of these projects fall short of realizing this vision, and in some cases even exacerbate food insecurity. This paper examines the issues of food insecurity among indigenous smallholder populations engaged in 'low-carbon' (green economy) agro-industrial crop production (e.g. oil palm and rubber) in ancestral domains in the Philippines. Observations from a year-long field research in the frontiers of Palawan Island suggest that the expansion of oil palm and rubber plantations has contributed to changes in livelihoods and patterns of food access, acquisition and preferences among indigenous small-holders. Evidence points to smallholders' increasing dependence on commercial foodstuff and their mounting debt accumulation in attempts to maintain adequate food access. Concurrently, there are indications of how transformations in traditional forms of livelihood (particularly swidden cultivation) also translate to changes in gender relations, such as the reorganization of reproductive and "invisible" labor, which have implications on household access to and preferences on food. As indigenous smallholders realize the worsening food insecurity condition they experience under the green economy regime, some have abandoned such dreams to return back (with varying success) to swidden cultivation, while others endure to manage cash crop production fields regardless of the consequences.

Proto-Medicalised Practices. the Role of Functional Foods.

The relationship of man with food, as with drugs, testifies, at any time, the crossover between culture, technology and marketing. Regardless the apparent paradox between a sophisticated food science and the expansion of diseases related with food ingestion, in modern societies, food has, progressively, played a dual role: instrumental as a supplier of nutrients as well as therapeutic resource managed both in isolated and combined way. Functional foods, a category of processed food, are a product of food science and the marketing of the agro-food sector, that are supposed to improve health and well-being and prevent future disease, fuelling a consumerist *ethos* leveraged by a growing reflexivity, knowledge and activism by the healthcare consumers. As a hybrid object they are a material expression of the blurring of boundaries between food and medicines and the natural and the pharmacological and bring the symbolic capital of medicines to the dining table.

Looking into the Portuguese reality, my current research as a PhD student will cross the results of the first national food and nutrition survey, with 1200 respondents, performed since mid-1980s, with the analysis of half a million transactions (period: 2013 – 2015), integrating any sort of functional food from a hypermarket chain´s loyalty cardholder database, to produce the portrait of profiles and consumer habits of functional foods by the Portuguese population. Further qualitative research through Focus Groups (n= 32) will try to uncover the logics of consumer's adhesion to such "natural" tools, and explore the hypothesis that techno food's therapeutic usage is a contemporary expression of medicalization, even if expressed in proto-medicalised practices, fostered by the market forces and the dispositions by reflexive individuals to consume food-based products, marketed and perceived as having drug-like qualities, reflecting the balance between risk versus efficacy.

The Global Call for Users Involvement in Mental Health Policy and the Local (in) Visibility of Users Organisation: Results from a Social Systems Based, Qualitative Case Study from Chile.

The recent WHO's Mental Health Action Plan 2013 – 2020 explicitly calls for the involvement of mental health services users' in all the levels of policy making, including "advocacy, policy, planning, legislation, service provision, monitoring, research and evaluation" (2013, p. 10). Under the WHO's governance scheme, the main responsible to assess the existence and level of involvement of users organizations continues to be the State's and its mental health system. Given the interdependencies across global and local policy actors in the production of forms of identification of the agency of users, and the limitations of traditional assessment mechanisms given the complexity of users' participatory processes, this paper tries to understand how national mental health systems, under the guidance of global calls and assessment mechanisms, define and identify the collective actions of users, how this identification has emerged and stabilized over time and through which kinds of verification procedures – based upon formal assessment tools or not - an image of users' is constructed *within* the mental health system

(Luhmann, 2012). The results come from empirical qualitative research conducted in Chile during 2015, in the context of a PhD project mapping the global and local production of the idea of user involvement in mental health policy, guided by Niklas Luhmann's version of Social Systems Theory.

MONTERO, KERRY* (RMIT University, kerry.montero@rmit.edu.au)

Doing Youth Work in the 'Asian Century': Let a Hundred Schools of Thought...

The relevance of the philosophical disciplines to diverse areas of human service practice has been explored fruitfully by a number of authors. In the area of youth work practice, which has often struggled to define its claim to specialist professional practice, its 'purpose' and ethos, Aristotelian traditions have opened up productive avenues for thinking about the purpose, and the *doing* of youth work (Bessant 2009, Emslie 2014).

In recent years there has been a renewed interest in the ways that Chinese philosophical traditions may compliment and augment our ways of thinking about the nature of human experience and our relationship to the world – the 'contextualised self'. These insights relate to not only human relationships, but our relationship to the 'non-human'. Using a case study of youth work in a road safety education context, I explore the philosophical dimensions of this practice, drawing on insights from Chinese philosophical tradition, particularly Confucian schools of moral philosophy. I ask whether there is potential in this tradition for enriching the philosophical foundations for youth work.

Youth work in Australia is characterised by great diversity and complexity, embedded in a rich tradition derived from its indigenous and multicultural history. It also carries the legacy of its colonialist origins, with its history of stolen children, institutionalised abuse and repressive policies targeting young people. At a time of rapid social, political and economic change, youth work should be able to draw on core principles of openness, creativity and adaptability, to open itself to new/renewed ways of thinking/doing youth work.

In this paper I explore the opportunities offered by Australia's unique geographical and cultural position in the 'Asian century' for the development of models of youth work that dynamically work with, and within, the rich philosophical traditions of cultures that have characteristically been ignored, silenced, poorly understood.

State-Society Interplay: Institutional Ethnography in Governance Scenarios / Interacción Estado-Sociedad: Etnografía Institucional En Escenarios De Gobernanza

Esta ponencia tiene dos objetivos. El primero está relacionado con enfatizar la potencialidad metodológica y epistemológica de la etnografía institucional para analizar las reglas formales e informales en escenarios donde interactúan agentes del Estado, el mercado y la sociedad. El segundo implica presentar y discutir los hallazgos de investigación en la que se realizó observación participante en tres escenarios específicos de gobernanza. Tales escenarios, referidos en la literatura especializada como "innovaciones democráticas", se caracterizan formalmente por incluir la participación de agentes no gubernamentales en los procesos de toma de decisión pública. Con ello, siguiendo las premisas teóricas de la gobernanza, se propone democratizar y legitimar las decisiones tomadas por los agentes de gobierno. No obstante, en la práctica, estos escenarios encuentran dificultades de funcionamiento. En la ponencia se busca responder al porqué de estas dificultades. De manera hipotética, se plantea que las inercias institucionales (reglas informales) impiden que estas innovaciones democráticas favorezcan la inclusión efectiva de opiniones externas en la toma de decisión.

Transitions Towards Equality: Sociological Analysis of Contemporary Irish Fathering

Fatherhood is the most commonly shared experience of adult men (Clare, 2000). Consequently, how men construct this role and the influence of fathers in family life remains a critical issue for social enquiry. In the midst of rapid transformative social changes for families within Irish society, various narratives of fatherhood have emerged. There are indications that men are becoming considerably more 'involved' in fathering, implying greater engagement with the physical, nurturing and emotional care of children (Pleck, 2012). Yet, although men appear to

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

be forging new ways of fathering, what is unclear is; how this process is evolving, what models of fatherhood men are following, and to what extent these changes indicate greater equality in gender relations.

A recurring theme across scholarship on fathers and the family is that gender equality has 'stalled' because of a lack of understanding of men's relationship to family life. Deutsch (2007) proposes that the 'missing' piece in gender equality research is the potential of interactional levels in society, to embrace changes in attitudes and practices, providing opportunity for 'undoing' gender, i.e. embracing beliefs and behaviours that reduce gender difference in families, thus advancing gender equality.

This paper discusses the findings of a qualitative study, conducted with fathers in stable relationships and resident with their children. Utilising, thematic analysis of the data, it examined how fatherhood is constructed and practiced, and specifically explores the extent and nature of involved fathering as described by Pleck (2012). Fathers' engagement with their children is examined as part of a process of 'undoing' gender difference (Deutsch, 2007), i.e. as it contributes to gender equality. 'Undoing' gender was explored within the interactional context of family life by examining the extent to which fathers' attitudes and practices in relation to childcare embrace inclusive rather than separate roles for parents.

MOORE, IEVA* (University of Latvia, moore@latnet.lv)

Artistic Integrity and Contemporary Business Models.

Creative industries have given art professionals a ticket to look openly into commerce. This contrasts with the traditional approach where artists are rewarded in gift-like forms. The tradition of public funding and non-market rewards results in artists performing or exhibiting their work for free. This stems from patronage which from the 19th century has included the State with public museums for educating society more broadly.

In the 21st century public financing for art and culture is decreasing and having a significant affect on art professionals. Now artists are expected to earn their living. So what are the business models of today's artists and what role does public financing play?

Art does not have utility, it is an artist's self expression; while design provides a utilitarian good because it is for a customer. Design constrains the artistic process. Art does not have justifiable commercial value while design is fully commercial.

Sociology abstracts from economic transactions while economic theories often abstain from difficult to measure emotional aspects. However, both are looking at the same life processess - simultaneously people create art, live in families, communities and society and earn their living.

On one hand the tradition of cultural education ignores commerce since it is believed to compromise artistic integrity, while every professional artist needs to have their personal business model to survive. Much of society does not appreciate that the artistic process requires intensive personal input, creating broad gains in the form of a public good, but which is not fully rewarded by the commercial market. Artistic input is not a "service" whose commercialization is simple. Present thinking concludes that the solution for culture professionals is not one but a set of elements combining a more rational approach by artists to generating revenue and a more supportive attitude from their audience.

Exploring Transitional Reforms and Civil Society in Serbia through the Role of the Expert

The acceleration of transitional reforms after 2000 in Serbia involved attempts to reform institutions and policies according to global models, and the emergence of civil society as a key state partner in 'reform efforts'. In such a context, the figure of the expert as a professional guiding complex transformational projects has gained prominence. Experts occupy an intermediary position in reform and policy relationships, as they have knowledge of two 'worlds', i.e. donors and abstract policy models on the one hand, and beneficiaries and particular local contexts on the other (Mosse 2005; Sampson 2002). They also acquire multiple professional roles in different sectors and skilfully mediate between them (Wedel 2009; Stubbs 2013).

In this light, expert communities active in Serbia can be regarded as crucial agents in the diffusion, translation and contestation of global policy ideas in a transitional context. My research focuses on the ways in which experts produce and perform expertise, and act as intermediaries in everyday practice. Specifically, it investigates how they translate between different social worlds and interests, produce official representations of reform projects and their success, and reconcile the contradictions inherent to policy relationships. This paper presents the initial research findings of several months of fieldwork on one civil society project that is currently being implemented in Serbia. As the processes I focus on are delocalized, I deploy a multi-sited approach and use an interdisciplinary framework based on discourse analysis, interviewing, document analysis and fieldwork ethnography.

Exploring the practice of expert communities can shed light not only on how global policy ideas are translated within local context, but also provide insight into the complexities of global changes in the modes of governing, the proliferation of new institutional spaces as well as the rise of policy as an organising principle of contemporary world (Shore and Wright 1997).

Elites, Poverty and Inequality in Brazil and South Africa

The paper discusses how different elite sectors in Brazil and South Africa perceive poverty and inequality in their countries. Do they perceive poverty and inequality as important problems across elite sectors? What they perceive as the main causes and consequences of poverty and inequality? Under what circumstances, if any, would they accept redistributive policies? Based upon survey research conducted in 2013-2014 in both countries, comparisons between these national elites also take into account analyses on the same subject done in both countries at the beginning of the 21st century, seeking to identify if there has been significant change in perceptions in the last decade and if so how they relate to changes taking place in the two national contexts.

David Moral Martín (josedavid.moral@urv.cat)

La historia de la Formación Profesional (FP) europea nos muestra diferentes periodos. La Edad Media, con una FP semejante en la mayoría de países europeos. Los siglos XVIII y XIX, en los que surgieron diferentes sistemas de FP en los citados países, configurándose sus tres modelos clásicos -liberal, burocrático y dual-. Finalmente, en las últimas décadas del siglo XX y comienzos del XXI emerge un movimiento de unificación en materia de FP dentro de la Unión Europea (UE).

Este último movimiento se explica si analizamos las recientes estrategias europeas de FP, basadas en considerar a estos centros como uno de los agentes constituyentes de las infraestructuras de conocimiento de las que se ha de dotar la UE. Por otra parte recientes estudios han confirmado que las competencias como las de: representación, participación, colaboración, negociación y resolución de conflictos en los diferentes ámbitos de las organizaciones, resultan fundamentales para la mejora de la competitividad de las distintas regiones y estados de la UE en el actual capitalismo global.

Es por todo ello por lo que el objetivo de nuestra comunicación es describir estos cambios y su afectación a los procesos de participación, así como abrir el debate sobre el papel de la FP en una economía del conocimiento cada vez más inclusiva.

Building an Inter-Disciplinary Perspective on Children's Agency: More Insight or More Noise?

Achieving inter-disciplinarity in childhood studies is a complex challenge. There are already many examples of research which bring together biological and psychological approaches in studying children and childhood but few of those also incorporate a sociological perspective. Some exceptions can be found in the field of health, and to some extent in social work research, under the rubric of 'the psycho-social'. However, many studies are multi-disciplinary rather than *inter*-disciplinary. In other fields of social scientific study, trans-disciplinarity is emerging as an important move which seeks to dissolve the epistemological boundaries implicit in the term 'discipline' although this is not yet evident in childhood studies. I argue here that developing an inter-disciplinary perspective for childhood research means grappling with two key questions: firstly what does the term 'inter-disciplinary research' mean and entail? Secondly, what are the implications for the sociology of childhood as a disciplinary perspective? This latter is relevant since establishing a sociology of childhood involved carving out a specific disciplinary engagement with the lives of children, distinct from the approaches taken by, for example, psychology. This distinction was important since, as is well documented, developmental psychology occupied a hegemonic position in regards to

empirical and theoretical accounts of childhood. An early challenge for a sociology of childhood was establishing the theoretical and empirical warrant for locating the child as a social actor, an agent, and as a member of society. Following this, the question is how to reconcile the premises of the sociology of childhood with those of the other disciplines most commonly concerned with childhood in inter-disciplinary work? In this paper, I explore this in relation to the concept of children's agency and social competence, paying attention to the difference between inter- and multi-disciplinary approaches, and examining the gains that can come from inter-disciplinarity both theoretically and empirically.

Poor Health and the Labour Supply of Senior Workers

As Lindeboom (2006) and Deschryvere (2004) highlight, the existing evidence seems to suggest that health plays a significant role in shaping individuals labour supply decisions. Much of the existing literature develops from the presumption that health displays a linear relation with labour market participation or, where endogeneity is ascertained, that it flows in both directions. However, a recent study by Boot et al. (2014) suggests that that health might play moderator effect, i.e. it can change the strength and the direction, on the factors that influence the labour market participation of senior workers. Acknowledging the moderating effect of health is very imortant as it will help us to work out more comprehensive intervention strategies that, among other things, help to boost the labour supply potential of individuals with poor health.

In this paper, we aim to further explore this hypothesis. In line with Boot et al (2014) we adopt a stratified approach, whereby we apply a similar explanatory model to two sub-samples, extracted according to the health status of individuals. However, we promose a more sophisticated analytical model, which recognises the presence of a selection bias (Heckman, 1979) in the analysis of the labour suply of senior worker. Our data suggests that the presence of multimorbidities has a stronger effect on the number of hours women perform, than on their decision of participating in the labour market. Our results also suggest that, for healthy seniors, the heavier the burden of care, the stronger the reduction in the number of hour reported. This is however not the case for people with multimorbidities. Finally, our results also suggest that investment in the prevention of mental health problems would have particularly positive effects in promoting the labour market participation of senior workers with multimorbidities.

Análisis de la Evolución de las Identidades Religiosas en la Fiesta de El Vítor (España) a lo Largo del Siglo XX a Través de las Imágenes de los Programas de Fiestas

La fiesta popular se entiende en esta comunicación como un hecho social total (Mauss, 1991), definido como elemento central de la cultura española (Gil Calvo, 1991) y caracterizado por ser un campo muy potente en el que explorar las transformaciones sociales (Ariño y García Pilán, 2006).

Por ello, en este trabajo se utilizan las instantáneas que aparecen en los programas de una de las fiestas más importantes de España, El Vítor de Horcajo de Santiago, para analizar cómo las identidades religiosas han ido evolucionando a lo largo del siglo XX en dicha ciudad. Los inicios de esta fiesta datan de 1650, es conocida por su procesión, la más larga de la cristiandad y existe una lista de espera para portar el estandarte hasta el año 2071.

La metodología utilizada es la cualitativa y la técnica el análisis documental. Se realiza la comparación de las imágenes y textos que aparecen en los programas de fiesta de 1944, 1959, 1969, 1978, 1982 y 1997. Resulta imposible entender la comparación propuesta sin tener en cuenta el contexto social, político y económico en el que se encontraban Horcajo y España. Dada esta circunstancia, se analizan años clave de la historia de España, tomándose uno programa de cada década desde el más antiguo que se conserva en el ayuntamiento.

Las imágenes muestran como la rueda del cambio social marca el rumbo hacia un nuevo destino al que se dirige la identidad religiosa, la tradición pasa a ser la protagonista frente a una desgastada religión. Década tras década la religión se va difuminando dejando paso a una nueva sociedad democrática y capitalista. Resulta de especial importancia la promulgación de la Constitución Española en 1978 y su artículo 16.1, gracias a él España pasó a ser un país aconfesional, conformando los elementos sustentantes de nuevas identidades religiosas.

Gestational Surrogacy in Spain: Parental Transformations in the XXI Century in Spain

Gestational surrogacy is an increasingly way to access to motherhood and parenthood. This paper deepens, from a feminist approach, on the questions that surrogacy raises about two key concepts of Western society: motherhood and family.

First, gestational surrogacy challenges the concept of "motherhood" as socially has been constructed and accepted, since it separates the roles of gestational motherhood, social motherhood and genetic motherhood. It also raises a challenge to the existing heteronormative ideals about motherhood the way that traditionally has been understood. The surrogate, rejects social motherhood, leaving the care of the baby to someone else, therefore, she rejects the ideals that place women as primary caregivers (Teman, 2010).

Secondly, surrogacy also states that family becomes a social construction and not a natural product. Through surrogacy, family happens to be created through the market, being no longer a question of destiny but becoming a choice.

Finally, although the Spanish law on human assisted reproduction does not allow surrogacy, since more than twenty years ago Spaniards have been creating families through it. This paper will also give some outputs about the general situation of surrogacy in Spain and its implications. This paper is part of an I+D research project (CSO2014- 55556-P) which holds the first survey about the topic, primary data from this survey about the sociodemographic profile of families created through surrogacy as well as about their experience will be presented.

Sexual and Reproductive Health of Immigrant Women in Catalonia: Consequences of the Application of the Royal Law Decree 16/2012 for Sanitary Regulation

The Royal Law Decree 16/2012 for sanitary regulation, led to the elimination of certain benefits for people not registered in the Spanish National Security Social System. Thus this means the end of the universal and free health care for all citizens who live in Spain. This regulation creates an unequal access to a recognized basic right, a human basic right and legally recognized. This paper aims to provide an assessment of the impact of the elimination of such health care rights for immigrant people, specifically by exploring their implications for immigrant women, both regarding health rights abolition as a whole and the attention related to sexual and reproductive health in Catalonia.

Disputes Between the Rainbow of Social Movement and the Green "Pink Money": Analysis of Political Disputes in the 9th LGBT Pride March in Florianópolis (Brazil) through Visual Sociology.

Florianópolis is a tourist town known as the Gay capital of Brazil. 13% of Brazilian LGBT resides in this municipality. The 9th LGBT Pride March was held in 2015. 30,000 people attended the event. Important political disputes took place between the social movement and the politicians elected by the LGBT population. The tensions stood out in the Brazilian media. The LGBT social movement claimed that Pride March is no longer a struggle for rights event but that it comes to tourism and profit. Using the considerations of Douglas Harper on Visual Sociology, there were photographs from the beginning to the end of the event. Bourdieu's theory was used in the analysis. The photographs show a strong presence of white people and middle class. Few participants were lesbians and transsexuals. The political and financial use of Pride March was marked in the arrangement of sound trucks and speeches. A representative of the LGBT social movement was present in the main sound truck and he wasn't allowed to do speech. The presence of poor vendors and old from distant cities was a relevant information that visual analysis showed. In event were few banners and posters were claiming

Global Reputation: An Inquiry into the Question of Why Jurgen Habermas Is a Global Household Name and Niklas Luhmann Is Not

In 1987, Michèle Lamont posed the question of how one becomes a dominant philosopher. His answer to this question formulates criteria for the quality of scholarly work.

The main drawback of this approach is that it reconstructs an already successful author's career, formulating criteria through a backward narrative. After all, there were many outspoken and critical French philosophers in the 1960s. In addition, most of Lamont's data are restricted and anecdotal, relying on biographies and a small, random sample of interviews.

This study uses contrasting cases of two social scientist or philosophers: Jurgen Habermas and Niklas Luhmann. Both authors share a similar post-war German biography and publication record, and both developed a grand, complex social theory. However, Habermas has gained a large following, whereas Luhmann's work has remained a luxury shared by a few scholars. A large bibliometric database, using the Web of Science, was created primarily of patterns of reception, from quantitative and qualitative perspectives. These analyses revealed that, for instance, reception does not follow a linear process, in which a few initial scholars convince others and those persuade even more, but instead, at first, a quite erratic path. Furthermore, only a few works appear to underpin the reputation of particular authors. Using text mining, analysis of titles, abstracts and keywords suggests that external events (e.g. the Eastern bloc) triggered waves of success. A detailed analysis of top papers citing Habermas shows that these shifted from content-driven citation to merely standardised citation in later years.

These findings suggest a much more complex picture of global reputations driven by external events, the Matthew effect and formulaic citations of certain authors. Overall, these results suggest that Lamont and others' analysis needs to be revised using more sophisticated tools to track global reputation patterns.

How to Clarify the Interactions Between Social Movement and Its Opponents: A Case Study of Anti-Base Construction Movement in US-Occupied Okinawa.

This presentation clarifies a methodology that opens up one of the research possibilities of the interactions between the Social Movement and its opponents from the strategic perspective.

Social Movements define its opponent strategically in order to achieve its goal. However, internal strategic process of the opponents, such as the state, is often concealed or difficult to access due to the security reason. Therefore, the theory of the relational approach of Social Movement focusing on the strategic process has to be made and sophisticated through the empirical practices of SMs and archives of the state institutions in the past. This type of accumulation will contribute the relational approach that analyzes the ongoing SMs as well as the reassessment of the historical approach of the SM.

As a case that illuminates strategies of both Social Movement and state institutions, I focus on an anti-live firing base construction movement in Okinawa in the 1970 under the US military occupation. This movement emerged after the US-Japan agreement on reversion of Okinawa to mainland Japan in 1972. The case shows how the strategy of the movement split US military as a global network and the US military administration of Okinawa (United States Civil Administration of the Ryukyus) in two in terms of the responsive strategic process of those institutions. By tracing the internal strategies of both sides, I want to deepen the understandings of the mobilization and interaction process of the Social Movements and its opponents.

Creative Professionals. Innovation and Creativity in Architecture and Biotechnology

At present, the discussion and analysis of the constitution processes of the knowledge-based economy, modelled by learning and powered by innovation become increasingly necessary. An important aspect to this contribution is represented by the subject matter of our research: to analyse the importance of innovation within the so-called creative occupations, in the case of Catalonia (Spain). We study the creative process that the creative professionals carry out and the influence that the cities, where these professionals live, exert over this process/ the influence exerted by the training that they receive. For this purpose, we analyze two creative professions within the exploratory phase. The architects and the biotechnology scientists; professions that we have selected after an analysis of the composition of the creative occupations in Spain and their evolution in the class structure through secondary data sources (Labour Force Survey - EPA, Population Census, etc.), considering that in our research we also study the implications that these occupations have on social mobility. Therefore, we have followed a qualitative strategy with in-depth interviews and generational analysis. Our paper aims to present the results of this exploratory phase and open the debate on creativity and innovation, as well as the relationship between creative cities and creative occupations, and whether they are important aspects of the processes of institutional and social construction of the knowledge-based economy. But, how do these relationships take place? How do they work today, in Spain, the relation between the training received by the professionals/creative city and creative occupations, between creativity and innovation? In what aspects should it be improved?, and, What impact do creative occupations have on social mobility?

How Communicative Acts in Dialogic Literary Gatherings Contribute to Enrich Language Skills and Increase Social Cohesion

Social cohesion is a global challenge in the information age. The Lisbon Strategy from the European Commission marks social cohesion as a priority. The present paper analyzes the role of communicative acts in Dialogic Literary Gatherings (DLG) to enrich language skills and increase social cohesion. DLG is a successful action identified under the FP6 INCLUD-ED project. The main feature of DLG is that classic literature is read and discussed in egalitarian dialogue. To make egalitarian dialogue possible, some crucial aspects are contemplated. DLG depart from the conception of dialogic understanding of knowledge, thus, participants regardless of their social background or educational level provide their interpretations of the text. It is the validity of the arguments (Habermas, 1987) that are decisive for the discussion rather than the social position of the person who emits them. From the perspective of communicative acts (Searle and Soler, 2004) DLG provide a space in which power relations are reduced and dialogic interactions prevail opening up the possibility for linguistic, cultural and social diversity. In this context, especially those people who are traditionally excluded and bereft of their cultural intelligence, such as working-class people or migrants can participate on an egalitarian basis and enrich not only their linguistic skills but also their cultural skills through the reading of classic literature and their social relations. In this space people get empowered and personal and collective transformation is enhanced. The dialogic interactions taking place in DLG offer the possibility to establish new social relations in the community which fosters social cohesion and participation in other areas of social life. The present research evidences that the language situations in DLG with communicative acts free from social power constraints contribute to increasing language skills especially among vulnerable groups such as migrants and linguistic minorities and improve social cohesion.

Communism Is Dead, Long Live the Labor Movement?

Recently, sociology of work has been most interested in transformations and innovations in labor mobilizations. The persistence of traditional forms of industrial conflict has been on the contrary largely ignored. Taking a historical perspective covering the last four decades, I analyze the cycles of collective action of motorcycle factory workers in a small town of Tuscany, in the middle of a region known for adhering to the "red subculture". This subculture emanates from the first peasants' mobilizations at the beginning of the 20th century, and it is based later on the local hegemony of the Italian Communist Party. After WWII, the Party, excluded from the national government, has been organizing the local civil society with the help of its tight network of associations, from the 70's getting as well the control of the local government. The local community became, therefore, a "political community" coordinated by the Party. Thus, in the late 70's the com-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

munist framework regarded virtually all workers of this territory. However, the construction of this institutional and cultural framework underwent a process of progressive bureaucratization which often limited labor unions collective action by constraining workers choices of mobilizable institutions and collective action frames. The dissolution of the Party in the early 90's and the progressive erosion of its sub-cultural background left the labor movement weakened and defenseless. Nevertheless, the workers 'culture of solidarity' has still persisted and has been transmitted to the younger generation through family and local community socialization, as I show in a recent ethnographic research of mine. Today, when workers are facing threats of delocalization and policies of labor flexibilization, we assist finally to a partial political disentanglement of the local labor movement, through a renewal of the traditional repertoire of contention as well as of resistance practices at work.

'I Really Have Thought This Can't Go on': Housing Tenure and the Health of Older Australians Dependent on the Age Pension

Although life expectancy is generally increasing there is a growing consensus that the affordability, adequacy and security of tenure of housing are key factors determining the health status of older people. The importance of affordable and secure housing for 'ontological security' is well-established. In the case of older (65 plus) Australians, the minimal regulation of the private rental sector means that older private renters are generally in a very different position to older social housing tenants or homeowners. Older private renters often have minimal security of occupancy and the cost of their accommodation often accounts for a substantial proportion of their budget. This study draws on 125 in-depth interviews with older homeowners, private renters and social housing tenants dependent mainly or solely on the age pension. It examines the impacts of the cost of accommodation and security of occupancy and illustrates that the financial stress and minimal security of occupancy experienced by most older private renters potentially have serious health implications. Besides precipitating substantial anxiety, the high cost of their accommodation made it difficult for older private renters to look after themselves adequately. Most of the private renters felt that they had limited or negligible control over their present and future housing circumstances. In contrast, the older homeowners and social housing tenants because of the low cost of their accommodation and guaranteed security of tenure could usually control their budgets and their present and future housing situation. The study shows how their housing situation generally laid the basis for a positive outlook. Many felt that their home and their status as outright homeowners or social housing tenants were absolutely central to their health and capacity to lead a decent life. They felt secure and in control.

MORRIS, ALDON* (Northwestern University, amorris@northwestern.edu)

W. E. B. Du Bois: Erasure from Classical Sociological Theory

There is a major gap in classical sociological theory. In a new book, The Scholar Denied: W. E. B. Du Bois and the Birth of Modern Sociology, I demonstrate that for over a century mainstream sociology ignored and marginalized Du Bois's innovative work in sociological theory. In this paper, I show how Du Bois was first to develop a structural theory of racial inequality. He was the first to advance a social constructionist theory of race. He was the first to offer an intersectional theory of stratification highlighting the interactive nature of race, class, and gender. By excluding Du Bois's theoretical contributions, the field of sociology has only recently come to embrace Du Bois's seminal theoretical ideas. The paper argues that if this gap in theory had not occurred, the field would be far more advanced. Ideas are advanced as to how scholars can improved their theoretical work by taking Du Bois's work into account.

MORRIS, CAROLINE* (University of Leicester, cm582@le.ac.uk)

Risk-I: Exploring Risk-Identification to Prevent Cardiovascular Disease - an Institutional Ethnography

Identifying individuals who may be 'at risk' of disease has become increasingly prominent in healthcare policy. As the demographic of disease becomes dominated by so-called 'lifestyle' related conditions, many of these diseases are seen as preventable.

In the UK, screening for cardiovascular risk is achieved through the NHS Health Check and opportunistically in routine primary care consultations. It hinges around a computerised tool which calculates risk based on risk factors such as: age; diabetes; blood cholesterol; blood pressure; weight; ethnicity; and address. Efforts in preventative care are focused on increasing uptake of screening

- through which individuals are presented with information on how likely they are to have a heart attack or stroke over the following 10 years. This is calculated as a numerical probability, and may also be represented visually. The assumption is that this information will trigger them into altering their lifestyle, or taking medication to modify their risk.

People's experience of being targeted for risk identification may not reflect the ideology of preventative care. Many healthcare professionals working in primary healthcare are concerned that strict adherence to clinical guidelines may harm, rather than benefit, individual patients through side-effects of medication, or harms from being labelled as being 'at risk'. As risk thresholds are reduced, there may be increasing uncertainty about the balance of benefits and harms, and a greater role for shared decision-making between patient and practitioner. Uncertainty is particularly acute in cardiovascular risk identification, where guideline-based care is largely based on surrogate outcomes, rather than on outcomes which have more relevance to patients – such as morbidity or mortality.

This study, using institutional ethnographic methods, investigates problematics around preventative care from the standpoint of people who are the target of screening for risk.

MORRISON, IAN* (The American University in Cairo, imorrison@aucegypt.edu)

Interculturalism and the Question of National Identity in Québec

Since at the introduction of *La politique québécoise du développement culturel* in 1978, a succession of governments in Québec have sought to develop a model of pluralism that explicitly rejects both the American model of an assimilationist melting pot and the Canadian model of multiculturalism in favour of a policy of integration. Québec's model of integration, which would come to be labelled interculturalism, is based on two main principles. First, integration is defined as a long-term process culminating in the ability of immigrants to participate fully in, and develop a feeling of belonging to Québec society. Central to this is a mastery of the French language, enabling the participation of all citizens in public life. Second, interculturalism is to be guided by a moral contract which outlined the rights and responsibilities of Québécois of all origins, and the relationship between immigrants and the host society. As such, the limits of pluralism are defined by the boundaries of the fundamental values of Québec society.

The institution of policies of interculturalism has coincided with, and revealed the complexity of an attempt to develop a civic conception of the Québéc nation. Since the early 1990s a series of controversies related to the integration of migrants has led to a renewed concern about what the inclusion of migrants into a reconfigured sense of nation means for a national project. While some nationalists have argued that interculturalism undermines the particular identity of the Quebec nation through de-ethnicisation and what they consider a reduction of Quebec identity to one based solely on language, others argue that interculturalism fails to provide a means for genuine integration and belonging, as it is founded upon the history and values of a particular ethnic group. It is this relationship between interculturalism and nationalism that this paper will examine.

Decline of "the American Dream?" Outlook Toward the Future Across Three Generations

Inspired by the "American Dream," generations of parents have encouraged their offspring to get ahead by working hard, achieving in school, and holding high aspirations for the future. Women's continuing advances in education and the labor force, and other feminist movement gains, have provided an increasingly positive climate for girls' thinking about their futures. However, a deteriorating economic climate, particularly since the "Great Recession," may have diminished the outlooks of many contemporary youth as they envision their futures.

We examine shifts in future orientations across three generations of Midwest American families. Our unique data archive from the Youth Development Study includes 266 Generation 1 (G1)-Generation 2 (G2) parent-child dyads and 422 Generation 3 (G3) children. We assess within-family change over the past two decades in parental expectations about their children's educational attainments and adolescents' own future outlooks, with special attention to shifts in girls' future orientations. Using confirmatory factor analysis, paired sample t-tests, and within-family regression models, we examine adolescents' aspirations for socioeconomic attainment, their perceptions of their parent's expectations for them, the obstacles they perceive to their career progress, and more general optimism about the future.

With controls for age, socioeconomic status, parental unemployment history, and parental work attitudes, we found that parents' (comparing G1 and G2) ed-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ucational aspirations for their children, and adolescent children's (comparing G2 and G3) own socioeconomic aspirations, have increased. Upward shifts across generations were especially pronounced among adolescent girls. Compared to their mothers (G2), observed at about the same age, teenage girls (G3) also had more positive life course expectations in general, and anticipated less work-family conflict. We conclude that the "American Dream" is still alive---especially among adolescent girls, whose educational and occupational opportunities have expanded across generations, and whose optimistic outlooks are supported by the long-term successes of the women's movement.

Life Experiences Linked to Positive Trajectories during Adolescence and the Transition to Adulthood

Key formative experiences have the potential to influence youths' movement through the transition to adulthood. Positive experiences promote resilience and success among at-risk youth; negative experiences can derail young people who are doing well at the outset. Taking a holistic and person-centered approach, we leverage data from the Youth Development Study, which followed 1,139 St. Paul youth from the 9th grade to age 38 (19 waves of data collection).

First, using latent class analysis, we identify youth who exhibit constellations of attributes indicating greater or lesser age-specific "success" in mid-adolescence (age 14-15), late adolescence (age 17-18), and early adulthood (age 25-26). In mid and late adolescence, more successful youth had higher grades, educational aspirations, and intrinsic school motivation, and avoided smoking/alcohol use. More successful young adults were employed, economically self-sufficient, making progress toward career goals, satisfied with their jobs, and lacked physical and emotional problems.

Second, we trace shifts between classes as respondents moved from middle to late adolescence and from late adolescence to adulthood. Though the majority was "stable," considerable movement occurred between classes.

Finally, using multinomial logistic regression (controlling background characteristics), the following experiences distinguished adolescents moving from less to more successful classes ("resilience"), and affected the likelihood of staying in the more successful class (versus "downward mobility"): positive parent and teacher relationships, peer support, and school autonomy. These experiences continued to predict positive trajectories during early adulthood. Key protective factors emerged in early adulthood: a teacher/professor who influenced career goals, work autonomy, supervisory support, and delayed child-bearing.

We conclude that the quality of family and peer relationships, and specific experiences in school and work settings, differentiate youth exhibiting more or less positive trajectories. Because the quality of adolescent experiences continue to influence trajectories during the transition to adulthood, it is especially important to address deficiencies in adolescent contexts.

Endangered Legitimacy: Survival Strategies of Russian Non-Governmental Organizations Under the "Foreign Agents" Law

Our contribution investigates the survival strategies of Russian non-governmental organizations under the condition of endangered legitimacy. The state bill "Introducing Amendments to Certain Legislative Acts of the Russian Federation Regarding the Regulation of Activities of Non-Commercial Organizations Performing the Function of Foreign Agents", which is in force since November 2012, required Russian non-profit-organizations that receive foreign funding to register as so called "foreign agents" if they are conducting political activities. The implementation of the law started hesitantly in 2012. However, it has gained momentum since mid-2013, with 90 organisations having ended up on the foreign agents list through enforced registration in September 2015. These organizations not only will be under tightened governmental control, but also are obliged to declare as a foreign agent in all their public actions. Empirical evidence suggests that particularly the latter significantly distorts their relations to their key constituencies by attacking their identity as nonprofits and suggesting them being actually "for profit" and remunerated for their services by foreign states. Moreover, by damaging the organizations' credibility as participants in public debates and restricting their possibilities of informal cooperation with and access to state bureaucracies, the label "foreign agent" undermines crucial operational preconditions of many NGOs. In spite of these burdens, however, most organizations have managed to persist and further pursue their goals – even if they had to change or abandon their original organizational form. Referring to detailed case studies of Russian NGOs coping with the aftermath of the "foreign agents" law, we explore (1) how this legitimacy crisis has affected the relations between the organizations and their key constituencies (members, clients, donors, media, state bureaucracy), and (2) what strategies the organizations are following in order to survive and preserve their autonomy and identity (such as emigration, formal commercialization or the transformation into informal networks).

MOSSBERG, LINDA* (Department of Social Work, University of Gothenburg, linda.mossberg@socwork.gu.se)

Designations and Categorisation: Its Content and Consequences in the Swedish Mental Health Landscape.

Designators for people who use welfare services have been under change and are under continuous debate. This paper investigates the usage and meaning of designations used in interaction between human service organisations representatives (HSORs) and service user organisations representatives (URs). 75 unique terms were found in audio-recordings of observations of eight Swedish mental health strategic collaboration councils' meetings. Seven analytical categories were set up in relation to characteristics, aim, when it was used, and who were using the category. These were *the cog in the organisation, the representative, the ordinary but eccentric, the independent but dependent, the person in need of change, the trapped,* and *the member.*

HSORs mostly used the Swedish equivalents of "service user", "client", and "patient". The URs mostly used "members", followed by "people", and "persons", or expressions like "many of us who...". Results showed that participants were in negotiation on what characteristics service users had, where the categories were used for certain aims. URs and HSORs shared some categories, such as *the ordinary but eccentric*. Some categories were used with differing aims and starting points, such as *the representative.* One group exclusively used some, e.g. the URs and *the trapped*. The use of categories were divided in a collective and an individual perspective. Participants agreed on service users having complex needs but not essentially different. Service user representatives emphasised a structural perspective, a society unequipped to meet service users' needs while respecting their citizenship. Professionals more often used the individual perspective. Their categories were better established and thus more resilient to resistance, while also connecting to the individual explanation models widely spread in mental health care. Agency was seen in both the URs' use of alternative designations and the joint aim to emphasise the "normal" found in category *the ordinary but eccentric.*

How Do Adults Realize Children's Freedom in Modern Settings?: A Case Study of the Japanese Adventure Playground Movement

"Children are social actors." "Children have agency." These slogans are easy on the ear. However, in reality, children live in modern settings that presuppose asymmetrical relationships between adults and children such as school education and child protection systems. Sociologists of childhood should not stop analyses at the point of finding children's agency. Instead, we have to tackle questions, such as how they enjoy agency and how we are able to let them have it in this structure.

This paper will show one case study of the Adventure Playground movement in Japan, analyzing documents and interviews with participants.

The movement originated in Europe and appeared in Tokyo in the 1970s. The park is a paradoxical place in which adults offer children "free" and even adventurous play, which had been missing from urban life. In the course of its development, the members of the movement had to cope with claims that the place was dangerous and dirty. They appropriated modern notions such as "responsibility" and "risk," and contrived a challenging motto to the existing views on children: "Be Responsible and Play Freely"

It is true that this space is being preserved by adults with elaborate strategies. It is none other than adults who cope with matters of laws, economics and politics, especially related to safety issues, which children cannot solve due to the (lack of) responsibility given to them in the modern social systems. However, by doing so, the space is being suspended from the modern conception of the adult/child dichotomy and has become a free space not only for children but also for adults.

My paper will show the way the movement realizes this utopia, intentionally or unintentionally. This will serve to show the contemporary constellation of concepts related to childhood and a practical way to dislocate the existing system.

The Protestant Ethic Thesis: Some Forerunners of Max Weber in France and Brazil

It is well known that the "Protestant Ethic" thesis had existed for a long time prior to Max Weber's own formulation. Some specific cases of anticipation are represented by Napoléon Roussel (who wrote over 1,000 pages of historical analysis of the subject) and Émile de Laveleye in the French speaking world of the 19th century. Apparently Weber never mentions Roussel, but he does occasionally mention Laveleye in his essay on the Protestant Ethic. During the same century or by the beginning of the following one, Brazilian writers T. Bastos and E. Carlos Pereira, among others, in addition to a certain number of missionaries of English and North-American also dealt with the issue of Protestantism and Progress. It is unlikely that Weber was acquainted with Brazilian authors and English-speaking missionaries working in Brazil. In any event, Weber, never seems too eager to mention predecessors and sources on the issue of the Protestant Ethic and this also includes Hegel's writings on the philosophy of History. These precursors did not necessarily reach the same level of theoretical or theological sophistication as did Weber (Hegel certainly did), they view adhesion to Protestantism (albeit, at times, in a rather secularized and cultural sense) as a necessary condition for modernization and economic development. Indeed, Weber's own formulation of the thesis seems to represent a secularized version of a central tenet of Protestant apologetics. And, again in largely secularized terms, this is still, in early 21st century, a fully living, indeed a burning issue in both France, Brazil and elsewhere, being but a continuation of the *Kulturkampf* that has for so long opposed the traditional Protestant and Catholic conceptions of society and modernization.

How Organization Transform Law- Sociological Thoughs on Judicial Work

Dealing with the issue on the « quality of justice », our presentation is based on a synthesis of our different fieldworks on Justice courts these last ten years. We have observed the growing impact of managerialization inside these courts, and their consequences on the magistrates' work. If the structures of the courts and the functions of each magistrate is governed by the Law, empirical researches show beyond doubt that organizational adaptations and assessment objectives have deeply transformed their work. Efficiency, quickness, and productivity have imposed new standards in the decision-making process. The pressure for more repression, based on law and order policies, has also had an impact on the magistrates' choices

However, our different studies -on the criminal courts' *quick answer* system, on the family justice system, or on the children courts- point out that this movement of managerialization is not leading to a single movement of standardization, but to a large range of adaptations. If some magistrates subscribe to this logic of efficiency at any price and accept a weakening of the quality in order to produce more decisions, many other resist to this movement. Admittedly individual beliefs in what is good justice play a big part in this choice, but our results underline that some functions inside the judicial system are more likely to favor the support of managerialisation whereas any others make magistrates inclined to resist to this movement. We will present a comparison of what we call « the different pattern of Justice », linking them to the magistrates' function inside the courts and comparing public prosecution, criminal courts, family courts and youth judges.

These "Others" Who "Are Not Charlie": A Slogan to Unity, a Rhetoric of Exclusion?

On 7 January 2015, the offices of the French satirical newspaper *Charlie Hebdo* were hit by a terrorist attack in which 8 members of the editorial were murdered. Just one hour after the tragedy, an art director created the slogan "I am Charlie" that was immediately adopted by a growing mass of supporters of the paper and largely spread on social networks. The next week-end, four million people joined street demonstrations with the slogan on their placards. It became a symbol of defense for freedom of expression and resistance against terrorism. But if the slogan was effective so as to bring people together, there was not a complete consensus. Some "others" refused to join this movement. On January 15, the well-respected daily newspaper *Le Monde* dedicated an article to "those who are not Charlie": this group of people was described as "horrified by the attempt (but) do not recognize themselves in the *sacred union* of a France in communion with the slogan". Our aim is to investigate how language has been used to identify the "others" as "not Charlie" knowing that the pro-Charlie movement had the best reason to consider itself as "natural", "obvious" as sure as the event was terrible and indefensible. We would like to analyze the labeling process in this special case, knowing that it was difficult to reject this incomplete unanimity without being seen as "pro-Terror". How did "others" react when they were "in the hot seat", required to justify themselves? Their silence could be interpreted as an admission of guilt but as well their arguments were under the pressure of the majority. In such a perspective, we will review the origin of the classification between "we"/"others" on the intersection of sociological and linguistics issues. Our conclusions will concern the performativity of this kind of categorization

MOYLE, JUDITH* (Deakin University, judith.moyle@deakin.edu.au)

Considering Disability As Functional Difference in the Diversity Discourse in Australia

Over the last decade, Australia has undertaken one of the greatest sociological revolutions in the history of disability care. The question raised in this Paper is whether the introduction of the Australian National Disability Insurance Scheme Act (2013) has unwittingly led to the enshrinement of DIS/ability as a distinct and permanently separate 'othering', or is there still room to replace 'DIS/ability' terminology and move toward celebration of functional difference in the diversity discourse?

From the time the Australian disability community started searching for a way to provide a more equitable service system, and a National Disability Insurance Scheme was first mooted, debate has hovered uncomfortably around whether acceptance, equality, relationship and inclusion can be crafted through legislation. Although many had hoped to move the perception of people living with a vast array of functional impairments (currently bundled together into the DIS/ability domain), into the broader embrace of the diversity discourse, a burgeoning disability budget drove a powerful alternative productivity-led debate down a different pathway. The felt - need for greater equity and fairness within the disability service system itself somehow drowned out the emerging desire for a change in the perception of people living with functional impairments, to be embraced and celebrated within the diversity population that the rest of the community enjoy.

The passionate intention of many well-meaning leaders in the consumer advocacy movements was to reduce structural discrimination and inequity in the funded service sector, while at the same time promoting inclusion and participation in preferred community based activities. The inevitability, however, of attempting to partner a government-led productivity-based structural revolution with a utopian dream of authentic community relationships has begun to be felt in the disappointments of many who dreamed of welcome and acceptance, but have discovered little change in attitudes of discrimination and exclusion.

Factorial Surveys in Social Psychology: External Validation of a Factorial Survey with Longitudinal and Administrative Data

In Factorial surveys (FSs) the experimental variation allows assessing the causal impact of dimensions on the evaluations, while at the same time the multifactorial design forces respondents to make judgments based on trade-offs. Moreover, the hypothetical nature of the stimuli enables researchers to focus on rarely observed events. The experimental design provides a high amount of internal validity, while the implementation in a survey is assumed to ensure a high amount of external validity. Given this advantages, factorial surveys have a long tradition in many

disciplines of social sciences, including social psychology, to measure attitudes, norms, social definitions, and behavioral intentions.

However, from an empirical point of view, it is still unclear to what extent factorial survey show external validity, and in particular, to what extent behavioral intentions measured by a factorial survey help to predict real behavior. Hypothetical decisions and stated preferences might differ from real decisions for many reasons, including discrepancies between planned and real behavior. So far, there are only few empirical studies focusing on the validity of factorial survey results. Most of them suffer from severe limitations such as mixing up different concepts of validity and using different samples for stated and revealed preferences.

To overcome this research gap, in this presentation first theoretical reasons are provided why stated and revealed preferences might differ. Second, results from a validation study based on job-related mobility decisions are presented. The study was performed in a large-scale German panel study, which offers the possibility to utilize non-reactive, administrative data on job search behavior. All in all, the research tries to gain better knowledge about the validity of FSs, but also the designs needed to allow validation of results: Do stated and revealed preferences diverge? If yes, for what reasons? Which design features help to validate FS research?

Renewal in a Crisis? Union Responses to Precarious Work in the Retail and Metal Sectors of Estonia, Poland and Slovenia

Based on company-level case studies and sector level expert interviews with trade union activists, this paper addresses the problem of trade union responses to the precarisation of work in the retail and metal sectors in Estonia, Poland and Slovenia following the 2008+ economic crisis. Even though the crisis led to some convergence, Estonia and Poland remain the examples of decentralised systems of collective bargaining while Slovenia represents a neo-corporatist system. Due to the differing industrial relations systems and sector-related union capabilities, responses to precarisation have differed. Central-level collective bargaining – which in certain cases only institutionalised the developments springing from the grass-root mobilisation – aimed at halting the growth of precarious employment during the economic downturn proved to be more effective in Slovenia than in Estonia and Poland. Conversely, trade union responses in Poland and Estonia were predominantly based on company-based union organizing and social campaigns. Simultaneously, some innovative union strategies emerged: (1) bottom-up organising of temporary agency workers and subcontractors by large company-level unions in the automotive sector; (2) centralised organising in Polish and Estonian retail and Estonian metal sector based on the transfer of the 'managed' organising model to the sectors; (3) public awareness raising campaigns using new electronic media and pressure on customers in the retail sector; (4) experiments with community-based organising by smaller radical unions and non-union organizations in retail sector (in Poland); (4) strengthening cross-sectoral cooperation; (5) the use of European employment relations institutions and international informal contacts to counter-act precarisation at the company level. We suggest that the final outcome of a successful mobilisation, nonetheless, depends heavily on the importance of particular sectors (or even particular company) in the national economy as well as on the established institutional infrastructure of industrial relations in a given country.

Association Between Social Capital and Depression

Social relationships are known to be related to different aspects of health. One specific concept of social relationships is Pierre Bourdieu's conception of social capital. Bourdieu developed a theory of different forms of capital. He argues that besides economic and cultural capital also social capital is an important resource for individuals and their chances in their lifes. Previous studies showed that low social capital is related to poor health in general but also for example to higher rates of obesity. Previous research showed that in general weak social networks and weak social support are related to bad mental health. But also low socio economic status, low income and low education are known to be related to bad mental health.

Our aim was to analyse whether low social capital is also related to bad mental health and to mental conditions close to depression. We took particular interest in the question whether social capital retains its influence after adjusting

for variables like socio economic status, income and education since these are known to be related to social capital.

We analysed the association between social capital and depression by means of multivariate regression analyses. The database was the 2006/07 Austrian Health Interview Survey (ATHIS), in which 15000 individuals in Austria aged 15 years or older where interviewed. Our results show that low social capital is related to proxies of depression even when adjusting for education and income.

MUELLER, ARMIN* (University of Goettingen, armin.mueller@sowi.uni-goettingen.de)

The Interface Between Migration and (Global) Social Protection in China

Economic globalization and the accelerated growth of the reform period have reinforced spatial and social mobility within and through the PRC. Its labor markets are fueled with rising numbers of migrant workers and foreign citizens crucial to its new position in the global economy. How are those migrants protected socially while being on the move? Based on institutional analysis and semi-structured interviews, this paper compares the social protection arrangements of domestic and transnational migrants. It relies on the new conceptual tool of the "resource environment" to explore the interface of migration and social protection between migrants' sending and destination points. In the post-planned economy, both groups face similar challenges regarding formal social security, which largely depends on citizenship, residential and occupational status. Their mobility exposes them to gaps and overlaps between the protective institutions of both places and problems of portability when crossing international and/or sub-national borders. For both, integration into social insurance in Chinese cities depends primarily on a formal Chinese labor contract. Formal protective institutions at the sending points can serve as fall-back-options upon return, or be extended across borders to cover (some) migrants in their destination areas. Markets provide functional equivalents for those able to pay. In similar ways, informal social security via family or community networks can be extended to, or integrate migrants. The inter-penetration between different national and sub-national welfare regimes determines the stratification of international and domestic migrants' resource environments in the PRC. The individual policies of the sending and receiving states and sub-national jurisdictions alter the coverage of formal protective institutions, and migrants' dependence on informal social security. The level of protection largely depends on the social positions they simultaneously hold at their sending and receiving points.

MUELLER, GEORG* (Univ. of Fribourg, Georg.Mueller_Unifr@bluewin.ch)

International Student Migration and the Field Theory of Kurt Lewin

This paper aims at a field theoretic reinterpretation of the classical pull-push migration-theory of Everett Lee (1966). It assumes that pull- and push-factors of a migration-target are in the psychological terminology of Kurt Lewin (1964) "positive/negative valences", which generate a field of "driving forces", that determines the "locomotion" of migrants to the mentioned target. The strength of this field depends on the migrant's social attributes as well as on the number of structural holes (Burt, 1992) in the target-region. Even more complicated, the field of the considered target also interacts with the fields of alternative migration targets as well as the retaining field at the origin of migration.

In the second, empirical part of the paper, the outlined theory of fields of K. Lewin is used in order to explain observational data of the inter-university flows of Erasmus students (European Commission (2014), "Erasmus"). The strength of the field of a target-university is hypothesised to depend on positive valences like its international academic ranking, the number of structural holes in terms of study-places reserved for Erasmus students, but also on negative valences such as the cost of living or the particularities of the language of teaching. These factors are assumed to interact with the migrant student›s position in the mentioned social attribute space, operationalized by the teaching language, the cost of living, and the university ranking at the place of origin. By taking all these factors into account, it is possible to explain the observed migration flows by means of statistical regression techniques.

„It's God-Awful, but You Have to Deal with It." - Individual Patterns of Action and Interpretation Among Older Male Caregivers

When asked about retirement, especially older men often report of freedom and their plans how to catch up with things they couldn't do during work life. Thus first associations with life in retirement are usually pretty positive. But what does

　　denotes a presenting author. Abstracts are organized by first presenting author's last name.

it look like, if the individual plans for retirement cannot be realized? Apart from factors like a weak financial situation or health problems it is mainly the situation of becoming a caregiving relative that can change the life in retirement very strongly. And while there is already a growing scientific discourse about professional care work in ageing societies and general gender aspects within this field, so far, only little attention is paid to the situation of older men whose spouses are in need of care.

This contribution takes up this topic and presents preliminary findings from analyzing individual patterns of action and interpretation among older male caregivers with regard to the meaning of gender roles and male identities for their daily care practices. The methodological framework of the study consists of problem-centered interviews that are analyzed based on Grounded Theory. Even though the process of iterative theory-development is not finished yet, so far our analyses have already shown narrative constructions of a certain role-migration older men have to deal with when starting to care for their spouses. And although the decision to take responsibility for the daily care practices is framed as a matter of course, there seem to be specific limits of care that are connected to gender identity and the role allocations that have been practiced within the relationship before the wife became in need of care.

MUKHERJEE, UTSA* (Royal Holloway, University of London, utsa.mukherjee.2015@live.rhul.ac.uk)

Locating the Transnational and Studying the Diaspora: A Study of British Indian Children

The concept of transnationalism has gained considerable attention in the study of diasporic communities. Theoretical interventions in this field have often problematized the association between the notions of transnationalism and diaspora. The transnational context is deemed to be implicit in the very conceptualization of what is meant by the 'diaspora' and is therefore an integral part of the same (Safran, Sahoo and Lal 2009). By focusing on the Indian diaspora in the UK, this paper seeks to trace the ways in which such processes of transnationalism, through its institutions and structures, impact the everyday lives of children belonging to such diasporic communities. The site of leisure becomes a crucial marker in assessing the interplay of these forces as they shape the cultural milieu of British Indian children in contemporary England. Moreover, the processes of globalisation have initiated modes of economic transactions and cultural preferences which have played their part in influencing modes of consumptions. The nuances that foreground the relation between the 'host' nation-state, the 'homeland' and beyond inform the cultural consumption and socialization of these children. For instance, the transmission of heritage languages to these children involves factors that continually connect these communities to memories, institutions and ideas of the ancestral homeland (Barn 2008). The study of cultural consumption throws up critical questions that reflect on the very theoretical premises of transnationalism and globalisation and their implications with regard to diasporic families, especially those belonging to the Indian diaspora in contemporary England. It is through the study of British Indian children that the paper attempts to yield meaningful insights into the debates on transnationalism and families.

Restoration of the Linguistic Tradition of Ethnic Livs (Latvia): Aspects of Motivation

Livs are one of the Baltic Finnish ethnic groups, their historical location is northwestern part of Latvia. According to the 2011 census, 250 individuals defined themselves as Livs, and this marks a significant rise of their population, compared to 48 individuals in 1970s.

Linguistically Livs are Fenno-Ugrians, thus differing from Latvians, who represent Indo-Europeans. Ethnological data of 19th and 20th century provide evidence, that Livs have been predominantly bi-literal: they were in command of both Liv language and Latvian, leaving their own language in the second place as a communication tool in families and local community. During the Soviet occupation the Liv language was actively destroyed and it did not appear in public space. Therefore the natural inheriting of the language diminished consequently, until it was broken as, supposedly, the last native speaker Grizelda Kristiņa (b. 1910) deceased in 2013.

Nowadays one can observe a strong tendency to restore Liv culture and linguistic tradition. The present-day statistics indicates about 200 speakers of Liv language, but only 40 are fluent in conversation (level B1), besides, only half of them are ethnic Livs. It can be stated that the interest towards culture, language and its revival has been stronger outside the Liv community than inside it. Field research shows that members of the Liv community recognize the increase of prestige and popularity of their language, nevertheless the main language experts today are researchers and interested amateurs. This might serve as an evidence

that the language tradition is revived rather than inherited within the Liv community.

What is the motivation to restore the language tradition in the 21st century, if the instrumental linguistic function of ethnic minorities has become clearly marginalized and only symbolic aspects have remained topical – this question will be examined in the paper.

MULLEN, ASHLI* (University of Glasgow, a.mullen.1@research.gla.ac.uk)

The 'Blonde Angel' and the 'Gypsy Childsnatcher': Racialisation of Romani Family Relations in the British Press

The 'Gypsy Childsnatcher' scandals of 2013, in which three Romani children were illegitimately taken from their families in Greece and Ireland, provoked extraordinary levels of international media attention. This paper will explore this case as a specific episode in the racialisation of familial relations. These relations were racialised in two senses: the basis of the removal of the children was founded upon assumptions of a seeming incongruity between their pale skin and blonde hair and their 'darker' parents, and the explanations offered for their alleged abduction by way of motivation were centred around imagined social relations of exploitation (as begging or stealing 'tools'). The contemporary valorisation of the historically constant 'Gypsy Childsnatcher' trope demands greater attention, in line with the need to destabilise the consistency of the 'conceptual Gypsy' over time to reveal the differential *functions* of its deployment (Selling, 2015). Based upon exhaustive qualitative empirical analysis of 339 UK newspaper articles and informed by an intersectional framework which seeks to reveal the relationality of particular representations (Anthias,1998), this paper will explore the manner in which the construction and reproduction of these highly racialised stereotypes were also reliant upon classed and gendered discursive repertoires. I will argue that as Romani people in Britain are discursively constituted as an underclass, insofar as the stereotypical representations produced draw upon the same language, discursive strategies, imagery, and modes of articulation, the historical Gypsy Childsnatcher trope is imbued with its contemporary resonance due to the connection forged between Roma and the politics of welfare at the level of the British national imaginary. In keeping with the theoretical contention that the 'Conceptual Gypsy' is borne of images and myths (Selling, 2015), this presentation will be punctuated by a series of images that proved to be definitive at particular junctures of the case.

The Hyperreality of the Trailers As a Communication Strategy: A Reflection on Simulation Approach

The hyperreality is present in the technological world and could be defined as the technological capacity to combine virtual reality, physical reality, artificial and human intelligence, integrating them in a natural way to serve as a user interface for access to advanced applications (Tiffin and Terashima, 2001). In this context, underlying the fundamental elements of audiovisual language, there is a discourse that supports the argument of what appears in the form of audio and visual advertising discourse (Iuva, 2007). We can see then that the trailers are an important tool for communication and dissemination of a movie or proposed idea, seeking to attract individuals or by objective aspects (measurable), or subjective experiences (sensory). There are three types of narrative strategies in the trailers, which can be combined with each other: direct argumentation, narration and seduction, fascination. In the latter, it raises the question of this research: Does the hyper-reality of the trailers lead the individual's seduction to create distortions of what is real?

On the other hand, the media influence the behavior of post-modern society, especially television wich created a "simulational world" where individuals change very quickly their perceptions, and cancel any relationship to the past. Baudrillard (1991) did not believe in the the good use of media as he saw them as a non-communicative way, a quality that allowed them to manipulate people, creating constantly several simulations. Baudrillard (1991), initially propose a resistance to this simulations and destruction of the transmission and the world of media technology through a revolutionary action to return to the conversation face to face. Based on these discussions, the objective of this paper is to analyze the hyperreality of the trailers based on the simulation approach proposed by Baudrillard.

Looking Back the Nuclear Compensation Process in the Tepco Nuclear Power Plant Accident (Tentative)

Four and half years passed since the East Japan Disaster occurred. The Tokyo Electric Power Company (TEPCO) nuclear power plant accidents caused nuclear contamination in a huge area in East and North Japan, ramifications of which still overshadow lives of the people in the region. TEPCO paid damages for real property to most claimants in 2014 and began to terminate the payment of compensation for evacuation as the Government gradually lifted evacuation orders in the region. Although thousands still have not received compensation, the payment process for nuclear compensation for economic loss is approaching to the final stage. This paper looks back the whole process of nuclear compensation from the setting up of the Nuclear Compensation Dispute Review Commission in April 2011 to early summer 2016. Lawyers have tried to manage individualized claims of victims mainly through the Nuclear ADR, but they failed to reach victims effectively because of their lack of the human resource and internal conflicts inside the legal profession. The TEPCO and the government which controls the TEPCO have dominated the whole process of compensation, deciding the amount of compensation and terminating payment based on government's schedules. The courts are virtually invisible except only in scattered few cases. The nuclear power plants have been constructed as a national policy of the conservative party and the compensation process has been heavily affected by the policy that would keep nuclear power as a significant part of the energy resource in future.

Australian Think Tanks: Key Sites in a Global Distribution of Power?

Murray argues that Australian think tanks are permanent persuaders, that is, they fight at the frontline in a war of insinuation: a battle to get their ideas into the popular consciousness as a common fair dinkum understanding. Although Australian think tanks cover the left-right political spectrum there are many more of them on the right where the dominant ideology is neoliberalism, that is, they openly acknowledge and promote an acceptance of a market driven society that satisfies their corporate funders and convinces labour of the necessity to make sacrifices in relation to their labour and their welfare.

Lifestyles of Risk and Infamy

Approached from the perspective of edgework, a visual ethnography of graffiti writing and street art offers a unique perspective to the exploration of the growing participation of voluntary risk taking behaviors in the urban setting. Both the lifestyle and practices of graffiti writers can involve a considerable degree of risk and personal danger –criminal records and long-term legal consequences, illness, addiction, physical harm, and even death. The participation in and documentation of graffiti writing 'missions' also presents the researcher with considerable risks and dangers which are shared with the research participants creating new ethical and methodological challenges for ethnographic work. It also provides a fertile position from which to develop a situated reflexivity in relation to these shared risks and dangers that can help to further empirical analysis of this type of research. How can the ethnographic investigation of graffiti writing help cultural analysts to better understand the relationship between risk taking behaviors, creative expression, alienation, and disobedience? What methodological and ethical considerations must a researcher confront when dealing with edgework that enters into the realm of illegality or crime? This paper aims to address these methodological and ethical concerns through an analysis of fieldwork experiences and photographic documentation of graffiti writers and street artists in Canada, Germany, and Portugal.

Youth Led Organizing in Jerusalem: How Does Gender Change the Game for Young People

Youth engagement is essential for youth and society development and change. Yet not all young people have the same opportunities to access and practice the equal right of participation. This research will look into gender and how it impact young women engagement within youth led organizing groups in Jerusalem. It will look at the challenges faced by youth led organizing groups when planning and implementing their actions for change in Jerusalem, and it differ based on gender. It will explain what types of assets are accessible to youth based on the gender difference, and whether youth utilizes different resources based on their gender. Further, it will look if gender affect youth differently based on their education, locality. Assets and challenges studied are related to the group itself as in structure, capacity, networks, culture, and leadership style; It is related to the assets and challenges that the local society is facing and type of resources and challenges in it; and finally the sociopolitical context and how it impact youth led organizing.

This research utilizes institutional ethnography and survey research as research methods. The survey that will cover all active youth groups members will explore the main challenges and assets that are identified by youth activists over the period of the last five years. Institutional ethnography will facilitate understand the position of youth groups within a larger field and its interaction with that field. The research will follow 8 youth led organizing groups that are active in the city of Jerusalem. 6 of these groups are still active, and two of them halted their activities. The comparison across the groups will permit us to look into what ensures groups ity and reaching its best capabilities.

Youth Mobilizing in the City of Jerusalem on a Cross Road: Changing and Teaching Ourselves

Statistics about youth engagement in Palestine has been showing a decline in youth participation. Youth has been stepping away from political parties and development organizations working with youth. Although they have been trying to have their own youth led initiatives, yet over the years they could not merge into a power that can make a change in their society. Knowing the history of youth engagement in Palestine the withdrawal of youth is an alarming issue. This research aims at presenting from a youth perspective, their perspective about their role, the challenges they face, and how they perceive their position in a larger field of actors. This research is part of a reflective process of youth community leaders in which they are trying to evaluate their previous approaches and develop a better practice of community organizing.

This research is based on Participatory action research with youth led organizing groups in the city of Jerusalem. A core group of youth leaders are part of the research team, and they are supported with their groups' members for implementation. The research works on an issue recognized by all members of the core group to be the place for their intervention and community change. The intervention and making change process will include a continuous reflection process among young people to ensure the learning process, and the awareness about the previous and current practices, what works and what fails. Youth will be bringing their experiences from the various groups to polish, develop, and enhance their own model of community change. It will be built on their worldview and their capability to make it take place.

Ethnographying the Juridicization of Protests in Russia: Assistance to Resistance?

Soon after adhering to the Council of Europe in 1996, Russia accepted to ratify the European Convention on Human Rights in 1998. However, the compliance of the Russian justice system with democratic standards has been often questioned since. This paper, based on the ethnographic research held in Moscow in march-may 2015 within one of the Russian oldest and biggest human rights NGOs, the Memorial Human Rights Center (HRC), seeks to avoid the normative approach of condemning human rights violations in this country. It aims to analyze, instead, the existing forms of legal mobilization, relying on the case of the Memorial HRC lawyers' bureau. In cooperation with European Human Rights Advocacy Centre they are working on preparing complaints to be addressed to the European Human Rights Court (EHRC). Lawyers treat cases of individuals, who haven't found justice in national Russian courts: bypassing the national level, lawyers' practice aims to bring pressure on the state from outside and create the so-called "boo-

merang effect". Taking the case of pleadings concerning participation in opposition protest actions, the paper questions this legal practice not only as one of the human rights advocacy strategies on the international level, but as a set of practices, which go beyond their legal definition. Getting ready for representing "victims'" pleadings before the EHRC, lawyers adapt in advance their legal tactics on the national level not only to the European legal pattern but also to the "European" vision of a situation of protest. While supervising or participating in hearings on the national level, they realize operations of preliminary translation to get at the end of national hearings a case "ready" to be addressed to the EHRC.

Critical Thinking and Decision Making in the Military

That the mind has its limitations is no news. However, only after the 1970s topics such as heuristics began to receive thorough scientific scrutiny. One by one disciplines such as Economy, Management or Medicine began to report irrational decision making and behavior in contexts where reason should have been the norm. Debiasing research in the Military is still in its infancy. We were able to identify some studies performed for the U.S. Army but they are just at an informative and descriptive stage. Moreover, we identified some internal manuals (Field Manuals) that identified the need for debiasing, and addressed it a promising fashion as "operations design" – "applying critical and creative thinking to understand, visualize, and describe complex, ill-structured problems and develop approaches to solve them". However, when analyzing the content of design we found that the problem of critical thinking is treated in a lapidary and vague fashion. As for the Romanian Army, we were not able to find references to cognitive biases in the manuals and instructions used for planning and conducting military operations, nor in the Doctoral thesis that were defended thus far in Carol I National Defence University. We propose a new approach to debiasing heuristics by means of critical thinking and offer the theoretical and methodological benchmarks for testing the framework (cvasi) experimentally.

The Crisis of the Social Dialogue in Poland and Labor Unions' "Constitutional" Response

After the crisis, Polish government has undertaken certain actions (flexibilization of working time regulations, rise of the retirenement age, limiting the early retirement schemes, freeze on public sector wages) despite labor unions' strong objections. Government's disregard for the labor unions caused a serious crisis of the social dialogue. As a result of the marginalization of the unions by the government, all three nation-wide unions suspended their participation in the Triapartite Commission as of 2013.

One of the ways that labor unions adapted to the technocratic agenda of the cabinets of Donald Tusk and Ewa Kopacz was an increased activity on the level of the Constitutional Tribunal. Paper will include an empirical evaluation of those actions after the crisis. According to the Polish Constitution, nationwide labor unions have the right to appeal to the Constitutional Tribunal for the judgment on the conformity to the Constitution or ratified international agreement of a law or other normative act. Since 2007, labor unions used this right 25 times. More importantly, the character of the actions has changed, and they are no longer solely defensive as was the case in the past (i.e. are not limited to simply blocking the austerity/neoliberalization agenda). Recently, one of the unions succesfully proved inconformity of regulations limiting the unionization right to the employees hired on labor code contracts, that prevented the access to the unions for the civil law workers and self-employed. It is a huge success of the labor movement given a substantial increase in the non-standard contracts after 2007. The judgment of the Constitutional Tribunal forces the legislature to pass a new law that will enlarge the scope of the access to the labor unions, which shows that right to appeal to the Constituional Tribunal may be replacing ordinary policy-making influence that became ineffective after the crisis.

Inequality Despite or Due to Educational Expansion: English Teaching in Rural Areas Versus Big Cities in Poland.

English speaking is nowadays a crucial factor that influences success on labour market. It also conditions further education, thus providing an equal access to English learning is a concern for many governements in the world. Any inequalities in access to or serious discrepancies in results of English learning rivet the attention of policy-makers and educational researchers. Frequently found phenomena of lower English proficiency among the pupils in rural areas (Hu, 2003; Sharplin, 2002) exists in Poland too, as identified both by nation-wide exams and specific research projects (Gajewska-Dyszkiewicz et al., 2015). Moreover, it seems that the proficiency gap between rural areas and the cities is (at least for Poland) larger for English, than for other school subejcts (Dolata, 2014). This lowers the odds for pupils from rural areas on labour market or in a university career.

In our two nation-wide empirical studies- one in primary school (age 9-12), second in junior high school (age 13-15)- we have addressed questions concerning English teaching in Polish public schools. In this paper we will aim to identify differences between English teaching in Polish rural areas and cities. Teacher preparation and qualifications often pose a problem in rural areas (Boyd et al., 2003; Monk, 2007), but in our study it did not differ from these in bigger settlements. Socio-economical status (SES) of families and fact of taking additional English lessons were identified as having strong relation with lower English proficiency in rural areas. Moreover, we determined that many pupils did not take on additional lessons not because of limited financial capacities of their families, but because of the limited accessibility to the high-quality additional lessons in their vicinity. We will conclude with recommendations of how this situation can be solved to promote equality in education.

Children's Dynamic Roles in Migration: From Social to Cultural Actors for Diplomacy

Introduction: Children's roles are often overlooked in migration and in a family unit they are also considered as passive, with evidence of (still) lack of research showing their active roles in familial and social relationships in transnational migration. The dynamics roles of Indonesian migrant children in Japan in social and cultural contexts is the focus of this research.

Aims: The aims are to reveal and elaborate the roles of children in migration contexts, which is one of them to be cultural actors through school exchange programs, cultural exhibitions and festivals, evoking their identities through languages, religions and cultures in exotic minority.

Methods: This research is qualitative descriptive research, integrating library and ethnographic research. The library research includes media sources and related publications to explore the participation of Indonesian migrant families and children in Japan. The researcher also conducted interviews to children, parents, from 20 households in Nagoya and Indonesian School of Tokyo, teachers and the principal, including an in-depth observation in the school for a year.

Results: Almost two-thirds of the parents interviewed, acknowledged receiving language supports from their children in daily and social activities in Japan. While in the school, children actively and regularly participate in continuous cultural and exchange programs among local schools, and encouraged by the embassy. Their activities include performing traditional martial arts, indigenous musical performances and various outdoor activities. They are purposively trained and prepared for these events. Teachers also grants permission for them to leave classes, aiming for promoting the cultures of Indonesia, by means soft diplomacy.

Conclusion: Children have dynamic roles in migration, being the social actor in language supports contributing the well-being of their families, and cultural actors for soft diplomacy. Although the roles of children in migration are irrefutable, the next question should be whether they feel exploited with such responsibilities.

Publishing Experience of the Urban Poor: Katik Newspaper

Solid waste recycling workers, who work in the streets and garbage of Turkey, were publishing a newspaper called *Katık*, in order to share and struggle the problems they encounter in both work life and various spheres of social life.

This study is on *Katık* newspaper. The study endeavors to read poverty through the pages of *Katık* and attempts to find the answers of questions such as "How do the urban poor experience, make sense of and express their poverty, their exclusion from society and their encounters with others?"

This study is designed as an ethnographic research and uses qualitative methods and techniques. The data of the study is collected by analyzing some documents, participant observation and interview techniques. The main analysis material is 9 issues of *Katık* newspaper. In addition to this, the data collected through participant observation process, such as the production phase of Katık, the working and daily lives of recycling workers are also included in the analysis. Another information source for the study is the semi-structured and informal interviews with the editors of the newspaper and recycling workers. Other reference sources used in this study are, the original forms of *Katık*'s content, in other words, manuscripts as well as various videos, reports and relevant legislation documents focusing on recycling workers.

Social Capital and Pre-School Participation in Indonesia

Pre-school enrolment has a wide range of beneficial effects on educational outcomes. Consequently, policy makers in many countries actively seek to increase preschool attendance rates, and Indonesia is no exception. At the same time, academic research has consistently shown that children from low-income households or poor communities are underrepresented in preschool. Drawing on social capital theory, we argue that high levels of household and community social capital not only lead to higher preschool enrollment rates, but also temper the negative effects of socio-economic status on preschool attendance. Hypotheses on socio-economic status and social capital effects and their interaction were tested with Indonesian census data, collected in 2009, on 43,879 children, nested in 42,855 households, nested in 14,774 villages. Three dimensions of social capital were measured at both the level of communities and the level of households: association, reciprocity and trust. Multilevel regression analyses confirm the strong negative main effects of low socio-economic status. Preschool attendance is significantly lower for children from low-income, low education households, and for children from poor or rural communities. Also low levels of exposure to modern mass media significantly decrease preschool attendance. We found positive main effects for two of the three social capital measures: household association and community reciprocity increase preschool attendance. Interaction analysis yielded two significant effects. First, trust at household level amplifies the effect of household education on preschool enrolment. Second, reciprocity at household level tempers negative effects of a low income on preschool enrolment. The findings point towards the importance of social capital as a potential buffer for low income households and communities. Policy implications are discussed.

Newer, Smarter, and Greener: Demographic Metabolism As a Driver of Green Consumption and Pro-Environmental Behaviour

Based on the theory of demographic metabolism – a macro-level theory describing how societies change as a consequence of the changing composition of their members with respect to certain relevant and measurable characteristics – this paper assumes possible lower per capita carbon emissions in the future. Demographic metabolism is the process whereby individuals with certain characteristics from older birth cohorts are replaced by individual with other characteristics from younger birth cohorts. The entry of new better-educated cohorts is in fact the key driver of various socioeconomic changes including transition to low fertility society and increase in longevity. With respect to environmental issues and climate change, greater exposure to public discussions, political debates and media reports on environmental problems and climate change can result in greater environmental concern among younger cohorts. Likewise, individuals with higher level of education are found to be more likely to take pro-environmental actions e.g., recycling and buying green products. Therefore, with the exit of older generation and the entry of younger better-educated generation given universal educational expansion, this can contribute to lower carbon emissions in the long run. Indeed, preliminary analyses of pooled Eurobarometer Surveys data for the years 2008, 2009, 2011 and 2013 covering 111,648 respondents from 28 EU member countries suggest that behavioural change may well take place following demographic metabolism process. For instance, considering the proportion of individuals who regularly use environmentally-friendly transportation as opposed to using their own car, evidently the younger cohorts are significantly more likely to opt for eco-friendly transportation means than the older ones. Furthermore, we also found that the number of mitigation actions taken is positively associated with years of schooling and climate change concern. This implies that the entry of new better-educated cohorts can subsequently bring about more sustainable consumption patterns and lifestyle.

Images, Mind Maps and Itinerant Soliloquies: A Transdisciplinary Exploration of Social Perceptions about Expo Milano 2015

This contribution explores the effectiveness of a method (i.e. PAK MAP: Photo Apperception Knowledge Map - http://pakmap.net) that proposes the combination of different visual and participatory techniques to collect qualitative data on the social perception of a complex, public and international event such as Expo Milano 2015. Such a method adopts an interdisciplinary approach that sees the dialogue between social researchers, visual artists and a variegated constellation of social actors (inhabitants, tourists, etc.) as a crucial component of the research. The proposed method – still a work in progress – specifically avails itself of the construction of "mind maps" within the setting made available by "interviews with images" (i.e. in particular a photographic composition on the past-present cityscape of Milan) and of a peculiar declination of what radical interactionism calls "soliloquy". In the research process described, the temporal dimension assumes a decisive consistency in methodological and content terms, both for the techniques employed and for the different timing considered of the phenomenon observed, i.e. 1) the "before" tied to the expectations about the event; 2) the "here and now", represented by the opening of the Universal Exposition (1st May - 31st October 2015); 3) the "post" event, and the effects perceived in the following months. Such a research process is articulated, as a whole, through the different visual, multi-sensory and narrative itineraries that the actors involved in the research develop of the social world and places, that, from various angles, intercept the "fleeting" cosmos represented by the Expo. Using sociological imagination to make visible the interweaving of individual stories, collective narratives and hidden/dominant images tied to a great event occurring in a city, this paper intends to contribute to the building of a sociological knowledge that is the result of collaborative and programmatically open ways of doing "research".

Politic Activism from the State

This paper presents results of my PhD thesis "Youth and Political Share: the youth situation in the contemporary Peronism" (Institute of Development Economical and Social (IDES), National University General Sarmiento (UNGS) in Argentina) on youth share in Peronist political organizations in the city of La Plata, Capital of the Province of Buenos Aires, Argentina, during the second term of government of President Cristina Fernandez de Kirchner (from 2011 to 2015). It presents some new elements to think the articulation of notions about the state and the state bureaucracy and its relationship to the everyday practice of youth's political activism, putting the focus on the subject and different political practices that circulate around the state as articulating element of politics. The interest is not accidental, since the last period of Peronist management (from 2003 to 2015) of the Argentine government has promoted a revitalizing his national state as an axis of social transformation, as opposed to the adverse effects to Argentina who have had prescriptions international financial institutions in the orthodox neoliberals policies from nineties and early two thousand. This paper is divided into two stages: in the first, some representations that themselves young activists have of what the state itself is, and which should be its functions in relation to the world of politics, we'll call "1. The state as a tool, as a solution and as an object of care "; and in the second section, analysis of the practices of young activists it appears in state management through the interpretations of themselves young activists, who call them "2. Politic activism from the state and activism to the state, "Politic activism from the state ".

Canadian Women College Presidents, Deans and Senior Faculty, Their Professional Identities and Contributions to the Hi Tech Knowledge Economy

Community colleges (as compared to universities) are not constructed as sites for knowledge production, but rather as training facilities for 1) the trades; 2) technology workers supporting professions such as engineering; 3) female dominated fields such as early childhood education; 4) workers supporting businesses; 5) literacy workers; and 5) female-dominated health professions, This paper argues, based on a national study of 320 college administrators and faculty, that sexually- or racially-minoritized women presidents of colleges; deans of, for example, trades, technology, so-called 'allied' health professions; or faculty members developing innovative curricula in both feminized and masculinized fields can be reconstructed and thus become visible as essential workers in the global knowledge economy. These individuals have taken up discourses of entrepreneurialism in the construction of their professional identities, which they may incorporate unproblematically or as a work of social justice or making-a-difference. Even where deans and coordinators in these fields were not women, male and racially-minoritized administrators were found to work with national or local organizations to

recruit women and students (such as Aboriginal students in northern colleges, or women in the trades) into college programs where such students were difficult to engage. The paper will examine the discourses taken up by these college administrators and faculty, showing the complex interplay of their contributions to the knowledge economy as well as problematizing their roles in the construction of a global economy.

MYTHEN, GABE* (University of Liverpool, g.mythen@liverpool.ac.uk)

The Problem with Radicalisation: A Critique of the Logic of Drivers

The idea of radicalisation has come to prominence as a means of explaining the process by which individuals become attracted to extremist ideology and endorse the actions of terrorist groups that use violence. Over the last decade, the notion of radicalisation has gained traction in policy, political and media circles in Britain, being commonly indexed to concerns about the threat of 'home-grown' terrorist attacks. This paper directly addresses and critiques the understanding of radicalisation outlined in PREVENT, the UK Government's strategy for combatting violent extremism. I wish to focus in particular on how radicalisation is *constructed* in PREVENT and how evidence is *deployed* to generate a particular narrative of the process. First, the analytical logic underpinning the radicalisation thesis and the interventions that this logic permits are examined. Second, the evidence for the specific 'drivers' of radicalisation articulated within PREVENT are questioned. Third, we discuss the key problems that arise when the problem of terrorism is approached via the concept of radicalisation, focusing on elisions and iatrogenic effects.

Leisure Providers and Consumers: A Case of Art of Living

Leisure in public life has declined, however, the commercialization of leisure and recreation is catching up at fast speed. In the contemporary time, on the one side, we find that leisure and recreation is around family or in the intimate association. On the other hand, people are more and more engaged with television, video games, computers, ipads, internet, chatting devices. The entertainment and leisure activities with the electronic devices are more of a commercializing in its nature. At the same time people are also in search of leisure moving towards visiting Ashrams for "Art of Living". Vast numbers of people are regularly visiting Ashrams at different places. This activity has also enormous growth and commodification and becoming popular in world and particularly in India.   It is not only becoming popular among the old age people but also becoming popular among the younger lot also. Going out in the Ashrams for "Art of living" is also more relying on market principles. Thus, in the present paper we will discuss about the consumers of leisure i.e. "art of living" and providers (Gurus) of leisure. Further we will also focus on some of the specific selected "Ashrama" and look into their various activities.

International Comparative Usability of the National Index of Interpersonal Destructiveness: A Validity Analysis

Human well-being is determined by a number of factors including quality of interpersonal relationships. The creation of the National Index of Interpersonal Destructiveness (NIID) was inspired by adverse impacts of violence on interpersonal relationships as research evidence on one hand and the 1996 World Health Assembly that emphasized the need for violence prevention on the other. The NIID is based on nationally representative subjective data of various sources (Integrated Database of World Values Survey and European Value Survey, WHO Online Mortality Database, World Bank Open Data, and the Standardized World Income Inequality Database), and national statistics of 62 societies around the world covering 21-year period from 1989 to 2010.

The paper introduces the NIID that is created as an internationally comparative index and addresses its internal (IVA) and external (EVA) validity analysis. By IVA, special attention is paid to how NIID is working in comparison of different societies while by EVA, we looked at the relations between NIID and different variables measuring interpersonal destructiveness that were excluded from the Index structure due to low availability of relevant data across the countries and the time points in focus.

The analysis demonstrates that interpersonal destructiveness of a society is related to attitudes towards interpersonal violence spread in this society and more specifically with the interpersonal destructiveness in schools. However there are a couple of outlier societies in terms of how the NIID is working. These societies are examined in more detail. It is concluded that the NIID has a potential as a valid instrument to provide a yardstick for evaluating and comparing the situation of societies worldwide.

Diverse Differences of Youth Spirituality Between Unchurched Believers and Liminals in Korea

How do youth and young adults construct and practice the meaning of life in the post-modern life-world? The privatization of religion (Luckmann, 1967) has accelerated today's religious discourses on spirituality on which scholars do not have a consensus but emphasize its social characteristics such as autonomy, experience, authenticity, self-fulfillment, etc. There appear more and more blurred boundaries between religionness and non-believers in the religiously pluralist society; however, less has been researched about the different types of spirituality between "unchurched believers" and "liminals" (Lim, MacGregor, Putnam, 2010).

For this task, our reseearch team interviewed 30 college students for five months in Seoul, Korea. They can be classified as "unchurced believers" or "liminals". Data analyses resulted in various codes regarding the types of individual belief or spirituality of 'unchurched believers:' religious spirituality (Christian or Buddhist), alternative spirituality (e.g., New Age, holistic practices, fortune-tell-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ing, healing programs, etc.), the immanent frames (e.g., scientism, materialism, post-materialism, etc.). Our findings suggest that the types of authenticity should be systematically analyzed in accordance with its social implications: emotive authenticity or reflexive authenticity. Also, autonomy as the core concept of spiritual individualism, needs to be empirically categorized as anomic egoism, transitory individuation, or responsible autonomy.

In addition, both unchurched believers and liminals showed the high degree of antipathy against the external authority of institutional churches. However, there are clear differnces: whereas the unchurched believers, especially holistic practitioners show more post-material interest like well-being or holistic health than liminals, liminals may show less interest in spirituality than churched believers. For liminals, the ultimate significance of life or the ways of pursuing happiness tend to go toward consumptive gratification or material goal-attainment in the immanent frames.

Neither Reform Nor Regime Change: Labor Politics in China and India's Automobile Industry

The summer of 2010 saw an unprecedented upsurge of labor unrest in the automobile industry in China, beginning with the much-discussed wildcat strike at the Nanhai Honda transmission plant in Guangdong province. The Nanhai strike set off a chain reaction of unrest among autoworkers around the country as strikes erupted in supplier plants for Honda and other foreign automakers. While worker activism in auto plants in India was not as concentrated as in China's 2010 strike wave, the period 2009-2014 witnessed 20 strikes nationwide, indicating a significant uptick after the global recession. Like their counterparts in China, the striking Indian auto workers demanded representative unions, wage hikes, job security and end of draconian work discipline. How might we characterize this labor-capital conflict? The 20th century labor movements created reform, typical in northwestern Europe and North America, in which liberal democratic states incorporated labor movements into systems of industrial relations, which allowed for rationalized contention between labor and capital. Without discounting huge internal variation, the reform path implied a democratic negotiation of class compromise. Labor movements in the newly industrialized countries of the late 20th century showed a different political trajectory of regime change. When we look at the paradigmatic cases of South Korea, Brazil, and South Africa, we see that politicized labor movements in particular – and autoworkers in particular – played a key role in anti-apartheid and democratization movements. Drawing on this historical experience, we might reasonably expect a strong labor movement challenging state power in authoritarian China, while the democratic Indian state should be relatively supple in adopting reforms in response to labor agitation. But despite very different conditions in China and India, we show that intensified labor resistance from below is translating into neither reform nor regime change.

Thinking about Alternative and Local Food Networks in Japan: Exemplification of Organic Food Groups Facing the Fukushima Nuclear Accident

Concerning about the safety of domestically grown foods has spread in Japan since the Fukushima nuclear accident. In case of the nuclear accident, no one can forecast when the accident will be truly over.

This study examines how the Fukushima accident has influenced farmers› and consumers' behaviors. The analysis bases on two data sources: the open-data researched by Miyagi prefectural government and the central government, and my own interview with an organic farmers group in southern area in Miyagi prefecture from 2013 to 2015.

One of the findings of this study suggests that declaring a state of safety based on the official safety standard influence sales recovery. In this research, secondly almost all farmers' and fishers' groups declared a state of safety based on the national standard. On the other hand, some organic farmers' groups are reluctant to declare the safety. Why are they reluctant?

Firstly, generally organic farmers are skeptical of government's positions. The government has often protected industry's interests first in case of severe environmental deteriorations.Organic farming movements in Japan were affected and supported from anti-pollution movements in urban areas. Both farmers and consumers who concerning about organic foods are skeptical of the argument that government could manage the food safety in the case of the Fukushima accident.

Secondly, these organic farmers believe that consumers should be the crucial main actors who make a decision on food safety. Their strict and sincere policy

has been supported by some consumers, but it resulted in delay of the recovery of sales.

Finally, we discuss the implications of this study focusing on the trust making process between farmers and consumers.

"Invisible" War Trauma in Japan: Medicine, Society and Military Psychiatric Casualties

In Japan, it was after the Great Hanshin-Awaji Earthquake in 1995 that the concept of trauma and the diagnosis of Post- Traumatic Stress Disorder (PTSD) had been accepted and recognized more widely. Although Japanese modern society had faced and caused massive violence so many times before the devastating earthquake and there were some moments when terrified people after massive violence were drawn attention, they were "forgotten". Where have they gone?

This paper deals with the war Japan had experienced from 1937 to 1945 and its military psychiatric casualties as an example of "forgotten" trauma. There were two important institutions for war psychiatry in Japan. One was Kohnodai Military Hospital, which specialized in mental and neurological disorder and was established in 1938 after the Second Sino-Japanese War started. The other was Musashi Military Sanatorium, which received veterans with mental disorder and was established in 1940.

This paper explores how Japanese wartime medicine and society responded these casualties. One reason why these people have been "invisible" is the absence of wartime official documents which Japanese military incinerated or concealed just after the end of the war. To make up for this absence, this paper is based on the survey of the archives of clinical records documented in Kohnodai Military Hospital and Musashi Military Sanatorium. Although these records were documented mostly by doctors, they will provide us plenty of quantitative and qualitative data on patients. Through analyzing these records, this paper reconsiders war trauma not only in medical but also social, political and cultural contexts.

Notion of Ethnicity and the Sense of Belonging to a Neighborhood Community: An Insight from City Life of Betawi in Jakarta, Indonesia

The greater Jakarta area represents a heterogeneous social space where a multi-ethnic condition is omnipresent. This presentation focuses on neighborhood districts historically dominated by ethnic Betawi, the so-called "Batavian Indigenous." The presenter examines the sense of belonging to "face-visible" neighborhood communities as is recognized and represented in everyday lifeworld of Betawi residents in regard with ethnicity, an abstract concept of human-classification designed by the nation-state as sub-categories under the nation. The aim of this presentation is twofold. First, it attempts to depict the layered structure of group consciousness perceived in neighborhood districts, which cannot be reduced to a singular abstract category. The notion of Betawi Ethnicity, as it emerges in the immediate social settings, does so in relation to the sense of belonging to respective neighborhoods. This analysis will clarify that the abstract group consciousness is based on attachments to neighborhood communities. An ethnic community and a neighborhood community are both imagined but in very different styles. The secondary aim is to point out some of the characteristics of the style in which the "face-visible" communities are imagined in contrast to ethnicity. Cases of Betawi dominated neighborhoods in Jakarta shall exemplify that the imagination of a neighborhood district as a community to which people feel their belonging is essentially made possible through daily face-to-face interactions where individuals are recognized in their singularity; but that this community is imagined in an abstract manner in that people often do not have holistic knowledge of, nor are acquainted with most of its members. In Jakarta, what makes this abstract community feel so "face-visible" is the recurrent juxtaposition of it to a more abstract community of ethnicity. And this reiterated juxtaposition is what ensures a channel so as to recognize and represent individuals in Jakarta not by the homogeneous classification but by multi-layered ascription.

NAKANISHI, MACHIKO* (Chukyo University, machikon@mecl.chukyo-u.ac.jp)

The Transformation of Reflexivity and Japanese Market

The purpose of my presentation is to discuss the transformation of reflexivity and to study reflexivity in the Japanese market. Reflexivity refers to the concept of reflecting oneself in the presence of others, and discovering oneself by other's

reflections. By repeating this feedback process, we change who we are. In self-reflexivity agent reflects on itself. Institutional reflexivity refers to social conditions upon which agent reflects.

Anthony Giddens thinks it is very important for reflexivity to be based on sociological and linguistic foundations. He suggests many personal habits become collective as they are shaped by commodification, or as a result of the influences of institutional reflexivity. Urlich Beck distinguishes reflection as self-conscious and reflexivity as autonomous. He defines the autonomous, undesired, and unseen transition from industrial to risk society.

Scott Lash criticizes Beck and Gidddens, as they presuppose that reflexivity is essentially cognitive and institutional. He draws attention to the aesthetic dimension of reflexivity than the cognitive. He insists capitalism opens up possibilities not only cognitive but also aesthetic reflexivity. Aesthetic reflexivity is fundamentally mimetic in nature, and is in the tradition of European modernism in the arts. It can be seen in the expressive individualism in contemporary consumer capitalism. He also argues about hermeneutic reflexivity.

The concept of reflexivity changes according to social change. The senses of sight, hearing, taste, smell and touch are changed by markets and, globalized by commodification. Including senses, emotions, and consumer behavior etc., new reflexivities can be born and transform themselves according to markets, which I call market reflexivity.

I conclude that in the global information society, market reflexivity will change us more radically and quickly than at present. It is important especially for Japanese, to be conscious of market reflexivity to predict its future affects and other reflexivities that may arise.

Ethnic Ties Stronger Than Family Ties: Ethnic Network Utilized By Japanese Immigrant Women in the US.

After the rapid economic growth era of Japan (1960-1990s) there are some Japanese women who were dissatisfied with the patriarchal society and migrated to other countries to seek better career opportunities and alternative life. Their transnational migrations were not motivated by political or economic reasons, but by the cultural reason; escape from the patriarchal society. This paper aims to discuss how those cultural migrants utilize their ethnic network for their mutual support.

On the basis of semi-structural interviews with 27 Japanese women who voluntary immigrated to a metropolitan area of California after the Second World War, the author found that they rely on their Japanese friends immigrated to the US more than their family they had made in the US. This tendency increases when they are getting older.

Unlike immigrants from other East Asian countries, many new Japanese immigrants came to the US are women now. Many came to the US alone and not accompanied by their Japanese family. That is to say, many Japanese immigrant women start their new life in host country without "strong ties" (Granovetter 1973).

Informants rely more on formal and informal ethnic networks instead. There are some NPOs established to help elder Japanese women living in the area. They also created semiformal networks to help others or to share information they needed (i.e. child care systems for working mothers or groups for expectant mothers). More informally, most of them have Japanese friends to support each other when they become physical or mental illness. Although most of them married transnationally, some women even said their Japanese friends are more important than their husband.

The author concluded that extra-familial ethnic network of Japanese immigrant women works as proxy family systems that can cover the shortage of their relatives in host country and support well-beings of their lives.

Inequalities Based on Caste System and Relative Deprivations in Nepal

This study clarifies (1) how caste system causes inequalities and relative deprivations in contemporary Nepalese society, (2) how these inequalities and deprivations effect on their social lives. Caste system is one of the strongest social stratification systems which affect on status, occupations and other social atributions of individuals within that society, and which cause inequalities in that society. Officially caste system has been destruted in Nepal, it still remains influential in their daily lives nevertheless. Ongoing democratization and globalization is throwing the caste system into confusion; some higher caste group is missing their advantageous positions, some lower caste group is uprising economicaly. We could define relative deprivation between (1)caste groups and between (2) time(past-present-future). We conducted a questionnaire survey in Kirtipur which contains old Newar community and newly ethno-mixture community in Nepal.

Respondents were asked to evaluate their own status in Cantril's ladder(0-10). Furthermore, they were asked status of their own group and other(higher and lower) groups. Status is not only that of present but also that of past, future and ideal. From these evaluations we could define several types of relative deprivations and inequalities. There are different tendency of deprivations between caste groups. It is confirmed that relative deprivations effect on subjective well-being and dissatisfaction. We'll examine, from rational choice point of view, whether these inequalities and deprivations are affecting their attitudes and behaviors to other social organizations from our survey data.

Capturing What Impairment Enables: A View from an African Urban Situation

For a long period of time, medical sociology and disability studies have been the main disciplines that concern disability/impairment from a sociological perspective, while recent sociologists are starting to contemplate disability/impairment as a sort of equality and diversity problems just like gender, "race", social class, etc. However, there is room for theoretical sophistication to bring up the issues of disability/impairment for discussion of diversity. A way to achieve this is to examine case studies from different time and space.

This presentation aims to evaluate the viewpoint which regards impairments as diversity as an analytical tool for ethnographic research on survival strategy of people with physical impairments in developing countries. To achieve this, I analyze qualitative data collected during my field research in Dar es Salaam, the largest city of Tanzania. In the Tanzanian society, like other African countries, two different conceptual sets of disability/impairment coexist: concepts imported from the global north, like "disability" as distinguished from impairments, and local terms used in daily situation to recognize a part of people by their physical or mental features, which are similar to "impairments" in words of the north. The society does not afford adequate welfare systems provided by officials for the "people with disability." In such situation, people designated "disabled" or "impaired" utilize their physical features to survive. In the Tanzanian context, impairments and disability do not directly mean the people's exclusion from the society, and impairments can even function positively in getting a job. This is relevant to the historical socio-economic backgrounds, the general economical disability (poverty), and the situation that most economic activities are carried out in informal sector. I assert that, to capture their survival strategies and to describe complicated situations around people "with disability" in Tanzania, an approach which regards impairments as a sort of diversity is effective.

Female Activism, Empowerment, and Social Networks: In Case of Female Genital Mutilation

Discourses on human rights in the 21st century have developed a spectrum from universalism to ethnic parochialism. Women's human rights are a significant issue in underdeveloped and developing nations, and Female Genital Mutilation (FGM) is one of the most controversial practices causing violence against women. Scholars have utilized varied theoretical approaches to the practice, including intra-culturalism, socio-culturalism, patriarchism, feminism, modernization theory, convention theory, etc. Anti-FGM activism strategies of many NGOs, however, are limited to education about FGM's harmful effects. Such strategies are not sufficient to challenge traditional and patriarchal hegemony and the social reproduction system that make FGM continue in practice. A different way of social imaginary as a new cultural frame should be devised based on overall networks as a newly "imagined community." A girl's cultural and societal contexts need to be broadly included to empower women's sustainable change of their positions against FGM. This study demonstrates a field work in Kenya, Uganda and Ethiopia for three months in 2010-2011. Interviewees were selected from five tribes including mutilated and un-mutilated girls, FGM practitioners, village leaders, policymakers, and community members. Research findings show that FGM is the process of cultural construction of the girls' self-identity as culturally legitimate wives and mothers. When girls escape from the community to avoid the threat of FGM and return with consistent survival tactics, they could gain societal acceptance. The findings emphasize that social safety networks for anti-FGM are very significant in supporting not only value education but also community-oriented survival strategies. Female activism should utilize social networks to ensure women's social survival and enable women to be accepted in their community despite refusal to undergo FGM. This study provides the contextual analyses could develop social networks and policies that may pave a new way of social imagination.

Comparative Dynamics of State-Society Relations for Health Provision in Argentina, Pakistan and Singapore

We study how the political organization of society changes the provision of basic health in Argentina, Pakistan and Singapore. Our approach implies combining the analysis of social movements and the state bureaucracy to understand how a grievance (lack of good provision of health) is translated into specific state health responses when the degrees of political organization of society are different. Through this study we hope to examine how social inequality in the Global South is shaped by diverse patterns of state-society relations, bureaucratic capability, and the associational capacity of the society.

The specific dynamics between the elements of grievance, type of bureaucratic organization and degree of societal political organization change the state's provision of health services. The countries represent three distinct types of state-society relations, illustrating interesting diverse societal dynamics and outcomes. Singapore is a case of a society whose needs are anticipated by the state bureaucracy in the provision of services, while Pakistan is the extreme opposite – an atomized society which rarely sustains the articulation of collective grievances and a bureaucracy that is more responsive to patronage. In neither country do we find effective citizenship-based claims for service delivery, although a key difference is that those services are nonetheless provided in Singapore but not in Pakistan. Lastly, Argentina represents a case in between, where the society is organized to claim for their rights, and – even though patronage is used many times – the bureaucracy responds to some of these claims in relatively successful terms. Based on this comparison we elaborate a possible explanation to one important dimension of the persistence and reduction of social inequality in health provision in the Global South.

NARANJO BOTERO, MARIA* (Universidad Nacional de Colombia, melviranaranjo@yahoo.com)

Acciones Colectivas De LOS Destechados Colombianos Desde La Subjetividad Y La Raz"N

Por: María Elvira Naranjo. Socióloga, Candidata al doctorado en Estudios Políticos de la Universidad Nacional de Colombia.

El texto es un avance de la tesis de grado sobre el movimiento social integrado por los colonos comunistas de Provivienda, en Colombia, desplazados del campo a la ciudad, que emprendieron acciones colectivas para obtener vivienda propia por autoconstrucción; resistieron a la violencia estatal mediante proyectos solidarios que les posibilitaron sobrevivir, superar el desarraigo y crear una nueva identidad colectiva como pobladores urbanos y actores transformadores de su entorno.

Inicialmente, fueron barrios organizados con prácticas colectivas de ocupación de ejidos y posteriormente por compra comunera. Con procesos de movilización y apoyo a las luchas sociales de otros sectores, lograron la solidaridad de organizaciones sindicales y consolidaron procesos de urbanización autogestionarios. En cada barrio construían una escuela, una casa cultural y un amplio parque. No construían iglesia.

Fundaron barrios populares con pobladores que a pesar de la intensa persecución estatal, participaron en el movimiento político de la Unión Patriótica y con sus votos llevaron a sus dirigentes a hacer parte de algunas corporaciones públicas, concejos municipales y alcaldías, logrando la legalización de sus viviendas pero también fueron víctimas del genocidio contra los opositores políticos, al culminar el Siglo XX.

Son de alguna manera, protagonistas de una transición y precursores de los movimientos sociales alter globalización que emergen a partir del Siglo XXI. En América Latina, Provivienda es la única organización social de viviendistas que, desde 1959, ha logrado fundar 500 barrios con aproximadamente un millón de personas, en 125 municipios a lo largo y ancho del país.

En el análisis se exploraron las posibilidades que ofrece la interdisciplinariedad, el pluralismo teórico y metodológico incorporando diversas categorías de las ciencias sociales.

Gender on the Ropes: An Autoethnographic Account of Boxing in Tasmania, Australia

This paper documents how I fought for a place as a boxer in a regional Tasmanian boxing gym over a 30 month period. This work builds on existing ethnographic accounts that argue that, for women, becoming a boxer is more than just a matter of developing a fit body and physical skill– it is a continual project of negotiating gendered identity. Through a series of evocative stories and drawing on contemporary theories of masculinity, I share my individual experiences as a boxer, and in turn, reveal the complexities of bodywork and gendered identity within Tasmanian amateur boxing culture. I conclude that my performances of masculinity were precarious, fragmented, and anxious.

Nationalism Vs. Cosmopolitanism: Postcolonial Interpretation of Identity in Mass Education

This study focuses on role of post-colonial state-commissioned mass education system in the process of identity formation of co-nationals and citizens under state sovereignty. It asks whether education does or does not promote civil society and universal values of inclusion compatible with current modes of cosmopolitan identities, driven by globalization.

In my conceptualization, the use of the term "civil society" is used in its broadest sense to include universal and cosmopolitan identities. It views all cultures as equally important to human civilization. As a result, "Identity beyond Borders," is attempting at unpacking the process of collective-national identity formation. It assumes that identities are developed in the dialectic between sameness and difference, where difference turns into hierarchy in which "we" - the people- is defined against an external "Other." Therefore, the study analyzes how state-commissioned education textbooks deal with the process of identity formation, and the relationship between the particular and the universal.

The study analyzes history, geography, and civic studies school textbooks currently used in Jordan, Israel, and Palestine, and analyzes how these national narratives -- particularly, myth of origins -- is constructed, and the ways by which national identities are formed. It also draws upon similar studies covering cases from Africa, Asia, Europe, Middle East, and Latin America.

Theoretically, the study adds significantly to our understanding of political socialization and the role of the nation-state educational system in the production of collective identities. Postcolonial theories have been very critical of the project of Enlightenment and its failed emergence form of the nation-state system as a universal system of organization of world societies. Importantly, postcolonial theories ask whether the recent waves of globalization mark the return of neocolonialism in the form of cultural, economic, and political domination of the west over postcolonial societies in rest of the world.

Relevance of Critical Theory in the Tourism Research: A New Formulation

Tourism as a study object has been complicated because it has become a dependent discipline. There is mostly a traditional and conventional tendency in tourism research. Tourism is a social phenomenon that should integrate into a transdisciplinary research co-involving a critical perspective.

The critical turn has been a new approaching for tourism research driving the researchers to a new borders of tourism thinking and reflexivity. Critical realism in tourism research is a pointer to get into a new formulation of critical theory. There have been a few tourism researchers who participates in this filing.

The tourism researchers must think over the importance of knowledge tourism research and its alienation to traditional standards. Rethink under a reflexive critical perspective the importance of the new formulations form Critical Theory is one new challenge in tourism studies.

The Critical Theory is a possibility to think reflective the tourism research. Maybe it is not the only way but it´s do one that involve and articulate the total social changes in the present. The future of Critical Theory should be written in the present. The Critical Theory implications should be updated in the discipline's performance.

The present research aims to develop a critical framework for tourism research getting challenges to approximate through a critical reflection of method and theory as categories involved in the construction of tourism as study object. In this context the emerging question is: ¿ Could be the critical theory the future research program in tourism research?

First, the tourism as a transdisciplinary study object. Secondly, the critical theory in present of tourism research. Some reflective thinking about tourism and critical theory through tourism as study object.

Key words: Critical realism. Critical Theory. Method. Tourism.

NAVA, ELENA* (Instituto de Investigaciones Sociales - UNAM, elena_va1@yahoo.com.mx)

Medios De Comunicación Indígena: Entre El Acceso y La Exclusión

En los años ochenta y noventa del siglo XX, varios países de América Latina transformaron sus legislaciones intentando adaptarse al modelo del derecho internacional, donde el reconocimiento de la diversidad cultural se hacía explícito y denotaba las nuevas relaciones entre los estados y los pueblos indígenas. Estos cambios en las legislaciones nacionales desembocaron en políticas multiculturales que coadyuvaron a la relegitimación del estado (Gros, 2003 *apud* Burguete, 2008).

El caso que presentaré devela, a través de la etnografía, las tensiones entre la exclusión parcial y el acceso diferenciado al derecho a la libertad de expresión de los pueblos indígenas en México. El foco de este trabajo se centra en los procesos de comunicación comunitaria e indígena en el estado de Oaxaca; aborda algunas maneras en que grupos de actores indígenas se articulan localmente para posicionarse frente a la legislación federal de telecomunicaciones.

La discusión sobre el estado racial de Goldberg (2002) nos dará luz sobre el asunto, al mostrarnos cómo el estado en relación a sus pueblos indígenas se realiza en un entramado de fuerzas y caminos, entre la homogeneidad y la heterogeneidad, entre el racismo y la resistencia, y cómo vive la paradoja de la inclusión de la alteridad y su rechazo (Goldberg, 2002: 6). Además, la perspectiva de "la colonialidad del poder" de Quijano (2000) nos permitirá reflexionar sobre el acceso/ exclusión de los pueblos indígenas al derecho de la libertad de expresión, pues muestra cómo la idea de raza, como instrumento de dominación de la alteridad, subyace a las relaciones entre Estado y pueblos indígenas.

NAVARRO, ALEJANDRA* (University of Buenos Aires - Argentina, navarroalejandra@ymail.com)

"Argentinean Army Officials in Democracy: New Challenges for the Military Profession"

As a part of Argentina's democratic transition after 1983, the Armed Forces faced a series of challenges which implied in normative, organizational, and educational reforms. Among the later, some of those changes implied for most educational institutions the revision and redesign of their syllabi. A modernization landmark for the Army was the creation in 1990 of the Army's Higher Education Institute (*Instituto de Enseñanza Superior del Ejército, IESE*), which gradually took under its direction most of the army's existing educational centers. The reform also reached the country's Military School (*Colegio Militar de la Nación*), whose institutional status was upgraded from tertiary to university. Army cadets started to receive an important amount of academic training to the detriment of military training. For some cadets, this meant some sort of defeat: "we applied [to this School] *to receive military instruction"*, as an official puts it. The changes involved entailed substantial symbolic transformations for both institution and its members.

Our work deals with the following questions: How are the abovementioned changes experienced by those who have studied and are working as Army officials within the after-military-dictatorship context? What is the meaning of a military career in the present scenario? *"It's like attempting a surgery without a surgical knife"*, as someone put it. The testimonies collected in our fieldwork seem to suggest a feeling of pointlessness, ultimately discouragement, with respect to the profession. Based on biographical interviews, we attempt to reconstruct Army cadets' educational and professional trajectories as a means to explore their perceptions about the changes experienced.

NAVARRO, PABLO* (University of Valencia, pablo.navarro@uv.es)

Social Subjects, Social Objects and Their Mutual Bootstrapping: A Constructivist View on the Morphogenesis of Human Societies

Human societies emerge and develop their multifarious forms through a double process of sociogenetic bootstrapping. This process intertwines the progressive differentiation of human social subjects and the correlated differentiation of (constructed) social objects. It is a process of mutual boostrapping: human subjects differentiate by means of their dealings with other subjects; but these dealings are meditated through social objects. And social objects are socially constructed in the process of interaction between subjects. The sociogenesis of the individual subject may be viewed as a process of progressive differentiation between *ego* and (the representation *within and by ego's mind* of) other subjects. Initially, the child is an undifferentiated subject (there is no difference, within its mind, between *ego* and *alter*). Through a process of subjective boostrapping, the child starts to distinguish between itself and other subjects. This process may be conceived as a process of agential symmetry breaking. Agential symmetries are broken *reflectively* (through the production of different, contrasting images of *ego* and *alter*) and they are recomposed *transactionally* (by means of a trans-action between *ego* and *alter*). The sociogenesis of social objects is parallel to that of social subjects. Initially, the child lives in an undifferentiated world. Progressively, this undiffentiated reality starts to break into distinct (physical) objects endowed with peculiar properties. A similar process drives the emergence of social objects. In this case, those objects are defined not by means of physical interaction, but by means of social interactions (which involve *ego*, but *alteres* as well). The differ-

entiation of the social subject amounts to the constitution of internal, imaginary societies that guide the interactin of the social individual. On the other hand, the differentiation of social objects amounts to the constitution of internal "social world views" that are in gear with the "individual society" of each social agent.

NAVARRO, PEDRO* (Universidad de Zaragoza, pnavarrol@zaragoza.es)

Lobbying As a Systemic Social Force: An Analysis of Spanish Policymaking System.

Lobbying as a systemic social force: an analysis of Spanish policymaking system.

Who governs? Who really rules in Spain? Who takes part in public policymaking and who knows it? Spain is formally a democratic system. However, the dominant framework for understanding public policymaking has a lack of transparency and accountability.

According to a lobbied point of view, the best way to explain it is to focus on the many organized groups jostling to advance their interests through government decisions.

This paper presents some results of a study about lobbying and the role of think tanks in Spain using a participatory action research and sociocybernetical approach. Theoretically, we consider that lobbies and think tanks are necessary to maintain a proper functioning of the democratic system, if we understand that neither the government nor the civil servants have a monopoly on common sense and knowledge of the subject. However, lobbies concept as an imperfect systemic social force must be reformulated, as we, as a country, don´t have a robust theoretical and normative debate over whether this is good or bad, the general opinion about the phenomenon is mostly critical.

Since the Spanish legal system is probably one of the most decentralized in the world, it allows more possibilities to be lobbied, so a new regulation proposal should analyze not only the national situation but also the regional and local one.

The paper is divided in five sections including introduction and conclusions. First we describe the general context. Second we explain a concept developed in comparative law, 'traceability', a sort of legislative footprint as a memory accompanying any legislation in which it would expose everyone who has proposed concepts introduced and who has prevented others from entering. And thirdly, we characterized who´s been lobbying and who´s been lobbied.

Los Investigadores En Las Universidades Ante Un Nuevo Esquema De Trabajo

El contexto laboral de los investigadores en las Instituciones de Educación Superior (IES) es complejo porque las condiciones de trabajo distan de ser las mismas con relación a décadas pasadas. Ahora sobresale la subcontratación, el trabajo por horas y en ocasiones, la desprotección social. Eso en cuanto a algunos grupos de académicos que laboran en las IES porque cada vez son más reducidos los espacios de inserción en este ámbito. Este aspecto adquiere relevancia porque las IES enfrentan el problema del envejecimiento de la planta docente y limitaciones estructurales para renovarla. En el caso de México el Consejo Nacional de Ciencia y Tecnología (CONACYT) ha puesto en marcha un programa denominado Cátedras para Jóvenes Investigadores, con ello se pretende impulsar la investigación en las IES a través del desarrollo de proyectos que incidan directamente en beneficio de la sociedad. El eje central es la contratación de jóvenes investigadores altamente calificados y su asignación a grupos en las IES para desarrollar el proyecto.

El objetivo de esta ponencia es mostrar que este programa rompe con los esquemas de los grupos de trabajo de las IES en cuanto a los procesos de inserción. El argumento central es que las dinámicas de inserción son distintas en las culturas académicas de los grupos a los cuales fueron asignados, a ello se suman las diferencias organizacionales e institucionales en las IES. Lo que aquí se presenta forma parte de un estudio en curso que tiene el propósito de explicar el proceso de inserción de los jóvenes investigadores a partir de la socialización profesional. La metodología es cualitativa porque busca comprender las prácticas, convenios, alianzas y estrategias de los jóvenes investigadores ante esquemas organizacionales e institucionales tanto de los grupos a los cuales fueron asignados como ante las IES y del CONACYT.

Responsible Teachers in Venezuela and Mexico

This work is part of the research project: *Professional Ethics in Teachers Training*. The principal purpose of the paper is to present and compare the results obtained in Venezuela and Mexico, with 250 teachers from six universities specialized in training teachers that work in different educational levels, about the answers to the open question "In your opinion, which are the main features of being a responsible teacher?" The teachers who answered the open question, in general, are simultaneously working in education institutions and are graduate students in this type of universities. We selected this special question, because responsibility is the most important value in professional ethics in the theoretical framework and in the empirical outcomes. The answers were classified with the methodology of "Content Analysis". They were also organized in five types of competencies: cognitive, ethical, affective-emotional, technical and social. We found interesting differences between the two Latin American countries. By example, in a descendant order the highest percentages were the ethical and technical competencies in Venezuela (30.89% and 28.28%) and in Mexico (both with 29.22%). In the first country the social competencies are in the third position (21.97%), meanwhile in México they are in the fifth place (5.84%). The cognitive competencies are in the fourth situation in Venezuela (8.92%) and in México in the third (22.58%). The affective – emotional competencies obtained the last place in Venezuela (8.24%) and in México the fourth (13.15%). In Venezuela the principal features are Attendance and punctuality, Being a good worker, Responsibility, Autonomy and Planning. In Mexico the highest are Responsibility, Actualization, Planning, Attendance and punctuality and Emotional capacity.

Women Empowerment and Participatory Development through Women Self-Help Groups: Empirical Explorations from the Eastern India State of Odisha

Self-help group (SHG) is a small, economically homogeneous and affinity group of poor people that helps its members save some money in a common fund and meets the emergency needs of the members by providing collateral free and low interest loans on terms decided by the group. This paper intends to examine: 1) the extent of economic, social and political empowerment of women through Participation in SHG activities, and 2) the relationship between the level of participation of women SHG members and economic, social and political effectiveness of Self-help Groups,. Adopting a survey method, and using a structured interview schedule modeled before the Likert's summative scale, we studied 353 women SHG members (a sample selected by the joint method of multistage and simple random sampling method) and analyzed the result applying Chi-Square, Correlation, ANOVA and Regression. In the first section, our findings suggest that increasing level of participation in SHG brings for its members better employment opportunities, better income, stabilization of old jobs, and entrepreneurial skills, which together we call economic empowerment. The second section reveals that increased level of participation in SHG brings for its members more household decision making power, better health facilities, increased self-confidence & self-esteem, capacity building and financial literacy (which are all indicators of social empowerment). The third section divulges that level of participation in SHG is positively and significantly associated with the community mobilization and political participation of members (that we term as political empowerment). The quantitative results have been triangulated with the qualitative findings obtained through observation and case studies.

NDLOVU, LOVEMORE* (Maranatha Christian University, lodizah@yahoo.co.uk)

Religion As a Tool for Legitimization of the Political Institutions – Lessons from the Anglican Church Crisis in Zimbabwe

Sociologists of religion have noted that there are some situations when religion provides explicit legitimizations of the political power apparatus. Examples include instances when churches support political projects or political parties. To contribute to this debate, the author examines the Anglican Church crisis in Zimbabwe. The study finds that the Anglican power struggles are closely linked with the power struggles in politics, and different political players used the church for political mobilisation and legitimization, in their quest for power. The study demonstrates the infiltration of the church by political players and how they used the church for political leverage. The study concludes by noting that in the case of Zimbabwe, religion and politics are intertwined and it is difficult to draw a demarcation between the two. Religion is thus used as a tool to legitimize the political power institutions.

NEGRI, MICHELE* (University of Tuscia, Viterbo, michele.negri@gmail.com)

New Indicators for the Study of Pathways to Political Participation

The study of political participation is firstly based on the construction of data ensuring an adequate description of the structural aspects of this phenomenon. They represent the core element in sampling, in stratified analyses and in comparative research. In the light of the multiple and multiplying forms of political participation (diversified not only according to its organizational structure (institutions, parties, movements, associations, etc.), but also taking into account other aspects such as intensity, duration, scope, coherence along the right/left axis, or based on the civil society/institutions dichotomy or continuum etc.] the need emerges for a review of the old indicators or development of new indicators so as to detect and interpret changes . The research on transformations in party systems may inspire and meet such demand for innovation, especially as concerns the degree of fragmentation and of cross-party conflicts. This was the case for some indicators, which proved crucial for an analysis of political culture in Italy.

Present Situation and Perspectives in the Educational System of the Italian Armed Forces: General Aspects and in-Depth Analysis of Military Health System

The paper analyses the characteristics of the current educational and training system of the Italian Armed Forces with a view to assessing its capacity to meet the professional requirements associated with an extremely variable operational context as well as its flexibility (i.e. its spendibility over space and time in different working realities, such as institutions, private companies, non governmental organizations, civil associations, etc.)

Special attention shall be reserved to a specific working area of the Armed Forces: Military Health, which appears of particular relevance for its combination between the two professional dimensions. Medical professions transcend the organizational boundaries of the working reality where they are carried out, which might be regarded by some as a problem for the military health system, having regard to its hierarchical and organizational requirements, and by others as an opportunity for professional inter-organizational cooperation, extending beyond the military establishment, capable of generating positive spill-over effects in terms of social security and defence.

This paper is a desk-based study, it relies on a number of secondary data, which have led to some original elaborations, as well as on the exploration and analysis of scientific papers or documents written by authoritative experts in this field of work.

NELSON, FIONA* (University of Calgary, nelsonf@ucalgary.ca)

Dead Girls: In Fiction As in Life?

An emerging sub-genre of Young Adult (YA) literature, which I refer to as the "dead girl genre", is characterized by recently deceased female narrators/central characters who not only often embark on exciting new adventures once dead, but sometimes also find that it is only once dead that they are listened to and have their experiences taken seriously. Most strikingly, these books are, for the most part, romances. According to these books, once one is dead (although sometimes it is good enough to be dying), one can find true love and can have sex without consequences. There is no parallel "dead boy" genre; boys do not need to be dead or dying in order to freely pursue sexual relationships. My concern is with these books as artifacts of a culture that allows little to no sexual agency/ subjectivity for (living) teenaged girls and young women. Young women's sexuality is closely monitored, policed and condemned. We frequently hear of cases of young women being harassed and bullied for their (real or imagined) sexual activity (even when it was nonconsensual), sometimes to the point of suicide. I will consider the questions of how it is that "dead" has come to be promoted as a viable sexual subject position for young women, how these books might actually nurture a culture of bullying and suicide, and how this literature both reflects and contributes to profound inequalities between young men and women. Do these fictions expand young women's imaginative subjectivities or do they merely reflect and reinforce cultural constraints on both young women and young men?

Eliciting Perceptions on Malaria Using Photovoice in Endemic Communities in Palawan,Philippines

Malaria being place-specific disease is endemic in Palawan, Philippines, The disease was once ranked as one of the leading causes of morbidity in the country. Photovoice, a participatory Action Research strategy developed by Wang and Burris in 1994 was used to elicit social risk perceptions on malaria. There were two groups of 5 adult male participants per group. Each of the participant was loaned a camera for a period of 1 week and were instructed to take pictures that can suggest answer to the question, How does one get sick of malaria? The participants were then gathered for focus group discussion to share their perceptions on risk factors associated with malaria using the pho-tos taken by the participants. The common perceptions as a possible cause of malaria are drinking water contaminated with mosquito eggs and larva. It was found that perceptions on causes of malaria were not widely varied and have hardly changed over time. Despitethe intervention efforts and increasing biomed-ical knowledge on diseases, folk beliefs such as *pasma (diseases related to abrupt change in temperaturature as in weather conditions)* and *pilay (broken limbs)* tend to be persistent. *There is an evident need for health professionals to be more innova-tive and creative in communicating health education messages on the prevention and control of malaria to address underlying perceptions and rectify erroneous notions of illness causation.*

Sustainable Citizenship on the Local Level in Sweden: Towards an Understanding for How to Resolve Tensions Between Social, Economic, and Ecological Sustainability

This paper aims to illuminate the challenges in capacitating lifestyles that are at once socially, economically, and ecologically sustainable. Although these three spheres of sustainability are inherently linked not least by the finite resources of the planet, they are often discussed in isolation and thus the tensions between each type of sustainability are rarely addressed in an explicit manner. Starting from the perspective of citizenship as a lived experience, the paper theorizes how regular people advance or hinder sustainability in their everyday lives. To approach this research agenda empirically, the paper analyzes the policy and reg-ulatory environment on the federal and local levels in Sweden in order to gain insight into how much these structures incentivize people to care, work, and con-sume in a sustainable manner.

The literature has already expounded to a large degree on how to address sus-tainability dilemmas intrinsic to each social role: social sustainability depends on enabling care-giving, economic sustainability depends on enabling labor market participation, and ecological sustainability depends on responsible consumerism. Although the best way to promote each sphere of sustainability remains debated, even less is known about how to capacitate all three roles simultaneously in a sus-tainable manner. What implications do best practices regarding social sustainabil-ity hold for ecological sustainability? How do best practices to address ecological sustainability influence economic sustainability? And so on. Although these ques-tions have been taken up by various research communities such as de-growth and social investment, much more attention is needed to delineate how lifestyles can become truly sustainable in the future. An analysis of Swedish policies on the local level promises to deepen our theoretical and empirical understanding of how to resolve tensions between social, economic, and ecological sustainability.

NEMIROVA, NATALIA* (Saint-Petersburg State University, nnemirova@yandex.ru)

New Way: Renaissance of Neokantian Tradition in Sociology of 21 Century

The rise of a new social reality challenge sociologists on forming new sociolog-ical theories, developing research methods of social processes. Nowadays we are speaking not only about the common European crisis, but also about the common world economic, political, international, and social crises. The same social phe-nomena and processes were happening at the turn of the 19th – 20th centuries.

The main Neo-Kantian goal was reformation of sociological knowledge and a turnaround of the young science of sociology from a long-drawn methodological crisis. The main branches of Neo-Kantian activity can be put as follows:

1. Methodology plays a specific informative, sense-making and purposeful role in sociological knowledge. Methodology itself explains the structure of knowledge and the ways of its acquisition. Sociology should form its own methodology which differs from the methodology of social philosophy or natural sciences.

2. Classification of scientific knowledge, position of sociology in this science ty-pology. Search of a "sensible compromise" between cognitive methods and "rea-sonable synthesis" of nomothetic and ideographic approaches.

3. Definition of the key role of the purposeful actions of an individual and, as a result, development of teleological formations, separation of the principles of teleologism and causation in sociological and social knowledge.

4. Operationalization of scientific notions. Generation of new mechanisms of the formation of new theories and class notions.

5. Breakaway from subjectivism in sociology, formation of the objective eval-uative judgments based on the principle of "attribution to value", while endue-ing it with greater psychological and moral load. In general, the leitmotif of the neo-Kantian work was the ideas of moral foundations of personality.

The ideas of neo-Kantianism are consonant to the development of a modern situation in society and sociological science.

NEMOZ, SOPHIE* (International Centre REEDS, sophie.nemoz@gmail.com)

The Intertwining of Macro-, Meso- and Micro-Social Scales to Understand Innovation in Sociology. the Case of Eco-Housing in Europe.

According to a common view, innovation proceeds in a more or less linear model of diffusion from research through to engineering and applied develop-ment, and then to commercialisation. Nonetheless, the growing adoption of a prior discovery in science does not reflect the dominant processes by which most innovation has occurred historically. Looking beyond R&D at the firm level, mul-tiple perspectives highlight the innovative capacity of societies. Taking as witness the dissemination of eco-construction in France, in Finland and in Spain under the auspices of sustainable development, the paper aims to report on opportunities offered through the sociology of innovation within the context of a systemic and multicultural approach. This allows one to break with a strictly linear concept of innovative processes, as well as breaking with the blind form of analysis which sometimes gives rise to contradictions in the parallel evolutions macro, meso and micro-social observation due to divergences of scale. From the socio-political landscape to householders' homes, passing through the foyers of production in initiatives already in place, my thesis provides a reading of change and inertia concerning the dissemination of eco-housing in three dimensions (Nemoz, 2009). It emerges that policies can support and channel innovation through promiting standards and initiatives. However, they cannot allow one to avoid the fact that the systematic transitions to the works in place are somewhat uncontrollable in as much as the latter can neither be initiated nor arrested. Innovations are neither individual acts nor isolated artefacts. The assemblages that organize and disorga-nize them evolve through very long time horizons which explain that innovations are simply never introduced in their final forms.

Sociological Analysis of Maternal Healthcare in Madhya Pradesh India

Reducing maternal mortality ratio forms one of the objectives of Millennium Development Goal (MDG-5). Institutional delivery has been promoted to curtail the high MMR in India; however, there are barriers which prevent the use of insti-tutional deliveries among the women especially in the rural areas. These barriers are believed to be essentially borne out of their perception about childbirth which influences their choice of the place of delivery. The objectives of the study com-prise of conducting a sociological analysis of the perception of mothers in regard to institutional delivery and the provisions of healthcare in the select district of Madhya Pradesh and to study the various factors that influences the perception of the mothers towards institutional delivery and help formulate suitable inter-vention on reducing Maternal Mortality Ratio on the basis of understanding the perception of the mothers. The research project is conducted in a select district of Madhya Pradesh. The study involves both qualitative and quantitative methods of data analysis employing both statistical analysis as well as content analysis. A sample size of one hundred and twenty has been selected from the age group of 15-49 who have children of five years and below. Purposive sampling is used to select the samples. Research tools such as questionnaire and interview are used to collect the data. The study brings out cases of divergence in the provisions of

denotes a presenting author. Abstracts are organized by first presenting author's last name.

public and private healthcare. The paper asserts on the pertinent need to look at the socio-cultural factors that determine maternal healthcare while designing a policy as there is a tendency to disregard them.

Women in the Forefront: Women's Movement in Manipur

The twentieth century witnessed a number of significant instances of participation by women in socio-economic and political uprisings in India. Similarly Manipur, situated in North East India also witnessed such women led movements. Women in Manipur have always played outstanding role in the political history of the state. The paper explores the sequence of such movements starting from the 1st Nupilan (First Women's Agitation) in 1904 against the British rule; the 2nd Nupilan (Second Women's Agitation) in 1939 against the economic policies; the Nisha Bandh movement; and the Meira Paibis (torch bearing women); movements led by the Kuki Mother's Association, the Naga Women's Association, All Tangkhul Women's Association. Even in the individual level, there was Rani Gaidinliu who led a freedom struggle against the British in Manipur. In the present scenario, Irom Sharmila who has entered her 15th year of fasting and protest demanding the repeal of the Armed Forces (Special Powers) Act is one remarkable women activist. Interestingly, the paper brings out that despite their valour, industriousness and contribution in their respective community during critical situation, women hold a very inferior social position. The paper brings out how women are poorly represented in the larger decision-making bodies. The paper brings out this lack of female representation and asserts for a larger representation of women in the decision making bodies in the state. The paper also points out the lack of interaction, their isolation and independence and calls for a need of strategic action to be initiated among them. The paper also recommends on bridging the gap and work towards improving women's rights and empowerment.

Workers' Militancy in the South African Mining Sector, 2009-Present

South Africa's embrace of neoliberal capitalism in the post-apartheid era has been accompanied by an unequivocal decline in organized trade union power under the Tripartite Alliance (African National Congress, South African Communist Party, COSATU Federation of Labour). For more than 20 years, the government has channelled spontaneous Black worker agitation and dissent against poor conditions and despotic corporate management into a formal system of labour relations directed at regulating and containing strikes and rank-and-file militancy. The failure of the state and the National Mineworkers' Union to address the rise of precarious labour and declining wages has stimulated informal and migrant worker self-activity and unsanctioned mass action that is challenging the credibility of the government and trade union leaders. In the process, a new trade union movement is forming in the mining sector through the Association Mineworkers and Construction Union and throughout the South African labour market. This paper examines the rising challenge to neo-corporate labour relations, viewed by most labour activists and academics as the ideal frame to represent workers' demands in the Global South. Instead, in South Africa, as elsewhere in the Global South, militant workers are emerging and are forming independent committees and organizations, or directing the demands of new and existing unions in opposition to the institution of neo-liberal capitalism which has severely eroded worker rights. New struggles are taking on a new, more militant character, which is driving unrest against transnational corporations, existing unions, and the accommodation of states to the strictures of global capitalism.

NEUBERT, DIETER* (University of Bayreuth, dieter.neubert@uni-bayreuth.de)

Intellectuals and Activists Against the Rest of the World. Why (post-)Development?

Since Escobar's and others radical critic of the development concept the intellectual discussion of post-development is unbroken and united with the notion of post-colonialism. What started as a left-wing skepticism of modernity has now reached the core of sociological debate. Gurminder Bhambra's book "Rethinking modernity: post-colonialism and the sociological imagination was an intensively debated topic at the Yokohama ISA conference. This debate merges with a radical critique of neo-liberalism by the anti-globalisation movement and its offspring such as the occupy movement. This critical debate (e.g. Rodrguez et al.: Decolonizing European Sociology) creates the impression that the narrative of development is at best part of the history of science; or even more critical it is the root of all evil.

At the same time the World Bank, the IMF, UN, numerous NGOs and mainstream economists do not stop to praise development and growth as the panacea for the problems of the Global South. Interestingly large parts of the population in the Global South pin their hopes still on development, especially in Africa but also in the poorer parts of Asia. Even those groups who criticize neo-liberalism and capitalism like the left-wing movements in Venezuela or Bolivia present a socialist version of development. How is it possible that the intellectual debate that claims political responsibility and normative leadership is so far away from popular thinking? And how is it possible that the large scientific staff of World Bank, IMF and UN widely ignores the critique of the development concept and of neo-liberalism? Is there a chance to re-link these separated strands of scholarly thinking in a productive way? What kind of macroscopic political, economic and social changes facilitated this divergence of scholarly thinking?

STOLL, FLORIAN (University of Bayreuth)

Kenyan Visions of the Future Between Individual Advancement, Uncertainty and Political Hopes

Kenyan visions of the future seem to be quite uniform: individual advancement via education and entrepreneurial activities and a strong support for economic development and a democratic society. A closer look shows remarkable differences. At first, the majority of Kenyans including the biggest part of the middle class actually live in a situation of uncertainty. Even well paid jobs or a running business cannot guarantee a certain future because of economic instability and weak social security systems. The way how this uncertainty is managed shows different schemes of life linked to different visions of the future and a different range of future planning. Second, the overwhelming support for democracy is linked to quite different political expectations. A widely shared expectation is that democracy will lead to economic prosperity via the control of corruption inside the powerful political elite. This goes in line with international development debates on good governance. There are groups that work for a political future with a system of checks and balances, civil rights including minority rights. However, corruption is still endemic and other groups in the society accept it as long as they, and their regional-ethnic constituency benefits of clientelistic favors. In a similar way democracy is understood as simple majority rule on national but also on local level. This understanding marches very-well micro-nationalist tendencies.

The different future visions do not simply follow socio-economic class interests and they are marked by rising socio-cultural differences with new relations between individualism and family and group orientation and/or different concepts of political freedom. Therefore, there are no future visions of "the South" or "Kenya" in general but the future visions are sign for an ongoing process of social differentiation.

From the South to the North – Theoretical Insights on Gender and Work from Latin America

The paper draws on critical perspectives on the Sociology of Work that have pointed at the eurocentrism and male bias of labor studies. With the erosion of formal work during the current capitalist crisis, the structural similarities of labor markets in the Global North and the Global South have increased. Even tough social scientists from northern countries identify new trends of labor precarization and informalization, they disregard the existing research on similar processes in Latin America. Furthermore, labor studies reproduce androcentric perspectives by neglecting the sphere of social reproduction and the specific insertion of women into the labor market. In order to address these shortcomings, this paper introduces scientific knowledge from Latin America into academic debates centered in the Global North, by focusing on the nexus between gender and work. Therefore, three historical phases of knowledge production are identified: the first during the 1970s, when development theories dominated the Latin American academic discourse and feminist approaches emphasized the particular intersection of gender and class in the structurally heterogeneous labor markets; the second, during the neoliberal era of the 1980s and 1990s, when scholars pointed out the "feminization of work/poverty"; the third, during the recent consolidation of post-neoliberal trends, when studies focus on the extent to which gender inequalities on the labor market could be reduced by new state policies. Finally, the paper discusses the transferability of these analytical perspectives to other contexts and their theoretical insights for current debates in European labor and gender studies. It

will be revealed that the analysis of labor and gender relations in Latin America can make important contributions to the reflection of the entanglement of different axes of inequality to the understanding of precarization during the European economic crisis and to a political perspective beyond structural adjustment and austerity programs.

NEUHOLD, PETRA* (University of Vienna, petra.neuhold@gmx.at)

Multilingualism in the Monolingual School. An Institutional Ethnography of Viennese Secondary Schools from the Perspective of Teachers

Multilingualism is an essential part of everyday life in Viennese secondary schools. A majority of pupils (and some teachers) think and chat in different languages. Furthermore, communication among teachers, pupils and parents is often only possible through translations by dedicated neighbors, pupils, relatives or multilingual teachers. Nevertheless, the German language remains the sole official language of teaching and communication in schools. This contradiction between lived multilingualism and official monolingualism, as well as its entanglement with the neoliberal restructuring of the Austrian educational system, creates a wide range of challenges for pupils, parents and teachers.

In this paper, I adopt the perspective of secondary school teachers on this situation, describing their ordinary practices and the related challenges they face. The aim of this paper is to map parts of the complex ruling relations that structure teachers' everyday school life and hinder democratic education for multilingual pupils. As a sociologist and secondary teacher, I draw on the methodological strategies of institutional ethnography and auto-ethnography. My dual role enables a critical analysis of the educational reproduction of linguistic, racial and social inequalities by acknowledging secondary teachers' local knowledge, practical experience and emancipatory strategies.

Charitable Giving in the Field - Evidence from a Quasi-Experiment at Bottle Refund Automats in Germany

The study of the emergence of a social norm of helping strangers by donating money to charities or non-profit organizations has been scrutinized from different perspectives. Theoretical approaches like warm glow behavior or feelings of social obligation to help others have mostly been tested using either laboratory settings that come with the usual drawbacks or within survey experiments that were conducted to mobilize donors. Additionally, a few field experiments have highlighted the importance of framing decision contexts by providing descriptive cues about the social expectations to enhance contribution to a collective good. Using a unique research design from a supermarket chain in Germany, we systematically alter the information provision of the decision context at bottle refund automats with the option to donate the refund. By that, we are able to test competing hypotheses about the emergence of a social norm of helping by donating money to a non-profit organization.

Pro-Environmental Behavior in High Cost Situations –Evidence from a Mixed-Mode Panel in Germany

Empirical studies reveal that even respondents with pro-environmental concerns frequently do not show pro-environmental behavior. According to the low-cost hypothesis on the one hand pro-environmental concerns only matter in situation where pro-environmental behavior is perceived as low-priced by the actors, pointing to additive effects of instrumental incentives (e.g. low costs) and concerns or a positive interaction between them. On the other hand, dual process theories claim a negative interaction between pro-environmental concerns and constraints, i.e. actors with strong concerns behave in an automatic-spontaneous way by neglecting the costs. Our study operationalizes both approaches to assess which one performs better in an empirical test. The data come from two waves of the Gesis Panel, where two different forced choice scenarios were presented, systematically changing the costs of pro-environmental decisions. Using a multi-level-logistic regression model, we are able to control for the perceived definition of the situation (high vs. low-cost) and will check for framing effects regarding the interpretation of differential wording of gains. If respondents have to choose between green energy and conventional energy, pro-environmental concerns have a robust positive effect on choosing green energy regardless of the definition of the situation as high or low cost. Further, strong pro-environmental concerns have still an effect on the choice if conventional energy is much cheaper than green energy. If respondents have to choose between sustainable and conventional investment opportunities the effects of environmental concerns depend on the situation´s definition as high or low cost: while we find positive effects of environmental concerns on the probability to choose the green investment in low cost situations, we do not find any significant effect for high cost situations. We conclude that the explanatory power of the low cost hypotheses depend on the framing of the choice problem.

When Police Hijacked #Blockupy Frankfurt: A Critical Analysis of Activists' Social Media Tactics

In this article, we critically question the idea that street action in combination with activists' social media tactics can produce alternative perspectives and public visibility. We argue that social media grant authorities potential for greater control over public discourse concerning protest events – through surveillance opportunities as well as active use of social media tactics to produce their own "counter-information". The argument is based on the case of the trans-European Blockupy alliance mobilized to block the opening of the European Central Bank offices in Frankfurt am Main, Germany. The study combines ethnographic fieldwork with an analysis of social media data. The ethnographic fieldwork is composed of field notes from participant observation during the Blockupy action, interviews with activists and an online ethnographic inquiry into Facebook groups. The social media data consists of a social network analysis of Twitter (n=229.911), collected on the basis of protest hashtags (#Blockupy, #Destroika, #NoTroika).

Identification of social media practices and tactics reveals two trends: a) an interaction of surveillance and improved social media tactics by authority such as the police; and b) a focus on violence and property damage, mass action, and performativity in protest events to produce publicity on social media. In today's over-mediated environments, activists use new tactics to report from street protests through social media in combination with mainstream and alternative media. Smartphones have replaced the tent through which information was formerly uploaded onto the IndyMedia alternative media platform, and activists risk becoming subject to surveillance. On social media, images of riots, peaceful protests, artistic action, as well as police and news media struggle for public visibility in today's saturated media environments. In the Blockupy Frankfurt action, police became the dominant actor in this struggle by hijacking the protest hashtag and tactically using images of riots to produce a positive image.

Towards Socio-Gerontechnology: Modelling the Theoretical Intersection of Social Science and Gerontechnology

This paper investigates the theoretical gains which can be made by combining conceptual and theoretical insights from social gerontology and science and technology studies with gerontechnological theory. Although ageing is globally recognized as one of the biggest societal challenges and investments in technologies to deal with this challenge are high, current gerontechnologies mostly fail to live up to expectations. Partly this is due to the poor connection between social scientific understanding of ageing and the mostly technically focused discipline of gerontechnology. This paper presents a theoretical model in which the relationship between designers and users is modelled as reciprocal and evolving over time. The connection between design and use is made via the script concept whereas the connection between use and design is made via the user representation concept (both pertaining to actor-network theory). Acceptance is seen as dependent on technological literacy, technology generations, perceived stigmatisation, perceived benefit and domesticability of a technology. Older users are, in turn, seen as potentially active actors who are both enabled and constrained by gerontechnologies. However, older users are also constrained within their context (having to act their age, bounded within pension systems, care relations etc.). The evolution of the connection between older user and the technology can subsequently be followed over time, which allows for conceptualizing the life course as a user-technology hybrid. This model sensitises us to the stereotypical imagery of ageing that underlies many gerontechnological designs, to the constraining (and enabling) effects of age scripts that are the result of such user representations and to the ability of older people to act as active technology users who change and circumvent such scripts. It thus allows a deeper and theoretically more re-

fined understanding of the ageing-technology nexus. We conclude by exploring the implications of our model for policy making and gerontechnological design.

Fostering Professional Development Among UK Dental Undergraduates with a Dental Scrubs Ceremony: Findings of a Two Year Study

Professionalism is a key aspect of the teaching and training of dental students. However, the task of instructing professionalism to dental students can be challenging (e.g. Ziljistra-Shaw, Robinson and Roberts 2013, Riley and Kumar 2012, Coulehan 2005). Students tend to understand professionalism as a set of behaviours (Riley and Kumar 2012, p.9) that they are told they must adhere to or avoid, rather than appreciate professionalism as 'a special form of personal and professional formation' (Inui 2003 quoted in Coulehan 2005, p. 895). While students need to have a clear 'cognitive base'(Cruess and Cruess 2006, p.205) in terms of what professionalism entails in the first place, the formal curriculum must also be supported by an informal curriculum and organisational culture which sustains and reinforces the socialisation of their fledgling professional identities(Birden and Useherwood 2013, p.380).

This conference paper documents a pilot initiative at a UK Dental School to strengthen its informal curriculum on professionalism with the introduction of a scrubs ceremony for its second year students. The Scrubs ceremony was inspired by the White Coat ceremonies that medical students have in North America universities (e.g. Huber 2003, Karnieli-Miller, Frankel, Veatch 2002). This event marks the students' first step in their professional and clinical development, as they transition from pre-clinical to clinical stage of their studies, with the public presentation of dental scrubs to the student cohort and the recitation of a pledge of conduct. An evaluation of this initiative and its impact on students and faculty staff's perception of dental professionalism will be presented and discussed.

The State and the Agrarian Public Sphere in Venezuela

Does socialism eviscerate civil society? Theories of the transition from absolutism to bourgeois society identify several factors that impel or at least facilitate the emergence of the public sphere of civil society. Theories of 20th century totalitarianism suggest that state socialism annihilates, suppresses, or at least fails to allow the emergence of civil society. Yet "21st-century socialism"—pursued most stridently in Venezuela—has witnessed an efflorescence of civil society organizations among the popular sectors. This paper contributes to a growing critique of the totalitarianism literature by incorporating this anomaly into, and thereby extending, the Habermasian theory of the emergence of civil society and the public sphere. Focusing on agrarian civil society, we reconstruct Habermas's theory—which argues that vertical contradictions between the state and the public sphere were characteristic of the transition from absolutism to bourgeois society—by showing that *horizontal contradictions within the public sphere characterize the transition to 21st century socialism in Venezuela*. This is due to two factors: as Habermas noted, (a) the state establishes the conditions in which public sphere participants develop their positions; but, as Habermas failed to consider, (b) the state's communicative and economic activities have not coincided in the Venezuelan case. That is, the state there has pursued an increasingly radical-socialist agenda as articulated in its words, and a moderate-nationalist one maintained in political-economic policy implementation. The organizations in the agrarian public sphere have defined their political perspectives against the state, but differ due to referencing discrepant aspects of it. This has given rise to myriad mutually-conflicting positions in the agrarian public sphere. We support these arguments by analyzing laws and presidential discourse; lending practices, the land structure, and marketing support for farmers; and agrarian civil society organizations in the key agrarian state of Portuguesa.

Racial Segregation and Inhumane Treatment of Foreing Domestic Workers in Hong Kong

Since the time of the *mui jai* system in Hong Kong, a system in which impoverished girls and women were bound to households as servants and which did not disappear until the 1970s, mistreatment of women as carers in other people's

homes has been documented. However, these women were ethnic Chinese, and since the time when Hong Kong first started allowing foreign women into Hong Kong to fill the caring gap left by rapid economic development, the policy has been to hire women from Southeast Asia, mainly the Philippines and Indonesia, instead of culturally and racially closer Vietnam or Mainland China. This has been to prevent the integration of foreign domestic workers into local society, as they are to be treated as disposable and replaceable sources of caring labour, not potential new immigrants. From 2011 to 2013, foreign domestic workers fought for the Right of Abode in Hong Kong after seven years of residing in the territory, to which highly skilled foreign workers or 'expatriates' are entitled. This presentation introduces the 'herstories' and experiences of eight women who were in a shelter for foreign domestic workers during that period, illustrating the racial- and gender-based dehumanisation, segregation, exploitation and abuse of these women and others.

Factors Leading to Development or Stagnation in the School-to-Work Transition of Economically Disadvantaged Youths

This paper examines the factors leading to development or stagnation in the school-to-work transition of economically disadvantaged young people. Based on eight focus group interviews with 50 youths growing up from low-income families in Hong Kong, our results show that this population is among the most disadvantaged in school-to-work transition, as the majority of these youths were either engaged in low-skill jobs with limited career prospects or disengaged from both work and education. Among the interviewees, those who left school early were at the greatest risk for social exclusion, as most of them were unemployed for more than one year. Contextual influences such as lower levels of parental involvement and lack of further education opportunities were found to constrain both the formulation and pursuit of educational and career goals. In contrast, service use and supportive interactions with parents and non-family adults were found to foster more adaptive transition. Furthermore, our results indicate a striking difference in intrapersonal agency and coping styles between young people who were attending further education or engaged in jobs with advancement opportunities and those who were not. The implications of our findings for future research and policy development are discussed.

Informal Employment and Social Exclusion Among Young Rural-Urban Migrant Workers in China

This study investigates informal employment and social exclusion among young rural-urban migrant workers in China. Based on interviews conducted in Hangzhou, China, the study found that the deprivation of rights for social protection among these workers during the informal employment process is a result of total and structural surplus in the Chinese labor market. Such exclusion is further intensified by systemic problems in the social insurance system and by problems in its regulation and implementation. Based on these results, this paper argues that the social exclusion of young rural-urban migrant workers in China is different from the new poverty in the West: it is intake exclusion within the labor market in the context of globalization. In China's present socio-economic environment, informal employment, which has resulted in the social exclusion of this population, still has a positive effect on both rural-urban migrant workers and the wider society. As a result, measures that address the problem of social exclusion should also place more emphasis on the development of the social insurance system and the use of investment policies, including human capital investment, to facilitate the empowerment of the target group and achieve the goal of social insurance for all.

"I Don't Really Have Time for People Who Get Moody": Young Men Negotiating Emotions in Education Contexts.

This in-depth case study project involved 16 Australian male high school graduates over the course of the year in a series of interviews. The study focused on masculine identity formation in the transition from adolescent to adulthood and the role of boys' social contexts in this process. A grounded theory approach was taken to analysing the interview transcripts. This paper will draw on data from the

first interview, in which the young men reflected on their school experiences and the second, in which they compared school to tertiary education settings. One of the strong themes emerging from this analysis was the role of emotion regulation in sustaining male peer social networks in the school setting. Specifically, the boys learned, from their participation in male friendship groups at school, how to avoid experiencing intense feelings and thus avert the risk of appearing emotional. We will show how, through a gendering of the meaning of emotion, girls were attributed with inherent emotionality which was seen by the boys as prone to spill out, producing "drama". We argue that the social space of school, which produces a high degree of visibility for identity performances, creates a high risk environment for males to be explicitly emotional. We identify some regulatory mechanisms which, the boys report, assist in sustaining an even emotional tone in the male peer environment. One of these is "paying out", an Australian colloquial term for banter, which is an important competency for successful male peer group membership. Through ritual insults, boys probed each other's sensitivity and hardened each other to emotional attacks. In the process, boys learned who they could trust and how to be trusted and, paradoxically, experienced positive emotions associated with belonging.

Sociocultural Evolution: The Case of Modernity. the Discourse on Modernity from the Perspective of a Theory of Long-Term Social Change

The paper departs from the thesis that sociology without a genetic perspective cannot deal adequately with its object of knowledge. However, after a phase of intense discussion in the 1960s and 1970s in sociology as well as in social and cultural anthropology, the modelling of long-term sociocultural processes of change was set aside in the great recent theoretical conceptions. Research on macro-social processes of change nevertheless is simply indispensable for an understanding of early and contemporary societal forms of organization and knowledge structures since they build upon prior structures. Thereby, it is not a matter of a causal chain in the sense of an if-then constellation for the determination of social processes; it is not a matter of a logic determining and inherent in processes of change which realizes itself in a pre-determined succession of forms. Moreover, it is a matter of the analysis of facilitating and restricting conditions for systemic change.

At the example of the discussion about modernity and in special reference to the analysis of civilizations of Shmuel N. Eisenstadt as well as its critique I will make clear the meaning the historical perspective attains for a sociological theory of modernity. At the same time I will elaborate critical points out of his analysis which in turn are to be taken into account for the development of a general theory of a long-term change. In conclusion, I will sketch a sociological model of sociocultural evolution which takes into account the contemporary state of knowledge.

Trade Unions and Environmentalism – the Case of Austria

Although trade unions are crucial societal actors, their role in the current debates on social-ecological transformation is usually neglected (e.g. WBGU 2011). In Austria the relation between trade unions and environmental issues has a long, contradictory and conflicting tradition. The most important occurrences in the younger past are the conflicts around the nuclear plant "Zwentendorf" and the hydroelectric plant "Hainburg" in the 1970s and 1980s. Both conflicts must be considered as central experiences regarding the relation of the trade union movement and ecological issues. Although the sustainability debate also had certain impacts on Austrian trade unions (e.g. Ritt 1998), these experiences continued to shape the collective memory of the trade union movement regarding environmental questions. The central axes of conflict regarding the two power plants were the creation of jobs and competitive and locational advantages – arguments that are significant for the discourse on labour and the environment in general. For a comprehensive consideration of the relation between trade unions and environmental questions it is, however, inevitable to go beyond this discourse (cf. Räthzel/Uzzell 2012).

Following this assumption and considering the newly arising debates and coalitions in the wake of the crisis and its management, the project "TRAFO LABOUR" is asking the question how trade unions and workers' interests can be appropriately taken into consideration in social-ecological transformation processes.

The 'GDR Children of Namibia'. Outsiders with a Problematic Sense of Belonging

The term 'GDR children of Namibia' is used to describe a group of approximately 430 people. They were taken to the German Democratic Republic (GDR) from refugee camps in Zambia and Angola in order to remove them from the threat posed to their lives in the camps during the war of independence which was fought by the South West African People's Organization (SWAPO) against South Africa's occupation of Namibia from 1979 onwards. As part of a solidarity project between the GDR and SWAPO, the children were cared for in Bellin, Mecklenburg, and in Staßfurt near Magdeburg. In this socialist environment, they were educated to be the elite of a future, independent Namibia. However, once Namibia had achieved independence and the GDR had ceased to exist, the children and adolescents were suddenly and without preparation flown to Namibia without completing their school education. Due to their socialisation in the GDR, they were now experiencing typically European problems in Namibia – it was too hot, they were shocked by the eating and lifestyle habits and experiencing problems with the language. Girls in particular were experiencing serious problems, especially with the highly patriarchal family structures in Ovamboland in northern Namibia. Some of the group were the first 'black' pupils in Namibian German Schools where they were feeling like 'aliens' and facing racism. The analysis of the biographies shows how the 'GDR children' figurate themselves as outsiders with a problematic sense of belonging. They label themselves as part of an outsider grouping. The study of the media discourse about the group offers that multiple cultural identities are attributed to the GDR children which mark them out as being different. This paper examines their problematic sense of belonging and their problems finding a place for themselves in society.

Digital Myth? Visions and Open Questions in the Field of "Digital" Work

The "Internet Age", and hence the widespread introduction of digital technologies in diverse work environment(s) are recognized as *the* important change in work in all sectors in industrialized societies in the last decades. Visions like "industry 4.0" or the unlimited mobility of "virtual work" fuel discussions on scientific but also on political levels. The question, however, how digital technologies concretely affect current work and how these are initiating changes is still largely unexplored. Furthermore empirical evidence of "digital" work still is rarely discussed within theoretical models of work.

Based on a review of current visions of digital work it will be argued that the scientific and political debate is still in a phase of "digital myth" creation. In order to understand and shape the characteristics of "digital" work it seems crucial to develop a theoretical model of work and technology. This model should be able to (a) reflect the highly different work environments of "digital" work and (b) to identify technology as enabler for changes at work. Thus, the paper proposes a contextualised approach towards work and technology: The introduction of digital technologies creates socio-technical spaces that are initially influenced by technical parameters to which organizational and individual working structures adapt ex-post.

The authors conclude that it is important to deliberately design socio-technical working spaces – on a micro-level – according to normative principles for "good" employment. Furthermore – on a macro-level – a societal debate on "digital" work should start in a sense that the power of digital technologies may be transformed into the 'classical' ideal of work and technology: "*machinery, considered alone, shortens the hours of labour, but, when in the service of capital, lengthens them; since in itself it lightens labour, but when employed by capital, heigthens the intensity of labour*" (Marx, Capital, Vol I, ch. 15).

The Involvement of Art Institutions in the Construction of a New Symbolic Order. Polish Art Institutions after 1989

Art institutions are among the players in the field of art, along with artists, institutions raising artists (art colleges/institutes, known in Poland as academies of fine arts), art critics, art collectors and art dealers. Each of the entities with its own interest in mind strives to gain advantage over other players in a given field to obtain a monopoly for dictating rules, norms, and guidelines concerning artistic activity. The field of art is also influenced by external factors, both economic and political.

This paper is aimed at analysing the status of Polish public art institutions in the strengthening of the social impact of art following 1989. The art of the 1990s is a record of its own kind, of the Polish social and political transformation. This was a time where art institutions competed against each other to gain the symbolic

upper hand to decide on the shape of the Polish art domain. Since art institutions belong with the state administration system, whereas a critical description of reality was at the core of critical art's purpose, it remains to be answered whether the institutions in fact guaranteed the freedom of artistic expression and work. Therefore, it has been my intention to resolve if, and to what degree, art institutions were actually involved in the discussion on the shape of the Polish society, and to establish the role they played in constructing and maintaining the discourse of the so-called "critical art" which dominated the Polish artistic scene back in the 1990s.

The Taste of "the Stranger." Performing Heritage in Culture and Language Festival in Norway.

Cultural heritage can be understood twofold – as a set of cultural norms and values or as an artistic patrimony of a group. Passed on from generation to generation and constantly being negotiated, cultural heritage is usually inscribed in the ethnic identity of immigrants and becomes an important marker of group boundaries in multicultural societies in Europe. Being a source of pride and a reference to culture of origin, cultural heritage is both a chance and a limitation of integration that often causes tension between the host and immigrant population. It enables development of a sense of belonging to both – the group of origin and host society by negotiating norms and creating narrations that allows linking new practices to one`s background. Simultaneously it may be seen as a factor that negatively distinguishes immigrants and threatens the host society`s values.

This paper discusses how heritage is being used and negotiated by the participants of Language and Culture Festival in Drammen, Norway, allowing them to cross group boundaries. It exemplifies the role of art in providing new space for mutual relationship between the locals of different ethnic backgrounds including the major society. The paper is based on an ethnographic observation accompanied by photo documentation conducted by the author in Drammen in 2013-2014 . Special focus is put on two groups of Drammenians – ethnic Norwegians and Norwegian Turks.

Since 2009 the Language and Culture Festival has provided a platform of cultural heritage exchange between its participants in Norway. The festival takes the form of a competition in which locals of different ethnic backgrounds, including the representatives of the host society present a song, folk dance, text composition, drawing or stage performance in a different language other than one`s mother tongue.

Demographic Diversity in the Kostroma Region in Russia: Indicators and Dynamics of Local Communities

The Kostroma Region is one the most well-known historical areas in the Russian Federation. In the public opinion it is considered to be 'the Heartland of Russia', the cradle of the Romanov dynasty, and symbol of '*Russianhood'.* The Kostroma Region is located 450 kilometers North-East of Moscow. According to the last Census (14 October 2010) in the Kostroma Region full resident population is 667,6 thousand people. The population is very unevenly distributed among 24 municipalities and 6 urban districts. In the past two decades, the population of the Kostroma region, as in many other regions of Russia, is declining. The Kostroma Region is among the champions of the depopulation in the Russian Federation. Inside the Kostroma Region the difference of the pace of depopulation and other demographic characteristics among the municipalities is very high. What are the differences in the dynamics of the population of certain areas in the region? How can these differences be interpreted? We assume that the demographic characteristics of the region correlates to the location of municipal districts depending on their proximity to the regional capital (City of Kostroma). Best demographic situation is characterized by a positive growth of population, highest life expectancy, and younger population which is recorded in the capital. The combination of the worst demographic indicators is typical of the areas that belong to the so-called periphery and far periphery. The basis of this spatial patterns is the unequal distribution of public goods (hospitals, universities and colleges, workplaces, police, etc.), access to which is reduced as the distance from the capital expands. Thus, therefore basic demographic indicators in the Kostroma Region are, in fact, the markers on the scale of social well-being.

NIKOLAEVA, ULIANA* (Lomonosov Moscow State University, ynikolaeva@list.ru)

The Concept of 'Archaic' in Interpreting Contemporary Community Life

The concept of linear progress for a long time dominated in social sciences. The primitive irreversibly is replaced by more sophisticated, new and efficient. As it turns out, the past does not disappear without a trace. Most modern processes - for example, the process of globalization - generate two opposite effects: (1) The worldwide distribution of the latest technical and economic progress; (2) Re-animation and spread throughout the world of the most archaic forms of social and economic interaction (criminal shadow economy, corruption, violence, and other). When we say 'archaic', we mean the following (*see* Malinowski, Mauss, Polanyi). Firstly, it is the earliest - primitive, primordial, pre-class. It is a relationship of mutual aid, reciprocity and exchange of gifts. Secondly, the period of transition from a primitive to a civilized society, or a period of "barbarism." It is a relationship of direct violence and physical pressure on the part of the militarized groups. Small, mobile, well-armed groups regularly rob neighbors, draped their tribute. Thirdly, the so-called "eastern", "redistributive" societies (Polani), or "Asiatic", "Asiatic mode of production" (Marx). One can see these societies, in retrospective, in Ancient Egypt, Mesopotamia and China. It was a relationship of complete domination of the state in the economy, politics and culture. It was at the same time a lack of autonomy of the individual and equally domination of the so-called 'collectivistic ethics'. The flows of immigration—the outcome of globalization—brings into being a multicultural mosaic of cultures, including the archaic one with all its pre-historic and early historic facets. In this sense globalization seriously undermines the communal way of life in the countries of so called 'peripheral capitalism' and makes the archaism more aggressive.

RC24-298.2

NIKULA, ILARI* (University of Lapland, inikula@ulapland.fi)

Environmental Crisis and Depoliticization

Along with the idea of global environmental crisis there has emerged depoliticizing trends that are driven by processes that are justified by their capacity to improve the sustainability of societies and individuals. This paper examines these depoliticizing political and societal implications that derive from this crisis. Also the ways in which the crisis has been constructed and governed are analyzed. For a theoretical framework Michel Foucault's studies of power and governing is used. The analysis is specifically built around the concepts of governmentality and biopower. Thus, this research has a foucauldian premise and it presumes the political nature of all knowledge-claims. It approaches the knowledge of the world discursively.

It is argued in this paper that the environmental crisis is moving us towards a post-political, or post-democratic state. This includes the tendency of issues being centralized under global technocratic management and consensual policy-making of institutions like Kyoto protocol or annual climate summits, and other institutions that are further called for to police the world. These depoliticizing tendencies reduce the sphere of democratic political deliberation and debate. As the current understanding of the environmental crisis as a "*supra*-national and *non*-class-specific *global crisis"*transcends social differences, proper political choice between competing ideological visions of a different social order is slowly reduced.

Furthermore, the global framing of this existential threat creates one global polity. It makes global governmentality possible. It centralizes the tools of rule and governing, as 'the biosphere' and 'global climate' are brought into being only through biopolitical practices of assessment, such as the generation of statistical data and graphic representations. This allows a governing from a distance, using policy and statistical evidence to influence how people see their local environments and their relation with it.

Socio-Political Events and Language of Twitter: The Representation of Events in Ukraine in Russian Twitter

Today social networks undoubtedly play an important role: it is a source of information, a mean of mobilization and an environment for the public discussion and reflection. Nowadays social reflections research takes new turns using language technologies. We propose the simple approach to the interpretation of social networks' language.

The topic of the following research is concerned with many neologisms appearing in the period of popular socio-political events. Unlike Mass media language, language in social networks is more uninhibited and as far as Twitter is online

denotes a presenting author. Abstracts are organized by first presenting author's last name.

platform users are free to use new words. The emergence of new emotionally charged words that directly reflect actual events is more likely in Twitter. Users create new words that express new concepts or new ideas or include the most popular emotional evaluation. E.g. "майдаун" (Майдан [Maidan] +даун [daun] = [maidaun]) expresses negative attitude as it's ending sounds like Russian insulting word "даун" (~mentally retarded).

Currently much research is being done on the analysis of neologisms. For example, BBC Magazine published an article "Twitter spawns twitterverse of new words" (5 September 2011). Lots of works are focused on detecting neologisms on Facebook. However, the majority of these studies do not pay attention to the reason of appearing of certain words, i.e. neologisms are studied in general, without any communicative focus. We focus particularly on factors leading to the creation of new words and/or changing the words meaning (key words, neologisms, memes), pointing out inseparability of society and language. The other task is to match the words and the communicative roles (information, manipulation, self-expression, etc.).

Our research is actual and reliable as it based on representative corpus of tweets and the survey of 110 informants. The primary set was obtained by the statistical analysis to extract the most significant keywords (February-April 2014).

Travelling Texts. Justifying Early Intervention.

Building on ideals of social equality and a welfare system promoting equal opportunities, there has been an increasing awareness in the kindergarten sector in Norway of kindergarten employees' responsibility to identify children at risk and to initiate early intervention. When kindergarten employees talk about children they are worried about, they tend to refer to their "gut feeling". Indeed, a terminology for worries seems to be lacking. Consequently, different educational programs have been initiated to enhance kindergarten employees' knowledge about various risk factors and to increase interdisciplinary collaboration to find suitable interventions. The process from identification to intervention involves a complex chain of actions in which documentation is at stake. In this paper I follow this process, departing from the standpoint of kindergarten employees, particularly highlighting how texts are integrated in the chain of actions and how individuals enter into the text-reader conversation. The texts often serve to justify intervention from agents outside of the kindergarten. Acknowledging the "power of the written word" kindergarten employees need to find ways to articulate their gut feeling, e.g. by documenting their observations. In doing so, they build on existing terms and categories and implicitly (re)construct "children at risk", "children with learning difficulties", "children with delayed motor development" etc. Like Ian Hacking warns, there is a risk herein of "looping effects", in which certain people are 'made up' and the categories making them up reinforced.

How Can We Understand Senior Camps in Relation to Social Policies and Images of Ageing?

Since the beginning of 2000 senior camps have been established on several places in Sweden,with the purpose to decrease social exclusion and improve health amongst old people. These senior camps build on notions of what it means to age and to "be old" in relation to activity, health, functional abilities and participation in society. In addition, the camps are firmly grounded in cultural norms on how to "do camps", and what is important values for well-being, often connected to nostalgia and national icons. In a cross-scientific and holistic study at CASE, Lund university these senior camps have been studied from three perspectives 1) History of ideas. What is the cultural meaning of senior camps? 2) Ethnology: how is age made visible and important at senior camps? 3) Occupational Science: What are the individual social and health aspects of the senior camp?

In this presentation we focus on the results from part study 1, that is, the cultural and historical meaning of senior camps.The data consists of material from the camps and interviews with directors for the senior camps. We will frame senior camps in a cultural context and discuss them in relation to discourses of active ageing and care. Furthermore, we will show examples of how the organisation of, and the rhetoric surrounding senior camps is similar to the child camp tradition in Sweden where culture, the idea of nature, activity and governing becomes central issues. What structural and ideological values about age and "Swedishness" are made visible in these utterances? We will discuss this in relation to our findings.

NIMROD, GALIT* (Ben-Gurion University of the Negev, gnimrod@bgu.ac.il)

New Social Roles and Well-Being in Later Life

New social roles are central to the Innovation Theory of successful aging (Nimrod & Kleiber, 2007), which differentiates between two types of innovation: Self-Preservation Innovation (SPI), that somehow continues earlier roles, and Self-Reinvention Innovation (SRI), that has nothing in common with previous roles. The theory suggests that both SPI and SRI may contribute to well-being in later life. Based on a telephone survey of 545 retirees (age≥60), the present study aimed at examining the two types of innovation and their association with well-being.

Analysis indicated that SPI activities were significantly more common than SRI activities. Moreover, innovators who reported adding at least one SPI activity had significantly higher life satisfaction than the rest of the sample. No such difference was found regarding innovators who added SRI activities. To determine whether differences in life satisfaction resulted from SPI activities or from differences in background characteristics and activity repertoire, a three-step linear regression was conducted. Results showed that it was not the type of innovation, but rather its result – namely, a greater activity repertoire among innovators – that predicted post-retirement life satisfaction.

The prediction of life satisfaction according to total activity repertoire is in line with the main tenet of Innovation Theory, as Nimrod and Kleiber maintained that the impact of innovation on well-being is not direct. Accordingly, it appears that the innovators who added SPI activities reported more satisfaction with life than others because they had a greater activity repertoire that accorded them more sources of challenge, companionship and meaning. One may still inquire why this was not the case for innovators who added SRI activities, even though they too enjoyed a greater activity repertoire than the rest of the sample. A possible explanation posits that only SPI promotes well-being in later life, underscoring the importance of internal continuity.

Project of Citizen Identity Card and Institutional Design of Security Policy in México

In Mexico, the Personal Identification Card has been a controversial theme since it was first mentioned in 2009. The official objective of the Card was to procure the unified identification of all citizens, concentrating the data that forms their legal identity, linked with biometric data in order to incorporate fingerprint registry, face and iris of every Mexican.

News of the project gave footing to diverse controversies, for one part, it was warned about the duplication of work invested in the expedition of a citizen identity card, since it was argued that the current Voter Card (expedited by the Federal Electoral Institute, IFE) serves as one of the main identifications in the country and that the possession of the unique identification card could discourage the inscription of the citizens in the voter rolls and could negatively impact the influx of citizens to the elections.

The second issue was of an administrative character and turned around toward what instances of public and private character would be the ones to carry out the management and control of the administration of the card. Linked to the administrative issues, another group of themes was the possession and protection of personal data.

In 2013 the Identity Card ICM project was included in the public agenda as a result of the recent acts of violence and insecurity in the country. The main argument is that a new Identity Card will ensure the identification of criminals. This issue is going to be central in the public debate because concerns the privacy and protection of personal data. In the case of Mexico, the main debate is about the weekness of the governability, the lack of moral authority of the government and the enviroment of social discontent in which this new changes are being constructed.

Medicine, Media and Identity: The Discourse on "Developmental Disabilities" in Japanese TV Programs

The term "developmental disabilities" (DD) generally covers learning disabilities, ADHD and autism-related disorders in Japan, and discourses around the term typically describe specific characteristics such as relatively short attention span or particularly strong preferences for certain things as defining features. However, these characteristics have not always been regarded as disabilities. Some research has observed a cultural tendency towards "medicalization": certain behaviors have been pathologized over time and controversy continues among medical professionals and lay people concerning over-diagnosis of DD. NHK, Japan's national public broadcasting organization, has regularly aired programs related to DD and may be considered an influential medium for discourse

on the subject in Japan. This presentation describes discourse analysis of 51 NHK TV programs—selected using an electronic program guide and covering almost all programs on this subject aired between 2012 and 2014—examining how identity is constructed.

The analysis reveals that the majority of programs about DD are "welfare programs" (38 programs), and individuals who are introduced as having DD are highly represented. They are identified as having DD multimodally, including captioning when they are introduced. Various aspects of individuals' lives (strong preference for a certain color, for example) are identified as typical features of DD. The effect of such forms of representation is to define and delimit individuality through the discourses of medicine and welfare, even though the medical definition of DD is itself unstable. In fact, this tendency in representation is sometimes questioned by newscasters and those introduced as having DD on the programs. These constitute exceptions, however, and are usually unexplored. Thus, the dominant discourses are demonstrably those which directly or implicitly pathologize behaviors. This study suggests the need for greater critical awareness, flexibility and diversity in representation of individuals with specific characteristics.

Women's Employment after the First Childbirth in Japan

Women's employment after the first childbirth in Japan

The employment patterns of Japanese women show unique features among industrial societies. They are; relatively lower employment rate of mother of infants while higher employment rate of women as a whole, and unclear impact of higher educational attainment on women's employment. This paper tries to explore reason for them by analyzing employment patterns and their determinants of women mainly born in the 1960s and the 1970s.

There are several reasons for focusing on the women's employment patterns of these cohorts. First, it is worth exploring why employment rate of mothers are still low regardless of some policy changes aiming at gender equality, such as Childcare Leave Act and the Equal Employment Opportunity Act for Men and Women, which were enacted and expanded after the 1990s when women of these birth cohorts had their childbirth.

Second, more women of these birth cohorts pursued higher education, and got into the workforce after graduation, compared to the earlier birth cohorts. Investigating the reason why they could not utilize their human capital in the workforce is another important issue because even more women of subsequent birth cohorts have been seeking for university degrees.

Using Japanese Panel Survey of Consumers (JPSC), this paper presents descriptive analyses on employment patterns around the time of their first childbirth, and results of multinomial logistic regression analysis on determinants of women's employment status at a year after the first childbirth. The main finding of analysis is that type of occupation rather than educational attainment has a significant impact on Japanese women's regular employment after the first childbirth. Based on the results of data analysis, the interaction between labor market structure and social policy, and its impact on women's employment and gender role in Japan will be discussed.

Racial Discrimination: An Experience of North East Indians in the Metropolises

One of the challenges in the construct of a modern political nation of India is the competing identities that confronts in the making of an Indian identity with regard to Northeast region (NER) and their women working in the metropolitan cities in India. The NER is the melting point of South Asia and Southeast Asia, as a result of which there is microcosm of cultures that reflect both the regions which are uniquely of its own and do not reflect the Indian counterpart in their society and culture. Many North East people have sought livelihood in the cities. After the advent of liberalizing in the Indian economy there has been an onslaught of MNCs in which many Northeastern women are employed wearing western attire to suit the image of the company, which has led to stereotyping them in a derogatory manner that makes them vulnerable to confront violence in the changing social landscape of the metropolitan cities. The paper seeks to study how the hyphenated identities of Northeast Indian is confronted as gender relations gets strained with increasing tensions between men and women belonging to a different racial and cultural milieu. The racist hate crimes of Richard Loitam, Ms.Sangma and Nido Tania followed by a rape of 14 years old girl from Manipur in New Delhi drew massive protests and formulation of anti-racial laws. Why do the mainstream Indians perceive the North East Indians with prejudice? Why has the new spirit of intolerance increased? How will the new anti-racial laws be used effectively? What are the strategies to reduce racial discrimination in India? The intersectionality theory would be used to comprehend why the North East women are the easy targets of discrimination, racism and violence comprehending the social realities of the hyphenated identities of being a North East Indian.

Does Diversity Enrich or Jeopardize Society?: A Critical Answer to an Oversimplified Question

There is still a controversial debate about the question if diversity implies enrichment or a threat for societies. The sociological theory offers at least three different answers. Optimistic representatives of the diversity concept as well as representatives of corporations emphasize the positive aspects. In their perspective, diversity and multiculturality are seen as a societal asset that pays off both operationally and economically. In contrast, the culture conflict theory (e.g. Huntington 1998) argues similar to Parson's structural functionalism that cultural differences threaten social cohesion.

The third answer criticizes both approaches as they likewise tend to reduce human identity to a singular attribute such as gender, race or religion (see Sen 2006). Starting points are Simmel's metaphor of the "intersection of social circles" (1908) and the diagnosis that the diversity concept, similar to the concept of exclusion, distracts from economic inequalities (see Michaels 2006) and, therefore, promotes the neo-liberalization of sociological theory.

In consequence, it is argued that diversity might only lead to social cohesion if the differences are not linked with economic inequalities. In other words, diversity research should be aware of "horizontal inequalities" (Stewart 2008). Moreover, it has to recognize that criss-crossings of cultural and economic cleavages use to enhance social cohesion.

Therefore, the diversity concept will only survive within sociological theory if it does not obscure economic inequalities and ignore economic conflicts. In short, diversity researchers should resist their instrumentalization by culturalists, politicians and managers. This argument is underpinned by empirical evidence, such as entrepreneurial mission statements, the development of economic inequalities in South Africa and the multicultural practice in the UK.

A Qualitative Comparative Analysis of Patterns in the Catching-up Performance of the Former Soviet Union Republics

There is no consensus about the causes of dissolution of USSR. But surely Soviet Union most probably would not have dissolved, had it fulfilled the promise to catch up economically with U.S. – even if this would have happened only in 1990 or in 2000, and not in only in 1980 (as was solemny promised in the III Programme of the CPSU adopted in 1961). Although Perestroika initiators did not promise that „shock therapy" style market reforms („500 days" or so) will enable reformed

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Soviet Union to catch up with U.S. in some 20 years, the hope and promise was that they will lead Soviet economy out of low growth trap. The market reformers in Boris Yeltsin circle believed that „sheding off" the internal empire will boost catching up performance of Russia even more. Nationalists in other Soviet republics believed the same about the economic effects of the independence. The paper uses „American standard" (did a fSU republic decrease the GDP per capita gap, separating it from U.S., or failed to do this during recent 25 years?) to measure economic success of the restoration of capitalism and national state independence. After division of the fSU republics into two subsets (the „success" and „failure" cases), qualitative comparative analysis (QCA) is applied to explore the causes of the difference in the catching-up performance. The pride of place is given to the institutionalist explanation: did the differentiation of fSU economies into the liberal market capitalism, state capitalism, political oligarchic capitalism etc. varieties matter? Or was the economic success (defined by „American standard") conditional on other interacting or counteracting causal forces?

NOSKOVA, ANTONINA* (Moscow State Institute of International Relations (MGIMO University), avnoskova@mail.ru)

KUZMINA, ELENA (Moscow State Institute of International Relations (MGIMO University))

Children Play Activity in Russia: Coexistence of the New and Traditional Types of Playing

The paper analyses some issues concerning with the specific of children play activity in modern Russia. The first one is the transformation of the playing behavior under the influence of changing mechanisms of socialization. The second one is the coexistence of new and traditional types of children playing. The theoretical grounds of the research are the classical and the modern social theories concerning with socialization, personality, identity, playing process (G.Mead, M.Mead, E.Ericson, M.Parten, J.Piaget, L.Vygotsky).

The paper deals with the content and structure of contemporary children play activity as a factor of forming and shaping child's social behavior. The authors present the results of two empirical researches. There were conducted 300 formal interviews with children of 10-15 years old and the 15 in-depth interviews with mothers of pre-school children.

The questions of interview were focused on the different dimensions of play activity. Authors distinguish two main dimensions: the play as collective activity when a child plays with others and the play as individual activity, when a child plays alone. The paper emphasizes on the set of the most popular plays and games and the set of rare, not popular plays. The play in the family group is also analyzed. The in-depth interviews with mothers were aimed at the research of family factor, which influences the playing activity of pre-school children. The disappearing and new playing practices were defined.

It is found out that the modern children in Russia play outdoor group games much less in comparison with generation of their parents. The virtual reality becomes more and more important and influential even for pre-school children. However, traditional types of playing remain the most significant factors of socialization. Play activity forms children's reality, helps them to understand the social world and rules, teaches them how to behave in different situations.

NOSSEK, HILLEL* (The Kinneret College on the Sea of Galilee, hnossek@colman.ac.il)

"Anonymous Soldiers": The First Facebook Protest of Israeli Soldiers

David Adamov, a soldier of the Nahal Brigade of the IDF (Israel Defense Forces), was videotaped having an aggressive confrontation with Palestinian teenagers at the occupied city of Hebron, in which there is a constant ongoing tension. The videotape which has a prominent title: "Youth against Settlements", was constructed by this Palestinian activists group, aims to trigger the incident while videotaping the confrontation with Adamov, as part of "Electronic Intifada" (uprising) campaign. After the video was posted by Ma'an News Agency – a Palestinian independent news agency at the occupied territories – it was posted by the independent Israeli right wing online news site 0404 and then broadcasted on Israeli television (29.04.2014), accompanied by a military spokesman declaration that Aamov behaviour was not compatible with the IDF's code of conduct.

The Facebook protest was characterised by anonymous soldiers, also women soldiers, wearing common army uniform, some only pants, some declaring their military units, soldiers photographed from their backs, since no one showed his face on facebook. Photographs were taken by Smartphones, presenting hidden faces of soldiers covered by a hand written paper or a placard: "We are all with David the Nahlawi" (about 3000 photos and 100,000 likes). The main facebook slogans where common right wing demands, opposing the Israeli military legal code of ethics and conduct that reduces and constrains the use of military power by the IDF in relation to Palestinian civilian population of the occupied territories.

The paper analyses the paradoxical outcomes of this protest which was supported by right wing politicians as well as by the left-wingers. In addition, a peculiar question arises about the representation of the protest in Israeli media: why the source of the videotape was rarely discussed in Israeli mainstream media.

Anti-Muslim Racism and the Feminization of the Extreme Right. Examples from France and Germany

Some scholars estimate that the female vote will be decisive for the future success of extreme right parties in Europe. Only until recently most of the extreme right movements and parties were facing a gender gap. According to opinion polls, women seemed to be less attracted by the extreme rights' anti-Semitic and often misogynist ideology and more reluctant to vote for the extreme right than men. However, latest electoral trends show that some extreme right parties like the Front National are becoming increasingly accepted by women. Similarly, more women are holding political leadership position like Marine Le Pen in France, Pia Kjaersgard in Denmark and Frauke Petry in Germany. While anti-Semitism represents an important feature of the traditional extreme right's identity, new right wing populist parties which did not directly emanate from the traditional extreme right often distance themselves from these positions. As part of her "de-demonization" and "normalization" strategy of the Front National, Marine Le Pen refrains from any public and explicit anti-Semitic articulations. This ideological make-over also includes a shift towards anti-Muslim racism, which seems to echo with a much broader societal acceptance. Moreover, through the juxtaposition of women's and gay rights with Islam and Muslim communities, anti-Muslim racism got justified and normalized. By drawing on examples from the Alternative for Germany (AfD) in Germany and the Front National in France we will discuss to which degree the apparent ideological shift from anti-Semitism towards anti-Muslim racism in the contemporary extreme right is facilitating women's support of and identification with these parties. We will argue that an analysis of old and new entanglements between gender, sexuality, racism and nationalism are central to the understanding of these recent developments.

HERNÁNDEZ AGUILAR, LUIS* (Independent Researcher, luis.hernaguilar@gmail.com)

The West Vs. the Rest – Locating the "Transnational" in Discourses on Islam

The aftermath of the 9/11 and the ensuing 'War on Terror' have reactivated and provided a new air to racial constructions of Muslims and Islam as the violent enemies of what is deemed the West. The problematization of a Muslim ontology seems to disperse and transpire uniformly trough different national contexts. Notions like "the west", "Muslim countries", "the Muslim", and the "Umma", to name just a few, function as signifiers of the transnational characteristics of the issue. While Orientalism and its contemporary avatar Islamophobia are usually described and conceptualized as genuinely transnational emphasizing the continuity, recoding, and legacy of colonialism and imperialism, empirical studies of these discourses often remain within the national framework.

In this paper, we want to address two interrelated issues: On the one hand we will examine how in public media debates in France and in Germany "Islam" and "Muslim communities" are discursively constructed as transnational phenomenon. In particular, we will focus on the discursive positioning of self-labeled secular Muslim intellectuals who have appeared as the most credible critics of Islam and Muslims, since they are deemed as "authentic voices" and representatives of an alleged transnational Muslim community. On the other hand, we want to address the above mentioned gap between the transnational in theory and the national in discourse analysis concerning the study of islamophobia.

We argue that contemporary Islamophobia poses a challenge to its academic inquiry since the entanglement of this discourse articulates beyond the borders of particular nation-states. We seek to contribute to the critique of methodological nationalism through showing how statements of native informants circulate both at the national and transnational level. Finally, the analysis requires taking into account the transnational scope on methodological level but also the specific embeddedness according to its local and national contexts.

Extremism, Its Different Types and Influential Factors That Help Shape It

Extremism is a notion which becomes meaningful in democratic and lawful societies. This is sometimes interchangeable with the terms, Fundamentalism and terrorism. It is often said that one who aims to fight against terrorism, must first challenge and overcome extremism. Thus, Analysis of the potentials of extremism in a society is highly articulated. Whereas Fundamentalism intend to bring about changes in sociopolitical system and always work within the regulations of the system, extremist pursue domination over the whole system and consider violence justifiable. At the end of this continuum is terrorism which aims to sabotage the system through military and terroristic deeds.

Extremism is mostly a political rather than sociological notion and refers to individuals who exploit equipment and strategies beyond the laws and regulations of system to protest sociopolitical system. They are the minorities of the society who intend to introduce changes within the accepted principles of the majority of the society. This can be stated through different means namely: a plan, a Discourse and or an ideology. In fact, they diverge from the norms of the society. Nowadays, there are different types of religious extremism which have their roots in social, political and psychological factors. Analyzing extremism can be categorized in 3 ways: doctrine, organization, and action. The following paper intends to analyze extremism in its ideological walks. Furthermore, it will expand upon social factors that highly impact on forming this in the Middle East in particular.

Social State and Gender Equality in Modern Russia

In recent years scientific disputes on prospects of the social state and its possible alternatives became more actual. There are objective and subjective explanations of these premature conclusions about a decline of the social state. Reproduction and development of gender equality can serve one of factors of neutralization tendencies about a decline of the social state. Social position and features of female mentality in a bigger measure are aimed at preservation of the basic principles and achievements of the social state.

Among heads of the companies in Russia women make 43% - it is one of the highest rates in the world, is almost twice higher than an average for the European countries. But in power structures this indicator in Russia isn't enough. Low representation of women in power structures isn't connected with our historical roots. Russia was the seventh country in the world, which affirmed a vote for women in article 1 of Provision on elections to the Constitution assembly of Provisional Government of September 11, 1917. In such countries as the USA, France, Great Britain, women acquired a vote at general parliamentary elections for 60 and more years later, than men. In the USSR general literacy of women, as well as men, was reached in the middle of last century. The Russian women – the most educated women of the world: among them the higher education have 61%.

Modern Russian business learned to convert successfully knowledge, education and talent of Russians women in effective work, but increase in number and a share of women in the sphere political power structures deserves the special studying, aimed at a sustainable development of civil society and social state.

NOWICKA, MAGDALENA A.* (University of Lodz, m.a.nowicka@tlen.pl)

Transnational Dispositive Analysis? Cross-Cultural Limitations of Post-Foucauldian Methodology

The aim of this paper is critical reflection on how Michel Foucault's concepts of discourse and dispositive work in different political and cultural settings. For Foucault (1981: 52) order of discourse means "that in every society the production of discourse is at once controlled, selected, organised and redistributed by a certain number of procedures." The application of Foucauldian perspective in discourse research carried out in the context of global diversity challenges, however, the assumption that the procedures of rarefaction of discourse are universal and transnational on the meta-level of scientific communication. We tend to forget that Foucauldian model of knowledge production and his method of an analysis of power derive from Western European lines of thinking and are deeply embedded in particular tradition of critical reasoning. Incorporation of Foucault's concepts to analyzing discourse within e.g. post-communist democracies in Eastern Europe, post-colonial societies all over the world or emancipatory movements emerging in non-Western dictatorships, entails cultural and geopolitical translation of this methodology.

The question of the cultural specificity of Foucault's concepts particularly concerns today an approach of post-Foucauldian dispositive analysis. As an analytical category dispositive refers to a heterogenic composition of discursive and non-discursive elements of social reality, producing knowledge and linked together with dynamic relations of power which can be studied empirically on the basis of discursive and non-discursive data. In the historical perspective, dispositive always responds to a certain form of power/knowledge emerging within the Western heuristic models of government. Consequently, globalizing of the concept of dispositive can be discussed as *traveling theory* (in Edward W. Said's terms) entangled in the process of translation and hybridization of its meaning. This consideration of cross-cultural and transnational inconsistencies and deficiencies of this methodological approach is illustrated with chosen examples of empirical research done in various political and epistemic arenas.

NOZAWA, ATSUSHI* (Japan Society for the Promotion of Science, ats.nozawa@gmail.com)

Negative Aspects of Noneconomic Compensation for Technological Disaster Victims-Contemporary Issues of Minamata Disease-

In the context of technological disaster issues, it is often claimed that financial compensations for victims is not enough to solve a problem: noneconomic measures such as security of medical treatment, education, job training and residential care services need to be developed. Implementing both will be positive for the comprehensive solution. Through analyzing Minamata Disease problem, this presentation will also point out negative aspects of noneconomic measures and discuss its meaning for the framework of environmental sociology.

Minamata Disease was caused by quicksilver pollution of Shiranui sea, south Japan, by wastewater from a large chemical factory. 60 years have been passed since the occurrence of the disease. In recent years victim's symptoms and disabilities have become more severe as they grow older. Residential care services for the aged victims have been percepted as an urgent issue by authorities and have implemented some measures in practice. Especially congenital victims have confronted with severe situation because of deterioration in disabilities. This presentation will focus on them.

The interview surveys with the victims and their caretakers will show that the necessity of further residential care services. Careful supports need to be implemented by the authorities. However this result has or will lead two problems. One is that behind implementing noneconomic measures existing financial compensations and certification process has been stagnant. Second is that the more careful care services the authorities offer the victims, the less services people with disabilities in the damaged area get relatively. It will lead to relative deprivation. Especially from second issue, as a conclusion, this presentation will suggest that to understand and solve environmental disaster problem, Environmental sociology needs to be developed not only by connecting with similar discipline like environmental law, economics, politics, but also by disciplines related to social problem like social welfare, disability studies.

RC41-482.2

NTOIMO, FAVOUR* (Federal University Oye-Ekiti, Nigeria, ntoimof@yahoo.com)

Family Structure and Men's Health Behaviour in Nigeria

Life expectancy at birth, health-adjusted life expectancy and adult mortality in Nigeria are lower for men than women. For instance, the probability that a fifteen-year old will die before age 60 (adult mortality rate) in 2011 for men was 393 per 1,000 people and 360 for women. Even though the economic well-being of most households in Nigeria depends largely on men little research attention has been paid to men's health in relation to their demographic and socioeconomic characteristics. The current study examined the association between family structure and men's health behaviour, and the mediating effect of their socioeconomic characteristics. Although health behaviours are not direct measures of health, they are among the very important factors that influence health. Data were obtained from 2013 Nigeria Demographic and Health Survey, and the study population consisted of 8980 ever married men. Health behaviour was indicated by tobacco smoking (cigarette, pipe, chewing tobacco, using snuff). Family structure was measured by number of wives, number of unions, age at first union duration of union and number of living children. Measures of socioeconomic status were place of residence, highest level of education, household wealth index, and employment status Results of logistic regression models showed that all the family structure indicators except number of living children were significantly associated with tobacco smoking. Adjusting for socioeconomic characteristics slightly attenuated the effect size for most of the significant family structure variables, but did not change the direction of association. Contrary to the perspectives that marital union enhances health-promoting behaviour, marital union does not seem to promote healthy behaviour for men in this study, although longer marital duration increased the likelihood of health-promoting behaviour. This calls for more research on the association between intra-family relationships and men's health behaviour in Nigeria.

The Extent of Competency in Socio Cultural Adaptation in Maintaining Psychological Well-Being of Indonesian Migrant Nurses in Japan

International mobility of the "Knowledge worker" such as health care worker, being noticed as a trend in the current globalized world. The increasing number of health care worker migration such as nurses is partly a result of industrialized countries attempting to solve their skill shortage (WHO, 2012) in the caring field. Since 2008, there are approximately 1000 of Indonesian nurses migrated to Japan under bilateral agreement namely Japan-Indonesia Economic Partnership agreement (JI-EPA). Migration is the process of social change whereby an individual moves from one cultural setting to another for the purpose of settling down. Successful adaptation in the new culture may lesser their cultural stress and improve their psychological wellbeing. This study aimed to figure out the relationship between the competency in socio-cultural adaptation and mental health. This study conducted one year after migration, a total of 166 Indonesian nurses who migrated to Japan participate this study. This study utilized the SCAS-R to measure the socio cultural adaptation, whereas the psychological wellbeing measured by General Health Questionnaire (GHQ-12). The result showed that there were statistically significant correlation between the competency in Socio-cultural adaptation and mental health (r=.359, p<0.001). Furthermore, the sequence of correlation coefficient by the component of sociocultural adaptation were, personal interests & community involvement (r=.402, p<0.001), followed by academic/work performance (r=.358 p<0.001), interpersonal communication (r=.289, p<0.001), language proficiency (r=.189, p<0.001) and ecological adaptation (r=.176, p<0.005). This finding can be assumed that the competency in sociocultural adaptation is a critical point in maintaining migrant's mental wellbeing. Divided by the component of socio-cultural adaptation, this finding assumed that those who able to maintain their personal interest and involving with the community's activity tend to have better psychological wellbeing in the first year of migration

Unanticipated Outcomes of Social Movements: The Case of Football Fan Activism

The aim of this paper is to critically explore unanticipated outcomes of social movements on the example of transnational football fan activism. The study is focused on the unintended social dynamics that arise following a critical engagement of football fans with contemporary football culture (e.g. the processes of commodification, securitization of the game or corruption and mismanagement). To analyse different types of unintended social dynamics, this study theoretically extends Simmel's distinction between social form and social content by introducing the notion of meta-form. By assuming that any standpoint of social movements represents a meta-form that is strictly intertwined with existing and contested social forms and contents, I would argue that unanticipated outcomes of social movements are materialized as reconfigurations of the assumed relation between meta-form, social forms and contents. Hence, a critical perspective of fan activists can be understood as a meta-form that is related to social forms and social contents of contested football culture and aims to transform these forms and contents. However, the stated goal of fan activism, to transform social forms and contents of football culture, is frequently undermined due to internal differentiation of football fan activism and due to the dynamics between political and football authorities, and football fans. The research is empirically informed by a transnational qualitative study. The data that underpin the analysis are drawn from a variety of primary and secondary sources available online and offline. Firstly, semi-structured interviews with supporters, football associations' and football clubs' officials, mainly from Italy, the UK and the Czech Republic have been carried out. The research is further informed by a documentary analysis of newspaper articles, e-zines, blogs, internet discussions and websites. The paper is part of the wider FP7 EC project "Football fandom, reflexivity and social change (FANSREF)".

Migration, Insecurity, and the Steaming Body: Healing Rituals in Johannesburg

Hidden away from the public gaze, women and men, migrant and members of different Zionist and Apostolic Churches, gather to participate in healing sessions using the steam bathing structure they have constructed next to a mining dump site located in a southern suburb of Johannesburg. Steaming is a common practice in Southern Africa as well as in various other geographical contexts worldwide. Although participants report to have used steam baths at home before, this practice was less frequent and mostly used individually to treat minor physical ailments. Now it is also to address spiritual problems. With steaming people become shielded and their powers enhanced.

We argue that the body is at the centre of the experience of insecurity, it is the preferred target when harm is intended and also when harm is inflicted through invisible agents. This work conceptualises the religious practices of the body in the practice of steaming as performative acts in search of healing and the state of 'being healed' as an unaccomplished one which requires investments of the body through physical and emotional work. The spiritual work encompasses body techniques (Mauss, 1979) such as observing sexual abstention, fasting, and observing sexual abstention, vomiting, praying, and wrestling against the devil. The work of healing in turn, involves body practices to cleanse, to open and to enhance the body such as the induction of vomits, performing body incisions and steaming. Genealogically these body practices rooted in both Christianity and in African traditions. While this amalgamation of tradition is well documented in the literature and often explained in the syncretised origins of the African Independent Churches, not enough has been said regarding differences and tensions between these traditions.

NUNGESSER, FRITHJOF* (University of Graz, f.nungesser@gmx.net)

The Elephant (Pig, Cow, Chicken, Sheep,...) in the Room. Mass Violence Against Animals As a Non-Topic in the Sociology of Violence

Despite its upsurge in the last decades, the sociology of violence has almost completely ignored one of the largest, most systematic and most long-lasting phenomena of mass violence. According to the Food and Agriculture Organization (FAO), in 2012 around 67 billion land animals were slaughtered worldwide (in Austria 83 million; in Germany 765 million). Hence, every year almost 10 terrestrial animals are killed per head. These numbers only became possible through the modernization of the economic, political, judicial, technical, and medical conditions of animal production – especially since the 1950s and 60s. Therefore, mass violence against animals can be regarded as an essentially modern and rationalized form of violence. This very fact, however, also poses a problem for the self-understanding of modern societies which see themselves as basically peaceful and non-violent. For this reason, violence usually is explained (away) by referring to "pathological" developments within individuals or societies, a "relapse" into premodern times et cetera. Yet, for obvious reasons, these narratives do not really work for violence against non-human animals. As a consequence, the question arises, how we cope with the uneasiness many of us feel with regard to the treatment of our non-human relatives. In this talk, I will analyze some of the narratives and methods through which emotional and cognitive disengagement from mass violence against animals is produced. These help to explain why violence against animals is, in most cases, not conceptualized as violence at all. This also helps explain why it has not been much of a problem for sociology – just as for society at large.

Biographies on-Line: Interaction Between Biographical and Imaginary in Video Essays

Video essays could be described as a "new variety of qualitative methodology" (Shrum, Dugue and Brown 2005), and also as a "documentary turn" of critical art production (Biermann 2008, Charleworth 2009, 2015). My paper addresses on- and off-line biographical material and works of art by a Portuguese transnational artist who practices a genre of video-recorded essay by "video-portraying" individual lives of Portuguese emigrants in search of a new home, created both online and for online audiences. The boundary between media consumption and media production gradually disappears due to constant reflection upon the artist's own biography through her artistic subjects which very often include members of her family or close cultural community. Biographical narratives comprise memories about places she visited, lived, and dreamed about. The artist consistently refers to particular reference objects: photographs, diaries, drawings, and soundtracks in order to recreate (activate) her memory "lanes", her travel diaries, and her drawings as converted to work of art. I argue that when research materials involve auto-biographical video-essays we first engage with the imaginative material in which artist's biography "acts" as means of artistic expression, and then secondly as a "documentary" source. The methodological approach to the analysis of video-recorded essays is developed on basis on T. Scheff's "part/whole morphology"

Jürgen Hartmann on Youth Mobility and Cultural Contacts and Their Relevance to the Youth Research of the 21st Century.

Swedish sociologist and youth researcher Jürgen Hartmann (1944-2015) was ahead of his time on the most significant issues in youth research: the importance of new technologies, youth mobility and travel. My paper addresses just one of Hartmann's legacies-the research concept of "youth mobility" as related to the "emergence of a European consciousness and a fruitful co-operation in economy, politics and culture" (Hartmann, 1995). In the 1990-s he analysed consecutive types of youth mobility in Europe after WWII: initially labour market mobility-particularly of young people to areas with a higher demand for labour, which was regarded as a social-economic tool in fighting regional imbalances between the European north and south as well as between rural and industrialised regions. Then, from the mid 1990-s a changing concept of mobility that included three main aspects which Hartmann related to the rise in youth mobility of a different kind: (1) individual rights of free movement as embodied in the EC Treaty and as developed in the Single Act; (2) sufficient occupational and geographical mobility to maximise the benefits of the development of the Internal market and (3) a need to maintain social cohesion and regional balance across the Union and to avoid some of the negative effects of previous migrations.

Hartmann provided an analysis of Euro barometers on the statistics of young people aged 15-24 who have experience of travelling abroad. In 1991, 50% of that age band had travelled. He also argued that in case of Sweden, for example, the European inter-rail ticket has contributed to young Swedes' experience of being "European" to a much higher degree than any institutionalised exchange programme. With youth migration back at the top of the political agenda Hartmann's methodological and analytical advances on youth mobility could be an invaluable resource to address new challenges.

Restricted Internet Access: Students Perspectives on the Right to Expression and Privacy in a Developed Nation.

The challenges posed by globalization and the knowledge-driven society, has resulted in the development of new policies in education across the world. The internet freedom is one of such policies in the educational setting as it has been identified to provide both academic and social benefits which can be accessed anywhere ranging from home, school, libraries and on the go, with the aim of equipping students to be a well-rounded individuals.

There were cases of government restrictions on access to the internet, including certain web sites, credible Reports, and also a monitoring of e-mail and internet chat rooms by law enforcement agencies, thereby challenging users freedom of expression and privacy. This study investigates the perspectives of students in the Scottish higher education regarding restricted access as a challenge as aspect of their human right and dignity. Data was collected through qualitative enquiry conducted among 30 students using a random sample selection and analysed using Nvivo 10. recomendations were made thereafter.

The Chemistry of Time-Poor Gendered Lives: Institutional Gender Culture, Technology and the Politics of Knowledge Production

The European Union supports the building of a democratic "European Knowledge society," which includes a focus on mutual interconnections between science, technology, society and culture. One of the approaches to tackling these is oriented on the gendered nature of scientific and university institutions, the resulting "waste of talents", the impact this may have on knowledge production, its characteristics as well as the lives of women researchers. The funded projects often take the form of introducing changes to S&T institutions in hopes of improving the conditions for women already working there, and opening them up to women candidates that might be interested in them.

In the past eight months, I have taken part in a feminist research and advisory team that conducted twenty in-depth semi-structured interviews with women researchers of different generations, positions and specialisations at a Czech technical higher education and research institution. While fairly broad, the interviews also focused on the perceived role of women in science, the obstacles they face and ways of overcoming these as well as the very desirability of striving to overcome them. At the same time, the interviews covered individual biographical paths to the research participants' current position and their strategies of combining their time-poor research, teaching and personal lives. In the paper, I specifically focus on how they understand, embody but also challenge highly gendered cultural and institutional practices (such as Czech/institutional values regarding the provision of childcare) in the context of their professional lives. I show that personal stances and strategies are always already contingent on specialized technological equipment and fundamentally time-constrained in a gendered way. This makes me argue that their complex experience cannot be understood or assessed without a direct link to the particular politics and culture of science and knowledge production.

O'BRIEN, JOHN* (Portland State University (ret.), je.obrien@wanadoo.fr)

"India's Overdetermined Précarité: Caste and Class Between Tradition and Modernity"

Indian caste identity, coupled with the emerging neoliberal class logic, is intensifying the précarité for the bottom of the labor and economic ladder; leaving half-billion people in poverty. What's to be done and what might a Public Sociology contribute?

After moving intrepidly from colonial subservience to the world's largest democracy, India is a favored case of modernization. Is the result enlightened opening to the world, or a threat to the symbolic infrastructure that allows governances for this huge, diverse population? Blocked opportunity, prosperity and privilege at the bottom, allows less than one-percent to enjoy life in the comfort zone at the top. This resists modification in a way that eludes the normal language of Western analytics.

India's burden on the bottom is equal to the entire population of European Economic Union. Still, because of the unusual power of the Indian spiritual system, with less concern about material conditions and an identity linked to caste, there is little alienation of the sort experienced in London, Berlin—or New York. These people want food, clothing and shelter, but leave such worry in the hands of the gods; with powerful sub-national social movements none the less showing its explosive nature. The marginally employed, undereducated and poor in India are squeezed twice: once by their caste identity and once by the growing importance of technical economic class processes.

Indian government data will be used to profile the inequality related to labor status and life style. Interview material developed during six field visits over the past three years (government, industry, academic), are used to explore alternative scenarios, from entropic collapse due to précarité and overpopulation, to a second heroic political movement. Theoretical foundation will rest on the work of Marx, Weber, Durkheim and Smelser; with stress on macro-processes of allocation and constraint in dialectic relation.

Older Workers and Caregiving in a Global Context: A Theoretical Analysis of Pressures Towards Convergence and Differentiation

This paper develops a theoretical analysis which seeks to explain the range and variety of policy responses to the issues of work-care reconciliation for older workers. This phenomenon is increasingly studied and has become the central focus for policymakers and campaigners in diverse areas of the world as exemplified in the forthcoming special issue of Journal of Cross Cultural Gerontology. The introduction outlines the background to this development, showing the part played by population ageing, the rising proportion of citizens in advanced old age, increased female labour force participation and longer lives of people with serious illness/disability.

The paper's main focus is on the range of policy responses to this issue, and the social, political, economic and cultural factors behind these. Developed initially by Fast and Yeandle (2014) in a policy publication comparing policy developments in Australia, Canada and the UK, the paper is in two main sections. Part 1 explores the conceptualisation of support for work-care reconciliation, as evidenced in policy and practice around the world. This highlights four types of response: rights and recognition of people providing unpaid care to others; financial support for their foregone earnings; workplace rights/support for working carers; and local provision of care services. A theoretical model is developed which explains how these types of support have emerged and relate to each other. Part 2 considers the extent to which responses in different jurisdictions tend towards convergence or differentiation, seeking to explain these in relation to cultural values regarding care and ageing, policy choices about funding support and political priorities in relation to gender equality.

The paper concludes with an assessment of the direction of change in work-care reconciliation policy and practice regarding older workers, setting out some still unanswered questions and indicating areas for future research and theorisation.

Refugee Education:the State of Nigeria's Preparedness

The spate of insurgencies and conflicts in the country and around the sub-region have led to the increased presence of refugees and Internally Displaced People (IDPs) in Nigeria. This has resultant challenges on the basic needs of refugee and IDPs at different levels. One of the highest priorities of refugees and IDPs communities is education. Nigeria is obviously struggling to provide basic education for her citizens hence the emergence of refugees and IDPs and their need for education put a double burden on the nation's education system. Sections of the 1948 Universal Declaration of Fundamental Human Rights; 1951 Convention on the Status of Refugees, 1989 Convention on the Rights of the Child, and 1990 Declaration of World Conference on Education for All call for no discrimination in the education of men, women and children irrespective of status; compulsory and free education for all and the right to education in emergencies. These are supposed to be policy and implementation guidelines for ratifying countries.

Observations show that in spite of the challenging situation, there is little evidence of commitment by the Nigerian government through the Universal Basic Education Commission (UBEC) to the education of refugees and IDPs. In cases where some levels of provisions are available, one wonders about the quantity and quality of such provisions.

Since there is no guarantee that the situation will change soon, this paper examines available provisions and institutional approaches for the education of refugees and IDPs in Nigeria; establishes the level of Nigeria's preparedness for providing education for refugees and IDPs persons; and makes propositions for meeting this global reality.

An Alternative to Reputation Mechanism in Modern Society: Case Study and Game-Theoretic Analysis on Labor Unions

We present a detailed case study and game-theoretic analysis on labor unions to examine the validity of various theoretical possibilities suggested by the existing literature on the mechanism of human cooperation. The unions we studied are individual-affiliate unions in Japan, so called, community unions. The community unions are loosely knit organizations that have a very high turnover rate of members. They seem to have a small amount of social capital. Previous theoretical studies showed reputation mechanism is crucial for sustaining cooperation (Nowak and Sigmund 1998). Reputation mechanism requires much information about members' past actions. Thus this mechanism cannot function well in loosely knit organizations, where members have very limited information. However we found that members help each other in community unions.

What mechanism functions in the community unions? In order to solve this puzzle, we made an overlapping generation repeated game with imperfect private monitoring. We found an equilibrium to sustain cooperation that can function well in such organizations. The equilibrium strategy based on interviews to union members mainly has the following feature; a player helps the other player who he has met in the previous helping activity. Due to this feature, every player has an incentive to help cooperative players because he can meet other players who will help him in the next period. Thus this strategy can construct belief-free equilibrium in the private monitoring game. Therefore this belief-free mechanism has potentials to sustain human cooperation in loosely knit organizations in modern society.

The Iconoclastic Spirit of Literature and Art: The Case Study of the Street-Propaganda(gaitousenden) Performances in 1920s Japan.

In the 1920s, avant-garde and modernist writers resisted against and reconstructed the centralizing "Literary world" (bundan) through the possibilities of new media, magazines and a printing type（Katsuji）.

The golden age of this movement was the mid-1920s, the time when print media became widespread and a new concept of "the masses" emerged. In this period, the most influential journal in the *bundan* was "*Bungei Shunju,*" founded in 1923 by Bubdan leader, Kikuchi Kan.

In opposition to this, the iconoclastic writers built their own networks and they published and distributed magazines such as Kon Toukou's "*Buntou"* and Umeha-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ra Hokumei's "*Bungei Shijo*" at their own expenses. Their common method was "iconoclasm", the attack and destruction of beliefs, institutions and established values of "literary world".

This presentation examines the iconoclastic spirits of the literary and art world in 1920s Japan through the case study of their Street-Propaganda performances. In particular, I show how the Street Propaganda movements relates to the message of "*to the streets*" and discuss the social background of this message.

Aesthetic Cosmopolitanism: After the Omnivore Thesis, an Entry to the Cosmopolitan Theory. the Case of Young People in France

Aesthetic cosmopolitanism of young people in France: after the omnivore thesis, an entry to the cosmopolitan theory.

The rise of globalized cultural industries and digital media led to a cultural turn, transforming consuming strategies and path, from the snob and elite sole preference for highbrow culture (Bourdieu, 1979) to the ability to mix different products, either lowbrow or highbrow, as a distinction (Peterson, and Kern 1996). This omnivorism is, according to Peterson himself, partly a mechanical effect of the increasing circulation of cultural products. This shift is mainly analyzed in terms of volume and composition (seldom in term of leisure time) of the cultural repertoires (how many different consumption, which tastes, how many time), mostly in the case of music listening : but the effect of this shift on aesthetic repertoires, modes of reception and imaginaries (Appadurai, 1996) are seldom shed light on, especially related to social stratification and mobility. Research either choose to focus on social stratification of cultural repertoires, either to discuss the modification provoked by the circulation of cultural goods (standardization versus indigeneisation or hybridation).

Based on a national enquiry conducted in France among young people aged 18 to 29 (N= 1650), the presentation will discuss different forms of aesthetic cosmopolitanism. We propose to consider aesthetic cosmopolitanism as a combinaison of consumption of foreign products, use of foreign langages, knowledge and taste for foreign cultural repertoires in a wide range of cultural consumption and participation, that both 1°) reshapes the social stratification of cultural participation 2) presents the aesthetization of every day lives as a new point of entry into the cosmopolitan theory. This gives opportunities to consider a new figure in the sociology of culture : the cosmopolitan amateur, that may either be considered an heir of the omnivore or a renewed entry to the cosmopolitan.

Celebration of Holy Ramadan: The Case of Turkey

Ramadan is the holy month for all Muslim world. During this period, Muslim people have to fast all day time. actually the basic purpose of this month is not only fast but also stay away from all forbidden activities which are written in the Kur'an while fasting.

if we examine with functional perspective, leisure is the basic institution in sociology and the main aim of it to let people to be a part of in which he or she lives in. by doing so, the sense of belonging can be created in people. similar to this, ramadan activities can be accepted as leisure time practices. since by taking a place in these practices such as Teravih (a kind of praying activity practiced during only ramadan month), the sense of being Muslim is recreated.

in addition to religious practices of ramadan, in Turkey there are different type of celebration facilities like festival during this month. this is very old custom goes back to the time of Ottomans and afore. since the rising of religious tendencies in Turkey during last decades, these unforgetten activities have been remembered by particularly government and its agencies. this recreated identity is accepted and liked by people. some claim that, by ramadan festival the spirit of "we" is recreated.

ýn this presentation the tools of recreating «we» is examined in terms of Ramadan festivals in Turkey. these tools are investigated by symbolic interactionalist perspective.

Theorizing the History of Youth and Being Young in South Africa

Through much of South Africa's history, youth have played critical, challenging and epoch-defining roles in galvanizing political change and in the social, cultural and economic transformation of the country. Paradoxically, while youth are recognized in formal national and local structures today, many are marginalized, unable to enter the formal economy or the higher education sector, with poor prospects for a bright future.

This paper reviews the predominant theoretical elements of youth culture and politics over three generations: the 1950s, 1970s-80s, and after 2000. In the first era, youth had radical views within the confines of liberal-transformational resistance ideology, whilst simultaneously being creative in challenging both state and authority structures within their own organizations. Importantly, this period produced a proliferation of writers, reporters and journalists: writing emerging as a force of resistance and radical thought. In the seventies (1976 in particular) youth continued with disciplined resistance politics whilst its leadership was in prison, exile or hunted down. Though violence was directed at apartheid structures it spilled over into black townships, universities and into households.

In the new millennium, youth are somewhat ahistorical ('Ipi-machini-wams': 'where is my machine gun') sentimentalizing the 'violence' of their elders, imitating a struggle of the past, yet also seeking new lines of resistance (to decolonize universities for instance). Some move to 'alternative' political parties in search of hope or to resist the ruling party's dominance. Others traverse national or provincial politics, or the corporate world, for access to wealth and better lifestyles. Those caught in the maelstrom of resistance may emerge as another lost generation especially as the African Charter's (UNESCO, 2006) definition of youth stretches up to 35 years.

Defensive Behaviours in Innovation Teams – an Analysis How Teams Discuss It

Project team members and project leaders of innovation projects were interviewed about the possible presence of defensive behaviours within the team. Discussing defensive behavior is not self-evident. While investigating defensive behavior can be done validly by observation techniques, to talk about defensiveness often leads to socially desirable and therefor invalid information. However, applying discourse analysis techniques from the discursive psychology sub discipline reveals how intentions to discuss defensiveness leads itself to defensive behaviour. The study demonstrates that how individuals are using pauses, taking turns, and respond to the questions and to each other, provides a view that even meta-discussing defensiveness is very hard. The relevance of this finding is that defensive behaviours in teams, whose members are working on innovation projects, might be detrimental to the innovation goals, given that defensiveness may lead to risk avoidance. Controlled risk taking is crucial for innovative outcomes of such projects. The implication of these findings is the need to develop socially safe team climates in which team members can regulate feelings and emotions in such a way that defensive behaviours can be avoided or that the causes for defensiveness can be made discussable, in order to reduce the possibilities of innovations to fail. The teams under study are responsible for an innovation or renewal and come from both private and public organisations.

OEIJ, PETER* (TNO, peter.oeij@tno.nl)

Innovation Leadership in Innovation Projects: The Application of the Reflective Practitioner Model

In 1982 Donald Schön wrote the *Reflective Practitioner* which implicitly but never explicitly contains a model of steps what it is to act as a reflective practitioner in real life. In this paper we apply that model and try to make this latent (tacit) model into a manifest (explicit) model. Project leaders of innovation teams were studied via in-depth interviewing to assess how they dealt with critical incidents in their projects. Some of these project leaders were able to set in motion actions of recovery which led the project back to the track into which the chances improved to achieve a desired result. Without being aware of it, they applied the steps of Schön's model. These steps are roughly: recognize a problem, research the problem, develop solutions, test solutions and alternatives on their validity, try and experiment with solutions, select and apply a solution, evaluate the process. The results of the study can help innovation leadership in practice.

OETSCH, SILKE* (Department of Sociology, silke.oetsch@mailbox.org)

Economic Practices and Role Models of the Transition Movement: From Market Societies Towards New Modes of Provisioning?

The contribution discusses Karl Polanyis theories of marketization and alternative modes of provisioning in regard to today's interrelations of markets, man and nature. It focuses on the potential of the Transition Movement. Studies on the state of the environment usually suggest technical solutions or, recently, the need for a social transformation. Despite of criticism regarding the rebound effect, propositions for a transformation of the economic system are largely left aside.

This paper first puts Polanyis analysis in the context of actual discussions on marketization and disembeddedness. It then takes out the Transition Movement to discuss economic practices and ideas that are found within the movement. As data basis I use a) reports on modes of provisioning (*REconomy*) from the networks publications and homepages and b) qualitative interviews I conducted with persons involved in the movement. The interviews deal with conceptions of society and economy and role models. I reconstruct the functioning and logic of the economic models in question. I later compare practices and ideas with those types of provisioning, which Polanyi derived from anthropological studies. I also contrast them with forms and theories of alternative way of economizing from the 60s onwards.

It turns out that concepts of provisioning in the Transition movement are diverse and little theorized. Radical concepts and forms of self sufficient life or collective swarm behavior coincide with neo-liberal ideas of entrepreneurial action, leadership, "alternative" finance and the market power of the consumer. Most of the models had no clear concepts about how to keep achievements of the welfare state (such as retirement provisions or medical devices) and how to manage the transformation from capitalism to a degrowth society. I finally try to identify convincing concepts and indicate crucial problems to be solved by the movement and researchers engaged with transformation.

OETSCH, SILKE* (Department of Sociology, silke.oetsch@mailbox.org)

The Welfare State, Taxation and Tax Privileges

In Sociology, inequality is discussed under categories of labor-capital relations, social closure, types of capital, dominance, capabilities, in a vast number of empirical studies and much more. The role of taxes and public finance is often regarded as subsidiary. As historical studies show, the extension of public finance by the implementation of collective assurance and tax systems paralleled the emergence of modern welfare states.

Using the example of post war Germany, Wolfgang Streeck distinguishes the period of the "tax state", the "debt state" and the "consolidation state". The welfare state coincides with the tax state and is increasingly questioned. Susan Strange emphasizes the role of international capital markets and transnational companies, allowing international actors to misuse the scope of action in overlapping tax systems to avoid taxes (Piciotto 1999). Up to recently developing countries lose high amounts of capital because of tax avoidance and evasion. On average, multinational companies pay increasingly lower taxes than the official rates, even in rich countries. As corporate taxation is related to other forms of taxation, especially of capital, financial structures are expected to change.

Although tax avoidance and evasion are often framed in national categories and jurisdictions, structures of the offshore economy only partly go back to national interests. From the beginning of the extension of tax systems in the 19th century, political authorities designed tax systems containing loopholes for the benefit of elites. Tax systems – either on the regional, national or international level – reflect power relation in the time of their installation, namely power within a society and between states. The paper takes out crucial practices of offshore finance, e.g. Luxembourg's tax rulings, the European banking secrecy, Delawares company taxation, to trace flows of capital, the role of elites and consequences for public finance and the welfare state in typical cases.

Construction of Migrant Care Workers in East Asia: Intersection Between Migration Regimes and Care Regimes

In many developed countries, lack of paid or unpaid care which is referred to as 'crisis of care' has been met by various measures including the introduction of migrant care workers. In East Asia, rapid population aging, decreasing capacity of the families and state's retrenchment from the social security induced the transnational migration of care workers. While increasing number of women in East Asia are mobilized into the labour market to achieve gender equality at the national level, the women in Southeast Asia have to cross borders to undertake care work in richer households and care facilities. However, the meaning of care work differs significantly depending on how care regime and migration regime intersects within different contexts. Migration regime shapes the social status of the migrants in the host society and care regime defines the quality of care work undertaken by migrants.

In Taiwan, migrants from Southeast Asia care for the elderly predominantly in private homes; in Japan, migrants from the same Southeast Asian countries

entered under the bi-lateral free trade agreement and working in care facilities; and in Korea, Chinese Koreans enter the care labor market as co-ethnics. The presentation aims to compare how the different configuration and intersections of migration regimes and care regimes in Japan, Taiwan and Korea have defined the entitlement of the migrants and resulted in different construction of care work. It also aims to unpack the notion of 'migrant care workers' by analyzing the role of institutions such as state, market and family through the perspective of the migrants and discusses the sustainability of globalization of care work that is emerging in East Asia today.

Intergenerational Coresidence Between Adults: A Form of Mutual Support

Intergenerational coresidence can be associated with precarious circumstances, such as an adult child who is supported by an older parent, an older parent living in the household of an adult child, or the two generations living together and supporting each other. The French Family and Housing survey that was linked to the 2011 census is used to explore how multi-generational households are organised. The results confirm that this type of household continues to exist and should be considered other than a form of living arrangement that is destined to disappear. Approximately 8% of individuals aged 30 years and above with a parent alive coreside with a parent, representing 1.8 million individuals. Overall, coresidence is associated more with men, individuals not in a couple, childlessness, unemployment or inactivity, crowded housing with poor amenities, and poor urban areas where the monthly income is below the average. Sharing a household can be considered as a family response to life course hazards. Three types of response can be identified. Adults living with their parents (38%), who are more likely to be men with low resources, whereas women who have comfortable housing conditions are associated with living conditions where a parent is supported by an adult child (32%). In the third group (30%) the two generations are more likely to belong to higher social class sectors, although the available data cannot distinguish whether children accommodate their parents or parent accommodate their children.

Digital Activism and Censorship in the Post-Gezi Era

Gezi Movement, the uprising against the neoliberal politics of the ruling party (AKP), represents a milestone for the emergence of digital activism and citizen journalism in Turkey. Social media and mobile phones, which were mostly used for entertainment became technologies of resistance. Similar to many square protests in various countries, Gezi activists were mobilized around social networks where they communicated, coordinated the movement, especially through Twitter and Facebook. Gezi resistance was intertwined with the interaction of offline and online performances of activists, who created a symbolic resistance space via the internet. They constructed a collective identity, leaded new ways of resistance, especially cultural jamming.

Two years after Gezi protests, activist media still continue to resist despite the state censorship and repression. While the government is attacking alternative voices using brand-new 'state apparatus' (Althusser) such as surveillance technologies, trolls, internet censorship, hate speech and/or legal sanctions, activist media create their own survival tactics. Turkey ranks 149th out of 180 countries in the 2015 World Press Freedom Index. Moreover, in February 2014, the former prime minister increased oppression via telecommunications authority (ICTA) over Turkey's internet users, such as storing user data for up to two years, or blocking URLs without court approval. Also, Erdoğan ordered to ICTA to block Twitter and YouTube in March 2014.

In this presentation, we will focus on the news production practices of Turkish alternative media under the censorship. How can digital activists deal with this censorship? Which survival tactics are used for it? Our methodology consists of in-depth interviews held with the editors of alternative media networks between July 2013-August 2015. Furthermore, we made observations on the working methods of media activists in both online and offline world.

Exploring Youth Religiosity and Multiple-Secularities in Korea: Quests for Happiness in the Immanent Frames

In the post-secular life-world, "religious nones" and secular types of spirituality are becoming more apparent and significant in contrast to religiosity. Scholars have, so far, talked of a variety of thematic categories such as religiosity, spirituality, and secularity in accordance with theism, spiritualism or New Age, atheism, etc. However, from the perspective of the Immanent frame (Charles Taylor, 2007), the quests for happiness, namely, "the fullness of life" need to be empirically and systematically explored in order to better understand a variety of youth religiosity and multiple-secularities.

Our research team utilized both quantitative and qualitative method for the youth religiosity and multiple-secularities in Korea: we surveyed 900 college students and interviewed 40 students in the Western Area of Seoul. In addition, our team performed participatory observations for four atheist associations of college students.

Findings report that the youth generation has greater emphasis on autonomy and seeking spirituality rather than conformity and dwelling religiosity in Korea. The quality of life for the youth generation also differs depending on theistic, spiritual, humanistic or scientific atheism. The quest for happiness should be categorized in accordance with different layers of agents' quests: self-transcendence, spiritual values, and secular goal-attainment. Discourses on autonomy, authenticity, and authority gain different socio-cultural significances depending on emotion, consumption, or reflexivity. Types of atheist movements vary in accordance with its value-orientations: autonomous or interdependent, scientific or humanistic.

This research might open a new horizon for understanding a variety of the immanent frames like happiness beyond dualistic tension between the religious and the secular: it will shed light on a common ground of the quest for the fullness of life for the better world.

The Change of the Habitus of the Japanese Since the End of the Second World War

This presentation aims to analyze how the habitus of the Japanese has changed since the end of the Second World War through the Americanizing, informalizing and globalizing processes. Americanization has changed the political and economic systems of Japan by giving the Japanese the opportunity to understand how democracy brings them peace and prosperity; informlization has replaced the rigid and feudalistic samurai code (the habitus of the warriors) with more realistic, flexible and business-like lifestyles. And globalization has also taught the Japanese how they can gain more profits by transforming an agriculturally oriented society into an industrially based one. This sort of sociogenetic and psychogenetic change has continued to occur in Japan especially from the 1970s to the 80s. Norbert Elias's essay entitled 'Technization and Civilization' is very useful to show that the Japanese case is a suitable example.

On the other hand, many Japanese people have suffered from a tragic memory of war, so-called war trauma. Even 30 years after the war when the Japanese economy was rapidly growing, older generations were not able to leave behind the crime they thought they had committed as supporters of ultra-nationalism caused by their 'collective fantasy' during the war. Meanwhile, younger generations (some were extremely leftist) began to criticize older ones who cooperated with the military government in invading other Asian nations. Thus, younger people wanted to create their own new identity in global society different from the war-time identity of their parents. This historical process of Japan seems somewhat similar to that of Germany. So, Norbert Elias's book *Studies on the Germans* will play an important role in this comparative sociological study.

Nonstandard Work Schedules and the Work-Life Balance of Mothers in Japan

With the prevalence of '24/7 economy,' an increasing number of mothers across the industrialized countries work hours that fall outside of a typical daytime. Japan is no exception. This labor market trend has raised concerns about its potential impact on children's well-being. The issue is more important for single-mother families because single-mothers are more likely to work nonstandard hours and they have fewer time and money to spend on children when compared to their married counterparts. Furthermore, not only in the US but also in Japan, the gap in time spent on children between single-parent families and two-parent families has widened in the past few decades (Fox et al. 2013, Tamiya and Shikata 2007). Despite the growing concern over inequality in children's well-being in Japan, there has been no study that explicitly focuses on mothers' nonstandard work schedules and their possible effect on family resources spent on children. Thus, using a unique survey that comprises of single and married mothers in Japan, this study investigates factors affecting mothers' decision to work nonstandard hours,

and the effect of mothers' nonstandard work schedules on the time and money spent on children. I also use the Statistics Bureau's Japanese Time Use Survey between 1991 to 2006 to examine the trend of mothers' time spent on children.

Workforce Diversity in Higher Education in Australia: The Representation of Scholars with Asian Backgrounds

This paper will examine the workforce diversity in Australian universities by focusing on faculty representation of scholars with Asian backgrounds. In recent years, the Australian government has been actively promoting its economic ties with Asia, and adopting various policy strategies symbolized in the term "Asian Century." This policy orientation is reflected in various education policies as well. While the significance of Asia has been widely acknowledged, however, the roles of Asians and Asian Australians in higher education have received relatively less attention. Existing studies mostly focus on the growing prominence of Asians in the student body in Australian tertiary education. The diversity of teaching professionals in universities, on the other hand, has not been recognized as an issue in research and policies. To what extent has the current government's policy orientation been reflected in the diversity among scholars in teaching and research? Are Asians and Asian Australians well represented in Australian higher education, especially at the managerial level? Based on both quantitative and qualitative data collected from major Australian universities, this paper will analyze the positions of scholars with Asian backgrounds, and address various issues surrounding minority representations in higher education.

Age Management, Anti-Ageing Practices and Working Class Masculinity

The neo-liberal ideologies that point to individual responsibility for risks increasingly influence countries of the global North. The anti-ageing industry reflects this dictate and encourages middle-aged people to use their products and services to manage their ageing. However, given the negative connotations attached to the term 'anti-ageing', which is usually seen to focus on aesthetics and thus be a woman's concern, men may be likely to disavow being involved in such activities. However, men live in the same ageist culture in the global North as women, and thus are not immune to the dictate to fight the visible signs of growing old. The paper uses interview data collected from Finnish working class men aged 50–70 to explore how men adhere to the call to manage their ageing when such anti-ageing activities are seen to be potentially feminising. We find that these men reflected neo-liberalism in the sense that they felt that, although ageing cannot be prevented, it can be controlled. Also while they generally rejected anti-ageing products and services that they judged to affect aesthetics, they reported using those that they define as promoting health and masculine performance instead. In talk of their age management, working class men distanced themselves from women and especially from other men: Americans, Swedish, homosexuals, white collars, and celebrities. These differentiations show that in distancing themselves from anti-ageing products and services men do not only emphasise their masculinity in contrast to women. Simultaneously they also (re) produce a normative version of a working class masculinity. Groups to which men attach the consumption of anti-ageing products represent an antithesis of the working class masculinity. This illustrates that there is not only a gender divide in the use of anti-ageing products; this consumption is also largely a matter of class-based values, identities and distinctions.

Online Religious Communities: Spirituality and Faith through E-Leisure

Throughout the Cyberspace, there are many active "Online Religious Communities", from which we can learn about the offline and online leisure of different religious audiences. Applying a netnographic approach, this case-study research aimed to explore the leisure culture of such online community, the *Bechadrei Charedim* forum, that target orthodox Jewish Internet users. Five months of ob-

***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

servations and analysis of 3000 online discussions led to identifying four main characteristics of that community:

1. Personal and group identity games, which indicated that this religious community maintained a 'relative anonymity' regarding its members along with exchanging distinct messages as for their personality, beliefs and life styles.

2. 'Religious-secular discussion', that included nine major topics: current affairs, leisure, "Halacha" (religion and its statutes), politics, courts struggles, life cycle events, orthodox identity, health, and technical-technological.

3. Teeming online leisure activity, in which participants were engaged in writing, responding, expressing thoughts and witnessing events. Prolonged asynchronous interaction as well as almost synchronic interaction amongst members were observed, taking place in unusual times such as after midnight and around holy days sundown.

4. Unique religious expressiveness manifested in the emotional and style aspects as one. While we observed mutual criticism, which sometimes resulted in insulting exchanges, it was clear that the orthodox community asked to lead its members for solidarity and care, as expressed by the biblical commandments on behaviors between humankind.

The novelty of this research is evident in two aspects. On the empiric aspect, this research made use of a fascinating qualitative and interpretive methodology, which enables a deep observation of the many faces of a society, especially one that is considered "enclave culture". On the theoretical aspect, this case study contributed to increase our knowledge in the study of E-leisure of different segments of the society in the digital era.

"I Am Austro-Ghanaian" - Citizenship and Belonging of Ghanaians in Austria

To what extent do Ghanaian migrants who have become Austrian citizens really belong to their new home? By means of analyzing life histories of nine individuals, the paper interrogates current narratives on migration, citizenship and belonging. The work emanates from ongoing fieldwork among Ghanaian residents in Austria. Using a qualitative method, the paper draws on interviews with eight Ghanaians and an Austrian wife of one of them in order to tease out these Ghanaians' understanding of their citizenship and belonging in Austrian. Some respondents described themselves variously as "Austro-Ghanaian", "Ghanaian-Austrian", "Ghanaian" or "Austrian". The common denominator of these individuals is that all of them have obtained Austrian citizenship, which raises the question of what it means for Ghanaians to be Austrian within the crucible of stringent European immigration laws.

Do Societal Ties Matter? the Role of Associational Participation in Shaping Health and Health Inequalities in Advanced Welfare States

Health inequalities are shaped by various individual and societal level factors. Researchers have long recognized the importance of individual social position in shaping health outcomes and increasingly look to macro-level factors, including social policies, to explain health outcomes and inequalities. At the micro-level, the focus has been on various factors, including social location, social capital, and lifestyle choices. At the macro-level, we have often looked at the welfare state as a key institution in shaping inequalities. While both streams of research are important, they do not capture the interaction between individuals and society in determining health and health inequalities. In this paper, our main interest is on whether and how individuals are tied to society through their participation in various voluntary associations (e.g. religious, civil, or political) and whether the impact of such social capital varies by the type of welfare state. Using data from the World Values Surveys and the European Values Study, combined with national-level indicators for the welfare state, we test the impact of organizational OR associational participation on health and health inequalities in advanced, industrialized nations. We use Hierarchical Linear Modeling to evaluate how the welfare state and organizational OR associational participation impact health and health inequalities, with a focus on whether participation matters more in certain kind of welfare states. Our preliminary results indicate that participation in voluntary associations may matter more for health in weaker welfare states, possibly compensating for the positive health effects that a more encompassing welfare state may provide. This line of research highlights the importance of moving beyond an understanding of macro-level indicators of health toward an approach that evaluates how individuals are embedded in a specific welfare context and how this interaction impacts health and health inequalities.

The Freedom of Making a Choice: How Social Policies Shape the Possibilities for Healthy Lives and Positive Health Outcomes Across 32 Nations

The interplay between society and individual status in shaping health outcomes is a key sociological concern. Comparative health researchers have found mixed evidence for the health effects of the welfare state in general, with some findings supporting the notion that the population is healthier in more encompassing welfare state, but other findings contradicting that pattern. However, much of this research simply focuses on policies at the macro-level and does not take into account how individual actions are shaped by the broader context. The theory of constrained choice allows us to link together the macro-level of social policy and the micro-level of individual choices. Using data from the 2011 Health Module from the International Social Survey Programme (ISSP), I evaluate how the choices people make across 32 nations translate into physical and mental health outcomes. Importantly, the ISSP includes variables that have been shown to impact health, including use of health services and lifestyle factors. One of the key elements of the constrained choice approach is a consideration of whether certain choices are more or less difficult within certain social policy contexts. Therefore, I use analytical strategy that evaluates whether healthier choices are more likely to take place in contexts with social policies that facilitates such choices. From there, I evaluate how factors at the national and individual level impact health and health inequalities and more importantly whether there are interaction effects between the two levels. The findings indicate that individuals that live in a social policy environment that is more pro-active in promoting health and health behavior are more likely to engage in such behavior, and that individuals who reside in countries with such policies experience better health outcomes. They also indicate that groups that are vulnerable in society may benefit especially from such policies.

OLEKSIYENKO, OLENA* (Institute of Philosophy and Sociology, Polish Academy of Sciences, olena.oleksiyenko@gmail.com)

Political Inequalities and the Formation of Russian Ethnic Minorities in Post-Soviet States (1993 – 2014). Comparative Study.

The main aim of this paper is to compare the patterns of non-electoral political participation in the former soviet states namely, Latvia, Lithuania, Estonia, Kazakhstan, Kyrgyzstan, Belarus, Ukraine and Moldova, Georgia, Armenia and Azerbaijan during the process of transformation with a special focus on differences between majority and the Russian-speaking minority populations of these countries.

All post-soviet countries share the "legacy" of the common Soviet past, i.e., Russian-speaking minority, which consists of not necessarily ethnic Russians, but people using common language and characterized by certain social identity opposed to the full integration (Hagendoorn et al.2001). During the Soviet Period ethnic Russians were the most mobile group among all nationalities. Some experts perceived this mobility as an "empire expansion to the peripheries" (Tishkov et al. 2005). Ethnic Russians in republics were settling mostly in urban and capital areas and belonged to privileged social classes (Kolstø 2011). After the USSR dissolution, they status changed to minority group.

Currently post-soviet scenery presents a great variety of the scope conditions for the political participation. There are differences in regime types- from democratic to authoritarian, different attitudes toward Russian minority-from exclusion to favoring, as well as different levels of the economic development. All these factors, along with social policies toward ethnic minorities in countries of settlement, shape different pattern of participation typical for minority and majority groups. Minority status influences the political participation, but the nature of this influence is to the great extent context-specific and associated with the state characteristics.

In this paper processes of ethnically and linguistically based political inequality formation will be put into historical context and examined using statistical analysis of the available secondary data from the international survey projects (e.g. *World Values Survey* and *Life in Transition*) conducted in former soviet republics from 1993 to 2014.

Race and the Brazilian Sociology of Education Renewal from South Theories

The sociology of education has expanded significantly in recent years, following the expansion of access to formal education in various parts of the world, in Brazil the theoretical discussion in this field is still largely seated on theories

produced in American and European context. However, the changes that have occurred in Brazilian education, with affirmative action for the black population in higher education, the introduction of african-Brazilian history and culture in the curriculum of schools, has sued the search for new theoretical frameworks to understand the reality produced in schools and universities. In this article I seek to discuss how the southern theories can collaborate to understand the changes taking place in the educational reality in Brazil, especially with regard to transformations in higher education. I will do this discussion articulating with empirical data on the presence of black population in public universities in Brazil in recent years through affirmative action, realizing that the race issue brought the demand for new theoretical approaches, renewing the brazilian sociology of education.

Making Visible (re)Presentations: A Paper That Explores the Use of Participatory Arts-Based Methods (visual and narrative) with Lgbtiq Migrants and Refugees.

Can participatory arts based research contribute to social justice movements? Do these methods reveal increased insights into 'hard to reach' groups of people? How are issues of power addressed between research participants and the researcher/research team? This paper will discuss the use of arts-based methods, with special attention paid to two participatory visual and narrative projects that were conducted with LGBTIQ refugees living in South Africa. Using these two projects as case studies, this paper will critically examine the role of community-based participatory projects that seek to engage research and research participants with social justice action. The paper will attempt to address issues and concerns of representation, ethical considerations and epistemological quandries of visual and narrative research with populations that are considred 'vulnerable' and under-represented. Furthermore, the paper will examine tensions, links and strategies when seeking to share bodies of visual works in public spaces.

Aesthetic Experiences in Movement: Literary Production in the Periphery of São Paulo

The more central the disputes over urban spaces and their meaning become, the more the problems and the cultural landscape of cities become both the object of and stage for diverse interests. As a result, the margins occupy a prominent position in social science, because they redefine the points where art and urban life, inclusion and exclusion, culture and violence intersect. In this context, a cultural phenomenon emerging in the outlying areas of São Paulo has been observed for over a decade now: the rise of literary writers from poor neighborhoods, who use the adjectives "marginal" and/or "peripheral" to refer to themselves and their products. The phenomenon has evolved to the point where one can speak of the consolidation of a new marginal literature. This robust literary production is written by authors who do not "fit" in the symbolic hierarchies' canon and do not utilize the more traditional spaces of consecration. Between the late 1990s and early 2000s, these writers began to lead an important artistic transformation of their respective territories by organizing massive events popularly known as *saraus*. Even today, the *saraus* gather hundreds of people from across the city on a regular basis, which has been altering the cultural dynamics of these urban spaces, as well as the representations of the outskirts of São Paulo. The goal of this work is to analyse such a specific literature – namely works that are centred on experiences of violence, exclusion, and racism – and to map out the process of forming of new writers and the community of interpersonal and translocal networks that these actors have been developing since the late 1990s. Thus I would like to verify to what extent it is possible to link literary creation to community participation in that phenomena in evolution.

Repertoires of Diversity: Ethnic Boundary Construction in Contemporary Brazil

The stir on the quotas for blacks in public universities placed, once more, the issue of race in the Brazilian public sphere. This is however only part of the implementation process of affirmative action that has been consolidated in the last decade. This article examines how racial categorizations are appropriated by different cognitive frameworks that provide a reading of collective identities and how their borders are perceived. In such repertoires, national, group and individual identities intersect allowing to organize the perception of ethnic and racial diversity as well as its public expression according to different frames. We distinguish three main repertoires of ethnic and racial categorization, namely social-fusionist, structural-categorical, dialogical categorical, that have implications for the ways how modalities of governance of diversity are conceived, the social force of collective identities and the perceived role of the State in distribution and recognition practices.

RC04-51.2

OLIVIER, ALICE* (Sciences Po/INED, Paris, alice.olivier@sciencespo.fr)

Shaping Professional Bodies and Emotions: Male and Female Students in Midwifery and Social Work Schools in France

Because they imply quasi-permanent physical interactions with users, midwifery and social work are two occupations in which professionals' bodies play a key role (Dubois, 2010) and which call for a significant emotional labor (Hochschild, 1983). In this paper, I focus on the consequences this has on students in midwifery and social work study tracks: how do the institutional discourses and practices shape their bodies and emotions as a central element of their education (Becker et al., 2003)? How does this contribute to (re)producing inequalities between male and female students (Boni, 2013)?

Drawing on 120 interviews (students, teachers, internship supervisors) and 400 hours of observations (classes, internships, student sociability…) conducted in two midwifery and two social work schools in France, I develop my analysis in three points:

- I compare the ways in which students' bodies and emotions are educated in these two tracks. Because they are both highly feminized and require competences seen as "natural" to women, students are encouraged to express "feminine" emotions such as empathy and tenderness. They are however discouraged to develop "too feminine" body characteristics such as wearing strong make-up or figure-accentuating clothes. There is nonetheless an important difference in the ways they are asked to present themselves to users: midwifery students are educated to become exchangeable health professionals while social work students are pushed to become personalized interlocutors.
- I show next how the few male students are considered in this process: being encouraged to develop their "manly" physical and moral assets, they are given better learning opportunities than their female counterparts, which contributes to a "glass escalator" process (Williams, 1992).
- Finally, I present the resistances developed by a few male and female students against this shaping of their bodies and emotions. I analyze how these can contribute to redefining the study tracks and, therefore, the professions.

Citizenship Projects for a Better Future: The Struggle for Education in Mexico

Citizenship projects for a better future: the struggle for education in Mexico
Key Words: alternative futures, utopia, citizenship projects, social movements, educational structural reforms

One approach to analyze possible futures from social movement perspectives is organized through the critical theory of citizenship. Social movements seek to build utopias, as alternative futures through spaces of experience, memory production and a future vision (Pleyers, Habermas, Heller, Lefebvre, Tamayo). Utopias are dialectical processes of social construction, expressed in alternative projects of citizenship, being movements seeking to establish themselves as a universal alternative for social change (Dagnino, Olvera, Panfichi, Tamayo).

Mexico is an example of an uneven and combined impact of globalization, expressed in the categorical imposition of structural reforms towards privatization, such as education, and the dismantling of workers' rights at the turn of twenty-first century (Olivier).

Teachers, Zapatista indigenous communities and Ayotzinapa young people normalistas have raised, not without difficulty, distinctive citizenship projects, which place the aspect of education as a solid foundation of social and pedagogical construction of alternative futures.

The emphasis of this paper is to reconstruct and compare these distinctive projects of citizenship. It will outline the dense and paradoxical path of citizenship building, facing the challenges of the global era. At the same time, it will show limits and opportunities to align contention discourses in the definition of viable utopias (Laclau), in the face of globalization.

Exploring the Foundations of Human Environmental Behavior: A Deep Dive into Relevance Systems and Practical Intelligibility

This paper argues that answering late Ulrich Beck's question: "Why is there no storming of the Bastille because of the environmental destruction threatening mankind" we have to understand the non-epistemic dimension of human behavior. I claim, building on Alfred Schütz's, Theodore Schatzki's and others' thoughts, that the intellectual nature of environmental predicament for the bulk of urban citizens is incommensurate with the pragmatic dimension of their everyday activities. The relating between the pragmatic necessities borne upon the lifeworlds and the cognitive dimension – knowledge, morality, ethics and values in terms of the natural environment formed through experiences, education, mass medias and so forth – of human activity has to be better understood if environmental sociologists want to provide better founded guiding for public policies. It is obvious that this relating is partly cultural, but to what extent it is and can be so?

The exacerbation of global environmental predicament requires that we social scientific scholars take a close look at our assumptions of the nature of human behavior. Instead of assuming that behavior is either epistemically or pragmatically motivated, Schütz argues that people do according to what appears relevant for them in daily situations with their actual biographical state. For Theodore Schatzki it is the practical intelligibility that governs action by specifying what makes sense to do and causes what an actor does next in the continuous flow of activity. The key to understand Beck's dilemma is that environmental experts' system of relevances differs from that of all the other people in terms of the environmental predicament – what seems to be relevant on one level may become entirely irrelevant on the other. This paper contributes to and recapitulates the recent critique against cognitivism in environmental social sciences.

The Global South Powered By the Sun

Solar resource is the largest energy source in the planet, larger than all the other combined. This is rarely understood and even less, it seems, is this abundant form of energy considered as a principal energy source for nations. There seems to be a northern as well as an establishment bias in the research; sunlight is a much more evident solution for the southern countries. Countries of the Global North are typically situated in higher latitudes with less sunlight and much more seasonal variance in sun's radiation. Fossil fuel sector is one of the largest and most established in the current era and they have much power in setting the agenda for energy research in addition to directing government subsidies. The answer for solar future is to be found in the realm of politics rather than economics and technology, even though the latter have to be analyzed and got right as well.

Regardless of the manifold reasons why the Global South has not embraced solar energy as a major form of energy, sunlight offers unique possibilities for alternative political economy of energy. The ubiquitousness of sunlight allows for a genuinely decentralized energy production in technical terms. Harnessing the solar resource through millions of households would radically increase the economic autonomy and hence political power of these masses. This promise of democratization is desperately needed in various southern countries. Yet, an alternative political economy of energy is not an easy feat in technological or organizational terms and is likely to face resistance by the hegemony of the Global North and the dominant energy forms through collusive governments. Therefore the emergence of a solar energy in the Global South is likely to require massive mobilizations and social struggles. This paper studies possible sociopolitical pathways for solar futures in the Global South.

Organizing Workers in a Changing Labour Market: The Norwegian Experience

Compared to most other advanced capitalist countries in the global North, the Scandinavian labor movements – and not the least the Norwegian trade unions – have been spared the most severe consequences of neoliberal globalization. Union density has remained relative stable and labor market regulations have been defended. Indeed, it is mostly in connection with intensified labour migration that Norwegian unions have experienced the most direct impacts, as the use of labor migrants particularly in the Norwegian construction industry and oil-related manufacturing exploded after the inclusion of Eastern European countries

in the EU from 2004. A special challenge for the unions in this situation was the growing tendency to employ workers through temporary staff agencies and subcontracting. In meeting this situation, the union that organizes workers in these branches of the economy was, after initial resistance from employers and several years of political and ideological preparation, succeeded in establishing an institutional framework for securing equal pay for equal work, based on their slogan of "we are the union of all construction workers in Norway, not only the Norwegian workers". A central element was the use of a general application of the collective agreements, which prescribes the right of access of the local unions to tenders from subcontractors and temporary staff agencies, which gives them the opportunity to control the use of subcontractors with regular agreements. In this paper we will discuss the role of local union leaders in their observations of the general agreement, their attempts of organizing the foreign workers and urging them to make demands for collective agreements, under conditions of radical transformations of manning and work organisations through extended use of subcontracting and temporary work agencies. The paper builds on ongoing research and its empirical basis is mainly interviews with local and regional union leaders.

Social Exclusion: Pathology or Misdevelopment?

If critical theory seeks to distance itself from traditional theory by means of its orientation towards emancipation, a decisive part o f the work of the critical theorist lies in formulating an interpretation of the present time based on an analysis of the emancipatory potentials embedded in social reality and the obstacles thereto. Each critical model features, therefore a (specific) notion and a (radical) condemnation of what it considers to be the obstacles or hindrances on the path to an emancipated society. The orientation towards emancipation that is distinctive of critical theory is expressed, therefore, only in this eminently negative way.

Hindrances to emancipation were denounced throughout the history of critical theory with the aid of a number of concepts, such as "exploitation" and "alienation" (Marx), "reification" (Lukács), "domination" (Adorno and Horkheimer), "oppression" (Iris Young), and metaphors such as "colonization" of the lifeworld by the system (Habermas). Recently, the analogy to medical language has gained importance, according to which it is necessary to identify (via precisely a "diagnosis" of the present time) the "social pathologies" that affect contemporary societies (especially after Axel Honneth). In this paper we intend to examine the different meanings tha idea of "social exclusion" throughout different moments of Honneth`s model of critical theory and its relation to the diagnosis of social pathologies.

The hypothesis of interpretation we try to demonstrate following the path of theconcept of "social exclusion" in Honneth's œuvre is that the shift from misrecognition to the suffering from indeterminacy and, then, to the social misdevelopments of the spheres of ethical life is intimately connected to a theoretical turn in which the paradigm of the struggle for social recognition is gradually replaced by the institutionalization of social freedom – and this results, we argue, in a decrease in the critical nature of Honneth's theoretical model.

The Pono' (Pondok) Examinations in the Context of International Relations in the Southern Border Provinces of Thailand

This paper discusses examinations in traditional Islamic boarding schools (*Pono'* in Patani Malay and Thai, *Pondok* in Standard Malay) in the southern border provinces (or the deep south) of Thailand based on participatory observation in *Pattani* province for six months in the 1990s. In this type of education organization, neither paper tests nor interviews for evaluations are conducted, except for elementary Jawi and Arabic; this is entirely different from Western-style schools and universities in Thailand and modern Islamic schools in Malaysia or Indonesia. For this purpose, they dwell in small cottages (They are also called *Pono'*) built around the house of the *Babo* (the most important leader of the *Pono'*). They study these books repeatedly for prolonged periods, and gradually begin to teach at their own dwellings according to the extent of intelligence recognized by younger students. Students who attained fame as good teachers increased their chance of being invited to dinner or to special ceremonies with the leaders. This is a long process of examination culminating in the students becoming to *Ustadhs* (Islamic teachers), and finally, becoming the *Babo*. This examination procedure is a tradition among the *Pono'*. However, it also results from the present international relationships between Thailand, Malaysia, Islamic powers such as Saudi Arabia, and Western powers such as the United States. This is because it is considered as being too dangerous to use any textbooks or testing papers sourced from these global or local powers for evaluating students in the midst of severest tension between them since the end of WWII. It is inevitable that these traditional styles of

Rebuilding Communities Following the Great East Japan Disaster: Restoration of Ties Among the Victims

The earthquake and tsunami that struck northeastern Japan on March 11, 2011 not only caused extensive direct damage to local residents and their property, but triggered a nuclear power plant accident bringing the terror and reality of radiation.to the surrounding populace and beyond. The reconstruction of communities in Iwate, Miyagi and Fukushima Prefectures has posed enormous problems. While communities affected only by the earthquake and tsunami can possibly be rebuilt physically and socially, it will be very difficult for people in the radiation-contaminated areas in Fukushima to restore.

The social bonds among both groups of sufferers have changed. Though some people have already redeveloped ties in the quake-tsunami disaster areas, others, especially those whose houses were not destroyed by the tsunami, have hesitated to communicate with less fortunate neighbors because of "survivors guilt." In Fukushima, the additional nuclear disaster inflicted quite another kind of damage on people. It was not only physical, but mental. Many people who fled the radioactivity to evacuate to areas dispersed far and wide throughout Japan, weakening or even eliminating ties from their original communities. Further, in spite of having directly heard the concerns of the displaced, through both public meetings and surveys, central and local governments have done little or nothing to alleviate their social problems to date and the refugees are losing hope and confidence in their governments.

This paper summarizes the ongoing community consciousness of refugees based on the results of a questionnaire and interview survey of those who have been living in temporary housing both near and far from the areas. In addition to discussing these conflicts in communities arising from the disaster, the paper also explores the possibilities of rebuilding, focusing on how to cope with "social demise of communities" that local people had formed and occupied all their lives.

Women, Indigenous Knowledge and Climate Change in the Niger DELTA Region of Nigeria

Climate change has become very topical in academic and policy discourses. This derives prinicipally from the phenomenal impact that climate change is having on global resources and livelihoods. The Niger Delta coast is currently faced with a gamut of environmental problems, including: soil and coastal erosion: oil pollution; population pressure; and flooding. A study of the Niger Delta region by the World Bank in 1995 states that the major economic and environmental problem of the region is land resource degradation manifested in flooding, and renewable resource degradation as it affects agriculture, fisheries, forestry, biodiversity loss, etc. The impact of climate change increases livelihood vulnerability of the rural farming households in this region. Climate change makes access to food sources unpredictable and increases poverty and disease. On the whole, economic activities can be truncated and infrastructure destroyed in an event of sea level rise caused by climate change, while the already common problems associated with the local rainfall regime and tidal influences, can be accentuated, thus increasing the physical and socio-economic vulnerability. Research has shown that women are disproportionally affected by natural disasters such as drought, floods, and heat waves. Studies on climatic variability and changes in Nigeria have been carried out ,but there still exists a gap in knowledge on the impact of climate change on the most vulnerable groups, especially women in rural Nigeria, and how they adapt using their indigenous knowledge. Often in research, it is wrongly assumed that rural and indigenous women do not offer scientific knowledge even though, in many communities in the Niger Delta, they are the caretakers of biodiversity and experts in herbal medicines. This paper intends to contribute to the debate about the role of local knowledge in environmental policy. We are looking at cultural responses to specific social and environmental conditions.

Practices, Flows and Networks: Towards Understanding Sustainable Global Food Provision

Food provision involves important environmental challenges, including a large contribution to climate change and severe impacts on biodiversity. Addressing these challenges needs engagement with the complex dynamics of contemporary, global as well as local, food production and trade in conjunction with the multiple, locally diverse, ways and forms of consuming food. Conceptually the challenge is to understand global versus local dynamics, small versus large scale and material versus social dynamics in multiple modes of food provision. Different elements for building such a conceptual framework are available, such as global environmental networks and flows and social practices. This paper intends to contribute to theoretical innovation within environmental sociology by analysing the possibilities to integrate these two conceptual frameworks.

Environmental networks and flows build on material flows studied in environmental sciences but combines this with notions of non-material flows and social networks from sociology. This framework has already been applied to study global food flows but does not include consumption. Social practices, on the other hand, constitute a framework to study routinized activities such as consumption and by taking material aspects and dynamics into consideration this approach may generate a better understanding of environmental issues in everyday behaviour. Social practices are however rather time and place-bounded concepts.

On the basis of existing literature this paper analyses the conceptual frameworks and ways to integrate them to assess possibilities for analysing environmentally relevant global and local dynamics in contemporary food provision. This conceptual framework is illustrated with case-studies on palm oil and seafood.

What Is the Best Micro-Foundation for Mechanism-Based Explanations in Analytical and Rational Choice Sociology?

In AS (Analytical Sociology) as well as in RS (Rational Choice Sociology) micro-macro relationships are center place as a major mechanism. This presentation addresses the question of which theory is best suited as a micro foundation for this mechanism.

The presentation continues the discussion in the special issue of Social Science Information from 2013 (with contributions by Opp and responses by Ylikoski, and Manzo and, finally a response by Opp). The comparison of DBO and RCT is taken up again in new publications by Manzo and Hedström/Ylikoski in the volume "Analytical Sociology," editd by Manzo (2014). These contributions provide new arguments some of which are discussed in this presentation.

I will offer a discussion that goes beyond my previous work and will be of interest to AS as well as RS scholars. One argument I will address is the claim that the wide version of RCT includes every factor and is thus without explanatory content (repeated in Hedström and Ylikoski 2014). Another point I will discuss is the assumption of subjective utility maximization (claimed in the wide version) that is rejected in AS. What are the alternative "principles" in AS? I will analyze some contributions in AS to answer this question.

"Devils from Our Past". Racist Historicism in Contemporary Anti-Muslim Discourse

This paper provides insights from original research on current forms of articulation of anti-Muslim racism in Austria. Combining theories of hegemony with Critical Discourse Analysis and Critical Race and Postcolonial Studies, I analyse interviews conducted with journalists and editors of major Austrian news media outlets (print and TV) to tackle the question: How can we understand the broad appeal of anti-Muslim discourse registered by recent research in 'Islamophobia Studies'? Or, put differently: What is it that allows anti-Muslim discourse to be articulated with a broad range of social positions and political allegiances, becoming part of an emerging social consensus?

Following Stuart Hall's analysis of 'moral panics' in the context of a social and political crisis, I trace the discursive modalities in which Muslims are summoned as 'folk devils', and how they are linked within a wider ideological field of anti-Muslim racism. I specifically identify 'racist historicism' as a crucial discursive mechanism which allows actors from diverse social, cultural and political background to inscribe themselves into a common ideological horizon of anti-Muslim racism.

Anti-Muslim racist historicism is organised around the notion of Muslims as 'non-contemporaneous others', belonging to a different temporal order. One of the key topics articulated in this discursive operation is antisemitism. In this paper, I show how the articulation of the figure of the Muslim with the topic of antisemitism effects a 'temporal othering'. Muslims are constructed quite literally as being 'backwards', belonging to a past where sexism, homophobia, violence, authoritarianism and, not least, anti-Semitism ruled the day, and which is represented as thoroughly overcome. The threatening presence of the Muslim other is thus revealed to be part of the summoning of a peculiar kind of folk devil: 'The muslim' as a 'devil from our past'.

The Place of 'Respect' in the Sociological Understanding of Inequality: Some Reflections Based on the Chilean Case

This paper reflects on the place of "respect" in the sociological understanding of inequality. Respect has been a central topic in moral philosophy, but it has not received enough attention in sociological research. Certainly, sociology has addressed some dimensions of respect through the analysis of the concept of status and more recently through the analysis of the problem of identity politics and recognition (Fraser & Honneth, 1993; Honneth, 1995, 2009). However, the analysis of the several dynamics involved in the granting and neglecting of respect to others at the level of everyday life is still a pending task. This is a relevant failure. In fact, several authors in recent times have argued, although from different reasons, that a better understanding of respect –or similar phenomena such as worth, recognition or status- is needed in order to improve the general sociological understanding of inequality (Lamont et.al. 2014; Ridgeway, 2014, Therborn 2006; Sennett, 2003). In light of this, the paper proposes an analytical framework for the sociological study of respect at the everyday level. In order to show the performance of this approach, the paper discusses some preliminary findings of a mixed method study carried out by the author in Chilean society. Finally, the paper argues that studying respect is relevant in explanatory terms, but also in normative terms. By highlighting how and why the experience of lack of respect is unequally distributed and how it produces moral suffering to people, sociology has an opportunity to put the problem of inequality into the front.

Factors Influencing the Diversity of Non-Liturgical Activities in Russian Orthodox Church Parishes

This paper examines the factors that influence the diversity of parish non-liturgical activities in Russia. According to congregational studies in other countries (Chaves 2004; Sider, Unruh 2005; Ammerman 2005), the number of different non-liturgical activities is a very important indicator of the development of social life in a parish. On one hand, the higher the variety of social activities available at the parish, the higher the probability that every parishioner finds something that fits his/her interest and predisposition. On the other hand, it allows us to compare parishes with different welfare service and social activity profiles on a unified scale.

The analysis is based on the Orthodox Monitor data – a representative survey of the core Russian Orthodox Church members (http://socrel.pstgu.ru/en/orthodoxmonitor) conducted in 2012 (412 respondents). Some of the questions were designed to ask the respondents to describe their parish as experts. These are the questions we use as the basis for the model described in this paper.

We used confirmatory factor analysis and structural equation modeling with M-Plus 7.2 software to construct the models.

The results of the analysis suggest that the main factors influencing the diversity of parish non-liturgical activities are the presence of a strong parish community, the presence of children in the parish, and the parish prior leadership style. The leadership style is one of the most important factors influencing congregational social life, social services and programs. In some parishes it is the priest's fundamental responsibility to perform social work and organize social life, while in the other parishes this duty is outsourced to the laity. Partial delegation of these responsibilities to the laity has a positive effect both directly and indirectly (through the overall effect of community development), while the full delegation has a far more significant positive effect.

Boko Haram in Nigeria: Statistical Trends, Patterns and Social Implications

The rise of *Jama'atu Ahlis Suna Lidda'awati Wal Jihad* or Boko Haram continues to generate major concerns in the West African sub-region. In particular, the kidnap of 276 girls at Government Secondary School Chibok, Borno state, Nigeria on 14 April, 2014 remains a watershed moment in the insurgency. The incident was a spectacular criminal act even by the standards of a country in which kidnapping had become relatively routine since the late 1990s, particularly in the oil-rich Niger Delta region. Boko Haram's response has been to kidnap more people and destroy more homes. This paper draws on the Global Terrorism Database (GTD) to analyze the trends, patterns and social implications of the Boko Haram insurgency.

Findings indicate that the average number of victims killed in terrorist activities in Nigeria was much lower prior to Shekau's Boko Haram. Nigeria registered about 124 terrorist fatalities per year on average in 2006, 2007, and 2008, while 730 fatalities were recorded on average in each of the following five years (2009 to 2013). This represents approximately six-fold increase in the number of deaths from terrorist attacks. The analysis also indicates that armed assault, bombing and explosion, and facility/infrastructure damage are the main techniques employed by Boko Haram. The paper concludes by articulating the implications of these findings vis-à-vis Nigeria's war against Boko Haram.

"the Fight for the Soul of Nigeria": Framing Strategies of the #Bringbackourgirls Movement

The kidnap of 276 girls at Government Secondary School Chibok, Borno state, Nigeria on 14 April, 2014 by *Jama'atu Ahlis Suna Lidda'awati Wal Jihad* or Boko Haram had the unintended consequence of raising consciousness among a relatively privileged class of Nigerian women. The incident and attendant inertia by the Nigerian state led to the formation of the #Bringbackourgirls organization by a group of highly educated women. Although there has been significant media coverage accorded the activities and goals of the organization, its operational micro-mechanics and framing strategies remain unexplored in scholarly literature. Scholarly attention has been focused on examining the tactics and mode of operation of Boko Haram. The aim is to fill the gap in the burgeoning literature. This paper is based on data garnered through participant observation at the daily "sit-out" of the #Bringbackourgirls organization as well as interviews with activists during field work in Abuja, Nigeria in summer 2015. Primary data is complemented by secondary data — publicity and strategy-related materials published by the group. The paper analyzes the operational dynamics and framing strategies of the #Bringbackourgirls movement.

The findings demonstrate three major master frames in the movement: The human/women's rights frame, failed state frame, and the injustice frame. The paper explicates how changes in Nigeria's political process has led to evolution from violent antagonism towards the movement to tolerance and accommodation of the movement by the state.

Latin As a Tool for Social Differentiation. a Study of the Italian Juridical and Medical Language.

Sharing language is an important way to encourage social inclusion, while using different languages can be a tool for social discrimination (Philips 2005). In our research, we consider Latin, an ancient language which is no longer used in any context, including the scientific and religious one. Latin gained great importance as the formal language of the Roman Empire. After its collapse, it evolved into a variety of spoken-only languages, Latin being still used for writing. In other words, Latin was used as a lingua franca up until the 18th/19th century, when it was replaced by national European languages. Nowadays, Latin's social use has radically changed to a point that it is no longer a language of social cohesion, but rather a powerful tool for social differentiation. In this perspective, the main focus of our research is the analysis of its use within Italian languages for specific purposes such as the juridical and medical one, where Latinisms are often found. More precisely, we aim to present the outcome of a research carried out on five hundred judgments rendered by the Italian Supreme Court from 2010 to 2015; also, a wide number of clinical records made available from two Italian hospitals will be taken into consideration. Our study shows that the study of Latinisms' use in specific scientific areas is crucial, despite instances of simplification of the language of public administrations are more and more perceived. Our project is inserted in the series of studies dedicated to languages for specific purposes understood not only as specific vocabularies (Beccaria 1973; Berruto 1987; Cortelazzo 1990; Sobrero 1992), but mostly as "discursive patterns" that express precise and distinctive professional visions (Orletti 2000). Concerning the juridical language, cf. Gunnarson (1984), Shuy (1993), MortaraGaravelli (2001), Bellucci (2005). As for medical language, cf. Mazzini (1989), Serianni (2005), Orletti&Fatigante (2013).

Social Customer Service: Responses to Customer Complaints

Over the past few years, companies have increasingly started to utilize social media to influence and build rapport with customers online. This is illustrated by the numerous marketing strategies modern businesses regularly engage in to attract new customers and maintain existing clients (Márquez-Reiter et al., 2015). Although the subscribed customers consume what the page administrator generates on the company's profile, the affordances (Gibson, 1979; Hutchby, 2001; Herring, 2010) of such participatory websites allow them to complement or undermine the messages (Walther, 2012). Given that the customers increasingly understand Facebook as way of voicing their concerns, it is inevitable for companies not to provide customer service, although this may not be their primary aim.

Drawing on publicly available data from the Facebook page of a Slovenian public transport company called "I'm going by train", the study examines interactional instances of polylogal interactions (Kerbrat-Orecchioni, 2004) between the company's anonymous Facebook page administrator and its customers. The interactional analysis presented in this paper focuses on the way the customers post disparaging comments on the company's Facebook page and rant about (a) particular issue(s) or event(s). To prevent the complaint from becoming a customer service disaster, the administrator uses strategies to block the complaint, preventing customers from seeking redressive action. This is achieved by means of sequential deletion (Jefferson, 1973), by posting generic, scripted responses or by refusing to respond to the complaint altogether. While customers' complaints do not necessarily trigger remedial actions over the phone either (Orthaber & Márquez-Reiter, 2011), this type of asynchronous technologically mediated interaction, unlike the telephone, allows company's agents to ignore them. The analysis provides further evidence of how open-comment platforms such as Facebook create ripe conditions for public outrage to erupt on corporate walls (e.g. Champoux et al., 2012; Matzat & Snijders, 2012; Bruxelles & *Kerbrat-Orecchioni, 2004*).

Environmental and Social Impact Assessment of Golf Tourism: A Social Participatory and Multicriteria-Based Process Applied in Southern Spain

Environmental and Social Impact Assessment is an extremely useful tool for identifying and evaluating the social and environmental repercussions of a wide range of projects. Especially when the project and its impacts are very complex, an ESIA can result in the identification of a high number of impacts needing to be prioritized in order to be addressed effectively and efficiently.

In recent decades, southern Spain has experienced an explosion of golf tourism. Favorable climate and a wide tourist offer of Andalusia has made a major golf destinations. However, the construction of the golf courses and the accompanying tourist developments are assuming enormous pressure to local ecosystems suffering environmental, social and economic. Although an strategic planning for reduction of risk and impacts is needed in the studied area, it is also necessary, and urgent, taking decisions in order to restore the balance socioeconomic and environmental

This paper shows the main results from a methodological proposal for the assessement of impacts within an ESIA based on participatory and social justice criteria applied on a golf-based tourism project in Huelva (Spain). This methodological approach is structured into four main phases: 1) Creating the stakeholders' platform; 2) Preliminary identification and assessment of impacts; 3) Categorizing and reducing the selection of impacts; 4) Assessing and prioritizing impacts using MCDA.

Institutional Conditions for the Creation of Moralistic Trust

This study investigates the effects of individual's evaluation of political-institutional conditions on the moralistic aspects of generalized trust. In studies of social capital, institutional conditions are considered to be one of the main determinants of generalized trust. With the knowledge that institutions can impose sanctions on untrustworthy behavior, people trust others as rational choice. However institutional conditions influence not only the rational aspect of generalized trust. Institutions also produce habits and norms, and make people inherently trust-worthy through socialization mechanisms. This leads to create moralistic aspect of generalized trust, which is beyond rational prediction. Specifically, institutional conditions such as the fairness of police and legal system and the achievement of social equality are considered to be the determinants of moralistic trust. These theories have not been empirically tested hitherto, since previous studies did not differentiate rational and moralistic aspects in measuring generalized trust.

Therefore this study differentiate two aspects of generalized trust, and examine the effects of the confidences in police and legal system and the evaluation of social equality on two aspects of generalized trust. We use the data of Japanese internet survey conducted in 2011(sample size=1,137).

From the results of regression analyses, first, we find that while the confidences in police and legal system promote both rational and moralistic trust, the evaluation of social equality increase only moralistic trust. Second, there is a negative interaction effect between these two predictors on moralistic trust. This result suggests that the evaluation of social equality further promote moralistic trust when people have little confidences in police and legal system.

Facing the Challenges of Precarity: African Women Migrants in a Globalized World

This presentation will explore precarity in the lives of African women on the continent and in the Diaspora in case studies based on my research during the past two decades: – 1. Zimbabwean entrepreneurs involved in cross-border trade with South Africa and 2. African women immigrants in the Greater Boston and Philadelphia areas. The presentation begins by defining precarity as the widespread condition of temporary, flexible, casual work in postindustrial societies, brought about by neoliberal labor market reforms. These reforms have strengthened the employers' ability to "manage" workers and weakened the bargaining power of the latter since the late 1970's. Precarity affects many members of our societies – especially women, youth, immigrants and disproportionately populations of color.

The case studies that I will examine involve women who have voluntarily migrated or are refugees and have experienced marginalization in the labor market and in the broader society. Globalization and neo-liberalism in the Global North and the South create precarious circumstances for many at the bottom of the socio-economic hierarchy. And many poor immigrant women often find themselves at the bottom. Despite the difficulties of precarity and intersectionality in their lives, these women are resilient and continue to demonstrate agency.

The feminist political economy paradigm informs my work and will be discussed and applied to the case studies investigated in this presentation. Further, a transnational lens also assists in "making sense" of the precarious situations that Zimbabwean women cross-border traders experience as well as African immigrant and refugee women in the US. In the midst of the challenges presented by precarity, African women migrants "recreate home" in part through the organizations that they establish and have helped create a new Pan-Africanism that emanates on the continent and in the Diaspora.

Reproductive and Productive Social Mobility Strategies of Latin American Migrant Families in Spain

The general aim of this paper is to study the transnational social mobility strategies, focusing in the interaction between reproductive and productive strategies, of Latin-American migrant families in Spain, in a context of economic crisis. We will look into the way households negotiate family social mobility strategies, by analyzing the actions individuals choose in order to climb social ladders, as well as the series of personal and collective itineraries they undertake within the social hierarchy and the transnational social space. Our analysis will be based on an inter-generational and gender perspective. What is the impact of migrants' transnational reproductive and productive strategies on their social mobility trajectories? And on those of their children? How do they differ in terms of gender? Do some transnational strategies represent social stagnation for some household members, yet revert on the other ones in the form of upward social mobility? We will analyze the articulation of reproductive, economic, affective and social practices of immigrants, and how this articulation determines the social mobility of households and the gender relations. The methodology is based on in-depth interviews and family life stories. The fieldwork was conducted in Madrid, Galicia and Barcelona (Spain), including different communities (Brazilian, Ecuadorian migrants), as well as in some of the migrants' countries of origin (Equator and Argentina) in the framework of the Research Project "Gender, Transnationalism and Inter-generational Social Mobility Strategies" (FEM2011-26210, Ministerio de Ciencia e Innovación, Spain).

OSRECKI, FRAN* (University of Osnabrueck, fran.osrecki@uni-osnabrueck.de)

Play to the Rules: Managerialism, Neo-Liberalism and the Sociology of Professions

In modern sociology the term neo-liberalism describes very diverse and sometimes incompatible developments. Largely used by its critics, the term is ascribed to the shrinking of the welfare state, the rise of global free-trade arrangements, the privatization of public goods and the introduction of markets in hitherto protected fields. However, the term is also used in relation to managerialism, i.e. the import of methods of business administration in organizational settings that have been dominated by professional self-regulation: health care, education, public administration etc. In this presentation, it is argued that neo-liberalism and managerialism form two very distinct logics of reform, the latter being centered around the vision of making professional practice not only more cost-efficient, but also, if not primarily, making it more accountable in terms of enforcing professional rules and standards as strictly as possible to enable (often formalized and quantified) lay control. In fact, the lack of accountability and transparency is a critique shared by both managerialist reformers and scholars influenced by the "power approach" in the sociology of professions. Thus, it is argued that the "audit explosion" (Michael Power) in professional work was to some degree enabled by social scientists critical of professional autonomy. This rarely explored coalition is meanwhile critically reflected in the sociology of professions, especially by researchers who highlight the unintended consequences of auditing and formalized mechanisms of transparency in professional practice. Yet, a model of limits of lay control in professional practice is still missing. To fill this gap, the organizational concept of "functional deviance" is presented. This somewhat neglected concept shows that there are necessary limits of operational control in organizations and that the sociology of professions should in more detail discuss limits of rule following and lay control in professional settings.

RC52-600.5

OSRECKI, FRAN* (University of Osnabrueck, fran.osrecki@uni-osnabrueck.de)

The Transparent Professional: Unintended Consequences of Rule Following in Professional Practice

Over the last decades the autonomy of professionals became heavily criticized from several perspectives. While some social movements (e.g. environmentalists, self-help groups) and large parts of the social sciences attacked professional autonomy as an outdated, uncontrolled, non-democratic and often abused power relation, managerial reformers in most Western societies saw it as a hotbed of inefficiency and lack of accountability. Though very diverse visions emerged on how to control professionals, the perhaps most influential one was to make professional practice transparent via formalized audits and control mechanisms. Meanwhile, a well-established field in organizational sociology has emerged that deals with the rise, the spread and the consequences of this "audit explosion" in professional work. Most studies in this field criticize auditing and control mechanisms for unintentionally creating over-bureaucratization and an obsession with self-observation. In this presentation, it is argued, first, that both the sociological critique of professional autonomy and managerialist reforms share a similar vision: that formalized (often quantified) techniques of transparency can and should force professionals to play to self-defined rules as strictly as possible in order to enable lay control. Second, it is shown that an unintended consequence of this vision is that it binds affected professional organizations to an inflexible "work-to-rule" mode in professional practice. Here, case studies are compared that show how this enforced rule following paralyzes decision making in public administration (corruption control) and health services (evidence-based medicine) and creates incentives to outsmart surveillance and transparency techniques. Finally, a theoretical model is presented that explains such professional reactivity by re-discovering the organizational concept of functional deviance, i.e. the need to break formalized rules on a regular basis to maintain organizational adaptability.

The Role of Spaces As Support for Social Inclusion of Youth in Japan

About 20 years have passed since young people's independence began to attract attention in Japan. Since then, youth support programs have been institutionalized. However, in the process of institutionalization, it was found that there were many young people who had serious difficulties in finding employment (for example, because they were socially withdrawn, developmentally disabled, or had complicated family backgrounds, which couldn't be solved,) in the existing supports to young people's occupational self-reliance.

Within this social context, attention has been given to means of support that provide safe, comfortable spaces to youth who cannot find their place in the society, and especially youth in a state of social withdrawal in Japan, in what are called "free spaces" or "*ibasho*."

"*Ibasho*," is a Japanese term which translates as "a place where one feels at home." It has been thirty years or so since the word "*ibasho*" started to be used in scholarly articles. Nowadays, it is closely related to discussions of social withdrawal.

The "*ibasho*" support aims to make young people adapt to the space. Therefore it does not seem compatible with support to young people's occupational self-reliance that aims for their transition to work. Furthermore, it is difficult to measure the effects of the support quantitatively.

Because of these reasons, this research studies youth support facilities that absorb people with developmental disabilities and have a free space for self-help groups for people with developmental disabilities. We conducted ethnographic research and interviews to find out about the underlying philosophy of supports and users' opinions about them. Through a comparative study of the two entities, we aimed to find out how "*ibasho*" currently function and how it is understood in the social context of youths' occupational self-reliance.

China's Beauty Proletariat: The Body Politics of Hegemony in a Walmart, China

In her best-selling book, *Beautiful Faces Grow Rice* (*Meili liandan zhang dami*), author Lu Junqing articulated an emergent aesthetic and economic logic: women's pursuit of beauty is the most certain means of achieving career success. Now anxious about the state of their appearance, millions of women flock to retail beauty counters where they consult with cosmetics sales agents about how to best enhance their appearance so as to ensure their place in the labor market. This research examines the workers of China's beauty economy through a case study of rural migrant cosmetics sales representatives in an outlet of a major global retailer. The Author asks, how are the new "body rules" generated by the beauty economy used to organize and discipline labor in the workplace? Body rules are norms for the public presentation of different types of bodies. Retail cosmetics employers recruit bodies to become models for customer emulation, vehicles of display, and vessels of communication. Employers seek to alter and control this physical capacity. The author argues that as retail employers offer women workers opportunities to master new body rules for femininity, perceived as a form of cultural capital, they are less apt to question the low-wage and insecure conditions under which they labor. This state of affairs is termed embodied hegemony.

Post-Crisis Utopias? - Future Orientation and Sociological Imagination

Guy Standing's "Politics of paradise", Göran Therborn's "Decisive Battlefields of future (in)equality" or the "Convivialist Manifesto" of Les Convivialistes are only few examples of post-crisis utopias in the social sciences. With this term I am referring to socio-political scenarios for future development published after and in reference to the financial crisis (2007/2008). Rather than outlining a new form of utopias, contrasted to pre-crisis types, I want to zoom in on offers of orientation through social scientific research in times perceived as critical junctures. Much like diagnoses of time this kind of "sociological imagination" (Mills) is a contribution to broader contexts beyond "academia" and aims at societal and political influence.

Besides the interest in a comparison of the imagined scenarios, it is worth looking at the ways in which different authors/author collectives conceptualize their visions to make them powerful. To do so I want to pronounce the "how" in the analysis of these interpretations: How are the ideas configure and promoted? How do they gain plausibility and potentially stability? Metaphors, subject positions, connections to social movements or relation to prior interpretations are examples of associations that might be involved in these processes. For this task I combine a theoretical framework based in Science and Technology Studies (ANT, Post-ANT) and an empirical approach that links content and rhetorical analysis.

My goal is to gain further insights into sociologists' involvement in public affairs, something that is commonly seen as marginal, while retaining a critical perspective on the production of knowledge in the own discipline. For this session this is highly relevant since social scientists can be spokespersons or inspiration for social movements based on their outline of desirable futures. They are (or rather want to be) involved in the shaping of possible futures – an involvement that needs further elaboration.

OVERLAND, GWYNYTH* (RVTS - Ragional trauma compeency centre Southern Norway, gwyn.overland@sshf.no)

Religious Radicalisation: The Ways of Norwegian Jihad

How do people become radicalised and what does the term really mean? "Radical" comes from the latin *radix*, root. Etymologically, "religious radicalisation" thus suggests a process of returning to the roots of a religion, to its fundamental teachings. Using both theoretical and empirical sources, this paper explores the background and processes involved in the radicalisation and recruitment of young Norwegian citizens into militant Jihadi groups by means of appeals to religion and meaning incentives (Weggemans, 2015). What are they missing, the vulnerable outsiders who risk becoming the prey of scouts for extremist organisations, and what do they find?

Theoretically, the paper is based on classical sociology of religion sources, historical and religious explorations of the Crusade-Jihad nexus and contemporary radicalisation research.

Empirically, the sources are interview and observation data from an on going evaluation study. The focus of the study is a longitudinal project aimed at preventing the recruitment of vulnerable young men from Norwegian secondary schools into violent extremist organisations. The paper will present preliminary findings from the research.

The Radicalization Awareness Workshop – Providing Analyses and Interventions for Marginalised Lives and Communities?

Led on by the European Radicalisation Awareness Network (RAN, www.ran.eu) competency milieux in Norway have been mandated to implement the RAN prevent workshop among frontline helpers. This paper will briefly present the workshop and our experiences with implementation.

The work of analysis and intervention in this field is often divided into two main areas: 1. Prevention, involving social and political transformation as well as interventions with marginalized youth, and 2. De-radicalisation - involving disengagement, reintegration, mentorship and exit programmes.

Prevention is the focus for the RAN workshop. Does the workshop help workers to redeem disaffected youth? Does it give them adequate tools for effective interventions? These questions will be addressed in the presentation of the workshop. It is in the second area, de-radicalisation, that the counter narrative motif becomes central. ISIL appears to be "winning the narrative war", winning the hearts and minds of thousands of young people from 80 countries, succeeding where Al Quaida failed. ISIL narratives weave together historical symbols, beliefs and core grievances with the narrative of a global caliphate - an Islamic Camelot if you will (Lavoy et al., 2014). How to meet the challenge and supply satisfying alternative narratives?

The paper explores the common ground for prevention and re-integration from a clinical sociology point of view. Both prevention and re-integration initiatives must be informed by an understanding of why people actually take the step from mainstream to marginal - loneliness, alienation, fear of never belonging, lack of a belief in a future, lack of meaning. Recent research indicates that these problems are the same for returning Jihadis as for disaffected youth (Weggemans 2015, Harris, 2014). Both prevention and re-integration posit strategies for meeting these challenges.

Barriers and Facilitators to Women's Advancement and Leadership in Academic Medicine

Academic medicine is currently characterised by the underutilisation of women's talent and potential, especially, at senior levels and in leadership roles. This presents a serious threat to the quality and international competitiveness of the future health workforce. In order to identify barriers and facilitators to women's advancement and leadership in academic medicine, we conducted a systematic review of empirical studies published in peer-reviewed journals since 1985. We searched Medline, CINALH, ERIC, and Theses and Dissertations. Two reviewers thematically analysed data from included studies and assessed their methodological limitations.

Most included studies were from North America and frequently had methodological limitations. Eight themes emerged: women may attain lower research productivity than men (as measured by publications and grants); women tend to be more interested in teaching and clinical work than research; women may lack career advancement and leadership skills; there is a lack of adequate mentors and role models for women; women may experience gender bias and discrimination; the culture of academic medicine is less supportive to women; work-life integration is harder for women than men; women are more likely to leave academic medicine than men.

Medical schools and university hospitals should take immediate action to eliminate all forms of gender discrimination and unconscious bias. Strategies and interventions aimed at providing women with the necessary support to increase their research productivity, with adequate mentors and role models, and with opportunities to develop career advancement and leadership skills may encourage more women to stay and seek senior and leadership roles in academic medicine. Institutions can better align research, teaching, and patient care in academic careers and develop more flexible working conditions for both genders. High-quality studies are needed to monitor and evaluate experimentally such strategies and interventions.

The Role of Culture and Health Beliefs in Diabetes Self-Management Among Black African Community in the UK

THE ROLE OF CULTURE AND HEALTH BELIEFS ON DIABETES SELF-MANAGEMENT AMONG BLACK AFRICAN COMMUNITY IN THE UK

The research draws on a qualitative study to identify the impact of cultural beliefs on self-management behaviours and the significance of sociocultural approaches to health and illness among Black African people with type 2 diabetes. The study will examine lay perspectives and how they can contribute toward reformulating diabetes management policy in the UK in order to reduce health inequalities.

Type 2 Diabetes is a significant public health issue and one of the growing health problems particularly among Black African community, which presents a multi-faceted challenge to health care systems and expenditure in the UK. There are evidences that people from African descent with type 2 diabetes has poor health outcomes. Behavioural changes approaches to health promotion have increasingly been influenced by social, economic and collective model of health. However, the role of culture and health beliefs is yet to be integrated into such an approach when working with the Black African community in the UK. Realizing the multi-faceted nature of type 2 diabetes, integrated, cohesive and holistic approaches shaped by a sociocultural perspectives are important for promoting self-management practices among people with type 2 diabetes to avert any long-term complications, improve diabetes care delivery and reduce health inequalities.

Data will be collected through interviews conducted amongst the Black African community who live with type 2 diabetes and then, also, health practitioners to examine the difference in cultural understanding and interpretation of diabetes self-management behaviour within the cultural group. Better understanding of the relationship between the contextual determinants of healthy behaviours and outcomes among people with type 2 diabetes could facilitate the development of culturally sensitive interventions programmes that can help to modify beliefs, assist acceptability and support self-management lifestyle among this population.

Shifting Household Activities at Peak Demand

In order to supply electricity, demand of which varies daily and seasonally, generation capacity must be able to meet peak demand. To avoid potential shortages it is useful to identify households who would be willing to 'shift' their energy-intensive activities so as not to use electricity at peak times (Strbac, 2008). This paper reports on the findings of a 'dynamic' time-of-use tariffs trial conducted in London, UK, and explores how householders responded to dynamic tariffs. Unlike 'static' time-of-use tariffs, which are regular and predictable, dynamic time-of-use tariffs are irregular and unpredictable, because they are based on renewable energy, such as wind power, and tariffs change according to the availability of electricity from the renewable source. A recent study of time-of-use tariffs found that people dislike the unpredictability of tariffs and that dynamic tariffs are the least popular option for consumers unless an automation feature is added (Fell et al. 2015). Similarly, research has identified a number of issues that limit people's abilities to change their routines in the household. For instance, certain domestic appliances cannot be discarded no matter how they are 'greedy', and life is for living and the use of certain appliances or household activities are necessity. There are temporal rhythms of the household. Also, family negotiate about electricity consumption with possible disputes and conflicts among household members (Hargreaves et al., 2010). So, how our trial participants felt about dynamic tariffs? How did they respond to price changes? We found some trial participants enjoyed

the dynamic tariff and changed their routines. In this light, this paper investigates: to what extent people shift their daily and weekly routines to go along with the tariffs; how environmentally sustainable practices can be incorporated into people's everyday lives; and how sociocultural shifts towards more sustainable ways of living can be created.

UN-Doing Differences. Towards Creating and Managing Capabilities

With regards to the challenge of shortage of skilled workers especially for SMEs as engines of the German economy, companies depend on creative employees as key actors. Nevertheless, demographic change is perceptible so that the labour integration of resident immigrants and women become more important. But *doing differences* in the labour market in sense of discrimination persist. To counter this, diversity management is a possible tool but predominantly used by bigger enterprises. However, managing diversity makes differences visible and is therefore considered critically.

Statistics state persisting occupational segregation which contributes to a gender pay gap. This challenge is not only identified as a gender problem, it also reveals a social one and depends on the interaction of different social power structure of the dominant groups, especially by reducing the number of women at higher levels of the career hierarchy facing a glass ceiling. According to Hartmann (2004), career opportunities are defined by social origin, cultural capital and upper class habitus which are responsible for social reproduction. These issues are hidden in the discourse of managing diversity in business.

This qualitative research examined diversity activities in German SMEs and shows that diversity management is in very little usage by SMEs. Besides, it was also examined the challenges of mastering the transition into occupation of higher educated women in Germany additionally with foreign origins. The results tend to underline inequalities in career paths predicated by social constructions ethnicity, gender and social milieu – also defined as categories of inequality. In terms of the research lack of implementing Nussbaum´s *Capability Approach* (2012) on the meso level, promoting capabilities and competences of employees are key policies. Every enterprise should be able to design a framework to support development of capabilities defined as enlargement of freedom in sense of real and available opportunities.

OZEKI, AYAKO* (chilibou, ozeki@center.wakayama-u.ac.jp)

The Generality of Language, and Diversity of Reality ---Positioning of the Language in Bergson and Durkheim---

The background of this presentation is an awareness of the issues whether the difference between sociology and philosophy consists in essential difference of their disciplines or segregation of their domain. For this purpose, I compare the methodology of Durkheim, the founder of sociology and his contemporary philosopher, Bergson. Then I clarify their similarity and difference. For that, their views of language will be the theme of this presentation.

As in generally known, Bergson criticizes the language, being reduced to a commonness with the others, for the reason that with that we cannot seize the reality of "my" life in a lively way. As opposed to it, Durkheim considers that human nature consists in the ability to synthesize the special, accidental and individual by his reason and to think according to a universal form. And he points up that such language is given by the society.

What I entertain doubts is a question that the following simple schema is self-explanatory or not. That is, Durkheim emphasizes the fact that even though there is a certain difference and diversity in our actual everyday life, in point of fact, we abstract them and grasp our reality notionally, and then we lead social life smoothly. In comparison with him, Bergson recognizes the actual condition of such "closed" society too, and furthermore, he aims at a stricter understanding.

Supposing this schema is right, it naturally follows that the both aims only different purposes. Durkheim merely judges that sociologist needs not to insist on trifling difference. On the contrary, Bergson merely focuses on the exclusive exception.

Or, this schema is inapposite? Is there a fundamental difference between their view of language and thus their view of human being? I expect that this question will be solved in my presentation.

Rights-Based or Anti-Systemic? Environmental Protest Movements in Turkey

A new wave of popular protest activity has flashed onto the Turkish political scene since the 1990s in response to big energy and mining projects. Although they initially emerged at local levels by expressing the right of the locals to live in a clean environment as well as by referring to the importance of local space-based identities, these movements have acquired a different character than the so-called new social movements emerged in the Western European countries. Unlike their counterparts in the industrialized world, these movements did not mobilize around a particular environmental issue, but linked local environmental concerns to broader economic and political grievances, and questioned not only specific projects but also energy and mining policies of the government as well as broad economic and political structures that shape these policies. This study argues that the leadership of left groups and the dominance left frames in these movements played a critical role in the shape that they have taken. The leftist figures, who have the necessary political skills and experiences to lead a movement, heavily involved in environmental movements by regarding them as part of the broader leftist struggles against capitalism and corporate globalization. They articulated a discourse that portrayed the energy and mining projects as 'exploitation of local people and natural resources' by multinational corporations, and presented environmental movements as 'anti-imperialist' struggles against imperialist powers and their national collaborators. Although environmental protest movements go beyond particular rights-based movements in this way, they could not turn into a broad counter-hegemonic political collectivity mainly because the leftist leadership prevented the involvement of both liberal groups and rival leftist groups. Moreover, the involvement of the leftist figures was used by the state as a pretext to repress environmental movements.

Was It a Hopeless Battle? Consequences of the Gezi Park Protests in Turkey

Turkey has recently witnessed the emergence of one of the largest popular movements in its republican history. The particular struggle against the demolition of Taksim Gezi Park in Istanbul turned into nationwide mass protests within just a few days. During the nearly two-month long period, many social groups and individuals with diverse identities, positions, and social demands poured into the streets and squares to express their discontent not only with the current neoliberal and conservative hegemony in the Turkish context, but also with the increasing authoritarian tendencies of the AKP (Justice and Development Party) government. This study focuses on the effects of the Gezi Park movement on the Turkish politics. It argues that Gezi protests produced two contradictory consequences. On the one hand, in contrast to the intended aim of the protests, the government became more and more authoritarian, creating a more repressive environment for the Gezi protesters in particular and social movements in general. On the other hand, Gezi protests made its participants more sensitive not only to urban and environmental issues, but also to social and political rights. Many local informal organizations were established, leading to the emergence of subsequent mobilizations in various cities and towns against the privatization and commercialization of urban spaces as well as the destruction of natural environment. Moreover, new civil initiatives emerged which range from those that monitor elections to prevent fraud and corruption to those that support labor strikes, and a political front consisting of a number of left-leaning small parties, academics, and NGOs was created. The study concludes by considering the implications of the increasing politicization of the society within an increasingly authoritarian environment.

We Want a Food Secure Future: Addressing Public Policy Failures for a Food Secure World

The prevalence of undernourishment across the countries of the world is disturbing. This is even more critical among developing countries within which Nigeria is situated. Despite the efforts of the United Nations (UN) through the Millennium Development Goal (MDG) number one to eradicate poverty and hunger by 2015, not much has been achieved. The latest UN report through the Food and Agricultural Organization shows that about 795 million people continue to experience undernourishment globally. This gloomy scenario is even more worrisome in the African region, as the total number of undernourished people continues to increase with an estimated 220 million in 2014-16 compared to 175.7 million in 1990-92. Out of the estimated 220 million undernourished people in Africa, 11 million consisting of 15% percent of the whole are from West Africa. The proportion of Nigerians among the undernourished people in Africa is significant, considering the huge population of the nation. More significantly is the fact that Nigeria is one of the countries that could not meet one of the two international hunger targets by 2015. With an extensive review of literature and primary data,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

this paper examines how the failure of public policies has exacerbated food insecurity in Nigeria. Specifically, conscious attempt is made to show how public policy failure generated unemployment, rural urban migration, rural infrastructural scarcity, peasant agriculture and disempowerment of women farmers culminating in food supply crisis and persistent hunger ultimately. Some suggestions are proffered in the quest for a food secure future.

New Desires, New Selves: Sex, Love, and Piety Among Turkish Youth (2015, NYU Press)

New desires, New Selves: Sex, Love and Piety among Turkish Youth (2015, NYU Press) provides a unique investigation of self-making among upwardly-mobile young adults in Turkey through the critical lenses of love and sexuality. Based on 87 in-depth interviews with a diverse group of young Turks in Istanbul who represent the most salient differences based on class origin, religious devotion, and sexual orientation, it links individual biographies with the "biography" of a nation, elaborating their interconnections in the creation of new selves in a country that has existed uneasily between West and East, modern and traditional, secular and Islamic. For these young people, sexuality, gender expression, and intimate relationships in particular serve as key sites for reproducing and challenging patriarchy and paternalism. As *New desires, New Selves* evocatively shows, the quest for sexual freedom and escape from patriarchal constructions of selfless femininity and protective masculinity promise both personal transformations and profound sexual quilt and anxiety.

Rethinking Patriarchy in Muslim Cultures through Unpatriarchal Male Desires

Rethinking Patriarchy in Muslim Cultures through Unpatriarchal Male Desires
Gul Ozyegin
ABSTRACT
Over the last decades, patriarchy has lost its prominence among Northern feminist theorists as a conceptual tool for theorizing and describing gender. "Outsourced" to the global South, especially to the Muslim World, in the words of Inderpal Grewal, "patriarchy" circulates to explain violence to women done "elsewhere" while remaining undertheorized and devoid of temporal and cultural specificity in our literature. Yet patriarchy remains a critical and named prism through which women and men negotiate their self-making in a variety of contexts. Our failure to adequately theorize patriarchy thus limits our ability to richly voice the lived experiences of these subjects. In this paper I suggest a rethinking of the place of patriarchy in gender theory from the perspective of young heterosexual men in Turkey who are the subjects of, and mediums for, (re)producing patriarchy but who have unpatriarchal desires and struggle to make themselves into men who are explicitly anti-patriarchal. This apparent contradiction is shaped, at least in part, by the historical link between patriarchy and paternalism in Turkey, which renders men the "protectors" of women and thus limits the potential for masculine self-expansion. In their projects of neo-liberal self-building, these young men are radically rethinking the models of masculinity embodied by their fathers and in the process seeking out new arrangements for their affective relationships with women. Their narrated experiences of sex, love, and romance constitute a rich site for furthering the theorization of the masculinity-patriarchy nexus in Muslim cultures.

Expanded Scope and Accountability? National Regulatory Reform of Health Professionals in Australia

In 2010, a drastic change occurred in the operation of health professional regulation in Australia. Prior to this date, there had been in excess of 80 organisations across the country involved in the registration and accreditation of health practitioners.

Those arrangements across Australia's six states and two territories had delivered inconsistences of governance, registration requirements, fees and comparative self-regulation. Within the context of a political desire for economic productivity and efficiency, regulatory failure galvanised governments into action and the 'National Scheme for the Registration and Accreditation for the Health Professions' came into being in July 2010.

Now, fourteen professional groups have consistent arrangements relating to continuing professional development, criminal history, English language skill, insurance and recency of practice. Consumers have a clearer pathway to have issues addressed, and the nation has more reliable workforce data.

This paper will report on the findings of a qualitative research project that has married the analysis of documentary evidence and policy mapping with key informant interviews of policy actors and core profession stakeholders.

Two core issues will be addressed in the paper. First, how in its first five years, the scheme's operational entities (its respective professional boards and the Australian Health Practitioner Regulation Agency) have expanded the scope of regulatory influence, and secondly – exploring how an entity established through legislation and parliaments, answerable to a collection of ministers with no legal standing can be accountable to the community.

PACHER, ALICE* (Meiji University, alisa.pacher@gmail.com)

Sexless Couple Relationship of Modern Japan

This study examines couple relationships, which avoids sexual acts in their relationship.

Since 1994, the Japanese society has started paying attention to the sexless couples; the discussion is focused on the reasons of not having sex and not about the prevention.

The purpose of this study is to clarify the actual situation of Japanese sexless phenomenom.

First, to understand the sexless phenomenon, this research looks at preliminary study of sexual consciousness and behavior of Japanese men and women in modern Japan.

Second, to understand the background of the sexless phenomenon deeply, the research method we used is an interview research aimed at 35 young adults of Japanese men and women in age of 20's-30's.

Especially among the interviewees of younger adults in 20's we can see that, they haven't got any specific sexual education to get close with the question about sexual health or sexual satisfaction. One main factor is that most of the younger adults believe that after turning 30, the interest in sexual relationship will decrease because of the age. Among Interviewees in their 30's it shows that, after living together, marriage, or childbirth, the interest for sexual contact decreases in general.

In this research, it comes out that the common grounds for sexless couples are, that they have less social support like sexual education to prevent the sexless phenomenon or learn about sexual satisfaction. On one hand, interviewees don't see sexuality as an important form of communication in a relationship and on the other, they consider love and sex as separate in a relationship. Some interviewees preferred to have sex outside the relationship, like dating another person or use some erotic services instead of having sex with their partner.

PADRON-INNAMORATO, MAURICIO* (Instituto de Investigaciones Juridicas. Universidad Nacional Autonoma de Mexico, mauriciopadron@gmail.com)

Jóvenes, Trabajo y Derecho. Condiciones Para La Construcción De La Ciudadanía En México y Uruguay

Desde hace ya varias décadas, el acceso al trabajo no es sinónimo de logro de integración social pleno, es más, este proceso se ha convertido en un problema, toda vez que la noción de trabajo se ha reformulado debido, entre otras cosas, a

las nuevas relaciones laborales que le han quitado la característica de mecanismo de aseguramiento y acceso a una serie de derechos.

Así, el proceso de inclusión social de los jóvenes, como sujetos de derechos, se enfrenta a una contradicción que en general parece imposible resolver. Por un lado, son ciudadanos de democracias más o menos avanzadas, lo que implica el reconocimiento pleno de sus derechos y, por otro lado, la inserción a un mercado de trabajo estructuralmente inestable, precario y flexible, los coloca en una situación de vulnerabilidad que no deja de ser peligrosa ya que es compartida por la mayoría de ellos.

De lo dicho, se asume como punto de partida el reconocimiento de la heterogeneidad de las situaciones laborales de los jóvenes y de sus consecuencias en las formas de integración social en los diferentes contextos. Además, se entiende que el efecto del derecho como instrumento de regulación de relaciones sociales (y como aproximación al marco institucional de los Estados nacionales), tiene un impacto decisivo en las posibles rutas de construcción de la ciudadanía de los jóvenes, por medio del trabajo.

Es así, que este trabajo busca caracterizar, discutir y debatir acerca de como los procesos de inserción de los jóvenes a los mercados laborales en México y Uruguay, no permiten, en general, romper con situaciones de vulnerabilidad, y favorecer así la construcción de ciudadanía en contextos donde, lo institucional, además de lo económico, parecería funcionar más como un obstáculo que como un facilitador para la integración social de este grupo particular de la población.

PAETAU, MICHAEL* (Center for Sociocybernetics Studies, michael.paetau@sociocybernetics.eu)

Money As a Medium/Form-Distinction: The Challenge of Blockchain-Economy to Luhmann's Concept of Money As a Symbolically Generalized Communication Medium.

With the emerge of „Bitcoin" since 2008 a new understanding of money arose which is a great challenge for Economic-Theory. Blockchain-Economy, based of experiences with Bitcoin says: Looking for a medium to solve the problem of the failing coincidence of wants at a certain stage of market-complexity, it was not in every case necessary to find a good which could play the role of an general equivalent to the complete world of goods on the market. It was sufficient and easier to account credits and debits of the actors of the market, and at certain point of time it was balanced. This idea turns the traditional understanding on the nature of money upside down: Money is nothing than a form of credit (or debit) represented by a specific form of currency. So Money is a sign for a specific social relation. In this view Money is not a good, it is the system of credit account and their clearing that currency represents. In his work „Die Gesellschaft der Gesellschaft" Luhmann calls the attention on the fact, that in economics the concept of money is reasoned with the facilitation of exchange but doesn't consider the medium, in which exchange take place. So – this is Luhmann's consequence - there is no reason for sociologists to take over this initial point of the economic discourse. „Probably money was generated not with respect to its intermediate function for exchange but as a sign for unbalanced performance ratios, first probably in household economies." (GdG 348) Even if systems thinking Sociology is better prepared for the challenge of cryptocurrency there are open questions. Particulary for Luhmann's Theory of Social Systems the question arise, if BITCOIN would modify the code in the sence, that a new media/form-difference could be dominant in the economic system of society.

PAETAU, MICHAEL* (Center for Sociocybernetics Studies, michael.paetau@sociocybernetics.eu)

Refugees Welcome? Mass Migration As a Highly Complex Steering Problem

The exodus of refugees in the year 2015 from Syria, Iraq, Afghanistan and different countries of Africa to Europe hits the European Union in a complicated situation, where the economic and social positions of the single member states heavily differ from each other and no consensus exists about an adequate strategy how to handle the surge of refugees pounding at Europe's gates. Finding a solution which can operate even on an approximate adequate basis, requires a way of thinking and analysis which is able to deal with highly complex and dynamic matters.

The paper proposed here, will show the potential of SOCIOCYBERNETICS to do this. It concentrates on the situation at the second half of the year 2015 in Germany, when the German government declared its willingness to accept entry of a very large number of refugees for offering them asylum. In contrary to earlier situations the German government and the German public accept that the question whether the refugees after a while will return to their homeland or not is an open question and one have to recognize that most of them will stay in Germany or another European country for the future. This presumption requires strategies to ensure the inclusion of a large number of asylum-seekers into society (and that means in all social systems) at an early stage. My paper using an observable model will show which arrangements are necessary in three different respects:

1) for different social systems (economy, education, family, health, etc.),

2) on different administrative levels (federal, single German states, administrative districts and municipality), and

3) in different time frames (immediately after arrival, within the first three month, within the first year, three years etc.).

Resilience Cells in New Orleans: Challenges and Opportunities for Socially-Optimal Housing- Reconstruction Governance Models

By focusing on the post-Katrina New Orleans reconstruction framework, the objective of the paper is to analyze the potential of the affordable housing movement as a plug-in for building new urban visions with improved resilience for the city. The analytical kernel of the analysis is housing; a material artifact that is treated not only as a noun (a commodity) but also as a verb, 'to house', the emancipatory process of housing, which is itself part of a broader process of rebuilding socio-ecological systems.

The theoretical orientation of this paper is founded mainly on a building dialogue between theorists of social capital (Bourdieu and Castells), social innovation (Moulaert), political ecology (Swyngedouw), and housing (Turner). The theoretical insights are then applied in the case of New Orleans with a historical retrospect in order to analyze how housing actors have been built in and interacted with each other over the recovery years. This provides us with an analytically significant chronological platform on which we can test how redevelopment has been variously imagined and re-imagined, shaped and reshaped in terms of narratives, policy orientations and actions.

Over the course of a six-month fieldwork, various housing groups (i.e. non-for-profit and for-profit housing developers, CLTs, CDCs) were studied with the aim to: a) understand the diversity of claims, modes of actions, and sustainability challenges; b) investigate the functional and institutional complementarity with each other (bridging social capital) and with the state (linking social capital), and c) dig out the heterogeneity of the resilience dynamics.

This heterogeneity of 'resilience cells' consequently leads the discussion towards the investigation of the 'new' role of the government in formulating relevant disaster-recovery governance models that hold a potential to accommodate the redundancy in housing actions; which could also be seen as a strategic and democratic planning tool to incubate urban resilience.

PAIVA, ANGELA* (PUC-Rio, apaiva@puc-rio.br)

Mobilizations and Social Movements in the Contentious Brazilian Public Sphere

In recent years we have witnessed several forms of protest in Brazil. June 2013 has become a kind of reference for new forms of social mobilizations and considered a watershed for contentious politics in the country. This proposal first aims to differentiate the various forms of mobilization and movements in order to understand the complexity of the political scenery. Secondly, it will be defended that the idea of rights is a powerful triggering factor to various forms of protests and is behind most of them: both to social movements based on demands of social and civil rights (such as the homeless or the gay movements), but also to several mobilizations whose motto is a diffuse list of claims which reflect the hardships of daily life in Brazilian cities. Finally, it is important to question which concepts dear to the theory of social movements have heuristic validity for the understanding of current mobilizations in the Brazilian public sphere.

Interprofessional Research Between Social Work, Biographical Analysis and Psychoanalysis with Young Women Who Experienced Violence in Their Childhood and Adolescence

How can we succeed in interviewing persons that are often out of reach for social scientists? For my doctoral thesis I interviewed young women who had experienced violence in their families at an early age and whose later childhood and adolescence were marked by trajectories of suffering through violence, drug abuse, health problems, difficulties in school and at work, as well as in their personal relationships. Establishing contact and a sense of trust with my interview partners was based on the knowledge of concepts of social work and counselling experience in combination with the methodology of biographical narrative interviewing. Psychoanalytic theory, in particular on traumatic processes, adolescence, language and drug use was essential for the analysis of the interviews. Professional experience as social worker facilitated the working alliance with the interviewees and also their narration, as trust could be built through knowledge of

the interviewees' living situation, an understanding of their migrant and language background and also of the challenges drug users face in their relations with their partners and families. Communicative skills from social work practice were a pre-condition for conducting biographical narrative interviews. Psychoanalytic knowledge such as the theory of adolescence and trauma theory was decisive for case reconstruction and developing theoretical findings. The insights of trauma theory were also essential for understanding how severe events were reported seemingly lacking emotions and for how intensely the traumatic processes influenced the interviewees' lives. Holding on to the symbolic structure of the interview setting was thus only feasible because of the psychoanalytic knowledge of trauma theory, transference and countertransference. However, the biographical theory of process structures was essential in recognizing how the young women attempted to gain control of their life situation and develop agency.

Practices of Making Active Citizens: Disciplining the Body in Finnish Youth Activating Workshops

This presentation analyses the everyday practices of activating labour market policies targeting young people. We analyse how these practices concentrate on developing the self-governance of the youth, which is put into practice through taking care of one's body, controlling time and managing sociality. Our analysis is based on ethnographic research in youth activating workshops in 2014-2015 in the metropolitan region of Finland. The workshops form part of the 'Youth Guarantee' that Finland introduced in 2013 to struggle against increasing youth unemployment and as a means to implement activating labour market policies. According to 'Youth Guarantee', a young person (16-25 years old) should be offered education, training or employment within three months of the registering as an unemployed job seeker. The official goal of the specialised workshops is to develop young people's professional and transferable skills. However, our research shows that the workshops follow a more or less implicit curriculum, which emphasises the construction of decent citizens through disciplining the body. The well-being (e.g. proper nutrition, proper amount of sleep) of the body as well as its conformity to the schedules of the society are seen in this curriculum as the basis for citizenship.

Feminist critique of the marshallian tradition of citizenship as duties and rights has emphasised that citizenship needs to be perceived as historically constituted set of rights and duties, but also as an embodied and gendered practice (Lister 1997). However, in our data the disciplining of the body and managing of time precedes rights. Thus, our conceptual argument is that citizenship needs to be understood as *a priori* embodied and practical – at least in the context of activation policies.

Engaging Climate Change in Transnational Spheres: Cosmopolitan Concerns, Local Mobilization and Environmental Civil Society in Turkey

Even though a strong societal opposition has recently emerged in Turkey in relation to environmental issues, contesting nuclear, thermal and hydroelectric power plants, urban regeneration, mining, and mega infrastructural projects, mobilization for climate change has remained limited, an issue that excites hardly any concern among policy makers and the general public. The research focuses on environmental civil society actors to address the questions of what aspects of the issue they emphasize and what channels they use to mobilize support and advocate change in relation to climate change. Crucially, the role of environmental civil society is conceptualized in interaction with transnational environmental networks. The paper analyzes the extent and nature of participation of environmental civil society in the transnational public sphere of climate change as well as the impact of the climate justice networks on the local/national context. It shows how the dynamics of local mobilization embedded in particularistic attachments can infuse with cosmopolitan concerns beyond immediate localities and borders, albeit in contested ways.

The research is built on in-depth interviews with representatives of national NGOs in Turkey that work on climate change (e.g. Greenpeace Mediterranean; The Turkish Foundation for Combating Soil Erosion, for Reforestation and the Protection of Natural Habitats; Doğa Association; Climate Network of Turkey) as well as members of selected local mobilizations (e.g. against a thermal power plant, a hydroelectric power plant and a mega infrastructural project). It will be complemented by fieldwork carried out at the COP21 in December 2015 to understand the dynamics of participation of some of these environmental NGOs in transnational spaces of climate action as well as their exchange with relevant organizations and networks.

Unemployment a Social Menace: (A study conducted in Nainital ,Uttarakhand,India)

All the leisure's of life are associated with work. Nothing shows the importance of work more than the loss of job or not being able to find one. Unemployment thus is a global hazard showing every indication of being a depressingly permanent feature of life for the foreseeable future. In India, there is a decrease in the percent of unemployment from5.20 percent in 2012 to 4.90 percent in 2013 reported by Ministry of Labour and Employment, India. This shows a significant growth in employment over the years. However, due to high rate of population growth and labour force there is an increase in the volume of unemployment from one plan period to another.

The GDP growth of India is 6.5 percent with just one per cent growth in employment. Uttarakhand alone recorded around six lakh unemployed youths (5.1 percent unemployed in Nainital) as per Directorate of Training and Employment. The objectives framed are as follows:
- To study the causes and consequences of unemployment among youth in Nainital, Uttarakhand
- To study the changing pattern of Leisure
- To suggest policy recommendations to combat unemployment

The researcher would study youth who are between (16 to 30 years), which are 25 all together constituting the universe of the study. Exploratory research designs with simple random sampling method would be used. One interview schedule will be prepared for data collection from the youth. Primary data would be collected from the youth and Secondary data will be gathered from journals, reports, libraries. Analysis of the data would be done using tables and graphs.

With no immediate prospect of a reversal in this disturbing trend and the likelihood that the continuation of high rates of unemployment in the future, it is becoming relevant to examine the contemporary influence of unemployment and leisure in life.

Economic Complexity and Creation of Non-Tradable Technological Capabilities

The technology transfer model (offer to produce knowledge / demand to receive knowledge), which is currently implemented by most developing countries and some emerging countries in Latin America, is not allowing to advance towards stages of technological and economic development, above to the already presents.

This initial hypothesis was reaffirmed in different analyzes carried out by Wu Peng Bert, Director of the Program for Energy and Environment (United Nations Development Program (UNDP), group of China), but also based on studies of evaluation about the impact of technological development, in the wealth of nations. There are strong arguments and empirical research references that show results about the negative effects that means resorting to international technology supply, through the purchase of turnkey technology and in the absence of State policies aimed to develop non-tradable technological capabilities.

Studies related with Economic Complexity, define the non-tradable technological capabilities, as a set of resources and skills related to the production of knowledge and intangibles susceptible to be quantified. This can be used for the generation of value and may appear from the education system, workforce, development of infrastructure, to scientific research and innovation activity.

In this conference, the aim is to show the theoretical composition and the impact variables related to the non-tradable technological capabilities within the international technology transfer process, which enables the development of new scientific and technological projects. In consequence, an impact on the sustained growth of GDP and the trade balance in Latin America occurs.

One of the main conclusions is that the complexity of determining the generation of non-tradable capabilities, allows developing alternative models in the field of knowledge absorption and international technology, considering aspects of economic complexity of technology and innovation.

Women's Voices in Management in Different Cultural Settings

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

This proposal is to develop the issue of gender equality through contributions to a specific table in the Roundtable about "Sociology of the Future: Braiding Theory-Making and Policy/Practice Change"

Our own **presentation** for that table would explore women's voices in management in different cultural settings – contexts emphasizing and materializing gender equality such as in the Nordic countries and in other settings less committed to gender equality such as the Mediterranean and the more traditional societies. We attempted to extend the knowledge base on the relationship between gender and top management, entrepreneurship and leadership in the complex socio-political and culturally diverse societies. Due to the combined scholarly and pragmatic orientation, it aims to derive insights amenable to implementation into economic and educational policies; namely endeavours to enhance the research-practice interface, making the knowledge obtained from research usable - be converted to operations, in particular **policy recommendations** and **training activities** and point at potential partnerships among **international forums, national and local governments and NGOs** engaged in gender equality issues.

Shaping Perceptions, Meaning and Use of Holocaust Memorial Spaces: Two Case Studies from Vienna

Along two case studies of memorial places in Vienna, Turnertempel and Judenplatz, this paper reveals two diverging conceptions and understandings of Holocaust commemoration and the particular individual commemorative practices they generate. Differences are most prominent in the way civil society and residents were actively incorporated in the decision-making process and were invited/excluded to make use of these memorial spaces in everyday life. Whereas the Turnertempel project, located in a multi-cultural less privileged residential area, stems from a small scale, local civil society initiative endorsed by the district government, Judenplatz - located in a central tourist area - was initiated by a high profile public figure and negotiated in a politically charged and press-mediated process.

In both memorial places a contemporary and abstract design language has been employed, albeit connected to different regulations and expectations of use which reveal diametrically opposed understandings of commemoration: the Judenplatz memorial does not allow people to engage with it in any physical manner (e.g. step or touch it), whereas the Turnertempel memorial encourages its visitors exactly to do that.

Drawing on data gained through ethnographic and socio-spatial analysis, this paper argues that the initial process, the design and the official regulations around a memorial have little explanatory power concerning the actual perception and use of public commemorative spaces. The quality of the wider spatial configuration and its specific location in the city, demographic and socioeconomic parameters and not least the memorial's active "promotion" by civil society activists are more important in shaping perceptions, mnemonic practices and various forms of engagement with a particular memorial space.

Status Brokers and the Regularization of Irregular Migrants in Thailand

Literature on the migration industry has begun to move beyond a limited focus on illegal activities facilitating irregular migration to more multifaceted conceptions of industry functions relating to authorized labor migration and state migration control. This paper adds to this literature by introducing the case of "status brokers" in Thailand, whose activities, spawned from state efforts to regularize undocumented migrants, serve to link irregular flows with formalized migrant labor schemes. While Thailand has signed bilateral agreements to regulate temporary migrant labor from Cambodia, Laos, and Myanmar, the vast majority of migration into the country is still unauthorized. In response to the estimated one million irregular migrants in the country, the Thai government sporadically opens registration periods in specific industries and provinces, requiring migrants to complete a nationality verification process in order to obtain documents and avoid deportation. Capitalizing on migrant needs to navigate state bureaucracies in an unfamiliar language, employer desires to hold onto cheap migrant labor,

and state efforts to manage a large undocumented workforce, a variety of brokers have emerged to facilitate this regularization process. Based on fieldwork in three provinces of Thailand, this paper examines the integral role migration industry actors of varying formality play in state efforts to manage migrant work and irregular migration flows. I argue that these actors and the services they sell serve to sustain migrant labor in several industries throughout the Thai economy in need of labor while also helping to manage a previously unauthorized and undocumented migrant population, thus serving both facilitation and management functions. Finally, I analyze the Thai case in comparison with more formalized migrant labor recruitment schemes in Malaysia and Singapore in order to characterize the varied role of the migration industry in infrastructures of migration management in Southeast Asia.

University Students' Perceptions of the Social Entrepreneurship Learning Environment

There is an avowed political commitment in most of the European countries to promote an entrepreneurial spirit through learning and training. It is accepted the potential of education systems to provide training in some of the skills required for entrepreneurship and social entrepreneurship. In Spain, in the recent education reform this objective is, with lots of critiques, strongly promoted. The 2013 Education Act state is to strength entrepreneurship for the performance of activities and business initiatives (LOMCE 2013). However, entrepreneurship is something more than just salaried employment; it is also related with social impact. Therefore, teaching entrepreneurship and teaching social entrepreneurship have some common elements but they involve different perspectives which sometimes are overlapping (DeTienne and Chandler 2004). We highlight the need to identify and make explicit the strategies specifically related to teaching social entrepreneurship. In the context of higher education, we can find numerous examples of universities that have implemented entrepreneurship extracurricular initiatives such as university-business foundations, business chairs, and programs to promote the creation of spin-offs. However, efforts in university programs to promote knowledge, skills, and abilities related to social entrepreneurship are insufficient (Palomares-Montero and Verdeguer-Aracil 2013). We would like to examine how the social entrepreneurship notion is being training and to identify knowledge, skills and abilities related to social entrepreneurship being promoted in Spanish universities. Thus, we apply a survey to students in the last course of their degrees, in the field of social and legal studies, at public universities in the Valencia region. We will know the student's perceptions of methods used in the classroom in an effort to identify perceptions of teaching and practice of social entrepreneurship.

What Makes the Difference Between Entrepreneurs and Social Entrepreneurs? a Pop up Discourse.

In the last decade, several governments are taking an active role as promoters of entrepreneurship. They have seen the value in entrepreneurial initiatives for enhancing economy development in turn of new professional careers. However, the idea of entrepreneurship cannot be limited to achieving economic benefit or alternatives to salaried employment (Mars and Rios-Aguilar 2010). There must be a commitment to create social impact. The perspective of social entrepreneurship is essential in order to have a deeper understanding and for establishing training programs adjusted to it at University. However, teaching social entrepreneurship is different from teaching business competences and it is necessary to identify which types of competences are closer to each approach. In both cases, the definition is open. There is no finite and comprehensive depiction of these phenomena and no clear understanding of social entrepreneurship (Mair and Martí 2006) and its related competences. Definitions of entrepreneurship are often tailored to fit specific purposes. The aim of this paper is to investigate how social entrepreneur people express themselves about being social entrepreneur (underlying conceptions). Thus, we should be able to identify which are the most relevant competences for being a social entrepreneur person, as well as to detect which of them clearly differentiate between being entrepreneur and being social entrepreneur, despite the absence of consensus on this topic. The Delphi technique to collect some evidences on consensus among panel of experts is carried out. The participants are people who have initiated a business or social project or who are willing with the topic in their professional career with in-depth knowledge

or experience of entrepreneurship or social entrepreneurship. To sum up, this paper tries to contribute directly to both theory and practice by providing a list of prioritized competences to characterize entrepreneurs and social entrepreneurs.

Practices for Food Waste Reduction in the Digital Age

While world population is substantially increasing, the current global market system is unable to provide effective solutions for the optimal allocation of scarce food resources (treated just like other commodities), meantime local farming systems urgently need to mitigate and adapt to climate change and the basic inadequacy of transnational policy concerning nutrition, make the food waste along the entire production and consumption chain an ever increasingly priority.

Such issue regards especially rich Western countries, where the phenomenon is not only more severe, but it becomes an ethical and social problem increasingly urgent because of the persistence of the economic crisis and the growth of inequality.

In Italy there many social initiatives to tackle such issue are being developed. The most successful are those ones that took action especially downline the distribution chain, between sale and final consumption: initiatives like Food Bank or Last Minute Market tend to develop win win network, of a social and solidarity nature, between Large-Scale Retail Trade and civil associations, while as for domestic consumption, the initiatives mostly involve education and awareness communicative actions.

The new paradigm introduced by the development of digital social networks, however, fostered innovative practices mediated by web platforms and aimed at reducing domestic food waste by means of supplying and sharing food. An example is ifoodshare.org or scambiacibo.it, which constitute a kind of extended self-organized distribution between citizens.

The objective of this work is therefore to explore the potential of this new form of distribution through a qualitative survey aimed at such digital platforms managers and organizers and users-citizens who use them, trying to highlight models of use/utilization, modality of participation, motivation, limitations and emerging social effects.

Leadership's Emotional Identity in Organizations: A Case Study of Social-Clinical Psychological Expression

In our research we study the creative personality and the emotional identity of the leadership in workplace of organizations. Social-clinical psychologists process the emotional intelligence as a "mental ability" as an 'aptitude' in common sense.

The question of the creative identity of the leadership includes some psychological theories abilities as verbal and non-verbal expression of emotions, communication with the employers and other multidimensional variables and plans.

The field research was a case study of a group of young students of the University of Athens. The hypothesis was to assess the stereotype of the current identity of the leadership and to study the active listening of the leadership reflects caring and respect of his employees. This means that there is a positive feedback from the superior (manager of the organization) to his employees.

The subjects want the head of their company to collaborate with them. Communication, responsibility, cooperation, knowledge, sociability are the words used by the students, but also have an achievement of quality goals such as creation, problem-solving, reliability of predictions, elimination of delays.

The active listening of the leadership is the most important thing for the students of our research. The words "communication", "cooperative" and "reliable" have been written 248 times (as we have seen to our figures of the statistic plan), either the leader was a third person (an ideal leader) or they imagine themselves as the leader of the company.

Leadership style plays a very important role and refers to the extent to which a leader is either relationship or task motivated. He must offer a positive feedback,

cooperation with his workgroup and create a collective common sense bands and social networks.

Euroscepticism: Migration and the Challenge to European Solidarity

Euroscepticism among European citizens has increased in the last years. Primarily, the financial crisis in association to a subsequent political crisis and a pre-existent democratic communication deficit of the EU, have nourished extreme attitudes in many member states. On the other hand, international developments such as the numerous migration flows from Asia and Africa to EU countries have aggravated euroscepticism and have questioned the fundamental priorities of member states' solidarity. Many countries follow their own political decisions ignoring the EU efforts to shape a common policy regarding the new migration waves in the summer of 2015. It seems that in times of economic and political uncertainty, national interests and national policies tend to prevail and be sustained by larger parts of the population.

Nowadays extreme right wing parties appeal to citizens because they nourish all kind of prejudices, fears (racism, anti-immigrants' stances) and rage against the marginalization of broad social strata. Some parties, in close relation to fascism theories, sustain an anti-European political program that is based on national purity and xenophobia. The migration issue tends to become a major challenge for the future integration of the EU and members mutual solidarity.

This paper aims to analyze publications adopting a Eurosceptic approach and been published during April – September 2015 in two national newspapers in Greece, Italy, Germany and France. The aim is to present common arguments and scopes of parties' political stance regarding migration flows and a common EU policy. Adequate frames will be created intending to point out similarities, differences and intentions to shape a common EU policy towards migration. Regarding the monitoring of news items we will use a combination of framing and content analysis.

PANAGIOTOU, ARISTEIDIS* (HAEF, aris@posteo.de)

The Human/Non-Human Imbalance in Science and Technology Studies: From Anathema to Exegesis.

The human/non-human distinction lies at the very heart of Science and Technology Studies. Nonetheless, there is little consensus as to how the two should be ontologically classified. Humanist accounts tend to ascribe to humans quasi-Promethean powers and downplay the significance of non-humans, while post-humanist narrations tend to conflate the two into a hybrid terminology. In this presentation I will critically examine how the human/non-human distinction is conceptualized in STS and argue that both voluntaristic and conflationist exegeses are equally unsatisfactory. By arguing that the human/non-human distinction should not be transcended, but should be sustained as an ontologically sound distinction, I will offer a different approach to the problematic by bringing closer together Ted Benton's ontological naturalism and Rob Stones' Strong Structuration Theory (SST). The presentation will argue that humans and non-humans should be placed in their broader social and natural environments and be embedded on a continuum where the relations between them are examined. SST will be suggested as a theory of action which can accommodate both humans and non-humans and can enable the researcher to perform hermeunetic and structural analyses. Specific examples which demonstrate the heuristic value of such an approach will be used.

Islam, State, War on Terror and Democracy in the Middle East

Freedom House 2015 Report (entitled "Discarding Democracy") shows a negative pattern of freedom in the Middle East, and categorizes 18 Middle Eastern countries as follows: 2 "Free", 3 "Partly Free" and 13 "Not Free". In fact, the rise of terrorism, fundamentalism and violence in the Middle East in recent years, along with the gradual decline of the course of "democratic revolutionary waves" in the region (December 2010 to mid-2012), is evident in the region. Thus, some political theorists suggest that the current conditions may lead to the re-enforcement of authoritarian rulers in the region. However, others believe that the democracies with higher "State Capacity" may survive these detrimental situations. Besides,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

one should consider the role of the so-called "war on terror" in this regard, to see whether it contributes to the rise or decline of democracy in this region.

To answer such question, we believe that the "history" of regional political conflicts might shed some light on this issue. Hence, we consider three themes in this paper: First, we discuss the role of Islam in the regional political developments. Second, we use both historical and institutional analysis to explain the role of State in the future of democracy in the region. Third, we focus on "WOT", "Globalization" and "Post-National" theories in which apparently state has lost its classical role. Our findings show that, the future of the peace, stability and democracy in the Middle East would not be achieved through WOT, but through moderate explanation of Islam and development of democratic political institutions.

Women's Resources and Their Political Efficacy in Iran

Many studies reveal that women have lower internal political efficacy than men, which affects their political participation. Surprisingly, it is shown that this gender gap persists despite women's increasing participation in workforce and higher education. Few efforts have been made to study and explain women's internal political efficacy in some western countries, such as the United States. However, the situation of internal political efficacy of women in the developing nations, like Iran, is yet to be studied. The aim of this paper is first to find out the level of the internal political efficacy of women in Iran, and then try to explain it through the resources available to them, such as income, political knowledge and free time, and other variables. The data was collected from a sample of about 700 people from the population of the Tehranian women aged 18 and more, using a questionnaire. Our main hypothesis was that the higher the level of the resources of women, the higher the level of their internal political efficacy. Our descriptive findings indicated that from our respondents 25 percent had low, 52 percent had medium, and 23 percent had high level of internal political efficacy. In fact, about 70 percent of our respondents believed that women had equal or higher capacity than men for political activities, which is quite impressive for a developing society. Explanatory findings revealed that the women's overall resources (including their political knowledge, free time, and income) had significant impact on their feeling of political competence. Other variables, including political attitudes, political experience, religiosity, and reference groups also had significant impact on their internal political efficacy.

Key Words: Political efficacy, Iranian Women, Women's resources.

Cyberspace and Intimacy: Maintaining Cross-Cultural Relationships at a Distance

This paper examines how online cross-cultural couples maintain love and intimacy at a distance. It draws on Thai women's experiences in dealing with and negotiating the process of moving in and out of the physical co-presence of their Western partners. The study considers emotional experiences connected to the absence of loved ones through the dominant perspectives of theories of emotion constructionism. I argue that intimate relationships are not only constructed through physical interactions between the two partners, but are also stretched across space and time. Thus, in order to maintain relationships at a distance, cross-cultural partners have to enact some behavior in order to preserve a sense of being in a relationship given the discontinuity between physically co-present interactions. The ability to access to new communication technologies increases the obligation and desire for regular and frequent contact. The exchange of virtual co-presence between cross-cultural couples can create more abstractly imagined forms of love and emotional care. It enables imaginary co-presence and allows cross-cultural couples to articulate their interdependence within their everyday lives and to create a sense of togetherness when physical co-presence is absent or non-existent.

Ethnic Identity and Everyday Life: Madheshis and NON-Madheshis in Nepal's Eastern Tarai

This paper is an excerpt from the PhD research on ethnicity and everyday life on the backdrop of ongoing ethnic contention between the Madheshis (Indian origin) and non-Madheshis (Hill origin [Pahadis]) in Nepal's eastern Tarai. Interaction between the people of Madheshi and non-Madheshi ethnic background when taken as a part of everyday life of the people living in an ethnically mixed setting needs to be studied with a different lens. The research brings out the idea of "ethnic intersection" from the study of the everyday experiences of the Madheshis and non-Madheshis. Ethnic intersection simply refers to where the elements of two different ethnicities/ethnic identities crosscut or are shared. The idea of ethnic intersection unearths the greater possibilities of commonalities of, and interdependence of ethnic elements despite the impermeability of the boundary between them. The preliminary finding illustrates that ethnic intersection is a conceptual category that could be employed to understand various dimensions of inter-ethnic contact, communication, dependence and co-existence. Furthermore, there are several predefined domains with their specific attributes that provide the space for the intersection and dissection of certain ethnic elements.

Precarious Stateness: How Construction Workers in Beijing and Delhi Navigate Informality in Claim-Making

The construction sector is a key driver of economic growth in both China and India, and the largest employer of internal migrant workers in both countries. Yet practices of subcontracting, endemic within the construction sector, give rise to problems of informality which severely undermine this huge population of workers' means of claim-making. Within the lower echelons of the subcontracting hierarchy, agreements between construction workers and petty subcontractors are largely verbal. Without any written contracts, however, workers face difficulties in establishing formal labor relations between themselves and their employers, and, in turn, obstacles in accessing labor protections from the state, or social protections predicated on documented labor market participation. Based on a comparative ethnographic study of construction workers in Beijing and Delhi, and more specifically, through tracing citizen-state interactions in instances of rights contestation, this paper argues for the central role played by the state in constructing categories of informality which relegates certain market practices, and with them, citizens on whom these practices are imposed, to outside the purview of the state. Furthermore, the comparison between the experience of construction workers in Beijing and that of workers in Delhi highlights the distinction between *exogenous* informality, arising out of the construction of boundaries of stateness, and *endogenous* informality, arising within the realm of stateness out of jurisdictional fragmentation. I argue that, whereas construction workers in Beijing are hindered from making claims upon the state due to *exogenous* informality, that is, falling outside the purview of the state, construction workers in Delhi are doubly burdened both by *exogenous* informality and by *endogenous* informality.

PANNEWITZ, ANJA* (HTWK Leipzig - University of Applied Sciences, anja.pannewitz@htwk-leipzig.de)

Material Spatiality As Condition of Female Violence. Qualitative Analysis Regarding Biographies of Young Female Offenders

Gender and violence tend to be negotiated in a restricting and stereotyping way. Not only a dichotomous construction of gender, but also the gender related generalization and homogenization of violent experiences – „women" as victims, „men" as perpetrators – reveals a normative reference to reality. Both deny as well the actually and constantly appearing polymorphy of gender identities in everyday life as individual life courses and experiences of violence.

In this context I will investigate the conditions of female actors in violent action, to understand how and why teenaged "girls" or "women" act violently: What does self-exercised violence mean for them? How do they arrange it in their own biographical context? The main focus is set on material spacial conditions of female violence: To what extent do spacial structures and realities in houses, apartments, residential communities or in public transport etc. have an impact on individual or collective, verbal or physical violence? How does space possibly promote violence against the own child, a flatmate or against an assaulted man etc.? And how is spacial structure woven into the individual treatment of self-exercised violence by the authors?

These questions I will follow by showing selected empirical material about violent teen „girls" and „women", that was collected by students of Social Work within a teaching research project from october 2014 till july 2015. At sequences from narrative interviews, which were analyzed by Grounded Theory, I will show spacial living environments as intervening parts of female life courses and violence.

How Do Individual Normative Attitudes Influence the Childbirth Between Two Waves of Ggs in Germany, France and Bulgaria

Based on the 1st and 2nd wave of the Generations and Gender Survey (GGS) data this paper provides comparative analysis of fertility and individual attitudes

towards children in Germany, France and Bulgaria. The aim of this paper is to answer the question of how different aspects of normative family attitudes influence the birth of a child and how this link differs in the above mentioned countries. It takes a cross-cultural as well as cross-national perspective to explain fertility transitions. Observing three different societies allows a broader view which enables us to better understand how culture influences fertility. Furthermore this can contribute to explain the differences in fertility behavior between these countries. Germany and France both fall under the category conservative countries (Esping-Andersen 1990), however they differ in their structural family policy, childcare facilities und fertility patterns. The involvement of Bulgaria in the analysis provides an interesting east-west comparison regarding the link between cultural attitudes and fertility. This paper focuses on individuals between 18 and 45 years and analyzes a total of 9,387 men and women. The multivariate analysis is carried out using logistic regression. In addition to the overall sample with country as additional control variable, analyses are carried out for each country separately, revealing the influence of individual attitudes on fertility behavior. The main dependent variable is the transition to a/another child. It is operationalized as the birth of a child between wave 1 and wave 2 or current pregnancy at the time of the second interview. The explaining variables are attitudes towards children and family based on the Theory of Planned Behavior. The current study provides new insights into the link between individual attitudes towards children and the childbirth. It also reveals cross-national differences in the relationship between attitudes and fertility behavior.

FRATSEA, LOUKIA-MARIA* (Harokopio University of Athens, fratsea@hua.gr)

"Putting Their Lives on Hold': The Adventurous Path Towards Migrant Integration into Greek Society

By the mid-1980s Greece entered into a period of transition *vis-à-vis* migration. Emigration was gradually replaced with immigration from "the Balkans" as nearly three quarters of immigrants came from Albania, Bulgaria and Romania. Recently a 'new map of European migrations' was unveiled, where new migrant flows originating from Africa and Asia are passing through Greece to reach Europe.

While the development of Greek migration policy paved the way for better integration prospects into the labor market and society, migrants' aspirations and expectations where "put on hold". Even before the start of the economic crisis, the record of migrant integration policy was significantly poor, while half decade later there are limited improvements.

In the midst of the most severe recession, migrants are amongst the most vulnerable groups and usually the hardest hit by the economic crisis. Rising unemployment rates of migrants are accompanied by rising anxiety about the future labour market opportunities. Job scarcity fuels competition in labour markets, while migrant workers are much more likely to take up precarious jobs and to endure poor working conditions regardless of their qualifications or education.

The paper aims at deciphering the various features of migrant's journey to Greece, by analyzing their aspirations, their motivations, and the challenges that migrants face. First, the paper elaborates on the available statistical data about immigration in Greece and then will critically review the current migration and integration policies. Next the paper draws from various research projects that were carried out before and during the economic recession in order to juxtapose migrants' expectations and challenges that they face in Greece today. Both quantitative and qualitative data are utilized offering a more integrated picture of migrants' experiences and problems. Finally, the paper will focus on current migration policy issues to be tackled both by policy-makers and local societies.

Migrant Labour, Casualization of Work and Social Clashes in Greek Agriculture: A 'Post-Crisis' Aftermath

The study of rural social structure in Greece unveils a diversity of family farm types which are gradually transformed into farm businesses or subsistence family units, while new social strata emerge due to the presence of migrant labour which is employed as regular or seasonal labour force. However, large number of migrants and segments of the indigenous population are increasingly affected by the casualization of labour in agriculture, which has significant repercussions upon the intensive agriculture systems and the well-being in rural areas.

Migrant labour has been of immense importance for increasing agricultural productivity in labour intensive agricultural systems, while its impact in local societies and economies has been highly disputed. The hierarchy of migrants, the ethnic division of labour, the employment conditions and the increasing antag-

onisms/ conflicts between migrants and farmers are major issues which will be discussed in the paper.

In Greece the 'return to the countryside' movement, which is considered by some commentators as a side-effect of the economic crisis, is related mostly to the reproduction of urban consumption patterns and less to an agrarian way of life. Migrants are those who are destined to carry out the manual tasks, while the returnees just like the farmers aspire to higher status jobs or to managerial tasks within agriculture.

The paper is based on a systematic analysis of the available statistical data provided by the Greek Statistical Service and also on empirical data collected at different time periods - before and during the economic crisis, in rural Greece. The focus of the paper is to compare the situation in Greek agriculture before and after the economic crisis, with the expressed aim to look at how migrant labour is incorporated into a constantly changing Greek rural society and economy.

Kill Brother: A Hegemonic Discourse of the Russian Aggression Against Ukraine

Immediately after the second "Orange Revolution" in Ukraine, Russia has started a massive hybrid aggression against Ukraine, which includes, along with a limited military component, a massive propaganda offensive. Through this offensive, Russian authorities are seeking to impose on Russia, Ukraine, and the international community a very specific hegemonic discourse, which should to legitimize the right of Russia to control Ukraine and to delegitimize the Ukrainian authorities and Ukraine as a state.

Like the Russian aggression against Ukraine itself, its' discourse is hybrid. It combines elements of the official Soviet discourse of Brezhnev's epoch with elements of archaic Russian religious-political discourse on the Russian State as the sacred center of the world's only true religion – the Russian Orthodoxy.

In accordance with presuppositions of the Soviet discourse, Ukrainians are officially described as "our brothers", "a fraternal people" (the true value of this Soviet euphemism is 'subordinate people'; the Soviet intervention in Czechoslovakia in 1968 was officially named "a fraternal aid"). At the same time, the Ukrainian leadership is stigmatized as "junta", "fascists", and agents of the Americans/the West. The existence of the separate Ukrainian nation is negated, and the denoting this nation ethnonym is deliberately distorted (Ukrainians refer as "*ukry*" and "*ukropy*" [the Russian "*ukrop*" is *dill* in English]). Ukraine is symbolically interpreted as a brother that should be killed.

In the framework of discourse on the sacred Russian State, the Ukraine is interpreted as a part of the sacred Russian State. Several traditional Orthodox religious symbols, which are geographically associated with Ukraine, are systematically confiscated in favor of Russia (in this purpose, for example, the President Putin personally retold the old legend that Saint Vladimir, the Grand Prince of Kiev who converted the ancient Rus' in Orthodox country, was baptized in Crimea, i.e. on the territory of Russia!).

The Unintended Outcome of Emotions within Social Movements: Division of the Movement for Food Sovereignty in Mexico.

There is a large scholarly literature on networks and coalitions within and between social movements, but we know little about why and when movements divide. This paper analyzes the division of the Movimiento por la Soberanía Alimentaria (Movement for Food Sovereignty) in Mexico into two different movements that differ strongly on their social constituency and their strategic decisions. It is argued that the division of the movement was an unintended outcome of the movement´s dynamics based on emotional responses of leaders to unexpected political events, and on the constituencies' response to these actions. Arguments are based on interviews with leaders and grassroot members as well as on direct participation in both movements for a period of two years.

Life Course Perspective on Return Migration: Coming Back from Spain to Cochabamba (Bolivia)

Return migration has received increasing attention in recent years, both from the political and academic discourse. Because of classical approaches and the tra-

***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

ditional way of understanding the phenomenon, the return migration has been analyzed as the last phase of the migratory project, isolated from the rest of the biography of individuals. The complexity of the contemporary migrations along with the current economic crisis in Southern European countries with a strong impact on employment rates have challenged the traditional analytical frameworks on return migration.

In order to overcome these approaches, the current paper aims to analyse the return migration from a transnational approach, including as an analytical and transversal tool, the life course perspective (Elder, 1994, 1995, 2003). More specifically, the objective is to reconstruct migratory trajectories of returnees from Spain to Cochabamba (Bolivia) in order to understand the role played by the economic crisis in their overall migratory trajectory. The proposed analytical framework seeks to understand how the four principles (agency; time and space; life-span development, and the principle of linked lives) interact to each other to macro, meso and micro level and generates transitions and turning points in the life of individual biographies. Based on twenty in-depth interviews with returnees from Spain to Cochabamba (Bolivia), the paper shows how the return phase connects with previous and forthcoming phases in the biographies of people and to which extent the economic crisis in Spain draws different scenario for the returnees depending on the configuration of the four principles of life course perspective. Our data come from two research projects led by GEDIME/CER-Migracions, Authonomous University of Barcelona: "Return from transnationalism, 2011-2014" and "Return Migration and Re-emigration: New migratory dynamics of Moroccans and Bolivians and the challenges for the mobility management, 2014-2017", both funded by the Ministry of Economy and Competitiveness of Spain.

PARFITT, EMMA* (University of Warwick, e.l.parfitt@warwick.ac.uk)

A Managed Heart in Relation to Storytelling: How Education Policy Shapes Young People's Perceptions of Emotion.

Literature searches indicate that Hochschild's theories of emotion have not been linked to oral storytelling in an educational setting. In *A Managed Heart* Hochschild researched how flight attendants at Delta Airlines managed emotion. Hochschild proposed that people were trained to manage emotion in the workplace. This paper explores Hochschild's theories in the context of educational policy and oral storytelling.

A storytelling space was created in three schools in the UK, Warwickshire, in 2013. Analysis involved NVivo coding of storytelling and focus group sessions one hour long, over five subsequent weeks, with young people from 12-14 years. In total, there were six groups of four children, of mixed ethnicity, ability, and socio-economic background. The students' conversations were recorded and transcribed for empirical analysis.

The findings suggest that English literature guidelines, set by the Department for Education, influenced the students' interpretations of emotion. There were significant similarities between educational guidelines and the way students discussed oral storytelling. For instance, the students connected character motivation to emotion reflective of an educational approach (a standardised way to interpret classroom texts such as *Romeo and Juliet*). The students identified a character's emotional 'motivation' and linked this to 'actions or events' in a causative way. Through Hochschild's work parallels can be drawn between 'how society uses feeling' (2003, 17) and how individuals might be educated to use feeling through Governmental policies like the National Curriculum. The analysis indicates that oral storytelling is a useful method for exploring the theories of Hochschild in a social context. If education influences the students' analysis of texts, and the analysis of oral storytelling, similar aspects of interpreting behaviour and emotions might arise in other situations in the students' lives. In this way education might have structural influence over students' emotional connections, and potentially, the negotiation of social relationships with others.

The Gendered Nature of Vulnerability: Evidence from Natural Disasters in India

The magnitude of the impact of natural disasters affects mostly the marginalized sections of the society because of their limited adaptive capacity. In case of women, the ideology of cultural-cum-material patriarchy forces them to be confined to the private sphere of life and the gender-based inequalities make them more vulnerable to disasters. Gender-based behaviours and stereotypes influence their coping capacity to natural disasters which have different means for the contribution to disaster risk reduction. The paper attempts to present a comprehensive literature on gender and disaster in India within the context of disaster management cycle, particularly evidenced from recent three major disas-

ters in India and aims to shed light on some issues and challenges relating to the integration of gender perspectives in disaster risk management in India.

PARK, JIN WOO* (Sogang University, jeja12777@gmail.com)

Conflicts Between Religions in the Public Sphere : The Problem of Validity Claims and Social Integration

What is the main role of religion in the public sphere? Scholars have viewed the issue from varying perspectives: functionalists (Parsons) and system theorists (Luhmann) tend to emphasize integrative forces of religion for the whole society, whereas the concepts of public religions (Casanova) and resistant religions (Smith) highlight the tension between church and state. In particular, how are the roles of religion manifested in the public sphere of a post-secular society?

This research addresses the conflicting roles of religion in the public sphere of Korean society, focusing on the recent case of a tragic failure of public safety (the Sewol ferry disaster on April 16, 2014). Utilizing qualitative methods such as participant observation and in-depth interviews, I selected Catholic and Protestant churches and examined the pro- and anti-government stances that church members took following the incident.

Each group employed different meaning systems by which they justified the validity of their respective claims – for instance, theodicy versus anthropodicy, patriotism versus humanitarianism, priest type versus prophet type (Weber), and nation-oriented civil religion (Rousseau) versus transcendental-principle-oriented civil religion (Bellah).

In addition, I found that religion does not remain in the private sector of society, but rather plays public roles both in integrative and disruptive ways. However, the different roles of religion have "elective affinity" with the different goals of a social system. Therefore, how the meaning systems of religion are interpreted in the whole contexts of social systems will color and signify religion's social implications.

Sexual Discourses and Religious Conflicts in Post-Secular Korea : Dialogue about Queer Festivals

What age qualifies as "modern times," and what is the main role played by religion during this period? Scholars have proposed various views of the modern age: Hegel spoke of religion from a secular perspective, and Burger suggested discourses of desecularization. Recently, Habermas popularized 'post-secular' arguments featuring separation between the spheres of faith and reason. Specifically, how are the roles of religions manifested in a post-secular society?

This research addresses the "conflicting roles of religions" in post-secular Korean society, focusing on one case of a sharp conflict of sexual discourses (Korea's queer parade held on June 28, 2015). Utilizing qualitative methods such as participant observation and in-depth interviews, I divided study participants into a secular group and religious fundamentalist group and examined their stances supporting and opposing the homosexual discourses.

Each of the two groups employed different meaning systems by which they justified the validity of their respective claims. For example, their colliding belief systems – religious fundamentalism versus humanitarianism (human rights) – aggravate their deep-seated discontinuity. In these circumstances of fierce conflict between religious- and secular-minded people over a single issue, what prospects lie ahead?

I found that this stark separation was caused by the gap between the desecularized religious group and secularized rational group. Further findings indicate that their troubling was inevitable, and in the absence of immediate endeavors toward discussion, societal disintegration worsened. Also, in terms of seeking a novel public path in this struggle, possibilities for peaceful dialogue and tolerant coexistence between the two groups are revealed, based on the post-secular argument of Habermas. Based on these findings, I propose that it is adequate in the post-secular age to embody the public meaning of individual beliefs and the whole contexts of social systems, rather than maintaining only the private aspect of meaning systems.

Friendship Networks and Satisfaction with Life Among International Exchange Students in a Korean University

South Korea, which has been one of major origin countries for international students especially in the United States over the last several decades, has become

one of preferred destination countries in Asia in recent years. The number of international students in Korean universities totaled 84,891 in 2014. Undergraduate exchange students show much more diversity in terms of students' backgrounds such as origin countries, languages, religious and other cultural backgrounds. So far many studies on international students' life experiences have examined students' satisfaction levels or their well-being, focusing on the number of local friends that they make in the new land.

This study aims to explore the relationship between friendship networks and satisfaction with life among international exchange students in a Korean university. Using a survey (N = 128), which includes approximately 70.8% of all the exchange students program participants in a selected university, this study applies the cohesive blocking method (Moody and White 2003) to measure the extent to which individuals are embedded in the exchange student community. The analysis comes up with two important findings. First, while the number of new local friends (i.e. Koreans) that these international students made is an important factor in estimating their satisfaction of life, the number of new non-Korean international student friends also has significant influence on their satisfaction of life. Second, in estimating students' satisfaction with life, the embeddedness in overall international student community is a better predictor than the number of new friends that they made. Based on these findings, this study will discuss the implications of structural position in friendship networks.

PARKER, JENNIFER* (Pennsylvania University, jpt7@psu.edu)

Between Giant Corporate Retailers and Family Food Economies: A Focus on Mothers as "intermediaries" in India's Neoliberal Development Strategies

This paper discusses findings from a qualitative study (involving interviews and survey data) that targets mothers as agents of change in shifting food and eating practices in urban India resulting from the growing presence of multinational eateries and a new consumer culture centered on corporate branding, shopping malls, and fast food.

Although a growing literature explores changing consumption norms in India as an outgrowth of neoliberal development strategies there has been no specific focus on the role of mothers in facilitating or resisting these changes. Furthermore, there has been no direct focus on how mothers' own degree of influence on the family diet has changed with the growth of the neoliberal state.

This paper views mothers as "intermediaries" experiencing and negotiating change between giant corporate retailers and traditional family food economies. In this way we are able to examine from mothers' own experiences and perspectives on 1) how the structure of eating has changed, 2) shifts in the family diet with the growing availability of alternatives, 3) concerns and conflicts in the family as a result of these changes and specific strategies mothers employ to negotiate them, 4) perceptions of the causes and culprits of dietary change, 5) how mothers' own power and influence on the family diet have been affected, 6) shifting gender relations within the family.

A particularly concerning outgrowth of neoliberalism has been the sharp increase in health problems in India such as obesity, diabetes, and cardiovascular disease that have been tied to lifestyle and dietary changes. Viewing mothers as intermediaries allows us to examine the intimate processes by which neoliberal social transformations take effect. It also allows us to see mothers as key agents in how public policy aimed at remedying the ill effects of the neoliberal food economy could be designed and implemented most constructively.

De- and Re-Constructing Violence with Residential Care Girls

Since A Black Feminist Statement by Combahee River Collective (1985) various women' group have made claims to change their unjust oppressive realities. Empowerment is considered as a practice of sharing power with participants so that they can take over their own life and make initiatives and decisions related to it to improve their own agency in life. Empowerment is based on the idea that supporting the self-development and holding people accountable for outcomes of their actions, will contribute to their competence and further their participation.

In this article we elaborate empowerment of young women who live in residential care institution especially in relation to violence-free life. In general, young girls experience violence in several life sectors. However, the girls who are living in residential care institutions are particularly vulnerable due to their age, gender, race, and their previous and often cumulative victimization to various forms of violence.

We benefit from the main results of our participatory research on violence experiences of the girls in residential care institution when building the empowerment program. In our study, the residential girls' authenticity and feelings of be-

longing appear as the ability to share one's experiences and display vulnerability, which would in turn support their individual imaginative and thinking processes in terms of gender violence recognition and protection. We also considered the ability to relate or re-label one's experiences to be a strong aspect of empowerment.

It became evident that to understand the gendered construction of violence, and to be successful in de- and reconstruction of girls' conception of violence, we should take sexism into account in the design of empowering education. Therefore girls were provided a possibility to belong for a group and to receive an alternative experience for learning, sharing and caring.

PARRACHO SANT'ANNA, SABRINA* (UFRRJ, saparracho@gmail.com)

The Creative District in Rio De Janeiro and the Rio Art Museum As Trading Zone

Since 2009, when Rio de Janeiro was announced as host city for the 2016 Olympic Games, many urban design projects have been proposed. In the wake of this process, building a creative cluster in the harbor area was presented as the most lasting legacy left for the city. Founded in 2013, the Rio Art Museum was presented as the showcase for the major project formulated by the municipality, but it has also been, since its opening, the target for criticism of different sectors of civil society, who saw the institution as the symbol of a process of gentrification and commodification of the area.

Presenting itself as a key institution in the cultural agenda of Rio de Janeiro, the museum set the stage for contest between different players and created a trading zone for different meanings of city. On the one hand, its role as political agent in the urban intervention is undeniable. Sticking to the original plan, the exhibitions increasingly expanded public have served to give visibility to the region and radically changed the profile of the area. On the other hand, the museum, created in a moment of raising protests in the city, has shown a major number of exhibitions that took urban policy as a point of criticism and discussion.

Attracted by the institution, different players have been negotiating, through contemporary art, the future of the city that hosts the museum. This paper aims to discuss how the institution has incorporated discourses, dissolving contention in a same architectural image which is, nevertheless, defined by its exhibition value.

Cosmopolitan Taste As Cultural Capital. Native Consumption in Immigrant Grocery Stores in Vienna

In many European cities, immigrant grocery stores with their manifold repertoire of "ethnic" food do more than satisfy the needs of migrants. They have become increasingly important for members of the majority population. By drawing on recent debates within the sociology of cosmopolitanism and cultural studies, a recent project at the University of Vienna examined the consumption practices of natives in immigrant grocery stores in Vienna. This paper presents the outcomes of this project and outlines the role of cosmopolitan taste within these consumption practices. The analysis of 31 in-depth interviews and 15 go-alongs with native customers in various immigrant grocery shops in Vienna showed that native consumption is based on several frames of evaluation, including "nostalgia", "authenticity", "patronage" and "cosmopolitanism". In this presentation we will focus on the latter, highlighting the importance of the senses for meaning-making-processes within cosmopolitan consumption. "Cosmopolitan taste" encompasses implicit meanings and imaginaries related to sounds, flavours and scents of the imagined "otherness" and "alterity". However, while we do acknowledge that this kind of "local cosmopolitanism" may facilitate cultural exchange, we want to emphasize that cosmopolitan taste also contributes to strengthening symbolic boundaries along class. It is mainly displayed by members of the privileged classes, who use their openness as a form of cosmopolitan cultural capital, resulting both in symbolic distinction and the demonstration of social superiority. We want to argue in favour of a more comprehensive understanding of consumption practices taking into account the effects of cosmopolitan taste on the (re-)production of social inequality.

PARZER, MICHAEL* (University of Vienna, michael.parzer@univie.ac.at)

Shifting Symbolic Boundaries on Cultural Markets. Entrepreneurial Strategies of Immigrant Musicians in Austria

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

This paper explores the strategies immigrant musicians apply to actively address members beyond their "own" community. By drawing on the findings of ethnographic research on immigrant musicians in Austria, I present a typology of presentation and marketing strategies. The strategies may make use of ethnicity ("authentic Turkish music") or draw on the recent political discourse on integration ("intercultural communication" and "art as a bridge between communities"). However, there are also forms of marketing which try to resist the commodification of ethnicity: By presenting their work as "cosmopolitan art", musicians avoid being stigmatized and categorized as "ethnic" or "migrant". These ways of positioning one's artistic work on cultural markets shed light on the ambivalent position of immigrant artists between the strategic use of ethnicity and their migration histories for commercial reasons and the negative implications of this commercialisation by (re)producing ethnic stereotypes and categorisation. The findings contribute to recent debates on the role of migrants' artistic practices in the making and unmaking of symbolic boundaries between minorities and the majority population. Additionally, I will exemplify in this paper the application of an immigrant-business-perspective on artistic production of migrants and show how it reveals the interplay between economic and cultural aspects within fields of immigrant artistic production.

Vernacular Epistemologies of Risk: The Crisis in Fukushima

On March 11, 2011, an earthquake of a 9.0 magnitude set off a tsunami that destroyed Japan's Fukushima Dai-ichi power plant. The International Atomic Energy Agency assessed the meltdown on International Nuclear Event Scale (INES) as a 7—a classification shared only with the Chernobyl Nuclear disaster in the Ukraine in 1986. Amid the dramatic transformations to the natural, built, and social environments brought about by these events (known as 3/11 in Japan) the ensuing epistemic changes arising from this disaster have been less obvious but perhaps no less profound in their consequences. With a specific concern for the epistemic crises emerging in and through the representations of 3/11 my analyses illustrate the variety of ways through which public health risks and their implications were constructed. It is based on a comprehensive collection of all articles published between March 11, 2011 and March 11, 2013 about the Fukushima disaster in four of the most prominent media outlets in the United States: the *Washington Post* and *The New York Times* and two nationally prominent blogs, *Politico* and *The Huffington Post*. In particular, I examine the practices through which these U.S. media constructed the presence and meaning of public health risks resulting from the nuclear meltdown. My analysis draws from poststructural discourse analysis generates complex ways of thinking about the relationships between the symbolic and the material, the empirical and the theoretical. I argue that the media produce vernacular epistemologies for public discourse that constitute not only particular kinds of knowledge but also particular kinds of global citizens in the service of dominant economic markets and political landscapes.

PASCUCCI, ELISA* (University of Tampere,
Elisa.Pascucci@staff.uta.fi)

Community Infrastructures: Ethnicity, Self-Reliance, and Refugee Governance in Cairo.

Over the last two decades, community-based interventions have become an important tool of migration and refugee governance at a global level, thus attracting increasing academic attention. Governmentality approaches have argued that, through the notions of 'community' and 'self-reliance', the same liberal rationalities of government applied to advanced liberal societies are being translated into technologies of governance for displaced populations. Other accounts have highlighted the potentially emancipatory character of migrant and refugees' self-organization, focusing on the productive and liberating effects of 'community', as always pre-existing and exceeding attempts at governing it. Drawing on ethnographic research conducted in Cairo, Egypt, among Sudanese and Ethiopian organizations, this article theorizes community as a socio-material infrastructure encompassing both human and non-human elements such as ethnic identity, relations of care, and material and financial aid. In Cairo, it is shown, community and ethnicity-based infrastructures are mobilized by refugee leaders not only in the professionalized provision of basic services coordinated by international humanitarian agencies, but also in collective protests in which the work of those very organizations is contested. The analysis contributes to two emerging debates in critical migration scholarship. First, it adds to the understanding of the role ethnicity, identity, and self-reliance play in contemporary governance assemblages in which humanitarianism intersects with the government of global mobility, and which can be identified as local arrangements of the global migration industry in the developing world. Second, highlighting how the relation between refugees and governance agencies encompasses elements of both dependence and autonomy, it resonates with recent literature that theorizes border and migrant struggles as sites of political ambiguity.

NICHE TEIXEIRA, ALEX (Federal University of Rio Grande do Sul)

Horror, Crime and Violence As Entertainment: A Brazilian Case Study

In April 2014, the corpse of a eleven-year-old boy, Bernardo, was found buried in a ditch in Frederico Westphalen, a country town of the southern Brazilian state Rio Grande do Sul. The history dominated the news media nationwide, in all its forms.

We believe that, in social representations of the phenomenon of violence, it is important to consider those produced by the mass media, which act as powerful instruments of "social construction of reality". Considering this perspective, this study aims to examine how the murder was approached and represented by the southern Brazilian leading newspaper: *Zero Hora*. The assumption underlying our research is that the fact was offered to the public as a novel divided into chapters, capturing the reader until the final upshot of the plot.

The tabloid treatment, i.e., the novel in serial, snatches the reader, commodifying the news to turn horror into a kind of show. Violence is represented in a spectacular fashion, that is, from a logic of visibility, sensationalism and trivialization, which on the one hand, contributes to the newspaper's sales and, on the other, concurs to the production and dissemination of a culture of fear with no social roots. As if these episodes were the result of a diffuse "evil" hanging over society, as if there were no social and historical factors involved in the production of violence.

We intend here to question the way press builds the senses of violence from certain discursive formulations which legitimate practices and policies that can act as obstacles to a more accurate understanding of such a complex phenomenon.

Laws to Prevent Trafficking of Women and Children in Disaster Prone Areas in India

Understanding of social construction of gender is significant in disaster related study as the two sexes experience disaster in different intensities. In any disaster, if analysed closely the vulnerability of men and women with respect to their capacities and options available to them during disasters differ in character and scale according to their gender. In the Indian sub-continent the places where there is recurring occurrence of floods have become epicentre for violation of human rights and indeed human dignity. While understanding the trafficking problem in the disaster hit area, it is important to note that it is a means to some end, for the family selling the children a means to come out of desperation in the poverty stricken situation although it does not result in the same. And for the trafficker a means to economic benefit. The critical is transaction of money and physical transportation of a person in different geographies unwillingly or ignorantly that ends up in exploitation. Although trafficking is a violation of Human Rights but during rough times it becomes a means to fight one's poverty trappings. The trafficking some time is myopically understood as synonymous to prostitution although some times the trafficked person ends up in sex tread mostly girls and women, it much more than sex business. However the social cognizance and a resistance to this social evil has not been notice apart from institutional mechanism to protect victims. Many organizations and institutions of law are working to deal with the problem. Although the efforts seems not yielding the required results as the issue is getting bigger and bigger. Through this study the researcher is trying to discuss that trafficking is not merely a question of law but it is an issue of complex reality of poverty, illiteracy and vulnerability.

Women and Vulnerability during Disasters: From Policy Perspective

In the recent years, the world has viewed in horror the kind of destruction and havoc that have taken place across the countries caused by natural disasters. Although these events might have taken place under various circumstances, there is a common factor which binds them under a similar platform, which is, that majority of the victims are women, children, elderly minorities and the disabled. In disaster related literature it is clearly expressed how the social structures and roles produce extensive human suffering and differential impacts. Social vulnerability reflects to how social, economic and political factors influence the extent to which the different communities in the society experience the impact of a disaster. The

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

existing social order discriminates among different social groups in the normal circumstances of life. So during disaster the power system of the social order operates in such a way that disadvantaged groups becomes vulnerable. Women in normal circumstances in life face difficulties to access resources where the social norms determine their mobility and access to resources. Presently none of the policies have looked seriously into the gendered aspects to design policies that would protect women from the vulnerabilities caused by disaster. This paper is an attempt to understand vulnerability during disaster from gendered perspective and how the different programmes and policies over the years have failed to address the same. Whatever feeble effort that policies have made has not resulted in preventing women from suffering. Hence this study will be an effort to understand these gaps in policy discourses and contribute in future advocacy of equitable policy making and planning with respect in disaster management.

How Do Wealth and Attitudes Towards Wealth Distribution Correspond? Contrasting and Complementary Typologies Based on Objective and Subjective Measures from the Hfcs.

Recent studies show the unequal distribution of wealth among Austrian households, a diagnosis that certainly holds not only for Austria. A sociological question in this markedly economically led debate is, how the distribution of wealth corresponds to attitudes towards wealth and its social distribution. The data of the European Household and consumption survey (HFCS) improved the data base for wealth research substantially. The HFCS data comprises detailed information on income, wealth and debts of national probability samples of households of the Eurosystem as well as sociodemographic, educational and occupational information on the household members. Beside the household's real and financial assets that are surveyed in detail a number of attitudes i.a. towards the social distribution of wealth, justice, self estimation of the social position, risk and trust were measured. Robust cluster analysis algorithms were used to construct eight household types according to the household's specific combination of wealth of different types (Reinprecht, Paulinger 2015). Attitudinal dimensions were extracted via factor analysis of a nine item battery measuring attitudes towards wealth distribution and the question how to become rich. The FA yields three independent factors that explain 41% of the total variance, interpretable as (1) "pro/contra equality", (2) "rich by personal merit", and (3) "rich by inheritance". In a following step different attitudinal types of households were clustered from the resulting factor scores. As a result the objective wealth types do not show major statistical significant differences on these three single dimensions, however the association between wealth type and attitudinal type is significant (Chi²-Test, p<0.05). While in wealth types with lower total wealth attitudes of "pro equality" are overrepresented, and attitudinal types with pronounced meritocratic dimension dominate the wealthiest types. The picture is not completely coherent, since there is a differentiation especially in respect to the "personal merit" dimension at middleclass households.

Social Support As Social Capital. Social Isolation As Lack of Support. a Generator Instrument for Measuring Social Capital.

Measuring complex concepts as Social Isolation, Social Support or Social Capital (SC) in a survey is a sophisticated task, due to a broad variety of definitions and operationalizations. Different kinds of generator instruments highlight and measure different properties of an individual social network: e.g. the size of a social network, the different kinds of contacts, the ressources and abilities of these contacts. To conclude from these measures to an amount of SC or a grade of Social Isolation is not a trivial task. The idea is to combine the ideas of SC and Social Support to solve this problem to some extent. We define SC as subjectively perceived potential support from social networks and Social Isolation as the absence or low supply. SC is an individual asset, as useful resources accessible through social networks that help to achieve goals which would not be achievable otherwise. The individual perception and potential value of the available SC depends on (1) the availability of network contacts, (2) the ressources and capabilities of these network contacts, (3) the willingness of these network contacts to make their ressources available and further (4) the matching of the resources with the situation and the goal to be achieved, suggesting the modularity and adaptability of the instrument. Further we distinguish between informal and formal SC, arising from interpersonal networks or respectively from formal organizations (state, associations, church, etc.). An instrument following this derivation was developed and tested as a pilot in the Austrian 4th wave of the European Social Survey (ESS). The validity of the measures and the considerable effect of this measure on subjective quality of life were analyzed in multiple regression models. The single support dimensions were explained in regression models. The aim of the paper is to discuss the instrument, its results and implications.

PAULOS, LETICIA ANABEL* (University of Ottawa, lpaul042@uottawa.ca)

Building trans-local spaces of political solidarity for environmental and social justice within/by the World March of Women Peru

Khasnabish, citing 'The Invisible Committee' contends that "[r]evolutionary movements do not spread by contamination but by resonance. Something that is constituted here resonates with the shock wave emitted by something constituted over there" (The Invisible Committee, as cited by Khasnabish, 2013: 66). This article explores the "shock wave" generated by the transnational political project of the World March of Women (WMW) in one specific place: Peru. The WMW originates in Quebec, Canada, in the mid-nineties as a "march" against poverty. Today the WMW is a transnational network that counts with more 60 National Coordinating Bodies spanning over five continents and has become a prominent actor in the transnational scene of environmental and socioeconomic justice. Drawing on a methodological design combining three data collection methods: qualitative semi-structured interviews (45 qualitative semi-structured interviews), observation (participant observation at 3 international conferences; local, national and provincial meetings and social movement activities that took place in 3 different regions of Peru) and documentary analysis of secondary sources (e.g. social media, news articles, online petitions) collected between November 2014 and October 2015, I investigate how the transnational political agenda of the WMW has been appropriated in Peru and what are the main trans-local spaces of political solidarity that the WMW has opened up locally. To do so, I focus on the struggles against extractivism and mining of the WMW Peru in two sites: the case of Conga, in the province of Cajamarca and the case of the Quechua community of Cañarís, in the province of Ferreñafe.

PAUMIER, ROMAIN* (Universite du Quebec a Montreal, romain.paumier@hotmail.fr)

Integrated Programs Paradigm As a Response to Harm Reduction Shortcomings in Quebec.

Especially strong as a political assessment and a scientific result in Quebec for the last decade, integrating programs and services has risen as a mean to enhance effectivity of public policies: rationalizing welfare, facilitating individual trajectories of health care and improving knowledge of marginalized populations. Trying to fit in actual harm reduction policies, integrating programs in the field of drug abuse is seen as systematic linkage between beneficiaries, street-level bureaucrats, and other institutions, from health care to drug courts.

This communication addresses the definition of harm reduction shortcomings in Canadian literature and in Quebec, and the solutions included in integrating programs and structures. Will be discussed that, somewhat contradictory with a large part of harm reduction principles, the strict application of integration at a larger scale might be problematic or even contradictory with the everyday acts of care and social intervention in drug abuse.

Advancing Alternative Views. Steps Towards More Expressive, Experimental and Experiential Forms of Visual Social Science.

An emerging practice in many venues, 'expressive' scholarly products (such as the photo essay), received relatively little explicit scholarly attention. As a result individuals seeking to create such a potentially exciting products are largely left out in the cold with respect to: how to select/produce and combine images, how to make them work in tandem with the textual parts (titles, main text, captions..), how to sequence them, how to construct an argument or experience through a thoughtful combination of images, typography, lay out and text (and possibly spoken text, music and ambient sound), and finally how to meet the disciplinary expectations. For indeed, in addition to the 'multimodal' and medium related challenges, scholars also have to come to terms with the scientific communities which usually are unreceptive or dismissive towards approaches that are implicit rather than explicit and that use expressive means other than words and numbers to convey insights. This presentation will argue that social science should open itself to more experimental, expressive and experiential forms of data production and communication. It will try to come up with a clear sketch of what is at stake, what impediments are on the way and how they can be tackled concretely. A 'visual' social science worthy of that name should not only try to investigate or deconstruct the image, but also try to become 'more visual' (Henny, 1986) or actually 'multimodal' in its way of 'communicating' its findings and insights. The challenge of the visually expressive scholarly products, therefore, is to exploit - but at the same time try to surpass - the purely mimetic qualities of the visual and to enable a level

of insight that manages to exceed the immediate and particularistic in favor of a more generalizable type of multimodal experience and knowledge.

Indigenous Movements and Politics in Bolivia: An Emergent Way of Governance in the XXI Century

It is in the beginning of the XXI Century that many countries in South America have experienced, for its first time, left wing governments. It has been expressed in different ways, according to the specific configuration of each country. This is a new phenomenon, due the fact that during the past centuries, the stereotype of people in politics in the region was the heterosexual, white, middle-age upper-class man, who usually performed in power of coloniality (Quijano, 2007). People who are not included in this stereotype, as woman, black, indigenous, homosexual, young and poor; were excluded from politics and from public sphere.

As Spivak mentioned, the subaltern cannot speak (2008), and this muteness is also extended to the political representation. It is possible to argue that politics and public policies in South America, for centuries, were made by white men for white men. It started to change in the last decade, in some countries shyly and in others more vigorously. One taboo in the region that remains until nowadays is the presence of indigenous people in power. The indigenous people are present and settled across the continent, but they still do not have power or political representation in the majority of South American nations.

This paper shall analyze the political changes in the only country in South America that has an indigenous as president, and one of the few that has been trying to adopt indigenous principles in politics: Bolivia. What does the adoption of indigenous cosmologies and principles in Bolivian politics mean? How does it operate? Does it mean better quality of life for its indigenous peoples? Is it a case of decolonization (Mignolo, 2009) in politics? These are some of the questions that this research intends to raise, using Bolivia as a case study.

Health Care As a Labour Market

The need for health workforce innovation and more integrated approaches is increasingly recognized by policymakers, but a lack of knowledge of sustainable professional development constrains efficient implementation. This essay introduces a theory-led matrix for comparing the trajectories of change in different institutional settings and professional groups. The aim is to contribute new knowledge to efficient health workforce development in Europe and, more generally, in resource-rich countries.

Four ideal typical scenarios of professional development were identified from the literature comprising 'frozen landscape situation', 'race-to-the-bottom transformation', 'polarisation' and 'generalised upgrading'; implications for three health workforce groups were explored. Used as a matrix for comparison, the results revel country-specific trajectories with uneven professional development especially between doctors and nurses. They also bring a need for more monitoring systems into view integrated to support evidence-based health workforce governance.

Legal and Social Aspects of the Institution of Mediation

Mediation as an alternative dispute resolutions method is an institution that has many advantages in contrast to the judicial system, especially for countries where justice system is not characterizes by democratization. The advantages of mediation, recognized even by the critics of this system, is a way of creating the preconditions for a democratic justice delivery system. Some of these advantages are the low cost in comparison to the high cost of the legal procedure, the simplicity in contrast to the complexity of the processes in courts and the ability of the persons involved in the dispute situation to decide for the solution of their problem. Our paper will focus mainly on the legal and social aspects of mediation in European societies where, despite the variations, some common features exist.

PEACOCK, DAVID* (University of Alberta, peacock1@ualberta.ca)

Producing and Raising 'low Aspirations': An Institutional Ethnography of a University Outreach Program with Elementary School Children

This article reports findings from an institutional ethnography of the outreach practices of student equity workers as they engaged school students and communities from socioeconomically disadvantaged areas.   From the standpoint of outreach staff in an Australian university that educates a comparatively high proportion of 'first generation' university students, I explain how a complex and diverse set of outreach activities was being coordinated and standardized by the use of government mandated reporting and evaluation templates.

Ethnographic descriptions and interview texts are constructed from an outreach program for elementary school students observed over two days. As outreach staff anticipated government reporting requirements and articulated their evaluation practices to them, they truncated their more complex and nuanced community engagement work into the deficit-based categories of equity policy that sought to 'raise the aspirations' of 'low SES' students. Yet this activation of ruling relations was not absolute. Within a less-selective university with alternative entry programs, and with long standing commitments to social inclusion and social justice, outreach workers were afforded possibilities for textually-mediated appropriations of the equity policy to the benefit of local students from Pacific Island backgrounds and students with disabilities.

The research furthers the sociology of university-community outreach by offering a rich and rare ethnographic description of so called 'widening participation' practices in higher education. It also contributes to the field of institutional ethnography by providing an empirical account of how 'what gets done' in university outreach practice is neither simple reproductive actions of extra-local discourses nor local, uninhibited innovative practice. In this university, community outreach became recognizable to its practitioners as it was constructed both as an instance of authorized policy and as 'what gets done here'.

Widening Participation As Behaviour Management: An Ethnography of Student Equity Outreach in One Low SES School

This paper seeks to illuminate the complex social relations entangling 'widening participation' activities within contemporary Australian higher education. Using ethnographic and interview data constructed for a doctoral study of student equity staff outreach into schools in low SES areas, I narrate and interpret McIlwraith university's 'Rock and Water' workshops with Years 8 and 9 students in one school. As well as providing 'rich and thick' (Denzin, 1989) descriptions of a contemporary Australian widening participation practice, the analysis traces the way the subjects of widening participation policy and activity, namely the students within schools whose 'aspirations' are presumed to be low, are objectified, evaluated, and accounted for via federal government's reporting requirements and policy mandates. The ethnography and informant interviews raise concerns over the role that the discourses of 'aspiration' and 'disengagement' play in the construction and governance of students and schools from low SES areas, and the way that widening participation policy is textually-mediated (Dorothy Smith) by university and school policies and practices, usually without opportunities for meaningful input and feedback from the students involved. In this school in a low SES area, there is a conflation of widening participation outreach activity and behaviour management strategies. Although the university outreach staff act skilfully and with concern for the students in the program, their work remains tangential to the work required to disrupt educational trajectories constructed by social class and gender relations and rurality.

PECKIO, TYLER* (City University of New York, Graduate Center, peckiot@gmail.com)

The Possibility of Aristotelian Friendship in Digital Public Spheres and Social Media

In Books 8 and 9 of the Nichomachean Ethics, Aristotle lays out a probing account of Friendship as the conceptual bridge to moral virtues and the higher philosophical life. With the prominance of Social Media, specifically the apparatus of Facebook, the dominant modes of social interaction and connection are being transplanted into the realm of the digital. Friendship takes on new meanings as the web of networks one has to maintain and navigate become more intricate and complex. The question inevitably turns to the quality of the connections we make and what effect the transition into the digital has on the formation of individuals. What I would like to explore in this paper are the following things: (1) the nature of Friendship and Intimacy in the Digital Age; (2) Whether or not Digital Friendship can achieve Aristotle's notion of Friendship in a meaningful sense; and (3) what this says about our relationship to Technology in general as a mediator of our social realities.

Zombie Utopia: Conceptualizing Utopia in Contemporary Pop Culture

While dystopian themes in pop culture are far from a recent phenomenon, the recent surge in popularity in a variety of mediums- books, movies, television etc.- belies a particular tendency towards a particular form of utopian thought. I would like to put forward the argument that the popularity of the settings presented in these mediums, be it Hunger Games, Walking Dead, or the Leftovers, make the case for a type of utopia that is only realizable at the point of absolute societal collapse. The ability to make the case for an affirmative notion of utopia, one that is realizable in the latent potentialites of present political reality, is exchanged for a concept of utopia that can only be realized when society has seemingly fallen back into a dark age. This style of utopia, I would like to argue, represents what Engels criticized Owenism of engaging in- one that is not reflective of actual political reality, but a utopia that is reflective of ones internal desires. It is reflective of a lack of desire to engage in political reality and to instead hit the erase button and start anew. Through an analysis of modern manifestations of dystopia in popular culture I will attempt to explore the expressions of what is ultimately an alienated formulation of utopia.

PEDERSEN, INGE KRYGER* (Department of Sociology, University of Copenhagen, ikp@soc.ku.dk)

What Is 'Good Doctoring' – in the Perspective of Antibiotic Resistance As a Global Issue?

In the new millennium the proliferation and mutation of antibiotic resistant bacteria has become a global health problem. Are we facing "the end of modern medicine as we know it?" This paper is purposed to examine how professional medical practices govern and control current prescription of antibiotics in Danish primary care and how notions of 'good doctoring' may be relevant for understanding the handling and care of patients. In particular, this paper explores changing jurisdictions (Abbott 2005), normative registers of health care practices and transformative capacities of diseases in clinical settings (Mol 2009; Mol and Law 2004).

The objective is to contribute new insights on the intra- and inter-professional responses to, and dynamics within, an emerging jurisdiction of the medical profession, related to not only individual patients' health problems but also global health problems such as AMR. It is examined how general practitioners (GPs) are mobilised to reduce the risk of developing AMR and how they manage dilemmas in clinical practice if and when decisions about antibiotic prescriptions cannot be based on facts about molecular conditions.

One key jurisdictional dynamic analysed in this paper is: How is jurisdictional labour maintained in professional practice and organization, when for example so-called 'wait-and-see prescriptions' are used, where patients are supposed to decide whether or not an antibiotic cure will be relevant for them or their kids to undertake?

Empirical materials include documents (standard procedures, registration forms a.o.) and qualitative in-depth interviews with GPs and key persons about goals, dilemmas and practices. This paper mainly draws on the GP interviews. It is demonstrated how GPs understand and engage with the challenges of AMR in regards to: (i) descriptions of the common practices and tasks in medical profession and (ii) understandings and opinions of professional practitioners about the global health issue of antibiotic resistance.

Motivating and Mobilising Stakeholder Reshaping of Corporate Climate Behaviour

Unions and employees are, amongst other things, stakeholders, in the behavior of corporations, but the ways in which they and other stakeholders can influence corporate behavior on seemingly non-industrial issues – particularly those relating to the climate crisis – are unclear. Other stakeholders include other capitals themselves (in particular, finance capital).

We develop a conceptual framework for analysing the factors that motivate and mobilise effective actor (stakeholder) influence on corporate climate behavior. Underlying this is an interest in a series of issues: the motivations of and influences on stakeholders; whether and how stakeholders seek to influence corporate climate behavior; modes by which stakeholders coordinate and mobilise

to influence influence corporate climate behavior; public policies influences on stakeholder behavior; and facilitators and barriers to stakeholders coordination and mobilisation.

We develop a framework that looks at both market and non-market outputs, at the decisions of both executives and boards, and which distinguishes influences on motivation (eg information; time horizons; scope of concerns; financial risk and returns; reputation; ideology) and influences on mobilization (eg recognition of common interest; efficacy; power resources; as well as ideology and the extent of motivation).

We also look at various levels of engagement by corporations in climate issues, ranging from denial or tokenism through passive and active engagement. Our ultimate aim is to theorise and enhance mechanisms by which such stakeholders can actively and beneficially influence climate change behavior by corporations.

Empirically, we draw to date upon interviews with some of the actors, including investors and lobby groups/networks associated with them, as well as prior research undertaken into the roles of employees, unions and climate-related NGOs.

Bulgaria: The Populist Political Communication Miileau

Academic attention to populism in Bulgaria is a comparatively new phenomenon in the country. The researchers are still not unanimous about the concept of populism and its peculiarity. The only consensus among them is that political actors (political leaders and political parties with populist leanings) have mixed features and are imitative in nature.

The conceptualization of populism in Bulgaria came to attention at the turn of the new century. It was preconditioned by the success of some newly-formed parties during that period that promoted softer or harder forms of populism and that managed to win, although not constantly, a considerable number of seats in the national parliament. Studies on populism have aimed ever since both at the identification of this phenomenon and its reasons and at building up a conceptual and classificatory framework for its analysis. Along with this, academic discussions have commenced about its conceptual dimensions so as to outline the manifestations of populism and of populist actors (party leaders, media, parties), and to seek new explanations of the attitude towards this phenomenon. Specificities of the study of populism result from the differences in populist techniques and approaches.

The aim of the undertaken research is to focus on the achievements as well as on the deficits, regarding the theoretical and empirical description of populism in Bulgaria as well as on the images of the populist activities (both in media and in social networks) as well as to reflect on the issues and demands behind these images. The analysis will be situated against the contemporary political, economic, social, regulatory and media environment in the country. In addition, some of the most significant images of the populist activities disseminated through both social networks and traditional media will be also analyzed.

Coping with Migration: Celebrations of Community, Identity and Belongingness By Andean Diaspora

What transnational experiences may signify for a migrant culture, which travels between places and spaces are discussed through case studies in this paper. By describing some Andean festivities and their contents I try to understand processes of cultural production as way of creating 'an own culture' in some European towns and cities. I study festivities where old and new meanings of identity based on a sense of community can be observed. Ways of constructing and representing a community as well as social unity with the means of Andean popular culture, dance and music, are studied.

Is it a question of defining new places and spaces for diasporic identities, or new identities through online and offline communities? Can these spaces be seen as new centres of meaning for diasporic groups or is it a question of reinventing and redefining traditions? How do issues of gender, nationality and age impact on the form and content of the festivities?

Celebrations where old and new meanings of identity and relationships based on enjoyment and relaxation can be observed, are focused. Issues such as how relationships between what is considered as the local, regional and national music culture are articulated, will be studied with ethnographic methods.

Reducing the Use of Pesticides in Europe. Birth (and death?) of a Transition Policy.

In 2009, the "pesticides package", an ensemble of four new European regulatory texts, is published. One of these texts is a directive that aims at enforcing a sustainable use of chemical pesticides, in a context of high dependency of most European agricultural activities to that technology. To achieve this objective, the directive compels Member-states to adopt national action plans that would engage a substantial reduction of this dependency. In comparison to the preexisting European regulatory regime, this directive represents a switch in the framing of the problem of pesticides. Under the previous regime, pesticide products had to be authorized before they could be sold on nationals markets. Then, they were evaluated separately in a risks/benefits approach. On the contrary, the new directive sets up a global objective of reduction for pesticides as a whole. Consequently, that text seems to initiate, beyond a more stringent regulatory regime, the intentional management of a socio-technological detachment process: the detachment of agriculture from pesticides.

First, following the literature on sociotechnical transition that invites to an historical approach, this contribution will revisit the emergence of this new regulation: how did such a policy of deliberate reduction of pesticides can emerge in the European Union? We will then discuss the mid-term sociotechnical transformations that this new policy embodies and the conception of change it entails. Second, building on comparative analysis between Member-States, we will question the impacts of this new objective on national systems of regulation.

PELLIZZONI, LUIGI* (University of Trieste, luigi.pellizzoni@dispes.units.it)

Rethinking the Commons: From Nondualist Ontologies to Use without Law

A major effect of neoliberalism and its obsession with commodification and marketization has been – in a Polanyian double movement fashion – to stimulate an ever-growing debate on the commons. The theme has been traditionally important to environmental sociology, even though the discipline has possibly worked more with the categories of public-private or state-market-civil society, leaving a larger room to institutional economics (e.g. Ostrom), philosophy (e.g. Hardt and Negri) development studies (e.g. Escobar) and anthropology (e.g. Descola). Today the debate gives growing relevance to nondualist ontologies, as allegedly a (or the) crucial feature of the commons. For many, these offer an alternative to the dominant destructive, proprietary relationship with the biophysical world precisely to the extent that they consist of and enact inextricably compounded human-nonhuman communities.

Yet there is evidence that nondualism has no warranted 'emancipatory' implications. Nondualist ontologies are crucial to new dominative orientations, while the non-Western ontologies on which many rely take the shape of 'invented traditions' (Hobsbawn) belonging to the problematization against which they are mobilized. There is also evidence, both historical (e.g. Linebaugh) and theoretical (e.g. Esposito), that the communal does not automatically prevent injustice and domination.

Environmental sociology, then, is possibly a good place where a considered assessment of the present debate – more attentive to the power/knowledge dynamics implied in the alleged (re)discovery of different forms of life – can be carried out. To this purpose the paper will review the notion of the commons by reflecting on what is arguably its key element: free access according to need and with respect for the needs of the others. Such element brings to the forefront the question of 'use', and the role of law therein. The 'Charter of the Forest' and Franciscanism indicate possible directions for inquiry.

RC16-202.2

PELLIZZONI, LUIGI* (University of Trieste, luigi.pellizzoni@dispes.units.it)

Speeding up, Slowing Down: On the Critical Limits of Nondualist Ontologies

The ontological turn is characterized by a variety of approaches and fields of inquiry. A common trait, however, is represented by the rejection of the binaries traditional to modern thinking (nature/culture, mind/body, subject/object, matter/language, reality/knowledge, sensuous/ideal etc.), which are regarded to be theoretically flawed, scientifically untenable and politically reactionary.

Yet it is possible to show that nondualist ontologies enable and support opposite arguments about the relationship between human agency and materiality. On one side, as for example feminist new materialists often do, it is possible to make a case for human humbleness, care and respect in the encounters with a lively, agentic materiality. On the other, as for example some scholars belonging to the speculative realism movement do, it is possible to argue about the full plasticity of both the human agent and its task environment, as enabling an unlimited (self-)transformation. In short, the ontological turn accommodates both post-humanist and trans-humanist arguments, precautionary and proactionary

outlooks, decelerationist and accelerationist claims. And, indeed, the difference between these positions seems to blur. This raises the question of the extent to which nondualist ontologies help analyze divergences and unrecognized affinities between, for example, new materialist movements, such as those promoting alternative forms of community organization and circulation of food and energy, and positions like those expressed by the 'Ecomodernist Manifesto', with their plea for an accelerated Anthropocene or decoupling of human societies from biophysical systems; positions which cannot be straightforwardly labelled as neoliberal or conservative, both for their arguments and for the intellectual record of some of their supporters.

The paper aims to reflect on the critical limits of nondualist ontologies, in their currently prevailing articulations, and on the possibilities to overcome them without returning to traditional dualisms.

Restructuring Public Sector and Social Intervention – the New Ways of Welfare Management Transforming Social Professions. Europe and Latin America in a Comparative Perspective

Following the crises of social welfare policy since the 1990s, and disregarding the specific configurations of national Welfare systems built in the post-WWI, governments of different countries have been undertaking the wide restructuring of their public sectors and social policies are undergoing significant rescaling processes. If the Southern European literature is rich on these reshaping trends and challenges, the Latin American research is currently dealing with these topics, according to the particular social, political and economic breakdowns. The scalar reorganisation of social policy management might be seen as an ambivalent outcome of welfare reforms aimed at contrasting the spread of urban poverty, rising economic and social inequalities, as well as cutting costs and devolving the burden of cuts to the local level, facing to new social demands within neoliberal strategies and after them.

This communication aims to contribute to the debate about public 'social intervention models' emerging in western European societies by recalling the evolution of Latin American countries, and by putting their 'social development' experience since the structural adjustment into analytical perspective with these concerns. Against the background of recent Argentinean experience, we seek to critically reflect on the institutional impact of these 'referentials' beyond the 'post-neoliberal' regimes of social organisation disseminated in this area. On the one hand, by regarding the frame of reference underlying the reforms of national public sector and the injunctions for a policy rescaling which involves the dynamics towards a 'multilevel management' of specific fields of public policies and the 'contractualisation' of social aids. On the other hand, by questioning their impact on social intervention and social workers, at the forefront of 'targeted' social policy strategies addressing 'the social question' (i.e. 'monitoring' social assistance devices and beneficiaries), and, namely at the local level, the constraining expressions of transformation of its public ways of management.

The Survey on End-of-Life in France

Two main changes concerning death arise during the last decades. Firstly death affects old and very old people due to the decline of mortality and the ageing of the population. Secondly, death occurs nowadays mainly in institutions while just after WWII, they mainly took place at home. Besides, the legal context of medical decisions, rights of patients and end of life has changed in many countries. In France, a law was passed in 2005 and another change is under discussion at parliament. To monitor medical decisions at the end of life has become important.

INED run a survey in 2010 on end of life in France, based on a nationally representative sample of 14080 deaths. Physicians who signed a death certificate where invited to describe the conditions in which these deaths occurred, the medical decisions if any, the use of palliative care... by answering to a self-administered questionnaire. They could answer on a paper questionnaire or online.

Table of Contents

This survey was challenging as it was the first survey on this topic at nationwide level in France; physicians are a "hard to reach" population resulting in high non-responding rates. Due to the highly sensitivity of the topic because we were questioning some illegal practices, we had to ensure the anonymity of the respondents for both ways of response (filled-in questionnaires and online).

This presentation will focus on the rationale of the research, the methodological issues we went through and how there were resolved in particular to encourage the participation and ensure the anonymity of respondents.

PEREZ, PATRICK-GEORGES* (Aix Marseille Université, egeamc@laposte.net)

Crise, Travail Et Profession : Le Cas Du Personnel Infirmier à Destination Des USA (1965-2015).

Cette communication porte sur la migration du personnel infirmier à destination des USA de 1965 à 2015.

On s'intéresse aux stratégies par lesquelles un groupe professionnel (personnel infirmier des USA), confronté à la concurrence de personnels formés à l'étranger parvient à augmenter le coût d'entrée dans la profession à travers l'instauration d'une épreuve standardisée de mesure des compétences. **L'hypothèse centrale** que nous voudrions développer dans ce travail pose que la période (70-83), marquée par un recul de la protection sociale et l'augmentation du recours à la migration, connaît, avec le développement d'épreuves standardisées pour l'accès à la profession, l'émergence d'un nouveau « dispositif» en matière de contrôle de la migration et d'organisation des règles d'accès à la profession. Une nouvelle alliance associant organisation professionnelle du groupe infirmier et instances fédérales (Travail et Immigration) se substitue à celle plus ancienne où Hôpitaux et Etats organisaient la migration réorganisant les modalités pratiques de la migration. L'examen du NC-Lex réunit ces deux composantes et institue une « norme professionnelle », promise à une audience au interne à l'ALENA (adoption récente du canada), voire internationale.

On étudiera dans un deuxième temps, l'évolution des flux d'entrée (présentation à l'examen et taux de réussite) selon les cycles de l'activité économique ainsi que les pays de formation. On cherchera à comprendre les raisons pour lesquelles les phases de croissance s'accompagnent d'une augmentation des demandes de migration assorties de meilleures réussites à l'examen alors que les périodes de récessions voient un mouvement inverse. Nous poserons l'hypothèse selon laquelle le « marché des compétences » s'accompagne au recours à des intermédiaires de la migration (agences de recrutement et professionnels de la formation) qui « pédagogisent » et « marchandisent » l'entrée dans la profession

La Configuraci"N DEL Sujeto a Partir De La Experiencia De Nadar Contra Corriente EN La Burocracia DEL Estado

En los ambientes de trabajo en la institucionalidad de la burocracia estatal, se han configurado campos de agresión y violencia que generan dos tipos de trabajadores: unos por encima de la línea, en términos de Fannon, con derechos civiles y laborales y otros carentes de ellos, por el acoso u hostigamiento laboral y sexual. Por luchar por su derecho al empleo, a que no se les discrimine, a que se les respete sus derechos fundamentales, que conlleva con el tiempo a nadar contra, corriente en el sistema, por luchar día a día, para surfear las tácticas y estrategias del mobbing. Flagelo que no solo pauperiza, vulnera los y las trabajadoras en el sector público, sino también genera graves daños y perjuicios a nivel económico, profesional, social y en la salud. Podría señalarse que se constituye en un nuevo riesgo en el empleo sin que se tipifique y cuantifique. A pesar que la disciplina y el control, como instrumentos ideologizantes determina las relaciones en el empleo, estas se violan constantemente observándose que las normas y procedimientos que están establecidos al interior de la organización como garantes del orden y la imparcialidad se violan, generándose procesos discriminatorios en donde las garantías procesales no existen para unos trabajadores pero para otros sí. En caso que el o la trabajador(a) recurran a las instituciones de defensa de los trabajadores o a la sede judicial, se encuentran que no se les defiende o no actúan acorde con lo establecido en la ley y el procedimiento por el tráfico de influencias de quienes ostentan el poder y lo reproducen. Observándose una impunidad, no solo para los actores que sirven a los actos que atentan contra la dignidad e integridad humana sino también, a los operadores de la institucionalidad estatal que ostentan el poder político y económico.

Eurocentrismo y Modernidad: Apuntes Sobre La Crítica Decolonial/ Eurocentrism and Modernity: Some Notes on the Decolonial Critique

Este trabajo aborda la crítica de la modernidad formulada por la perspectiva decolonial, que ha reanimado el debate sobre la vigencia de la modernidad en el mundo global.

En primer lugar se analiza el modo en que el "eurocentrismo epistémico" es constituido como categoría clave en la articulación del discurso decolonial, que la aplica para identificar las limitaciones y carencias que impedirían a la modernidad occidental ponerse en el lugar del otro colonial. En la medida que la modernidad ilustrada y/o postilustrada establece correlaciones de conocimiento y poder eurocéntricas, erige límites que no puede trascender, como desvelarían las naturalizaciones del límite referidas en la sociología de las ausencias de Boaventura de Sousa Santos o las oposiciones entre el ser y el no ser recuperadas por Ramón Grosfoguel. Así se bloquearían las aspiraciones de universalidad y emancipación de la modernidad, que, en última instancia, quedaría invalidada históricamente.

Y, en segundo lugar, se sostiene que, pese a su eurocentrismo original, la modernidad occidental como proyecto de emancipación y como actitud ante el mundo tiene el potencial necesario para superar las limitaciones epistémicas derivadas de la posición geopolítica desde la que elabora sus prácticas y discursos. Si la modernidad se interroga sobre la naturaleza de un presente cada vez más abierto a la contingencia y a la crítica, actitud que la ha conducido a cuestionar los límites entre naturaleza y cultura, lo natural y lo artificial o lo masculino y lo femenino, esta misma actitud la habilita para trascender lo límites con que la encierra el pensamiento decolonial.

Ethics of Research and the New Conditions of Knowledge Production

Until the mid-twentieth century, the development of science and technology was a relatively autonomous area compare to other social practices. It was expected that the production of knowledge followed the methods and techniques accepted by the scientific community, that it were free from particular interests or values, that its results contributed to foresee and solve social and natural problems, and that its final goal were the search for the objective truth (Mardones & Ursua, 1992). However, after the exposure of the abuses perpetrated against human beings in the sake of the scientific progress during Second World War, the international community began to commit seriously in the definition of the ethical limits of research.

Though, the enactment of statements and ethical codes has not been enough to prevent the development of questionable research practices and unacceptable research practices (Aluja & Birke, 2004). Similarly, up to now, some researchers still find very difficult to understand the commitment and social responsibility of science, beyond the mere production of knowledge (López, 2008). This situation has become increasingly critical today, given the current limitations of public funding for research and the productivity standards established for researchers.

Particularly in Mexico, higher education institutions have been the main establishments to develop scientific research in different fields of knowledge. Therefore, in this paper, we analyze the impact that the new conditions for knowledge production have had on the ethical behavior of researchers; conditions in which knowledge is "socially distributed, application-oriented, trans-disciplinary and subject to multiple accountabilities" (Nowotny, Scott & Gibbons 2003:179). We want to analyze both, good research practices and bad research practices, since we think that despite the pressures that researchers face every day, there are still many who continue working with a great ethical commitment and with social responsibility.

PEREZ-CASTRO, JUDITH* (National Autonomous University of Mexico, pkjudith33@yahoo.com.mx)

The Dualism Between Mass Participation and Inequality in Mexican Higher Education

Since the mid-twentieth century, higher education in Mexico has been considered a strategic sector for national development and social mobility. Between the 1960's and 1980's, educational policies mainly focused on coverage and institutional growth. But after 1990's, some other issues were introduced, all of them related to the quality of education, such as: evaluation, curriculum accreditation, reorganization of educational offer, accountability and equity (Márquez, 2004).

However, these measures have not been enough. Although, the expansion of educational opportunities is a frequent topic in the political discourses, the truth is that higher education coverage reached 33.7% last year (SEP, 2014). This figure is very far from the average of the OECD countries. The main factors that determine access and academic success in Mexico are poverty, gender, parent edu-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cational background, place of residency, the need to enter into the labor market and the household headship in the case of women (Bracho, 2005; Miller, 2009). Thus, while on one hand enrollment has grown progressively since the second half of the XXth century, on the other hand, a large proportion of people have been systematically excluded from higher education, especially those belonging to the vulnerable groups.

In this paper, we analyze the impact that public policies have had on the expansion of educational opportunities for vulnerable people. Specifically, we focus on those persons living in poverty, indigenous peoples and disabled. So far, Mexican government has implemented two important programs: the Maintenance Grants, aimed at lower-income students, and PAEIIES, for students from indigenous groups. However, up to date, there is no federal policy to assist people with disabilities that want to enter higher education. Nowadays, the enrollment rates of lower-income students in higher education is around 12%, indigenous people are between 3 and 5% and disabled students are around 5%.

PEREZ-CHIRINOS CHURRUCA, VEGA* (Universidad Nacional de Educación a Distancia, vegapchirinos@gmail.com)

El Discurso Del Emprendimiento Como Máscara Del Trabajo Informal

En los últimos años, el mercado de trabajo español se ha visto especialmente vulnerable ante la crisis económica, dadas sus particularidades (gran peso de sectores productivos muy elásticos como la construcción o el turismo, escasa capacidad de innovación, estructura empresarial obsoleta). El excedente de mano de obra derivado de esta situación no sólo no ha sabido reencontrar un lugar en la estructura productiva, sino que ha puesto en jaque la estructura del estado del bienestar, con lo que se han tomado diferentes medidas para paliar esta situación, tanto a nivel oficial como desde el punto de vista práctico. Los discursos en torno al emprendimiento han sido uno de los recursos utilizados por las instituciones para sacar a estos trabajadores en activo de las filas del paro, pero en la práctica estos "emprendedores" no son más que trabajadores autónomos, en una gran mayoría con problemas de impago de los clientes, falta de capacidad de asumir riesgos (por su historial de precariedad previo), poco conocimiento sobre sus protecciones legales y un mercado que tampoco está preparado para contratar sus servicios.

Además, la estructura que se dispone desde la Administración Pública sigue sin tener en cuenta las necesidades de estos trabajadores, fijando unos requisitos (impositivos, legales, etc.) que hacen muy difícil la supervivencia dentro de los límites legales, con lo que para evitar la pobreza empieza a ser necesaria la facturación "en B". De esta forma, los trabajadores que han ido perdiendo sus empleos se están incorporando en la economía sumergida, con el consiguiente aumento de esta y sin construir un tejido empresarial, productivo o social sostenible a medio-largo plazo.

Knowledge on Wellbeing Processes before Universal Social Policy

Social policy is concerned with wellbeing and has depends on frameworks from a select group of welfare states. As regards the global South there is lack of knowledge about core wellbeing processes and a concomittant tendency to apply social policy theories that have helped shape our understanding of the industrialized North. There are problems with this that may have undercut social policy processes in the global South. This paper is based on quantitative analysis of aggregate data on eighty developing countries. The paper addresses universal path models that reveal key wellbeing processes of the global South. Infant survival is used as an indicator of wellbeing, and the paper estimates the relative contributions of women's schooling, poverty alleviation and child health provision. The level of poverty has the largest contribution, followed closely by women's schooling, the effect of which is mediated by women's reproductive autonomy and an enhanced child health provision. The paper stress that the universal social policy may be an effective general strategy for the global South. Before designing extensive universal social policy programmes, solid understanding should have been formed between major sectorial elements of wellbeing processes.

Indexing Behaviours Indicative of Eco-Citizenship Among the Canadian Population

Within our current environmental predicament, the behaviours of citizens and consumers is coming increasingly under academic and public scrutiny. In an effort to create a better understanding of the current situation in Canada, this work has aimed at creating an index of behaviours indicative of eco-citizenship in the Canadian population. To date, a project such as this has not been done on the Canadian population and this information provides a valuable snapshot in regards to levels of eco-citizenship in the population. Eco-citizenship in this context is defined as a transformative way to reshape the relationship between humans, nature, non-humans, and other humans. This work was based off of the data from the Households and the Environment Survey (HES) 2013 cycle run biennially by Statistics Canada. The index was created based on a number of different dimensions such as environmental conservation activity, waste management practices, and purchasing decisions. The goal of a project such as this is to examine the current situation in a total population in an effort to see where improvement can be made. These results are also analyzed alongside the contextual situation of the households – such as income, level of education, and location – in an effort to understand which groups of citizens may be more or less likely to be engaging in this type of behaviour. This work could ideally be used to encourage behaviour in populations, target specific programs at groups to increase accessibility and participation, and provide a framework for improvement and implementation in other contexts internationally. Overall, this work is a first-step examination of the situation of eco-citizenship in Canada with the hope of making recommendations and change in the understanding of our relationship to the environment in the population of Canada.

PERNA, ROBERTA* (University of Turin, roberta.perna@unito.it)

Health Workers' Practices Among Diverging Institutional Logics in the Field Health and Migration. the Case of Piedmont.

The paper aims to analyse in what ways do health professionals negotiate among different or even diverging institutional logics in their daily encounter with irregular migrants, namely the policy framework on health and migration, the health organizations' priorities, and health professionals' values and codes of conduct. In the field of health in particular, ethical and professional values are considered as the fundamental institutional logic for discretionary practices. In such a case, discretion is an expression of a professional culture that orients and legitimizes workers' practices, and professional codes of conduct often constitute the value system that represent professionals' main source of legitimacy for action. However, health workers are often public workers, officially charged of policy implementation. They have the responsibility to abide by the law, adhering to given rules and procedures. Moreover, knowledge of their organization's rules, mechanisms, and goals become relevant as well. In a period characterized by reforms of health systems toward managerialism, shortcuts in public spending, and restrictive policies on immigration, a tension between bureaucratic responsiveness (to the state, the policy, the organization) and bureaucratic responsibility to engage in professional and ethical practices (to the patients) seems to take place in several European countries, where health workers have to deal with a tension between professional values and gatekeeping practices. By presenting the first results of an organizational ethnography in three health organizations in Piedmont, a northern Italian region, the paper will give some insights on how health workers interpret their mission and role when they face conflictual institutional logics in their daily encounters with irregular migrants, highlighting the relevance that managerial decisions and organizational structures in particular may play in orienting and shaping health workers' practices.

The Role of Transnational Trade Union Action for European Integration

Trade unions, NGOs and social movements have been criticising the strong emphasis on European economic integration to the detriment of social integration since the very beginning of the European Union. This asymmetry of integration corresponds to an inherent power imbalance between labour and capital: While labour is dependent on state support and ,democratic class struggle' (Korpi 1979) in order to advance its interests, capital can rely on economic power by controlling the means of production. The Euro-crisis and the EU' crisis management with its orientation towards austerity and supply-side economic policies have widened the gap between democratically legitimized decisions vs. technocratic policies in favour of the latter. Nevertheless, scholars state an increase in transnational collective action and a new "politization of the EU" since the crisis (Rauh/Zürn 2014).

Our contribution starts from the assumption that cross-border union trade action has contributed to generate transnational social capital which in turn might contribute to ,horizontal' European social integration (Pernicka 2015). However, in their attempts to create and maintain transnational networks and common understandings of resistance unions face both: supporting and impeding forces.

In our presentation we focus empirically on the transnational trade union action during the crisis (e.g. European Day of Action in 2012, campaign for a "new path for Europe" in 2014). We show that the different national cultures of resistance and the heterogeneity of political and economic conditions constituted obstacles to Europe-wide trade union action. At the same time, we observe processes of transnationalization of trade union action especially in Southern Europe. These processes are characterized by inner conflicts and struggles on the question of "international solidarity". As conflicts provide an important means to integration (Simmel) we maintain that they have contributed to transnational social integration and collective identity formation.

PERO, DAVIDE* (Nottingham University Business School, davide.pero@nottingham.ac.uk)

New Migrants Organizing and Civil Society: Insights from Low-Paid Latin American Workers' Initiatives in London

Civil Society is a heterogeneous field comprising an array of diverse organisations, groups, networks, associations and initiatives. It is often attributed Salvationist functions whether from a neo-liberal or Gramscian perspective at the time when the state's role and presence is changing and shrinking. Yet these debates have limited empirical grounding and research documenting the role, challenges and opportunities of specific civil society initiatives is fragmented. Furthermore, academic research tends to see the realm of civil society and 'the community' as analytically separate from other important arenas such as the workplace. Migrant workers are a valuable vantage point to explore current transformations in civil society at a time of crisis and its role in fostering social justice, social cohesion and a fairer society. They perform an important role in the economy yet they are constructed as one of the key social problems of our time in current public and political discourse. Crucially, there are sectors of British society that are working, often at the grassroots level, to build cohesion from the bottom-up in communities and workplaces. This paper will consider recent innovative campaigns for workers' rights involving community and workplace organizations in which low-paid precarious migrant workers played a central role.

The Missing Element in Understanding Social Network Influences on Mental Health: Correlates and Consequences of Health Regulation Ties

Social relationships are well-established vectors of both health and illness. Yet, the typical and most often referenced concepts reflect positive aspects of network ties. The effects of social support, social capital, and social resources on health can be conceptualized as testing the integration function of social networks described by Durkheim (1950 [1897]). However, little work (e.g., Umberson's work on men in marriage) has examined Durkheim's companion vector of social networks – social regulation, or active attempts by network members to influence their attitudes and behaviors, whether or not this involvement is welcome. We pose two fundamental questions: Which kinds of social network structures ("whole networks"), individual network ties (i.e., alter characteristics), and individuals with mental health problems (i.e., ego characteristics) are more likely to cultivate "hasslers" (i.e., individuals whose interaction with an individual with mental health diagnoses involves regulative aspects). Do regulative efforts in social networks produce salubrious, insalubrious, or no effects on individuals making their first major contact with the mental health system (i.e. "first timers")? We examine health regulation in the Indianapolis Network Mental Health Study's sample of individuals with serious mental illness and adjustment disorders. Using a multi-level modeling approach to capture the effects of social ties and social network structures, we find that women, older individuals, family members, those with confidence in medical professionals, and those who have experienced mental health problems are most likely to engage in health regulation. This is especially likely when they are embedded in weaker networks without similar structural characteristics. From a medical perspective, regulative ties are beneficial, increasing ego's trust in physicians and life satisfaction while decreasing perceived social stress. However, these effects are contingent on tie quality (i.e., large networks characterized by high degrees of closeness) and cultural beliefs (i.e., congruent with medicine) embedded in network ties and structures.

Images of Hybridization. Cross-Cultural Couples in the European Cinema

The visual representation of the mixing processes involving migrant and native people is a very strategic issue in modern societies, because it makes explicit hybridization, the most annoying perspective for ethnocentric and racist mentalities.

This paper illustrates the outcomes of a comparative sociological research on the representation of cross-cultural couples in the European cinema. Interethnic and interfaith marriages are a classic index of the mixing of cultures, having a strong euristic power both on survey and qualitative studies. Indeed, statistics concerning mixed marriages are typical data of the socio-demographic analysis of globalization and social change, while the perception of mixed couples is a traditional topic of inquiry on stereotypes and ethnic relations (Spickard 1991; Barbara 1994; Peruzzi 2008). It is not a case that cross-cultural couples is a *leit-motif* in the cinema, the medium born to publicly represent and collectively interpret the processes of modernization, always attentive to migrant lives (Naficy 2001; Berghahn, Sternberg 2010).

So, are cross-cultural couples a current topic in the European cinema? What are the main subjects in these plots? Can we find recurrent elements in the visual narrations of intimate relationships between migrants and natives? Are there significant similarities or differences in the representations of mixing of cultures made by the European creative industries? And, overall, what scenario for the future do emerge from these storytelling? According to the authors, will Europe be a better world or a cauldron of conflicts?

The research will be grounded on the analysis of a collection of selected movies whose plots are founded in stories of mixed couples. The study of movie scripts will be aimed at analyzing the recurrent elements in the representation of couples and of the social reactions provoked by their births. The outcomes will attempt to confront different nationalistic ideologies.

Public Participation in Environmental Impact Assessment Process: Case Study of the Signal Free Corridor and the Orange Line Metro Projects of Lahore, Punjab

Public participation in Environmental Impact Assessment (EIA) is mandatory legislative requirement under Section 10 of EIA Regulations, 2000 for environmental approval (EA). Public involvement in development projects is particularly based on equity and social justice principles. It is not only to protect individual rights which may be directly affected by the project but it also provides transparency to the whole project. To keep into account the importance of public participation in EIA, this article is designed with reference to the recent on-going Signal Free Corridor on Jail Road and Orange Line Metro projects of Lahore, Punjab. The specific objectives of the article are to identify the mechanism and level of public participation in EIA process and assess the outcome of public participation in above selected projects. The results of study conducted so far reveal that vital part of EIA process is mere symbolic due to substantial political influence, lack of environmental awareness, meaningless, pseudo, fraudulent citizen input and the farcical exercise of public hearing. Based on the results, there is dire need to improve the predictive quality of EIA by placing sufficient emphasis on public involvement in EIA process and strengthen the legal and technical framework thus the outcome of this process would be most effective and productive.

From Risk to Uncertainty in Emerging Treatment Markets: A Sociological Analysis

This paper seeks to sociologically examine the concept of 'uncertainty' within the context of emerging treatment markets. By examining interviews, and documentary material relating to the advertising, marketing and the provision of anti-ageing treatments and unproven stem cell treatments, we aim to explore the sociological significance of uncertainty in the dynamics of emerging treatment markets. Emerging treatment markets are characterised by a situation of unpredictability that by its character is difficult to govern. On the one hand, as our research has revealed, those considering undertaking an unproven stem cell treatment cite uncertainty about benefits and safety as the reason for not undertaking treatment. This conceptualisation of uncertainty differs from risk, which by its strict definition, is calculable and hence governable. For marketers, on the other hand, uncertainty about regulation and/or the science has proved valuable, in assisting the advertising of treatments. Our research highlights the difficulties of governing markets characterised by uncertainty, which needs to be

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

acknowledged in efforts to explain the dynamics of emerging treatment markets. We conclude by discussing the implications of our analysis for a sociological conceptualisation of uncertainty.

HILBERG, EVA* (university of sussex, eh53@sussex.ac.uk)

The Power of Information Technology: Governing Patients through Technology

Since 1990s the English NHS has used Information and Communication Technology (ICT) such as Electronic Patient Records and more recently health apps in order to improve healthcare delivery and patient experience. The rhetoric of patient choice has driven past policy but various studies have suggested that choice has failed to materialise (Dent, 2006; Henwood et al., 2011; Fotaki, 2010). In 2012 the Department of Health introduced the policy 'The Power of Information' whereby choice is envisioned to be enacted yet again through patients' 'informatisation' supported by various electronic interfaces. According to this new policy patients are supposed to be involved in decision-making processes that relate to their health. Indicative is the rhetoric of 'no decision about me without me' that underpins this policy. This new policy indicates a shift of the discourse on patients from 'health consumers' to 'empowered patients'. A fundamental aspect of this shift is the new role that is ascribed to patients; one that sees patients not as mere consumers but as producers of health information. ICT and more specifically health applications enable this new role by allowing patients to input and retrieve health-related information and to interact with healthcare professionals and patients electronically, facilitating management of their health. The aim of this paper is to examine the shift of this discourse and to study how patients are being governed (by themselves and by others) through assumptions embodied into ICT. We draw upon Foucault's work on 'governmentality' (Foucault, 1991), which has been used extensively to studies of healthcare reforms but has been applied much less so to studies of the role of ICT in shaping patienthood. We report on a pilot qualitative study and use interviews with relevant stakeholders such as health policy makers (NHS England); health ICT developers and representatives of patient groups and associations.

The Socialist "Middle Class" Revisited: Consumption-Based Class Distinctions in Four Post-Yugoslav Countries

During the entire existence of the socialist Yugoslavia (1945-1990), the ruling nomenclature insisted on the one-class character of Yugoslav society. The working class, later restyled into "working people" in the official terminology, was ideally meant to encompass all the actors of the legitimate social world in the country. Only towards the very end of the socialist system in Yugoslavia (i.e. in the late 1980s), some social theorists started to openly speak about Yugoslav society in terms of a class society, which also included a middle class.

This paper attempts to map and assess the evolvement of such a socialist "middle class" in the conditions of the postsocialist transition, with special attention devoted to the consumption-based class distinctions in the field of cultural practices. The interpretation is based on the results of a survey undertaken within the project "Life-Strategies and Survival Strategies of Households and Individuals in South-East European Societies in the Times of Crisis" on a national proportional multistage random sample of 3906 respondents in four post-Yugoslav countries (1000 in Croatia, 1000 in Serbia, 1002 in Bosnia-Herzegovina and 904 in Slovenia). The questionnaire included the relevant data for three generations in the family of the respondent. Multiple Correspondence Analysis was used to produce maps of the social space in the respective societies, and relate various social positions to the consumption styles in the post-2008 crisis context. Different levels of cultural participation, as well as orientation towards global or local cultural consumption, have proved to be important and reliable indicators of class distinctions.

Anti-Gay Marriage Movements in France and Croatia: A Conservative Response to Legal Liberalism

After being predominantly present in the United States, groups and initiatives that advocate socially conservative and religious values have been on rise both in Europe and in other parts of the world. Those groups often act in response to legislative amendments that threaten traditional family values by legalizing same sex marriage, or by recognizing the right to adoption to homosexual partners, or introduce educational curricula that are deemed contrary to parental value systems.

The paper will present the French conservative initiative "The Protest for Everyone" (*La Manif Pour Tous*) that organized massive protests in March and May 2013 against legislation that allow same-sex marriage and adoption of children by homosexual partners. It will aalso present the Croatian conservative civic initiative "In the name of the Family" (*U ime obitelji*) that managed to collect more than 700,000 signatures in May 2013 what served as a ground for a nation-wide referendum in November 2013 which introduced the Constitutional definition of marriage as an exclusive union of a man and a woman. We will argue those conservative movements act on behalf of socially conservative majority with the goal of reducing secular influence over the legislation and government's policies. The paper will establish why and how two conservative movements came into being, and who the main actors behind them are. The data on the Croatian conservative movement repertoire and organization were collected by conducting the semi-structured in-depth interviews, with scholars, and civil society activists both from the liberal and conservative spectrum of the Croatian civil society scene in April 2015. Data on the French *Manif Pour Tous* likewise draws from ethnographic observation of major movement events, and from in-depth interviews with movement founders.

Interest Pressure Group and Legislation: Expansion of Veterans Welfare Legislation in Croatia

War veterans in Croatia constitute a significant social group with articulated interests and high degree of organization. Being a powerful identity and interest group (numbering approximately 500.000 persons in a country of 4,5 million inhabitants) they managed to secure an array of legislative solutions that assure rights and benefits, both to them individually as well as to members of their families. A scarce previous research on the war veteran protection system revealed it has been primarily focused on compensation (assuring the rights within pension, health and social care systems), rather than on the development of reintegration of former soldiers into the working environment in wider society. This presentation will discuss the development of a robust postwar welfare by analysing the veterans' demands toward public policies (health, housing, education, pension system, etc.), and by discussing the societal circumstances in which war veterans gained expansion of their rights. The particular attention will be devoted to mobilization methods they were deploying in order to pressure for or against legislative amendments. By presenting war veterans as an interest pressure group and by analysing methods used, we will demonstrate how they were able to actively take part in a decision making process; how they have influenced the legislature to promote their interest; and how they managed to leverage the distribution of political power in a society.

PETRILLI, ENRICO* (University of Milano Biccoca, petrilli.enrico@gmail.com)

A Carnal Sociology of Clubbing, an Ethnographic Study on Senses and Pleasures

Club Studies, the field of interdisciplinary research devoted to study Electronic Dance Music (EDM) Culture and clubbing, have clashed with academics' attitude toward this topic since its origin. For decades even the most progressive scholars have not assessed Club Culture as a legitimate object, because it lacks of the rebelliousness and counter-cultural boost that characterized other youth subcultures (e.g. punk). On the contrary, EDM culture was considered a trivial and hedonistic phenomenon.

Nowadays, even if the situation is changed and dance culture have finally captured scholars' imagination, analytical and methodological problems remains. Both the culturalist approach to the study of clubbing, and the researches concerned with nightlife's risks and negative consequences have led to limited achievements, providing a representation of club culture, on the one hand, too idealistic and abstract while, on the other, too narrowed and pessimistic. In step with Western logocentrism, based on intellectual understanding and rational in-

terpretation, scholars have not been able to deal with this pre-discursive world and to describe physical and sensitive experiences of clubbers.

The preliminary results of a multi-sited sensory ethnography in Milan and Berlin will be presented. The focus will be the embodied practices, observing how clubbers through intersensorial experiences actively engage both with environments and with their bodies. The attempt is to develop a reflection able to overtake the lack of academic discourse about pleasure, given that all the activities done at EDM parties - enjoying music, dancing, having fun with friends, meeting new people, drinking and taking drugs - are directly linked to corporal and sensorial pleasures.

Economic Crisis and Migrant Suffering: A Multilevel Analysis of Return Intentions of Bolivian Migrants in Spain

The economic crisis, which has been developing in Spain since 2008, has played a major role in explaining the dynamics of the return migration in recent years. A lot of migrants in Spain lost their jobs and they felt the pain of the recession, with the addition of the separation from close family members in many cases. However, although structural factors in origin and destination are crucial to understand the decision of return, this process is strongly dependent on the migratory project and the migrants' resources (micro and meso factors). By considering this postulate, this paper highlights the need for a multilevel analysis of return migration, which could explain the relationship between economic crisis, migrant suffering and strategies of return. The multi-level approach allows us to consider the migrants' subjective experiences in the face of the economic crisis, as well as their capacity of agency, expressed in the ability to prepare the return to the home country. In doing so, this framework permits: 1) to overcome the success/failure dichotomy around the process of return; 2) to identify different profiles of Bolivian migrants with short-term return migration intention in regard to their strategies to cope with situations that cause suffering (as dealing with economic crisis), depending on the initial project of migration and the accumulated resources before and after migration.

This paper presents an analysis of twenty in-depth interviews with Bolivian migrants living in Spain, having expressed their intention to return in the short term. Our data come from two research projects led by GEDIME/CER-Migracions, Authonomous University of Barcelona (UAB): "Return from transnationalism (RETTRANS) 2011-2014" and "Return Migration and Re-emigration: New migratory dynamics of Moroccans and Bolivians and the challenges for the mobility management (REMIMOB), 2014-2017", both funded by the Ministry of Economy and Competitiveness of Spain.

Ageing As an Increasing Uncertainty

The fourth age basically embodies all of the common fears of ageing; it brings frailty, helplessness, and loss of autonomy. The combined effects of ageing, illness and disability characteristic of the fourth age change irreversibly a customary way of life and call into question one´s sense of self. In advanced age it is a challenge merely to maintain an acceptable concept of Self, one's self respect, and a dignified life. The institutional practice, the contact with welfare and health systems, conditioned the fourth age. But the older adults are not passive elements in this process, they actively negotiate and maintain a fragile sense of self in the face of increasing disability and frailty. Personal identity is more a process then an essential status and its nature is relational – thus the ageing self-identity is constantly re-negotiated in the contact with significant others, care providers, institutions or even with one´s own changing body and mind. The preservation or reconstruction of one's identity thus seems to be a key challenge for the fourth age, since the adaptation mechanisms successful in the third age may fail as one passes into the fourth age. The increasing uncertainty in day-to-day activities is a key characteristic of loss of the agency. It is the gradual loss of mobility, for example, loss of strength in hands, weakening of sight. Our paper is based on the results from the mixed method (secondary analysis of SHARE data and qualitative interviews) research project "The Fourth age: the Identity of Disability during the period of active ageing" focusing on the relational and negotiated nature of self-identity in very old age.

The Production of Knowledge in Excellent German Research Groups - an Ethnographic Case Study

At present the German university system is undergoing a number of reforms to improve its models of teaching and research. In doing so, the universities are reorganized within the concept of New Public Management to competitive enterprises, which need to cover their funding with an increasing amount of third-party funds. The so increasing competition between universities for research grants leads to a greater focus on quantifiable, scientific output, in particular on the number of already rated publications, prices and grants. The excellent initiative, as one of the most important initiatives in higher education, is aiming to promote top-class universities with additional funding to become internationally visible. This political intervention has generated inequalities within the German research institutions.

How does this kind of project-orientated funding influence research? Which effects does it have for the production of knowledge?

To answer these questions the presented study is based on two ethnographic case studies of two scientific working groups, physicists and chemists. The participatory observation were realized over a period of two years and supplemented by interviews. Participating at the everyday work of young researchers, especially PhD candidates and postdocs, I tried to identify mechanisms of exclusion and inclusion and thereby to understand how the academic field operates.

The Social Construction of Excellent Scientists

At present the German university system is undergoing a number of reforms to improve its models of teaching and research. As one of the most important initiatives in higher education, the excellent initiative is aiming to promote top-class universities to become internationally visible. The participating institutions should create excellent training and career conditions for young researchers and also endeavor to realize the promotion of gender equality.

But how does this kind of project-orientated funding influence research? Which effects does it have for academic carries of young researchers? And may such a funding finally make a contribution to gender equality in science?

To answer these questions the presented study is based on two ethnographic case studies of two scientific working groups, physicists and chemists. The participatory observation were realized over a period of two years and supplemented by interviews. Participating at the everyday work of young researchers, especially PhD candidates and postdocs, I tried to identify mechanisms of exclusion and inclusion and thereby to understand how the academic field operates. Supposing that there is an academic personality how is socially constructed, the aim is to understand how young researchers become like this when successfully trained through the academic career, especially in excellent research fields. The focus of this investigation are the everyday practices of researchers, since I assume that a number of including and excluding practices and their incorporated implicit attributions, are not made consciously by the actors, but happen interactive and are visible in scientific practices and in habitual actions.

PETTERSSON, PER* (Uppsala University, per.pettersson@kau.se)

Deregulation of Welfare and Religion – New Challenges to the Church of Sweden By Neoliberal Market Values

Sweden is internationally known as a country with a comprehensive welfare system. The Swedish welfare model has the last decades been affected by a strong wave of neoliberal economic philosophy influencing politics and demanding reduced public costs and outsourcing of state-managed activities. Publicly funded services including welfare provision have been progressively deregulated since 1980s. Deregulation and outsourcing of public welfare services has resulted in greater attention to civil society organizations as agents in welfare provision. In parallel with deregulation of welfare, a deregulation of religion in Sweden was accomplished January 1st 2000 when Church of Sweden became a separate agent in relation to the State, as the final stage of a long separation process. This turned the former state church into the largest voluntary organisation, at a time when new expectations were directed towards civil society organisations as welfare providers. Growing impact of neo liberal economic market rationality implied a demand at religious organizations to establish partnerships with the state, which however mean tensions between fundamentally different systems of values.

While the previous state-based welfare model advocated financial solidarity and equal rights to welfare services, the new marked-based model is founded on the idea of the individual's right to freedom of choice and accepts unequal distribution of welfare. From being advocates for a comprehensive welfare system equal for all, religious organizations are presently invited to become contracted

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

parts of a system accepting inequality in welfare provision related to the financial capacity of the individual. Taking the Church of Sweden as an example, this paper discusses the consequences for religious organizations identity and freedom by entering into partnership or contract with public authorities dominated by neo-liberal market philosophy. One long term question is if these contractual relationships in practice establish new forms of state-religion regulation?

Global Cities and the Financial Class

Our contribution is related to the research project "Global Financial Markets and Global Financial Class", pursued at the Department of Sociology at Goethe-University Frankfurt am Main in collaboration with the Macquarie University in Sydney. In the project we ask if the global financial markets constitute the economic background for the formation of a "global financial class".

Deep economic transformations associated with the term financialization have led to the global integration of financial circuits over the last decades. In this context the class formation of financial professionals lacks an examination and especially their involvement in specific urban landscapes of global cities such as Frankfurt and Sydney.

Using a contrastive comparison of the two financial centers we want to highlight the urban life styles, group formation processes and articulations of global imaginations in the two cities Frankfurt and Sydney. Taking into account the distinctive positions of financial professionals as protagonists in the global city formation it is the linkage of local urban elite networks to global corporate business circles that needs to be addressed.

With the paper we aim to confront the image of a specific management type being presented as boundary-less and cosmopolitan with empirical findings in the financial community of two second-tier financial centers, namely Frankfurt and Sydney. The local embeddedness of an increasingly global business such as finance is still biographically conveyed in career patterns of financial professionals. Following the argument financial centers become visible as arenas intrinsically bound to the creation of inequality. Urban practices of financial professionals are to be framed as cultural struggles over privileged social positions that find their expressions in the build environment of the city.

Behavioral Willingness and Real Behavior in "Normal" Situations. a Horn-Honking Experiment in Field and Survey

Survey experiments are increasingly used in sociology. Benefits are often seen in a high flexibility as well as in the usability for the investigation of sensitive issues. Compared to conventional direct measurement survey experiments provide a more detailed description of the situation and are thus closer to reality. It is widely believed that the higher precision provides less room for interpretation and evokes therefore less bias by social desirability. The method was even developed originally, to collect more valid responses on sensitive topics (e.g. via fictitious acting other people). However, systematic studies on the validity of the measurement of behavioural willingness with survey experiments are rare and inconsistent. While some authors indicate a high correlation between reported willingness and real behaviour, others have some doubt regarding the validity of behavioural measurement, especially in everyday situations.

The present study compares the results of a survey experiment with the results of a field experiment. To simulate an everyday situation a so called horn-honking experiment has been carried out in a German city. Here, subjects are blocked in their cars randomly at a traffic light by an experimental car. Following former versions of this experiment, status and origin of the frustrator car have been varied by car size and licence plate. While the status effect of previous studies could be replicated in the field experiment, the survey experiment yields an effect of the regional affiliation of the car. These opposite results suggest that the application of survey experiments in "normal" situations may rather lead to the report of a behavioural willingness that is consistent with relevant norms instead of with real behaviour. This supports the idea to use survey experiments primarily for the measurement of norms and values instead of for the measurement of behaviour, especially in their application for sensitive topics.

The Worth of International Experience during Education for Potential Employers. Some Hypotheses and Experimental Evidence

In relation with the internationalization of economies it is often argued that highly flexible and internationally experienced workforce is becoming more and more important. Thus, governments undertake some remarkable efforts to motivate future professionals to spend a period abroad. However, experience in international mobility as specific resources for labour market success in globalization has hardly been investigated empirically. In the presentation we will specifically focus on the assessment of international student mobility by potential employers.

The question suggests a reference to typical labour market theories, such as job market signalling and human capital. At a first glance, we can expect a positive evaluation of international educational experience by employers with these theories. However, individual productivity can also be signalized by other characteristics and knowledge acquired in an international environment can also be understood as specific instead of general human capital. A second consideration is therefore that the worth of international educational experience may vary with the grade of internationalization respectively regionalization of the company.

The assumptions are tested with data from a factorial survey experiment. Companies of various sizes and industries were surveyed with an online questionnaire wherein characteristics relevant for the labour market of fictitious graduates have been varied experimentally and presented randomly to human resource managers. With the obtained data the influences of classical features, such as graduation and practical experience, and international experience during education, such as study abroad, internship abroad or just travelling, upon the employment intention of the participating managers can be compared directly. The results provide evidence that international mobility during education is not generally perceived as separating signal or as general human capital by human resource managers, but that the perceived worth is moderated by the internationalization of the companies. This leads to some considerations about a global-local labour market segmentation.

Why Do Seniors Often Chose Family Care? Elderly Care Recipients Between Care Policies and Culture.

In the 'housewife marriage' – the dominant form of the family in most mid-20th century European societies – senior care was mainly organised as unpaid work in the private family household. In the mid-1990s, together with new long-term care legislation, many European welfare states have introduced new social rights for senior citizens with care needs to publicly funded care. However, in many welfare states, a relevant part of the seniors who are entitled to receive publicly funded care by care agencies, choose instead care by a family member. The paper aims to answer the question: How is it possible to explain why seniors in part choose family care in spite of the new options to use publicly funded care by agencies?

The theoretical framework is based on the theoretical approach of societal 'care arrangements' of Pfau-Effinger (1998, 2004), according to which the behaviour of people in need of care in the context of care policies can be explained with the complex and in part incoherent interaction between cultural, institutional, social and economic factors.

The paper introduces findings of an empirical study that analyses the degree to which seniors make use of their right to use public care in the context of different welfare state policies and different cultural ideals about care in the population. It analyses data from a comprehensive study of care policies and care structures in 6 European welfare states in the DFG-Projekt FAMICAP, based on document analysis, data of different waves of international surveys like SHARE and Eurobarometer, and national data sets.

The findings indicate that a traditional cultural orientation towards family care and discrepancies between the popular definition of a good quality of care in the population and the definition of good care in the concepts of care policies contribute to the explanation of the differences.

Education in World Society: Combining Neo-Institutionalism and Social Systems Theory

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.*

Since the days of Talcott Parsons (1973), Joseph Ben-David (1977) and Burton Clark (1983), education research has been deeply rooted in the analysis of individual national education systems and in their comparison. For a long time this has been an appropriate and fruitful approach, since in many countries of the world education has predominantly been organised as a service of the public sector, and education institutions have been mainly regarded as national institutions. But this approach becomes inadequate in our days.

Depending on the theoretical framework applied, the focus on national education systems can also come with the risk of methodological nationalism. This term indicates the conceptual equation between society and the modern nation-state in scholarly debates and – as a consequence – the tendency to explain social phenomena and change as predominantly endogenous, internally driven by the nation state. In such an understanding, individual nation states would be regarded as self-contained entities and the main source, dominant actor and sole end of changes in education.

But such an approach does not sufficiently take into account that education is a global function systems – and from this perspective sharp limits arise regarding the capability of the nation states to shape *their* education systems. Therefore, a global perspective is required.

Probably the most prominent among contemporary sociological concepts that take world society as the reference framework for their theorising are Neoinstitutionalism (represented by John W. Meyer or David Baker) and Systems Theory (represented by Niklas Luhmann or Rudolf Stichweh). Both schools of thought show similarities, e.g. the social constructivist background and the rejection of methodological individualism.

Even if there exist some principal differences between the two sociological schools, the paper will try to find ways to combine concepts and tools of both concepts rather than to insist on their differences.

On the Coherence of Political Finance Regulation

What explains the evolution of party funding regimes and what factors shape the legislators' behaviour? These questions have garnered increasing attention among scholars working on political finance regulation. Different drives underlying political finance reforms have been identified thus far: egalitarian, cartel, or autocratic (Katz and Mair, Norris); revenue maximisation or electoral economy (Scarrow); institutional, strategic, or societal (Koss). Although recognizing that different drives may play a role in different moments in time and under different circumstances, these explanations rely on the assumption that political finance rules are bound together by some coherent rationale. This paper questions this assumption. Based on a comprehensive account of political finance rules in Europe, the paper will show that political finance rules are hardly coherent and internally consistent with regard to a specific type or model of legislators' behaviour.

Anti-Muslim Sentiments: The Effect of Direct and Parasocial Contacts

The contact hypothesis (Allport 1954) assumes that contacts with members of an outgroup under certain conditions reduces stereotypes and leads to positive attitudes towards them. Indeed, many studies on the contact hypothesis suggests that face to face contact even in less than optimal conditions may produce significant reductions in prejudice, varying in magnitude according to frequency, duration and intensity (Pettigrew and Tropp 2006). However, this is not the case with indirect or 'parasocial' contact (Horton and Wohl 1956): in particular bad news about Islam seems to have a negative effect on attitudes towards Islam and Muslims (Schiffer 2005; Hafez 2010). This is especially problematic if negative attitudes shaped by indirect contacts with Islam and Muslims are not mitigated by prejudice reducing direct contacts – for instance in East Germany where only very few Muslims live and where after 9/11 the derogation of Muslims has increased to a very threatening situation especially with the recent emergence of HOGESA (Hooligans against Salafists) and PEGIDA (Patriotic Europeans Against the Islamisation of the Occident). Against this background we ask the following questions. What kind of face-to-face contacts reduce the stereotyping regarding Muslims? Do various forms of stereotype-reducing contacts differ between age groups, gender and educational background? How does media (public TV, private TV, newspapers, Radio and Internet) influence anti-Muslim sentiments? And in what way does the debate of religious extremism in different settings have an impact on the views on Islam?

Our research is based on the quantitative database of the Religion Monitor 2013, which gathers data from 13 countries, as well as the German General Social Survey (2012) and the European Values Study (1989 – 2014) and a study conducted at the University of Münster ("Perceptance and Acceptance of Religious Diversity 2010").

Embedding Ethnographic Comparison

Comparison is at the core of social science. Sociological and Socio-anthropological knowledge, in particular, claims it is always and inherently comparative. Yet ethnographic comparisons have typically tended to avoid problematizing the very assumptions and tacit knowledge behind the act of comparing. In this paper I give a contribution to this literature by reflexively discussing the ways in which I failed to carry out my ethnographic comparative project. I intended to scrutinise the everyday representations of Roma in both a Romanian and an Italian city, and the ways in which those representations impacted on Romani communities' position in the urban space and more broadly in urban life. However, once back from both fieldsites, I realised how the very assumption of similarity between the two cities in my research design was largely flawed, and how my differently perceived selves (not a co-citizen in Romania and not a co-urban-dweller in Italy) substantially influenced my informants' representations of local Roma. The paper is a reflexive analysis of this post-fieldwork epiphany, and employs Strathern's concept of "partial connections" to argue that we-ethnographers may benefit from reflexively understanding the extent to which we ourselves, in our very everyday fieldwork practices and thinking, embed and embody "partial connections" rather than, or along with, producing perfectly flawless comparisons.

PICKER, GIOVANNI* (European University Viadrina, giovanni.picker@gmail.com)

Racial Inequalities in Continental European Cities: Expanding Diversity

Since 19th century's massive processes of urbanisation following industrial development, diversity has unfolded along with socio-economic stratification and inequality. In the current global order, where non-citizens or just-citizens are overrepresented within cheap-labour market niches including low–skilled jobs, a major marker of urban inequalities in the Global North is skin colour, and generally physical appearance. A large body of research has shown how racist assumptions and thinking behind policy and actions keep "others" on worse socio-economic conditions than the (white) majority. Cleaners, taxi drivers and domestic workers across cities of the Global North are just among the most well-known examples of how global economic inequalities materialise in increasingly diversified urban settings. From such a global perspective, this paper questions the virtually complete absence of racial inequalities in the burgeoning diversity scholarship on continental urban Europe, and theoretically expands the concept of diversity to include racial inequalities as constitutive of hyper-diversification processes in this part of the Global North. Drawing on my long-term ethnography (2007-2013) of the housing conditions of Roma in Italian and Romania cities, the paper shows the pivotal role of racial thinking behind state policy and civil society discourses and actions. It historically and ethnographically dissects key economic, political and cultural factors behind residential inequalities between Roma and the majority in Pescara (Italy) and Cluj-Napoca (Romania). It shows how local political economy concerning social housing (Pescara) and land (Cluj) merge with electoral interests, capitalising on the racist everyday and local media discourse on Roma based on racial assuptions and thinking. In order to expand the concept of diversity, the paper theoretically builds on the scholarship highlighting the need to acknowledge racial inequalities in continental Europe (e.g. E. Fassin; D.T. Goldberg; A. Lentin), and complements this literature with an accent on cities as key sites for understanding (and expanding) diversity.

Educational Inequality in Nuevo Leon and Oaxaca, Mexico, 2008 and 2010. the Basis of an Uncertain Future for These Societies.

Education in society especially in Mexico, seems to be a powerful instrument of intergenerational social mobility to produce individuals with "capabilities and functions" (Sen, 2010) allowing them to obtain a greater well-being. "Education as schooling" (Bazdresch, 2001:65), in the first instance, improves the individuals liv-

ing conditions, since this is a path to a better way of living and a privileged way to achieve a higher economic and social position within a society (Bazdresch, 2001). However, education's purpose is not only to be thought as schooling for economic well-being, but also as an element of cultural integration and general well-being within a society. Based on that, we have studied the educational inequality in two states in Mexico during the years 2008 and 2010. To this end, we have incorporated into a model of multi-dimensional logistic regression, and index of educational inequality. This index, consisting of three focal variables: educational backwardness, access to technologies of information and communication, and family education spending. These variables allowed us to quantify more accurately this form of inequality. The observed results are worrisome, even more because; this derives other inequalities for the families of these societies, including reducing opportunities for better employment, and thus provoking lower standards in health, housing, nourishment, and social participation among others. Educational inequality is, therefore, another factor that originates poverty in the society.

Should I Stay or Should I Go? Polish Migrants Settlement Practices in the UK, a Decade after Accession

While existing research into post accession Polish migration indicates that migration of Poles to the UK is motivated by a desire to improve their quality of life or the life of their families, little is known about how they evaluate or assess the quality of their life since their arrival in the UK, and how this affects their decisions about settlement. Rather than migration being analyzed as single event driven by migrants' desires and expectations, this study recognized migration as process that comprise of set of social practices where migrants' decisions about staying or returning are subject to ongoing considerations that change over time. Therefore, this paper will discuss the nature of Polish migrants considerations, actions and experiences involved in their settlement practices.

The central concern of this study is to explore the key drivers and events that have an impact on Polish migrants' decision to stay, their actual settlement practices and migration plans. Drawing from the analysis of 24 semi-structured interviews with Polish migrants in Glasgow and Edinburgh, this study indicates that recently arrived Polish migrants go through different stages of the settling process which does not necessarily result in their final decision about staying or returning. The findings of this study indicates that migrants' age at the time of arrival in Scotland, life-cycle stages and feelings of economic and social security are as significant for understanding their settlement practices. It also indicates that despite Polish migrants reflections and future plans were predominately tied up with their country of residence, they remained ambivalent about their settlement intensions and highlighted that dichotomous distinction between intention to stay or return did not explained fully their experiences following migration.

Is Neo-Liberalism the Best Strategy to Manage Capital-Labor Conflict? the Italian and Chinese Cases

Following neoliberalism ideologies, European national governments have progressively weakened labor-capital conflict by delegitimizing trade unions and workers' collective actions, even more in the aftermath of the last economic and financial crisis. As a consequence, in Western countries, trade unions have lost their crucial role as mobilizing structures. This has occurred even in those countries where collective bargaining, the regulation of industrial relations, and a consultation model have lasted longer than in other countries, such as Italy. Likewise, similar tendencies have occurred in authoritarian contexts. First and foremost, starting back in the 1980s, China has progressively opened to market economy, in a political system characterized by a one-party rule and a single trade union, which can be hardly classified as socialist capitalism. In this framework, antagonist forms of workers' claims have been controlled either through indiscriminate and repressive violence or through the regulation and recognition of illegal trade unions.

In this framework, this paper aims to examine first, the role of the State in labor conflicts; second, old and new types of workplace collective actions, namely strikes, in Italy and China as well as their efficacy in labor-capital conflicts.

By joining insights from mainstream social movement theories, namely the political process model focusing on the crucial impact of political opportunities and constraints in shaping engagement in organizations and in collective actions, with insights from industrial relations perspectives, we argue that neo-liberalism represents one the most useful ways adopted by **democratic and non-democratic** governments for managing capital-labour conflict.

Empirically, we draw on ILO and the Chinese Official Labour Force data to show changing patterns in the use of collective actions, inter-alia, trade union participation rates, number of people going on strikes among the employed population, number of days lost due to strikes, between 1950 until 2012.

Seriality and/in Mediations of Leisure: On Netflix and Its Everyday Mobilities

It's not TV, it's not HBO, it's Netflix. In the age of ubiquitous entertainment, especially with the proliferation of digital streaming services and interfaces, the contexts of using media content have become more mobile and flexible. Serialized flows of popular culture – based on the recurrent material-semiotic movements of information and meanings – are entering a new mode of mediation to be experienced as 'lived in' rather than encountered in a separate realm of representation.

To promote its launch in France in September 2014 the American streaming platform Netflix created a digital outdoor campaign made entirely of GIFs. With more than 100 different GIF-scenes from popular films and television series to appear on more than 2.000 digital billboards placed in Parisian public spaces and reacting to various situations of urban everyday life, it was designed to generate a simulation of what Netflix declared as an experience of "100% contextuality".

Because of the cyclic and repetitive but also mobile and interchanging nature of the GIFs which changed their content to match the context of their surroundings depending on the current news, weather and time of the day, this campaign has managed not only to illustrate the capacity of Netflix to provide online content on-demand – whenever and wherever the people want it to be provided – but to actually make the Netflix experience part of the everyday mobilities.

Drawing on the affective and performative capacities of this interactive mobile brand environment to connect every leisure situation with a good reason not just to watch a particular movie or television series but to watch it on Netflix, this paper proposes to discuss the synthesis between the logics of database navigation, televisual narration and web 2.0 virality within the process of content differentiation across constantly shifting trajectories of our everyday movements between online and offline settings.

The Compensation of Asbestos-Related Illnesses in France

This paper, based on a study of a French occupational illness scandal, examines disparities in the instigation of legal proceedings. Asbestos, a toxic substance commonly used in French industry in the "Trente Glorieuses" (Thirty Glorious Years; France 1945-75), causes pulmonary illnesses and death by cancer. The toxicity of this product has, however, been known since the beginning of the twentieth century. Following the scandal which erupted in France in the 90s, legal and administrative innovations were implemented in order to compensate employee victims: civil lawsuits are now easier to win, and the government has created a specific compensation fund for victims of asbestos. The latter increases the compensation for victims in comparison to other occupational illnesses, with the aim of limiting the number of lawsuits. Victims thus have the choice between legal and extra-legal compensation mechanisms. Although these mechanisms are in principle open to all victims, our study will nevertheless demonstrate disparities in the victims' choice of mechanism.

Drawing on forty interviews carried out with professional victims of asbestos, we will demonstrate how commitment to the mechanisms depends largely upon the situation of the victims. In particular, we shall highlight two essential factors to explain the victims› choice. Firstly, involvement in collective associations or unions created to assist in the preparation of dossiers is a large influence in the choice of civil lawsuits. Secondly, the employment path of the victim, if it is stable, promotes the causal link to work and the attribution of responsibility to the employer. On the other hand, those with a non-stable employment path (in particular, temporary workers and subcontractors) have more difficulties in identifying their professional activity as being the cause of their condition and are less likely to initiate legal proceedings against their employer.

Work Hard, Party Harder: Le Travail Des Djs Dans La Ville De São Paulo

Cette recherche a pour but d'analyser les trajectoires occupationnelles des DJs dans la ville de São Paulo, lesquels font partie du marché du loisir, un espace informel et non réglementé où les événements qui servent de lieu pour leurs performances musicales sont vendus. Nous avons discuté les critères les plus importants dans le processus de la construction de leur identité sociale en tant que travailleurs, en observant la corrélation avec certaines valeurs qui sont devenues très importantes après la flexibilisation des relations de travail. Nous soulignons le fait que les professions liées aux secteurs artistiques et de la musique, historiquement éloignés des représentations traditionnelles des emplois salariés, ont gagné un nouveau sens dans le nouveau paradigme de l'entrepre-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

neuriat culturel, qui apporte un groupe de nouvelles qualités valorisées, comme le dynamisme, l'autonomie et la polyvalence. C'est une activité basée sur des projets temporaires qui ne favorisent pas la planification de la vie. En utilisant une méthodologie qualitative, à travers des entretiens semi-structurés et travail de terrain, nous avons analysé ce processus d'acceptation de l'instabilité occupationnelle, qui est compensée par des discours de la liberté de création artistique et de contrôle sur leurs horaires de travail. Il est une occupation qui est situé dans une zone frontalière entre les différentes identités de l' artiste indépendant et des travailleurs précaires, toutefois les deux figures sont imprégnées par les valeurs de la flexibilisation, culminant aussi dans la différenciation entre la création indépendante et la soumission aux exigences du marché. Il existe aussi une caractéristique relationnelle dans le métier des DJs, qui apparaît dans le besoin d'articulation des réseaux interpersonnels pour l'échange d' informations stratégiques au sujet des opportunités. L'utilisation de ces réseaux interpersonnels résultent éventuellement d'un plus grand engagement subjectif, en raison des sentiments de confiance et de réciprocité demandés.

On Leisure Education in Universities

Leisure is an important part in life. It reflects the humanistic quality and development level of a person as well as the whole society. Leisure Education is the need of personal life and life world. It has a special place in the field of leisure studies. On the situation of leisure education and its development in Chinese colleges and universities, a survey questionaire will be used in some universities to investigate the present situation of leisure life for university students and their views of leisure life, their lifestle issues, the existing difficulties and problems, trying to find out educational strategies. With the idea of closely connected function of school, society and family, it is expected to assist students in getting more closely to life world, reality, enhancing a better integration into social life, *feeling the pulse of society. Meanwhile,* in exerting Chinese traditional leisure culture of "Advocating nature, *mould your temperament*, create arts", which are compatible with the serious leisure perspective, students will be enabled to have a better respect of life and *love of nature. They are expected* to use their leisure in personally rewarding ways, and enhance successful inclusion into social life.

Defining Healing Aspect of Leisure through Spirituality

Shri Shri Ravishankar quoted "If we want to make sense it has to come from silence". Much beyond the literal meaning which refers leisure as 'free time' ,it can prove to be the governing force for personal as well as social well-being of a person. Leisure is the best recreational activity with beneficial outcomes covering the areas: social functioning ,physical, psychological & spiritual health and wellbeing, family , economy and the environment. In discussing the spiritual orientation of leisure, James Murphy wrote ,"Leisure may be viewed as a part of life which comes closest to freeing us. It enables people to pursue self-expression, enlightenment and their inner soul ". A healthy spiritual life needs the healing dimension of leisure. Complexities of modern life, people getting more and more busy with their work, they hardly get any time with their families and are regardless of their social life. Due to which they are building faith in spirituality and to gain peace and extract the real value of life they are joining various camps aiming at spiritual relief and meditation. According to recent facts people from upper middle class are getting inclined towards spiritualism. It is because these are the people burdened with maximum workload, thus they are engaging in spiritual activities so as to rejuvenate themselves both by body and by soul. A person indulged into spiritual activities is found to be more focused towards his work, more concerned about his personal well-being and more devoted towards his social relations. Thus in all aspects he leads a balanced life and builds a feeling a contentment and satisfaction in what he has, relieving him from all the evil issues residing in his mind.

The Discursive Trajectory of Street Demonstrations in Brazil (2013-2015)

Street demonstrations in Brazil between 2013 and 2015 have taken a peculiar trajectory.
 Four different discursive moments can be identified in this trajectory:
1. A left-wing struggle for free urban transport;

2. a dispersive discourse where each person on the street represents one demand;
3. an articulated discourse supporting the central right-wing presidential candidate Aécio Neves; and
4. an articulated discourse against the reelected president of the Republic, Dilma Rousseff. Demonstration discourse has shifted from the left to the right within two years.
This paper intends to answer the following questions: How was the right wing discourse constructed in the street demonstrations over these two years? What was articulated in the discourse? What meanings were constructed? Was there any place for left-wing discourse?
This paper is not an empirical analysis of the demonstrations but an analysis of discourse based on three key notions of the theoretical approach of Ernesto Laclau: logic of equivalence, antagonism, and people. It intends to reach two results: to explain the trajectory of the discourse of the Brazilian demonstrations and to apply a methodology to overcome analyses of content type.

From Principles to Practices: A Comparative Analysis of the Enjoyment of the Right to Social Protection in Algeria, Morocco and Tunisia

Comprehensive social welfare systems are fundamental to ensure a minimum standard of living and income security to any citizen[1], but are especially beneficial to persons with disabilities in light of the additional costs faced by persons with disabilities and their households[2]. Accordingly, the CRPD[3] establishes in Article 28 the "*right to an adequate standard of living and social protection*".
Tunisia, Morocco and Algeria are signatories to the CRPD and the three countries have ratified the Convention. They have known recent political transformations in the aftermath of the Arab Spring. It then becomes interesting to understand how their welfare regimes have changed to tackle new human rights obligations and how these are being translated into political commitments (*rights in principle*), policies and programmes (*rights as policy*) and concrete practices (*rights in practice*)[4].
This paper will present the outcomes of a comparative study of the social welfare systems in three North African countries and their impact on the conditions of living and social protection of persons with disabilities. Results were obtained through a comparative analysis of national laws, policies and programs, as well as semi-structured interviews (N=180) and questionnaires (N=180) applied to a sample of persons with disabilities 12-45 years-old, in urban, peri-urban and rural settings in Algeria, Morocco and Tunisia. Results will highlight key factors that enable or inhibit the enjoyment of social protection and adequate standards of living by persons with disabilities in the region and draw recommendations for more inclusive social policy design.

    biancamaria.pirani@uniroma1.it)

Reclaming the Ssocial throughout Embodied Practices

This paper focuses on   the role of the experiential body in the construction of global civil culture. The thinking, feeling and acting body will figure as prominently as the mind, cognition, and rationality in combining the framework of the research and the methodology underpinning its development.
To what degree do individuals have control over their own bodies? How significant is the body for the development of an intercultural competence and communication, by which to denote the ability – and willingness – to enhance human contact and inte-ractions across the diversity of traditions, experiences, values and cultural identities?
 The paper starts from the consideration that what is traditionally viewed as culture and is often used as a variable, should be broken down in *behavioral components*, that can be empirically assessed. Therefore, we like to depart from the hypothesis that many so called 'cultural' behaviors are in fact *local practices* with very specific and local dynamics, due to the way real people are part of it: male and female, low and high status, religious and non-religious, different ethnic background and involved in different age groups. This paper suggests, synthetically. a *contextual* idea of culture, by approaching cultural differences in terms of the patterning of behavior and its tuning in the intrinsic social group. Culture is, in-

deed, considered as a *dynamic bridge among social temporalities and places*: which is *open, pluralistic, moving and permanently being updated.*

Is the Self-Management Possible? a Study on the Recovered Factories in Brazil

The context generated by the productive restructuring associated with financial crises and changes in the Brazilian economy in the late 1990s led to the collapse of many companies and resulted in increased unemployment and increasing instability and insecurity of labor relations. Thus, workers sought other forms of livelihood, including the associated work. ANTEAG (Associação Nacional de Trabalhadores em Empresas de Autogestão e Participação Acionária) [National Association of Self-Management Companies' Workers] emerged in this context, with the goal of supporting groups of workers to unite and take control of bankrupt factories in which they worked, preserving their jobs. So, the first "recovered factories" emerged. At this time, the movement of the Solidarity Economy also begins to grow, and Unisol Brazil (Central de Cooperativas e Empreendimentos Solidários) [Central of Cooperatives and Solidary Enterprises] arises to support various types of solidary economic enterprises, including the recovered factories. Thus, our purpose is to make a general analysis of the current situation of recovered factories in Brazil. To do this, we return to some of the pioneering experiments of recovered companies. Our goal here is to discuss if and how cooperative and self-managed values are present in these enterprises today. So, we performed a literature review of case studies about recovered factories and visited several experiences of this type, where we conducted observations and interviewed leaders and workers, using some semi-structured scripts. In addition, we seek to look at our subject from an international perspective, so we visited Argentina and France. In general, we note that, although the ideals of cooperatives and self-management remain in the speeches of many workers, their enforcement encounters many obstacles in practice. In other words, to be viable, recuperated factories face many pressures in the market, which eventually modify some of your initial goals.

PIRES, ALINE* (Universidade Federal de Sao Carlos, aline.sociologia@gmail.com)

Young Workers in the Information Technology Area: A Speech about the Flexibility of the Y Generation in Work

On the last decades, the world of work has suffered a series of transformations. More and more, the formal work, for uncertain time and built based on careers gives place to a flexible work. This work is characterized by being temporary, organized by projects, realized on variable places and times, network dependent, and individual. In a world of work configured this way, the idea that the young workers would be able for these new experiences gains power, as they were more flexible, open to the risks and to the shapes of flexible work in general matter. This discourse gains power with the notion of "Y Generation", that presumes that the young workers that are entering in the labor market have intrinsic characteristics associated to the idea of flexibility. So, our proposal is to discuss critically the idea of Y generation, analyzing the way that the workers live the new configuration of the work worl, that means, in what level the flexibility discourse, the idea of innovation, the individual talent, the constant update and the "creative" unstableness are interiorized by them. For this, we interviewed, using a semi-structured script, about 30 workers, between 20 and 30 years old, approximately, that act on the Information technology(IT) area in the São Paulo state, Brazil. The IT area was chosen because it is the in the ones that most increase in the context of work flexibility, with expressive participation among young people within its employees. We have observed that, regarding the existence of a speech that affirms that the young workers flexibility is "positive", these workers have to be submitted to ways of work increasingly precarious and intensified, that, in some cases, results on ways of physical and psychological illness.

Life Ongoing. Shades and Blows of the Real in the Lives of Persons with Mental Illness

In 2014, I began researching the changing frontiers of psychiatric and spiritual care in the context of globalizing trends in mental health care. A core feature of this project includes analytical accounts of the lives of people diagnosed with disabling psychiatric disorders. Between April and June 2015, I interviewed seven persons attending a Lisbon psychiatric hospital daily care unit . Prior to these interviews, some of these persons had been subject to periods of internment in different medical facilities. Since the interviews, most of these patients have been discharged from the daily care centre on account of their reported improvement.

Although providing valuable insights into the impact of mental illness on the lives of these individuals, my approach left me with a deep sense of frustration. What had become clear was that, besides the contingencies of the intersubjective relationship underlying the interview, these illness and life narratives had been strongly conditioned by the more unusual facets of experiential approaches, such as psychotropic medication, electroshocks and the psychiatric institutional setting. And then, life, of course, continued. At any rate, some of these persons manifested a strong sense of life continuing: discharge from the psychiatric institution was equated with a return to reality; with all its possibilities, closed doors, threats and blows.

In this presentation, I argue that in order to do at least a bit more justice to experience in sociological research, we are to complement conventional forms of narrative recollection with methodologies capable of articulating duration, rather than memory; encounter, rather than narrative; and ontological openness, rather than epistemological relativism. In dialogue with the work of anthropologist Michael Jackson and Cultural Studies scholars Lauren Berlant and Jacqui Alexander, I will build this argument through reference to some of the above mentioned persons.

The Youth and the Perception of the Future. Between New Values, Transnational Orientations, and the Reinvention of Politics

The aim of the paper is to shed light on the new transnational orientations that spread among new generations and on their perceptions of future. The goal is to provide a critical assessment of macro-trends of change affecting youth, regarding the system of values, the relationship with religion, the family and love, the involving in social relations (peer to peer groups, insertion in social networks), the approach to study and work, the civic and political involvement, leisure and cultural consumption, deviant behavior. We will explore how these variable influence the perception of the quality of life, the feeling of vulnerability and uncertainty, the perception of the future. Finally, we will identify the way in which youth frame and try to actively build the future, both on the individual and on the collective level. The analysis is carried out comparing data provided by major international and national survey on young people and exploring surveys and analysis conducted by national institutes devoted to youth studies. The analysis will focus on three Southern European countries: France, Italy and Spain. The hypothes we follow is that the younger generation presents multiple and original synthesis between subjectivity and collective dimension. implicitly suggesting new social arrangements. Particular attention will be paid to the political youth movements arised in the three countries, and to the more recent mobilisations, as indignados movement, as example of a reinvention of politics leaded by young generations, that experiment new combination between individual and global concerns and between individual and collective future. The critical analysis of the empirical evidence provided by macro-data, may represents, in our opinion, a step forward in overcoming rethorics and stereotypes conditioning youth studies, to be integrated with more qualitative analysis focused on individual narratives and devoted to in-depth analyse new forms of social and political interactions.

Understanding Calamity Impact As Evolutionary Global Innovation Trends

The current age is a bifurcation between development and calamity and social scientists are more and more in troubles to draw distinctions between threats and opportunities. This paper   copes with the   epistemological and methodological frames to select the scale and use of data sets to let research be focused on the differences which really make the difference in shaping the key global challenges of our times and evolve viable systemic policy models to improve the governance toolkit for high complexity scenarios for example about technological high speed changes , demographic   increase, reconfiguration of knowledge making and diffusion, the shaping of evolutionary strategies

The starting point is Sorokin's famous list of traits featuring societies in calamity to use it as a standard to assess our age positioning in the bifurcation through the nonlinear and chaotic trends of evolutionary complexity in global change.

Can We Tether Finance to the Productive Economy? Experimental Monetary Practices in Islamic Finance

Islamic banking and finance is an ongoing Southern experiment to critique conventional finance and to construct morally superior new monetary practices and representations that are "Shari'ah-compliant." $1.9 trillion USD of accumulated wealth is engaged in this experiment; over 97% of these assets are located in the Global South.

This paper focuses on the emic practices and representations of a key concept in this South-South dialogue—*riba*—so as to address an etic research project of interest to secular social scientists: Is it possible to tether all financial activity to the productive economy? If we can, is that desirable? To investigate these two questions, this paper draws on 48 focused, ethnographic interviews conducted in 2012 and 2013 in profit-oriented investment banks with financial engineers and Shari'ah scholars who co-produce new monetary practices.

Pious Muslims are instructed to avoid profiting from *riba* (literally "increase" in Arabic) but the interpretation of *riba* in contemporary finance is far from self-evident. The present dominant interpretation is that virtuous profits are derived by receiving money in exchange for providing a real asset or service. In contrast, it is forbidden to make money from money (e.g., to receive interest, i.e., to receive money in exchange for money of the same currency, rather than in exchange for a real asset).

The paper describes three cases of novel monetary practices that are designed to elude *riba* by tethering financial activity to the productive economy. The first case describes the creation of Shari'ah-compliant stock indices and the second case describes the monetary practice of *tawarruq*. Between these two cases—the first uncontroversial and unproblematic, the second controversial and yet difficult to resolve—we find our third case, *sukuk*, a diverse category of new monetary economic practices designed to replace interest-bearing sovereign or corporate bonds.

The paper concludes by answering our two questions.

América Latina y Europa. Una Perspectiva Comparada De La Evolución De Sus Sistemas De Relaciones Laborales

La comunicación analiza la evolución reciente y la situación actual de los sistemas laborales en América Latina y Europa. Desde los años '80 el post-fordismo y la hegemonía financiera están desmantelando, en Europa, los pactos sociales de post-guerra y socavando sus sistemas laborales. Por su parte, muchos países de América Latina, durante la "heterodoxa" década de los años 2000, experimentaron una recuperación económica y de sus mercados de trabajo, junto con un fortalecimiento relativo del mundo sindical y de la institucionalidad de las relaciones laborales. No obstante, aún mantienen una alta proporción de trabajadores en la economía informal y al margen de las protecciones sociales y laborales reguladas por los convenios colectivos de trabajo.

Nos preguntamos qué tendencias y procesos organizan las relaciones de empleo en Europa y América Latina. Al respecto, se presentan resultados de una comparación entre los principales rasgos de las relaciones laborales en tres países de la Unión Europea (España, Alemania y Reino Unido) y en dos países de América Latina (Argentina y Brasil).

Se comparan, sintéticamente, las características centrales de sus mercados de trabajo, el contexto legal y administrativo, el papel de los principales actores de las relaciones laborales (sindicatos, empresarios y autoridades públicas), los alcances, temas y rasgos de la negociación colectiva actual, y la dinámica general del conflicto laboral. A partir de la comparación de estos aspectos analizamos los mecanismos de transformación y los patrones de evolución de las relaciones laborales en estos países.

La metodología utilizada es el análisis comparado sobre la base de información secundaria. El enfoque comparativo permite captar los procesos y mecanismos comunes, así como las particulares de las instituciones y actores sociales nacionales.

How Environmental Movements Shape the Global

Social movements are both products and producers of global transformations. Both the meaning and the reality of the global have considerably evolved since the start of the century and environmentalist movements have taken an active part in it.

Drawing on extensive fieldwork with a range of movements and actors (local food movements, young environmental activists, de-growth, "buen vivir" in Ecuador, ENGOs, political ecology intellectuals in Europe and Latin America…), I analyse how environmentalist movements have contributed to frame and shape the "global" by focusing successively in three of its interconnected meanings.

1. After a fast process globalization of social movements in the late 1990 and early 2000, environmentalist movements now combine it with the will to put "relocalization" at core of their practices, claims and alternative societal project.

2. Actors of all sectors of the environmentalist movements foster more holistic approaches of local and global challenges. They link climate change with social and economic issues, connect daily-life consumption with citizenship and personal responsibility and promote a holistic approach of the "good life" that challenges the concept of development.

3. Finally, these actors contribute to a shift from "globalization" to what Albrow (1996) has called the "Global Age". They promote worldviews, practices and epistemologies that take into account two major feature of this global age: an increasing interdependence at the scale of humanity and the finitude of the planet.

A study of the practices, claims and meanings of these actors provide us with empirical material to understand today's world. It also points to some major challenges of social sciences that remain deeply rooted in the modern project, unlimited growth and permanent expansion.

Older People in the Context of the Greek Dept Crisis. They Shoot Horses, Don't They?

In ancient Greece, starting with Homer's epic *Iliad* and his iconic figure of Nestor, continuing down through the centuries to Plato's era with the character of Cephalus in T*he Republic*, there has been a literary tradition in showing great respect to older people and their intellectual power. However, in the years of 'late modernity', it seems that Greek society has put this notion in ambiguity. Within the financial crisis, according to the OECD Employment Outlook, total poverty in Greece reached 13%, (2% higher than the OECD average and the second highest in the EU). Importantly, the poverty rate for people 65 years or over rose, from 22% to 24%, while the combined at-risk-of-poverty and/or social exclusion aggregate rate reached 34%. Furthermore, an estimated 800,000 Greeks are without medical access due to a lack of insurance or poverty, while youth unemployment rate jumped to a record high of 59.5%. Additionally, significant increase in indirect taxes (electricity, food, heating oil) and special levies (e.g.'extra' property levy) have been applied targeting the middle classes, but affecting mostly the vulnerable groups. Considerable cuts in current and future pension schemes and social benefits have put older people deeper in poverty risk. Due to the financial crisis, more than ever, older Greeks are pressured by the 'risk society', experiencing pensions' reductions, unemployment in their family and huge transformations in the Greek welfare system. And it's not only the young Greeks whose 'biographies' are no more 'lives of a linear narrative', as Sennet argued, highlighting *'the personal consequences of work in the new capitalism'*, back in 1998. It is the older Greeks indeed, obliged now, to acquire in their old age 'flexibility skills', or else to die.

But on Whose Scale? Staff and Student Perspectives on Valued and Valuable Outcomes in the 'Counter-Spaces' of Flexible Learning Programs

For marginalised young people alternative education settings, referred to here as flexible learning programs, are thought to provide a powerful 'counter-space' to damaging and exclusionary experiences of mainstream schooling. Such programs are, however, inherently contradictory with potential to also re-produce stigma and disadvantage. The provision of secondary schooling via flexible learning programs is significant. In Australia, for example, the sector serves over 70,000 students. To address educational inequalities we need a better understanding of student experiences and outcomes in these educational spaces. Drawing on interview data with staff, students and graduates from two flexible learning programs located in metro and regional Victoria, Australia, this paper adapts Edward Soja's (1996) theorisation of the conceived, perceived and lived space to explore what outcomes are valued, and how success is measured, in these programs. The paper shows that a diverse range of academic, social and personal outcomes are articulated by staff and students in ways that are meaningful to the students' experiences but also to external mainstream systems. This diversity of outcomes and measures of success support a more expansive vision of schooling than dominant perspectives. This has implications for traditional and alternative educational spaces, as well as the relationship between them. The paper suggests that these FLPs operate both as counter-spaces, and as third space, a hybrid place bringing together the conventional and the alternative to create a valued and valuable education for marginalised young people.

Legitimization As the Foundation of Innovative Societies

Successful innovation needs societal acceptance. The societal legitimization is based on the societally accepted interpretation of the relevant societal tradition at the point in time in question. A reinterpretation of a societal tradition occurs from time to time. In this presentation, the causes for a reinterpretation in addition to the limitations thereof are assessed. It will show that the relevant societal tradition sets unchangeable limits to innovation as well as time-dependent changeable limits. In this presentation, the mechanism of a reinterpretation is assessed. There may be innovation that can be legitimized in the context of one societal tradition and not in the context of another. The predominance of the Occident for at least 300 years has camouflaged the limitations of the Occidental Tradition, but the rise of societies founded on other societal traditions, e.g., the Sino Tradition, will increasingly demonstrate the limitations of the Occidental Tradition in the context of innovation.

Many Diverse Sciences in a Multipolar World

Science and technology are an expression of society. Specifically, society and its interpretation of its societal tradition defines the rules of legitimizing science and technology. Historically, there have been different sciences and technologies reflecting different societies and different rules used in legitimization. This presentation assesses the present challenges and future acceptance of three sciences and technologies, i.e., the science and technology legitimized based on the Occidental Tradition, based on the Amerindian Tradition and the Sino Tradition. Because the current situation of each of these sciences and technologies differs, the present challenges differ. The science and technology legitimized based on the Occidental Tradition has been predominant for at least the last 300 years, but the Occidental Tradition sets limits to its development. These limitations are assessed. Science and technology legitimized based on the Amerindian Tradition and the Sino Tradition offer new paths forward, but science and technology legitimized based on the Amerindian Tradition will require the reconstruction of the Amerindian Tradition.

„We Have Offline Meetings Twice a Year" - Coordination and Justification Work in a Virtual Cooperative

Virtual organizations (VO) use novel coordination regimes that rely less on geographical proximity than conventional organizations. They can also deal with less consistency and homogeneity of their member's working-results. But while they are relatively free from old constraints, VOs have their own new problems and challenges. VOs are fundamentally dependent on virtual communication. Depending on the tools used, virtual communication has characteristics that facilitate coordination (storing and retrieving of communication) and characteristics that complicate coordination (asynchronous communication, absence of nonverbal communication). Also, virtual interaction lacks the motivating and disciplining effect of the physical presence of other people in shared workspaces.

I will present an analysis of the coordination of work in a virtual cooperative that distributes and sells beverages, QC. In a legal sense, QC is just a registered trademark, but in the sense of practical coordination, QC is a cooperative because all stakeholders (business partners and consumers) have the right to take part in decision making processes. QC is a networked organization that is made up of a multiplicity of heterogenous, geographically dispersed actors who fullfill varying functions for the organization. QC does not have any employees and almost no written contracts, but approximately 680 business partners and 50 „speakers", people who communicate with and take care of venues and shops that sell QC-beverages. For communication and decision making QC has been using an e-mail list for 11 years, but changed to an online board a year ago. Guided by theoretical and methodological considerations from the sociology of conventions, my analysis is based on data generated in the e-mail list and the online-board, as well as interviews with members of the collective.

Biographies in the Shadow of a Resistant Family History: The Meaning of Discourse and "We-Group" in Intergenerational and Biographical Processes

On the basis of my ongoing research about "Resistance against the National Socialism and its intergenerational transmission in Austrian families" I want to present biographies of descendants of resistance fighters of one family to discuss the interplay of discourses and "we-group" in the development of intergenerational and biographical structures. I will stress two aspects: Related to the fact that in Austria a discourse of denial offers pattern of interpretation to conceal resistance I firstly want to focus on the impact of this discourse of denial and silence on intergenerational und biographical structures which have been developed by members of this family. Beside the impact of this discourse I want to ask for the role of the existence or absence of a "we-group". Concerning resistance against the Nazi-regime especially political groups like the communists or socialists play an important role as a place of (collective) remembrance of the past after 1945 and as a place where descendants have the opportunity to appropriate to a collective history which is not concealed. But what happened if such a "we-group" does not exist? In which way does the absence of a "we-group" influence the intergenerational and biographical processes? What does this mean for the intergenerational transmission process?

What We Need to Know about Cross-Country Equivalence When Studying Gender Differences in Labour Market Outcomes

Since early 1960s comparative sociology has been relying on survey data from nationally representative samples. The 1980s saw a rapid growth of cross-national survey collections which continues in the 21st century. While much progress has been made in ensuring international comparability of attitudinal indicators, non-equivalence problems are rarely considered in the aftermath of data collection. Instead researchers often assume that if items have been carefully developed, tested and well translated, their meaning is approximately the same in heterogeneous populations. This pervasive methodological oversight has led to flaws in accepted conclusions of some influential social research (see ANNU. REV. SOCIOL. 2014 or SOC SCI RES 2015).

One of the key challenges facing the research on labor market experiences of men and women is to distinguish universal processes from country-specific legal, economic and social conditions. Yet, the research on work experiences that compares men and women's perceptions of their work autonomy, discretionary time, promotion prospects, satisfaction and career development opportunities has employed cross-national survey data without due concern to the implications of potential distortions to cross-country measurement equivalence.

To alert researchers to these problems we present a comprehensive analysis of a number of frequently used scales developed to measure labour market experiences in the European Social Survey, the World Values Survey, the International Social Survey Programme, and Survey of Adult Skills. We assess these scales with four strategies: 1) multi-group confirmatory factor model with several sets of fit indices, 2) regression approach, 3) multilevel confirmatory factor analysis and 4) alignment optimization. Nearly all scales display a substantial degree of international non-equivalence and lack of cross-gender comparability. We present sub-

'Liquid Migration' Beyond the City: Environmental Values Vs. Urban Everyday Life

Recovering the ancestral reunion with nature is not only a matter of personal choice; it is becoming an imperative. This trend stands true for many societies in the contemporary world, including Russia. Against this social background, a new migration trend takes place. The residents of big metropolitan capitals, such as Moscow and St. Petersburg who represent relatively wealthy middle class professionals, begin to acquire local property in the remote rural sites of the Kostroma Region in the Near North of Russia. This includes traditional log houses and barns, which are turned them into so-called *"dachas"* or summer homes. The newcomers exceedingly extend their presence in the summer houses, turning them into their main residential family places, densely packed with all modern commodities and info-communications. The latter allow the reinvented rural dwellers to continue their professional work in the mode of a distant office. In this context, the quality and benefits of the natural become critically important in the urban residents' decision to substitute their city life with rural existence. As such, the notion of "natural capital" (Costanza, 1997), which refers not only to the physical characteristics of fresh water and atmosphere but also to the condition of the surrounding virgin woods and the general aesthetics of landscapes becomes central in the radical remodeling of one's life. However, newcomers are not inclined to settle down in the villages permanently for the rest of their lives and, hence, to destroy all ties with a city. On the contrary, their state of mind is something that one may describe as "liquid migration" (Nikita Pokrovsky, 2011). Mobility potential and possibility of being "on the move" are principally important to them. Is this migration tendency episodic and temporary? Does it represent an early warning sign of a significant historical cycle?

Fostering Collaborative Practices: The Governance of Sharing Economy

One of the most important waves of social innovation that is growing in the last few years is the diffusion of collaborative practices, frequently named as sharing economy. These practices deal with different dimensions of the social life, such as working, housing, caring children or aged people. There is an increasing debate on the economic and social impact of these practices, both on the positive side (mutual help, sociability, welfare cost reductions, etc.), and on the negative one (the inequalities they may foster, their use as a justification for a retrenchment of welfare services, the increasing share of for-profit venture, etc.). But there is still no general understanding on the role public institutions may have to govern this phenomenon and to rule over its effects. The literature describes several empirical case of both bottom-up and top-down governing strategies usually deployed at the Municipal level, but little on their implication on inequalities. Departing from existing knowledge, we first propose to focus on how different local administrations can tackle the sharing economy practices and to consider in particular the problems of potential inequalities associated with specific sharing practices. We then look at two local administrations, Mantua and Milan, which have tried to govern these practices in diverse manners so to assess their social implications. We thus expect to shed light on the impact the local governance of sharing economy has on our cities.

Technological Determinism on the Media Representation of the Conflict over Guatemala's Hydropower Plants: An Exploratory Survey

Guatemala is a country with high potential for producing renewable energy, particularly hydropower. However, it is woefully under-exploited and Guatemala depends on imports of fossil fuels to produce about 30% of the energy it consumes, adding considerable load to its carbon footprint. Moreover, hydropower is strongly criticized by environmentalists and community organizations mainly over the damages on their territories. This article, part of the preliminary research on a larger project, raises some basic questions to address this conflict from an

STS perspective. It focuses on the representation on digital media of the conflict around hydropower. It is used as a methodology framework the work of Bijker (1997) and Bucchi & Neresini (2007) on public participation, and the work on technological determinism (TD) on Roe, Smith and Marx (1994), among others, to analyze the content in a purposive sample of opinion columns published on digital outlets between 2010 and 2014, whose subject was conflicts on hydropower. The analysis led to the conclusion that TD is part of the discourse in almost all the columns that are in favor of hydropower, as expected. However, TD was also part of the approach on a slight majority of the articles in opposition, while some of them held more constructivist views. TD seemed to be, for both sides, a good rhetorical device. In those columns that favor hydropower, it helped depicting concerned communities as illiterate and gullible; while in those that oppose it, TD fed their historical mistrust of the other (Orantes, 2010) and added evidence for a complete rejection of hydroelectric projects. However, in both narratives, the average citizen had only two options, accept or reject hydropower projects, and with them their technology and consequences. Few articles considered the possibility of citizens influencing their development, and thus adapting it to their needs and concerns.

Gender Roles in Television Commercials in Asia: A Comparison of Japan, Korea, China, Taiwan, Thailand, and Singapore

Television advertisements are a rich source of data for social scientists to investigate. Gender-role stereotyping in advertising has been a prominent topic in the literature since the 1970s. Over the past decade, gender stereotyping in television commercials has received particular attention. Most studies reveal that men and women are depicted differently in television advertisements, and the differences are in accordance with traditional gender roles and reflect the construction of gender roles in society. Additionally, several other studies suggest gender role stereotyping in advertising does exist but seems to be decreasing over time. However, although research of gender roles in advertisements is plentiful in the United States, our understanding of sex-role portrayal in an international context, especially in Asia, is limited because there are so few studies. Therefore, this paper compares the gender roles in Japan, Korea, China, Taiwan, Thailand, and Singapore.

This comparative content analysis result of 2,450 sampling advertisements, collected randomly during August and October in 2013 in these six Asian countries, show that there are significant differences of gender, age, type of role, type of working role, type of non-working role of the main character, and gender of voice-over among these Asian countries. Most of the findings of this investigation are similar to previous results in the literature in terms of the gender of the main character, voice-over, and age of male and female characters.

However, this research result refutes the conclusion that the roles of males and females in advertising correspond accurately to the construction of gender roles in reality. In contrast, the advertisements analyzed seem to reflect an ideal image of gender roles in society. Moreover, the results of gender roles in television commercials in some countries show equality in gender roles, and this supports the concept of a decrease of gender stereotyping in advertisements.

Etica Y Productividad Academica. SOBRE Las Evaluaciones DEL Trabajo De Profesores Universitarios

El propósito de la ponencia es evidenciar las discrepancias presentes en tres procesos de evaluación a los que se someten simultáneamente los docentes de la Universidad Autónoma de Chiapas (Unach), quienes forman parte de los núcleos académicos de posgrados reconocidos en el Padrón Nacional de Posgrados de Calidad (PNPC) del Consejo Nacional de Ciencia Tecnología (Conacyt).

La ponencia se inserta en una investigación más amplia sobre la ética profesional que subyace a los procesos de formación de investigadores. Se plantea que el incremento de las comprobaciones que requiere cada evaluación coloca a los docentes ante dilemas éticos en los que la justificación de su quehacer se realiza en condiciones tales en las que tienden a abandonar un comportamiento ético profesional. Frente a esta justificación se encuentra lo que Bauman (2010) denomina la liquidez de los códigos normativos, los cuales presentan tal dispersión y ambigüedad (además de inmediatez) que pueden ser manipulados de manera conveniente en cada circunstancia.

　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Los procesos de evaluación aludidos son: a) Programa para el desarrollo profesional docente para el tipo superior (Prodep) de la Secretaría de Educación Pública (SEP) cuyo propósito es profesionalizar a profesores para que alcancen las capacidades de investigación-docencia, desarrollo tecnológico e innovación... consoliden en cuerpos académicos y... generen una nueva comunidad académica capaz de transformar su entorno; b) Sistema Nacional de Investigadores (SNI) del Conacyt, cuyo propósito es promover y fortalecer, a través de la evaluación, la calidad de la investigación científica y tecnológica, y la innovación que se produce en el país...; c) Programa de Estímulos al desempeño del Personal Docente (PEDPD) de la Unach, cuyo propósito es estimular a los docentes de acuerdo con su nivel de profesionalización, experiencia y productividad.

Educación Superior En Contextos Carcelarios. La Situación Carcelaria Como Experiencia Límite

Planteamiento del problema. La experiencia carcelaria no es exclusiva de aquellos a los cuales el Estado ha obligado a perder su libertad. Los humanos podemos vivir en una cárcel durante toda nuestra existencia. Sin embargo, la experiencia concreta de estar encerrado entre muros, tiene cualidades peculiares.

Preguntas-guía. Ciertos *acontecimientos* que *acaecen* dentro de la reclusión llegan a configurarse, para algunos internos, en una *experiencia límite*. Pero ¿de qué tipo de acontecimientos estamos hablando? Y ¿qué es lo que *acontece* y cómo es qué estos acontecimientos develan un umbral, un límite?

Las condiciones en el interior de la mayoría de los reclusorios de la ciudad de México, son deplorables, aflictivas, inesperadas y crueles para la gran mayoría de quienes se ven forzados a vivir dentro de sus muros. Sin embargo, hay determinadas peculiaridades de esa experiencia concreta del encarcelamiento que a manera de *humus*, propician que ciertos eventos se tornen en *acontecimientos apropiadores* configurándose en una *experiencia límite.*

Dos interrogantes guiaron el trabajo investigativo: ¿en todos los casos, la reclusión forzada se erige como *experiencia límite*?, y ¿cómo se retorna a casa, en tanto experiencia límite, cuando la reclusión forzada ha posibilitado un *"experimentar el Ser (Sein) a la luz del acaecer (Ereignis)"*?

Objetivos. Documentar, cómo ciertos *acontecimientos propicios* constituyen una *experiencia límite.*

Analizar los diversos sentidos que puede llegar a adquirir la educación superior en contexto de reclusión.

Health and Health Choices of People Living in Precarious Prosperity in Romania

This paper looks at health status and health choices of people living in precarious prosperity in Romania. It analyses the various constraints coming from both structural contexts and social position that influence the health status of people in precarious prosperity. First, the paper scrutinizes how different structural contexts given by residence (rural/urban) can determine health and health choices. Second, the paper concentrates on the constraints coming from the social position of people living in precarious prosperity and describes the mechanisms through which they influence health status. Finally, it looks at the spillover effects that health status can have in other domains of life. Our analysis focuses on a social layer represented by those living in precarious prosperity situations, in a position above the poverty threshold and facing high material deprivation. The data consists in two waves of in-depth interviews with people living in households in precarious prosperity from two different communities in Romania (one urban, one rural). A total of 88 of households were interviewed in two consecutive waves: 50 households in the first wave (2012-2013) and 38 in the second wave (2014-2015). A qualitative content analysis of the interviews is carried out. Results show that structural contexts impose important constraints on people's health choices in what regards access to health and this has spill-over effects in other domains of life. Also, there are important limitations coming from the social position that impact on the life chances of people in precarious prosperity.

Central American Unaccompanied Minors in the U.S.: Motivation for Migration and Precarious Status in the Host Society

This paper explores the motivations and precarious legal status of unaccompanied child migrants who arrived in the United States from Central America in the spring and summer of 2014. There is a long history of migration from Central America to the United States for a variety of economic, political, and environmental reasons, many of which can be understood in the context of sociological theories of migration. However, the recent surge in migration from the Northern Triangle countries of El Salvador, Honduras, and Guatemala indicates a significant change in patterns of migration, particularly among children. Most children are fleeing violence from gangs and other criminal organizations, lack of economic or educational opportunity, or domestic abuse in their home countries. Once in the United States, however, many find themselves unable to regularize their legal status due to procedural and political concerns about accepting large numbers of immigrants. These findings have important implications for both this population of vulnerable children and for the United States' immigration system. This study draws on screenings conducted by a nonprofit organization with 1,349 children held in Office of Refugee Resettlement shelters and uses quantitative methods to examine the associations between children's reasons for migration and their age, gender, country of origin, and indigenous status.

School Graduates' Attitudes Towards Education and Labor Market in Russia

One of the most important resources of innovational development of our society is motivation of young people to education, their intentions to continue it and their attitudes towards profession. Results that are going to be reported are based on the materials of the project "Education, labor market and social behavior of youth in modern economic situation"[1], where multistage combined sample was used. The survey was conducted in the nine federal regions of the Russian Federation.

The data about the kinds of education that young people consider essential to be successful in life, what level of education they prefer; what motives drive them in choosing this level of education and future profession is described. School graduates' attitude towards the world of professions: the prestige, social significance and profitability of the different occupations are discussed and the ratio of estimates on these criteria is analyzed. The results of the study of future profession choices of young people leaving school and motives of such choices are also described. No decision about the future is significant for quite a large part of school graduates. In conclusion, attention is drawn to the importance of targeting young people to receive higher education. Mass aspirations to a high level of education get great value in today's world.

[1] The study was supported by a grant from the Russian Science Foundation (project №14-18-01985, "Education, labor market and social behavior of youth in modern economic situation") and implemented by the Institute of Sociology of Russian Academy of Sciences.

Upbringing of Engineers: Resources and Limitations of "Intergenerational Career"

This paper focuses on the issues of the resources of family upbringing of future engineers under crisis conditions in engineering education in Russia. The balance of fundamental knowledge and practical skills in the higher engineering education curriculum, as well as the role of continuity in its development are at the heart of current discussions regarding a new stage in its development. One of the issues of today's discussion is the application of the historical experience of family traditions of professional practice in the 19-20 centuries science education as a possible resource of efficiency of modern engineering.

The subject of this paper is the examination of practices and prospects of the incorporation of professional family traditions into the formation of the early careers of younger generation. Key questions are associated: firstly, with the socializing effect of professional experience of the previous generations, which becomes the "initial" career capital for the new generations; and, secondly, with the impact of the so-called professional family dynasties in the sphere of engineering profession on this process. This offers grounds for discussion of the "intergenerational career" issue – career advancement, based on socialized and integrated resources of professional family practice.

Professional dynasties were encouraged during previous periods of Russian/Soviet history. How highly in demand are they under the present conditions in the engineering profession? Knowledge and practice in the field of science and technology are changing dramatically. Do the inherited professional practices be-

come an obstacle for the new generations of engineers or, on the contrary, are the professional family traditions - an advantageous start for their new careers?

These issues are examined based on the research project (supported by the Russian Foundation for Humanities, grant № 15-03-00666), encompassing the analysis of semi-structures interviews with experts and engineers.

PORTERIA, APRIL* (University of the Philippines-Diliman, aprilporteria@gmail.com)

Making Money out of People's Misery: Has Disaster Capitalism Taken over Post-Haiyan Philippines?

In the age of neoliberal globalization, it is no longer surprising that even the most distressing situations can be a source of profit. The term "disaster capitalism" has been used to describe the global pattern of big businesses profiting from disasters. This was observed in the aftermath of Hurricane Katrina in the United States, Indian Ocean Tsunami in South and Southeast Asia, and the Haiti earthquake. The aftermath of super typhoon Haiyan provides some indications of disaster capitalism at work. However, while elements of disaster capitalism are evident, there is distinctiveness in the post-Haiyan case. This critical essay argues that disaster capitalism in the Philippines has specific nuances that mirror the pre-existing characteristics of the Philippine political economy, which is a combination of patronage politics and neoliberal policies. The article also highlights the role of people's movements in resistance and efforts of insulating the country from disaster capitalism.

Jóvenes, Emprendedores y Solidarios. Procesos De Participación y Comunicación a Partir De Un Estudio Cualitativo En La Comunidad De Madrid

Este paper se centra en un estudio cualitativo llevado a cabo en la Comunidad de Madrid en el que participaron chicos y chicas con edades comprendidas entre los 18 y 25 años a través de la técnica del focus group. El diseño de la muestra de los tres grupos realizados tomó en cuenta las variables de edad, sexo, clase social, hábitat, origen, estudios así como el interés mostrado hacia las cuestiones sociales. Esta investigación combina dos perfiles de joven: aquellos implicados socialmente a través del voluntariado y los que nunca participaron en este tipo de acciones no lucrativas.

Este estudio pretende elaborar un diagnóstico sobre los procesos de comunicación y participación social de los jóvenes en España a partir de una investigación realizada en la Comunidad de Madrid. El punto de partida es averiguar en qué medida la juventud considera que el emprendimiento y la innovación social contribuyen a transformar el entorno. Es decir, reflexionar y analizar en qué sentido estas iniciativas sociales que persiguen la mejora del otro podrían considerarse herramientas útiles hacia el progreso de la sociedad. Se aborda esta interesante cuestión desde la perspectiva de la comunicación, el altruismo y la cooperación.

PORTOS, MARTIN* (European University Institute, martin.portos@eui.eu)

Taking to the Streets in the Context of Austerity: Comparing the Cycles of Protests in Spain and Portugal, 2008-2015

2011 has been defined as the year of protest. A large and visible number of mobilizations shook the socio-political scenario in many distant parts of the globe. Southern Europe was a hotspot for popular dissent, although comparative studies within this context heve seldom been traced thus far.

Portugal experienced its largest non-trade union or political party led demonstration in March 2011, the so-called "Geraçao à Rasca" mobilization, which gathered around 10% of population in the country to protest against the negative prospects of a precarious generation. Only a couple of months later, Spain saw how hundreds of thousands mobilized to claim against the political status quo and austerity policies being implemented, and to bring real democracy now. Yet, while standards of extra-conventional mobilization persisted over the subsequent years in Spain (until we observe a declining trend, at the beginning of 2014), Portuguese levels of collective mobilization remained low. Why so? What does explain different timing and trajectories of contention in both cases, under the shadow of austerity?

In Spain, the movement(s) managed to contain radicalization attempts and postpone institutionalization through, on the one hand, fragmented and sectorial fights and, on the other hand, thanks to the strategic alliances with traditional unions to deliver recurrent mass performances. By contrast, in Portugal, protesters did not manage to appeal to broad sectors of the population in a persistent

manner, as they were rapidly coopted by the left-wing opposition parties, which fostered divisons among challengers.

Regarding empirical design, a mixed methods approach is implemented. Two original datasets via semi-automated coding of Protest Event Analysis are collected to assess timing and trajectories of mobilization. Additionally, information from more than twenty semi-structured activists with key informants is used.

POSLUSZNY, LUKASZ* (Adam Mickiewicz University, posluszny.lukasz@gmail.com)

Biography of Thing and Thing in a Biography

According to Igor Kopytoff, things also have biographies. By looking at them, one tries to find answers to the questions concerning production of them, their careers, and recognizable "ages" of their lives. That scope enables to see social values and interactions of groups mirrored in materialized dimension of things, considered as equally important actants in creating, and sustaining social life. In the presentation, therefore, I would like to look into highly materially deprived life of Nazi concentration camp prisoners, and their everyday struggle differently than we used to, that is through more materially oriented perspective, and one particular object: bread. This approach will enable me to connect the importance of bread in life of survivors after incarceration with variety of usage the object was involved in the concentration camps.

The decision to follow the bread in accounts of survivors is based on two factors. Firstly, its importance in testimonies, both in qualitative and quantitative aspects. Secondly, its recognizable presence in private and public narratives raises the question of its role in commemoration processes.

In the presentation, the attention will be paid to different biographies of bread, which mark wide range of different cultural activities it was involved in. At first, its career evolves from an nutritive object, through currency to functional thing. Then, after the war, memory of the camp is conveyed through everyday practices related to bread: showing the great respect in which it is held, and recording the rituals and habits of camp provenance. But bread is also present as a narrative element that illustrates deeply symbolic events, both momentous and traumatic in survivors' biographies.

Research is based on the accounts which come from written texts and memoirs, Majdanek State Museum and Auschwitz-Birkenau State Museum's archives, and narrative inquires conducted by the author with survivors.

Who Is a "Maladaptive Citizen"? the Czech Media Discourse on Groups-Associated Disorder in Public Space

Who Is a "Maladaptive Citizen"? The Czech Media Discourse on Groups-Associated Disorder in Public Space

The paper focuses on the problem of incivility and disorder in the urban public space of the Czech Republic. Specifically, it studies disorderly conduct associated with specific groups, such as the homeless people and the Roma minority, and its framing in the national media. The paper builds on an extensive qualitative content analysis of the country's media coverage of disorder in public space from 1990 to the present. The analysis observes the changing notions of what constitutes a „disorderly conduct" and the gradual establishment of the national discourse on incivility and disorder in public space. In this discourse, the term „maladaptivity" (or „maladaptive citizen") is identified as central, referring to specific groups who are portrayed as possessing characteristics which make their presence in public space undesirable. The data show that the term „maladaptive", originally used as a placeholder for homelessness, has slowly become a common-knowledge term for the Roma minority. While in reality, there is very little overlap between these two groups, they are, through the notion of maladaptivity, ascribed similar traits and actions which are portrayed as damaging the peaceful co-existence on the urban street. The analysis is accompanied by a brief sketch of the development of the legal regulation of conduct in public space in the period in question.

POSPECH, PAVEL* (Masaryk university, pavel.pospech@gmail.com)

Women in the Public Space of the Early 20th Century Czechoslovakia: The Guidebooks for „Proper Conduct" in a Men's World

This paper focuses on the position of women in the public space of the early 20th century Czechoslovakia. Traditionally, the urban public space has been a masculine domain and the entrance of women into this domain has induced a change in the meanings, codes of conduct and standards of civility in public.

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In order to account for this change, the genre of „manners books" and social life guidebooks has addressed the position of women in public space extensively, providing advice for women in everyday situations, from walking the city streets to social events. This paper is based on an analysis of these books, published in Czechoslovakia after 1900. Drawing on similar works by scholars on the U.S. (Sewell, Deutsch etc.) and on western Europe (Cas Wouters), the analysis focuses on women-specific rules of conduct in public space. The paper examines the inferior position of women in public and the ceremonial means of either overcoming it or suppressing its visibility. It is argued that ceremonial means and rules of conduct were employed to facilitate women's presence in public but also to provide legitimacy for their exclusion and their unequal position. The results are compared to developments in western Europe and in the U.S.

GIORDAN, GIUSEPPE* (University of Padua, giuseppe.giordan@unipd.it)

Branding the Devil in New Age, Catholicism and Pentecostalism: A Sociology of Exorcism

In Medieval Europe, it can be argued that people believed more in the devil than in ghosts. This cultural focus was carried by, for example, Catholics who increased the performance of exorcisms during the Reformation to justify the strength and veracity of their doctrine. During Victorian times, the perspective on the supernatural changed and ghosts became more important than the devil. Today, perceptions of westerners with regards to ghosts, possessions and the devil are multifarious. The current literature on exorcism claims that we are witnessing an increase in the need for exorcist rituals, especially, among other things, because of the growth of New Age spiritualties. With channelling and other alternative spiritual practices, New Age is offering a different 'brand' on how to access the other world. As a reaction to this, the amount of exorcists and exorcism has increased within, for example, Catholicism and Pentecostalism, and offer another type of 'brand'. This paper will argue that the perceived increase of the presence of the devil in our society, and the need to protect vulnerable believers, is largely due to a religious competition in the devil's market.

NIXON, ALAN* (Western Sydney University, A.Nixon@westernsydney.edu.au)

Crisis of Analysis and the Power of Data

The unprecedented level and scale of information production that the 21st century has unleashed, presents sociologists with an opportunity to reimagine the way we approach our fields. The multilayered uses of information technologies means that people are not simply living with them but also through them. As a result, social analysis no longer sits solely in the domain of the academic researcher. Tools are now available that allow explorations by the public and those in other disciplines. This potential analytical crisis contains an opportunity to add new techniques and approaches to our toolbox, that go beyond those available to the public. As researchers there is a need to assess our approaches when engaging with the increased digitized nature of the social world. This idea can be seen as especially important in a world increasingly affected by the agency of algorithms. In this presentation, we will frame the debate with an acknowledgement of digital data as a system of knowledge that is intrinsically tied to power relations due to social embedding.

Conditional and Universal Welfare Benefits in the UK: Social Framings of Entitlement and the Implications for Wellbeing and Inequalities in Health

Recent changes to welfare provision in liberal welfare states, particularly around increasing conditionality, have prompted debate about the possible effects on individual wellbeing and public health.   This study draws on data from interviews with 29 older citizens (aged 60 years+) in three areas of England (London, Cambridge and Sheffield) to identify distinct framings of conditionality which influence different consequences for wellbeing.   Entitlement that is understood collectively, as arising from financial or other contributions to a social body, were framed largely as taken for granted expectations of being part of a welfare state. Uptake of these had positive impacts on the self, beyond the material gains, including the social recognition implied by standing in a reciprocal relation to the state. Entitlement therefore (for those who qualified) was seen as a positive mark of belonging and contributed to wellbeing by facilitating social integration. Other forms of conditionality, based on individualised concepts of need or vulnerability, fostered debate about legitimacy; fracturing feelings of solidarity. These framings of welfare benefits reduced uptake of some entitlements (thus having a direct, material impact on health and wellbeing). There were, however, also implications for the structural determinants of health through the erosion of social capital among older people. When considering the wellbeing impacts of introducing further conditionality to welfare entitlement it is important to consider not only the material impact on individuals but also broader effects on relational meanings linking the individual, the social body and the state.

Romantic Utopias and Affective Morality in the Use of Digital Media As Emotional Support

This paper discusses, from results of my doctoral research, the circulation of affective morality by the use of digital media as emotional support in Brazil. This research aimed to analyze the uses of digital media such as emotional support, conceptualized as a social relation in which subjects seek for help to deal with emotional demands. These refer initially to affective-sexual relationships which lead to subjective processes that deal with gender, social class, sexuality, race, age, occupation, among other possible axes of analysis. The aim was to explore the meanings around the use of digital media as emotional support interfaced with subjective processes evoked by the analysis of objects that reveal the components of emotional morals. In this paper I focus on two empirical universes that were part of the research, from which I intend to understand the affective-sexual morals and, above all, reflect about love conceptions going through the horizons of aspiration of each segment analyzed. Thus, the analysis will be guided by support modality conceptualized by "digital sentimental offices", used by homosexual men and heterosexual women of popular classes; and online communities used by heterosexual men and women mostly of medium Brazilian classes.

In this sense, I suggest an approach in this text which contrasts experiences that circulate within each proposed object of analysis, and verify the correspondences between provided emotional support with each social context of each public targeted. The hypothesis is that different sexual experiences of the empirical universes establish regulations about gender and sexuality morals, allowing reflect a framework that observes different conceptions of love in the both speeches on each object of analysis, as the horizons of aspiration in each kind of emotional support.

Ever-Changing Political Narratives? the War on Terror As Carrier for Political Debate in the USA and Austria from 2001 to 2011.

The War on Terror was one of the core issues that made an increasing gap in political ideology and positioning between many European in the early years of the 21st century evident, yet there were several political and economic developments that influenced the de- and realignment of the European and US American narrations of the War on Terror, e.g. the European endorsement of the election of Barrack Obama as US president or the social upheavals in the middle east in early 2011.

The presentation shall discuss this process and provide insight into how it is framed in the US media – represented by the opinion leading *New York Times* (n=1983) – and the Austrian *Die Presse* and *Der Standard* (n=1387) – national quality newspapers with close ties to the political sphere – from 2001 to 2011 via a Mayring inspired qualitative content analysis.

Illustrating the volatility in issues associated with the War on Terror and showing which political issues were attached to the War on Terror in two countries with very different geopolitical positioning and involvement in the conflict makes it evident that the War on Terror can be seen as more than only an ongoing conflict. Much more it is a decisive societal fault line that structures discussions about political and societal values and created the chance to re-evaluate the meaning bestowed upon certain terms like security, democracy and belonging.

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Because of this it can be argued that War on Terror will continue to be used as a term describing an expanding series of interrelated conflicts, developments and political struggles while it has established itself as a suitable cultural figure to make ever changing societal values tangible for societal discussion and cannot be seen as a conflict that can be resolved until the cultural figure loses its societal relevance.

Moving Beyond the Mediated Discourse - How the Austrian Public and Journalists Understand the "War on Terror" and How This Relates Newspaper Depictions.

Discourse analysis of journalistic text is currently one of the most relevant concepts in the social sciences, when it comes to analysing the emergence of meaning and knowledge about certain events that are tied to the transnational and global processes that shape the still early 21st century.

Because of this my paper aims to critically ask how information gained in a media based discourse analysis relates to the interpretation about certain events in the public sphere and how journalists reflect on their output and the decision making processes that influenced this.

Grounding this discussion in an Austrian case study I start with a qualitative content analysis of material published by national quality-press *Der Standard* (n=687) and *Die Presse* (n=689) from 2001 to 2011, that discusses the war on terror *(WoT)* - used as an example for a global conflict that shapes the current geopolitical situation. The strains of discourse found in this material is used confront journalists (n=25, guided interviews done in 2012) with the output they provided, how it came to be and how they understand the discourse now.

It is illustrated that the published material does not necessary match the journalists understanding of the discourse nor their knowledge about the *WoT*. This is furthered via an in-deep discussion about journalistic practices as well as a contextualization of power balances within and outside the journalistic enterprises emerge as intervening variables. Additionally, it can be noted that the depictions of the discourse provided by the journalists during the interviews relate more closely to a stratified non-full-probability-online-survey (n=846) on Austrians, than the content found in their media.

Furthermore, there are only a limited number of core issues in the mediate discourse that endure the ten years observed, they are not necessary present in the public discourse.

These results are used to discuss wider implications regarding (miss-)alignments of discourses and illustrate methodological possibilities to combine media-content based data with interview-based material, while limiting possible negative effects on result validity.

Health Status and Health Selection Processes in Intra-Generational Mobility When Living in Precarious Prosperity

This presentation looks at the relationship between health and quality of life of people living in precarious prosperity in Romania in the attempt to understand paths and mechanisms through which health status influences other domains of life and overall quality of life. The paper also aims to analyse whether health has a role in social selection, by looking at how health status influences intra-generational mobility of people living in precarious prosperity. The analysis is placed within the theoretical perspective of quality of life which takes into consideration people's perceptions and evaluations of all important circumstances of life. Moreover, the paper makes use of previous research and theories looking at health selection processes in intra-generational mobility. The data comes from a qualitative study based on in-depth interviews with people living in households in precarious prosperity from two different communities in Romania. Households belong to a precarious prosperity stratum of population which, without being poor, live in the vicinity of poverty and face high material deprivation. The sample consists in a total of 88 households interviewed in two consecutive waves: 50 households in the first wave (2012-2013) and 38 in the second wave (2014-2015). A qualitative content analysis of interviews is carried out. Results show that health status has spill over effects in other domains of life. Also, there is some evidence in favour of social selection theory in health although more research is needed in this respect.

Adult Immigrants Biographies and Social Mobility in Transnational Perspective: The Ambivalent Role of Credentials and Educational Participation

Most international immigrants emigrate broadly speaking in order to seek a better live. However, as has been repeatedly shown for various immigration countries, clear-cut social upward mobility in the new country is far from guaranteed. Adult immigrants who bring along educational credentials and work experience from abroad are confronted with the substantial risk that potential employers and/or state institutions devalue this qualification. The consequence of such devaluation processes are unemployment or under-employment in badly paid jobs, i.e. social downward mobility or stagnation, as well as self-contempt. One possible strategy for the individual immigrant to counter such risks is to "re-invest" into cultural capital (Bourdieu) to be accumulated in educational institutions in the receiving country. These individuals are at the center of my study: Why and how do immigrants who experienced the devaluation of their devaluation of their educational credentials and professional experience find their way to "going back to school" in the country of reception, in this case Germany? Assuming that education participation and educational attainment can be both an important of individuals' identities and a significant part of their socio-economic mobility throughout their lives, how do they perceive their transnational educational biography? I will present first results of in-depth interviews, with immigrants attending German educational institutions like government-sponsored vocational training for the unemployed. The theoretical concept of bounded agency applied to biographical-narrative research will help to understand how immigrants maneuver between restrictions they encounter and chances they take. The analysis of boundary making with regard to ethno-national categories and educational-occupational ones related to social hierarchies will shed light on the complex relations of intersecting inequalities in these immigrants' lives. This research is part of a three-year mixed-method project on immigrants' transnational life courses and their educational opportunities, funded by the German Research Foundation (DFG).

Unequal Carbon Exchanges: Understanding Pollution Inequalities As Embodied in Global Trade

Ecological modernization (EM) theory argues that a country's phases of economic development coincide with that society's environmental awareness and subsequent care for the environment. Within this framework, environmental reform is seen as resulting from the interplay of economic actors, citizen-consumers, and political actors, such that environmental considerations increasingly become reflected in a country's economic domain. A criticism often launched at EM theory is that it tends to disregard the larger, global economy in which environmental change occurs. In contrast, Ecological Unequal Exchange (EUE) theory considers the larger context of global trade in which countries are situated, and argues that more developed or 'core' countries accrue larger environmental benefits through their unequal trade patterns with less-developed, more peripheral ones. In this paper, we bring together both EM and EUE theories to consider carbon emission transfers occurring through trade among 186 countries over a 20 year period. We define a *positive* carbon emission transfer (CET) as referring to a country having more carbon embodied in its imports than its exports, and a *negative* CET referring to the opposite. Our findings show a U-shaped curvilinear relationship between countries' GDP per capita and their CET, suggesting that countries are typically heavy net importers of carbon in early phases of economic development, become balanced or even net exporters of carbon in middle stages of development, and then return to being heavy net importers of carbon in later stages of development. We reflect on these findings in the context of Ecological Modernization and Ecological Unequal Exchange theories.

Gender, Technology and Work Relations: Case of Women Employees in Food Processing Industries in Manipur, India

This paper explores the problems faced by women workers and supervisors in the selected food processing industries in Manipur. Feminist studies of technology constitute broad theoretical perspective that has been applied to analyze the linkages of gender, technology and work in the industries. Not only, women employees play submissive role, but also their status remain inferior in comparison with men counterparts. Lack of educational qualification, technical training and physical capacity of the women employees has determined their submissiveness and subjugation. Women are mostly assigned in unskilled and manual tasks while men in skilled and technical tasks. Eight industries have been selected as an empirical case and supplemented by in-depth interviews and personal communication to the workers and supervisors of the industries. The paper concludes that feminist studies of technology significantly explain the empirical case of women in the industries. Practically, not only, men control heavy machineries that possessed masculine character, but also lack of educational qualification and technical training provided to the women employees, exclude women from the mainstream work setting in the units thereby declining their status and role.

Perception of Precarious Work By Households Living in Precarious Prosperity. Evidence from Qualitative Research in Urban Romania and Switzerland

In modern societies, work is probably the most important underpinning of both physical survival and social identity. If the employment situation becomes precarious, it has important consequences at the macroeconomic, community, familial and individual levels. Our presentation introduces findings from a qualitative study and is designed to portray how households living in precarious prosperity, i.e. in constrained and volatile financial situations, not poor and not in secure prosperity, perceive their situation in Romania and Switzerland. The approach analyses low quality jobs and precarious work as a strategy to maintain or improve the household situation or to avoid slipping into poverty. Precarious employment patterns vary in many aspects between the two countries yet they are similar in terms of uncertainty and instability. In the Romanian sample a part of people have standard employment contracts with variable or very low salaries (minimum income) or non standard contracts, in the Switzerland sample, persons living in precarious financial situations are self-employed and have standard and non-standard working agreements with constant or variable payment. In both countries, the working situation is contingent on structural opportunities, yet it also depends on the individual's resources, qualifications and choices in the past. For example, in Switzerland, choosing certain professions, e.g., an artistic profession and knowing that job opportunities are rare and with non-standard can lead to a precarious financial situation. In Romania older generations chose their profession before 1990. The qualifications for the labour market then are no longer in demand today. At the same time, family constraints (young children or a dependent person in the household to care for) restrain work possibilities and lead to accepting flexible jobs and sometimes to financial insecurity.

Severe Worries and Anxieties? Concerned Citizens and Their Attitudes Towards Asylum Seekers and Refugees

In 2015 the debate on refugees reached a new level. Pictures of people welcoming refugees were and are still omnipresent. At the same time Germany recognized a severe increase in hate crimes of right-wing populist and right-wing extremist groups. Concerned citizens protests against immigration and the welcome culture of civil society, especially in front of refugee shelters. Their arguments addressed the costs of immigration, the exploitation of the welfare system, the deprivation of autochthone Germans and the erosion of the labour market. The protestors even attacked politicians and media by stating that they just address the worries of ordinary people. Right-wing populism clearly addressed some of the most relevant causes of prejudices and discrimination: anomia, dominance and so called rights of established. As well we argued that the demand for a ,reconquest of traditional status positions and national superiority' defined right-wing populisms in Europe. This belief in reconquest is not identical to social dominance or authoritarianism. In January 2014 we conducted a cross-sectional survey which addressed the sentiments of 'concerned citizens' which show up in late 2014 (e.g. Pegida). With this data we test a theoretical model (SEM) of the alleged worry about the economic development on the clear rejection of multiculturalism and their outcome for the debate on refugees, mediated by potential influencing factors as anomia, social dominance, and Elias' concept of Established and Outsiders. Results clearly show that the frequently expressed economic worries do not play any role for the devaluation of asylum seekers. Even disorientations or classical dominance strategies have no effect. Instead, it is the belief in different facets of the preservation of the 'good old order' that explains the rejection of asylum seekers.

Transnationalisation of Labour Mobility - Trends and Challenges for Its Regulation Ludger Pries

The volume and quality of cross-border mobility of workers is changing substantially. This holds for individual labour migration and the mobility inside profit- and non-profit-organisations extended and differentiated in its forms. Transnational intra-organizational mobility is part of labour conditions for more and more employees. New challenges concerning the collective regulation of the conditions of employment, work and participation arise: what is the frame of reference for payment of transnational mobiles? who is responsible for representing their interests? There are also new questions of justice like the employment and working criteria for people working in the same area but with different contract conditions. Based on a comparative research the paper presents patterns and recent trends of cross-border mobility of work of Mexican and German profit and non-profit organisations and discusses the challenges and requests for transnational labour regulation.

Towards a Sociological Perspective on Data Society

Datafication by now has invaded every sphere of the social and, hence, poses a challenge to sociological reasoning. Media studies have pointed out the implications of digital forms of communication as well as knowledge production, consumption, and distribution mostly with respect to social media. Building on these insights we argue for a more radical approach that understands an increasing number of societal processes as being data driven and, thus, analyzes our current society as a 'data society'. We will argue for such a perspective by making a twofold argument:

(1) We point at the imperative necessity for sociology to develop theoretical perspectives and practical methods to meet the uprising challenges posed by datafication and digitalization. Although big data is currently paid considerable attention, it is mostly treated as a rather isolated phenomenon with discussions being limited to narrow issues such as privacy. However, data based social processes not only have become *ubiquitous* but their (re)production, utilization, and relevance have reached *novel qualities* which render *society as a whole* deeply changed. Therefore, sociological reasoning needs to confront itself with this data society.

(2) In order to demonstrate this, we will *reconstruct* processes of *algorithmization* and their relevance to society at large. Drawing, among others, on system theoretical approaches, we develop an analytical framework to understand the new forms of data communication and their data traces, identified by media studies, as manifesting interpenetrating qualities to all kinds of social systems.

Eventually, this focus on data related communication enables us to formulate a *research agenda* that meets current societal developments.

PRIETO BLANCO, PATRICIA* (National University of Ireland, Galway, patriciaprietoblanco@gmail.com)

Maria's Bag. Negotiating Identity and Belonging through Old and New Visual Media.

Maria has been living abroad for over ten years. She takes pride on her status as foreigner while trying her best to fit in. Her strategy includes keeping visual records of most of her interactions and distributing the snaps shortly afterwards in social networks. Up to here, her story is ordinary. However, Maria always carries a photography bag with her. It is a tote-bag in fact, which she changes every now and then. Inside, she keeps her camera along with 10x15cm half-disintegrated photo-albums, post-cards, flyers and all her sd-cards. In short, she carries most of her visual archive all the time, everywhere, with her. As her story exemplifies, propinquity is not restricted to the world of ones and zeros.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

This paper unfolds Maria's narrative under two main themes: belonging and mediation. An non-media-centric media studies approach (Moores, 2012) allows to accentuate the contextual conditions of media pragmatics, as well as the complex dynamics between media, institutions, technology and politics. A focus on processes of belonging sets the frame to inquire the deeds of networked photography (Gomez-Cruz, 2012; Lehmuskallio, 2012) and the relevance of place and time as variables in mediated interactions (Lapenta, 2011; Villi, 2014, 2016).

How do old and new media aid Maria in her self-presentation? How does Maria include/exclude others from her circle of reference? Why does Maria hold so tightly onto her sd-cards and paper copies of digital snaps? An ethnographic visual narrative approach (Bach, 2007; Connelly & Clandinin, 1990; Lapenta, 2006) and the subsequent visually crafted account intends to offer answers to these questions.

Saving Deportees: Dynamics of Mobilizations Against Deportation in Switzerland

This paper explores the dynamics of mobilizations against the deportation of rejected asylum seekers in Switzerland. Based on a qualitative study of five protest movements that took place between 2006 and 2015 Switzerland, it examines the configurations, the development and the outcomes of these social movements. The five case studies include documents from different media as well as 25 in-depth interviews with the involved migrants and the key actors participating in the protest against deportation.

These data are used to present general patterns of how mobilizations against deportation emerge and evolve. Beyond aspects common to all of the observed cases, we distinguish two ideal types of mobilizations: On the one hand, there are small groups of left oriented activists using the defense of one or several asylum seekers to make claims regarding political reform. Their commitment is framed by ideals of free movement and human rights. The deportees exemplify a collective cause that the activists have been defending before and will continue to defend afterwards. On the other hand, "ordinary" citizens with different political views form a protest group to prevent the deportation of a specific person or family seen as well integrated and thus "meriting" the right to stay. In this case, the actors involved usually have no previous protest experience. Their mobilization ends with the annulment of the deportation decision or its enforcement.

Addressing factors of success or failure to prevent a deportation, the support of political elites and the quality and intensity of the media coverage appear to play an important role in shaping the outcome of the protest. They allow the deportee's defense to enter the public and political arena, where his or her case will become the object of a battle with a binary outcome: success or failure of the protest movement.

Nobody Needs Sociology of Organizations. On the Dwindling Impact of Sociological Reflection on Organizational Theory and Practice.

Sociological reflection has always been at the very core of organizational science – it is a fact well recognized by theorist and practitioners alike, that sociologists have made some of the greatest contributions to the field. In the recent decades, however, both the quality and quantity of relevant sociological reflection on organizations has decreased.

Based on both my academic and consulting experience as an organizational sociologist and psychologist I will argue that this is due to the fact that Sociology of Organization is losing its ground to the field of Industrial and Organizational Psychology, that offers both theoretical and practical contributions to the field of organizational behavior from within a dominating and a well-structured research paradigm. This paradigm, unfortunately, doesn't have its counterpart in a multi-paradigmatic and diverse field of sociological reflection.

I will present an argument that in order to stay relevant, Sociology of Organizations has to (1) reevaluate its role as a positive force for organizational change in the 21st century workplaces (2) build stronger institutional relationships with the fields of Industrial and Organizational Psychology and Management Science (3) establish a strong research paradigm that would institutionally build the foundation for the dialogue between sociologists, psychologists, management scientists and practitioners alike.

Power, Corruption, and Media Scandal: The Case of Japan

Media scandal can be defined as revealed transgression of individual elites (political, coporate, cultural). It becomes publicly disclosed (usually via whistleblowing), framed by more or less conflicting media outlets (with certain effect on the public) and is eventually publicly denounced (leading to individual and institutional consequences). On the one hand, media scandal is a universal "social fact" (Durkheim), originating in social institutions and media cultures, and arising from the ground where various transgressive "movements of life" and effects of institutions intersect. On the other hand, scandal is an "empty signifier" (Burkhardt), and the recognition of certain behavior as "scandalous" – including the way it is narrated and mediated – is until certain extent a culturally-specific process. This talk develops a model of scandal mediation in Japan, during which the mainstream media, the power elites, the business circles, and the organized crime (yakuza) intersect in a political and journalistic "field of struggle" (Bourdieu). In terms of its social function, we approach scandals as narratively structured "social dramas" (Turner) and secular rituals that follow major moral disturbances in society in order to re-instate the imaginary equilibrium (Durkheim). Furthermore, we conceptualize (not only Japanese) scandal as mediatized ritual of pollution, purification through exclusion (scapegoating), and eventual re-integration. In order to illustrate the collusion a corruption of the power elites in postwar Japan, the function of scandal a non-transformative pseudo-ritual, and the disputable role of the media as "democracy-watchdog", we scrutinize the most recent Japanese scandals with global reach: the 2011 Olympus scandal, the 2015 Toshiba scandal, and the 2015 Olympic logo scandal.

Signals of Trustworthiness in Social Exchange: A Theoretical Framework and Empirical Evidence

Signaling theory is concerned with situations of strategic interdependence in which one actor (the sender) aims at persuading another actor (the receiver) of the truth of a state of affairs that the receiver does not observe. The unobserved state can be a quality of the sender the receiver would like to know more about and act upon. Signaling theory has been applied to explain individuals' investments in higher education, employers' choice of employees, style of dress, cultural consumption, aggressive behavior, but also cooperation in social exchange. In this paper we review the signaling theory framework with regard to its application to explain cooperation in social exchange. After restating the core elements of the theory, we discuss extensions to the basic framework which have proved useful in conceptualizing and explaining cooperation in social exchange. In particular, we show how distinguishing between (1) signaling costs and benefits, (2) signal production and signal display, (3) signals and signs, (4) signals and reputation, and (5) signals and counter-signals can make signaling theory more broadly applicable. In our discussion of the extended signaling theory framework, we illustrate the conceptual elements with evidence from empirical work. The paper concludes with novel hypotheses and an outlook on future research.

PSARIKIDOU, KATERINA* (Lancaster University, a.psarikidou@lancaster.ac.uk)

Unfolding the Multiplicity of the 'Temporal' in the Pursuit of Sustainable Mobility Futures

Recent years have witnessed a 'temporal turn' in the study and pursuit of sustainability (Reisch, 2001; Rau and Edmorson, 2013; Shove et al, 2009). Research has focused on the environmental impact of various 'unnatural rhythms' of everyday living and raised the significance of the 'temporal' in not only shaping, but also changing unsustainable living patterns (Adam, 1998; Lefebvre, 2004; Southerton, 2009). This paper aims to contribute to such theoretical and empirical enquiries by investigating the multiple temporalities of urban mobilities that we need to consider for configuring low-carbon futures. Much work on transition studies has focused on the mutually constitutive socio-technical nature of system change, while ignoring the significance of 'the temporal' in such developments (Geels and Schot, 2007). This paper aims to contribute to an expanding literature on the role of time and diverse time-cultures in the configuration of low-carbon transitions (Svenstrup, 2013; Rau, 2015; Shove, 2009). Drawing on mobilities research conducted for the Liveable Cities project (see http://liveablecities.org.uk/), it aims to unpack the multiple temporalities of urban mobilities by going beyond a singular understanding of a time 'monoculture' (Geissler, 2002; Urry, 1999). By exploring the multiple, both chronological and kairological, calculative and qualitative temporalities (Cipriani, 2013; Szerzynski, 2002) of urban mobilities, it investigates the different dimensions of time (e.g. speed, weather, age, duration, synchronisation, frequency, periodicity, disruption, etc.) and the traditional dichotomies associated

with them (e.g. fast/slow, cold/hot, young/old, long/short, empty/full, past/future, day/night, etc.). But, it also attempts to challenge the dominant understandings of such dichotomies by showing the relative perceptions, associations and values that can be attributed to them (e.g. cycling as both slow and fast). In doing so, it proposes to situate the introduction of time-cultural alternatives, and thus, sustainability transitions in the transcendence of various conventional understandings and experiences of time.

Effects of Retirement Pathways on Health and Income Inequalities from a European Perspective

Background:
The adverse ratio of people in employment and people in retirement constitutes a serious challenge for the European welfare state as the public expenses in general increase due to increasing expenses for the retirement benefits, health and care for older people. In reaction to this challenge governments in Europe have enacted a series of retirement reforms with the aim of keeping older employees in employment for longer since the 1990s. As a consequence a decoupling of the exit from employment and the entry into retirement and a diversity of pathways to retirement has been observed. These pathways to retirement are defined and influenced by the institutional arrangement of the labor market, the pension and welfare system of a country as well as by the individual determinants of the people in the country.
Methods:
By using SHARE data and by taking a cross-national European and longitudinal perspective, I aim to explore the distribution and forms, as well as the causes and consequences, of the different pathways to retirement on the level of the individuals and on the contextual level of the institutional arrangement of a country in a time-frame from 2004 to 2014. For this panel I propose to discuss my results on the consequences of different pathways to retirement with regards to inequality in health status and income by analyzing how the institutional arrangements of various European countries exacerbate or mitigate these inequalities resulting from different pathways to retirement.
Contribution to theory and policy:
From a theoretical point of view I aim to contribute to theories on social inequality as well as on theories of welfare state regimes and retirement systems. In terms of a policy perspective I aim to contribute to the discussions on the effects of recent retirement reforms that have been enacted in European countries.

PUASCHUNDER, JULIA* (Harvard University, Julia.Puaschunder@gmail.com)

Ethical Decision Making Under Social Uncertainty: An Introduction of Überethicality

Decision making research has been revolutionized by prospect theory. In laboratory experiments, prospect theory captures human to code outcome perspectives as gains or losses relative to an individual reference point, by which decisions are anchored. Prospect theory's core finding that monetary losses loom larger than gains has been generalized in many domains; yet not been tested for social status changes. Social status striving has been subject to social sciences' research for a long time but until today we have no clear picture of how social status prospects relative to an individual reference point may influence our decision making and action. Understanding human cognition in the light of social status perspectives, however, could allow turning social status experiences into ethicality nudges. The perceived endowment through social status may drive social responsibility. Ethicality as a socially-appreciated, noble societal contribution offers the prospect of social status gains given the societal respect for altruism and pro-social acts. An Überethical filling of current legal gaps or outperforming legal regulations grant additional social status elevation opportunities. Building on prospect theory, two field observations of environmentally conscientious recycling behavior and sustainable energy consumption tested if social status losses are more likely to be answered with ethicality than social status gains. Social status losses are found as significant drivers of socially-responsible environmental conscientiousness. Testing prospect theory for social status striving advances socio-economics and helps understanding the underlying mechanisms of social identity theories. Pegging social status to ethicality is an unprecedented approach to use social forces as a means for accomplishing positive societal change. Future studies may target at elucidating if ethicality in the wake of social status losses is more a cognitive, rational strategy or emotional compensation for feelings of unworthiness after social status drops.

The Beauty of Ivy: When Inequality Meets Equality

Thomas Piketty's (2014) *Capital in the 21st Century* revolutionized economic thoughts on inequality. Started by the 2008/09 World Financial Crisis and cumulated in the subsequent Occupy movement, attention to rising inequality regarding economic wage, opportunity and wealth led to advocacy for a more equal society. Innovatively, this article argues for a mixture of equality and inequality within a societal network holding value when access to opportunities to transfer implicit wealth is distributed merit-based. By the example of Ivy League educational institutions, but also elaborating on social environments and interaction networks, a novel economic wealth transfer model is proposed. Within an economic system, dyads of *unequal* crystallized value based on heritage (e.g., royal families, legacy admits) and merit-based *equality* represented by offspring from families with underprivileged backgrounds, whose outperforming ambition, fluid intelligence and drive may lead to fruitful social interactions and beneficial wealth transfers, may create beneficial economic outcomes. On the societal level, within networks favorable environments may serve as transformation hubs if entered merit-based by underprivileged families. While presenting a preliminary idea of an economic model of value transfer between equality and inequality, the article outlines a blatant research gap on information about the direct and indirect transactions and interactions between equality and inequality representing agents within societal networks. The article concludes with giving hope in Piketty's outlook of rising inequality by showing the economic merits of inequality when paying attention to merit-based distributed value transfer opportunities.

Exploring How the Platform for People Affected By Mortgages Is Building a Civil Discourse

This paper presents the results of an analysis on the civil discourse build by a social movement called *Platform for People Affected by Mortgages (in Spanish: PAH, Plataforma de Afectados por la Hipoteca).* This analysis is part of a PhD which aims-to understand how the PAH's participants are transforming their conceptions on politics, law and common good –and also their identity as citizens– through interactions, discourse and participation and, how the civil society is being affected as a result.

Civil society is understood as a civil sphere where solidarity is central and represents a mutual support between members of the same culture to promote justice; this means to repair the social. In this respect, the civilian sphere has its own normative and institutional logic and it is different from other spheres –political, economical or religious– although they are mutually influenced. Beyond the institutional,a subjective dimension mediating symbolic codesappears. The binaries codes are located between pure and impure and theydistinguish motives, relationships and institutions between civil and uncivil categories. The positive ones are related to democracy, freedom and a civil society based on solidarity whereas the negatives take part of a repression discourse –thus they are uncivil.

In particular, the analysis presented here corresponds to a participant observation carried out during four weeks in ten activities of the movement. The results of the first approach of data analysis show that the discourses are alike among participants and not always coherent in terms of civilian categories. Despite that fact, their discourses allow the participants to define themselves as "we" in front of "others" to whom they attribute an uncivil discourse.

Social Movements, Crisis and Squatting Experiences: The Case of Naples

The work that we will present focuses on the twin phenomena of mutuality and self-organization of social and living spaces, starting from the squatting experiences analysed in Naples. Especially, the analysis will consider two areas, i.e. the Materdei neighbourhood and Eastern part of Naples.

These experiences were approached from a comparative qualitative point of view, leading to highlight a specific form of resilience and resistance to the social conflict for housing needs, especially in the ongoing crisis.

The aim of the paper is to describe and compare the responses to housing needs in two contexts that, though being in the same metropolitan area, are characterised by different levels of vulnerability in terms of economic and territorial development (Cannon, 2008).

The selection of the unit of analysis stems from the fact that the chosen cases are the most relevant squatting experiences in Southern Italy in the recent years and show how the generated conflict becomes a trigger of cohesion, participation, common vision, self-organization and mutuality, even though resulting from different needs and modalities of action (Della Porta, Diani, 2009; Kamerman, Kahn, 2014). In particular, the relevance of these two cases consists in the difference between current and previous experiences of squatting in terms of the nature of social conflict. In fact, in the previous modalities of squatting housing needs had often find resolution in individual and poorly structured actions. Nowadays, different forms of resolution give an answer to the same housing, based on a discovery of mutuality and collective action.

In a nutshell, in both areas the conflict is key to resilience and resistance, however the different methods of management and organization of squatting are the backdrop for different interpretations of the phenomenon, which move between the old and new interpretative categories and practices of self-welfare.

Constituting Anti-Racist Feminism for Today's World.

What are the new ways of constituting anti-racist feminism? Based on our data on the different media depictions of sexual violence in India and the activism and actions generated in the United States to save Indian women, we offer two arguments for constituting anti-racist feminism today. First, we argue that while racism is typically studied within countries, it is important to develop theoretical frameworks that are able to question the processes that utilize over-imagined gender hierarchies in other places to sustain racial hierarchies within countries. Thus the US based media depictions-compared to those in India—present sexual assault as an outcome of non-modern culture in India. The constant visibility of sexual violence in India in the media occurs alongside the near invisibility of sexual violence against women of color in the US. Consequently US is implicitly presented as a safe space for women compared to other unsafe places. Second, we show how affective sociologies of race are used to sustain racist activist/scholarly/policy agendas even as activists declare themselves to be feminists with anti-racist agendas. Erasures of histories of activism and scholarship on violence against women in India, and reuse of some older colonial tropes, shape these affective sociologies of race.

feminists are part of the cultural assemblages that lead activists, and scholars to want to save women over there. We argue that anti-racist feminism has to start from a position of awareness and knowledge about the subject of activism. Such scholarship and activism should be historically grounded, be informed by activism, agendas and scholarship already produced in other countries and by scholars from the groups that are the subject of discussion. Most of all, anti-racist feminism has to continue to examine privileges and marginalization locally and transnationally in order to be relevant in todays world.

PURKAYASTHA, BANDANA* (University of Connecticut, Bandana.Purkayastha@uconn.edu)

Thinking about Knowledge Categories, Contexts, Voices and Silences.

Many feminist scholars have challenged West-centric epistemologies and offered concepts such as multiple modernities and decoloniality as more appropriate frames for understanding knowledge hierarchies. Much of these challenges have come from the two-thirds world, though some emanates from scholars located in the one-third world (who are often mislabeled as "post colonial" scholars). The discussions of knowledge hierarchies continue to be broadly classified within binaries such as the Global North and South, or one and two thirds worlds even though every region, nation-state, and locale is marked by many discussions, debates, and challenges between the privileged and marginalized within that realm, currently and historically.

In this presentation I wish to focus on indigenous and transnational knowledge production, and the silences and silencing processes embedded within our current understanding of knowledge hierarchies. Indigeneity carries within it an understanding of groups that experienced settler colonialism (within nations). Do indigenous knowledge challenge, contribute to, or fit in with knowledge produced by the privileged non-indigenous within their realm? The term transnational feminism is often used to denote knowledge that is developed through and across nations during the current phase of globalization. How do earlier phases of transnational knowledge production play a part, if at all, in how we understand transnational knowledge today? Does transnational knowledge include indigenous knowledge? Do our discussions of knowledge production have to reframe some of the categories of knowledge producers, politics and contexts of knowledge production to identify how power works to give voice or silence different types of knowledge production?

"Work As Unto the Lord:" Enhancing "Employability" in a Faith-Based Job-Readiness Program

The 1996 passage of welfare reform radically reshaped the principles and practices of poverty management in the U.S. On the one hand, it brought about an end to welfare as an entitlement and imposed rigid time limits, work requirements, and a programmatic supply-sided focus on "job-readiness." On the other hand, it permitted and promoted the expansion of faith-based organizations in the provision of social services. This ethnographic case study of a prominent "faith-based" job-readiness program--Jobs for Life (JFL)--is situated at the underexplored nexus of these two trends. Drawing upon participant observation in a JFL class, in-depth interviews with class instructors and participants, and content analysis of organizational materials, this article documents the program's use of Biblical principles and teachings to expound on the moral irreproachability of work and to fabricate "employable" subjects who submit themselves to both God and the employer. At play is a project that we call the "righteous responsibilization" of the poor, a responsibilization achieved through religious salvation. The case of JFL, we argue, not only deepens and extends our understanding of religious neoliberalism, revealing how it shapes the process of subjectification and practices of poverty management. It also remediates a tension at the heart of neoliberal ideology between its emphasis on individualistic entrepreneurialism and its demand for submission to the abstract, alien decrees of the market. In the religious neoliberal framework exemplified by JFL, deference to capital is recast as the first step toward the entrepreneurial achievement of individual salvation.

PUTTERGILL, CHARLES* (University of Pretoria, charles.puttergill@up.ac.za)

Ideology and Pseudo-Science: Drawing Lessons from a Critique of Sociology of Race during Apartheid for Current Practice-Based Science

This paper explores knowledge production within an emerging sociology of race, aligned to Afrikaner nationalist thought, which set out to provide justification for apartheid in addressing the so-called 'racial question' within the South African society. In a context of contestation, claiming objectivity and scientific authority the emerging 'nationalist' sociology of race set out to demonstrate its utility as a credible body of knowledge to not only legitimate exclusionary racial practices within the society, but to shape policy implementation as well. Racialisation embedded within modernity, normalised exclusionary practices within the society, institutionalising racism. Given this trajectory of an applied sociology of race in support of an indefensible policy a number of questions are raised in conclusion with regard to power, ideology, and how in addressing pressing social issues questions of inequality and social justice should be foregrounded in current practice.

Continuity and Transformation: Family Relations and Obligation in China

Since the early 1980s, as a strategy to advance its previously planned economy to a more market-driven economy, the Chinese government relaxed its control of population movements so that industry, of which there is now a great deal, could have a flexible labour supply. One result of this change is the greatest movement of population in China since 1949 when the communist party came to power, and possibly globally. Enormous numbers of people are moving from inland regions to coastal areas, from rural settings to urban, and from less developed to more developed economic zones. These so-called 'migrants' form an entirely new social category, '*liudong renkou*' or 'floating population'. A large body of literature focuses on the young migrant workers who move from rural areas to cities in search of employment, and, correspondingly, the women, children and the elderly who remain in the villages and small towns, the so-called 'left-behind'. This 'left-behind' group draws the attention of researchers and also the media. The present paper is to fill a gap examining an emergence of grandparents who are not 'left behind' but join their migrant adult children to provide child care. The paper will show that under conditions of economic, social and cultural change family obligation in China continues to play an important role and at the same time that the conventions associated with the relevant expectations, attitudes and emotions have undergone significant change.

Emerging in a Digital World:the Politicization of the Internet and the Disability Activism in China

This paper examines the political use of the internet by disabled people, and, the development of China's disability activism influenced by their actions. Over the last few decades, disability activism has been organised around the world to challenge discrimination and oppression. This, however, has not yet been established in China, where a 'strong state-weak society' regime is identified. Will things be changed in a new digital era? Based on one-year online ethnographic exploration and interviews with disabled netizens, this paper suggests that:

1) Internet use empowers disabled people in their personal political participation by removing financial and structural barriers. They are more engaged in public affairs, at least in the cyber world, both politically and culturally.

2) Based on gathering and interaction in virtual 'public sphere', disability organisations are emerging on the internet, forming disability consciousness and producing online collective actions.

3) Some online organisations have been extended to the offline world and have played a role in the policy-making. Online social media remains to be their main arms in the process. Their offline activism are supported by online presence.

4) This process is influenced by both Chinese government and the inputting western values. But generally speaking, cooperation with the government is the main target for most of these new-born organizations. Disability activism in China is co-constructed by the government and disabled people themselves.

By arguing that, I conclude that the politicization of the internet in China has to some extent empowered disabled people, and, promoted the development of disability organisation and disability activism. After emerging online, however, disability movement are limited by the lack of resources and the interruption of the government. The position of disabled people can hardly be changed by leveraging the internet only, not to speak of the general system in China's society.

QUACK, SIGRID* (University Duisburg-Essen, sigrid.quack@uni-due.de)

Cross-Border Careers in an Emerging Transnational Labor Market for NGO Staff

There is now a consensus that the rise of international nongovernmental organizations (INGOs) is an important element of world society. But despite all the attention they receive in the media and the literature for their role in international politics, INGOs are not yet well understood in their function as employers. While there is anecdotical evidence of career mobility between both, headquarters and national offices of large INGOs, no systematic study of the emerging transnational labor market in the third sector has been undertaken to our knowledge so far. To contribute to closing this research gap, the paper examines emerging transnational labor markets for NGO staff through the lens of cross-border careers of individuals working for INGOs. The purpose of the paper is twofold: At a theoretical level, it draws on the sociology of careers in the Chicago School tradition and combines it with insights from the French sociology of conventions to develop a theoretical framework for the study of transnational labor markets in the making. Both approaches suggest that people's careers are not just an individual phenomenon but unfold in orientation towards to reference groups, through which they become socially recognized. Hence, careers are a good starting point to investigate the links between mobility patterns, collectively defined career scripts and labor market institutions in a transnational context where institutions are expected to be fluid and undergoing recurrent negotiation. At the empirical level, the paper presents results from a pilot study of careers of staff in 30 INGOs drawn from different policy fields such as environment, development and human rights.

#Witchlife: Witchy Digital Spaces

This paper will report on current research that examines the complex and nuanced ways witches interact and network in digital spaces. In particular, it will explore ways women creatively rework mainstream conceptualisations of gender by re-imagining the witch within digital spaces. Methodologically the research project utilises a multi-site ethnographic approach across different field sites, including digital spaces such as Facebook and non-digital spaces such as witch-camps. This allows for unanticipated trajectories to be followed when tracing a cultural phenomenon across and within digital and non-digital sites. In my research the 'witch' is used as the common phenomenon that is traced across digital spaces. This approach reveals the fluidity and creativity of reworking gender and identity within networks composed of fixed and moving points. Discussions about the witch in digital spaces that occurred during interviews as well as through online interactions will be analysed using a phenomenological lens. This lens allows for the specificities of women's experiences to be analysed as well as how such experiences alter implicitly gendered ways of being in the world. For example, I investigate the experience of `becoming' and embodying the witch through women's participation in online discussions and activities that resist, challenge and rework traditional religious and gender structures. This behaviour may occur through counter-cultural presentations of the self or engaging in public discussions and debates about social inequalities, religion and activism. What I will demonstrate in this paper is the way in which the emergence of the online witch discourse dynamically constructs how witches creatively use digital spaces as sites of gender alterity and resistance.

Faith Based Organisations and Marginalised Youth in Pretoria, South Africa

The main aim of this paper is to illuminate the role of faith based organisations (FBOs) in an urban environment, namely Pretoria central areas, in the lives of marginalised youth. In current South African policy documents focusing on the youth, scant attention is given to potential and actual contributions of FBOs even though the vast majority of South Africans indicated affiliation to a particular religion in a census and past surveys. The state's policy discourse on social cohesion does not include formal relationships with organised religion, and in practice instances of a wide variety of relationships between the state and FBOs can be observed – ranging from co-operation to manipulation to mistrust. Employing purposive sampling, this research is based on 20 in-depth interviews and two focus groups with participants between 16 and 25 years old as well as formal and informal discussions with FBO staff and other involved community members. The presence/absence and contributions/hindrances of FBOs were all considered. Complicated narratives were found with certain participants lacking any support network and others relying only on capricious social relationships. FBOs made both practical and spiritual contributions to individual youth on short, medium and long term basis. However, despite commendable efforts from specific FBOs aiming to support individual agency of the youth and restoring their dignity, limited resources and at times tenuous relationships with local state departments undermine the potential positive effects of FBOs in an urban environment.

Children As Public Subjects: Can Educational Transmission be More Than Leading Children into the Future We Want?

The ideals purported in the International Convention of the Rights of the Child concerning children's participation have launched a tremendous investigative effort on the conditions of possibility to ensure the fulfilling of such rights. This move has generally taken for granted the given statute of deeply rooted institutions of society, such as the educational system, as if its long sustained cornerstones could be left untouched once children became active participants and duly involved in matters concerning them. This paper presents a case in point by considering children's participation in schools. It aims at interrogating the process of educational transmission in the school context in our days insofar as it can provide conditions for children's construction of their public subjectivities and the production of a common space for discussion on issues relevant to their everyday life, struggles and difficulties. Firstly, the notion of public space is discussed in relation to childhood, once children's contribution to society has remained non-public, invisible and mostly irrelevant. It is discussed how the notion of publicity, in its descriptive and normative aspects, can address the specificity of the school context and the relationships therein produced characterized by their hierarchical and asymmetrical aspect to children's disadvantage. In such a place of restricted possibilities for action, the question is how children manage to bring forth their own interests and validate their viewpoints on school experience. Secondly, empirical data from a research project in Brazilian state schools are discussed in order to verify how the conformed roles and rules of the school context are re-signified and re-constructed by children as they attempt to re-frame the process of educational transmission in accordance with their own interests. The far-reaching effects of children's participation on the cherished perspectives about the future, as adults conceive them, are discussed.

Solidarity- Theoretical Concepts and Empirical Measurements

Solidarity is intimately linked to social inequality, and may even be regarded as a precondition for a just world. The concept of solidarity seems to be well known and is regularly demanded in various political and social debates. However, theoretical concepts, explanations and descriptions are diverse and based on different dimensions and levels. What all attempts to define solidarity seem to have in common is the assumption that solidarity includes the support and help given from individuals or groups to any other person. In addition, some authors refer to abandonment as an important element of solidarity, what makes empirical observation difficult (e.g., absence of action may indicate solidarity). Furthermore, different ranges of solidarity can be identified, e.g., a general solidarity with people who are not known personally and who also do not belong to a similar group with same interests vs. solidarity within the family. The empirical verifiability of these theoretical assumptions and considerations, however, is limited. Predominantly, general attitudes and values are queried. The possibilities of the empirical measurement of everyday activities still seem to be hardly recognized.

The paper will first systematize how sociologists have conceptualized solidarity and how they have explained the origins, dimensions and historical changes of solidarity. In a second step I will compare these theoretical concepts with the various ways of measuring solidarity empirically. From my point of view, the operationalization of these concepts of solidarity is not exhaustively developed and probably often only suitable for certain historical and social (national) contexts, what makes international and historical comparison difficult. By contrasting theoretical concepts and empirical measurements the paper discusses strengths and limitations of these approaches and tries to develop suggestions for future research.

RADIUKIEWICZ, ANNA* (Institute of Political Studies ot the PAS, radiukiewicz@isppan.waw.pl)

Meanings of Civic Activity By Polish Activists

In the ever-changing context, it seems an interesting question about contemporary functioning, or understanding of the concept of citizenship. In my paper I am going to present results of my studies, which allowed me to formulate conclusions related to the specific differences in defining the role of the activist between members of diverse types of Polish civic organizations. Thus, it turned out that the most common understanding of activity in organization is perceiving it as work. Often it is special work, distinguished by low wages. A special feature of this type of work is also good, friendly and often non-hierarchical relationships between members of the organization. However, the activists of different types of organizations were distinguished by their own understandings of being an activist. Thus, through research in organizations of a non-governmental (the so-called third sector), economic (employers' organizations and trade unions) and political type (social and political movements), it became possible to identify both common and specific features of the picture of contemporary civic activity.

Transnational Spaces of Care – Migrant Families of the Elderly Poles

Intensifying spatial mobility poses a challenge to the family as the primary provider of care for the elderly in sickness and frailty. In EU-10 nations, where family model of care predominates, care deficit is likely due to the intensive out-migration since 2004. Hence, this paper directly inscribes into the topic of the Forum by attempting to understand the future and inquire about the prospective forms of care over the elderly in transnational families (TNF). We assume that physical proximity is not *sine qua non* condition of caring (Baldassar 2007:257–258). Drawing upon multi-sited transnational ethnographic research in Poland and the UK, we inquire into the forms of care the TNFs develop. We employ Kilkey and Merla's (2013) typology (direct provision with physical co-presence, direct provision at a distance, coordination of support, and delegation of support) in order to trace configurations of care in TNFs of ageing Poles. We argue that: (1) parents of the Polish migrants, still considerably young, often do not yet call for personal assistance and they are often net contributors of care rather than only receivers; (2) ageing parents facilitate reproduction of their migrant children; however, (3) additional caring responsibilities of the ageing parents need to be taken into account in order to explain transnational forms of care (e.g., over their own 85+ parents), which calls for re-thinking of the concept of "sandwich generation", (4) similar forms of care are developed in the TNFs and families of internal migrants (should the distance impede visits on the daily basis). However, instances of illnesses of ageing parents of migrants or emergencies already show how direct provision of care is organized today. As we argue, informal non-kin social networks are important actors in provision of care and should be taken into account in research on configurations of care in transnational spaces.

Violence in the Experience of Deportation from the United States

The topic of deportation has been long neglected and it was not until the onset of this century that we have witnessed intensive development of the literature dealing with the problem. Deportability and deportation have been argued to be a mean of production of sovereignty in the modern nation-State (Walters 2002, De Genova 2010), especially in the face of unauthorized flows of transnational migrants, often perceived by the sovereign states as "losing control". This paper, although indebted to the scholarship on deportation, seeks to path its own way by the adoption of micro-level approach and attempt to show the intimate face of social suffering related to deportation. The aim of this paper is to **show the process of deportation from the perspective of individual as an experience in which various forms of violence come together**. Drawing upon ethnographic research conducted by the author between 2012 and 2014 in a Mexican pueblo, 31 testimonies of Mixtec deportees in particular, the paper gives an account of the lived experience of the US State that encloses in the process of deportation. The paper looks at the stages that from individual perspective compound the process of deportation: detection and apprehension, detention, immigration court, and transfer to the country of citizenship; and inquires into types of violence that operate on each of them. The contribution of the paper is to show that the suffering of the deportees consists not only in the physical violence that sometimes is used by the US law enforcement agents, but also by the structural violence that contributes to their deportability, and symbolic violence that often operates during the hearing before immigration judge.

RAHBARI, LADAN* (PhD in sociology, rahbari.ladan@gmail.com)

Gender and the Right to the Space: The Impact of Modern Architecture on Elimination of Private Spaces for Women in Iran

Iranian home is a multi-functional unit and is used as private, semi-private and public space. Due to Iranian norms of social interaction, and the concentration of a vast majority of social practices inside the house, it is not unconventional for the outsiders to enter the house. This sort of intrusion disrupts household activities which are more related to women's roles than men's. The Iranian house has still kept its traditional functions despite the large alterations in its functions and structure. Domestic space is used for interacting with everyone including the outsiders and the "Namahram" whom are male social actors unwelcome to interact with female residents of the house. Women have to appear in hijab and socially accepted dress code in front of the strangers. This paper will discuss how the openness of the domestic spaces introduced by modern architecture has reduced the privateness of domestic space and as a result decreased the realization of women's right to the space. The modern architecture and changes brought by it to the domestic space, such as the deletion of traditional only-female spaces called "Andarouni" and excluding barriers that provide privacy for female residents, has not been conformed to the Iranian lifestyle and patterns of social relations Iranian contemporary architecture has adopted characteristics of the modern home design movements, while the social relations have stayed traditional and unchanged and therefore has not acknowledged women's right to the appropriation of the domestic space.

Spaces of Terror and Women's Activism for Realization of Right to the City: The Case of Serial Acid Attacks in Isfahan, Iran

In autumn 2014 in the city of Isfahan, a serial acid attack aimed at female victims who were driving cars, took place in urban public spaces. The officially confirmed number of victims was four while the general public firmly believes that the perpetrations were far more numerous. The violence, which had an obvious sexual dimension, raised public fear among inhabitants of Isfahan as well as other big cities. As perpetrators have not been brought to justice and the underlying scope of their action has not been clearly identified, collective narratives are created among different groups of people based on their socio-political status. Acid attacks on women for reasons of hatred, vengeance, or chastisement have been mostly taking place for personal motives in Iran. These serial attacks however, were widely perceived to be systematically organized. In the weeks following the attacks, Isfahan's female inhabitants' urban practices were disrupted and the public spaces, once partially safe for women, turned in to spaces of terror limiting women's movement and daily life practices. As a result women started taking collective initiatives for providing secure spaces. These events also led to a collective reaction, which as I will suggest, was one of the rare urban protests in Iranian history to claim women's right to the space. This paper has adopted qualitative methods such as in-depth interviews and focus group discussions to discuss women's perception and reaction after the attacks. Interviewees selected by snowball sampling technique were women who participated in a wave of activism to publicly condemn the attacks. Appropriation of the public space and participation in the collective appeal for the interpellation of the authorities responsible for public security by Isfahan inhabitants indicated the rising awareness of the right to the city as a human right as suggested by Henry Lefebvre.

Adaptation Strategies and Resilience of LOCAL Communities in the Struggling of Forest Resources

This study aims to map the adaptation strategies of the local communities in the context of conflicts over forest resources with the government. This study was conducted on two locations: Gunung Halimun Salak National Park (GHSNP), West Java and Sungai Utik Forest, West Kalimantan, Indonesia. GHNSP is a conservation area where there is Kasepuhan community. Meanwhile, Sungai Utik forest is the site of a cultural heritage where Dayak Iban community lives. However, in this area there also some forest concessions (HPH). In this study, a constructive paradigm was used. Data were collected through in-depth interviews and participant observation. Data were subjected to a qualitative analysis. Results showed that the local communities in the two sites had different adaptation strategies and resiliences. Both communities experienced very challenging events with high stress levels and threat in the form of losing their access to control forest resources. However, in the context of conflict, they managed to survive. The resilience of Dayak Iban community came from the support of other parties (the support received from surrounding people) while the resilience of Kasepuhan community came from the ability of its individuals in maitaining relationship with other parties (social and interpersonal skills or the ability to seek outside support). The assumptions and facts found in this study supported a new theory of "Social resilience in the struggle for forest resources". Resilience was understood as a struggle for survival. In other words, complex social conflict might bring social resilience.

Changing Gender Roles - Do Unmarried Cohabiting Men Have More Egalitarian Family Related Attitudes?

During past decades important changes have taken place in Western societies and strict norms that controlled family life have loosened. Non-traditional family forms, especially unmarried cohabitation have become increasingly popular - for instance in Estonia it is accepted as alternative to marriage. That is also illustrated by the fact that in recent years over 60% of children were born out of wedlock. Different studies, mostly carried out in the US or Scandinavian countries, have shown that people who prefer cohabitation hold less traditional values (Huang, et al 2011; Noack & Wiik 2008). The traditional gender role expectation is that men are the initiators of important family events, e.g. propose marriage. This allows asking whether cohabiting men are representing egalitarian gender role attitudes and therefore prefer not to marry or are there other mechanisms behind it? Estonia as the former socialist country forms a good model to test this argument because of being witnessing most dramatic and overwhelming changes that determined deepening of the intergenerational gap in people's values. Using mixed methods approach we analyze data collected in the Estonian Men Survey in the year 2014 (N=1373, in age 15-55) together with semi-structured interviews of married or cohabiting men (N=13). Our results show that cohabiting men are not only egalitarian but their attitudes also reflected ambivalence. That is important finding, while it emphasizes that cohabitation might not be a product of egalitarian values but ambivalence and cohabitation itself may initiate the ambivalent attitudes. This also supports the idea of norms and counter norms, people still carry old norms as they try to act according to new ones. Thus, our results point out that the unmarried cohabiting unions are characterized by mixed feelings towards men's role and gender equality in a relationship, which in turn may increase the uncertainty of these unions.

The Migration Industry: Labor Migrant Recruitment Practices in Israel

In this paper we examine the practices involved in the recruitment of Southeast Asian labor migrants arriving in Israel to work in three sectors: caregiving (from the Philippines, Nepal, and Sri Lanka), agriculture (Thailand), and construction (China).

We show the forms by which migrant networks and manpower agencies and agents intertwine to self-perpetuate a continuous flow of precarious labor force from South East Asia. Currently, Southeast Asian migrants comprise 74 percent of all migrant workers arrivals. The study draws on 200 semi-structured interviews conducted in with migrant workers from Thailand, China, Philippines, Nepal and Sri Lanka All five countries of origin have established mechanisms aimed at regulating the recruitment process, curtailing illegal recruitment and protecting migrants from exploitation. But combating recruitment irregularities and exploitation of migrants ultimately depends on regulations and their enforcement in the destination country where most malpractices and abuse take place. The authority vested in private manpower agencies in Israel to manage the recruitment of migrants creates a favorable environment for malpractices and the subsequent exploitation of workers. Charging exorbitant recruitment fees has become a rampant practice which the Israeli authorities have failed to curb. The high brokerage fees also lead to other forms of abuse and contract violations placing the workers at risk of apprehension and deportation.

RAINFORD, JON* (Staffordshire University, jon.rainford@research.staffs.ac.uk)

Making Internal Conversations Public: Reflexivity of the Connected Doctoral Researcher and Its Transmission Beyond the Walls of the Academy

Recent advances in social networking have reduced the isolation of doctoral researchers who may previously have been limited to discussions of their work within their institution or specific field at conferences. It was through my own informal academic network on twitter that I developed the proposal for my doctoral research and formed links with the institution I am situated within. In contrast, a recent study in a doctorate of education programme found that the students ranked social networking low on a list of activities important to their doctoral development (Rayner et al., 2015).

Examining a series of critical incidents (Tripp, 1993) during my first year as a part-time doctoral researcher, this paper will explore how twitter has acted as an aid to the development my professional identity and a way of engaging beyond my field of study and academia. These incidents focus on experiences have been previously inaccessible to the doctoral researcher including a dialog initiated through live tweeting and blogging during a conference and the development of a conference paper utilizing both images of my process and drawing on the experiences of others. Drawing on Margaret Archer's (2007) work surrounding reflexivity and internal conversations, this paper examines the way in which twitter forms a core part of my reflexivity, central to my internal conversations and development as a researcher. It will explore these incidents in terms of her four modes of reflexivity. Through conducting these conversations in a public way, this paper will also discuss the potential not just for self-development but also as a form of public scholarship. This paper will also discuss the limitations of this as a form of public scholarship and ways in which practices need to be shaped for both the needs of the researcher and the target publics.

Making It Fit: Institutional Variations in Access and Success Policies

Access to Higher Education is a central concern across the world in relation to its transformative power and the contribution this has on equalizing life. For Higher Education Institutions within England and Wales, it has been a requirement since 1999 they document how they will fund measures to reduce the barriers to accessing higher education and succeeding within it. Since 2004 they have had to set this out in an Access Agreement; an annual statement of how they will allocating funding and carry out work within their institution. The agenda for these local policies is mandated through the National Strategy for Access and Success (HEFCE and OFFA, 2014) yet whilst this work is set within a national policy context, the range of local policies is diverse with varying focuses on outreach, financial support and post-entry support.

This paper will discuss the initial findings of a Critical Discourse Analysis (Fairclough, 2003) conducted on the access agreements for 2016/7 of ten institutions across 5 cities in England. These institutions were selected with one long established university that is broadly selective (pre-1992) and one newer, recruitment focused university (post-1992) in each city. It will explore those areas of similarity and difference between institutions and will explore how different institutions focus on various areas of disadvantage and how the nature of what they do to

reduce these barriers differs. It will explore how institutional strategic missions can develop into a 'linguistic habitus' (Bourdieu and Wacquant, 1992) that shapes the focus of local policies in a way that shifts it in directions unintended by the author of the overarching national policy. The paper will conclude by discussing how these findings only offer a partial view of what is happening and will discuss future work on the relationship between these institutional policies and enactments.

Secondary Education in Brazil: A System That Persists in Social Reproduction

This empirical research analyzes the transformation and expansion of secondary education in Brazil over the last decades. Despite the rapid growth in the rate of enrollment observed after 2005, factors such as income, ethnicity, urban-rural - are still strongly related to educational inequity process. Also in relation to the labor market, the Brazilian secondary education system appears to be extremely selective and responsive, with a low percentage of student workers accessing and remaining at that level of education. Another point to consider is the poor quality of education offered (as indicated by several national and international systems of evaluation). Finally, it also shows the crucial difference between public and private institutions. In conclusion, the research highlights the existence of a "perverse educational pyramid" (NEVES; RAIZER; FACHINETTO, 2007) in the country that- despite the policies and programs implemented in recent years, persists and reduces the social role of education, shaping a strong reproductive educational system.

Nomads and Societies of Control: Role of Information and Communication Technology (ICT) in a Global Refugee Crisis

NOMADS AND SOCIETIES OF CONTROL: ROLE OF INFORMATION AND COMMUNICATION TECHNOLOGY (ICT) IN A GLOBAL REFUGEE CRISIS

Unrelenting wars of attrition, global terrorism and widespread economic deprivation have created a global refugee crisis. The uprooted populations have begun to migrate *en masse* to more stable parts of the world, e.g., European countries, in pursuit of freedom from hunger and oppression. Focusing on the current refugee crisis in Europe, my paper will examine:

- What role does information and communication technology (ICT) play in facilitating and accelerating the inflow of mass migrations into Europe?
- What are the current and future social and political implications of the global mobility of such massive groups of migrants as they seek asylum in nations whose values and norms so far have been socially and culturally more homogenous than diverse. Could ICT breakdown the barriers to social integration?
- In what ways could ICT be useful in smoothening the social shocks that would follow such a sudden and massive influx of refugees into a country? In the process of absorbing massive migrations of such diverse populations, what methods and tools would the recipient societies need or have to develop for integrating such masses of migrants in order to avoid social friction and exclusion leading to their ghettoization?

The theoretical framework will be drawn from Michel Foucault, Gilles Deleuze & Felix Guttari : Disciplinary Society, Societies of Control, Nomad's Deterritorialization/Reterritorialization, as they apply to the experiences of the migrants and the recipient European countries' facilities and rules of integration. Contemporary events and current data will illustrate the above issues.

Goldsmiths and the Informal Sector : A Study on the Changing Nature of a Caste Occupation

The contribution of the informal or unorganised sector to the economy is significant in developing economies. But their role and potential to a developing economy has attracted attention only in the last two decades. This paper attempts to understand the contribution made by one such vital sector –the craftsmen specifically the Goldsmiths in the city of Chennai, South India. The paper addresses their caste background and occupational compulsions, potential for entrpreneurship and their social status in the changing dynamics of their occupation in an urban context.

The Goldsmiths form one of the five artisan castes in south India. The four others being : the Blacksmith [works with iron], the Brass smith, the Stone mason and the Carpentor. This traditional caste occupation which has been passed on through an oral tradition demands full time internship from childhood has faced

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

many challenges due to changes in the economic arrangements in the society. Jewellery making and selling has been influenced by demands of standardisation and quality control. Consequently mechanisation of labour in the initial stages of the craft has become inevitable,leading to a decline in the demand for craftsmen.

However, for those who can afford ,a piece of jewellery is a customised product – the difference now being that the craftsmen accept orders thourgh the jewellery showrooms and not directly from the customer/client unlike earlier times. This paper will capture the fragile status of such goldsmiths who work with high value products but remain in the informal sector and are highly vulnerable to job security and find little space in any policies to nurture or protect their skill and craft.

Spiritual Engagement in Post-Disaster Resettlement and Environmental Risk Governance

The Sarvodaya Shramadana Movement in Sri Lanka is a spirituality based grassroots movement, whose work since 1958 was mostly concentrated in the areas of rural development. Since the 2004 tsunami, the Movement made a significant stride into the field of post-disaster resettlement establishing Sarvodaya tsunami resettlement villages in the Western, Eastern, Southern and Northern provinces of Sri Lanka. Sarvodaya hence brought its spiritual dimension for rural development into the field of post-disaster reconstruction and environmental risk governance. This study examines how the Sarvodaya Movement implemented its philosophical basis which comprises of consciousness (spiritual development), economics (sustainable development), and power (good governance) into its Sarvodaya tsunami resettlement villages. With the data gathered from semi-structured interviews with villagers and Sarvodaya officials, this study provides an analysis of the spirituality-based Sarvodaya framework of ecologically sustainable development. It is expected that this analysis will provide important insights into the Sarvodaya post-disaster resettlement policies as well as policies aiming at environmental risk governance, which is a growing area of the Sarvodaya Movement's spiritual involvement. Further, this analysis can also inform a new framework of spirituality based environmental risk governance and post-disaster reconstruction for wider application.

La Responsabilidad Social En Las Empresas De Comunicación y El Impacto De Las Campañas Sociales En La Sociedad Peruana

El buen ejercicio de la responsabilidad social en las empresas es generadora de políticas y prácticas beneficiosas para la sociedad, las cuales pueden lograr un impacto importante mejorando la calidad de vida de las personas y contribuyendo a superar los problemas sociales más graves de Perú. Impacto que resulta más evidente si se trata de las empresas de comunicación y en particular de las campañas sociales.

La ponencia presenta el estudio realizado para la tesis doctoral que aborda de qué manera las campañas sociales pueden ser una importante estrategia de responsabilidad social para las empresas de comunicación. En particular se destaca del caso de la campaña de nutrición titulada "Los primeros tres años deciden la vida" la misma que fue difundida por RPP Noticias durante más de 5 años de manera ininterrumpida, logran un impacto positivo en la población peruana, en especial en las madres gestantes y niños menores de 3 años y además contribuyendo directamente en las políticas del gobierno en la lucha contra la desnutrición como lo describe el caso.

El estudio propone un modelo de gestión de campañas sociales que desarrolladas desde el enfoque de responsabilidad social resultan ser positivas y generan un beneficio compartido para el medio de comunicación y sus principales grupos de interés.

Reducción De La Pobreza En México: Programas Productivos y Microcrédito

Con relación al tratamiento de la pobreza, las Leyes de Pobres inglesas iniciaron el proceso de convertir la caridad cristiana en política pública.

El término Welfare State fue acuñado en Inglaterra en 1942 y se refiere a las acciones del Estado, financiadas por el gasto presupuestario, en política social y distribución del ingreso. A partir de este momento, las políticas y programas

para aliviar o reducir la pobreza tuvieron más que nunca una homogeneidad en el mundo occidental.

De 1950 a 1970, la lucha contra la pobreza se relacionaba con el impulso al desarrollo e incremento de capital físico e infraestructura. La inversión en salud y educación iniciaron durante la década de 1970.

En la década de 1980, las políticas públicas características del Estado de Bienestar se extinguieron y las acciones contra la pobreza se focalizaron.

Los programas de trasferencias monetarias condicionadas (Conditional Cash Transfers, CCT) durante la década de 1990 se colocaron como el eje central de la lucha contra la pobreza a nivel mundial y actualmente mantienen esa hegemonía. A partir del año 2000, a los CCT se les adiciona la creación de oportunidades para que los pobres aumenten sus activos y con ello su inserción en el mercado.

Para ayudar a corregir la desigual distribución de activos se consideró, como un mecanismo de apoyo, el impulso de programas de acceso a microcréditos. Estos programas estarían dirigidos sobre todo a mujeres pobres y así, también disminuir la desigualdad de género y contribuir al empoderamiento de las mujeres.

En México, desde hace un par de décadas, se han establecido e impulsado programas sociales para que la población pobre tenga acceso a microcréditos. Este trabajo analiza el panorama del microcrédito en México desde los programas productivos.

RAMMELT, HENRY* (Sciences Po Paris/ Sciences Po Lyon (Triangle), henry.rammelt@sciencespo-lyon.fr)

The Lasting Influences of Social Mobilization. the Effects of the 2011/ 2012 Romanian Anti-Austerity Protests on Subsequent Movements.

Romania was for longtime perceived as being one of the archetypical examples for the scarcity of post-communist civil societies (Cf. Crowthers 2004). Romanians ranked low in indicators for civic engagement, and the only (visible) post-1989 protests took place in the early 90s and were brutally repressed. In 2011 a wave of protests erupted that shoked internal and external analysts, as well as longterm activists. Unlike the predictions of militants and experts expecting this wave of social mobilization to be a mere episode, one year later, a new wave of protests shook the country – the protests against Rosia Montana or the "Romanian Autumn". In a qualitative analysis, based on interviews with activists, we demonstrate how the Anti-Austerity protests facilitated the appearance of the 2013 movement against the exploitation of Rosia Montana. We identify four major "unintentional consequences" (Giugni 1999) of the events in 2011/2012 that became influential on the following wave of social mobilization and maybe for subsequent movements in the long run. Three of those consequences deploy their force on the participants of the protestes themselves: the accumulation of relational and cognitive social capital (the growth of the activists networks and an increase in the intensity of social ties, and the strengthening of feelings of togetherness and of a collective identity) and the accumulation of protest specific knowledge (how to protest, how to deal with the police etc.). The fourth consequence observed was a change in the public discourse regarding protests, especially the right to protest, and the protesters.

What this case shows is that protests should not be seen as "unrelated episodes" of social contention, but, as long as there is a continuity in terms of participants and structures, movements often grow organically and we need to look on how social mobilization impacts on further collective action.

The Impact of Cultural Capital on Undergraduate Students' Performances in Brazil

The main goal of this study is to verify the effect of cultural capital on students' performances through the student´s grades on ENADE (a specific test applied to students in the first year and last year in the undergraduate courses). The data set used is from the year of 2008 and involves 824.804 students. The standard test is applied each year. Along with the test a questionnaire is applied to identify students' demographic characteristics as well as their families' profile. The research question is: what is the impact of cultural capital on students' performances in the ENADE test controlling for their demographic characteristics? The theoretical background is based on James Coleman (1997), Pierre Bourdieu (1982, 2007) and Basil Bernstein (1997). Among Brazilian scholars the study includes the ideas of Nelson Silva and Carlos Hasenbalg (2000) and Maria Ligia Barbosa (2009). The study model has as the dependent variable the students' grades in the ENADE test and the cultural capital as the main independent variable along with the control variables. Descriptive analyses are used as well as regression models to obtain the effect of the independent variables on the dependent variable. The preliminary and main results show that there is significant association between levels of cultural capital and students' performances in the ENADE test. Specifically, there is a significant and positive correlation between parents' education, ownership of

RAMOS ZINCKE, CLAUDIO* (Universidad Alberto Hurtado, cramos@uc.cl)

The Co-Production of State and Poors Mediated By a Sociotechnical Device: A Socioeconomic Stratification Card

We investigated, through institutional ethnography, in Santiago of Chile, the interaction between the state bureaucracy, expressed in networks that go from the ministerial level to the local (municipality), and the citizens seeking state aid. This interaction is mediated by a measuring instrument that is a kind of social stratification form ("Social Protection Card" or "Social Card") used by many social programs for assigning aid. In such a bureaucratic device converge conceptions of social policy, political strategies, methodological procedures, econometric models and statistical calculations, whose production involves experts and government officials. The card is prepared and analyzed centrally, but its implementation is local, in each municipality. The individuals concur to local offices to be registered and then interviewed in their homes. Then, families will receive the resulting scores and, if they are classified as poor, will have access to state benefits.

The research follows the different stages of this procedure of classification and shows the double performative process that happens. On the one hand, this process contributes to the shaping of connections, networks and forms of state social intervention, as well as to the meaning and core identity of those networks and activities as component of the state. On the other hand, this process classifies individuals as deserving poor or non-poor, conditioning their self-conception. This is a dynamic and interactive process, in which families subject to classification resist and rebel, using the means at their reach, with adaptive strategies not anticipated by the state, to enforce what they consider their poverty condition. These strategies lead to a cumulative result that can be conceived as "normalized fraud" and it ends up being partially legitimized by the state bureaucracy that fails to stop it. All this stabilizes a particular form of relationship between the state and individuals, characterized by dependence and instrumental manipulation.

Advancing Strengths through Marketing in Social Enterprises

Social enterprises identify the needs of the society and provide the support to uplift their status or upgrade them for betterment. Social entrepreneur, find out social and economic problems of society, identify the financial resources and transferring the required resources for betterment, take risk, create opportunities. Social entrepreneur has several opportunities like creating employability, developing awareness towards social issues, encouraging awareness against social problems, educating vulnerable and marginalized people, generating networks for farmers for better utilization of resources etc.. It is also required to identify the need for socially desirable programs. In India as developing country there is immense potential for social initiators as there are several existing issues and unexplored areas for improvement. In the era of globalization and competition to sustain in market it is essential for social entrepreneur require vindicated marketing plan. Entrepreneur has to pay attention of ATL and BTL marketing plan. Majority of consumers are still oblivious about the programs of these social initiators. There is need to explore the ways through which long term connectivity is required. In the president study the SWOT analysis of marketing strategies of selected social enterprises will be analysed in India. It will also be the effort to identify the opportunities for the innovative marketing of these enterprises.

Sealing Knowledge Gap for Sustainable Agriculture Practice

With the increasing demand, protection of environment and better return for the farmer there is requirement of sustainable agriculture practice in present scenario. Sustainable agriculture practices include locally need based farming practice, resource conservation, use of renewable energy sources, quality seeds for ecological and economic sustainability. There is certain information gaps present in agriculture field especially in plant diseases, pest control, marketing, credit and loan facilities. The dissemination of knowledge of organic farming, ecological restoration is also essential for sustainable agriculture growth. For uplifting the position of farmers the government has taken several initiatives, but the problem is related with the source of information through which the ingenuities can be transported to the target group. For meaningful dialogue with the farmer the factors related to demography, age, literacy, gender, awareness and interest for knowledge and skill building are some of essential parts. Present paper discuss

about the gap available in information diffusion for affordable farming practices in India.

A Study on Alternative MEDIA Promoting Intracultural Communication through News Websites

Alternative media's rise has been facilitated by growth in Internet and other digital technologies. "Alternative media is a range of media projects, interventions and networks that work against, or seek to develop different forms of, the dominant, expected ways of doing media."(Chris Atton:2004).The characteristics of alternative media according to Atton are:-radical content ,be it political or cultural; strong aesthetic form; employ 'reproductive innovations/adaptations' taking full advantage of the available and cutting-edge technology; alternative means of distribution and anti-copyright ethos; transformation of social roles and relations into collective organisations and de-professionalism and transformation of communication processes-'horizontal linkages'(Kate Coyer etal:2009). The two main characteristics that differentiate alternate media from dominant media are in the content and in the mode of production which is more democratic and participatory.

The emergence of alternative media on the internet has led to changes in journalism and media. PeaceNet in the US and Green Net in the UK were the earliest internet based media projects which helped in bringing about social change. The internet has been used by social movements like Zapatistas in the Chiapas region of Mexico and the Arab Spring. Popular culture is also shared and promoted with the help of internet .The emergence of news websites is one such phenomenon.

This paper seeks to study two websites from India UthTime.in and citizenMatters.in. The content of the two website will be analysed for a month in order to understand the profile of the contributors to the site. It will also enable the researcher to understand the consumption and distribution pattern of the news stories. The organisational theory of peer production will be used to examine the dynamics of growth and sustainability of the new news media. Based on the observations conclusions will be drawn as how the websites aid in intracultural communication.

Globalization ,Popular Culture,Consumer Culture : A Study of Bollywood FILMS

Liberalization of the economy in 1991 has brought about transformation in every sector of the economy. Liberalization led to privatisation and globalization. The process of globalization brought changes in all sectors, where entertainment industries also got additional benefits in terms of financial support as well as volume of the audience According to **Chopra** (2007), Bollywood film industry also got "Industry Status" in the year 1998. Around six million people got employment in different form of production. Around eight hundred Bollywood films release every year.

In the generation of globalisation films are crossing multiple millions at box-office by releasing all across the globe, across different class and culture.(Bose:2006) The high revenue generating trend has created a concept of "Hundred Crore Club" known as Blockbuster. These films are recognized as platform for advertisement and promoting the product to create consumer cultural in sustainable mode.

This study seeks to explore how popular culture like Films has been used as a bridge between the corporate world and the masses. Films have so many genres with different target audiences, but in the 21st century digitalization and globalization has changed the face of promotion and distribution entirely. Corporate world, once they discovered the potential in popular culture through films, started placing their products in them. This paper would analyse films to see how they have been used as a promotional vehicle for various goods and services.

Patterns of Presenting and Experiencing Racism in Germany

The presentation is based on empirical findings of my PhD project which deals with biographies of people who experience racism – and find themselves in different outsider positions in various settings in Germany. The research is concentrated on reconstructing different ways of dealing with racism in interrelation with other mechanisms of in- and exclusion.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

To approach this interest I conducted biographical-narrative interviews (combined with a case-reconstructive approach of analysis). In my biographical research I draw specific attention to the interplay between existing power relations, discourses related to racism and life histories of People of Color. In this context I see biography as a set of experiences which are linked with specific present and past discourses within a specific historical constellation.

My empirical findings show that People of Color in Germany form different patterns of presenting their outsider positions in society (depending on their biographical experiences and also the interview setting resp. framing), e.g.:

- taking the position of being a member of an outsiders grouping
- see yourself in an outstanding position
- see yourself as a member of an established grouping.

In my presentation I will introduce selected types of these patterns in their genesis during the life history. With this contribution I would like to give an understanding of the complexity of the connection between power-relations and positions and their shifts in different constellations

Social Justice an Unfinished Agenda - QUEST for Amelioration of the Status of the Migrant Tribal Women in India

The question of Tribal woman's identity and inequality in India is a crucial point of discussion. As India being a developing, emotional and multicultural country, The major concern of attention at present in studies relating tribal is not simply pertaining to problems and disputes among this community but also involving them with non tribal society and protecting their identity. Protective policies and constitutional provisions are available as a support system but the concern and challenges are required to revisit.

Demand to set right the historical wrongs; Social justice has become the significant movement in India. This movement has accelerated in the past few decades due to the migration and immigration of the tribal communities.

Worries of judicial system are hidden and still we are not able to explore its problems , which leads to depression in the sector of migrant tribal. Issues relating to optimum balance to control crime and exploitation against them are still pertinent.

It has forced us to rethink upon the delivery of social justice through law and statues. Present Paper strives to highlight the aspects of the constitution which has assisted judiciary, to achieve the unachievable of the past. The judiciary has enthusiastically supported the improvement of the tribal immigrant woman in India through law and regulations and it has reached a substantial level to alleviate the situation yet long way to go. The paper would analyse various case laws, case studies and focuses on the guiding principles of social justice for the tribal labourers. Constitution being the most powerful document of democratic India lays down various principles for achieving social justice. As Mr. Justice V.R Krishna Iyer has aptly said "Dogs may bark but the caravan of justice passes by".

Social Capital in Social Work Disaster Preparedness Plans: The Case of Finland

Social workers have been involved in disaster mitigation, preparedness, response, and recovery actions in many countries. Various scholars have argued, however, that the profession should take a greater role in disaster management fora. The consequences of disasters are the worst for people who in normal life are also more vulnerable, and often already involved with social work and services: children, disabled persons, the elderly and minorities of the society. The aim of this study was to find out what can be learned of Finnish preparedness plan documents, in order to develop social work interventions in future disasters. Finland is not known for big disasters, but due to the geopolitical location of the country we have a long tradition in preparedness planning. The research questions in this study were: Which interventions are planned for social work in disasters in Finland, and which forms of social capital are emphasized in the interventions? The concept of social capital was used as theoretical framework in analyzing the emphasis on social work plans for disaster response. The data consisted of all Finnish municipalities' disaster preparedness plan documents of social work and services. Quantitative document analysis was used as the research method. The results show that social work has fulfilled its duty of preparedness planning in Finland, although in a very general level. Micro level social work and enhancing bonding social capital were emphasized. Bridging and linking social work to disaster-related structures should be developed already in the preparedness phase of disaster management cycle. The study suggests that the concept of social capital is used in developing social work preparedness, practice and training.

SAARINEN, ARTTU (University of Turku)

Associations Between Political Orientation and Attitudes Towards Leisure Activities

The changing voting preferences and public attitudes towards political parties are an integral part of the current democracies all over Europe. In Finland, after the parliamentary elections in the spring of 2015, public discussions soon turned to the formation of the so-called "red-green bubble" i.e. the interaction of the left and green among individuals. The "bubble" itself can be thought of as a different type of social network, or in practice, as an interaction based stable relationship or a contact between people sharing mutual political preferences. Following this, we argue that many of the influential social networks are formed on the basis of political preferences. In order to test this argument, we analyze the associations between political party preference and attitudes towards leisure activities. In contemporary research, it is generally argued that individualistic choices are more important than collective and structural interests. However, it can be expected that shared opinions, norms and beliefs influence the consumption practices of the network members. We utilize unique data derived from national-level surveys collected in Finland in 2009 (n=1,202) and 2014 (n=1,351). Both samples consist of respondents aged 18 to 74 years, thus providing an extensive look at the phenomenon. Our results suggest that political preference is an important predictor of consumer attitudes, even after controlling the effects of socio-demographic factors. Our hypothesis regarding the "red-green bubble" is also partly supported. The supporters of the Greens, the Social democrats and the right-wing party (the Coalition) are more hedonistic consumers than supporters of other political parties. When examining mundane consumption, the centre-right parties (the Finns and the Center) differ from the right-wing and Social democrats. However, our findings do not necessarily support the assumption regarding the interaction between the Left-Alliance and the Greens when examining hedonistic consumption attitudes.

Veiled Threats? Producing 'the Muslim Woman' in the UK Public Policy Imaginary

As Abu-Lughod writes,"gendered orientalism has taken on a new life and new forms in our feminist twenty first century" (2013 p. 202). This paper examines this phenomena in the UK context through a critique of the UK government's engagement with Muslim women as part of its Preventing Violent extremism (Prevent) agenda. Whilst superficially framed in terms of empowerment, such interventions reflect a narrow form of neoliberal empowerment focused on access to consumer capitalism (McRobbie 2009). The paper analyses the way in which such engagement, through a focus on religious identity alone rather than a broader more intersectional approach to Muslim women's lives contributes to a wider process of gendered racialization of Muslims. As such it feeds into new forms of gender injustice against Muslim women in the form of increasing marginalization, discrimination and racial violence. The paper will frame these developments in the context of historical continuities and global parallels. Furthermore, through deconstructing contemporary constructs of 'the Muslim woman' in the UK, the paper will discuss the possibilities for greater solidarity as part of a wider anti-racist feminist struggle.

RATCLIFFE, PETER* (University of Warwick, peter.ratcliffe@warwick.ac.uk)

The Neoliberal University and Racism Research

Focussing principally on UK research, this paper argues that neoliberalism poses a number of major threats to our work, and that this is especially true for those of us committed to pursuing a forthright public sociology geared to promoting progressive social change. National evaluations of our research primarily valorise those elements that are geared to intellectual 'outputs' where the readership is essentially confined to a narrow coterie of fellow colleagues and not routinely open/accessible to those whose social agency contributes to change. The paper provides examples of important research that is under threat from the bureaucratic regimes that infect the contemporary university.

Disconnected Spaces: Introducing Environmental Perspectives into the Trade Union Agenda Top-Down and Bottom-up

Our paper compares how visions for integrating environmental issues into the union agenda are articulated from two different positions in the Swedish Trade Union Confederation (LO), the position of a shop steward and the position of an official unionist, responsible for environmental policies at the top of the union. The basis of the analysis are 'life history interviews' and it directs attention to the biographical circumstances under which individuals are able to work with environmental issues in unions. The analysis shows that the conditions for integrating environmental issues are weakened by the hierarchical culture of the organisation and by the high levels and forms of institutionalisation. LO furthermore lacks routines for mobilising the interests of environmental enthusiasts. Being positioned at headquarters hampers the abilities of union officials to mobilise environmental interests among members. Comparing the experiences from Sweden with the case of Comisiones Obreras (CCOO) in Spain shows that success depends on a relationship between individual engagement and political conjunctures. Union transformation is contingent on developing issues that connect the immediate interests of workers with their long-term interests as citizens, such that a new workers' identity can develop and lead to practices that overcome the 'metabolic rift'.

The Debate on "Militarization of Public Security" in Brazil: After All, What Is It?

In recent years the community of social scientists, numerous human rights organizations and certain sectors of the media have pointed the militarization of public security in Brazil as an impediment to the construction of efficient and democratic security policies in the country. This paper attempts to map and understand the different concepts of "militarization of public security" of the discourse of the main social actors present in the public arena and critically discuss any expected implications and effects of such views on the possibilities of reform and transformation of police organizations and organizational arrangement of public security in Brazil.

A Question of Scale: The Sustainability Potential of Food Provision within Large Organisations

Food consumption outside home is increasingly recognised as a crucial issue with regard to environmental protection, economic development and health and wellbeing that requires collective, society-wide responses. Nevertheless, efforts to enhance the sustainability of food consumption in wealthy countries have frequently focused on influencing the choices made by individual consumers and households. For example, many grassroots initiatives and policies aimed at tackling food-related problems such as obesity or excessive meat consumption tend to appeal to individual consumers to reconsider and modify their food practices. However, this individualistic perspective tends to eclipse the significance of other actors, including large organisations such as businesses, hospitals or universities that provide food for public consumption on a daily basis. These organisations, through their role as intermediaries in the food chain, influence the production, processing and distribution of food and have potential to alter the consumption practices of large groups. Through a comparative case study of eight large organisations in the West of Ireland whose primary task is not the provision of food but whose canteens provide meals for employees, students, patients and visitors, this paper offers a context-focused sociological analysis of key actors and decision-making channels within these organisations that shape the meal choices of up to 40,000 people per day. Combining semi-structured qualitative interviews with 25 individuals responsible for food procurement, preparation and sales with quantitative information about the sustainability of food on offer collected using the FOODSCALE method (Goggins and Rau 2015), the paper delivers a rigorous cross-case comparison of organisational structures and decision-making networks and processes that reveals suitable points for sustainability intervention. Based on the findings, the paper makes a strong case for channelling more resources into research on food provision within organisations, with a view to informing organisation-centred sustainable food policy and practice.

RAVAL, CHANDRIKABEN* (Gujarat University, ckraval@yahoo.co.in)

Social and Health Status of Aged People of Ahmedabad

The phenomenon of population ageing is becoming a major concern of the world. India's older population will increase dramatically over the next four decades. The policy of India defines senior citizen or elderly as a person who is of age 60 year or above the older people have main two problems i.e. Social status and Health. As a social scientist, it is interesting to know about the social status and health of old people.

This paper is an empirical survey of 60-70 years old people of Ahmedabad. The main objectives of this paper is to know the primary information of aged people, their social and health status and problems related to social status and health.

The purposive sample of 250 old people was selected from different parts of Ahmedabad.

The interview schedule was designed as a tool of data collection.

This paper is divided in four parts. The first part introduces the situational analysis of old population of India and sociological concept of status, power and health etc. The second part is on methodology. The third part consists of data analysis and discussion of the survey and final part is on findings and suggestions.

The study reveals that till today most of the old people have lived in joint family. Some have lost their partner. They depend on their children for living. They spend their leisure time in religious and social activities. Most of the respondents' health is good, their health problems are related with age. They feel loss of status in social group.

The study makes a number of recommendations for corrective action.

RC51-586.1

RAVEN, JOHN* (Eye on Society, jraven@ednet.co.uk)

Harnessing Social Processes for the Common Good

The paper deals with ways of tackling the serious ecological, economic, and social problems facing our society. Findings suggest that these problems are not economic but arise from the way society is run.

The **solution** proposes is a learning and management system which is decentralised, dynamic, and characterised by innovation and evaluation. It will not appeal to those preoccupied with centralised planning, control, orderliness, and narrowly defined efficiency.

The first of three requirements for any radical transformation in society is the creation of a climate of innovation going along with better arrangements for monitoring innovative experiments.

Second, the evolution of much better arrangements is required for initiating the collection of information, bringing it together, sifting it for good ideas, initiating action, monitoring the results, learning from the monitoring process, and restarting the cycle. This is primarily a responsibility for public servants.

Third, new ways of thinking about management, bureaucracy, democracy, and citizenship are required. Recognition is necessary that **management** has to focus on **releasing the energy, creativity, and initiative of others**.

Such innovation requires new forms of participative democracy grounded in networkbased supervision of the public service. It cannot not be implemented by central decree. The invisible hand of the marketplace will be replaced by visible monitoring and learning arrangements aimed at understanding **systems** processes. This will allow the consideration, assessment, and control of **multiple** determinants of events and identification of a wide range of desired and desirable outcomes.

The main aim of this paper is to help to operationalise a concept of "the information society". An issue not discussed in the paper, but to which input is expected from the audience, is methodology. What is the appropriate methodology to understand and analyze the systems processes? Systemograms? Computer simulation? If so, which kind of simulation?

Of Vulnerability and Coercion: A Study of Sex Trafficking in Assam, India

This paper attempts to understand the issue of sex trafficking in Assam, India. It discusses the political, economic and socio-cultural context within which trafficking of women and girls take place for commercial sexual exploitation. Of specific concern is to understand the relation, if any, between existing gender norms, prevailing political conflicts and sex trafficking. It also seeks to analyse the strategies women build creating agencies to counter vulnerabilities to political conflicts and also to trafficking. This paper is based on data collected through informal interactions and group discussions with rescued trafficked women, interviews of state and non-state anti-trafficking personnel, observation at two shelter homes, and case studies collected from anti-trafficking organizations. This paper puts forward that gendered norms intersect with existing political econom-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ic factors to doubly disadvantage women vis-à-vis trafficking both in normal and times of conflict. Further, it argues that anti trafficking discourse in Assam largely infantilize women marking continuity in violence even in the post trafficking stage.

The Media Image of the Social Protests in Bulgaria

The contemporary technologically determined information and communication environment is not only facilitating users' participation in the process of generation and dissemination of content, but is also creating new opportunities for democratic citizenship. A variety of texts on new communication characteristics (Carpentier, Castells, Deuze, Fidler, Friedman, Jakubowicz, Jensen, Lash, Patriarche, Todorov, etc.) offer multiplex approaches to this phenomenon, elucidating the interrelations between the audiences, the traditional and the social media.

The proposed paper will discuss some major political and social implications of the new roles of the audiences viewed through the prism of the media activism in Bulgaria. It is based on comparison of two case-studies, focused on recent social events in the country that had significant political effects. The first one, triggered by the high electricity bills, is connected with disapproval of the living standards. It resulted in resignation of the acting government in less than two months – in February 2013. The second one has moral purpose – for sustaining the democratic standards. On June 14, 2013 about 10,000 people summoned spontaneously via the social networks to protest against the Parliament for the non-transparent appointment of a controversial media mogul as a head of the State Agency of National Security. Although the Parliament withdrew the appointment immediately, hundreds of activists were every day out in the streets protesting against other controversial measures of the new government, which resigned within a year after its appointment. Both events enjoyed extensive mainstream media coverage.

The aim of the undertaken research is to focus on the images of the protests (both in media and in social networks) as well as to reflect on the issues and demands behind these images. In addition, some of the most significant images of the protests disseminated through both social networks and traditional media will be also analyzed.

Constrained Choices: Migrant Workers' Access to Care in Qatar

This study draws on the constrained choice framework to examine the health and well-being of females in Qatar, with a particular focus on migrant workers. This framework provides an innovative multi-level model that demonstrates how structural constraints narrow the opportunities and choices available to individuals to achieve and maintain good health (Bird and Reiker 2008). It articulates how the social policy shapes one's status, access to resources, preferences and in turn one's options for making everyday choices that cumulatively impact health. I situate the health-seeking experiences and behaviors of females in Qatar within this model, drawing on qualitative interviews with 100 female patients at the country's largest healthcare facility. I compare the experiences of migrant women to those of nationals to elucidate how citizenship status further exacerbates women's limited agency regarding their health.

ARCIDIACONO, DAVIDE* (University "Sacro Cuore" of Milan, davide.arcidiacono@gmail.com)

The Open Data Challenge: Data Disclosure Between Citizen Empowerment and Digital Economy

In the post-democratic era (Crouch, 2003), the crisis of the traditional representation of interests is accompanied by a reconfiguration of the role of States (Sassen, 1996; Ohmae, 1999). The new scenario shows an unprecedented centrality of the citizen-consumer (Willis and Schor, 2012; Arcidiacono 2013). Citizens, thanks also to the use of digital platforms show an increasing interest for forms of direct democracy (Chadwick e Howard 2009; Della Porta, 2013), building a new partnership with government and public adminstration, based on three fundamental strategies (O'Reilly, 2011; Linders, 2012): the increasing involvement of citizens in monitoring and guiding public policies (*citizen sourcing*); the availability of technological infrastructure that support a new collaborative logic (*government as a platform*); the processes of self-production and co-production of public services (*do it yourself government*).

The Open Data issue (Volk, 2011; Auer at al., 2014; Bates, 2012; Kitchin, 2014; Gurin, 2014), promoting the transparency and online accessibility to governmental information, is a central part of this transformation. On this topic an extensive literature exists, mostly technical, or focused on regulatory, or economic aspects. We chose, instead, to study the phenomenon from a perspective on which there is a poorer analysis (Postigo, 2012; Tauberer, 2014): the role of spontaneous and informal groups of citizens that decide to mobilize exclusively for promoting data disclosure.

The study is focused mainly on the analysis of an Open Data Movement in a specific local environment, named *Open Data Sicilia*. It will analyze the birth and development of this on line community through mixed methodological approaches, combining traditional ethnographic observation with a net-nographic approach (Kozinets 2002), in order to assess how valuable this research path could be and fixing a possible research agenda on this topic.

Emancipative Movements, Emancipative Agency: Framing New Conceptualizations

The aim of this presentation is to rise some questions about a fundamental stake for social movements: that of emancipation. Indeed, the way in which movements claim for emancipation, and the contents of the very idea of emancipation can change across time and space, across history and cultures. Albeit emancipation is considered as a central concept of western modernity, with its history of emancipative mobilizations, it has been a fundamental element of collective action far beyond the western world. Hence, the sense of emancipation as political and cultural component of social movements, the role of emotions on which the search of emancipation is based, the idea from what or from who one should be emancipated can change across the cultural and temporal contexts. In the presentation we shall analyse the pluralist nature of emancipation inside collective actions, bridging together analytical finings of different researches on emancipative social movements.

What Is Left of the Subject, What Is Missing in Subjectivation: A Dialogue

By underscoring the processes of becoming, the French anti-idealistic and anti-existentialist approaches of Michel Foucault and Gilles Deleuze have paved the way to a radical reconfiguration of the idea of the "subject" as metaphysical foundation, rational actor or sense making creator. In this vein, subjectivation is a dynamic interplay between singular actions and power constraints, body perceptions and contingencies of the situation; subjectivation is always open to the unpredictability of the environment and its forms of government, autonomy and emancipation are not a simple effect of individual free will but an injunction to be reliable, and adaptable, in a complex society. And yet, subjectivation is not a simple and temporary outcome. The idea of subjectivation, fostered by Foucault's and Deleuze's legacy, only partially satisfies the sociological need to understand the dialectics between the human (as well as the post-human) and his/her environment. In the presentation we shall try to investigate whether this partiality can be tackle with a new conceptualization of the idea of "subject" able to include the criticalities highlighted by the idea of "subjectivation".

Posthuman Postmortem Postcards: Othering and Identification in Condolence Cards for Bereaved Pet Keepers

Drawing on the work of Giorgio Agamben, this paper analyzes the text and imagery of condolence cards for humans who have lost a nonhuman animal companion. Although previous research has suggested that there is a taboo on grieving lost pets, there is a growing global market for cards designed for people who mourn a companion animal. The grammar and aesthetics of these cards show what is possible and acceptable when it comes to the display of grief across species borders, and what is not. Most of the cards available recognize the loss of a pet as the loss of a person rather than a belonging, or the loss of grievable *bios* (political life) rather than expendable *zoē* (bare life). The analysis shows that while the cards recognize the privileged status of some nonhuman animals in the life of humans, they are concurrently dependent on using the kind of familiar anthropocentric language and imagery that also fuel human exceptionalism. On the one hand, the cards' rhetoric opens up representations that risk belittling or rejecting the grief for a lost companion animal. On the other, cards also challenge

the hierarchical human/animal distinction, emphasizing non-human animals' status as kin, in spite of the difference in kind. This balancing between othering and trans-species identification provides the cards with a posthuman quality: in accumulation the cards shed light not only on the othering operations categorizing nonhuman animals as bare life, but also on the volatile notion of a human 'we'. These posthuman postmortem postcards thus challenge what Agamben calls *the anthropological machine*; that is, they unsettle the idea of humans as exceptional animals and the discursive othering mechanisms that produce the distinction between *bios* and *zoē*.

REGIS, JACQUELINE* (Universidade de Brasilia, fiuzaregis@yahoo.de)

The Risk of Giving Birth in Brazil: The Struggle for Obstetric and Post-Partum Care without Violence

In this paper, which is part of a broader study on the discursive representation of pregnancy care and childbirth assistance in Brazil, I present a critical discourse analysis of narratives - birth reports and letters to the obstetrician - related to the birth event in that country. The choice of this theme was motivated by the question of hospitalization of childbirth in Brazil, country where the index of caesarean surgeries registered in private hospitals is 82%, the highest in the world. Employing analytical categories of the critical discourse analysis approach (Jäger, 1996; Jäger, 2012; Chouliaraki & Fairclough, 1999). I investigate the texts, considering the discursive construction of identity and processes of identification by women writing about the experience of giving birth, either hospital vaginal birth, home birth or cesarean section. Taking the documents as a record of a situation, I interpret the narratives and the evaluation they show as part of a wider criticism of the care model in Brazil, which embodies aspects of hegemonic struggle discursively performed.

Intersectionality and Social Inequalities in Health: A Comparative Study

The comparative study of social inequalities in health is a growing field and this is partly due to the fact that two central puzzles remain unsolved: 1) Despite considerable welfare and public health efforts health inequalities seem surprisingly stable and even growing in some countries. 2) Welfare states with a high level of decommodification provide safety from common life risks, particularly for the most vulnerable parts of the population, and yet we often do not find health inequalities too be smaller in countries with generous social policies. This paper aims to shed new light on this question by combining the idea of intersectionality of inequalities with new data sources and nonparametric estimation approaches. Intersectionality emphasizes that different forms of inequalities (e.g. education, gender, and ethnicity) are related and exist in a system of interactions. As an analytical strategy it indicates that focusing on only dimension of inequality masks some of the complexity in which social determinants affect health and this may be of particular importance for a comparative perspective. This paper compares social inequalities in health for patterned social groups (created based on multiple intersecting social categories) across advanced, industrialized countries. In order to do this it draws on multiple comparative surveys including the European Social Survey, the International Social Survey Program, and the Survey of Health, Ageing, and Retirement to investigate if detected patterns are consistent or depend upon the selected data source.

REIBLING, NADINE* (University of Siegen, reibling@soziologie.uni-siegen.de)

Reconciliation of Work and Family Life in Europe: A Pseudo-Panel Approach

The reconciliation of work and family life is a continuous challenge for working parents and a source of persistent gender inequality. National welfare policies constitute the institutional context that determines to what extent mothers and fathers can achieve work-life-balance. This paper analyses the effect of labor market regulations and family policies on gender differences in work-life balance for 28 European countries. Most comparative work on this topic relies on cross-sectional multi-level models for assessing the impact of national policies and thus faces the inferential challenge of unobserved heterogeneity on the country-level. Since there are no comparative longitudinal datasets available, this study applies a synthetic cohort design to generate panel data at the level of socio-demographic groups using three waves of the European Quality of Life Surveys (2003-2011). These pseudo-panel data allow addressing the issue of omitted country-level variables with a fixed-effects model. While our results confirm that national reconciliation policies shape gender-specific patterns of work-life-balance, the effects of individual policy indicators differ when compared to conventional estimation models.

REICHER, DIETER* (University of Graz, dieter.reicher@uni-graz.at)

Long-Term Civilizing Processes within Multi-State-Civilizations. a First Step Towards an Evolutionary Sociological Approach of International Relations.

At least, there are two different approaches to the term of »civilization«. Norbert Elias understood »civilization« not as a static concept but as a »process of civilization«. Elias links the long-term process of monopolization of the coercion (state-building) with a second process: the long-term refinement of manners and the control aggressive impulses. This approach is maybe helpful to understand long-term changes in patterns of violence between individuals and small groups. However, this focus bears some problems in order to understand long-term patterns of international relations. I.e., how to understand the normative structure of whole state-systems? The modern state-system or ancient state-systems evolved in the course of many centuries they are all missed a process of monopolization of coercion like sigle states.

The second approach to the term »civilization« is linked with Herders' idea that the world consists of different »cultures« side-by-side. Thus, there are »civilizations« in the plural. Following this approach, Adam Watson and other scholars of the so-called »English School of Realism« systematically focussed on multi-state civilizations, like the early Mesopotamian system of city-states. Michael Mann developed also a comparative design in order to analyze multi-state-civilizations. However, this approach does not provide a model to link the macro- and micro relationships within such multi-states-civilizations.

Therefore, this paper tries to discuss the possibilities to combine both types of approaches. The argument will be grounded on the historical comparison between three different multi-state-civilization: a) the ancient greek system of city-states; b) the Western European networks of kingdoms, duchies, and counties; and c) the modern Western state-system that developed since the Peace of Westphalia. It will be argued that there are some common characteristic in the regulation of warfare and collective violence between these multi-state civilizations. One important characteristic is the differentiation between established political entities and outsiders.

REID, JAMES* (University of Huddersfield, j.reid@hud.ac.uk)

How Do Teachers Come to Care?

This presentation reports the findings of an institutional ethnography in a primary school in the north of England during a period of 'notice to improve'. This regulatory status followed an inspection by the Office for Standards in Education, Children's Services and Skills (Ofsted) in which the school was judged as 'performing less well than it might in all the circumstances reasonably be expected to perform'. This study situates the teachers' experience of 'notice to improve' within their everyday practices and embodiment of 'care' as they enact the policy discourses that organize their work.

The study aligns institutional ethnography with a narrative method, 'The Listening Guide' (Mauthner and Doucet 2008), and a political ethic of care (Tronto 1993) to reveal and analyse the co-ordination of social relations. Care emerged as a problematic from the teachers' standpoint, a disjuncture in experience, as they activated and appropriated texts in order 'to get out of' notice to improve. Institutional ethnography (Smith 2005) enables explication of the ruling relations of policy and performative texts, and how these texts are taken up and activated by teachers in coming to care as an institutionally organized aspect of their work. As such the study reveals the trans-local, extra-local, and situated connections and co-ordination of work during a time of enhanced scrutiny and accountability, and the tensions with teachers' wider understanding of care. Analysis reveals an understanding of care as political and moral and involving more than the discourses of intimate relationships and role modelling promulgated as necessary to good pupil outcomes.

The research explicates the hierarchy of textual mediation of teachers' work and explores how teachers come to care through politics first, morality first, and personal and professional moral boundaries. It identifies a wider understanding of care that gives rise to more socially just and equitable ways of acting.

Fathers' Involvement: Interpreting Fathers' Contemporary Practices in Childcare By Contrasting Different Measures

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The gender division of paid and unpaid labor is rapidly changing, since women are increasingly entering the labour market. In Germany, this development is intensified by the new paid parental leave policies introduced in 2007 which provide exclusive entitlements for the father.

Still, there is an ongoing question of how to understand fathers' practices and therefore fatherhood in contemporary times. In recent studies, there are two main indicators for fathers' practices: their amount of time spent on childcare and their use of paid parental leave. Often defined as "paternal involvement", these practices are meant to indicate the fathers' engagement *with* their children as opposed to the fathers' engagement *for* their children within the male breadwinner model. In times where the dual earner model is on the rise, studies sometimes go beyond absolute measures of fathers' practices and analyze the relative practices (i.e. compared to their partner).

However, few studies integrate the examination of fathers' childcare and fathers' paid parental leave use as well as the examination of the absolute with the relative practices of fathers. With my analysis I aim at contributing to the questions (1) how fathers' (absolute and relative) practices can be explained (2) and how the two indicators of fathers' practices relate to each other.

For the analyses, German panel data (SOEP) with fathers of children born between 2007 and 2011 are used. In four negative binomial regression models socioeconomic factors, workplace factors and partner data are combined as explanatory variables to explain fathers' (absolute and relative) daily childcare and fathers' (absolute and relative) paid parental leave use.

These analyses will allow an interpretation of fathers' practices as well as the parents' division of paid and unpaid labour, and at the same time make it possible to reflect on indicators of fatherly engagement.

Let the Others Do the Job: Comparing Public Good Contribution Behavior in the Lab and in the Field

Under the assumption of payoff-maximization, standard game theory predicts that groups playing a public good game (PGG) do not manage to coordinate on the social optimum of full cooperation and play the pareto-inferior Nash-equilibrium of zero contributions instead. Contrary to this, numerous lab experimental studies have shown that subjects contribute on average positive amounts to a public good, which might be due to pro-social preferences. In our study we compare individuals' public good contribution behavior in a lab and field setting. University students working on an in-class group assignment, which is graded on the group level, are essentially playing a PGG. While in this setting investing a maximum amount of time and effort is the socially optimal strategy, free-riding on the efforts of the others may be individually more beneficial. We test if students' behavior in a standard PGG is correlated with their contribution behavior in the group assignment which is part of a university course. The PGG is incorporated into an extensive online survey which is also used to measure the students' performance in the group assignment and to collect data on other relevant factors. Among others, we control for individual motivation and possession of course-relevant skills, the social cohesion of the group, and the use of sanctions towards underperforming group members. Preliminary results suggest a positive correlation of the contribution behavior in the online linear PGG and the behavior in the group assignment, suggesting that individual characteristics, such as preferences, matter for the behavior in both settings. Students who are more cooperative in the online PGG also contribute a significantly higher quality of work to the group assignment. On the other hand, we do not find a correlation between conditional PGG contributions, measured with the strategy method, and field behavior. This finding challenges the generalizability of this method.

REINPRECHT, CHRISTOPH* (University of Vienna, christoph.reinprecht@univie.ac.at)

Migration Success As an Indicator of Migrants' Well-Being

Do migration experiences negatively affect the subjectively experienced level of well-being? International research suggests that the relatively low level of well-being among relevant parts of immigrant populations is related to their limited capacity to control one's life conditions, whereby the limited capacity of control is mostly interpreted as a consequence of a fragile status both in economic, legal, social, and cultural terms. By contrast, kinship and ethnic orientation are often identified as compensatory resources which may positively influence the sense of well-being, even under the condition of poverty and precariousness. These insights are in line with the traditional integration-approach: subjective well-being as a marker for migration *and*integration success.

In my paper I will present a different way to measure well-being in the context of migration, by taking subjective migration success as a key variable. However,

contrary to the widely spread practice to operationalize migration success by a summarized evaluation of one's migration project, my paper underlines the necessity to take into account the initial reasons and objectives of the individual migration project, and their fulfillment within it. It seems to be fruitful to conceptualize migration success in the intersection of (objective) status and (subjective) evaluation both of the migration project in general, and the multiple aspects of goal attainment in particular. Based on quantitative surveys among immigrants from former Yugoslavia and Turkey carried out in Vienna, Austria, the paper confirms the capacity of migrants to produce well-being under conditions of poverty and marginalization; furthermore, data analyses emphasize the particular relevance of specific goals such as future related investments an achieved autonomous life-course as key variables of success.

These empirical insights strengthen the argument that policies should basically be oriented in increasing migrants' capacity for individual and group-related self-realization.

Change and Continuity in the Perceptions of Brazilian Elites about Poverty and Inequality

How do elites in very unequal societies perceive the causes, consequences, and possible initiatives to reduce poverty and inequality? Under what circumstances they might be willing or compelled to back social policies to reduce poverty and inequality? These are the questions that drive the project "Perceptions of Elites about poverty and inequality in the Global South", where elites are defined as those who occupy top positions in bureaucratic, political and business institutions, and who potentially have power to influence or make decisions.   In this paper I first discuss the theoretical arguments informing the research design, and next compare survey results on perceptions of poverty and inequality among Brazilian bureaucratic, parliamentary and business elites in 1993 and 2013. The analysis points to significant changes in how they perceive inequality, suggesting that if in 1993 elites tended to see the trickle down effects of economic growth as the best solution to reduce poverty, now a significant percentage of them see opportunities for growth in the expansion of the consumption market promoted by distributive social policies. Yet, the data also indicate significant continuities such as, for example, in the elites evaluation of particular social policies, or in their normative conceptions about the role State.

Relational Strategies of Public Organizations to Stimulate the Diffusion of Knowledge in Innovation Systems

Studies of the innovation system Triple Helix have demonstrated how the interactions between industry, university, and public organizations spur the diffusion of knowledge. While we know much about the interactions between industry and university, our understanding of the role of public organizations is limited. This article focuses on how public organizations can stimulate the diffusion of knowledge. To do so, public organizations can use strategies that target the social structure of an innovation system that is modeled as social network and thus as web of inter-organizational relations. These relational strategies aim to intervene into the diffusion of the knowledge so that the aspired knowledge flow reflects both, the goal of research policies and the knowledge base of the innovation system. The relational strategies are detailed and illustrated focusing on industry-university interaction. Moreover, a flow chart for strategy selection is presented. Taking a sociological perspective of innovation systems and the interactions of the organizations it encompasses, this paper contributes to a better understanding of how public organizations can shape the knowledge base of an innovation system.

Extended Research Ethics in Qualitative Interviewing

By researching experiences and meanings within life-worlds qualitative interviewing constitutes close relationships between researchers and participants. Ethics guidelines and codes of practice suggest ways of protecting participants from harm resulting from the intensity of such relationships. The general safety of qualitative researchers is considered in some ethics guidelines; yet the confrontation of researchers with emotionally difficult situations and their processing is hardly problematised. Against this background the contribution first discusses key aspects of the kinship regarding theory and practice of qualitative interviewing on the one hand and techniques of counselling and therapy on the other. While counselling is usually embedded in structures of professional supervision, qualitative interviewing is not, although researchers are exposed to similar risks;

these risks are discussed in a second step. Finally, strategies of dealing with emotionally demanding research experiences are suggested in the frame of an extended understanding of research ethics. They are based on a pilot project involving external supervision throughout the process of a qualitative study interviewing young people.

Diversity in Society: The Disability Perspective

From the perspective of people with disabilities, inequalities can also emerge from spatial segregation, the lack of social contacts or limited economic resources. In order to reduce or even eliminate these disadvantages and increase general well-being, community-based participation as well as decentralisation efforts of exclusive residential homes are essential.

Therefore, the research project "Index for participation development and quality of life for persons with disabilities" (TeLe-Index, 2014-2016), which is anchored at the Technische Universität München in Munich and at a large residential complex and service provider for persons with disabilities in the outskirts of Munich, aims to develop community-based living environments. Two prerequisites are relevant in this process: (1) people with disabilities participate in the social life beyond the large residential and service provision centre and (2) the existing spatial approach needs to be redesigned. The final goal is to create an environment for every citizen regardless of disability, age or ethnic background that accommodates their daily activities and requirements since a diverse society is a society in which different individual needs and wishes emerge.

The UN-Convention on the Rights of Persons with Disabilities that was also ratified by Germany postulates the necessity of a user-centred design, especially when it comes to evaluating the individual needs and wishes of all citizens. Therefore, a multidimensional approach is needed. Based on these findings, the structure of the town-like centre will be remodelled to open up the community to all people as well as transform social space. This strategy should lead to equal opportunities and open the way for a much more diverse community.

Proximity, Art Openings and Potentiality

There are a lot of events in contemporary visual art. From the spectacle of the biennial opening, to the everyday gallery exhibition opening, events are everywhere. While the duration of events such as biennials, art fairs, gallery and museum exhibitions are variable - some lasting for months, others for days - what is shared by most art events is the apex of the opening.

To better understand these openings as what has been called field-configuring events (FCEs), we introduce the idea of proximity. The literature on FCEs fails to offer a sufficiently nuanced conceptualization of what happens at the events, in particular in the characterization of "pooling diverse actors" or the event's constituent symbolic parts. We take the concept of proximity and the empirical site of the art opening as a means to enrich the analytical rigour of this debate.

Opening events summon art world participants to come together in specific locales at specific times. The periodicity of art openings provides the temporally and spatially bounded events in which proximities flourish and fade, whether the time and place is every second May in Venice, or every June in Basel, or Thursday nights in Chelsea.

Proximity with other social actors at these events entails the potentiality for encounter and intimacy. The potentiality of encounter and intimacy of proximity is a defining characteristic of art openings and helps us understand the everyday experience and significance of these events beyond function and artifice, beyond the marketplace and stage.

RENA, HELGE* (Department of Administration and Organization theory, University of Bergen, helge.rena@uib.no)

Organizing First Responders' Crisis Response: Facilitating or Limitating?

An obvious advantage of organizational routines is efficiency. Routines give instructions on how similar type of stimuli should be treated in terms of behavioural strategies and how the different actors (individual or group) in the organization should communicate and interact. But what about hands-off situations like a crisis, events characterised by low probability and high consequences? Then the stimulus is of a kind that *not* has been experienced repeatedly in the past, thus, a situation where organizational design and routines do not necessarily fit.

Theoretically this paper is interested in how organizational and individual features interplay in times of crises, more specifically: non-routine behaviour and coordination. In particular, we are interested in how they function on the local level in times of crisis, and ask: *How does organizational design and routines affect crisis coordination and crisis response of first responders at the local level, and why?*

Drawing on new-institutional theory, sense-making literature and recent theoretical developments on organizational routines we develop a theoretical framework for understanding and explaining organizational behaviour in crisis situations. Subsequently we examine how the police, pre-hospital emergency care services and civilians responded once alerted about the shooting massacre at the island *Utøya* in Norway in 2011. There is a vast data material (logs, transcripts of line communication, GPS data, interviews) describing in detail what happened. The paper draws on this data, plus additional interviews and document studies. Preliminary findings show that the response of the professional first responders (police and pre-hospital emergency) were routine-following, but significant variation in how. Some responded reactively (blindly following the routine), others responded proactively (deviating from the routine). The civilian response, a spontaneous self-organised rescue operation, worked effectively. We conclude the findings suggest a need to adjust our understanding of how organizational design (central-local) and routines function in crisis situations.

Do Personalized Salutations in Text Messages Lead to Higher Response Rates? Results from an Experiment

The way we contact potential respondents plays a key role on survey participation. This is also true in Web surveys. Investigating the impact of different contact modes on response, a number of studies found that important response outcomes depend on the mode(s) eligible respondents were contacted. However, there is very little knowledge on the impact of other survey features, such as type of salutations, on survey response and data quality. For example, research by Heerwegh (2005) and Joinson and Reips (2005) found that personalization of e-mail salutations significantly increases response rate when surveying university students. This paper aims to further explore the role of different salutation types (personalized vs. neutral) on response and measurement error. Our hypothesis is that personalized salutations are positively associated with key indicators of response and data quality. We use experimental data from a national Web survey of Italian graduates in Social Work carried out in late 2013/early 2014. In our experiment, half of the sample was randomly assigned to the control group Neutral Salutations ("Dear graduate"), the other half to the treatment group Personalized Salutations ("Dear Name"). Using bivariate analysis and, when appropriate, multivariate modelling, in the paper we compare different indicators of response (i. e., response rates, response speed) and data quality (i. e., item non response, straighlining) for the two experimental groups. Preliminary analysis shows that personalized salutations are effective in improving response rates.

Audiovisual Activists from the Heart of the World: Interculturality and Knowledge Otherwise

Since the beginning of the 21th century, some collectives belonging to indigenous communities in the Sierra Nevada de Santa Marta (Colombia, South America) are working together and have been creating their own digital audiovisual productions. So far they have produced eleven audiovisual pieces, amid the conflicts, controversies and divisions surrounding Colombia's and the Sierra's geopolitics. These original productions place issues of representation, self-representation and knowledge generation and communication in the forefront. The production processes have demanded intercultural interactions among different indigenous peoples that live in the Sierra (Kogi, Arhuaco, Wiwa, and Kankuamo, to a lesser extent), as well as with external supporters, government officials and other stakeholders. These production efforts emerged as a political tactic (De Certeau) that sought to defend both the lives of these communities and the life of the "Heart of the World" as its original inhabitants call the Sierra Nevada de Santa Marta, currently under all kinds of threats. The main goal of this tactic is to create and expand intercultural networks with whom they call "younger siblings" (non-indigenous people), so that they help them to generate possibilities of resistance and re-existence (Escobar).

This paper seeks to explore the diverse communication practices (Martin-Barbero, Couldry) that have taken place in the production of these eleven audiovisual pieces and reflect on their intercultural (Fornet-Betancourt, Walsh) and decolonial (Mignolo, Mora) capability potential. For this we use a methodology described as an issue-centered impact analysis (Whiteman, 2009), reconstructing the various issue-networks emerging at different times of the processes of preproduction, production and circulation: audiovisual and knowledge tactics, alliances with mestizo documentary filmmakers, cultural change, educational processes and transnational intellectual practices (Mato).

Striving for an Alternative Path: Reimagining Politics and Law in the Never-Ending Greek Crisis. Could the Law Constitute an Empowerment Factor for the Political Transformation from below?

Since 2010, when Greek economic crisis burst out, successive bailout agreements were signed imposing harsh austerity measures. The dictated reforms, a mixture of deregulation, privatizations, devaluation of labour, deep spending cuts and tax increases, resulted in social hardships sharpening inequalities and increasing polarization. Furthermore, the crisis exposed the limits and weaknesses of the traditional political establishment to find a viable solution in favor of the social majority's interests.

The de-legitimation of the formal political system led to popular uprising and the re-invention of politics from below. It occurred in two phases. In the first (2010-2012), the political will of resistance took many forms of collective action ranging from civil disobedience mobilizations to mutual-aid cooperatives and social clinics. In the second period (2012-2015), SYRIZA, a small anti-austerity party of the left based upon a party-movement model that incorporated various grassroots demands, gained growing public support and finally, on January 2015 had formed a coalition government.

In this presentation, we will try to explore the emergence of Greece's new politics from the ground which are trying to shape an alternative, moving beyond the neo-liberal consensus. More specifically, we will trace the different forms at various periods that took the transformation of politics from below and the vision, which prevailed, for a new society with more direct decision-making procedures and an economy based on solidarity. We will also try to analyze, from a socio-legal perspective, how the Law is engaged in promoting the counter-hegemonic politics of a future post-neoliberal society: What kind of legal strategies are followed? Could the Law play an emancipatory political role?

The proposed theoretical framework derives from Sociology of Emergences which "aims to identify and enlarge the signs of possible future experiences, under the guise of tendencies and latencies that are actively ignored by hegemonic rationality and knowledge" (Santos, 2004).

Linguistic Capital, School and Immigration: An Ethnography of Contradictions and Resistances.

This paper presents the results of an ongoing investigation into the language learning strategies developed by pupils of immigrant Muslim background and their identity reactions in different formal and non-formal learning environments such as schools and mosques, as two case studies in Catalonia, Spain. The role of their place of origin, their religion, their linguistic capital, their skills in connecting community knowledge and school knowledge, and the position in which the school puts them weave a complex identity which helps or hinders their school and social inclusion.

The findings from this comparative approach follows, updates and complicates previous works by Carrasco (2001), Mijares (2006), Martín-Rojo (2007), Gregory (2008), Kenner (2004, 2008), Corona (2012) and Gibson, Carrasco et al. (2013). I will analyse the hierarchical position of the different linguistic and cultural capitals and the assimilation pressure at school as well as its consequences in secondary identity constructions in line with Ogbu's framework (1991, 1992), and similar developments described in the North American context (Valdés 2001, Delpit & Kilgour, 2002). In addition, I will show different linguistic choices made by the students that, in line with what Woolard (2008) proposed, challenge the dominant linguistic ideologies in the school institutions and what is really promoted by the school with respect to multiple or exclusive identities. Nevertheless, I will analyse the resistance attitudes (Willis, 1988) as well as the different kinds of capital that can be activated in the students with immigrant background from the perspective of the critical race theory and its transforming possibilities through the awareness of the hierarchical positions of their own cultures and languages (Yosso, 2005).

Family Habitus and Transnational Families: Mapping Gender and Generational Borders and Relations through the Lens of Migrant Youths

Transnational families give substance to what Castells (2000) daubed 'the network society', and whilst it is importance to recognize the jurisdictional context of the nation-state as a given of the transnational families experience, in our paper we argue that cultural worlds that transnational families occupy are equally relevant. Drawing on our empirical study of migrant youths' transnational family experiences in the UK, we discuss how processes of globalization, structural processes of inclusion/exclusion operate to facilitate and constrain these young adults experiences of family life across national, gender and generational borders. Our specific focus on adolescent and young adults from migrant reflects the fact that there is still limited research attention being paid to the transnational family lives of migrant youths. Comparing the experiences of highly-skilled and mobile migrant youths, alongside low-skilled and less mobile migrant youths we explore for these differing groups family relations within a transnational social field. Influenced by Bourdieu's notion of 'habitus' (1986) we also examine to what extent the transnational family practices of these migrant youths are 'family habitus': a structured set of values, ways of thinking and 'being' within the family that is built up over time through family socialization of culture and traditions (see Reynolds and Zontini 2013; Reynolds and Zontini 2014). In doing so, particular attention is given to the ways in which gender, generation and the social networks and resources (economic, social and cultural) families have access to, inform 'family habitus'.

Comparative Analysis of Causal Mechanisms, Prevention and Regulation of the Ethno-Social Conflicts in Academe: Cases of Russia and Ukraine

The basic research questions of the study that authors will present at the third ISA Forum are:
1)   What are the causal social mechanisms that determine a possibility of the ethnic/racial tensions and conflicts in the academe?
2)   Is it possible to prevent, to control and to normalize such conflicts? What are the routines and technieques of the prevention and control?

Specific research question include, but are not limited to: how can researchers deal with their own emotions within the analysis of ethnic, national, racial problematics? How can one delineate an emotional culture empirically? Is it true that emotions in the processes of protests are "painted into the colours of national flags"? In looking at these research questions more closely the authors will use causal comparative models and experimental designs and counterfactual analytical techniques.

In terms of methodology the study is oriented toward three basic approaches: the first is Comparative perspective centering two strategies – qualitative and quantitative and using mixed methods research; the second is Computational social sciences converging most recent tactics of using computers' and software's potentials as well as computational methods for studying social processes; the third is focusing on the approaches progressed in Visual Sociology.

There is still a need of methodological reflection for empirical research of ethnic conflicts and emotional involvement into protest activities. The authors welcome the approaches of studying discontent, social interactions and emotions empirically on the basis of exploration into everyday life practices of designated groups in academic milieu: professors, students, administrative, staff, and research supporting staff.

Comparative Capitalism: 25 Years of the New Societies' Evolvement in Post-Soviet Eurasia

The contemporary world calls for a research program of comparative capitalisms. The paper to be delivered at the Third ISA Forum is an attempt to offer analytical tools to the study of inter-linkages between issues of institutional settings

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of market making and problems of a capitalist society development in the fSU countries during 25 years after the collapse of the USSR.

The paper goes beyond a purely economic analysis of market and even beyond political economy or economic sociology inquiry into reality of market institutions in the post-Soviet countries. It is oriented toward developing broad socio-historical and socio-economic theoretical construction that treats capitalism as a "total society", a distinct form of society in which there are interrelations and interactions between the economic, political and other social institutions, and the cultural sphere. The aim is to explore into main elements in a real analysis of the nature of present-day capitalism in the fSU countries through detailed field research of everyday life social practices. It will be the study of the evolving patterns of human relationships that are concerned with the institutional framework and cultural settings. The focus will be on the nature and function of habits, routines and institutions.

The paper addresses several distinctive though interrelated problems. First, it is concerned with identifying the mechanisms by which institutional settings of capitalist society are coordinated. Second, it develops the argument that market institutions and other coordinating mechanisms of capitalist evolution are shaped by socio-political structures. The third is that the institutions are imbedded in a culture. Cultural settings of a society shape institutional configuration, technically and materially constrained them, politically defend or offend them.

The study confines great deal of attention to mapping the comparative logic and methodology of field research.

RC16-209.2

RHEIN, PHILIPP* (Ludwig-Maximilians-Universitat Munchen, philipp.rhein@soziologie.uni-muenchen.de)

Global Fields and the Global Social Structure

Despite the insight in the multi-layered dynamics of the global interlacing of social relations and the emergence of a global social structure, social inequality continue to be perceived in national categories. Consequently what happens to appear as "globalisation" is still considerably shaped by and experienced within a national framework. Although sociology is already reflecting upon the transnational dimensions of classes, social inequality, and social positioning, inequality still finds its major expression in national social structures. However, such a perception of the nation state as a "container" of society became questionable. We argue that this major premise of an analysis of social inequality, known as methodological nationalism, must be theoretically and empirically overcome if sociology wants to achieve a deeper understanding of the transnational conditions of the production of inequality. Consequently, an analysis of global inequality faces formidable challenges in respect of a conceptual openness for processes of globalisation and, likewise, their transformation within a nation state. We argue that Pierre Bourdieu's Field Theory is able to provide major insight in the complex dynamics of the global social structure. By considering that social fields are transverse and reach beyond national borders, globalisation can be viewed as conflictory processes that take place in different fields, in which the agents compete for scarce resources and social goods. At the same time the field theory also accounts for the fact that the resources accumulated in a specific global field can only be translated into a social position within a national social environment with its specific organizational structure. Not only allows Bourdieu's perspective to consider the practical formation of social structures, it also helps to display the transnational circumstances that produce social inequality and thus makes an important contribution to a comparative analysis of social structures beyond a methodological nationalism.

Law, Pragmatism and Legal Autonomy: The Problems of HIV/AIDS Public Policies in Brazil

This research aims at pondering about law autonomy regarding pragmatist concepts that ground public policies on HIV/AIDS in Brazil. In order to reach such a result, the research makes use of official data from UNAIDS to show the grounds of public policies on HIV/AIDS in Brazil, analyzing the event of violation to human rights within the period of post-adhesion to the treatment offered by the Brazilian Unified Health System (SUS). According to Law 9.313/96, the State offers free of charge, through SUS, Combined Antiretroviral Therapy (TARV), however, distribution of antiretroviral medications, necessary for the treatment of the disease, does not exhaust the cares with virus carrier patients. The side effects of the treatment demand from SUS structure with outpatient facilities and qualified healthcare professionals for seropositive patients to be able to properly adhere to the treatment, in addition to follow-up to avoid withdraw and further resume of treatment with virus resistance. The work provides with a reflection on the impor-

tance of law autonomy regarding pragmatist social demands. The great problem of law autonomy is that currently there is a trend to the instrumentalization of law to the economic-social satisfaction. Values are replaced for the ends. In this conception the pragmatist legal decision seeks the accomplishment of strategic goals and not the achievement of rights. The law is a mean to the result of the State's economic and political strategies, disregarding material values and formal rules. The investigation concludes for the need of law autonomy between affirmation of fundamental social rights assurance and public policies on HIV/AIDS in Brazil.

The History of Education in Brazilian Constitutionalism: From Colonail Brazil to 1964 Brazilian Military Coup

This research aims to describe the Right to Education on legal and political history, from the Colonial Period until the end of the Brazilian 1964 Military Dictatorship. The central issue is to demonstrate that the history of education in Brazil is marked by periods of great achievements and advancements in the sense of citizenship, full development and professionalism of the person, but also for periods of social setbacks with loss of collateral and weakening of educational institutions. To be achieved this result, we intend to identify the meaning of the Right to Education in politicians speeches, from the Colonial Period, describe the transformations that have occurred in the Republic, the progresses and setbacks of the Era Vargas, the Estado Novo and finally the setback of education in Military Period. These observations will be conducted through an analytical methodology, using as a guiding principle in the history of the relationship between the political-educational speeches embodied in the laws on education and the social context of each historical period. As a result, the research highlights the need to be careful with legal institutions on the ever presence of social setbacks threat, especially in political cultures of modernity, as is the case of Brazil. The legal history of education in Brazil demonstrates that prediction of rights alone is no guarantee of citizenship, full development and professionalisation of the person . The social setbacks can happen for various reasons, justifying themselves by Exception States that, as before, and even today in economic crises always new reasons not to implement the policies defined by the law.

RIBIC, BILJANA* (Belgrade University, biljana_ribic@yahoo.com)

Religion and Human Rights in Present-Day Serbia

Role of religion and church became more significant in the world, especially in transitional societies, such as post communist ones. Long-term crisis, breakdown of value system, resistance to transition and reforms, as well as wars and massive war crimes opened space for action of the forces that are resistant to changes. This subject could be observed from two sides: first, such as matters of right for free expression and practice of religion as one of the basic human rights, and second, as a relation between church and human rights.

In Serbia, human rights are in the process of gaining new meaning in society. This transformation is a long and slow-moving process and expressions of intolerance in the form of violent attacks against minority religious communities are still quite often. An encouraging development is that representatives of various religious communities have been conducting a dialogue in recent years, striving to achieve reconciliation and a higher level of cooperation. This includes conferences and religious services organized and conducted by representatives of different religious groups.

When looking at developments in the area of church-state affairs in recent years we can notice that several positive steps have been taken. These include the bringing of new legislation and attempts at harmonizing national law with

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

international standards, the increase of legal guarantee of general human rights protection and a stronger and wider inter-religious dialogue. Negative phenomenon includes a low level of religious tolerance in society, the postponement of resolving outstanding legal questions, the preferential treatment of the Serbian Orthodox Church by the state, very often at the expense of the other religious communities and the general discrepancies between the written letter of the law and its implementation in everyday life.

Youth Music Bands and Transitional Values in a Trilingual Region

The interconnection between music, identity and relationships is a major issue that sinthesizes many aspects of cultural belonging. According to Firth: "The issue is not how a particular piece of music reflects people, but how it produces them, how it creates and constructs an experience – a musical experience – that we can only make sense of by taking on both a subjective and a collective identity" (Firth, 1996). This paper presents the prosecution of a field research on music in South Tyrol previously carried out on choirs and local traditional music bands; this presentation regards how music bands of young generations handle multicultural issues, bilingualism debate and the theme of historical ethnic separation in their land. How music can "produce" values through experience? "(...)this definitely involves the often neglected social dimension of musical experience, namely the ways in which having a musical experience inevitably involves one in relationships with others"(Martin 2006), and can overcome social, cultural, even linguistic barriers. In listening to, or performing, music we must, as Schütz (1964) argued, "tune in" our subjectivity to that of others as we follow the succession of sounds in "real time", thereby constituting the intersubjective "we" which is the foundation of all social experience (Martin 2006).The present field work interact with music as a specific social action carried out by groups. 21 Interviews to 21 different music bands have been carried out to inquire the relation between the choice of a type of music and the outcome of new values, a specific relation to music, a specific relation to and choices of language. Music is inevitably implicated in wider configurations of social actions, thus analizing music action in these configurations can present a variety of "young" approaches to music "sounding" as new responses to political, social and cultural conflictual contexts.

RICHARDS, WAYNE* (University of Worcester, w.richards@worc.ac.uk)

Complex Lives - Intentionality, Hope and Change

This paper is written against a background of austerity policies in Britain which have significantly diminished the funding available to youth and community work and increased the pressure for workers to justify practice in economic terms and to adopt the language of evidenced based practice. This presents an epistemological challenge which draw practitioners onto the ground of linear causality whilst attempting to evidence that youth work strategies can contribute to change.

I am fortunate in being able to occasionally meet up with young people I have worked up to 40 years ago. In doing so, I am constantly surprised how memories are of the work we have done together remain so intact for them and I am gratified by the value they place upon it. However, I would be cautious about attempting to make a causal link to change that I could claim as a result of my work given the complex web of social relationship young people are immersed in. Whilst a claim to effecting change may be appropriate for simple goal directed work with predicable outcomes it does not in reality connect with the complex lives of young people and the turbulent cultures of change in which they are situated.   Instead, it could lead to an inflated sense of control in the face of uncertainly.

In this paper I wish to problematize the evidenced based argument in order to envision a different future which embraces the dual ontological structure of youth work and community work which at once both delivers planned interventions to impact positively on youth transitions and also sustains a person centred approach which starts where they are in order to liberate and transform. Such a paradigm perhaps operates as a pedagogy of hope and is likely to be truer to the authentic core of youthwork

Positive Social and Socio-Economic Transitions Associated with Antiretroviral Therapy Exposure and Adherence Among HIV-Positive People Who Use Illicit Drugs in Vancouver, Canada

The clinical benefits of antiretroviral therapy (ART) for people living with HIV/AIDS (PLWH) are now unequivocal. However, the ability of some key affected populations of PLWH, such as people who use illicit drugs (PWUD), to enjoy these benefits, is inhibited by structural disadvantages that accompany stigmatization. These disadvantages include social and socio-economic marginalization that can inhibit optimal engagement and retention in HIV care. Conversely, the potential role of ART in mitigating stigma-driven structural disadvantage has not been sufficiently explored. These analyses therefore examined potential associations between ART exposure and optimal adherence and improved social and socio-economic outcomes. We supplemented longitudinal data from a prospective cohort of community-recruited HIV-positive PWUD in Vancouver, Canada, a setting of universal no-cost access to HIV care and medications, with comprehensive HIV clinical monitoring and ART dispensation records. We developed generalized linear mixed effects models examining whether (1) exposure to ART or (2) becoming adherent to ART was associated with positive social and socio-economic transitions, including relationship initiation, transitioning out of homelessness, entering employment and ceasing involvement in illegal or prohibited income generation activity. Between December 2005 and November 2013, 755 participants were eligible for analyses of ART exposure and 724 participants were eligible for analyses of ART adherence. In final models, becoming exposed to ART was positively associated with transitioning out of homelessness and initiating a romantic relationship. Similarly, becoming adherent to ART was positively associated with ceasing prohibited or illegal income generation and transitioning out of homelessness, and marginally associated with initiating a romantic relationship. These findings point to the potentially important role of engagement and retention in HIV care for non-clinical domains in which improvements may mitigate the effects of stigmatization among PLWH who use illicit drugs. These findings reinforcing the importance of promoting access and adherence to ART for all PLWH.

RICHARDSON, LINDSEY* (Department of Sociology, University of British Columbia, lindsey.richardson@ubc.ca)

Welfare and Health Care Systems at Cross-Purposes: Interactions Between Institutional Capacity and Institutional Design As Impediments to Reducing Social Inequalities in Health

Recent scholarship on the relationship between welfare states and population health has identified mechanisms of redistribution, compression, mediation and imbrication (i.e., overlap) that modify the impacts of the social determinants of health (Beckfield et al. 2015). Similarly, health care systems may reduce social inequalities in health, contingent on their relative capacity to provide quality, accessible and public health-promoting services across axes of inequality. The effective reduction of social inequalities in health relies on these systems' combined and complementary ability to mitigate social and structural health disadvantage, particularly for individuals who are highly marginalized in complex ways. This paper theorizes that persistent social inequalities in health are linked to the interaction between the institutional capacity and institutional design of both welfare and health systems. The character of this interaction influences whether and how these systems reduce or exacerbate health inequalities. Through a case study examining the relationship between social assistance provision and drug-related harm in British Columbia, Canada, this paper highlights how deficiencies in the design and capacity of income assistance provisions can produce and reinforce institutional tension between welfare and health systems, with significant consequences for health inequality. The case draws on a growing body of evidence that links the monthly, synchronized disbursement of income assistance payments and insufficient income support levels to monthly spikes in drug use, subsequent and sometimes unmanageable escalations in drug-related health service utilization and elevated morbidity and mortality. By creating significant negative impacts on health service provision and health outcomes, deficiencies in the capacity and design of social assistance arrangements entrench health disadvantage for people who use drugs. The article concludes with a proposal to evaluate whether changing the design of income assistance provision away from monthly synchronized disbursement could mitigate tension between the welfare and health systems that exacerbate health inequalities in this context.

The Social Construction of Mental Disorders: Three Inevitable Consequences

The concept of mental disorder has been a hotly contested issue for many decades. Arguments have often revolved around whether there is a biological basis for mental disorder. Biological psychiatrists have argued that mental disorders are best understood as a physical disease. By contrast, anti-psychiatrists and psychiatric survivors have argued that there is no evidence for mental disorder and that psychiatry is used to control social deviance. We argue that this duality is unhelpful and re-examine social constructionist arguments to provide a fine-grained critique. Drawing on the epistemological and sociological literature we argue that social constructionism is necessary to understanding mental disorder and that there are three consequences of adopting this position. First, although we can assume that there is a world external to human beings, our view on 'natural kinds' (brain processes and their consequences) are deeply influenced by social and cultural perspectives. This makes it impossible to gain access to such issues without socially constructed concepts. Second, in the face of deep cultural fragmentation in western societies, psychiatry inevitably has to face divided public opinion on mental health issues. Individuals adopt a wide range of positions which range from lobbying for to opposition to mental health services. However, in all cases individuals use social constructions to orientate themselves to social problems. Third, as long as psychiatry is part of the medical field, it inevitably has to use and to apply socially constructed medical diagnoses. We conclude that the social construction of mental disorders is no argument for their non-existence. The social construction of mental disorders, however, is a major cause of the widespread medicalization of human problems.

Ultimate Risk and Final Paternalism: The Medicalization of Suicidal Acts and Wishes of People with Mental Disorders

Current mental health care is more and more empowering consumers and encouraging them to take 'positive risks' in order to make experiences on what works for the person and what not. Recovery and similar concepts aim at de-medicalizing important aspects of the life of people with mental disorders. At the same time there is a renewed discussion on suicidal acts and wishes by consumers, especially in terms of assisted suicide. Suicide assistance for people with mental disorders is usually prohibited by law in nearly all western countries. The ethical argument against suicide assistance refers mainly to the supposed mental incapacity of people with mental disorders when it comes to death wishes. In mental health care, suicidal thoughts, wishes and acts are regarded as part of the most serious risks that the care system has to deal with. Common sense knowledge on suicides in general indicates that up to 90 percent of suicides are caused by mental disorders. This paper argues that the handling of the suicide issue related to people with mental disorders is to a large degree paternalistic by medicalizing the ultimate risk. The paper makes a case for a rational concept of dealing with death wishes which does not any longer separate people with mental disorders from those without. By doing so, the paper will review the empirical evidence of the main assumptions, namely the causes of suicide and mental incapacity of consumers, and will also review the main arguments for and against assisted suicide for people with mental disorders.

Examining the Effectiveness of Book Distribution Programming on English As a Second Language Children: The Imagination Library Program and Implications for Refugee Resettlement

In this paper we examine the use of the Imagination Library book distribution program to assist children in their preparation for the English and book-centered U.S.A. educational system. This research is set in Syracuse, New York, USA, a federal refugee resettlement community that accepts an average of 450 to more than 800 refugees annually from some 38 countries. An additional 250 secondary refugees, those who first settled elsewhere, come to Syracuse each year. The Imagination library program mails one book per month to each child's home from birth to age 5 in an effort to provide needed literacy materials and catalyze excitement about engaging with printed text. Specifically, we examined the effects on speakers of languages other than English (which is the primary language of instruction in Syracuse schools).In this current research we find that consistent

exposure to the program (i.e. 3 to 4 years of the 5 year program) is associated with a significantly higher proportion of ESL children being screened as ready for kindergarten. Given our previous research suggesting high levels of book-centered parent and child interactions among refugee families enrolled in the program, we feel that the findings of this study could have significant implications for refugee resettlement communities internationally. This is particularly true given that the programming is fairly inexpensive and therefore can serve as the backbone for more intensive efforts.

Social Change and Growing Inequality in Educational Systems? a Multi-Level Analysis of Schools' Social and Ethnic Segregation with PISA Data from 2000 to 2012

During the last 30 years, social scientists observed an expansion of education and a decline in class based inequality in educational attainment in many Western societies. Nevertheless, the educational system still (re)produces inequality via processes of selecting students from upper class families to educational institutions with higher credentials. As a transmission engine, schools are especially relevant in reproducing these inequalities.

Social scientists have repeatedly confirmed effects of school characteristics on scholastic outcomes. Studies indicate that students' educational achievements tend to improve when they attend schools with higher proportions of students of a high socio-economic status and lower proportions of immigrant students. But while consequences of the socio-economic and ethnic composition of the student body are a major research topic, we know much less about the antecedents of the socio-economic and ethnic composition of schools. The current research aims at adding to the spare empirical evidence on this topic.

Our contribution is based on all PISA waves from 2000 to 2012 (24 Western countries). First results show that socio-economic segregation is comparatively high in Southern and Eastern Europe while it is rather low in Scandinavian countries. Ethnic segregation is also low in most Scandinavian countries while it is comparatively high in Central European countries with traditional labor migration, but also in the USA. Additional multilevel analyses show that a higher degree of stratification of educational systems raises socio-economic segregation in schools. Moreover, our analyses suggest that higher income inequality at national level leads to socio-economic segregation in schools. Schools' ethnic segregation is the higher, the higher the share of foreign-born people in the country's total population but seems to be the lower, the higher the average socio-economic status of immigrants. Several school characteristics also proved to be relevant for schools' socio-economic and ethnic segregation as well.

SEEWANN, LENA (Department of Sociology, University of Vienna)

The Decline of the Migrant Middle-Class in the City: A Comparison of Vienna Five Years before and after the Crisis Year 2008

There is an ongoing debate in social sciences on the shrinking of middle class since the 1980s, especially in the US. Meanwhile, this debate is quite visible in the public and political discourse of many European countries.

This is the background for the present contribution which discusses determinants of the shrinking of the middle class in the city, using Vienna's development between 2003 and 2013 as an exemplary case. Vienna is a dynamic city that grows older and younger at the same time as it becomes an increasingly international metropolis highly influenced by migration. In contrast to other parts of Austria, the middle class in Vienna has shrunk considerably during the last decade. However, this decline varies between subgroups of the population, for *immigrants were especially affected while the decline was minimal with natives*. But why? The present research aims to contribute to a possible answer to exactly this question.

Methodologically, we use quantitative data from a large survey conducted in Vienna five years before and after the crisis year 2008 (8,400 respondents in each wave). Trend analysis, for instance, shows that particularly those born in regions of the former Yugoslavia slipped out of middle class. Surprisingly, second generation immigrants, who are more frequently part of the middle class than their parents, dropped out to the same degree as first generation immigrants did. Moreover, multivariate analyses suggest that the deterioration in average class position of the migrant population cannot be explained by immigrants' educational or professional background characteristics since the average qualification of immigrants was higher in 2013 than in 2003. Overall, determinants of social position seem to be the same for natives as well as immigrants. At least in part, how-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ever, the large differences in status positions between natives and immigrants in 2013 are due to language deficits.

Aesthetic Cosmopolitanism and Media Consumption: Hybrid Possibilities within Young Peoplexs Everyday Lives in São Paulo, Brasil

The increased circulation of cultural goods, to the point that they are disseminated worldwide, develops a sense that a global common knowledge exists. In order to understand this context, we consider global culture as an engine of cosmopolitan ways of being, and our perspective focuses on the interaction of global culture and cultural consumption. Our research goal is to discuss the meanings of cultural globalization in young people´s everyday lives, based both on its mechanical effects and on hybridization, through aesthetic cosmopolitanism. Given this context, our discussion for this proposal focuses on media consumption by young people from São Paulo (Brazil), once media has gained a central place in the contemporary cultural consumption. Contexts are spreading because of the indiscriminate increase of technological platforms (TV, tablet, mobile phone, computer) and of the diversity of patterns of media consumption, meaning that new arrangements for the everyday experiences of young people are created and developed. The analysis will bring qualitative and quantitative data from interviews with graduate students (N=40) and from a survey with young people from São Paulo (N=500), all aged between 18 and 24. This data set is part of an international research project, awarded by the French Ministry of Culture and Communication and the SESC-CPF (Center of Research and Formation from Brazil). The research results show us hybrid possibilities within these individuals´ lives. They are hybrid because: 1) their consumption follows the logic of the global market, mainly in digital media, still it is not standardized, once there are possibilities of incorporating comments and content with local meanings; 2) there are different ways of local participation of these young individuals, some are engaged to actions that contribute to a reflexive stance, and others search for entertainment (mainly global) and don't connect to collective or local issues.

Cosmopolitanism and Migration in São Paulo: Reintroducing a Measure of Legitimacy of Being Cosmopolitan

Considering the importance of human mobility in the contemporary context, there are different perceptions and results regarding the time duration of this process, whether it is temporary or permanent, and mainly concerning economic, political and social aspects in the planning and execution of the process of mobility. Those who move permanently, migrants, in their majority, do it as a result of economic, political, or environmental pressures. Yet, there is also a group of people that choose to migrate and live in a different country, studying or working, after planning and structuring for this shift. Our concern in this research is to analyze the definition of cosmopolitanism, and to understand how migrants, forced or planned, have somehow to be cosmopolitan. This process has a significant distinction between global elites, highly educated expatriates, and forced migrants, once some choose to be cosmopolitan, and others are forced to live accordingly to a cosmopolitan stance. In this direction, our first step is to reintroduce a measure of legitimacy of cosmopolitanism with an approach that seeks to find traces of the great abstract principles of cosmopolitanism in the little things of everyday life (Skrbis and Woodward 2013), in the experience of social actors. The cosmopolitanism of migrants, who use several languages and sometimes mix them in their communicative practices, but also in their practices of consumption, would not be considered inferior to that of the cosmopolitan elites. Our aim is to develop a discussion on the emergence of cosmopolitan consciousness, practices, as well as imagination, comparing different groups of migrants in São Paulo, Brazil. This study is conducted through the analysis of interviews with individuals from different parts of the world, and of different social economic backgrounds, living permanently in this city.

Constrained Choice, Race, Gender and Health: The Divergent Pathways of Twins

This paper applies the multi-level Constrained Choice (CC) explanation to a real time narrative of twins, Andrea and Andre born in 1982 in Boston, Massachusetts and who experienced vastly different lives and health outcomes. Andrea, a 33 year old lawyer and woman of color, was a first time candidate for Boston City

Council in 2015. Her twin brother, Andre died in 2012 at the age of 29 while in state custody awaiting trial on home invasion and other charges. This paper examines the process and underlying mechanisms of how gender and race and institutional levels of decision-making shaped the divergent pathways. Theirs was not an easy life from the beginning as they lost both parents at a young age and spent time in the foster care system. Even in elementary school, they were split up as Andre got labeled a behavioral problem, while Andrea flourished. The CC framework explicates how and why their paths diverged —she moved through Boston Latin School, Princeton, and UCLA Law School, and he went to alternative schools and the criminal justice system. This true case example demonstrates how the various institutions (school systems, foster care, and policies) with whom they came into contact shaped their life courses. In a context of necessity these twins constructed 'choices' out of their priorities, values and options over time. None of these 'choices' take place in a vacuum. Rather they were formulated and shaped by the context in which they were made and whatever biological processes may have impinged on them. Further, this case example illustrates why this is a dynamic process and how making health a priority proved to be more difficult for Andre than for Andrea. This example highlights the broad applicability of a Constrained Choice explanation to both individual and population health disparities.

RINALLO, JENNY* (LEST-CNRS, jenny.rinallo@unimi.it)

Is Time to Leave the Nest? Describing and Explaining Time in the Transition from Youth to Adulthood

Background: Time and future perspectives are at the core of biographical studies on youth transition to adulthood. Lifetime, interpreted in terms of age, assumes a twofold interpretation. Years of age are an objective concept but the definition of age groups to study youth is a social construction. Object: We focus on timing of leaving parental home in Italy and France. The transition of leaving parental home is a complex process calling for both a quantitative description and a qualitative explanation. The subjective dimension is intrinsically associated with lifetime perception and definition of future choices. Method: The research problem calls for an explanatory mixed-method design. The quantitative analyse is carried out employing EU SILC cross-sectional analyses (2005 and 2011 panel) to identify which predictors affect the time of leaving home according to levels of education, social origin and gender. Subsequently, semi-structured interviews of Italian and French people aged 20-35 will help identify mechanisms and individual strategies in leaving the parental home. Results: Main results show how French young people feels to be late in achieving residential autonomy compared to previous generation. Social and familial norms are pushing factors to move out earlier, despite precarious job conditions and readiness. Italian young people use longer time at parent's home as strategic choice, especially for highly educated young men. In both countries, young people around thirty perceive to be "out of time" as if a mismatch occurs at a global level between what young-adult people are and what they should achieve. Conclusion: The comparative mixed-method analysis puts light both on cross-national difference in achieving residential autonomy and on how young people perceive the mark of adulthood as age based structure. Emergence of a young-adult category as an intermediate category will have a reflection in both the statistic-demographic domain and the socio-psychological one.

RC34-390.5

RINALLO, JENNY* (LEST-CNRS, jenny.rinallo@unimi.it)

Multidimensional Precarity: A Challenge for Young People.

Background: The economic downturn combined with the ongoing process of target segmentation of the work force have made increasingly difficult the access and the integration of young people in the labour market. A general worsening of job quality and under-qualification practises for new entrants are amongst the most marked features. Italian and French comparison shows how conjectural and structural factors force them to face precariousness with strategies based on personalised trajectories. Objective: The study aims at showing how precariousness affect youth careers and which dynamics they activate to achieve professional and personal expectations. We plan to explain how job precarity and life uncertainty concern subjective dimension, which depends on both socio-demographic characteristics and temporal-geographical perspective. Method: We shall investigate youth employment conditions through standardized dimensions and subjective perceptions. Cross-sectional analysis based on European Union Statistics on Income and Living Conditions will provide quantitative analysis. The qualitative analysis based on semi-structured interviews of Italian and French people aged 20-35 having different levels of education, social origin and gender. Results: In Italy and France, both the level of education and familial background occurred to explain intergenerational inequalities in work trajectories. In both countries, women are more educated and look for fulfilling jobs. They are more likely to use training to keep developing their abilities and accept temporary jobs. Men suffer more the lack of job continuity and perceive spells in unemployment like a personal defeat. They are oriented to economic satisfaction around their thirties. Active policies are factors boosting job attachment although widespread disaffiliation feelings,

denotes a presenting author. Abstracts are organized by first presenting author's last name.

which are more evident among youth from lower social classes and living in the Southern regions of both countries. Conclusion: Because of job precariousness and life uncertainty young people develop individual mechanisms to achieve a compromise between creative dynamic work search and passive acceptation of job precariousness.

RINGEL, LEOPOLD* (University of Bonn, lringel@uni-bonn.de)
WERRON, TOBIAS* (University of Bonn, twerron@uni-bonn.de)

How Developed Are You? a Sociological View of the Production and Impact of International Rankings

Rankings seem to be everywhere: they are used to rank athletes, scientists, universities, artists, schools, hospitals, websites, blogs and many others. They are, however, particularly widely used to evaluate the "development" of countries, with the Human Development Index (HDI) probably being the best-known example. In contrast to normative stances, our paper tries to establish a genuinely sociological view on development rankings, asking: How exactly do international rankings participate in the construction and evaluation of "development"? Which social relationships do they create between governments and other actors? What determines their success and spread as a global governance tool?

To develop preliminary answers to these questions, we will (1) give a short overview of the rise and diversity of international rankings since the 1990s and (2) present preliminary results of an empirical research project that looks at the ways in which rankings contribute to the construction of competition between nation-states. Our guiding assumption is that rankings create "artificial zero-sum games" by introducing performance indicators and quantitative measures that suggest that any improvement in development by one country by implication leads to the descent of other countries; if widely publicized, they are thus able to produce competition for what we call "modernity prestige" (Werron, 2014). This view draws attention to the impact of IGO's, NGO's, social scientists, journalists, media enterprises and others observers – "rationalized others" (John W. Meyer) – who invent the performance indicators and collect the data necessary for the production of rankings but also engage in the public promotion of rankings as a tool for the "objective" measurement of development.

Acupuncture in Brazil - an Intangible Cultural Heritage of Humanity under pressure

Already in 2002, the World Health Organization (WHO) came up with the Traditional Medicine Strategy 2002-2005, encouraging its member countries to incorporate Complementary and Alternative Medicine (CAM) in the national health systems.

Acupuncture is one of these alternative practices and a key pillar of Traditional Chinese Medicine (TCM), spreading increasingly around the world. Summarized, acupuncture is based on the theory, that by physically stimulating channels, the human body's self-regulating functions can be reinforced and bring health to the patient.

Since 2010, Acupuncture and Moxibustion are included in the representative list of the Intangible Cultural Heritage of Humanity by the UNESCO. According to them "Acupuncture and moxibustion are taught through verbal instruction and demonstration, transmitted through master-disciple relations or through members of a clan (...)" (www.unesco.org).

This view as well on healing as on teaching processes clashes with the conventional occidental view based on allopathic medicine and provides governments with the challenge to implement both into one Public Health System (PHS).

It is interesting to study the Brazilian case of integrating CAM into PHS because the country is relatively experienced in offering CAM services via PHS (Sistema Único de Saúde - SUS) to a broader public, as the law to include CAM services into SUS came into force already in 2006.

Consequently the question in this paper is not about the "if" CAM should be integrated into PHS but about the "whom" could/should attend the patients.

This paper attempts to outline a practical example, by describing the path taken regarding the regulatory attempt of practicing acupuncture in Brazil and additionally spotlighting patient voices and experiences. In order to accomplish the task there was conducted a literature analysis and in-depth interviews with patients, who are treated by non-medical acupuncturists in São Paulo.

RISO, BRIGIDA* (CIES-University Institute of Lisbon, brigida.riso@gmail.com)

Before Pharma: Transforming Samples into Bio-Objects

Biobanks are well-organised repositories of human biological samples associated to personal data for biomedical research. The frenetic sample collection taking place worldwide reflects their importance in the health industry, since they are being used as a source for biomedical research, drug testing and development, and technological innovation.

Biobanks address not only "ill samples" but also the ones from healthy donors. From collection to storage, through sophisticated technology, the sample is transformed and is given an independent and autonomous identity, sharing with the donor the unique and individual genetic information. The sample is submitted to quality tests and criteria, forcing the elimination of impurities and dangers. Even the former clinical waste could be now stored with a noble purpose of developing medical research, as a promise of new pharmaceutical and therapeutic solutions, specifically designed for one's genetic uniqueness.

Nowadays, the medical gaze is being overcome by a molecular gaze, centred in genetic and cellular processes: looking into individual bodies as samples and information providers. Even if they allow the identification of the original body, they turn the reconstitution of the body and his identity impossible. Corporeal reality is challenged: it is possible to "exist" in different times and different places as the samples harvest could be performed before birth, and it is possible to preserve and use them for years after one's death.

The political and legal framework, enabling the storage and the samples usage, is required to forbid commercial uses of public samples. Biobanks links to health and pharmaceutical industry were one of the main reasons justifying samples withdrawal by donors.

Conducting ethnography in a Portuguese biobank allowed me to follow the social lives of these samples, from collection to storage, enlightening how these processes of bio-objectification are reshaping health, illness and body conceptualisations.

RC15-185.7

RISO, BRIGIDA* (CIES-University Institute of Lisbon, brigida.riso@gmail.com)

Good Citizens: Citizen's Participation in Biomedical Research Biobanks

Biobanks have been developing more intensively after the Human Genome Project. In some countries, national biobanks were established over a particular idea of nation. Massive citizen's recruitment took place, claiming citizenship duties to help the national biomedical research, thus contributing to (re)construct a biological idea of nationhood. As good citizens, individuals "should" give their samples for the benefit of the whole nation. Besides, individuals willing to give samples often referred helping others and participating in a better future for their children and for humanity as personal reasons to motivate the donation.

In other cases, recruiting and collecting samples for biomedical research purposes is subtler. For ages, many doctors have established their own collections through their medical practice. During medical appointments, patients were invited to give samples - which is still a current practice. In Portugal, according to the law, the storage of a sample could only be requested by medical doctors, which enforces medical power. Although the medical profession has a central position, I argue that the varying symbolic value of each sample shapes the doctor-donor relationship – the way medical authority is performed is different when the individual has interesting samples to provide.

Citizens worldwide are actively participating defining the path of research, integrating decision boards, or through digital technologies. However, as there is no formal way to directly participate in decision-making in Portugal, joining patients association could be regarded as an effort to influence research by the available means.

This research aims to discuss how health and illness are being conceptualised in a changing health context still marked by the powerful medical authority of recent past. An ethnographic study is being conducted in a Portuguese biobank, in order to enlighten how these relationships between health professionals and donors are creating and redefining new modes of citizen participation.

Evaluation of the Plan of General Practitioners Zone in Rural Areas. Study Based on the Perception of the Physicians Participating.

Rural areas have scarce medical resources. Initiatives to address this situation in Latin America exist, but have been rarely evaluated. The Chilean Rural Practitioner Programme, a policy of recruitment and retention of physicians in rural areas, has been stable over time. The aim of this study was to examine how physicians who participate in this police evaluate it and determinants of this evaluation. A mixed-method study was designed. Qualitative assessment was performed trough in-depth interviews and focus group. Different areas of interest were determined and a specific instrument was developed for quantitative assessment. This instrument consisted in a nationally representative online survey, stratified by sub-regional administrative levels. Questionnaires were obtained from 202 physicians (60.5 response rate). The overall experience was evaluated with a 5.75 (in a 1 to 7 scale). Participants gave a greater positive evaluation to climatic conditions and income. Infrastructure, human resources, and workload obtained lowest scores. Evaluation of social relationships at destination place was the only condition associated significantly to overall assessment of the experience. Overall, the experience was positively evaluated, even beyond specific evaluations of areas of interest determined previously. Despite its limitations, this study fills a gap in the existing literature in Chile and provides information at national level to improve retention policies of human resources for health in rural areas.

Inclusion of Digital Technologies in the School of Catalonia, Spain. Consequences of the Compulsive Implementation of the 1x1 Project: "Escuela 2.0"

Nowadays we are experiencing a growing phenomenon of overcrowding and inclusion of digital technologies in key areas of our lives. However, a reflective and democratic basis has not always been given to this process. Compulsive initiatives have also proliferated, demonstrating the existence of a deterministic trend regarding its use, imposing the debate about the need and real use of them.

This situation tends to increase in education area, where the inclusion of digital technologies in the classroom is generating profound institutional andpedagogical changes. An emblematic case of this is the "Escuela2.0" project, that was implemented by the Spanish Government in 2009 in order topromote the digitization of the classroom in the first secondary years and in some primary schools. This digitalization was executed providing infrastructureand equipment as well as training and advice to the teachers. However, given the rejection generated by its compulsive execution by part of the educational community and the deep economic crisis lived in Spain in 2012, the project was canceled. As consequence, hundreds of schools were left adrift with the obligation to manage the project by themselves.

The process and the results obtained during the execution of the doctoral research entitled "Between innovation and transience in the technological education policies: analysis of the impact of the "Escuela2.0" project in Catalonia" are described in this paper. The actions that have been promoted byschools and the administration once the project was closed are analyzed. In addition, emphasis is placed on the analysis of the consequences of carrying out a public policy of this type in a compulsively way. The research was carried out through a study case in the Salvador Espriu High School, located in Barcelona which is a reference center about the inclusion of digital technologies in the classroom.

Latinoamerican Music, Aesthetics and Politics in the Global Stage: The Case of 'el Sueño Existe' Festival in Wales

'El Sueño Existe' is a festival of Latin American music, politics and culture performed in Machynlleth, Wales, inspired by the life and music of Victor Jara (1932-1973), a Chilean artist and militant of the communist party, and one of the precursors of the movement Chilean New Song, who actively supported Salvador Allende's and Popular Unity's political project and was killed few days after the September 11, 1973 Chilean Military Coup. After his death, Victor Jara became a symbol of culture, human rights and political engagement around the world. In the context of commemorating the life of Victor, a group of people from Wales created an association that organise 'El Sueño Existe' (The dream lives on) festival since 2005 every two years. This festival includes the performance of Latin American music groups -most of them living in the UK-, workshops on Latin American music, talks about Latin American poetry, among other cultural activities; and there is a political section where representatives of social and political organization talk and discuss topics such as human rights; anti-mining and solidarity campaigns in Latin America, or Eco-socialism. This festival integrates music, art and politics in a global perspective, taking as main reference the aesthetics and politics of Latin American revolutionary music and art. Using the results from an ethnography of the last version of the festival (2015), interviews with organisers and performers who participated in the event and the use of secondary data, I will explain some effects of 'El Sueño Existe Festival' in the production of a sense

of political belonging and aesthetic among Latin Americans diasporic community and also non-Latin people living in the UK.

White Nationalist Discourse on Hip-Hop: A Sociolinguistic Analysis of "Otherness" Construction

With roots stemming from "underrepresented black teenagers living in the South Bronx in the late 1970s" (Flores, 2012: 1), within the performative genre of hip-hop discursive expressions of dissatisfaction and dissent are a common means of opposing political power, authority and governance. Despite embracing Black Nationalism during the 1990s (see Decker, 1993), various observers have since documented the hip-hop's ability to "translate across cultural, ethnic, racial, geographic and generational boundaries" (Abe, 2003: 264). This transcendence into mainstream popular culture has not been universally recognized and certain nationalist identities, based upon racial otherness, have remained in close association with hip-hop. Furthermore, the centrality of black youth within the contemporary hip-hop imagination of many (see Collins, 2006) has prompted expressions of dissatisfaction and dissent among collectives on the political "outside" of the genre. Within a framework of us-them intergroup dynamics, this presentation showcases a sociolinguistic analysis of online data collected from a White nationalist discussion forum. Concerned with detailing intersections of politics, racism, extremism and the construction of links between nation-state identity, otherness and the performative genre of hip-hop, more than 200 individual discussion posts were analyzed. These posts were written in response to three main topics including attitudes toward white nationalist hip-hop, the social conversion of hip-hop cultures among white youth and suggestions regarding how to replace black hip-hop culture with pro-white hip-hop. The most significant conflicts emerged in discussions concerning how to "combat" black hip-hop culture with many posters supporting the idea that "we don't need pro-white negro music, we need to educate the youth so they realize there's no value in this 'music'" (forum post). The implications of such extremist discourse and the race-based nation-state identities of otherness constructed through reactions to hip-hop are also explored.

Brazilian Popular Organizations and Associations in Housing Policy: From Social Movements to Social Policy Tools

This proposal is based on the results of a research on the Minha Casa Minha Vida Program - modality social organizations/ entities, started from the Ministry of Cities public call for study proposals on the policy.

The "My House My Life" Program has been presented as one of the major achievements of Lula and Dilma presidential administrations (3.4 million housing units have been contracted and 1.7 million have been delivered)- including the 3 ranges/tracks of income and all production modalities. The focus of this proposal is the "Entities"/ social organization modality of the Program, addressed to the poorest population level of urban dwellers - families earning up to R$1,600, or US$ 510- in monthly income. The production of this program modality is contracted not by construction companies, but by popular organizations and associations, which compose the universe of "entities" (social organizations) which are responsible for choosing families and for the whole production process - from researching the land to project development and approvals, including execution of the civil construction. This modality resulted an insignificant production of housing units, but a paradigmatic political dimension, supported by tradition of self-managing policies, involving the most representative housing movements in the country. Working with the difference between housing deficit and housing police demand of popular and social associations, this proposal search: 1. to highlight that, with a small amount of funding and subsidies obtained by negotiation with social movements, the Program came to win the support of the historical housing movements for its beginning and operation; 2. to analyse the contradictory and conflicting dimensions that combine social movements for housing and business character of the Program My Home My Life in Brazil.

Judicial Performance and Emotion

Conventional understandings of the judicial role emphasise impersonality and dispassion as central to neutrality, legal authority and legitimacy. Performance of judicial authority should evince emotionlessness. Emotion is viewed as inherently

irrational, disorderly, impulsive and personal and therefore inconsistent with the legitimate exercise of judicial authority. However, the courtroom is not only a legal setting; it is also a social situation – an interaction order – where information and emotions must be managed in face-to-face interactions. Judicial officers are sometimes are required to act in a more human and personal way, and to manage emotions, both theirs and others, especially in the courtroom. At the same time, there are new pressures for more transparent or formal evaluation of judicial performance in which the judiciary is scrutinised for its behaviour as well as for the legal substance of decisions. These developments create a practical tension for judicial officers in their everyday work and a conceptual tension in understanding judging. Judicial behaviour which effectively incorporates human personality and feeling may enhance public confidence in the courts and the judiciary. However, some human, emotionally-laden judicial behaviour could indicate that the judicial officer is not sufficiently detached and so raise questions about the impartiality and legitimacy of judicial authority. Using surveys, interviews and observations of the Australian judiciary, this paper addresses these tensions by examining the ways judicial officers experience and display emotion and assesses the implications for legitimate judicial performance and its evaluation.

ROBERT, JOCELYNE* (University of Liege, jocelyne.robert@ulg.ac.be)

The Methods of Management: an Answer to the Crisis?

La question de savoir si les méthodes de management sont susceptibles de représenter une réponse à la crise est complexe. Il faudrait préciser de quelle crise il s'agit, de quelles méthodes nous parlons. Il nous semble que différentes méthodes de management peuvent être considérées comme des réponses à différentes crises.

Si, dans un premier temps, les méthodes proposées sont susceptibles de rencontrer les attentes du personnel, elles conviennent en retour également aux employeurs sans que ne soit toujours évoqué leur impact sur la crise.

Une analyse transversale des mesures proposées nous amène à croire que ces méthodes se basent pour bon nombre d'entre elles sur la responsabilisation des individus et laissent à penser que chacun peut trouver son bonheur dans un monde idéal. Responsabilisation, responsabilité sociale, management participatif, mobilité internationale, carrière nomade, flexicurité, ranking, éthique, bonheur au travail sont autant de méthodes qui accorderaient aux individus le pouvoir d'être considéré, d'agir en lien avec les autres acteurs impliqués et de trouver ce qui convient le mieux à chacun dans le monde du travail.

Nous reprendrons ces méthodes, présenteront leurs liens cachés et peu avoués aux différentes crises que nous connaissons. Au-delà d'intérêts divergents, ces méthodes semblent, en période de crise, se présenter comme un refuge, comme la solution idéale. En fait, sans le dire explicitement, elles tentent de répondre aux difficultés actuelles, voire d'anticiper les situations à venir. Elles nous laissent entrevoir des situations où les engagements souhaités et attendus de chacun prendront une autre forme, où les rapports de force seront différents. Ces méthodes peuvent être associées à des pratiques multiples faites d'aller et retour. Elles présentent des enjeux différents et relèvent de logiques entrecroisées. La théorie de la structuration et la théorie des conventions nous aideront à mieux analyser cette problématique.

ROBERT, PETER* (Institute for Political Science, Centre for Social Sciences, HAS, Budapest, robert.peter@tk.mta.hu)

Institutional Trust and Political Involvement in Comparative Perspective. the Variation in the Impact of Precarious Employment

In line with the topic of the session, the paper investigates the influence of precarious employment on three political outcome variables. The first one is related to trust (a factor based on institutional trust items); the second and third ones are related to behavior, voting as well as frequency of unconventional political activity. The analysis focuses on the role of a set of explanatory variables representing precarious employment like type of contract (permanent vs. temporary); fulltime vs. part-time; employee vs. self-employed in affecting the three outcome variables. Various types of regression models (OLS, binary logistic) are fitted to the data in accordance with the measurement level of the dependent variables. The influence of precarious employment on political outcomes is controlled for other individual characteristics, representing 'cleavages' in political science studies, like class (blue collar – white collar), urban-rural difference, age, religiosity, financial situation.

The general assumption is that precarious employment, flexibility in the labor market damages trust, loyalty and commitment and, consequently, has a negative impact on trust in political institutions, on participating elections or on involvement in other political actions. A country variation is expected on the ground whether an insider or outsider labor market operates in the country. European Social Survey data are used and this dataset allows differentiating between the following country types: social democratic (DK, FI, NO, SE), liberal (UK, IE), corporatist (BE, CH, DE-w, NL), Mediterranean (ES, FR, PT), post-socialist (DE-e, HU, PL,

SI). More ESS rounds are merged but the timeframe (2000-2014) allows only a limited analysis of temporal changes. Number of countries is restricted to those having data from all rounds.

The paper intends to study a) the difference in how precarious employment influences the political outcome indicators; b) the difference between the country types in affecting political attitudes and behavior.

RC55-620.3

ROBERT, PETER* (Institute for Political Science, Centre for Social Sciences, HAS, Budapest, robert.peter@tk.mta.hu)

The Impact of Public Safety on Subjective Wellbeing in Comparative Perspective

For contributing to the topic of the session, the paper investigates the impact of victimization and safety on wellbeing. The European Social Survey data are used for this purpose. Two questions can serve as main predictors: 1) Becoming victim of a burglary or assault in the last 5 years: percent of yes answers vary between 8 and 29 in ESS6; 2) How safe do you feel walking alone after dark: measured on a 4 point scale, means vary between 1.6 and 2.5 in ESS6. In general, two dependent variables can be used: satisfaction with life and happiness – both measured on a scale of 0-10.

A pooled file of ESS rounds allows studying the relationship between these two independent and dependent variables. Given the measurement level of the dependent variables, OLS regression is an option. The model will controll for other individual characteristics like labor market situation, education, financial situation, urban-rural difference, gender, age, religiosity, subjective health, etc. usually taken into account when analyzing determinants of SWB. The pooled ESS dataset allows differentiating between country types like: social democratic (DK, FI, NO, SE), liberal (UK, IE), corporatist (BE, CH, DE-w, NL), Mediterranean (ES, FR, PT), post-socialist (DE-e, HU, PL, SI). Number of countries is restricted to those having data from all rounds. The paper focuses on the variation between these country types. Though timeframe in ESS is relatively short (2000-2014), a limited analysis of temporal changes can also be included.

As a refinement, using the extensive module on wellbeing in ESS6, dimensions of wellbeing can be detected (cognitive, affective, hedonic, eudaimonic) by factor analysis. A further analysis can investigate a) the difference in how safety influences these various aspects of wellbeing; b) the difference between the country types in the impact of safety on SWB.

ROBERTI, GERALDINA* (University of L'Aquila, geraldina.roberti@univaq.it)

Brands and Consumption Cultures Among University Students

In the context of postmodern society, consumption gains an increasingly meaningful role in the self definition and communication processes. As also Crane (1992) suggested, the self definition is more and more based upon the construction of one's personal lifestyle and upon the adoption of specific patterns of consumption; consumer goods have an important communicational value, since goods – the visible side of culture – allow individuals, especially young people, to establish social relationships (Douglas, Isherwood, 1979). As researchers know, young consumers' practices are mediating their identity expression, enabling them to communicate their identity, the subcultures they belong to and their personal value system to the outside world.

In the light of considerations such as the foregoing, we decided to carry out a qualitative research study on a sample of University of L'Aquila students (Italy), in order to investigate elements that currently characterize their consumption cultures, with a special attention to their relationship with specific brands. To this end, we realized a series of focus groups comprising these students, and subsequently more significant issues were examined by means of semi-structured interviews of selected focus groups participants. Our main objective was to assess how, in their local context, the symbolic significance of a product/brand are incorporated in students' cultural patterns and self-definition dynamics.

The main findings to emerge concern firstly the importance of the realm of consumption for identity and socializing process: brands offer suggestions, moods and symbolic materials from which consumers can freely draw on to represent their self-images and share them with others. That means individuals include specific brands among the identity resources they use to express themselves. Those kinds of *lovemarks* (Roberts, 2006) are capable of entering into the symbolic world of the young consumers and reflecting their emotions, going beyond all rational or economic calculation as to utility.

From Oddities to Ordinary? the Legal Profession's Changing Attitudes to Women Lawyers in Australia

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In the last five years women lawyers have held prominent and powerful positions in the Australian community. In 2012, for example, when Prime Minister Julia Gillard's 'misogyny' speech went viral on social media, the positions of Prime Minister, Governor-General, and national Attorney-General were all held by women lawyers, and three of the seven members of Australia's highest court were also female. This paper examines how the profession's attitudes towards women lawyers, and particularly women judges, have changed in Australia as women have *gradually* gained greater prominence in the profession.

Feminist scholars such as Thornton and Hunter have demonstrated that after the Australian legal profession's doors were opened to women, women lawyers still faced a culture of hostility. This manifested variously through discriminatory briefing practices; the sexualisation of the female form; and, the gendered criticism of the appointment of women to the bench. However, as women became 'ordinary' in the profession and on the bench, did this also herald a change in attitude towards women in the law?

This paper explores this question through the lens of judicial swearing-in ceremonies. These ceremonies consist of speeches by leaders of the legal profession welcoming the new judge, followed by the judge's inaugural address. Described as a 'eulogy for the living', this 'ceremonial archive' records how lawyers, including women lawyers, speak about gender and the profession, while the repetition of the ritual over time and across Australia's vast geography provides a unique lens through which to explore changing attitudes.

Adopting a thematic approach, this paper demonstrates how key trends, including the depiction of the 'mother judge', and the 'trailblazing women of the law', dominate these ceremonial narratives. These are also themes which connect with international feminist analyses of how women have been welcomed to, and excluded from, the legal profession.

CLASS and Politics Among Young People in South and EAST Mediterranean Countries *This Paper Has Been Prepared within the Research Project FP7-Ssh-2013-2 Sahwa: Empowering the Young Generation; Towards a New Social Contract in South and East Mediterranean*

This paper is based on the results of interview surveys during 2015 with nationally representative samples of approximately 2000 15-29 year olds in each of five south and East Mediterranean countries – Algeria, Egypt, Lebanon, Morocco and Tunisia. The analysis uses several indicators of the young people's class locations – mothers' and fathers' education and occupations, respondents' education and labour market careers. It examines the associations between these class indicators, and also the independent and mediating role of religion, and the respondents' political activities and orientations during and since the events of 2011 (widely known as the Arab Spring).

How Leisure has become a Global Business. Is there an Alternative Future?

Since 1989 capitalism – specifically the Anglo-American model of shareholder capitalism – has become global. Responses to the banking crisis of 2008-09 have intensified an ongoing squeeze on government spending on leisure as a public service. Governments all over the world are currently seeking to cap or at least restrain growth in their own spending in the face of rising demands for health care and pensions. Leisure spending is always vulnerable except when the spending can be treated as a business proposition, usually to be repaid by increased inward tourist numbers or media revenues. The voluntary leisure sector has been resilient despite claims and fears that people are becoming internet couches and going alone whenever they go out. However, like the cinema, the voluntary leisure sector has never recovered from the participation crash that accompanied the birth of the age of television. Throughout the subsequent years the growth of leisure spending by private consumers, especially the better-off, has continued remorselessly. This has enabled commerce to carve niches initially, then to become a major provider of leisure services which were once overwhelmingly voluntary or public services – broadcasting and sport, for example. This is how leisure has become a global business. The academic study of leisure began in the early-and mid-20th century when commerce was treated as the enemy of good leisure. Theories about a future 'society of leisure' that the sub-discipline produced envisaged a continuing growth of leisure time, not rampant consumer spending. Many leisure scholars have quit for more hospitable pastures. The sub-discipline has fragmented into specialisms, mainly sport which has tended to migrate into health faculties, and tourism and hospitality which have migrated into business studies. This paper asks whether there is an alternative future for the sociology of leisure and its scholars.

An Anarchist Squat in Northeastern Paris : A Futur Here and Now ?

Dans cette proposition de communication, nous porterons un regard sociologique sur une initiative populaire de mobilisation : un lieu où s'expérimentent *pratiquement* des formes alternatives de solidarités en opposition au néolibéralisme. Il s'agit d'un squat, ouvert en janvier 2013 dans le nord-est parisien par une vingtaine de militants anarchistes et marxistes, et au sein duquel nous avons réalisé une observation participante de deux ans. Ce lieu, à destination des habitants et travailleurs du quartier, a pour objectif de créer un espace de « solidarité de classe » en développant de nombreux ateliers d'entraides (repas à prix libre, cours de français gratuits, permanence pour les sans-papiers, bricolage, cinéclub). Il fonctionne de manière autogérée, les décisions se prennent collectivement lors des assemblées générales ouvertes au public.

Habité par des imaginaires passés et des horizons partagés, cet espace hétérotopique est en quelque sorte une utopie autoréalisée et territorialisée (Foucault, 2004). Mais c'est avant tout un espace du temps présent, générateur de relations autres et de pratiques alternatives. Les acteurs sociaux y développent, en résistance à l'ordre social, des modes d'expression politiques propres (autogestion) et renouent avec certaines formes de partage (troc, gratuité). Par les données tirées de notre ethnographie, nous tâcherons de montrer comment cet espace contribue à ouvrir le champ des possibles, sans jamais pouvoir complètement se détacher de la société et des normes dominantes.

Par une expérience concrète de rupture, ce squat d'activités interroge en effet l'idée d'émancipation selon deux registres. Le premier, celui des représentations et du langage, consisterait à saisir ce qui permet une critique ordinaire du monde social (ce qui suppose un processus de *dénaturalisation* des structures qui l'organisent et le divisent). Le second, celui de la *praxis*, s'attacherait aux conditions de possibilité et/ou d'impossibilité d'un ensemble de pratiques qui travaillent à l'émancipation individuelle et collective.

ROBITAILLE, CAROLINE* (Universite de Montreal, c.robitaille@umontreal.ca)

Psychostimulants in the Digital Space: An Insight into Pharmaceuticalisation

Psychostimulants have known, for the last three decades, a "renaissance" of sorts. Relatively underutilized between 1970 and 1990, an increasing production, and use of prescription amphetamine and its derivatives continues to be observed by scholars and public health institutions. This accrued demand occurs in the context of Attention Deficit/Hyperactivity Disorder gaining traction in clinical practice, for which psychostimulants are a treatment of choice. Furthermore, taking a broader perspective, this renewed interest in psychostimulants cannot be separated from a "performance ethic", which permeates contemporary Western societies. (Ehrenberg, 1991) In the North-American context, these pharmaceuticals may be understood as tools to better adhere to values such as efficiency and control and, more practically, to answer to academic or work-related demands. Since the early 2000's, researchers have observed a rise in the *non-medical* use of amphetamine and its derivatives among young adults, chiefly to improve academic performance.

Various conceptual frameworks have been called upon, within the social sciences, to explore the non-medical use of psychostimulants; among these, most notably, is pharmaceuticalisation. While this has allowed to position users' practices within the broader political and economic context, there is a dearth of data pertaining to how psychostimulants contribute to fashioning contemporary subjectivities among young adults, within and beyond the academic setting. Exploring this question further, this communication draws on a netnographic study of psychostimulant-related online communities. Indeed, there is a growing overlap between the "virtual" and "physical" self (Boellstorff, 2012), and individuals are increasingly assembling within the digital space around various ideas and objects, including pharmaceuticals. We argue that the adaptation of ethnographic methods to the online setting (Kozinets, 2010) may bring forth new insights into the socio-cultural dynamics and transformations underlying the use of psychostimulants. This also contributes to shedding additional light on the processes of biosocialisation and pharmaceuticalisation.

ROBY, CATHERINE* (Université Rennes 2, catherine.roby@orange.fr)

Approche Des Conceptions Du Développement Durable Dans Les écoles D'ingénieurs Françaises

Depuis le début des années 1980, les catastrophes industrielles à répétition ont rendu difficile, pour les acteurs politiques et scientifiques, la minimisation

des risques technologiques encourus par l'être humain et son environnement. Cependant, les orientations du développement durable (DD) ne sont inscrites dans la définition des activités de l'ingénieur que depuis 2012. Mais qu'en est-il réellement de la compréhension du DD dans les écoles d'ingénieurs françaises ? L'éco-innovation, lorsqu'elle est-mentionnée, est-elle articulée aux principes systémiques du DD ?

Une recherche visant une catégorisation de ces écoles, basée sur la place et la fonction qu'y occupent les SHS dans les curricula, a conduit à étudier les textes de présentation des formations tels qu'ils sont affichés sur les sites internet des écoles. A l'analyse de ce corpus empirique, les conceptions du DD sont alors apparues comme un élément pertinent dans la construction des catégories.

La communication proposée présentera les trois conceptions du DD observées : 1) une méconnaissance, source de confusions ; 2) une conception centrée sur la protection de l'environnement et 3) une conscience des enjeux interconnectés et indissociables du DD. Ces résultats seront discutés en regard des affichages de sciences humaines et sociales (SHS) dans les écoles, les objectifs assignés au DD (entre autres, la réflexion transversale et critique), pouvant rejoindre ceux des formations en SHS. Par ailleurs, les conceptions du DD peuvent être interprétées comme un indice de l'ancrage sociohistorique des formations d'ingénieurs et de leur faculté à changer de paradigme selon leur domaine de spécialité. Au moins quatre caractéristiques font aujourd'hui obstacle à l'intégration du DD dans les écoles : 1) un progrès technologique perçu comme vecteur de progrès humain et social ; 2) des approches coopératives de gouvernance opposées aux schémas traditionnels de compétition ; 3) des formations basées sur l'enseignement de certitudes et 4) la faible place de la réflexion sur les savoirs.

Disaster, Violence and State of Exception: Memories of Lootings in the Aftermath of the 2010 Chilean Earthquake

Chileans, a population used to earthquakes, woke up with surprise in the morning of February 27th, 2010 since right after the earthquake that hit Concepción, the third largest metropolitan area in the country, massive looting to stores came about. Fed by rumors about roving mobs, Concepcion residents formed their own neighborhood defense squads to guard their homes, whereas the Chilean government declared State of Exception to restore the social order. Drawing on testimonies of men and women I interviewed in Concepción two years after the disaster, the aim of this paper is to explore the relationship between earthquake, collective violence, and urban insecurity. Following a theoretical discussion about collective memories, I explore how silence and forgetting are active elements in the process of collective remembering. In addition, this project analyzes the sense of exceptionality that my interviewees, other scholars, and state authorities have assigned to looting in the aftermath of the earthquake; events that, as I shall demonstrate, were interpreted as a symptom of moral decadence of Chilean society under the neoliberal regime. By scrutinizing historical data about past earthquakes, I look at traces of social and political conflicts associated with the occurrence of natural disaster like the one I describe here. Concerning the 2010 facts, I make use of the framework offered by Charles Tilly and Javier Auyero to present, at a micro-scale level, looting targets, dynamics and repertoires based on narratives collected empirically (among them, testimonies of storeowners who were victimized by the crowd). Finally, to explore the displacement of fear—in particular, from the fear to earthquake to the fear of the "others"—I point out the need to pay attention to the ways in which different neighborhoods are conceived of as well as the role of rumors.

ROCA, ANDREA* (Universidade de São Paulo, andrearocav@gmail.com)

Street and Fire: Protests, Insurgencies and Conflict Management in Santiago, Chile.

The aim of this paper is to discuss the results of an ethnographic research that explores two phenomena that have gained great visibility in the latest round of global protests that began in 2011. On the one hand, it examines the incorporation of a performative, non-lethal, and small-scale violence in the repertoires of protest from minority groups such as noted in a diversity of cities like Athens, Cairo, Sao Paulo, and Santiago. On the other hand, it accounts for the return of direct confrontation tactics in policing protests, supported by a militarized logic of management of urban conflict. In a context of emerging alter-globalization movements, both issues compel me to (re)think, first, the role of violence "from below" in contemporary politics and, second, the apparent normalization of the conflict between police and protest, especially in recent years in Western democracies. Drawing on a qualitative perspective, I will thus analyze the intersections and overlapping of these two lines of force by inquiring the mobilization carried out by the student movement in Santiago, Chile, which started in 2011 and opened up the largest cycle of public protests in that country since the restoration of democracy in 1990. To do so, it is fundamental to situating these violent protest

repertoires both in a synchronic and in a diachronic axis, the former to think of potential influences and similarities on a global scale and the latter to assess the weight the popular resistance against the Pinochet regime in the 1980s.

Potentialities and Limitations of Participation and Change Processes Based on Bottom-up Approach - Evidence from the Project Catalise in Portugal

New grassroots experiments based in new values, new strategic orientations and continual locally based learning are taking shape in different territories all over the world. Concepts like "(Re)localization", "Transition Towns/Initiative", "Permaculture", "Degrowth", "Gift Economy", and many others, embody practices, projects and local movements, of rural and urban base, anchored on principles of bottom-up participation in local governance, innovation, cooperation and community resilience. The "bottom-up" action principle refers to an inductive logic of enhancement and building of the knowledge base (community-based) and to the closeness of context, in small scale, in order to determine more general guidelines for medium/large scale. However, not always the relationship between these two levels of knowledge and action are carried out properly in order to build a real change of practices, of social and political conceptions. Differences of scale in analysis and also difficulties in accessing and understanding information and knowledge (whatever is general or locally based), frequently puts into question inter-knowledge and participation processes which are essential for local governance, as a potentiator for greater social justice and environmental, economic and cultural sustainability. In what concerns to the grassroots initiatives, constraints of different order (as the lack of resources like time, people, money, commons) seems to constrain possibilities of a wider and more continued participation on local processes of change, and also to respond to several dimensions of action (environmental, social, economic, political, cultural and others). Due to the CATALISE project was possible to identify the difficulties of coordination between the various agents in the local context and between the local and the macro scale, as well as outlining recommendations and proposals - which will be presented and discussed in this communication - designed to minimize such difficulties and to increase the potential of bottom-up governance.

Comparative Qualitative Research in Disadvantaged and Violent-Prone Urban Environments

This paper examines challenges enrolled in the deployment of qualitative research in urban contexts of the so-called global South. In order to understand urban renewal and gentrification processes taking place in Rio de Janeiro's favelas and Johannesburg's black townships, I lived for around three months in Dobsonville, one of the black townships of Soweto, and about two months in Pavão-Pavãozinho, a favela located at the south zone of Rio de Janeiro. I also researched thru qualitative methodology (ethnography and in-deep interviews with favelas' and townships' inhabitants) how people actively shape space and their built environment in these historically marginalised territories. The fieldworks mentioned above took place between 2013 and 2015. For this paper, I discuss hardships and challenges related to the use of qualitative methodologies in disadvantaged and violent-prone urban environments. To this respect, I discuss how race issues and urban violence can play a decisive role in the deployment of qual-

itative research methods. I also consider suitable ways to find out linkages or contrasts between the two cases of study.

The Positive Directions of the Complementary and Alternative Medicine Offer to the Managers of Primary Healthcare Services in Brazil

The World Health Organization advocates the insertion of the Complementary and Alternative Medicine (CAM) in their member countries' national health system. However its introduction in the Brazilian Unified Health System (UHS) has happened in a slow way, even taking into account a CAM National Policy, since 2006, and the positive directions about CAM pointed by the coordinators of primary healthcare services (PHS). The aim of this work is to analyse the positive aspects attributed to the CAM offer by the managers of the PHS of the Brazilian UHS. It was carried out 233 interviews, by telephone, with coordinators of PHS from the 20 municipalities of the ninth biggest Brazilian metropolitan region (Campinas, São Paulo), that adds more than 3 millions of inhabitants. The speeches of 117 coordinators of PHS services that offer CAM were analysed by thematic content. Those who were interviewed emphasized that there are positive senses of the CAM offer in the PHS to patients, especially in relation to: a) the improvement of the physical aspects related to the illnesses and chronic pains; b) the emotional aspects, with the improvement of the self-esteem; c) the enlargement of the autonomy, promoting the self-care; d) a consequent reduction of the medicine consumption and reduction of the demand of consultations with professionals. We conclude that the CAM introduction is timid in the PHS in Brazil, although their managers put forward positive senses to the offer. It was concluded, also, that the positivity of CAM offer may produce individual and collective changes that may create new care perspectives and sociability, which can change the basis of the conventional care developed in the primary healthcare services of the Brazilian Unified Health System.

RODRIGUES, EMMANUEL H.* (Universidade de Brasília, emmanuel_neo@msn.com)

Brazilian "Natural" Family?: A Critical Analysis of Parliamentary Discourses

In Brazil, the interference of religious practices in political spaces is common. The type of secularization in the country and the relationship between public and private allow this to happen. During the 54th Legislature of the Chamber of Deputies, from 2010 to 2014, it became clear with the advance of the called Bancada Evangélica, a religious group inside the parliament that during this period broke several guidelines related to sexual rights and LGBT citizenship (VITAL; LOPES DA CUNHA 2012). From its lobby, they even required setbacks in rights already conquered, as the rights to compose family. In this paper, I present parliamentary speeches about equal marriage made in plenary during the 54th Legislature by the deputy Ronaldo Fonseca. One of the leaders of the Evangelical bench, he was rapporteur of the Estatuto da Família, in order to promote the traditional family institution formed by father, mother and children as the only one acceptable according to Brazilian Law. The epistemology I used to analyze is the Critical Discourse Analysis (CDA) (FAIRCLOUGH, 2003), a linguistically oriented sociological analysis, anchored in a base of Systemic Functional Linguistics (HALLIDAY; MATTHIESSEN, 2014), with focus on Appraisal System (MARTIN; WHITE, 2005). Describing the situation with CDA, it was possible to make an explanation by sociological reading from the relationship between public and private existing in Brazil and its secularization. The results of this explanation, based on linguistics analyze, showed that the family representation guided by religious views and the determination of only one type of family make certain portion of the population as privileged with social rights and other family arrangements with no recognition. Thus, the interpretation with both linguistics and sociological way of these discourses suggests a proposal to limit democracy in the contemporary Brazilian political spaces.

RC25-315.17

RODRIGUES, EMMANUEL H.* (Universidade de Brasília, emmanuel_neo@msn.com)

Theoretical Developments in Critical Discourse Analysis: For a Linguistic about Brazil

The proposition of Critical Discourse Analysis (CDA) is to make a linguistically oriented sociological analysis (FAIRCLOUGH, 2003). This approach has to be adequate to both situation and culture context, according to Systemic-Functional Linguistics (SFL) (HALLIDAY & MATTHIESSEN, 2014). This presentation aims to discuss about the multiple modernities (EISENSTADT, 2001) associating it with CDA. In order to work properly about Brazil (TAVOLARO, 2005), it is essential to use specific appropriated tools, not regarding a single model of modernity. In Brazil, considering our secularization and the form of separation between public and private, the interference of religious practices in politic environments are common. The type of secularization of the country and its relations between public and private allow it to happen. It became clear with the growth of the religious oriented group of parliamentarians called Bancada Evangélica, from 2010 to 2014. In this period, this group fought against the advance of sexual rights and LGBT citizenship in Brazil (VITAL & LOPES DA CUNHA 2012). I applied this linguistic and sociology theoretical framework on parliamentary speeches about equal marriage made in plenary by the Deputies Pastor Marco Feliciano and Pastor Eurico, focusing on Appraisal System (MARTIN & WHITE, 2005). With the development of the linguistic description, it was possible to make an explanation by sociological reading from the relationship between public and private existing in Brazil and its secularization. The results of this explanation point that the construction of the religious positions, as in speeches analized, build a proposition in which part of the population do not have the same civil rights, proposing the repeal of the rights already conquered by LGBT. In conclusion, the sociological view of the analyzed linguistic data suggests that in these speeches there is a proposal to limit the democracy inside contemporary Brazilian political spaces.

RODRIGUES, EUGENIA* (Science, Technology and Innovation Studies (STIS), University of Edinburgh, eugenia.rodrigues@ed.ac.uk)

Citizen Science and the Democratisation of Knowledge Production

Citizen Science (CS) initiatives have become widespread in Europe and North America and very popular among a variety of actors, across various settings and contexts; they have gained support and encouragement through a number of official policies. Still, social analysis of what these initiatives entail, the questions they raise about the scope for public participation or, indeed, the implications they have for society at large and knowledge production in particular, is sparse.

In this presentation I will analyse some of these dimensions through the lenses of STS with particular relevance given to notions of knowledge democratisation and scientific citizenship.

Many STS authors have proposed thinking of issues of citizen or lay engagement in scientific or policy matters as scientific citizenship. But what does this term imply for the quality of being a citizen, a scientist or to the notion of science itself? The recent rapid rise of interest in citizen science prompts us to ask this same question in a novel manner: what distinctive contribution do the practices, systems and rationale of citizen science bring to the idea of scientific citizenship? Citizen science appears to offer itself as a good case-study in this field as the promises of a deepened engagement for citizens seem almost limitless.

My argument will be that beyond the potential and promise that surround the citizen science rhetoric of an extended participation and engagement of citizens in scientific activities (a discourse that is closely tied to the idea of democratisation and open knowledge), one needs to examine whether we are witnessing the emergence and consolidation of the 'scientific citizen' or 'scientific citizenship' through citizen science. I will base my observations on preliminary findings from case studies of citizen science initiatives primarily from the UK.

Legal Socialization Process of Children and Early Adolescents in Sao Paulo, Brazil

The study of the process of legal socialization of children and early adolescents led to important theoretical and methodological advances over the last years; in particular to the development of the conceptual framework to study the development of trust and the process by means of which legitimacy develops throughout childhood and adolescence. "Legal socialization" encompasses the process

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

through which the legitimacy of rules and laws, and the authorities that enforce these, may or may not affect the decision of individuals to violate or to comply with the rules. Though in the international literature there is renewed interested in the study of legal socialization. In Brazil, this subject has been somewhat ignored, constituting a gap that we seek to fill along our research. Our main objective is to present the process of development of legitimacy and trust in democratic institutions in its roots, and its impact on the behavior towards the law of early adolescents (11 years) as they move into adolescence (15 years). In other words, we intend to present how different forms of authority impact on the legal socialization process. The general assumption is: legitimacy, compliance with laws and democratic institutions in the city of Sao Paulo (investigation focus) can not be fully understood without a detailed study about how compliance with laws, rule and norms develops are internalized and expressed among children and early adolescents. Our primary research question is: how do early adolescents from different social background, living in urban areas with different characteristics, patterns of access (and violations) to rights develop an understanding of laws and authorities? As conclusion, we ensure the legal socialization process is one key issue to understand phenomenon of urban violence and crime, and also to understand the persistence of serious human rights violations even in the democratic period.

RODRIGUEZ, CLARA* (Fordham University, crodriguez@fordham.edu)

Do Exported US TV Programs Introduce or Reinforce Racial/Ethnic and/or Gender Inequality – American Style – to Other Countries?

A number of works have examined racial/ethnic/gender representation on US network television and found that the way in which television represents gender and particular racial/ethnic groups silently conveys and/or reinforces inequality. Additional works, including my own, have found that racial/ethnic characters tend not to be cast in lead roles, but in supporting, or silent-extra roles, when they are included at all.   In addition, the way that racial/ethnic characters are often drawn suggests that they are not, or should not, be seen as an integral or important part of the legitimate social structure that is central to the story on the screen. They are, in essence, "othered." Given the popularity, accessibility and consumption of US entertainment programs abroad, how do people in other countries receive such patterns? How do such programs affect their views about "otherness," immigrants, gender, and/or racial/ethnic minority groups in their countries and/or in the US? And do these views change (or not?) once these global viewers come to the US? I addressed these questions by personally conducting in-depth, semi-structured interviews with 63 Foreign Nationals that had been working or studying in the US for six years or less. Utilizing an abridged form of this questionnaire, I also conducted an electronic survey of 171 undergrads at a large university in the U.S. to gauge what differences exist. I found that many foreign nationals access US-TV to learn or improve their English, but how images of race, class, gender and ethnicity are received varies considerably -- from those who recognize that it privileges "whiteness" to those who view US TV as a medium that exposes them to greater racial/ethnic, gender, and class diversity and acceptance than they experienced in their homelands. The US-born group is generally more cognizant of the privileging of whiteness on TV.

RODRIGUEZ, EVELYN* (University of San Francisco, erodriguez4@usfca.edu)

Invisible, but Working for Liberty and Justice for All: Local and Global Political Views and Behaviors of US Second-Generation Youth

The politicization of US immigrants and their children is nothing new. The American public is quite accustomed to seeing, for example, notable political figures crediting their immigrant ancestry for their "compassion" (Colin Powell, former Secretary of State), "scrappy determination" (Hillary Clinton, Presidential candidate), and commitment to maintaining a nation that is "welcoming to all people" (Nikki Haley, Governor, South Carolina). Yet, while high-profile events like the 2011, 2013, and 2014 acquittals of white men who fatally shot unarmed black youth have re-ignited nationwide reflection and conversations on race, US racial tensions, and social change in America, the perspectives of Latino and Asian Americans (the US' two largest immigrant groups) often remain overlooked and/or unreported. Given this absence, it is not surprising that the general public is also not often made aware of if and how contemporary US immigrants and their children might be politically involved in their homelands.

This presentation will help address these gaps by drawing on qualitative interviews with college-age children of Latino and Asian American immigrants to describe their perspectives on 1) race and race relations, 2) their inclusion/ exclusion from major national reports on these topics, and 3) their political involvement-- both in and outside of the US. Special attention will be paid to if and how transnational frameworks and experiences (eg, family visits and/ or exposure/ immersion trips to parents' homelands) inform youths' political views and behaviors, and the

implications such understandings and approaches have for social change and development in the US, as well as in parents' countries of origin.

RODRIGUEZ, EVELYN* (University of San Francisco, erodriguez4@usfca.edu)

Troubling the Borders of Mexican and Filipino America through Second-Generation Daughters' Coming-of-Age Rituals

This talk explores how Filipino and Mexican female coming-of-age rituals in the US ("debutantes" and "quinceañeras," respectively) unwittingly offer spaces for considering, debating, and addressing divergences, conflicts, and inequalities within the US immigrant communities that celebrate them. Drawing on qualitative data and analysis from *Celebrating Debutantes and Quinceañeras* (Temple University Press 2013), this presentation demonstrates how these events' "troublemakers"-- the assertive daughters, playful consumers, noncompliant children, gays, and unmarried women who deviate from the ideals immigrant communities have constructed for mothers, daughters, and sons-- challenge families and communities to enlarge what it means to be "good" Mexican or Filipino women and men. This shows how US quinceañeras and debutantes are purposefully, strategically, and creatively employed to forge new understandings of what it means to be "Mexican," "Filipino," and "American"-- for mainstream Americans, as well as Filipino and Mexican Americans themselves.

The Role of Love and Social Interaction in the Global Differences Between Happiness and Satisfaction

In this paper we work with the idea that happiness and life satisfaction are different social phenomena even though they share some of their explanatory variables and literature has already built indicators of subjective well-being mixing both of them. We draw attention on those factors making the difference between both phenomena. Our main hypothesis is that happiness is strongly constituted by social interaction variables whereas satisfaction has more materialistic and individual basis. Specifically, we are interested on the role of love, kindness, the concern for others well-being and the pro-social behaviors. We focus on the articulation of visions and actions shaping what we call love and its relation to happiness. It give us the key to understand the power of love for turning the material satisfaction into non-material happiness. Our theoretical contribution attempts to go beyond the individualistic models from Economy or Psychology, towards a social and interactive understanding of happiness in the world. We explore in what extent and how the different roles take place across the globe. And we look for cross-cultural patterns of happiness causation. Even though we use individual data we focus on variables with clear social conceptualization. In order to achieve those goals we use data from 6th wave of World Value Survey and apply multivariate analysis and statistics tools and use its results to create a global map of happiness explanation. We conclude that happiness is not satisfaction.

RODRIGUEZ, PATRICIA* (Universidad Iberoamericana, patyloro@hotmail.com)

Capital Social, Los Jóvenes Como Actores De Cambio

La perspectiva del capital social sobre la juventud se refiere a los problemas en los que se ven inmersos los jóvenes, caracterizados por la delincuencia, el abuso de sustancias y la violencia. Esto contrasta con la perspectiva de impulso, que se centra en los activos y estrategias de los jóvenes para generar una juventud sana y productiva. Ambas perspectivas rechazan las formas complejas en que los jóvenes responden a políticas públicas coercitivas.

El enfoque del social capital conceptualiza los atributos de la comunidad, donde los jóvenes muestran la eficacia colectiva a través de redes de organización y el compromiso con los adultos (Sampson et al., 1999). Sampson, Morenoff, and Earls (1999) argumentan que "la eficacia colectiva de los jóvenes es producida por las creencias compartidas y capacidad conjunta para la acción de la colectividad.

El capital social establece tres vínculos entre la juventud, la justicia social y las comunidades. En primer lugar, los jóvenes participan en la creación de políticas que les afectan, sus derechos a la participación están vinculados a los derechos civiles, lo que representa un paso fundamental hacia la justicia social y la igualdad. En segundo lugar, los jóvenes son agentes con potencial para actuar y tienen un papel en la transformación de las condiciones de los barrios y las comunidades en las que viven. En una sociedad democrática, los jóvenes tienen un papel vital

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

como actores cívicos - a través de su participación en el desarrollo de políticas – lo que los lleva a continuar desarrollando las prácticas más eficaces en sus escuelas y comunidades. En tercer lugar, el proceso de desarrollo de los jóvenes cambia el enfoque teórico de las trayectorias de desarrollo individuales para los jóvenes como actores de la comunidad colectiva.

Aproximaciones a La Imputación De Ingresos Desde Los Estudios De análisis De Clase. Una Propuesta a Partir Del Uso De Técnicas De análisis Factorial.

El propósito del trabajo es analizar las implicancias de la utilización de distintos métodos de imputación de datos en relación a la variable ingresos. En este sentido, interesa describir y aplicar diferentes métodos y dar cuenta de las similitudes y diferencias entre ellos.

Específicamente, se parte del análisis de la estructura de clases (Fernández Melián, Clemenceau, Rodríguez de la Fuente, 2015). El objetivo del trabajo es contrastar dos métodos de imputación de ingresos: por un lado la asignación de ingresos al encuestado en función de la media de ingresos de la clase social de pertenencia y por otro, la asignación de ingresos resultante de la aplicación de la técnica multivariada de análisis de correspondencias múltiples. Ésta última permite observar la distribución y ubicación en el "espacio social multivariado" de aquellas unidades de análisis sin información sobre ingresos en relación a diversas dimensiones tales como la clase social, el nivel educativo, el consumo, las características habitacionales y también en relación al ingreso declarado por los restantes informantes.

Se utiliza como fuente de información la encuesta "Movilidad social y opiniones sobre la sociedad actual" realizada entre 2012 y 2013 en la Ciudad Autónoma de Buenos Aires, llevada a cabo por el grupos de estudios sobre "Estructura y movilidad social", del Instituto de Investigaciones Gino Germani, Universidad de Buenos Aires.

Construcción Identitaria De La Vejez: El Reto De La Resignificación Desde La Infancia.

La problemática de la calidad de vida en la tercera edad es un tema que ha cobrado relevancia en los últimos años. México atraviesa por un proceso complejo de cambios en la composición de la población, siendo este sector cada vez más numeroso y desdeñado. La complejidad de los elementos que constituyen la realidad de los adultos mayores, es una amalgama que requiere la mirada interdisciplinar mediante procesos de integración y diferenciación (García, 2006), de tal manera que las aproximaciones al objeto de estudio puedan estar en constante retroalimentación y reconstrucción cognoscitiva (García, 2000). La calidad de vida, abordada a través de la resignificación social de la vejez, como parte de un sistema complejo e interdisciplinar, se aproxima a un planeamiento reflexivo, histórico, social, inclusivo, identitario y cultural con implicaciones recíprocas entre los ancianos y la sociedad durante todo el trayecto de la vida, por lo que el objeto de estudio se dirige a la intervención en los procesos cognoscitivos y didácticos de resignificación de representaciones en los alumnos de Educación Primaria.

El objetivo del subsistema resignificación social, es aproximarse empíricamente a las representaciones sociales de distintas generaciones, así como articular sistemas de información, y mediante la disminución de la entropía en el sistema (Pozo, 2014), proponer un manejo más certero de las propuestas tendientes al mejoramiento de la calidad de vida de los ancianos, incidiendo desde la niñez.

Los resultados en la aplicación de grupos focales y entrevistas a profundidad muestran representaciones poco deseables respecto a la vejez y un deterioro paulatino de la imagen del anciano. El modelo de calidad de vida desde la resignificación social como sistema autogestivo y autoregulador (Bertalanffy, 1968), parte fundamental de las reflexividades múltiples de sus implicados y el fortalecimiento de la identidad a través de la inclusión de los ancianos.

Cultural Resonance and Creativity Processes

The main objective of this paper is to analyze the incidence of place in urban cultural creativity process from a sociological perspective. We seek to understand the social mechanisms through which certain characteristics of the urban environment are incorporated in cultural productions. Following the contributions of Harvey Molotch (1976, 2002) and Randall Collins (2005, 2009, 2013), we elaborate the concept of resonance. We understand resonance as the ability to certain cultural creativity processes to use some characteristic elements of the place and turn them into unique cultural products that, in turn, participate as content in other cultural creativity processes. From a qualitative methodological approach, based on interviews and observation, we analyze the resonance processes occurring between designers of Palermo in Buenos Aires and visual artists of Poblenou area of Barcelona.

ROELENS, JONAS* (Ghent University, jonas.roelens@ugent.be)

Fornicating Foreigners. Sodomy, Migration, and Urban Society in the Southern Low Countries (1400-1700)

During the early modern period, it was commonplace to represent sodomy as a phenomenon that particularly prospered abroad and could infect the native society through contact with foreigners. Immigrants therefore proved vulnerable for local distrust and defamations, which is illustrated by the high numbers of accused foreign sodomites in court records throughout early modern Europe.

This paper will examine to what extent this was also the case in the Southern Netherlands between 1400 and 1700. An analysis of court records of the cities of Bruges, Ghent, Ypres, Antwerp, Louvain, Malines and Brussels, who were in many ways among the major urban centers in the early modern Low Countries, has revealed 182 sodomy trials in which 360 individuals were accused of same-sex acts. In 51 cases, foreigners were involved, comprising a total number of 88 individuals. It appears that roughly one out of four prosecuted sodomites in the Southern Low Countries was an outsider to the urban community. Moreover, these migrants were more likely to be executed for their 'crimes' than their local counterparts. The convicted foreigners constituted a very diverse group of both individuals who were fully integrated in the urban fabric and people living at the fringes of society, which shows that the persecution of sodomy in the Low Countries was dependent on a variety of factors. Apart from origin, one's social position also played an important role during a sodomy trial.

Based on a meticulous examination of historic court records, this paper analyses the early modern perception of foreigners as potential sodomites and the relation between same-sexual behavior and migration experiences in pre-modern society.

ROGERS, ANNE* (University of Southampton, A.E.Rogers@soton.ac.uk)

How the Market Influences Formal and Patient Systems of Support for Long Term Condition Management: Stakeholder Accounts of Commonalities and Differences Across Six European Countries

The challenges of increasing provision of resources delivered by the market and how it influences influences long term condition management is a relatively under-analysed area. European countries policies and health care systems are increasingly adopting policies for the prevention and management of long term conditions which focus on enhancing individual, competencies, skills, behaviour and lifestyle changes. How the broader market influences relevant policy and practice such as those related to food production, distribution and consumption and the structural aspects and economics relating to physical exercise and governance of health care delivery systems are implicated in the populations ability to self- manage. This study aimed to identify key informants operating with knowledge of both policy and practice in order to explore how these influences are seen to impact on the self-management support environment.

Ninety semi-structured interviews were conducted with key stakeholder informants in Bulgaria, Spain, Greece, Norway, Netherlands and UK. Interviews were transcribed and analysed using thematic and textual analysis.

 The infrastructure and culture for supporting self- management practice was viewed as driven by political decision-makers, the socio-economic and policy environment, and the ethos and delivery of financially incentivised formal health care systems. Three key themes emerged 1) social environmental influences on self-management 2) reluctance or inability of policy makers to regulate processes and environments related to chronic illness management 3) the focus of healthcare system governance and gaps in provision of self-management support (SMS). Nuances in the salience of themes between countries related to the presence and articulation of dedicated self- management policies, drug company involvement and the impact of measures resulting from economic crises and public spending on shaping illness management.

There is a need to acknowledge meso level influences and the private market and economic and policy challenges in addressing people's capacity to undertake self-care activities.

ROGERS, KIMBERLY* (Dartmouth College, krogers@dartmouth.edu)

Affective Dynamics on Campus: Behavior, Emotion, and Event Likelihood

This research examines how campus cultures guide interpersonal behavior and emotion, and tests affect control theory's predictions of about interaction dynamics. Students at three colleges reported their sentiments for race, gender, sexual, and institutional identities. The stimulus list was compiled through a review of institutional documents, observations of student interaction, and discussions with students at each college. Student sentiments were used to predict typical role relationships between members of various identity groups, and to simulate likely interaction patterns and emotional experiences. In a follow-up study, students at each college rated the perceived likelihood of given events to examine the validity of simulation results. Randomly-selected social events were compared to events generated using respondent sentiments on several dimensions predicted to contribute to perceived likelihood: normativity or appropriateness, frequency or commonality in social life, personal familiarity or experience, likelihood of social interaction between the two parties involved, and likelihood of a given behavior in an interaction between the two parties involved. Respondents also provided a rating of overall event likelihood, of the type used in earlier research.

The research offers insight into three main issues. First, it demonstrates that patterns of meaning may vary in subtle but important ways between institutions of higher learning, with important implications for students' interaction patterns and emotional experiences. Second, it provides a test of simulation results generated with affect control theory models, demonstrating that events high in deflection (a mathematical indicator of discrepancy with shared cultural meanings) are indeed perceived to be less likely than those low in deflection (which fit more closely with the meanings held by students at a given institution). Third, it disambiguates the meaning of deflection in affect control theory research, by determining which aspects of event likelihood appear to be most salient in driving our motivation for social meaning maintenance.

ROGGENBUCK, CHRISTIAN* (RMIT University, Christian.Roggenbuck@rmit.edu.au)

Social Relationships of Indian and Filipino Residents in Planned Housing Estates in Australia.

This presentation focuses on the social relationships of Indian and Filipino migrants living in planned housing estates in Melbourne, Australia. Drawing on empirical research that explores their aspirations towards everyday social life and community involvement in regards to the built and social environment, it shall be argued that previous experiences of community can be conceptualised as a 'learnt capacity' influencing local social interaction.

Planned housing estates have become a dominant structure of developing residential land on the urban fringe of Australian cities. As these are developed around ideas of establishing a local community the estates are not only assemblages of houses, but construct a specific narrative for social life. However, these structures may differ from the aspirations of residents with diverse values, lifestyles or backgrounds.

With detached housing being the main form of residential provision and social activities being primarily based in the backside of the house, informal street life and everyday interaction between neighbours is limited. Thus, local relationships are rather formed through existing social facilities or organised community events or networks. For Indian and Filipino migrants this has meant a modification of their 'learnt capacity' towards 'perceived' Australian behaviours even though more neighbourhood contact is sought after. The lack of direct neighbourhood interaction and extended family around has meant that involvement in community groups has become more important for the maintenance of social relationships. Various cultural groups have been established and social relationships with co-ethnics have been fostered at the same time as existing communities have been adapting to a more diverse population. Integration in this context is a more complex process than merely a dichotomy of assimilation or segregation. Therefore, settling in a different social environment is a stressful life event, affecting well-being and requiring a transition of the 'learnt capacity' in everyday social interaction.

ROGLER, CHRISTIAN* (University of Vienna, christian.rogler@univie.ac.at)

Potentials and Challenges of Comparison in Organisational Ethnography

Producing a "fine-grained" (organisational) ethnography traditionally follows a holistic approach that entails 1) a prolonged stay in the field, ideally for one year or more and 2) the unity of the ethnographer as the person who records, interprets and writes up his/her own material. Accordingly, doing a comparative ethnographic study of two or more sites becomes a challenging and time consuming process – one that is aggravated by current trends of the projectification of academic research and the increasing time limitation of academic employment contracts. My presentation will discuss potentials and challenges of such an approach based on my experience of doing a comparative ethnographic study of two university departments in two different countries over a period of three years. It will address the following issues:

1) How can a comparison based on ethnographic research of two organisations which are characterised by (at least partially) profoundly differing features generate insights into large-scale social phenomena of public policy reform? In this respect, I will argue against a comparison that defines characteristics in advance to then compare them, and suggest reading one site through the other instead.

2) Comparing two sites by reading one through the other holds the risk of the analysis becoming mastered by the contrast, i.e. differences becoming absolutes instead of being positioned in a broader (global) continuum. My presentation will elaborate my solution of this challenge by focusing on areas of activities in these sites rather than the two sites themselves.

ROGOWSKI, RALF* (University of Warwick, r.rogowski@warwick.ac.uk)

Autopoietic Constitutional Courts

The paper proposes that constitutional courts can be analysed as autopoietic social systems. It uses Niklas Luhmann's ideas on autopoietic organisations for an analysis of autonomy and self-reproduction of advanced constitutional courts. It looks at three areas in particular in demonstrating how this theory is capable of developing a new understanding of the operative complexity within constitutional courts: (1) procedural mechanisms of docket control and agenda setting; (2) self-reference through self-citation as the core of self-reproduction in decision-making; and (3) reflexive processes in addressing their own impact through the adoption of a consequentialist jurisdiction. a key thesis of the paper is that the more secure constitutional courts can operate as autopoietic organisations, the more influential they become in legal and judicial as well as political communications.

SCHAEFER, MARTINA (TU Berlin, ZTG)

Organizing the Smart Grid: The Underlying Meso-Level Social Order of Smart Grid Development

In the course of a transition towards a post fossil energy supply, the establishment of smart grids plays an important role. Although there are many smart grid demonstration and pilot projects, scientific insights on enabling and restricting conditions on a social level, remain scarce. From a sociological perspective the planning and implementation of a smart grid implies changes on different social levels. On a meso- level a smart grid requires new forms of cooperation and the mobilization of diverse actors as participants of the "intelligent" grid. First surveys show that 'trust' plays a decisive role in this context. The necessary changes therefore involve new organisational structures and ways of interaction. As part of the interdisciplinary BMWi-funded project "Energy Net Berlin Adlershof", we aim at analysing the outlined changes and aspects from the perspective of organizational sociology. We are looking at the process of integrating and mobilizing new actors – especially high technology companies - as participants of a smart grid. Applying the theory of strategic action fields we want to examine how a meso-level social order is established and how actors undertake strategic action "to secure the willing cooperation of others". Our questions are: *What are the main aspects that influence the willingness of different actors to cooperate? How can actors be mobilized to participate in a smart grid?* Furthermore there seems to be a crucial linkage between the willingness to cooperate and the generation of trust. The aim is to link the concept of social capital with the theory of strategic action fields. Furthermore it will be explored if approaches developed in sociology of technology on the role of infrastructure, can be made fruitful in this context. The research methods involve qualitative interviews and participating observations.

Socio-cultural determinants of HIV Risky Sexual Behaviors among adult Latinas: a longitudinal study of a community-based sample

The socio-cultural determinants of HIV risky sexual behavior trajectories among adult substance misusing Latinas have been examined by few longitudinal studies. To examine the trajectories and correlation between socio-cultural determinants and sexual risk behaviors among adult Latinas, we used a longitudinal design to follow a sample of adult Latina mother-daughter-dyads (N=282) for 8 years, and collected four waves of data. The current study investigated the impacts of the following factors:(1) Individual Determinants (e.g.,socioeconomic conditions); (2) Cultural Determinants (e.g., acculturation to U.S. culture); (3) Interpersonal Determinants (e.g., relationship stress, mother daughter attachment, intimate partner violence); and (4) Community Determinants (e.g., neighborhood related stress) on HIV risk behaviors (multiple partners, sex under the influence of drugs or alcohol, vaginal or anal unprotected sex in the last 12 months) . We used SAS PROC Traj modeling estimates for our group analysis. Based on group trajectories we found a high probability group (2) and a low/medium probability of engaging in HIV risk behaviors (1). Among the mothers, there was not significant change in trajectory among group two. Among the high risk group, mothers with partners were more likely to engage in high HIV risk sexual behavior. US born women and women who reported speaking English were more likely to fall into the high risk probability of engaging in HIV sexual risk behavior (2). Among daughters in the low to medium risk (1), the probability of reporting HIV risky sexual behavior decreased significantly with time lived in the US. Age and experiencing stress in the relationship were significantly associated with women falling into the high risk group (2). Our findings suggest the need for culturally appropriate interventions for foreign born high risk adult Latinas as well as U.S. born Latinas in general who may be at increased risk of HIV infection.

Social Events and Biographical Experiences. The Ayotzinapa Case in Gestalt Therapy Sessions

Social events impact on people´s emotionality and biography, even if they aren´t direct participants. In the last decade, Mexico has gone through a major social crisis, especially since 2006, when president Felipe Calderon initiated a "war against drugs", whose effects have been an extended social discomposure and a constant experience of violence suffered by the population. Although numbers differ, we know that Mexico has tens of thousands of dead, missing persons, orphans and displaced people.

A key event that has shaken Mexican society is the disappearance, in September of 2014, of 43 students from the Teacher´s College of Ayotzinapa, which has led to massive protests demanding the student´s reappearance, the clarifying of the case and justice for the victims.

The disappearance of the students created both indignation and fear in Mexican population. In supervision sessions, many Gestalt psychotherapists have referred that the Ayotzinapa case became a common topic in the sessions of multiple patients, since they feared they or their families can also become victims. Patients talked about what it was to live in Mexico, stated their reactions to the protests, asked themselves about the pertinence of joining them, and redefined their political postures. They also referred their coping mechanisms to face the situation: from participating in collective prayers to partaking in the demonstrations, debating with friends and family, posting information in social networks and increasing self-protection measures.

Therapists themselves were struggling to understand the situation, dealing with their own emotions, and consulting their colleagues on the best strategies to work with what was being told to them in the therapeutic sessions.

Since the narratives of therapists can provide insight into subjective understanding of these events, we will show through them both the coping mechanisms of the patients and the responses that therapists articulated to be able to accompany them.

Walking through Cultural Heritage: The Pleasure of Cultural Tourism

Mexico has a large tradition of Cultural Tourism. Under the same name, the most important program of this kind is operated by the National Institute of History and Anthropology. It consists of one day-long walking tours, each one conducted by a specialist who shows the public significant places of historic memory, and Mexican tangible and intangible heritage. *Cultural Tourism* was stablished in 1954 and nowadays it outreaches fifteen thousand people every year.

For the people that attends the tour, pleasure is a central facet and a motivator of the experience: it´s part of the time they dedicate to leisure. The walking tour is an aesthetic experience where subjectivities meet each other, not only because the walker socializes with other people, stablishing an identification with them, but also because the audience submerges in National History, which is presented to them as spectacular, monumental and enjoyable.

They also find pleasure in learning and deepening the knowledge they have of their cultural heritage, in finding themselves as being part of a historic community. It is a practice that culminates in the appropriation of public spaces by their bodies: the final purpose is not to go from one place to another, but to *watch.* Then, they walk calmly, making stops to contemplate beautiful places and sharing their feelings and impressions with their companions, but also with people that a few hours before where complete strangers (and in many cases they become friends afterwards –as found in many interviews we have conducted).

We will show how in the cultural tour, pleasure is found simultaneously in being entertained, having some physical exertion (a walk lasts several hours), relaxing, having visual and cognitive pleasure (learning), and socializing.

Opportunities and Tensions in Self-Help-Organizations As a Consequence of Participation Practices – Results from a Multiple Case Study in Austria

Background. Self-help organizations (SHOs) as supra-organizations of self-help groups (SHGs) accumulate experiential knowledge on structural deficits in healthcare and suggest improvements of healthcare provision. Therefore, SHOs mediate between SHGs and the healthcare system. In Austria, SHOs are neither systematically funded by government nor do they have an official mandate for patient representation. SHOs, when mediating/participating, are in a field of tensions both within the self-help-field and between the self-help-field and the healthcare system. The aim of the study was to examine the participative practices of SHOs and associated tensions.

Methods. A multiple case study approach was used to examine 15 SHOs in Austria on national and country level. Data were retrieved from semi-structured interviews with representatives of the organizations (board members, staff, SHGs) and published documents. Data were analyzed using thematic analysis.

Results. SHOs use multiple ways to inform the public and healthcare about patients' needs and to make suggestions for improvements. These include PR-work, networking and participation on healthcare boards. Their role in these boards is

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

mostly consultative. Participation in decision-making is rarely offered but would be appreciated as sign of equality among board members. A major challenge for participation is a lack of resources, both financially and regarding the means of voluntary members. This results in only few very engaged voluntary activists carrying out participative activities.

Discussion. Participation on healthcare boards offers SHOs an opportunity to make their voice heard, to raise awareness for their topics/concerns and to network. Although decision rights would be appreciated, awareness work and networking seem more important. Volunteers representing patients are at risk of being overstrained, but they have a key-role for mediating activities, bringing up needs in board-meetings and communicating issues from board discussions to SHGs. Especially the latter is at risk due to scarce resources.

Islamic Feminism in Iran: The Case of Zanan Magazine

This paper takes a look at the role of *Zanan* Magazine as a *subaltern counter-public* (Fraser, 1990) that articulated women›s issues in Iran from 1992 until 2008. First published in 1992, *Zanan* was the first magazine since the Islamic Revolution to introduce feminist discourse within the Islamic context in the country (Sherkat, 2009). The paper first looks at the historic context through which Zanan magazine was created. It then briefly introduces its three categories of content: religious discussions, feminist discussions, and social discussions (Eftekhari, 2003). It finally looks at the impact of Zanan in shaping Islamic feminism in the public sphere in Iran. Follwing Fraser (1990), we show that Zanan and its contributors formed a *subaltern counter-public* within the patriarchal sphere of the country by putting forward the importance of women's issues within the public sphere of the country. This meant that, as a medium, Zanan was the communicator of *the political* discourse in *the politics* of the country (Mouffe, 2005). As a space dedicated to a subordinate social group, Zanan was able to question normative assumptions surrounding religious, social and women's issues in the country by articulating the feminist discourse as an alternative way of looking at women's rights in the country.

Social Media and Professional Discretion in the Swedish Police

Control and accountability, as well as the impact of new modes of public management, are well-established themes in research about professional discretion. In these studies, however, digital technology often emerges as a passive component. Research do not fully recognize the impact of the different ways such technology is able to enhance communication, and distribute responsibilities or decision-making. This paper looks closer at the technological potentials of social media and how it fosters justificatory challenges for the Swedish police in relation to professional discretion. The analysis conceptualizes discretion as the practice of good judgment in professional work, but it also link discretion with the concept of affordances, reflecting technological potentials shaped by broader societal conditions. By introducing affordances the study is able to analyze the relation between technological capacities and how officers assess opportunities to shape their own work in relation to a set of societal values. The empirical material comprises semi-structured interviews with 30 respondents from the police. Observations of how police use social media platforms have also been done. The analysis identifies two technological affordances linked with police discretion; strategic association and mass-association. Strategic association concerns the technological capacity to connect with networks and actors of strategic importance. Mass-association concerns the technological capacity to generate a broader spread of information. Investigative and patrolling officers link these affordances with different concerns for how to legitimate their discretionary power.

ROLLE, VALERIE* (London School of Economic and Political Science, v.rolle@lse.ac.uk)

From Shared Uncertainties to Inequalities in Discontinuous Work Regimes. Professional Mobility within Actors and Independent Graphic Designers

Alongside the development of atypical employment, artists are frequently cited as a new type of creative, mobile and self-motivated worker (Menger, 2002). Yet, their situation reflects shifts in labour markets since the 1970s (Castel, 2009), such as tendencies toward entrepreneurship, over-flexibility and self-commitment in an economy structured by networks. From this point of view, my ongoing comparative study on actors and independent graphic designers documents how a project-based organisation of work in discontinuous employment contexts (intermittent work, self-employment) impacts on career path.

The literature has already stressed the key role played by State benefits (Menger, 2011), multiple job-holding (Bureau, Perrenoud, Shapiro, 2009), employment relationship loyalties (Proust 2002; Pilmis, 2007), as well as social familiarity with the art worlds (Menger 1997; Ravet, 2007; Rolle & Moeschler, 2014) in ones ability to overcome the uncertainties of creative careers. In that manner, "success" is related to an unequal set of resources, opportunities and inheritances. But the first results of my study also show that actors as well as graphic designers can successively experience upward and downward professional mobility during their career path. The broader social configuration (sex, race, class and matrimonial statuses, as well as social, cultural and economic capitals) in which they are embedded is then paramount. Indeed, it allows us to understand how the reclassifications accompanying social and occupational moves affect career path.

In a nutshell, across a thorough comparison of actors' and graphic designers' narratives (based on 30 in-depth interviews), I will address career inequalities by focusing on social and professional mobility on project-based markets characterized by discontinuity.

ROLO, DUARTE* (Universite Paris Descartes, duarte.rolo@parisdescartes.fr)

Travail Et Aliénation : Retour Aux Sources D'un Binôme Fondamental

Les premières formulations marxiennes sur la thématique de l'aliénation accordaient au travail un rôle fondamental. En effet, l'expérience du travail telle qu'elle fut analysée par Marx constitua un des pivots de sa théorie de l'aliénation. Pourtant, le caractère aliéné du travail dans le mode de production capitaliste n'est pas une fatalité, contrairement à l'idée répandue par certaines lectures de Marx.

Tributaires de ces lectures et influencés par le légat wéberien, les principaux théoriciens de l'École de Francfort ont entériné ce fourvoiement en assignant le travail exclusivement à la sphère de l'agir instrumental. Ils ont ainsi condamné cette catégorie aux gémonies, l'escamotant au passage de son potentiel normatif et moral, voire émancipatoire. Or, il nous semble que l'on peut aujourd'hui exploiter, à l'aide de travaux empiriques issus des sciences du travail, des voies laissées ouvertes par Marx. Celles-cis nous méneront peut-être à entrevoir le potentiel critique qui se niche dans l'expérience du travail.

La Participation De La Société Civile Dans La Crise Des Réfugiés: Le Cas Portugais

Le nouveau paradigme de la sécurité humaine cherche à conceptualiser le passage de l'approche centrée sur les États et leur propre sécurité à une approche axée sur des personnes. Cela entraine aussi une nouvelle centralité des questions concernent l'identité, la diversité et de la citoyenneté.

Dans un monde de plus en plus interdépendant, les menaces et les opportunités ne connaissent pas de frontières. La coopération devient donc la voie naturelle (voire nécessaire/obligatoire) dans le développement des relations entre les différents Etats de la région euro-méditerranéenne. Nombreux moments et forums de collaboration et de dialogue - dans ses différentes modalités, domaines thématiques et géographiques, tels que le Dialogue 5+5, le Processus de Barcelone ou encore la Politique Européenne du Voisinage - semblent en effet corroborer cette affirmation.

Mais la crise actuelle des réfugiés en Europe signale une réalité très différente, où le manque de consensus entre les dirigeants semble démontrer l'inefficacité de l'Union européenne pour faire face à cette crise humanitaire.

Au moment où l'opinion internationale s'interroge sur les circonstances dans lesquelles se produisent les tragédies successives dans la mer Méditerranée, et sur la façon dont les réfugiés sont reçus, le ton critique sur le rôle de l'Union européenne devient plus fort. Dans ce contexte, plusieurs incitatives de la société civile se développent, par la mobilisation de groupes de citoyens et des institutions civiles.

Le propos de cette présentation est de discuter le lien entre le paradigme de la sécurité et coopération euro-méditerranéenne, et les rôles des citoyens et des organisations de troisième secteur au Portugal.

Document officielles de l'Union européenne et ses États membres, et d'autres sources de documents témoignant de la participation de la société civile, y com-

Visual Narratives of Chernobyl: Venerating, Mourning and Healing

This paper describes the ways in which people in Belarus resort to vernacular religion in oder to overcome the consequences of the Chernobyl catastrophe. It gives an outlook on the approaches and interactions between official and folk religion in the process of coping with the ecological and worldview crisis. I suggest an analysis of the Russian Orthodox icons of the Chernobyl disaster and the Chernobyl monuments which are located on the Church ground. I demonstrate the usage of the objects of material religion in the emerged rituals of purification for food and houses, as well as veneration of icons which are known for curing the consequences of the radiation impact. I aim to describe what religious images, texts and allusions were used on the official and folk levels of religion while commemorating the Chernobyl disaster.

Social Topography of Innovation Space: On the Role of Institutions, Networks and Cognitive Space

Rapid increase in the extent and speed of globalization, increasingly blurred boundaries between the local and the global and the exponential development of information technologies introduced a completely new dimension to the dynamics of societal changes, creating the conditions of 'hypercomplexity'. In this process, technological and social innovations play a double role. On one hand, they contribute to this condition, as even relatively minor local innovations can have disrupting impact on a global scale. On the other, the ability of societies to create innovations is becoming increasingly important determinant of their adaptability to these conditions. Sociological research, equipped with tools for understanding the factors influencing societal processes, seems to be particularly effective in explaining innovative processes and their outcomes.

In this paper, we are analysing the factors shaping the social topography of innovation space. The theoretical background is Jens Beckert's theory of social fields. Hence, we model the influence of three social forces – institutions, social networks and cognitive frames – on social topography of innovation space. On the basis of data compiled from a variety of international comparative sources (Global Competitiveness Report, World Competitiveness Yearbook, Innovation Union Scoreboard etc.) we test our model by conducting a comparative analysis on a sample of 30 countries. We conduct, firstly, structural equation modeling to analyze the causal relations within the proposed model. Secondly, fuzzy-set analysis helps us to combine the theoretical concepts with the empirical data and identify the necessary and sufficient conditions and the possible combinations of these conditions in determining the social topography of innovation space. We conclude the paper by examining how we can use the three social forces in purposeful attempt to improve innovative performance.

Racial and Ethnic Health Disparities and Cardiovascular Disease Risk in the USA

We examined the relationship between race/ethnicity and cardiovascular disease (CVD) risk factors (i.e., clinically-measured triglycerides, total cholesterol, and hypertension) among 40+ adults in the United States of America (USA), with socioeconomic status (SES) and health behaviors as potential mediators or moderators. We hypothesized SES, as a "fundamental cause," and health behaviors, which are shaped by SES over the life course, would reduce the racial/ethnic effect related to CVD risk factors, comparing Mexican-Americans and non-Hispanic Blacks to non-Hispanic Whites (Lantz, et al. 2010; Link & Phelan 1995; Phelan & Link 2015). We tested our hypotheses with multivariate negative binomial and logistic regression models using the 2005-2008 cross-sectional waves of the nationally-representative National Health and Nutrition Examination Survey (NHANES; n=6,063), adjusting for age, sex, nativity, medications, and fasting for triglycerides or not. SES included total household income adjusted for family size and highest grade of school completed or degree received. Health behaviors included smoking status and the number of days per week participants drank alcohol in the last year. We also tested for interactions between race/ethnicity and SES and race/ethnicity and health behaviors related to CVD risk. Compared to non-Hispanic Whites, non-Hispanic Blacks have significantly lower triglyceride levels, lower total cholesterol, and higher hypertension. Additionally, Mexican-Americans have significantly higher triglyceride levels, similar levels of cholesterol, and similar levels of hypertension compared to non-Hispanic Whites. Adjustments for SES and health behaviors did little to explain existing racial/ethnic health disparities. In conclusion, we found racial differences in SES and health behaviors did not generally account for racial/ethnic disparities in CVD risk (i.e. the argument for the non-equivalence of SES by race/ethnicity). Persistent racial/ethnic health disparities in CVD risk for middle and older age groups were also somewhat inconsistent with increasing life expectancy trends among older adults in the USA (NRC & IOM 2013).

ROOTES, CHRISTOPHER* (University of Kent, c.a.rootes@kent.ac.uk)

Confronting Climate Change: Environmental Movements, NGOs and Others in England.

The history of environmental groups and organizations in England is long and rich. Despite decades of organizational innovation and the proliferation of new groups, the successful conservation organizations of the late 19th century are still the largest environmental NGOs in the country. By the 1990s, around one in five adults was a member of one of more environmental NGOs, and organized environmental interests enjoyed relatively good access to policymakers. Climate change was, however, not a pre-eminent concern of established environmental NGOs, partly because they already had other, more particular issue profiles, but also because UK political elites were relatively quick to recognize the importance of climate change, and to take it up, particularly in international forums. By and large, major ENGOs were content to contract an awkward issue out to the Climate Action Network, of which all became members. This changed after 2000, when it became clear that elite international deliberations were failing to deliver action proportionate to the problem. Thereafter, street demonstrations were organized at least annually to demand action on climate change, and new, more activist groups were formed, often with the support of established NGOs. The formation of the broad Stop Climate Chaos coalition in 2005 presaged the campaign by Friends of the Earth that led to the passage in 2008 of the Climate Change Act. Less visibly, a plethora of new, grassroots groups became active in the same decade – from the Carbon Reduction Action Groups and the Greening Campaign to the Transitions Movement, which prescribed 'energy descent' as a response to climate change and peak oil. This paper examines the dilemmas of both formal NGOs and grassroots groups as they confront increasing urgency of action on climate change and the continuing impact of financial crisis.

The Ontological Politics in the Theories of the South

In the last decade a project around theories of the south has emerged in the global debates of the discipline. The several contributions fluctuate around a geopolitical critique of the mainstream theoretical debates in sociology, claiming for the inclusion of processes and categories originated in the southern experiences. Although not declaring a necessary connection to the "ontological turn", most theories and empirical examples arising from these literature can be read as *ontofomative*. The paper analyses two main questions: a) the different degrees in which the ontological turn appears in the theories of the south; b) the possible contributions of these theories to the broader debates in the discipline.

Providing for a Moral Economy: Labor Unions and Worker Centers in Turbulent Times

"A fox is defenseless against wolves; a lion is defenseless against traps. A prince must learn to act like both the fox and the lion." N. Machiavelli

How can traditional labor unions and worker centers in the U.S. cope with the challenge of representing more low-wage workers after the crisis of 2008, while experiencing a fall in revenue? To answer this question, I collected data through one year of participant observation in a prestigious Chicago worker center. I triangulated my observations through in-depth interviews and documents. The evidence shows that many foundations that formerly provided funds to the worker center could no longer afford to do so after 2008, even though more workers sought the aid of the worker center. Traditional labor unions helped to close some of the center's budgetary gaps, even when unions also experienced declin-

ing member dues caused by drops in membership. The result of this transfer of union resources to the worker center was that the labor movement, holistically viewed, was better able to cope with the demands of tougher economic times. Worker centers, being unbridled by the regulations of collective bargaining and its political fetters, were able to proselytize for workers in harder times in ways that traditional labor unions could not. The actions of the worker center not only helped low-wage workers but also attempted to help traditional labor unions in Chicago by supporting a local "moral economy" where traditional unions could better strive. As such, this case study brings together literatures at odds on the question of whether bureaucratic or social movement activities are more effective to protect workers' interests. It argues that both strategies can help the labor movement act like Machiavelli's fox and lion, reinforcing each other to survive.

The Role of Independent and Alternative Media As Base of a Social Movement and International Solidarity: The Ayotzinapa Affair in Mexico and Europe.

The massacre and the enforced disappearance of students of Ayotzinapa's Normal Rural School in September 2014 in Iguala, Mexico, provoked great indignation and gave rise to a large-scale social movement both at the national, and international level. Although news were disclosed with some delay and only by institutional spokesmen and Mexican authorities, a part of the civil society reacted by organising manifestations of protest and solidarity with the victims, in many cities around the world.

Manifestations were not only carried out in the streets, squares or in front of the Mexican embassies or consulates. Protesters activated an independent media movement, which was used for diffusing alternative information in order to counterweighting the official media bias. Inside this "media movement" information has been exchanged through different channels: online and face-to-face.

Although there are several definitions of free and alternative media, common specificities are highlighted on issues of autonomy, horizontal organization and alternative information and different authors recognize to such media a potential of *civil empowerment* in social fights. Some authors have coined the term "mediactivism" or "informational mobilization", indicating that the production of the information represents a question of fight itself, especially in situations where essential rights are restricted, such as the right to information.

Based on a content analysis of interviews and media contents, we propose to explore the role of this independent media movement as part of the social organization of the movement for Ayotzinapa in Mexico and in different European cities.

Sexuality in the Migration Process: Latin American Migrants in Chicago and Buenos Aires

Societies seek to regulate various aspects of sexuality, such as with whom to interact and with whom not to, as well as what practices are allowed and which are not, at what point in life one should exercise and even when one can speak and when one is required to shut up. That is to say, practices, communication and thoughts are constantly regulated. However, these aspects do not remain static. Their change is slow. But some events, such as international migration, can complicate the scenario.

Our goal is to comparatively analyze male and female migrant's feelings about changes in communication, control strategies and sexual practices. Qualitative results come from research conducted with two Latin American groups; one of whom migrated to a northern country and the other to a southern country: a) Mexicans in Chicago, USA; and b) Peruvians in Buenos Aires, Argentina. Between 2001 and 2002, 48 interviews were conducted for the first investigation, and between 2005 and 2007, 45 interviews were done for the second one.

We will show that when one spouse migrates and the other remains behind, couples must learn to negotiate agreements on sexuality. Communication and standards become more flexible. Moreover, those who migrate find multiple possibilities for exercising their sexuality and begin to question the controls that held them while in their countries of origin. Thus, migration causes a crisis, although at least temporarily, concerning the habits and norms regarding sexual exclusivity, promoting new contexts of restriction and permission. Finally, although one of the streams studied is masculine and husbands tend to migrate earlier than their wives, while in the other the opposite occurs, we find similarities in the challenges that migration imposes on the sexuality of those who go and those who remain.

ROSEN, ROBERT* (University of Miami, rrosen@law.miami.edu)

No Exit: Law and Religion in Hong Kong's Movement for Universal Suffrage

During Occupy Central and the Umbrella Movements in Hong Kong, Christian shrines, prayers, bible readings and hospitality were salient. In contrast, Confucian, Taoist and Buddhist manifestations were very muted. In multiple ways, Christian rectitude was presented, as against Confucian compromise. The religion of the old colonizer was deployed against the new colonizer (China). Xi Jinping's habit of quoting Confucius was mocked and the moral lessons of Confucius and Mencius were cast as tools of the colonizer. Manipulations of secular laws (even if allowed under the Basic Charter) were tested by Christian religious truths. Human rights were not Western ideals, but the beliefs of more than the 11% of Hong Kongers who profess Christian faith. The downside of this use of religion in the public sphere is that it led to there being no exit from the confrontation. Compromise was impossible. The attempts by Hong Kong officials to find a compromise were rebuffed by the Christian rectitude of many of the movements leaders. Some might say that the occupiers were defeated, as the occupations fizzled, after injunctions against them were obtained. Others might say that the Christian commitment to non-violence was upheld because the injunctions allowed the police to be "legally" violent. And others might conclude that the important thing is not the victory, but that the occupiers were unsullied, able to return in the future as they remained religiously pure. Hong Kong's movement for universal suffrage exemplifies the roles religion can play in undergirding social movements for self-fulfillment and human security. Weber would not be surprised that conversions to Christianity are becoming common among Hong Kong young financiers. They use their Christian identity as a coin to show that they are ethical and can be trusted. So too, do many in these movements for universal suffrage.

Translators As Self-Entrepreneurs in Brazil and France: A Profession at Stake with New Public / Private Boundaries

Our paper proposes a comparative analysis of the impact of the rocketing success of self-employment on the profession of translator in the last years in both Brazil and France.

Since the mid-2000's, self-employment has been actively promoted in both Brazil and France. In both those countries, this modernized employment norm has aimed at organizing the grey zone between independent work, informal labour and wage-labour providing access to protections and entitlements (Giraud et al., 2014). In the profession of translator, this highly flexible and cost-containing employment norm overcomes the classical cleavage between independent and wage labour. More precisely, today's self-employment triggers a multi-dimensional process of transformation of the public / private boundary: First, by providing incentives to informal workers to enter an institutionalized form of employment; Second, by lowering the costs of opportunity for the firms to replace employment contracts by the acquisition of provision on the market; Third, by removing most institutionalized and collective protections from the standard employment relations; Fourth, by facilitating the possibility to transfer the work-place from the firm to the private homes of the workers and by easing the fragmentation of working-time.

In that context, Brazil and France make up two contrasted cases as regarding their historical and socio-economic contexts as well to a lesser extent to the legal framework of self-employment. The comparative analysis of the logics of redefinition of the four-dimensional private-public boundaries triggered by the employment norm of self-employment on the profession of translator will be carried out on the basis of in-depth interviews about the work trajectories of translators on both sides of the Atlantic.

Nations to Destinations: The Developmental Limits of National Tourism Marketing

This paper explores processes of national tourism marketing as a significant, yet understudied phenomena in the current global competition of nation-states to attract economic flows. As developmental paradigms today expanded to include the transformation of culture into economic assets, destination marketing and branding have become central activities of the nation-state. To turn themselves into desirable destinations, nation-states invest billions of US-dollar into their marketing capacities. This research focuses on the marketing activities of multiple nation-states in the sources of potential tourists, i.e. the places where

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tourist come from. This interpretative-comparative case study is based on 15 months of qualitative data collection (interviewing, participant observation, discourse analysis) in India and the USA. In these sites, the nation-states' destination marketing agencies, the National Tourist Offices (NTOs), try to reproduce the nation-state as attractive commodity images. Here, the NTOs cooperate with local marketing agencies, the travel media and industry to make the destination visible for the potential tourist (in newspaper articles, tour packages, etc.). As I argue in this paper, the practices of marketing have significant impacts on the possibilities of tourism development, as the audiences of potential tourists dominate them, the market of consumer demand. Through the case studies of India and the USA as such markets, I will show that destination marketing functions on two competing conceptions of this audience: 1.) The audience as actor that defines what is of value in marketing the destination, and; 2.) The audience as object to be manipulated through marketing. I argue that this dual conception of the audience on the one hand creates a space in which destination marketing operates and competition is possible. On the other hand it erects strict boundaries towards a realm that remains outside of the control of marketing and the nation-state.

ROSENKRANZ, TIM* (The New School for Social Research, roset997@newschool.edu)

Outsourcing the Nation-State: Localities of Expertise in Comparison

This comparative case study of national tourism marketing practices in India and the USA analyzes how the nation-state in global competition outsources itself into local, professional networks of expertise. This paper shows through the process of translating the nation-state into desirable commodity images for tourists, how localization in global tourism markets is based on competing claims to expertise. Today, professional destination marketing and branding have become central activities of the globally competing nation-state. This paper explores these efforts of the nation-state by focusing on the professional networks of destination marketing in two main sources of the global tourism economy: the USA and India. This research follows approaches that theorize globalization as connecting localities in a fluid yet particular relation. Accordingly, I apply the methodology of global ethnography that defines cases not as closed off, but as globally interconnected field-sites. Only the process of destination marketing itself delineates my field-sites (India, USA) conceptually and empirically as two distinct, comparable localities within the global tourist-scape. They are produced as such, because the National Tourist Offices (the official marketing agencies of the nation-state) divide the global field of potential tourists into separate regions of marketing, i.e. sources. Drawing on qualitative data collected through interviewing and participant observation, this paper focuses on the interactions between the National Tourist Offices (NTOs) and the local, professional actors who *translate* the nation-state into a tourist destination. I show how this destination circulates at the source through the hands of travel journalists, travel agents, and local marketers. This circulation embeds the NTOs in local fields of cooperation, but it also expands the process of image production beyond the nation-states' organizational boundaries. I argue that this outsourcing process is based on professional claims to expertise and knowledge, which shift away from the nation-state towards the local source.

ROSS, ROBERT J.S.* (Clark University, rjsross@clarku.edu)

Killing - Converging Narratives of Disaster at Rana Plaza: The Race to the Bottom in the Rag Trade and Corruption and Incompetence in Government.

At the second anniversary of the building collapse in which 1138 garment workers were killed on April 214 2013, a Bangladesh leader of a worker education NGO said: "This was not a tragedy, it was a killing."

The day before the collapse, April 23, workers noticed cracks in the fatally flawed building. The building owner, later described as politically connected thug, assured the factory managers of the firms located in his building that all was well, as he got locally connected engineers to assert his will. The next morning the workers in the building, among the lowest paid in the global apparel industry, were forced back to work. At least 1138 died, another 2500 or so were painfully injured and ripples of poverty ran through the families of Savar workers.

This paper –using US Department of Commerce and WTO databases -- sketches the global race to the bottom that creates a cruel and apparently inevitable pressure on factory owners, brand sourcing agents and retail buyers to force laborers into poverty wages and dangerous work. But as they face these conditions these workers lack an otherwise indispensable ally: a government willing to defend their rights, enforce legal conditions and guarantee their safety. Local and global forces create a matrix of corruption and lack of resource making government of little use and even an adversary. The paper reports quantitatively and narratively a history of fires and collapses in Bangladesh that show the twin forces at work.

Among workers' alternatives and those chosen by their allies is de facto privatization of standards and building code enforcement that can defend their lives. The paper concludes with a reflection on this particular solution.

ROSS, ROBERT J.S.* (Clark University, rjsross@clarku.edu)

Parallel Government, Privatization, Soft Law, Jobber's Contract, Union Power, and/or Ngo Leverage?: The Many Meanings of Progress after the Rana Plaza Disaster.

The passing of the second anniversary (April 24, 2013) of the death of 1138 workers at the Rana Plaza garment factory collapse in Savar, Bangladesh witnessed incremental improvements in factory and worker safety and the realistic promise of more accomplishments in the next two years. These improvements have been obtained through three separate but overlapping initiatives. These are the buyer membership Accord on Fire and Building Safety In Bangladesh ["the Accord"], the Alliance for Bangladesh Worker Safety ["the Alliance"] and the government's National Tripartite Plan of Action ["Tripartite Plan"]. The Accord, as of 2015, appears to be the most significant of these initiatives, and certainly the one most influenced by the local labour movement, its international labour movement allies, and the international NGOs associated with the antisweatshop campaigns of the last two decades.

There are numerous perspectives from which the Accord and Alliance may be analyzed or criticized. The title suggests each of them. The paper sets two contexts within which these terms may be relevant. One context is the cruel constraints posed by the Race to the Bottom and what Ross and Chan called South-South competition. Original and up-to-date data based extracted from US Department of Commerce and WTO databases will set this context. The second is the local context of Bangladesh governance and interviews gleaned from a field trip occasioned by the 2015 anniversary. These come together (or clash) as the allies of the relatively weak Bangladesh labour movement uses global allies to obtain local leverage. The result requires reflection. The paper will include material subsequent to 2015, collected from NGO and Bangladeshi contacts.

The Shadow of Big Data: Data-Citizenship and Exclusion

Big data are understood as being able to provide insights on human behaviour at an individual as well as at an aggregated societal level (Manyka et al. 2011). These insights are expected to be more detailed and precise than anything before thanks to the large volume of digital data and to the unobstrusive nature of the data collection (Fishleigh 2014). Within this perspective, these two dimensions (volume and unobstrusiveness) define contemporary big data techniques as a socio-technical offering to society, a live representation of itself. More precisely, within a system theory approach (Luhmann 1982, 2010), large-scale big data work as a boundary-drawing operation where the difference between the system and its environment is reproduced. Here the result of system observation is defined by what is made visible as (big) data.

Within this process "data-citizenship" emerges. Data-citizenship assumes that citizens will be visible to the state through the data they produce. On a general level data-citizenship shifts citizenship from an intrinsic status of a group of people to a status achieved through action. This approach assumes equal possibilities of action for every citizen, even if research has shown that an unequal distribution of participatory potential is unavoidable (boyd & Crawford 2012).

Data-citizenships echoes what was envisioned by Luhmann (2010): When society is defined through the metacode of inclusion/exclusion, persons (of which citizens are equivalent within the legal system) are emancipated depending on their ability of being data producers. To empirically explore this topic, the presentation will present preliminary results of an ongoing research about the digitalisation process in the Danish public sector. Through the analysis of specific examples we will show how those citizens who do not leave (digital) traces not only appear at the margins or entirely disappear (Bourdieu 1999) in the shadow of big-data.

Europeanisation By Under-Regulation? the Role of Brokering Agencies in the (Informal) Care Market Between Germany and Poland

This paper looks at cross-border care migration between Poland and Germany resulting in so called *live-in* arrangements. This field is highly influenced by EU regulation and Single Market integration. Since EU Eastern enlargement, in Germany (as well as Austria and Switzerland), private brokering agencies placing Polish care workers in German households have spread considerably. They have

　　*** denotes a presenting author.*　Abstracts are organized by first presenting author's last name.

become new players in the European care market and – first steps in this direction are observable – in European politics.

Europeanisation literature points to the fact that negative integration (market making) and legal uncertainties create opportunity structures inviting actors to pursue their interests. Our hypothesis in the paper is that also in the field of care migration regulation gaps of the multi-level system, legal uncertainty and a lack of European and national enforcement (capacity) have created new opportunity structures for market actors such as the above mentioned brokering agencies. While many of these agencies are prone to 'strain' the law, resulting at times in severe violations of minimum standards for decent work and human rights, certain agencies seem to have recognised the importance of quality and legitimacy for their competitive advantage. Particularly in Germany, associations of brokering agencies have emerged, working on the enhancement of the still rather unethical image of that sector, building on voluntary commitments to (both care and work) quality standards for their members. Interestingly, at least in parts of the sector, under-regulation by public authorities seems to be answered by self-regulation of the private market actors. These developments may be seen as an example of how transnational actors develop new regulatory mechanisms beyond the nation-state. Based on a literature study and first explorative expert interviews with agency representatives, understanding in-depth the functioning of such mechanisms of Europeanisation is the core aim of this paper.

Fatherhood in Five Nordic Countries: Policies and Practices

The paper provides an account of contemporary policies and practices of fatherhood in the five Nordic countries, Denmark, Finland, Iceland, Norway and Sweden. The Nordic countries are known for their long term emphasis on gender equality both in labour market as in family live, often referred to as the dual earner and dual carer model. The paper investigates the policies set out to support fathers in caring for their children and how they have contributed to shaping the practices of fathers in diversity of family settings. The paper asks how fatherhood is shaped in interaction between policies, cultures and the daily practices of fathers- highlighting both similarities and differences within the Nordic region. The paper applies a policy analysis as well as state of the art regarding the outcome of the policies and the effects on practices of fatherhood.

Theaster Gates: Chicago's Entrepeneurial Artist

Theaster Gates stands at the crossroads of controversies surrounding arts and neoliberal urban restructuring. In addition to debates about arts' use as an instrument of financial speculation; the role of the creative sector and the "university industrial complex" in urban development; arts driven gentrification and the displacement of low-income community residents and the role of non-profits as partners with the urban growth machine, Gates' (who is himself African American) activities intersect with issues pertaining to race and culture in Chicago, one of the most segregated cities in the United States.

Gates, whose work engages the post-industrial fragment, racism, and the Black experience, is an international art star. He is also the director of Arts + Public Life at the University of Chicago, implementing the university's goal to create a thriving cultural life in Hyde Park, the Chicago South Side community which was once a center of black life and culture, but, due largely to the university's "Negro Removal Projects" throughout the 1950's and 1960's, developed a reputation as a staid academic outpost, surrounded by impoverished black ghettos.

Gates has purchased properties with money from his art sales in the blighted, African American community of Woodlawn just south of the University's campus, converting them into studio and exhibition spaces and winning acclaim and funding for his "creative place-making" and community revitalization projects. Residents there continue to battle depopulation, gangs, violence and a steady drain of employment and social services.

My study of the "Gates Phenomenon" deploys participant observation and interviews with members of his organization, university representatives, artists, and other community members to shed light on how discourses concerning the arts, community, heritage, and culture are harnessed to legitimate and push forward economic development and at what costs and benefits to community members such agendas are put into place.

ROUCHDY, MALAK* (The American University in Cairo, mrouchdy@aucegypt.edu)

Egyptian RURAL Protests Between the Urban Imaginary Construct and State Politics

Between January 2011 and until 2014, successive waves of protests and uprisings took place in the Egyptian streets and shook the society at large, all calling for political change and social justice. Concomitant to these waves of protests, the socio-economic and political conditions for the majority of the population continued to decline at a vertiginous rate. A closer examination of the literature of this period indicates that protesters came from the vast array of the Egyptian society and different geographic regions. However, the participation of peasant wageworkers, farmers and rural residents, remained understudied.

This paper will focus on the practices adopted by peasant wageworkers, farmers and rural residents to mobilize and protest against the prevailing socio-economic and political conditions. It will examine closely the factors that brought together rural protesters in seemingly sporadic actions, and will situate their demands within the larger ever-changing socio-political scene. The paper will also demonstrate, through an analysis of the discursive practices of the elite, how rural expression of grievances remained an obscure social dimension that the successive centralized governments apprehended and used to consecrate societal fears.

Finally, this study will suggest that rural residents and farmers' protests were group actions that unfolded as citizen movements within the larger socio-political dynamics, and folded at times of cooptation and intense levels of state repression. These actions were seldom recognized and supported by urban milieu as they took place in regions that have been historically marginalized by the centralized state. Therefore, these riots and protests were not only the expression of contentious grievances but they were equally the illustration of a societal imaginary construct of urban/rural divide that has been consecrated by the ruling elites.

Provider-Initiated HIV Testing for Migrants in the Times of Austerity: A Qualitative Study with Health Care Workers and Foreign-Born Sexual Minorities in Spain

Introduction

Provider-initiated HIV testing (PITC) is increasingly adopted in Europe. The success of the approach at identifying new HIV cases relies on its effectiveness at testing individuals most at risk. However, its suitability to reach populations facing overlapping vulnerabilities is under researched. This qualitative study examined HIV testing experiences and perceptions amongst Latin-American migrant men who have sex with men and transgender females in Spain, as well as health professionals' experiences offering HIV tests to migrants in Barcelona and Madrid.

Methods

We conducted 32 in-depth interviews and 8 discussion groups with 38 Lat-in-American migrants and 21 health professionals. We imported verbatim transcripts and detailed field work notes into the qualitative software package Nvivo-10 and applied to all data a coding framework to examine systematically different HIV testing dimensions and modalities. The dimensions analysed were based on the World Health Organization "5 Cs" principles: Consent, Counselling, Connection to treatment, Correctness of results and Confidentiality.

Results

PITC was conceptually acceptable for health professionals although their perceived inability to adequately communicate HIV+ results and resulting bottle necks in the flow of care were recurrent concerns. Endorsement and adherence to the principles underpinning the rights-based response to HIV varied widely across health settings. The offer of an HIV test during routine consultations was generally appreciated by users as a way of avoiding the embarrassment of asking for it. Several participants deemed compulsory testing as acceptable on public health grounds. In spite of „Ÿ and sometimes because of „Ÿ partial endorsement of rights-based approaches, PITC was acceptable in a population with high levels of internalised stigma.

Conclusion

As PITC expands in contexts where overlapping stigmas coexist with austerity budgets, explicit extra efforts are needed to safeguard the rights of the most vulnerable.

A Sociological and Aesthetical Essay on Alain Resnais's Film Hiroshima Mon Amour

The aim of this text is to analyse the film "Hiroshima mon amour" (Hiroshima, my love - a black and white French film of 1959), directed by the French filmmaker Alain Resnais (1922-2014), in order to highlight some sociological aspects present in the film and to establish an interconnection between, on one hand, some aspects usually seen as more accustomed to the social and political discussion in the director's films (in this case, France during the occupation and the bomb of Hiroshima - both events bonded to the Second World-War), on the other hand, the subjective process, particularly the aspects related to memory and the romantic relationship of the female character (played by Emmanuelle Riva) in Nevers (during the war) and in Hiroshima (few years after the war). The main methodological procedure is the internal analysis of the film, giving special emphasis to the expressive elements of cinema, such as camera movements, framing, music, dialogues, gestures etc. Thus, resuming the aesthetical discussion (analysing plans and musical repetitions, the "juxtaposition" of the two stories and images from Nevers and Hiroshima (among others) it is intended to explore social and political issues presented in the film, particularly, the flow of memories involving a character who survives in a world that has lived the experience of the war and the "annihilation". This proposal is part of my ongoing research called "The becoming Inhuman of human. A sociology of "non-actual" in Alain Resnais's work. Studies on Sociology and Cinema, which also includes the films "Nuit et brouillard" (1955 - Night and fog) and "La guerre est finie" (1965 - The war is over), both from the same director.

Espace Public ET Vies Privees Sur Facebook Des Femmes Politiques Roumaines

A la suite des changements paradigmatiques des deux dernières décennies décelables au niveau de la théorie ainsi que de l'empirie, nous nous proposons de voir comment la multimodalité (ressources sémiotiques et ressources matérielles) s'articule aux nouvelles pratiques digitales (*facebook* en l'occurrence) dans l'espace public politique roumain.

Les réseaux sociaux ont pris une place grandissante dans la vie des politiciens aussi bien que dans celle de tous les citoyennes et citoyens, depuis le fulgurant succès d'Obama en 2008, mais aussi depuis l'hybridation des genres liée à la centralité de l'oeil ("Centrality of eye" -Chris Jenks, 2003 , "scopic regime" -Martin Jay 1992 ,etc.), l'accroissement des contenus générés par les usagers et la complémentarité des codes sémiotiques (Jewitt 2010,2013, Kress et Van Leeuwen 2006 etc.).

Ce potentiel de multimédialité et intermédialité détermine l'efficientisation,la vi-lisibilité et la mémorabilité des figures et des messages.

Dans un premier temps nous essaierons de mettre en évidence l'articulation des principales tendances déterminées par la multimédialité et intermédialité pour nous arrêter à la manière dont les politiciennes communiquent sur *facebook* par leurs images (professionnelles/vs/personnelles), en cernant les changements (?!) que *facebook* a apportés.

L'un des principaux objectifs sera d'acquérir une réflexivité nouvelle dans la déconstruction de la dynamique du visuel et de la culture visuelle ainsi que dans l'approfondissement des fonctions existentielles, éthiques et politiques de la "vie visuelle".

ROY CHOWDHURY, ARNAB* (Indian Institute of Management Calcutta (IIMC), arnab.roy2007@gmail.com)

'Stranded in the Sea': The 'boat People' of South and South East Asia

In May 2015, a large group of about eight thousand people travelling in fishing boats and trawlers, tried to enter Malaysia illegally (via Thailand) through sea-faring routes. The Malaysian government refused them entry into the country and virtually left them floating in the sea. As a result of this, many children, women and older people died. Later, with aid from Qatar government, Malaysia agreed to give these people asylum and the status of political refugees.

Each year, huge numbers of poor Muslim labourers from Bangladesh and Rohingya Muslims from Myanmar try to migrate to countries like Malaysia, Thailand, Philippines, and Indonesia, illegally on 'boats' through sea-routes mediated by human traffickers in search of good life and bright future. They are hapless people fleeing from poverty or persecution, and in search of livelihood in distant lands. Hailing from Chittagong, Cox Bazar and Sylhet, some of the poorest districts of Bangladesh and the Arakan (now East Rakhine province) of Myanmar, they are often duped by human traffickers. They pay a proportionate sum of money to human trafficking agents just to find work in the 'host' countries, and instead end up being slaves, or even worse face gruesome death. If they remain alive, these traffickers take ransom and extortion money from the impoverished families of these people before releasing them.

This paper is the result of the author's 'ethnographic' involvement with a two year long project among these 'boat people' in Bangladesh and Thailand. The paper discusses what leads these poor people to embark on such insecure and dangerous journeys. It talks about the precariousness and liminality of their lives. It engages with issues of 'forced migration', and migration due to 'push' and 'pull' factors, and certain scenarios in which these factors might get 'intermeshed' and 'inseparable' from each other.

Faces of Rurban Mobility of Artists in Slovakia

Rurbanizaton is often being considered in the context of rurban policy with the aim of rural development. It represents a chance for revitalization of countryside by introducing some of the urban features, while at the same time preserving the rural ones. In the conditions of highly industrialized and urbanized countries, mobility of the urban population to the countryside shows various forms and functions. One of the vectors of this mobility is also the mobility of artists from the city to rural areas, which serves as a source of inspiration for artists, but also as a stimulation for overall process of rurbanization.

Our paper aims for mapping the trend of mobility of artists in Slovakia who moved from urban to rural area, and for comparing this trend with the situation in other countries. We are looking for answers to the questions of what are the artists' motives for leaving the city and moving to countryside, if and how mobility affects the manner of artistic creation, nature of works of art (topics, genres), ways of distribution of works of art, and its reception. We pay particular attention to mobility of artists in Slovakia from the point of view of post-socialist transitions. Methodologically, the technique applied is semi-structured interviews with visual artists, whose mobility seems to be the most visible among diverse artistic professions at present. Mapping of artists' mobility from city to village allows us to identify more concrete processes of changing social contexts, and vice versa, to see how the mobility of artists is reflected in the processes of rurbanization. The comparison of different geographical localities permits to see local particularities of rurbanization.

RUEDIN, DIDIER* (University of Neuchâtel, didier.ruedin@unine.ch)

The Representation of Ethnic Groups in National Legislatures

The political integration of ethnic minority groups is a key aspect of democratic governance and the legitimacy of regimes. This paper examines the extent to which ethnic minority groups are present in national legislatures – levels of descriptive representation. The comparative analysis covers over 115 democracies and focuses on individual legislators rather than ethnic parties. Both institutional and cultural variables are considered, and to a limited extent associations over time are explored. Preliminary results suggest that, once controlling for the ethnic make-up of society and cultural attitudes, electoral aspects seem of little significance. This is in contrast to what much of the literature suggests. The results cast doubt on the argument that the electoral system on its own – PR systems are often highlighted – is dominant in shaping political representation. Discussing implementation issues, the paper questions the effectiveness of institutional engineering in contexts where cultural attitudes are not supportive of the political inclusion of ethnic minority groups. It appears that levels of ethnic group representation are best explained with cultural variables, in particular liberal attitudes toward marginalized groups in society.

Indian Migrant Women's Biographies: Revisiting Transnationalism in South Africa

Migration has traditionally been seen as a primarily male domain, particularly in developing countries. However, global practices have increased the visibility of women migrants such that the feminisation and irregularization of migration has led to new flows of transnational migrant movements particularly to South Africa. This paper draws attention to the growth of south-south migration, specifically focusing on Indian women's migration to South Africa. The paper is based on exploratory research using qualitative interviews conducted with married and unmarried Indian women. Contrary to dominant migration literature that shows women migrating as dependents, this group of women, from various social backgrounds, migrated independently to South Africa. The paper explores the reasons for their migration, their choice to migrate specifically to South Africa, and how

gender is constitutive to their decision to migrate to a developing economy. The paper further explores the way gender relations are produced and reproduced in these transnational spaces, the nature of networks and migratory strategies that challenges the hegemony of traditional and patriarchal households. The paper purports that there are new forms of migration patterns that women undertake: as single women choosing to empower themselves; as educated, professional and mobile women; for reunification and career advancement, and as migrants who display agency by seeking opportunities in south-south migration. Set against the background of Newendorp's (2010) transformative effects of migration, where migration opens up new ideas of consumption, challenges work and family roles and new forms of leisure and recreation, the paper examines how these women view South Africa as a 'second home' as south-south migration opens up new ways of understanding their gendered lives and how they set about reconstructing their lives in South Africa.

RUGUNANAN, PRAGNA* (University of Johannesburg, prugunanan@uj.ac.za)

The Politics of Heritage, Religion and Identity in Johannesburg, South Africa

Fordsburg, constructed in 1888, was one of the early suburbs to be proclaimed after the development of the gold mines in Johannesburg in 1886. Initially created as a white working-class immigrant mining community in the late nineteenth century, Fordsburg becomes an Indian suburb and takes on an oriental identity in the 1940s, an identity forced upon it by the politics of the South African apartheid government. Post democracy, a diverse range of ethnic groups from Somalia, Ethiopia, Egypt, Morocco, to migrants from China, Pakistan, Bangladesh, India and Nepal, have entered South Africa as documented and undocumented migrants. The focus of this paper is based on empirical findings and shows how old and new migrant communities reconstruct space, place and identity within a contested political heritage. Many of the new migrants are Hindus and Muslims, the symbols and sites of their worship and faith adorn the physical landscape of Fordsburg. The choice to migrate to Fordsburg was purposeful; prior established networks and an Indian diaspora identified Fordsburg as a 'Muslim' place and an 'Indian' place. This Muslim identity featured strongly in the narratives of the migrants, subverting a Hindu identity such that religion became the central focus around which migrants construct their lives. Migrants depict their agency in choosing South Africa as a destination because of its economic potential, religious tolerance and the freedom to practice their religion. The paper asserts that migrant identities are fluid, situational and subject to change depending on social location, the space and place of the migrant's position within their communities. Set within the literature on Lefebvre's (1991) production and power of space, religion forms a conduit for the politics of heritage, memory, identity and place in Fordsburg, Johannesburg.

RUHSE, VIOLA ELISABETH* (Danube University Krems, violaruehse@yahoo.de)

Duane Hanson's Sculptures of American Everyday Life

Duane Hanson (1925-1996) is well-known for his hyperrealistic life-size sculptures. His main subjects are the common, everyday Americans from the middle classes. Hanson paid particular attention to laborers and the elderly that are often overlooked. In his late years, he focused also on racism and poverty. He favoured especially polyester resin and fiberglass as materials for his true-to-life sculptures. Hanson copied every small detail of his selected models and completed the finished sculptures with real clothes and consumer goods as accessories of everyday life (e.g. a FILA t-shirt, Coca-Cola bottles, a chocolate sundae, a copy of the magazine "Soap Opera Digest").

Hanson's interest for daily life is influenced by Pop Art. Furthermore, he is particularly interested in sociology. He transforms not only daily consumer goods that seems to be banal and trivial into iconographic material, but he also shows a critical attitude towards consumer culture and the marginalisation of certain groups. He draws attention to the solitude, despair and frustration of the middle class. Thus, the impersonality and alienation of modern American life is visualized in a vivid and powerful way. Hanson's wants to show provocatively that art does not have to be "on a pedestal, beautiful, far removed from everyday living". As he wrote in 1982, Hanson wants to support a social change "by making the viewer become aware of something in life that was always there, but was unnoticed".

In my paper, I would like to analyse the sociological aspects in Hanson's aesthetics from the perspective of visual culture. Special consideration will be given to Hanson's attention towards everyday life that is fundamental for his realistic sculptures and his humanist and democratic attitude.

European Borders. Between the Dwelling and the Content.

Considering the latest events taking place at Europe's borders, mainly in the Mediterranean coast, this paper aims to analyze this Europe's borders and the different actors operating there. Containment and differentiation of "them" and "us" are discourses that seek to legitimize an opening or closing position about the reception of thousands of people who every day try to get in a Europe that seems to shield itself legally and physically.

Borders are understood as geographic delimitation, but also as containers of social realities that pretend to establish a clear differentiation one from each other. This happens especially in this case in which Europe must stand as an emblem of Human Rights, meanwhile doesn't want to permit thoroughfare to the massive population crowding its borders. But, what do we face? We face a strong inner contradiction, as a sign of a confused and tumultuous time, which becomes the object of our analysis.

This communication aims to show a reflection about the role of European borders in the known as worst refugee crisis since World War II. Which is the role of sociology in the conformation of this phenomenon as a new social issue? This will be one of the main questions to be tackled. This communication aims to analyze the role of the Europe's Borders in forming an idea of refugee and the role of de Social Sciences in this phenomenon.

Humanitarianism: Between Morality and Action

This paper aims to focus on the humanitarian concerns that seems to be in force since a few years ago and plays an important role in the contemporary global context. "Different aspects of the humanitarism will be analyzed: its genealogy from its earliest concerns to its actual conformation, the moral aspect as well as the practice itself, and finally its great importance in today societies".

We will study humanitarian action as a mechanism that combines two worlds in one: on one hand, the moral, playing that role from the point of view of moral formation in the society that develops this action and, on the other hand, acting directly in the context of the situations to which it is directed.

This paper seeks to make a historical review and focus its attention on how the concern on suffering subjects is translated through the analysis on refugee population. A concern that becomes relevant since World War II, and that is seen by many people similar to present times. To face this situation, Europe acts in a contradictory or opposing way: it creates stronger border's surveillance while tries to promote action protocols, while in the middle of a strong debate about the responsibility of each agent. The communication will intend to analyze this double point of view on morality and action facing current events.

RUMMERY, KIRSTEIN* (University of Stirling, Kirstein.Rummery@stir.ac.uk)

Comparative Social Policy and Policy Transfer: The Example of Gender Equality and Care Policy

This paper is a reflection on the usefulness and desirability of policy transfer arising out of comparative social policy research. It is based on the theoretical and empirical findings of the Fairer Caring Nations project, funded by the UK Economic and Social Research Council as part of the progamem of work carried out around the Scottish referendum on independence in 2014. The project aimed to draw lessons on how to achieve gender equality using childcare and longterm care policy, and apply those lessons in a national and regional policy context. The research used a systematic Comparative Qualitative Framework to identify six case study countries/regions which scored highly on the Gender Equality Index, and to use policy transfer theories to examine whether it would be possible to

construct a 'best policy' scenario that would be applicable in a similar socio-economic welfare state with a lower Gender Equality Index.

Constitutional change (such as increased devolution to Scotland following the referendum) provides a unique 'window of opportunity' to effect policy change. This paper will both present the theoretical and empirical findings of the project, and provide a critical reflection on the opportunities and challenges presented by attempted to achieve applied policy transfer from academic research carried out during turbulent times.

It will be of interest to scholars working in comparative research, gender equality, childcare, longterm care and those interested in national and regional social policy developments; and to those attempting to work in an applied way to engender policy and practice change from academic research.

Science Fiction As a Path to Explore the Future of the Anthropocene and Worlds in Preparation: Representations and Imaginaries of the Habitability of the Planet

Should humanity prepare for life on a less and less habitable planet? As suggested by the term "anthropocene," visible traces are no longer mere scratches on the planetary surface. If, given the magnitude of human activities, the challenge is to think about their consequences, it is useful to explore what imaginative foundations can be used as a basis for collective reflections. From this point of view, science fiction may have the advantage of having anticipated the movement. By initiating and accumulating thought experiments, it offers a cognitive reservoir and a reflexive medium. Its representations are also a vehicle for interpreting the world. One of the few places where one can see "future generations" live, act and organize is science fiction and its imaginary constructions.

The method proposed here is to consider these fictional works as a form of problematization (in the sense of Michel Foucault). Starting from these bases, the proposed contribution will be organized in three sections. The first will show how science fiction, when it deals with ecological dimensions, can be in its way a problematization of planetary habitability and of issues that underpin the notion of anthropocene. The second will show the limits of the classical divide between utopia and dystopia and propose a reopening of the possible modes of apprehension of imaginable futures, precisely by considering the science fiction narrative as a vector of projective exploration of the future. While defending the idea that it is better to take science fiction productions as lines of flight (in the sense of Gilles Deleuze), the third section will aim at identifying and classifying science fiction that, in environmental matters, searches for new or different directions (particularly compared to the currently dominant model). The contribution will thus seek out adaptation pathways that appear closer to the register of hope.

What to Think about Think Tanks - Towards a Conceptual Framework of Strategic Think Tank Behavior

Expert advice is gaining importance in advanced knowledge societies. Particularly the demand for scientific knowledge increases as political decision-makers look for answers that help them coping with the ever more complex challenges of a globalized world. Likewise public discourses tend to rely on scientific knowledge for scientifically produced evidence developed into a strategic resource to justify world-views and political positions. Against this background the observed 'global spread' of so called think tanks, seems to respond to this growing demand. Defining what a think tank is, let alone what they´re doing and if they are able to effectively shape political ideas is yet a controversial issue. This contribution outlines a comprehensive conceptual framework for analyzing the strategies of different types of think tanks in distinct institutional environments. Starting with classical typologies to distinguish between organizations, which adhere to standards of scientific inquiry at the one end of a continuum and ideologically biased institutes at the other the analytical model takes into account distinct 'points of intervention' and systematically considers the respective institutional and ideological environment. The first dimension allows for distinguishing between distinct effects of political ideas: They can influence decision- making as concepts in the foreground or as underlying assumptions in the background of policy debates. At the cognitive level they can function either as *programs (*foreground), that is they serve as policy prescriptions for the political elite necessary to formulate actual agendas, or as *paradigms* (background) (cf. Campbell 1998). Considering different 'knowledge regimes' (Campbell, Pedersen 2011) permits to test for the influence of respective institutional and normative settings. In consequence it becomes possible to analyze how think tanks shape and are in turn shaped by their environment.

RUSH, MICHAEL* (University College Dublin, michael.rush@ucd.ie)

Theory and the Meaning of State Feminism and Global Patriarchy

Theories of patriarchy are central to a range of social sciences including sociology, gender studies, psychology and social policy. Previous research involved theoretical schisms between familial-based theorisations of patriarchy concerned with fathers as heads of households and meanings derived from concepts of hegemonic masculinity or patriarchy as a global system of male dominance. These latter theories tended to eschew any inter-generational aspects of patriarchy in favour of a focus on power imbalances between adult men and women and the social reproduction of gender inequalities. This paper revisits sociological meanings of theory, not in order to resolve these schisms, but rather to highlight their significance to gender studies and comparative social policy research on welfare state variations in the social citizenship rights and welfare outcomes of men, women and children. The analysis is based on a historical review of cross-national epistemology and policy. The review is focused specifically on countries with convergent work-life balance policies involving paid and individualised parental leave provisions combined and with varying degrees of children's social citizenship rights to centre-based childcare arrangements. The countries include Sweden, Germany, Japan and Portugal as exemplars of Nordic, Central European, East-Asian and Southern European welfare regimes. The study reveals that the concept of 'state feminism' has gained significance to feminist epistemology on gender equality and welfare state variations. The study proposes that national level concepts of 'state feminism' and regional-level concepts of Nordic feminism, East-European feminsim and East-Asian feminism are central to explanations of an epochal decline in global patriarchy or de-patriarchalisation and also to understanding the concept of neo-patriarchy and facets of re-patriarchalisation in advanced welfare states, particularly the USA.

Fathers and Antenatal Education in Italy. a Challenge for Gender Equality.

Pregnancy is a significant event marking men's and women's life courses. The experience of pregnancy and childbirth is no less profound for the father that it is for the mother. However there has been little research investigating this aspect of men's transition to fatherhood. There is a need for research investigating the role of fathers during pregnancy and childbirth and men's participation in antenatal education. This in order to understand if and how a careful involvement of fathers during pregnancy may positively impact on mothers' health, children's well-being, a better fathers' involvement in children's education, and gender equality.

Aim of this paper is to explore this aspect of men's transitions to fatherhood in Italy: if and how expectant fathers are involved in antenatal education. The data were collected in Milan through two data collection means: 6 qualitative interviews to key informants (obstetricians and birth-class instructors) conducted in February 2015; around 100 structured interviews to expectant fathers conducted in the period 2007-2013. The data clearly highlight the importance of antenatal education for expectant fathers; they also underline the need to introduce significant changes to better meet the needs of both mothers and fathers.

Our paper *draws* upon the results of a study (study team composed of: Alessandra Andrisani; Roberto Fumagalli; Marco Inghilleri; Lia Lombardi; Maria Cristina Ortu; Valeria Pecorelli; Elisabetta Ruspini - University of Milan and Padova) that tried to answer the following questions: How do expectant fathers respond to pregnancy? How do men feel about the physical and behavioral changes in their partner? How are birth classes organized? What kind of information are offered? Is there a positive interaction between fathers' attendance at antenatal classes, their involvement in childcare and their attitude toward gender equality in childcare? How do fathers feel after childbirth?

RUZZEDDU, MASSIMILIANO* (University Niccolo Cusano Rome, mruzzed@hotmail.com)

Common Goods and Political Participation in Rome

The phrase Common Goods has a double meaning: on one side, it denotes cases of active citizenship, where organized groups manage public commodities like community gardens, abandoned buildings etc. Generally speaking, the social actors involved are groups of neighbors or friends, just aiming to improve the life of their communities, with very little consideration for global or universal social-political issues.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

On the other side, this phrase refers to a criterion of interpretation of the world and orientation of collective action, aiming to a radical change of the current social order. In other words, the Common Goods theory has become a theoretical reference for a large number of activist groups, which are trying to propose a different kind of organization for the social activities of wealth production and distribution.

However, the two categories sometimes overlap and, since the years 2010s, there have been many examples of public commodities, such as dismissed theaters or abandoned buildings, managed by groups of activists, whose aim is not only to give a contribution to their own community, but also to imagine and realize different ways of social and economic organization.

My presentation will focus on the main cases of this category that have taken place in Rome, like Teatro Valle and Cinema America and their evolution though the time.

Namely, trough a content analysis of their on line activity a well as interviews to privileged witnesses, I will try to assess if now the CG theory is still an important instrument of sense-making, like it used to be a few years ago, or if the involved actors rely on other theoretical references to define themselves and their political/social aims.

RC51-589.2

RUZZEDDU, MASSIMILIANO* (University Niccolo Cusano Rome, mruzzed@hotmail.com)

The Notion of 'Phase Transition' in the Social Science

The notion 'phase transition' is one of the most important in the system and complexity theories. It denotes the passage of a system to a different condition. Actually, the use of notion is quite more frequent in the natural science, especially physics, and includes phenomena like liquid to vapor, not-magnetic to magnetic etc.

This presentation will explore the epistemic potentiality of this notion within the social sciences, where this category denotes all the cases of social change of a system, no matter if global, national or local.

More precisely, I will focus on the difference between the first order and the second order phase transitions. While the first describes an abrupt change from one state of order to another, the second refers to gradual and fluid changes, with high degrees of chaos in the between.

The point is that, while the social structures change according to second order phase transitions, with chaotic states such as strives, conflicts and other turbulences, the social representations of change are habitually first order. In other words, gaps can arise between social actors, which figure out immediate and complete changes, and structural changes, which are slow, incomplete and unclear.

Namely, those gaps are nowadays most frequent in the contemporary political-juridical domains, where political programs and/or laws are issued to quickly respond to an ever growing number of social demands. The consequence is that those programs fail to meet those demands, like in the case of school reforms in Italy.

Basing on this idea, I will try to draw a theoretical model, that can give account of the possible failures in the political goal implementation, in term of conflicts between legal/political systems, that hold first order phase-transitions, and the social structure that changes through second order phase-transitions.

Participatory Assessment As a Tool for Exploration and Transformation of Youth Participation from a Community Perspective: The Case of L'hospitalet De Llobregat (Catalonia)

This paper presents the process and the results of the participative assessment which is part of 4 years research "*Social cohesion, culture and participation: action research in the city of Hospitalet de Llobregat*" (I+D EDU2013-46704-R).

The participative assessment is built on theories that conceives neighborhood as a basis for communitarian relationships, in particular for youth. At the same time, neighborhood is understood as a context and key actor –composed of entities, social agents and civil society– to develop new ways of integration and social cohesion. The participative perspective allows the implication of the involved actors as a motor of the communitarian transformation.

The aims are: 1/ to explore the participation level of the youth who live in the three chosen neighborhoods, 2/ to identify contexts, places and ways of participation, 3/ to give the voice to youth and social entities, and 4/ to move forward to a citizenship model in which social basis was included in the communitarian process for the making decisions process.

The data-collection sources are: neighborhood context reports, sociogram which social entities and relevant specialists in the neighborhood took part and survey about interests and perceptions of youth.

Some results are: comprehension map of social services, relevant actions and entities to understand participation patterns of youth, contextualization report of the neighborhood at territorial level and as a social agent, and visibility of resources and participation ways as an opportunity to develop general actions in order to promote participation of youth in the territory.

Nuakhai the Replica of FOOD Culture of Western Orissa Tribal People a Case Study

The number of tribes that reside in Orissa is the highest anywhere in India. They are also the most backward in the economic ladder of Orissa. Different tribes have different culture, traditions, language and rituals. Various tribes engage in different occupations, but most are either into agriculture, fishing or hunting. Nuakhai is the agricultural festival of the tribal people. It is culture of the tribal dominated area of Western of Orissa. It is a festival for the worship for food grain. It has its best celebration in **Western Orissa**. Nuakhai is observed to welcome the new rice of the season. It is observed a panchamitithi (the fifth day) of the lunar fortnight of the month of Bhadrapada or Bhaadara (Aug-Sep) the day after the Ganesh Chaturthi festival. It is a social festival of kosal tribe in **Western Orissa**. Thus the study explains the ancient origin and current significance of Nuakhai as most important agricultural festival which played a major   role in promoting agriculture as a way of life. Nuakhai is now celebrated as a symbol of sambalpuri culture and heritage. Nuakhai is the occasions were tribal people dedicated their first food grain of the year totheir deity to get Her blessing. The rituals of Nuakhai are first observed at the temple of the reigning deity of the area or to the village deity. Afterwards the people worship in their respective homes and offer rituals to their domestic deity **Lakshmi** (the deity of the wealth) Thereafter follows the Nuakhai Juhar, which is the exchange of greetings with friends, well-wishers and relatives. This symbolizes **unity.**

The Effects of Globalization on Employee's Emotional Intelligence Job Satisfaction.(A Case Study)

In respect to the pressure of globalization, increasingly competitive markets and volatile market dynamics, the roles and responsibilities of workers at their job places are hard pressed. In the globalization era each and every organization wants to compete the world's changing scenario. . The global competitiveness of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Indian industry and also its employment generation potential is clearly dependent on availability of required skills, emotional intelligence.

The present world demands higher level of interrelation, mutual understanding and greater productivity. Job satisfaction is an attitude of an employee over a period of his job so the factors of satisfaction and dissatisfaction charges over the period jobs. So factors of satisfaction and dissatisfaction changes over the period. Goleman's Emotional Intelligence theory of performance had direct applicability to the domain of work and in predicting excellence in all jobs from sales to leadership (Goleman 1998).

EMOTIONAL INTELIGIENCE & JOB SATISFACTION

All types of works are not inherently satisfying. It is generally considered that employees with higher emotional intelligence will have higher job. Satisfaction.

Objective

1. To examine the effects of globalization on employee's emotional intelligence, job satisfaction.

2. To interpret - total score of emotional intelligence scale with total score of job satisfaction scale.

Method

Data were collected by using emotional intelligence scale and job satisfaction scale.

Findings

The values of correlation for employees of 25yrs- 40 yrs scores on emotional intelligence and job satisfaction in was found to be significant at 0.05 level of confidence i.e (0.262)*. So it may be inferred that employees with high emotional intelligence exhibited better job satisfaction and vice- versa in global competitive world.

Land Battles in the Motor City: A Field Guide to Subverting Neoliberal Land Policy from Detroit

The spectacular divestment and abandonment of Detroit has been well documented academically and in the media. Post-bankruptcy, Michigan's largest and most populous city is back in the position of battling social issues that have plagued the region, like all former industrial cities, for generations. One of the most pressing issues is what to do with the near 40 square miles of vacant or unoccupied land, comprising roughly one-third of the city. Enter the newly formed Detroit Land Bank and Detroit Future City – "a highly detailed long term guide for decision–making by all of the stakeholders in the City." DFC envisions transforming large swaths of the city into water catchment areas and "creative-development zones."

Combined with neighborhood re-branding efforts and massive public transfers into private hands, the future in "Detroit Future City" looks bleak. But residents' resistance and refusal to relinquish the neighborhoods they call home has made those plans uncertain. This paper will look at the ways in which communities in Detroit have come together to slow down and disrupt "urban renewal," and take back land in a city where vacancy and abandonment abounds, specifically in the downtown ("Illitch-ville"), southwest ("Springwells Village") and east side (Hantz Farms) areas. These cases all involve private developers, wealthy local investors, massive land giveaways and a whole cadre of non-profits – which gives an illusion of community input. Perceptions frame the resistance: in Southwest, the rebranding has been called 'neocolonial'; Downtown is viewed as a playground for the rich and many east side residents have turned vacant land into farms as a means to stave off land grabs and provide sustenance. These struggles put Detroit at the vanguard over "rights to the city" (Fainstien, 2010) and should serve as a clarion call to land-rights activists and academics in the neoliberal era.

SABBAN, RIMA* (ZAYED UNIVERSITY, rima.sabban@zu.ac.ae)

Precarious Motherhood

Homes/households in the United Arab Emirates (UAE) are increasingly becoming grounds for precarious motherhood. Two forms of precariousness in living motherhood are at play: national motherhood, which means mothers who are UAE nationals, and foreign domestic helpers and nannies as mothers who have left their children behind to help raise the children of their employers. Migrant mothers are also experiencing an alienating form of motherhood by proxy. This paper aims to problematize the intersection of the two forms of motherhood taking place in one of the fastest growing (modernizing and globalizing) Arab states today, i.e., the UAE. In fewer than 40 years, the UAE has gone from a subsistence-level society to a highly globalized neo-liberal market economy. Consequently, families and mothers in the UAE have been experiencing tremendous changes and challenges to raising their families.

Young UAE national mothers have become the sole autonomous figures in modern nuclear families; however, they are incapable of performing their mothering duties if not supported by foreign domestic helpers and nannies, who are becoming an integral part of the young national UAE family. A new generation of young mothers today are themselves the product of this neo-liberal and precarious mothering, i.e., when mothers are helped by transnational nannies and domestic helpers to accomplish their role, they are de-facto partial mothers. Newly educated national mothers are finding themselves in challenging roles, encouraged by the state elites to join the workforce. They seem incapable of sustaining the same norms and practices that their mothers and grandmothers had practiced. Based on direct interviews with young national mothers, the paper brings forward the voices of new mothers practicing motherhood under the continuous unsettling changes of globalization and neo-liberal economies in the UAE.

Methodological Reflections on the Relational Study of the Loving Couple As a Sensible Experience

In this paper, the authors present the methodological challenges involved in the study of love as a sensible experience from a relational approach. The authors identify the *WE loving relationship* as a figuration –in Elias' sense- in which at least two people are reciprocally conditioned (García Andrade & Sabido Ramos, 2014). In this paper, the authors analyze the information of 105 questionnaires applied to graduate students in a public university in Mexico City. Even though the information is from individual participants, the aim was to understand how they think about love and the performance of love related to the other.

The methodological tool was divided into diverse sections and considered the sociodemographic profile, sexual orientation and lapse of the duration of the couple. The central sections were oriented by two analytical levels named as *semantics* and *performance* (*Ibidem*). The first one has to do with cultural expectations regarding bodily senses and fluids, and places associated with love and sexuality in the couple. The second is related with particularities attributed to some bodily senses, fluids and spaces according to the experiences of the couple analyzed. The methodological tools used were closed and open questions, and images to activate dispositions in the subjects. The aim of the pictures was to let the subjects relate their perception and appreciation to analyze bodily contact with the couple.

The authors will show how the methodological tool constructed within a relational starting point helps identify: semantic regularities in the couples, semantic regularities in how gender differences are constructed around sensibility thresholds, and performance variabilities in each couple.

Finally, some limitations of the instrument and future agenda will be presented.

The Project of Sustainability: The Role of Project Management in Developing a More Sustainable Economy and Society

This research project intend to investigate the role of the Project Management (PM) profession in developing a sustainable economy. Sustainability has acquired a growing strategic importance over the last 10 years bringing with it a requirement for changes in traditional practices and paradigms of production for its successful implementation. These changes are typically managed as projects and delivered by dedicated project managers, that are assumed, have the knowledge and skills to take into account the social, financial, political, cultural and environmental sustainability of a project. As such project managers, through their distinctive roles, skills and competences occupy an important position in accomplishing sustainability, but little is understood about how they do this.

Using qualitative methods such as interviews, content analysis and ethnographic observation, I will focus on how sustainability is incorporated in PM discourse and practice by studying: how the profession makes sense of sustainability, and also sustainability in practice.

The topic of the research project is very timely as it addresses a growing interest on the topic of sustainability. The expected contributions of this research will be in: (a) explaining the institutionalization of sustainability within PM professional practices; (b) identifying under what conditions project managers adopt sustainability practices; (c) conceptualizing sustainability in PM contexts.

The Formation of Globalized Political Cultures

While economic globalization dynamics weaken nation-states governments and politics, snatching slices of their decisional power away, the very information technologies that make global markets a reality, also favour the rise of a global

public opinion that is slowly turning into a global political culture. A global public opinion that is starting to occasionally become active, organizing itself in order to exercise an influence on local, national and on international policies. If we think about it that's the very meaning of globalization itself according to Ulrich Beck (1999): globalization is not the end of politics but the setting of politics outside the nation-state categories and even outside the traditional schemes assigning political or non political meaning to roles and actions. A new political culture that needs to be constantly redefined as we will analyze in this paper.

MORRISON, CLAUDIO (University of Middlesex)

Transnationalism, Mobility and Migration in the Sociology of Work: A Missed Encounter

   It has long been recognised that sociological studies of labour need to account for changes induced by globalised capitalism (Thompson, Smith 2009) no less than transnational studies require greater attention to the social if wanting to generate better analysis as well as more viable policy recommendations (Castles 2003, 2010). This article intends to reconceptualise and problematize the transnationalism approach considering class subjectivities based on the interplay of interests and identities (Thompson, Smith 2009; Meardi 2007). Transnationalism is often negatively associated with decontextualized, fluid processes as well as empirically with individualistic solutions and loss of collective consciousness (McIlroy and Croucher, 2013; Smith 2006). The association of transnational, migration and diaspora studies with various aspects of the cultural turn, particularly its obsession with identity at the expense of class has further widened the gap. In this respect the notion of mobility power within labour process theory represents a significant innovation, but transnational spaces need to be identified to account for the social transformation induced by mobility. On the basis of interviews with migrant workers and analysts in post-soviet space the research intends to develop a transnational approach to labour studies. Methodologically, the study assumes the worker's point of view – a wealth of experiences and knowledge built across spaces – which allows accounting for temporal and geographical stretching. The post-soviet space represents a historically significant case for the exercise of mobility power as a form of workers' resistance. It is also a departure from models of migration and identities established in 'Western' English-speaking literature. Moving to a transnational agenda in the study of work should therefore help the sociology of work to remain relevant as well as contributing to more balanced accounts of migration and mobility processes.

SADAT, ZAHEDUS* (UC Davis, zasadat@ucdavis.edu)

Halaqa As a Place for Navigating Identities and Cultures: An Ethnographic Study of Muslim, Bangladeshi American Youth in Bay Area, California

   In the post 9-11 era, academics from diverse departments such as religious studies, sociology, anthropology and geography, have joined the discourse regarding Muslim communities, youth and identities in the west (Goody, 2004; Peach, 1990; Peach & Gale, 2003). However most of these studies highlight the debate between Islam and the West while ignoring the critical debate, contestations and negotiations within the Muslim world, especially between the first and later generations of Muslim immigrants in the west. One of the sites where there is an evolving debate of the teachings and practice of Islam is a *halaqa* which is an informal gathering to learn about the teachings and practice of Islam.

   I have been engaged in a critical ethnographic study (including participant observation, individual interviews, focus group discussions and workshops) of a family-based *halaqa* organized and run by about Bangladeshi Muslim immigrants in California for the last three years. There are about ten to twelve middle-class Bangladeshi immigrant families which attend the *halaqa* sessions regularly. All the parents are first generation immigrants who were born in Bangladesh and then immigrated to USA; the youth are second generation Bangladeshi Americans who were all born in the USA.

   I look at how youth negotiate and contest their 'hyphenated', fluid, Muslim-Bangladeshi-American selves in this setting. I also explore how the nature of the *halaqa* is cosmopolitan: on one hand there is a tendency to focus on Bangaldeshi

culture while the other hand there is a tendency to connect with globalized ideas and practices of Islam. *Halaqa* thus serves as a place for the Muslim-Bangladeshi-American youth to negotiate their fluid identities and connectivity to the Bangladeshi diaspora by practicing their religion and culture while also adapting to life as global citizens.

Local Response to Paradigm Shift in Gender Politics: An International Comparison of Sweden, France, and Japan

   The Beijing Conference on Women and the Platform for Action (PFA) shifted paradigms of gender equality politics. International actors have recognized the need to bring about fundamental change in lingering gender inequalities. This research compares three countries -Sweden, France, and Japan- which have adopted different approaches to implement the PFA, by analyzing the documentary data and in-depth interviews with gender equality advocates in the three countries.

   Sweden, one of the most gender equal countries, has adopted gender mainstreaming. By weakening the national machinery, Sweden has incorporated gender equality agenda in all policies at all levels. However, everyone's responsibility becomes no one's responsibility, so that Sweden experiences setbacks in gender equality following Beijing. In Sweden, there is no quota legislation of any kind.

   No country other than France has introduced strict positive action measures. Traditionally, quotas were not welcomed and viewed as contrary to the French idea of equality. A revision of the Constitution was thus needed to adopt gender quotas. Positive action measures have been reinforced since the victory of the left in 2012. The parity government and women's rights ministry were born. In 2015, a binominal election was hold at the local level: voters were choosing pairs of candidates – one man and one woman. France has experienced major progress in gender equality for the last two decades.

   Japan, ragging behind in the gender equality race, expanded the legal framework to promote gender equality and implemented "the basic law for a gender equal society in 1999. The introduction of the basic act symbolized momentum for the women's movement and promoting gender equality. However, a gender backlash occurred as a reaction to the basic act. Due to the backlash, Japan experienced setbacks in gender equality until recently. The neoliberal government today highlights the gender equality agenda to prime economy.

SAENZ, ROGELIO* (University of Texas at San Antonio, rogelio.saenz@utsa.edu)

The Demography of Race and Inequality: An Illustration of Latinos in the United States

   Throughout history the timing of the demographic transition has varied across countries as well as groups within nations of the world. Access to technologies, sanitary conditions, and vaccinations that reduce mortality has been driven by socioeconomic status, as is the case with access to technologies and contraceptives that reduce mortality. Thus, MDCs and majority/dominant populations within countries today have relatively low levels of population growth or even population decline due to aging populations; LDCs and minority populations within countries have high levels of population growth due to youthful populations.

   This paper provides a theoretical framework for understanding the demography of race and inequality. In particular, the framework provides an understanding of how racial inequality brings about current disparities in population growth across racial/ethnic groups and how groups in power use political, economic, legal, and social forces to maintain their political and economic power.

   The experience of Latinos in the United States is used to illustrate the demography of race and inequality perspective. The Latino population constitutes the largest minority group in the United States. Latinos exhibit great diversity with several segments of the population tracing their presence in the United States for more than a century while others have migrated to the United States only recently. The Latino population has historically had low levels of education and low socioeconomic standing in the United States. Over the last several decades the Latino population has grown rapidly alongside slow growth in the white population. Population projections suggest that the Latino population will expand significantly over the coming decades with the white population experiencing population decline in the next couple of decades. As the Latino population has grown rapidly, efforts have been mounted to minimize the political and economic standing of the Latino population.

SAHIN, NEVIN* (Yildirim Beyazit University, nevinsahin@ybu.edu.tr)

From Whirling to Combatting: Contesting Experiences of Mevlevi Sufism in 21st Century Turkey

Mevlevi Sufism, which is one of the oldest Sufi traditions in Anatolia dating back to the 13th century, ceased to practice its sema ritual due to regulations by the new republic in 1925. Since then, neither Rumi lost its prominence as a mystic poet and Sufi master, nor was the ritual forgotten. Starting from 1970s, the sema ritual regained recognition on the level of the state, which eventually resulted in the registration of the ritual as cultural heritage by UNESCO in 2008. However, this rising attention brought about the commodification and politicization of the ritual. On the one hand, the state started benefitting from the whirling dervish as an icon representing the country for tourism and turned certain sema performances into political meetings; on the other hand, organizers manipulated whirling dervishes as dancers entertaining tourists together with belly dancers. When there was a clash between the state power and the opposing youth in Gezi Park in 2013, there came again a whirling dervish with a gas mask on. Mevlevi Sufism has evolved into a field of interplays of power among actors comprised by performers, organizers, the audience and the state. This presentation aims at analyzing the power relations contesting over a Sufi ritual and contesting interpretations of Mevlevi identity in the 21st century Turkey. The data forming the basis for the analysis was collected throughout an 18-month ethnographic fieldwork in Turkey and Europe, among circles where sema ritual is performed, consumed and criticized.

SAHIN, YUSUF* (Metu Sociology, sosyus@gmail.com)

Educational Aspirations Versus Educational Expectations in Turkey

There is a comprehensive literature based on educational research aimed to find the determinants of educational aspiration. Although complex studies have been conducted, there is not a consensus about the definition of educational aspiration yet. Aspiration and expectation are two concepts very similar to each other, some researchers use both concepts with the same meaning, and some defines aspiration as idealistic hopes for future and expectation for meaningful realistic plans. Stephenson (1957) recognized a difference between idealistic and realistic plans. He supposes that all youth share the same high idealistic levels but that the realistic levels of youth vary by their socioeconomic origin.

Aspiration and expectation affect each other directly and aspirations are distinguishable from expectations; in other words there is a difference between what people hope to achieve and what they expect to achieve. Level of educational aspiration which influences an individual's educational status attainment, and level of educational expectation which describes the level of the educational hierarchy one's educational definers deem appropriate for him.

In this study, the transformation of students' aspirations from idealistic to realistic, due to labor market conditions in Turkey is analyzed. 400 students educational aspirations were measured in 11th grade in 2014 and their educational plans are asked in 12th grade 2015. The striking change of educational aspirations of students are analyzed and possible determinants of the change is discussed sociologically.

Struggle for Justice & Human Rights Framework: Cases of Successful Protests in Eastern India

The human rights movements in post independent India have been largely influenced by colonialism and western democracies. It made its presence felt especially in 1980s by social and political activists and attracted the support of marginalized sections of India. The issues of human rights centers on individual's conflicting relationship with the state. The Indian Protection of Human Rights Acts, 1993 says "human rights" means the rights relating to life, liberty, equality and dignity of the individual guaranteed by the constitution. Literature and empirical evidences suggest that unlike the west, human rights are constantly challenged by complexities of socio- political- cultural process.

The paper makes an attempt to analyse the historicity and dialectics of the conflicting relationship between the individual and the state and further emphasizes on the need to concentrate primarily on economic, social and cultural rights in the present age of globalization on an empirical basis. It also tries to articulate how the process of globalization facilitated the assertion of civil and political rights with the help of Indian middle class. The paper also makes an attempt to understand human rights movements in India from new social movement perspective.

 Against this backdrop, the paper articulates two successful people's struggle of Odisha, one popularly known as Anti Missile movement, against the proposed National Missile Testing Range and the protest against establishment of POSCO steel plant It is about the prolonged resistance launched by the local people, its genesis, processes and consequences. These protest movements under have raised several collective issues related to right to livelihood, sustainability, ecology, disarmament and issues of civil society.

Social Insurance in India: Achievements and Hindrances

Social Insurance in India: Achievements and Hindrances

Developing country like India, the rural population are more vulnerable than the rest of the population in coping with broad range of risks and crises that affect its livelihood. Over the years, state supported Social Insurance programmes and the Microfinance intervention both by the public and private sector has tremendously changed the scenario of rural India. The study aim to identify the role of Microfinance in mitigating risks of rural poor; strategies and means of people's response/ coping mechanism to such crises and risks; the demand and supply scenario of Microinsurance in rural setting; and the operational mechanism and claim behaviour at consumer level. The research identified a broad range of risks and coping stretegies which are faced by the rural communities. The study suggested that there is a high demand for the community based Microcredit and Microinsurance interventions among the poor which led them better manage risk both ex-ante and ex-post. The study also suggested that the partnership model of community Microinsurance e.g. Micro Finance Institutes and Insurance companies can play a vital role to mitigate the risks of rural poor in India.

Family and Community As a Perpetrator of Violence Against Girl-Child - a Study in Selected Districts of Haryana(India)

There is nothing new in the phenomenon of family violence on the girl child because it has existed in almost all societies throughout history for a variety of reasons. What is rather recent is the realisation and recognition that it is one of the most significant, widespread and major socio-psycho-ethical as well societal problem. It is rediscovered that in the family itself there is much violence on the girl child, the parents themselves are, to a great extent guilty of curbing the mental and physical growth of the girl by the discrimination they practice. The declining sex- ratio in- directly reveals the practice of family violence against the girl child in the respective societies. In India the sex-ratio has shown an almost continuous decline from 972 in 1901 to 933 in 2001. In almost all the Indian states sex-ratio is adverse to female but in few states and cities the situation is really alarming. Haryana which is known as one of the prosperous Indian states and placed among the top five indian states in terms of its GDP growth(8.6%) . But on the other side its continuously declining sex-ratio indicates the lower status and conservative attitude towards women and girls in the particular society. What are the different types of violence and discrimination practiced against the girl child in the family and community? How the girl children feel towards these discriminatory practices? These are some of the issues which would be discussed in this research paper. This study was conducted in four districts of Haryana state of India. The techniques employed for data collection were Interview, Observation, and Case- Studies. Total 200 mothers who had children of both sexes and 120 Girl-Children of '7-18' age group were being interviewed.

Globalisation and Delineation of Women in Engineering Domains

Globalisation has transformed world trade, communications, educational activities and economic relations since the later part of the 20th century. In mid 80's, the number of girl students in an engineering program in India, was hardly worth mentioning. This has been indicated by several studies and enrollment data available in public domain of engineering institutions at national as well as state level. As a result of globalisation, in early 90's the IT sector in India and demand of Indian IT professionals in aboard grown at an exponential rate. This suddenly created a huge vacuum in qualified man power. As a result of this private participation in engineering education saw a sudden spurt, threw open opportunities for the enrolment of girls in engineering institutions. With privatization of higher and professional education, enrolment of women in the engineering courses has seen an unprecedented increase. In spite of the increased growth in the number of girls entering engineering courses, there are still many issues which prevent girls from opting for technical education.

However, the present paper seeks to find out the trends in the enrolment of women in different branches of engineering which is traditionally considered as masculine discipline by comparing the last 10 years enrollment data of National Institute of Technology, Surat. The study also attempts to explore socio-cultural attitudes, religious beliefs and practices that limit women's mobility, access to resources and type of activities they can pursue that poses an obstacle in making

From Agrarian Distress to Sustainable Agriculture through Indigenous Knowledge: Case Studies from Telangana and Andhra Pradesh, India.

Agrarian distress is sweeping through the newly formed Telugu speaking states of Andhra Pradesh and Telangana with a number of farmers committing suicide due to crop failure and indebtedness. Small and marginal farmers of rain-fed areas are in a losing battle with agriculture as their material conditions keep deteriorating year on year. According to the National Sample Survey (NSS) data released in December, 2014 more than sixty percent of agrarian households in India are in debt trap ranging from 92.9% in Andhra to 17.5% in Assam.

In this scenario, it is pertinent to note that the benefits of highly extractive agriculture, which goes by the name of green revolution and based on 'high input technology' was cornered by the rich and affluent farmers operating in irrigated areas of Punjab, Haryana, Western Uttar Pradesh, Andhra, Tamilnadu and Karnataka. The poor and marginal farmers primarily in the vast rain-fed areas of India are the worst sufferers. Apart from the indebtedness, many farmers are unaware of the minimum support price and often, resort to distress sale to clear their loans which were obtained at exorbitant rates.

While the situation appears to be gloomy with thousands of farmers committing suicide in the Telugu speaking states and other parts of the country, the agrarian distress is not out of control. This paper aims to present evidence of sustainable agriculture practices achieved through indigenous knowledge with case studies from the states of Telangana and Andhra Pradesh in India. By following traditional cropping methods and using indigenous seeds, marginal farmers in the rain-fed areas of Telangana and Andhra Pradesh have shown that one can overcome the present adversity in agrarian sector.

Local Governance and Empowerment: An Analysis of Cross-Generational Impact of Democratic Decentralisation in Telangana, India

One of the most popular state reforms that have opened 'spaces' for a wider and deeper participation of citizens at the local level has been the decentralization process. In India, the 73rd constitutional amendment of 1992 is seen as an important landmark in enabling excluded communities to participate in the process of governance. In much of the late-developing world, one could see a process of exclusion of subordinate groups from exercising their rights and legitimate place in the power structure. This is achieved through means of social and economic conditions.

We should make a distinction between 'formal' inclusion of excluded communities and the 'real' empowering inclusion. Inclusion depends on several factors such as social discrimination, economic dependence, control over means of violence, access to information and nature of social movements to mobilize the excluded communities and groups.

This paper aims to look into patterns and determinants of empowerment and its cross-generational impact among the communities (women, dalits, tribals, and OBCs) who were excluded from local governance prior to constitutional amendment. Three case studies would be provided drawing upon studies done in Telangana state of India. Main points of reference in assessing cross-generational impact of civic participation in local governance will include looking into access to education, access to better livelihood opportunities, change in gender roles and social status of the excluded communities.

Contested Notion of Sisterhood As a Class Politics

The main subject of my study is women's collective action at the workplace. In general, it can be said that the study will problematize the well known question: How and in which ways objective conditions of the workplace and labour process turn into matters for collective experience of the workers? To put it differently, how an objective assemblage- an innate character of capitalist labour process- turns into associations among workers contrary to existing workplace organizations and capital's interests. For this purpose, following the work of Rick Fantasia (1988), I will use the concept "cultures of solidarity" as a medium between objective determinations of labour process and collective action of workers. In addition the notion "cultures of solidarity" may enable us to discuss multiple/

contesting forms solidarities concomitant to formation of commonality among workers. In this respect, through in-depth interviews with women workers participated/participating in strikes at two factories-Fiskobirlik and Serapool- in Turkey, I will question the well-known notion of feminist theory and politics, sisterhood, as a moment, matter and formation of class politics among women workers. In brief, I will discuss contesting associations and cultures of solidarity among workers: corporate solidarity, class solidarity and sisterhood as a matter and an effect of collective action.

The Context, Process and Consequence of Positive Action Policy for Gender Equality in Academia in the Japanese Government and Universities

This presentation empirically examines the Japanese government's positive action policy to increase female academics in Japanese tertiary institutions and investigates the context, process and consequences of the policy. The ratio of female to male academics in Japan has historically been low, at just 13.5% in 2000. However, in 2006, the Japanese government initiated a positive action policy to increase the ratio. The model employed was the Increasing the Participation and Advancement of Women in Academic Science and Engineering Careers (ADVANCE) Program, of the National Science Foundation in the United States. The Japanese government now grants subsidies to ten universities each year for three years in return for them establishing gender equality offices and offer various programs and services to support women.

Two conditions of Japan are behind the policy in the presenter's point of view. The first is the underrepresentation of women and the need for gender equality in Japanese academic institutions. Japan established the equal opportunity employment law in 1972, and the treatment of women in the labor field improved; however, female participation in politics and academia remains low. Second is a future shortage of human resources in Japan, due to Japan having a super-aged society, and the fact that scientific publications and a Japanese presence in science has dropped. The government is thus exploring the utilization of women as potential human resources to rectify these issues.

As the result of the policy, the ratio of female academics has increased and reached 22.3% in 2015. However, the context, process and consequences of the policy have not yet been investigated. This presentation utilizes government documents and tertiary institutions literature to examine in what context and justification for the the policy. How have institutions applied the policy, and what are the consequences for academia and Japanese society?

Water Conservation: A Study of Ugam Foundation, Balawadi, India

Ugam Foundation, Balawadi is in Sangli district, Maharashtra State. Khanapur, Atpadi, Tasgaon, Kavthemahakal and Jat Talukas in Sangli district are facing draughts frequently. As a result the lives of people, cattle and living creatures have become troublesome. Under the guidance of Bhai Sampatrao Pawar, Ugam Foundation is fighting against water scarcity in this area.

The objective of this paper is to study the role of Civil Society in the draught prone areas and how they counter the problems caused by draughts through water conservation.

Ugam Foundation has revived a dried up river 'Agrani' originating in Khanapur Taluka. This river flows through Tasgav, Kavthemahakal and Jat Talukas and meets Krishna river in Karnataka State. Ugam Foundation has built six small dams across this river between Balawadi and Benapur village. The distance between these villages is 3.5Km. 0.18 TMC of water has been stored in these 6 dams. 1000 Acres of land has been irrigated due to these dams.

These dams were built by voluntary labour and no displacement or rehabilitation has been done during their construction. Before the construction of these dams, water was provided by water tanks in these villages. Also, fodder depots were established for cattle.

At one place, Ugam Foundation has cultivated ten acres waste land with the help of ten backward community families in 'Hivtad' village in Atpadi taluka. They grew pomegranate trees and through proper water management; every family earns Rs.1-5 lakhs per year. Prior to this, these families used to migrate for sugarcane cutting. Today, these families are financially independent. Ugam Foundation has worked for water conservation and management.

The paper is based on secondary data, personal visits on the respective locations and interviews with the Foundation leaders and beneficiaries of villages.

Shifting Patterns of Professional Regulation: Medicine in Comparative International Perspective

Even in a single society, the forms of regulation of occupational groups regarded as professions in the modern world vary considerably at particular points in history as well as in the contemporary context. This paper compares and contrasts shifts over time in professional regulation, with specific reference to medicine, in three very distinct societies – Britain, the United States and Russia. As such, it overviews broad regulatory changes in medicine over two centuries in each of the countries concerned. The analysis is undertaken from a neo-Weberian frame of reference based on defining fully-fledged professions in terms of exclusionary social closure. It shows that the patterns vary historically following relatively early open fields from classic social closure through corporatisation to complete deprofessionalisation in the three very different socio-political systems concerned. Notwithstanding the common claims of functionalist theorists about convergence towards a single highly professionalised destiny for elite knowledge-based occupations in the developed world, it is argued that – for all the methodological issues involved – there is no trend towards one emergent contemporary pattern. Rather, the paper highlights that each particular configuration in medicine has evolved as a result of specific socio-political circumstances in the spectrum of countries considered – based on differing balances between the market and the state. The paper concludes by raising questions as to which of the regulatory patterns concerned might be most desirable in future in the struggle for a better world. In weighing up the advantages and disadvantages, innovative and graphic use is made of animal metaphors – employing the vehicles of zoos, circuses, safari parks and the law of the jungle – to depict the main regulatory models that are available. Each of these has different consequences for the public, not least in relation to the classically 'top dog' profession of medicine.

Using Administrative Data to Adjust for Nonresponse Bias in the National Educational Panel Study

Virtually all surveys fail to achieve complete response from all sampled units. One consequence of this failure is the possibility of bias in the survey estimates due to differential participation. Dealing with bias usually involves applying a statistical adjustment procedure (e.g., weighting, imputation) to account for (observable) differences between respondents and nonrespondents. Such differences can only be ascertained using auxiliary information available for the entire sample. In surveys, auxiliary information is usually limited to demographic variables, call records and other forms of paradata, and aggregate data on geographical areas collected from censuses. None of these data sources is ideally suited for nonresponse bias adjustment because their correlation with the survey variables is usually low. An alternative source of auxiliary information that we consider comes from administrative records. Administrative records often contain variables that correspond to many of the same variables collected in surveys. In this paper, we assess whether administrative records contain information that is useful for nonresponse bias adjustment. Specifically, we utilize administrative employment records linked to the National Educational Panel Study in Germany and we examine whether administrative variables are correlated with the response outcome and key survey variables, and whether their inclusion in nonresponse weighting adjustments affects the resulting survey estimates.

Anatomy of Collective Violence - When "Never Again" Happens Again and Again.

The 20th century was marked by numerous acts of killing, such as crimes on a massive scale. For the most part, the perpetrators were't punished for their crimes. To add insult to injury, those acts were justified and rationalized by society. Genocide and others mass murders were deemed necessary for reasons of security, improvement of living conditions and other values defined by the existing social order. Towards the end of the 20th century mass violence was perpetrated in spite of the advent of human rights. The international community remained a passive observer at the sight of horror. It seems safe to assume that the present century will be no different.

Killing is nearly the very bottom of the moral evil. Is therefore surprising, the ease with which many passes to the agenda on contemporary conflicts, rolled by the Western countries. Wars, as such, should appear as paradigmatic evil, they're organized mass killing.

The Holocaust and other mass crimes weren't merely aberrations. Each time it was the new universe opening, whose boundaries were crossed. The pervasiveness of violence altering the surrounding universe is breaking cultural framework

and exceeds the social taboo. After all the death of millions of people, no longer seems so impossible and terrible. Pretending that the most serious crimes were committed by barbarians' - who's outside the universe of sanity and moral obligations -is in fact a simple way to repeat these crimes. People are prone to violence when they feel that to regulate certain social relationships imposing suffering or death is necessary, legitimate, etc. – it's justified. Perpetrators not simply justify or rationalize their violent actions after the fact but usually reinterpret them (e.g. being a "patriot" motivated by "noble" motives). Emotions that guarantees the existence of social ties, can mobilize for collective acts of violence targeting "others".

SAKTANBER, AYSE* (Middle-East Technical University of Ankara, sakta@metu.edu.tr)

Between Equity and Equality: Muslim Women's Dilemma in the Face of Gender Equality

Muslim women's struggle promoting gender equality has always been faced with suspicion for in Islam women's and men's positions are relegated to an ontological condition. According to this the concept of gender equality contradicts with the understanding of *fýtrat* , that of men's and women's pre-given natural characteristics which prevent them from not only playing equal roles in social life , but also having equal rights before civil laws. Muslim women usually try to surmount this assigned difficulty by promoting notion of equity through which notion of justice plays a prime role for the betterment of women's social position particularly where women live under Muslim Law. In order to examine the dilemma of Muslim women in the face of gender equality this paper explores how Muslim women who live under secular regimes like Turkey try to develop a progressive perspective in pursuing women's rights within the framework of equity and raise their voices stronger in some selective issues. Violence against women is one of those issues and Muslim women are so active in rallying around some civil society organizations specialized about this particular issue, an issue the justification of which is easier for not being blamed as becoming a feminist when working as a Muslim woman activist. It also discusses how such women activisms give rise to an unprecedented subversive performativity for Muslim women who are carefully scrutinized particularly by Islamist circles to see whether they stray away from Islamic rules and regulations when working to promote women's rights. It also argues that gender mainstreaming constitutes another problem to overcome this dilemma by blurring the boundaries between gender equality and equity for both Muslim and secular women and creates a double-edged communication and solidarity problems between those women who both yearn for a better world.

Decline of the Established Religions and New Primordial Religiosity in Social Engagements in Japan

Although priests in Japan have struggled to prevent memberships from further declining by conducting doctrinal propagation and sincere religious services in Shinto shrines and Buddhist temples, they were considered to be irreligious by Japanese people who deemed that priests just want to survive in the age of depopulation and individualization. On the other hand, some priests who extended their activities to social actions beyond just serving parishioners and members seem to have found out new primordial religiosity that emphasizes healing distress and grief of ordinary people.

This case study discusses several examples such as palliative and terminal care, soup-run for homeless people, lifeline and community café, and chaplaincy by monks, which does not intend to proselytize but to provide social supports to the needy. In conclusion, new religiosity that attracts religious persons and scholars nowadays seems to exist in the niches of life and death, social classes, and various conflicts. Therefore, secular actions that bridge these niches become religious. The boundary of religious-secular will become more obscure and interchangeable in 21st century Japan.

An Assessment of the Current State and Uses of Data Linkage in Household Surveys

Linking survey and administrative data is a practice that many survey agencies worldwide have been implementing for at least a decade now. Although it is believed that data linkage may reduce survey costs and ease respondent and interviewer burden, there is little evidence to support this claim. In addition, linking

survey and administrative data is a complex procedure that, in some cases, poses specific methodological challenges. For example, negotiations with data holders are complex and time consuming; consenters are usually not a representative sample of respondents; the actual linkage process is not a straightforward procedures. The aim of this paper is to critically assess the use of data linkage in household surveys, with a view towards the total survey error paradigm. First, we provide an overview of the ways data linkage is implemented in the different household surveys (i. e., the type of administrative data linked to the survey data, the consent procedures, the linkage process etc), then we discuss the uses of the linked data with respect to their impact on the original survey design (are the linked data used to supplment or substitute the survey data?) and we evaluate whether the linked data are used to enhance the quality of the survey data, for example, by carrying out validation studies

Think-Tank Networks in Mexico and How They Shape Economic and Political Reforms

Think tanks and policy experts in Mexico have become increasingly conspicuous in the news media, as well as in the most relevant public discussions. But despite their influence on planning the economic and political reforms of the last three decades and the growing literature on think tanks in both the Global North and Latin America, little academic work has been undertaken on Mexican think tanks. This paper seeks to fill this void by analyzing their most important characteristics: who controls them; the networks they have constructed over the past thirty years; the strategies they pursue to influence policy-making; the most influential ideological orientations; and the extent to which the Mexican think tank network is linked to regional or international networks. I argue that the landscape of Mexican organizations undertaking policy research has undergone a profound transformation over the past three decades, partly due to a political economy increasingly centred in the market. The main changes point towards: (1) an increasingly greater presence of independent TT and private consultancy firms that undertake not only research on public policies, but executive and legislative lobbying too; (2) a more challenging advocacy role of academic and business TT that actively participate in the media and multiple forums to build consensus around, and acceptance of, the neoliberal reforms proposed; (3) the disappearance or fading away of former state research centers, particularly those promoting developmentalist tasks; (4) the concentration of state research in autonomous public agencies requiring very specialized information; and (5) new and more complex forms of collaboration and cooperation between business affiliated, academic and other TTs, national and regional. However, as neoliberal reforms have increased poverty, the concentration of wealth, insecurity and other problems, alternative policy ideas and think-tanks have appeared.

SALATA, ANDRE* (Pontificia Universidade do Rio Grande do Sul, andresalata@gmail.com)

Classes and Income in Brazil on the Last Decade: From the New Middle Class to the 'affluent' Working Class

This research aims to analyses, from the perspective of class studies in Sociology, the argument of economists about the emergence of a new middle class in Brazil. In order to accomplish it, we bring the debate conducted in Economics, in which class is defined by income, as well as the debate of the Sociology of Stratification, in which classes are defined by the occupational information. Using the National Household Survey Program (PNAD) data, from 2002 to 2013, we argue that the changes in the class structure were not significant enough to support the idea of the existence of a new class in Brazil, neither that there was a growth in the traditional middle class. As an alternative, we show that the changes in Brazilian society on the last decade could be better understood as a decline on income inequality between classes. Thus, instead of a new middle class, it would be more correct, in order to describe those changes, to talk about the reduction of the income inequalities between classes, as a consequence of the increasing income and consumption among working class families.

RC02-33.5

SALATA, ANDRE* (Pontificia Universidade do Rio Grande do Sul, andresalata@gmail.com)

Defining the Middle Class Boundaries in a Changing Society: Is There a New Middle Class in Brazil?

This research seeks to contribute to the current debate on the middle class in Brazil, focusing on class identities and the perceptions of Brazilians concerning the middle class. In the last decade thousands of families have ascended to mid-range income levels, and became part of the middle layer of the population. From the Economics perspective, many analysts have interpreted those changes as the emergence of a new middle class in Brazil. This research, however, aims to analyze it from the perspective of class studies in Sociology. First we will describe this middle strata according to variables such as schooling and occupations, and then we are going to analyze its class identities and perceptions. The results achieved show that the individuals whose socioeconomic profile falls in the middle are not those who are usually perceived, neither who typically perceive themselves, as middle class. In fact, a higher likelihood of identification with the middle class can only be verified among the more privileged. To test it, descriptive statistics and multivariate models were applied to data from the "*Pesquisa sobre Classe Média*" (Cesop/Unicamp, 2008). Furthermore, it also becomes evident that the image of the middle class constructed in Brazil applies to wealthier strata of the population rather than intermediary ones.

Sri Lanka to Monte Pellegrino: The Tamil People and Santa Rosalia.

In Sicily a religious festival is anything but a religious rite, so the famous writer Leonardo Sciascia stressed the presence playful during a religious festival. The situation changes if we look at the real context on Monte Pellegrino. The great pilgrimage started in the night between 3rd and 4th September protagonists are the young people of Palermo and young Tamils. Their presence makes the pilgrimage forms new vision of the sacred. Their devotion to the saint who resides in the sanctuary on the mountain is not only comparable to that to the goddess Kali but enriched in one respect the multicultural vision of the pilgrimage itself. This is because in one place is shared not only a form of belief or devotion, but thank you or asking for grace. The particularity of devotion "expressive" of the younger generation, who reside in the same place, Palermo, fundamental to analyze the aspects intrinsic to understanding the phenomenon of youth pilgrimage which intertwines two forms of cultures that converge in one place. The spontaneous presence of young Tamils, during the pilgrimage, is significant for the study of new forms of integration that relate to second generation. Religion and religiosity two terms similar but differing in their significance. In relation to the figure and the site chosen, the body that represents a woman and the mountain, high ground sacred, are symbolically interconnected in both cases placed in analysis. The presence of a female figure, holy to Palermo, who bestows confidence and compassion to the demands of the pilgrims is closely linked to the female figure sacred to Tamil people. The methodology used for the study of the case in the analysis is to place the participant observation in the field, technical support tool was the camera with video capture function**.**

Do Gender Norms Affect Performance in Math? the Impact of Adolescents' and Their Peers' Gender Norms on Math Grades in Four European Countries

Although girls outperform boys in academic achievement, boys still have an advantage in math and science in many countries. This gender imbalance is not only apparent in the educational system, but also in the labor market, where women are underrepresented in careers in science, math and technology. One possible explanation for the female disadvantage in math and their underrepresentation in technical professions are culturally embedded beliefs according to which girls have lower competencies in math and related disciplines. On the one hand, these beliefs can lead to different subject specific investment strategies of female and

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

male students during school and result in gendered pathways throughout educational and occupational careers. On the other hand, the presence of negative stereotypes about female inferiority in math in classrooms can hamper girls' performance via stereotype threat. Accordingly, not only the own ideas and beliefs are important, but also the attitudes of the classmates that reinforce behavior patterns of adolescents conforming the prevailing gender norms. Using data from the project Children of Immigrants Longitudinal Survey in Four European Countries we investigate, whether students' and their classmates' attitudes towards gender norms bring forward stereotypical math performance at school in England, Germany, the Netherlands and Sweden. Our results indicate a distinct gender differential in favor of male students in England and in Germany, while the gap is rather small in Sweden. However, traditional gender norms of students and their classmates are negatively associated with girls' math grade in all countries. Furthermore, no significant gender gap in math grades remains when students' and their classmates' gender norms are considered in the analyses.

"Thrown into the Jungle" – Experiences of Displacement and Disruption in Neoliberal India

Ahmedabad, the most populous city in Gujarat state, is presented as a pioneer in urban development in India. Several beautification and infrastructure projects have been carried out in the city since the early 2000s to the advantage of the middle and upper classes. Ahmedabad's quest to become a 'world-class city' has resulted in large-scale displacement of the urban poor – city-center slums are depicted as nuisances that need to be removed in the name of sanitation and development. Slum demolitions are increasingly pushing the urban poor to the rural-urban interface where they are containerized in low-quality resettlement sites. The apartments in the resettlement sites have been allocated by a computer-generated random drawing of lots, breaking apart existing social networks of slums.

This paper examines narratives of socio-spatial exclusion and marginalization in order to understand how resettled people construct and conceive their place in a world-class city. Drawing from ethnographic research in a multi-ethnic resettlement site located in eastern Ahmedabad, the paper explores how residents structure their relationship with the government and with each other using 'metaphors of marginalization' (Ramakrishnan 2014) and 'metaphors of difference'. Metaphors of marginalization – including those of 'dirt', 'jungle' and 'thrown away' – convey shared feelings of exclusion caused by displacement, while metaphors of difference – such as 'Pakistan', *'harami'* and 'third class citizen' – are deployed to reproduce caste-based and religious divisions and to express moral superiority over new, unwanted neighbors. The paper takes a critical stance toward the local government's resettlement policy, arguing that lumping disparate populations together in 'plebeianized' (Chatterjee 2014) spaces has intensified the urban poors' experiences of marginalization, exclusion and uncertainty.

The Future of Local Democracy: Has the Call for Citizen Participation Reached the City Councilors? the Case Study of Turku in Finland.

Despite the good reputation of democratic state, Finland´s trend of descending voter turnouts is faster than in other Nordic countries and Finnish voter activity is within the lowest third among the world´s established democracies. Public trust in politics has hit rock bottom and prior research has noted clear distinction between citizens´ and decision-makers´ opinions on citizen participation. It seems that demands for local referendums have not been taken seriously and implementations of new procedures of citizen participation are proceeding in Finnish municipalities rather slowly. Coincidently, local democracy has been challenged by the major changes in municipal operating environments such as market-demanding provision of services and new management styles. These trends have challenged democracy and driven future participation into discussion in substantially new aspect. Furthermore, recent academic discussion has emphasized the participatory character of democracy. This tendency has strengthened the interest for deliberative democracy theories and has manifested in expressions like "new democracy" and "participatory turn".

This research attempts to shed light on the current discussion focused on the "participatory turn" and the future of local democracy from the perspective of decision-makers. It is based on two surveys, which were conducted in the city of Turku in 2005 and 2013. In addition the research data contains the recent interviews of city councilors. The survey results indicate rather clear polarization in councilors´ attitudes towards citizen participation. In these results general positive attitude towards participatory democracy is indicated simultaneously with the increasing amount of supporters for minimalist democracy. In my presentation I evaluate the city councilors´ outlook on democracy and citizen participation by gender, age and political party.

From Knowledge to Policy: Mobilizing Social Science Knowledge in the Philippine Food Staples Self-Sufficiency Program

This paper measures the impact of Philippine social sciences on a chosen State policy, the Food Staples Self-Sufficiency Program (FSSP) of the Philippine Government which is being implemented from 2011-2016. Using quantitative research methods such as citation and social network analyses, the paper reveals a different facet of the process behind the utilization of a wide array of previously published social science research works toward a specific policy-making goal. This paper answers the following questions: Which particular social scientists and social science works have contributed the most to the crafting of the policy? Which particular schools of thought are most prominent in the policy? Which particular schools of thought have been excluded in policy making? Results of the quantitative analysis reveal that particular networks of natural scientists and social scientists as well as their respective schools of thought are given a privileged position in the crafting of the FSSP. Data from key informant interviews with actors involved in the crafting of the policy further contextualize these results. These findings provide insights into the nature and dynamics of knowledge mobilization at the national and policy levels. In particular, they highlight the centrality of social networks of epistemic communities and the consequent absence of epistemic inclusiveness in policymaking. The paper ends with reflections on how the production of social science knowledge could be better organized so that it could be mobilized only at the national and policy levels but also by communities and local governments.

Leisure for Pleasure- Women from Mumbai Suburbs Earning Pleasure out of Their Leisure Time Activities.

Leisure as a form of freedom and self expression could be a means of liberation from the restrictive gender roles and social routines, and thus a means of empowerment. Women's time and choices are closely circumscribed by their gender and also by their age, ethnic origin and class; these in turn shape their employment status, income levels and household circumstances. The autonomy which women have to enjoy as personal leisure is relative to these overarching structures. Leisure is thus one of women's relative freedoms. The women workers in Mumbai suburb save time at home by using modern gadgets and that is how they get time to work outside and earn. Leisure at their disposal allows them to prove their skill in cooking homemade food for the office goers, in the greater city of Mumbai. The owners of the eateries grab the opportunity of these unemployed but resourceful women of the poor worker's families waiting for a paid job. They give these women workers a job of their choice in order to allow them to fulfill their dream of supporting their family. Leisure creates for these women the opportunity to live a comparatively meaningful and dignified life and enthusing self respect, vigor and health.

The study aims at finding out the socio economic development of women in Mumbai suburb through working and food producing unit. As many as fifty women workers have been randomly selected.

It appears that leisure for work and pleasure as understood in the context of the present study, seems to operate in making sense of the social system of the women workers engaged in eateries. The study also reveals that they go through a socio-economic development but actually are still far from emancipation yet they try to find pleasure out of their leisure time activities.

SAMARSKY, ELENA* (University of Oxford, elena.samarsky@jesus.ox.ac.uk)

Calculated Risk - Risk Management Strategies in Migration: The Case Study of Highly Skilled Germans Relocating to the UK.

Migration is an action encompassed in uncertainties and risks. Such statement rests on the assumption that in the country of residence a person has fa-

r more knowledge of utilities, legislation, social structures, and many other aspects of life in comparison to the country of destination. Such asymmetry of available information may increase the risks involved in migration. It is therefore not surprising that across a variety of migration theories, attitude towards risk is assumed to play a significant role in migration. The case study of highly skilled emigration from Germany is overall intriguing, as due to the country's financial power as well as other well-developed and world renowned attributes, such actions may result in even higher risks. This paper is distinctive in its approach as it tackles the topic while applying two methodological approaches. First, the paper uses quantitative analysis of the German socio-economic panel to examine the willingness to migrate with relation to risk taking behaviour. The outcome is in line with other research, providing strong support for the hypothesis that those who express higher propensity to migrate also display higher risk tolerance. The investigation continues further with the analysis of the interviews with actual German migrants, which explores migrants' self-assessment of migration. The narratives surrounding migration decision depict intertwinement of interest: from the one side willingness to pursue personal or career goals and from the other attempt to manage risks associated with migration. Migration therefore, can be seen as a "calculated risk" action, where movers employ various strategies to manage the risk associated with migration which in turn increases their sense of control over migration. The study suggests that evaluating migrants' actions as strategies to minimize risks, will provide additional understanding of complexity of migration decision making.

RC34-JS-43.8

SAMARSKY, ELENA* (University of Oxford, elena.samarsky@jesus.ox.ac.uk)

Highly Skilled Migration Between Developed Countries: The Case Study of German Emigrants in the UK.

The subject of emigration from developed countries challenges the traditional view on migration, as it raises the question of why people chose to leave their highly-industrialized countries known for their high life standards, stable political scene and prosperous economy. In such context, the case study of highly skilled emigration from Germany is furthermore intriguing due to the country's financial power as well as other well-developed and world renowned attributes. From the theoretical perspective such a case study allows investigating migration in cases where there is no one overshadowing reason for migration (e.g. strong economic incentive or political unrest). Moreover, it contributes to the ongoing debate over the extent of the influence of the GDP and personal wealth on migration decision and in particular on the way they frame individual migration path, define motivation and colour the experiences of migration action itself. The paper is based on the analysis of the migration decisions obtained through in-depth interviews with highly skilled German emigrants in the UK. In the course of the project, it became evident that although securing financial stability was non-negotiable factor in migration (work contract singed before relocation) non-pecuniary factors played a significant role in the interviewees' migration decisions, and in many cases determined the country of destination. Migration narratives of this group - the highly skilled, whose human capital is transferable, and whose expertise is positively evaluated by countries - is mainly characterised by search for personal development either through personal experience or career opportunities. Migration in such cases is rather depicted as an opportunistic action addressed in terms of voluntary and rather calculated decision

SAMMET, KORNELIA* (University of Bielefeld, sammet@uni-leipzig.de)
ERHARD, FRANZ (University of Leipzig)

Alienation, Anomie and Fatalism: Durkheim Revisited

In sociological research, 'anomie' is used as a multidimensional concept that includes vaious, partly contrary meanings. The operation of 'anomie' in quantitative research as normlessness, social isolation, powerlessness, meaninglessness and alienation from work in fact refer to very different experiences. The paper argues that in order to distinguish between experiences of under-regulation and over-regulation, the concept of fatalism which was mentioned by Durkheim in a mostly overlooked footnote in 'The Suicide' should be integrated in the analytical framework. The relations of 'fatalism' and 'alienation' are discussed and applied to the empirical analyses of worldviews of unemployed people in Germany.

The paper examines anomic world interpretations in a double perspective. Firstly, the sociological discussion on anomic experiences is recapitulated with the result that the concept 'anomie' has varying meaning in different theoretical contexts, and the links to alienation theory are examined. Secondly, worldviews of unemployed are explored with a qualitative approach. Based on biographical narrative interviews, the paper analyzes experiences of contingency, alienation and heteronomy focusing on the perception of order or disorder in one's own life and the world. The empirical analyzes are thirdly condensed into a typology of worldviews differentiating the dimension of order and completing the Durkheimian opposition of anomie and fatalism by the perception of a well ordered world.

Don't Waste the Space – How Theorizing Relations Between Space, Waste and Organization Contributes to Comparative Analysis of Informal Worker Organizing

The majority of workers in the informal recycling sector throughout the world are not organized. However, in the last three decades reclaimers (also known as waste pickers) in a range of contexts have begun organizing around their collective demands. Increasingly, they are also sharing experiences, ideas and strategies, both within and across countries. In this paper we draw on more than ten and almost thirty years respectively working with, and studying reclaimer movements in Latin America, Africa, and Asia as well as the global level to contribute to the emerging body of scholarship on comparative studies of informal worker organizing. In seeking to understand commonalities and differences in how reclaimers organize we make three key interventions. The first relates to method. Existing comparative studies (including some or our own) tend to conduct comparison of places and movements framed as discrete units of analysis. Instead, we argue for and employ Hart's (2006) method of "relational comparison". Second (and relatedly), we argue that comparative analyses need to be rooted in a Lefebvrian ([1974 1991]) understanding of the production of space in order to move beyond comparisons that see places simply as containers where different movements organize and focus alternatively on how space, social identities (both individual and collective), politics, practice, and organization are forged in relation to one another. Finally, we argue that although the fact that each reclaimer movement organizes around waste and recyclables leads to commonalities, the different meanings attributed to, and histories of waste within different places lead to important differences that also present challenges to organizing across space and scale.

Multilevel Models Vs. Fixed Regression, Insights from Food Prices and Consumption in Mexico

Recent shocks in food prices have affected household food security. After recuperation, some prices have remained above past decades levels, some other have risen rapidly again, and some are likely to stay high for some time to come.

Changes in prices as well as in socioeconomic population composition could affect household consumption. Teasing apart period and cohort effects are central to understand how household welfare responds to changing contextual conditions, and to design better mitigation policies. In this paper, we compare multilevel models and fixed effects models to understand the impact of prices on food expenditures in Mexico. The latter methodology has been the most common tool in policy assessment, but recent studies have drawn attention to their capacity for assessing period effects.

We pooled 14 cross-sectional data of the National Survey of Income and Expenditure (1984-2012) and constructed a pseudo-panel that allows considering cohorts and periods. We first estimate fixed-effect models we construct a pseudo-panel based on birth cohorts, place of residence and household production characteristics. Then, we use a two-way pseudo-panel model to account for period and cohort effects. By using fixed effects, we simultaneously accommodate for the influence of observed and unobserved attributes on food consumption across multiple time points. Second, we adjust a cross-classified multilevel model where households are nested, simultaneously in period (survey year) and birth cohort. By adjusting random effects, we can describe household-level relationships that might vary over time, and over cohorts. We introduce food prices as period predictors while controlling for sociodemographic characteristics and cohort membership. We compare the results to address the following questions: a) how are price changes treated in the two approaches; b) how they differ on accounting for population change over time; and c) how they account for unobservables and how that could affect their conclusion for causal analysis.

Competitividad De La Mujer Investigadora En Las Universidad Pública

La competitividad de la mujer latina en las organizaciones enfrenta aún en el siglo XXI el reto de la discriminación, situación que ha dificultado su posicionamiento en las estructuras de poder y su valoración como integrante de la sociedad empresarial. En este trabajo, se presenta el Estudio de la competitividad de las mujeres investigadoras pertenecientes al Sistema Nacional de investigadores en la Universidad de Guanajuato que evidencia los obstaculos profesionales que enfrentan en su despempeño diario, así como estrategias que han implementado la permanencia en el sistema el cuál es el organismo más importante en investigación en México.

La investigación descriptiva, histórica, correlacional de naturaleza cualitativa se desarrolló en 2015 con el apoyo de becarios en el Verano de la investigación, integrando áreas como Administración de la calidad y la productividad, psicología, y Relaciones Industriales lo que permitió el análisis multidisciplinario mediante la aplicación de la técnica de encuesta con muestreo aleatorio.

La principal contribución de la investigación se orienta al diseño de estrategias institucionales que permitan establecer escenarios factibles para el desarrollo de la investigación de forma equitativa y el estabecimiento de redes con investigadoras a nivel local, nacional e internacional.

El Diseño De Plataformas Educativas Multimedia Para Comunidades Emergentes En México

La divulgación de la ciencia es una herramienta que refuerza la educación formal. Las investigaciones sobre la comprensión pública de la ciencia (Cáceres y Ribas, 1996) ponen de manifiesto que la base del interés, la actitud y los conocimientos científicos van muy ligados al nivel de formación de los ciudadanos. De este modo, se entiende que el interés se configura durante la enseñanza preescolar, primaria y secundaria; y posteriormente puede ser fomentado o satisfecho por los medios de comunicación, bibliotecas, educación formal e informal y centros de ocio; esto debería hacer a la ciencia más atractiva para la población.

En este contexto surge el proyecto Diseño de plataforma para la enseñanza de las ciencias naturales para las comunidades emergentes en el Estado de Guanajuato, financiado por CONCYTEG en 2014. La finalidad de la investigación es la elaboración de una plataforma educativa virtual tomando como base el programa de la materia de Ciencias Naturales de tercer grado de primaria, con diez temas seleccionados con actividades de hipermedia mediante el uso de los dispositivos electrónicos (celular o Tablet). En este proceso fue necesario llevar a cabo una reelaboración del "conocimiento científico oficial" (Blanco Angel, 2004), es decir, reestructurar el conocimiento de los libros de texto o revistas científicas para hacerlo comprensible para el usuario.

Democracy, Effectiveness and Identity

Interpretation og the concepts of democracy, effectiveness and creation of identity were central concepts in the research program "Ledelse, organisasjon og styring" ("leadership,organization and givernment") funded by the Norwegian government and conducted from 1987 until 1996. With a point of departure in these concepts, the end report present trends that implies siginficant challenges to the Norwegian system of government; increased plurality in the ways public administration is organized, increased plurality in and between democratic institutions and a greater degree of competion between institutions in society.

The background for the establishment of this research program was an understanding that good organization and leadership is a condition that Norway can maintain and further develop a varied business life and a well founded welfare state. The evaluation of this research program will be the topic of my paper.

RC46-525.3

SAND, HANS PETTER* (University of Agder, hans.p.sand@uia.no)

On Sustainable Development

The paper will deal with the end report of the research program *Alternativ Framtid* **(Alternative Future) that was conducted in Norway from 1985 to 1995. In this report, the focus was on the problems with the concept of** sustainable development. In the foreword of the report it was even stated that the concept of sustainable development itself had become an environmental problem. The intention of the end report was in fact to focus on this environmental problem: the notion of sustainable development. Sustainable delvelopment was really set on the political agenda when the «World Commission for Environment and development» published its report «Our Common Future» in 1987. The commission was led by the Norwegian prime minister Gro Harlem Bruntland. Since then the concept has come into public use. Most organizations have sustainable development as part of their program. In this paper I will, based on the end report of Alternative Future, discuss how the concept of sustainable development may get a more effective usage. The intention is not only to give a better understanding of what the concept means, but also make visible the disagreements about contens and application. I also wish to make visible how sustainable development may function in various contexts and how the concept may play a more pragmatic and constructive role in the debate on environment and development.

WG01-635.4

SANDAKER, SOLVE* (County Governor of Oslo and Akershus, ssossa@runbox.no)

Scarcity of Means; About the Social, Cultural and Political Embeddedness of Local Politics Solutions Management. Description and Interpretation of the Attempts of Solving Priority Problems in a Norwegian Municipality.

Main area of research. The intention of the paper is to describe and assess the situation for one municipality concerning the priorities the local government needs to make, to be able to meet already decided solutions and coming challenges. Some of the m.ost important areas for these decisions will be: Building of Culture house and Church (decided and only just started). Deciding rehabilitation or new building of schools, and resource allocation for primary and lower secondary schooling. Decisions concerning further building of nursing homes and elderly care. Renovation of the sewage system.

Method. Reading and interpreting the documents to each local government meeting and listening to the debate. Reading articles referring to the mentioned areas in the local newspaper(s). Possibly making interviews with some representatives in the local government to have their assessment of the situation, e.g. to what extent ordinary representatives themselves are allowed to explore alternative solutions or whether they are bound by the ordinary decision-making procedures (formally and informally). Assessing the magnitude and quality of the local bodys public dialogue (in newspapers or on internet) with ordinary citizens.

Theory. Local government politics is probably one of the most underestimated and consequential politics areas. The dilemmas and possibilities in this area are seldom explained or understood "in full". To be able to come to grips with it, it will be crucial to approach in an interdisciplinary way. The multifaceted interpretation will probably need perspectives from at least sociology, politics and literature.

Timespan. The aim is to follow the work of the local government etc. from the constitution of the new body in October 2015 and until summer 2016.

SANDERSON, PETER* (University of Huddersfield, p.j.sanderson@hud.ac.uk)

Complexity, Uncertainty and Rigidity in the Transformation of Advice Work in the United Kingdom

This paper seeks to explore some of the uncertainties and rigidities encroaching on the professional activity of providing legal advice to more marginalised citizens in austere times. Uncertainty, or indeterminacy (Jamous and Peloille, 1970) in the scope and character of poor people's justiciable problems, exacerbated as they are by complex problem clusters, policy shifts, and unpredictable decision making by administrative tribunals, is one of the foundation rationales for the provision of expert advice. As is the case with other public service professions (Traynor et al 2010), the extent of this indeterminacy is being eroded by the adoption of more rigid controls over the mode of professional advice delivery, originating either in concerns about service quality, or downward pressure on costs resulting from liberalisation of markets. A significant response by organisations employing professional providers of legal advice has been to explore the scope provided by technological innovation for the decomposition of legal knowledge (Susskind, 2013) and its embedding in telephone and web-based advice delivery systems. This paper explores the issues associated with the transformation of advice practice, in terms of its capacity to replicate the functions fulfilled by face-to-face models of advice delivery, for example in dealing with complex problem clusters, and in terms of a discursive shift from a commitment to outcomes to a model of advice consumption. The implications of these changes for professionals' reflexive conception of their role is also considered. The paper uses material from research projects in the UK over 10 years exploring the transformation of the landscape of advice for marginalised citizens.

New Leaders, New Members? the Impact of Party Leadership Renewal on Party Membership

Longitudinal data show a generalized decline in aggregate country-level membership figures (Mair and van Biezen 2001; van Biezen, Mair and Poguntke 2011; Whiteley 2011; Gauja and van Haute, 2015). Party-level explanations for membership fluctuations, based on party organizational features, seem particularly relevant when taking into account the generalized and recent process of party change that is ongoing in several advanced democracies (Dalton, Farrell and Mc Allister, 2011; Pettitt, 2014; Pilet and Cross, 2014; Sandri et al., 2015). The distinct but combined processes of personalization (Poguntke and Webb, 2005; Blondel and Thiebault, 2010) and democratization (Cross and Katz, 2013) of party organizational features could contribute in explaining the fluctuations and long-term trends of party membership. If the intra-party role and public image of party leaders become increasingly central to party dynamics, a change in party leadership and a process of renewal of leaders' features (in terms of political attitudes, age, gender, level of political seniority) could affect the recruitment processes and the parties' capacity to retain its members. The selection of a new, maybe younger or more radical party leader, especially when implemented via inclusive methods, could attract new members, even if just in the short term. Our research question, thus, asks whether a change in the party leadership or in its main political and socio-economic features could affect party membership size in the sense of increasing incentives for joining. We consider party leadership change and renewal, as the main independent variable of the study, which could explain the variations in membership levels. We use two international datasets that were recently made available: MAPP's party members' dataset (van Haute and Gauja, 2015) which provides merged data of membership figures in over than thirty nations, and leadership selection dataset (Pilet and Cross, 2014) which provides data on thirteen nations.

SANDRI, GIULIA* (Universite Catholique de Lille, giulia.sandri@icl-lille.fr)

VON NOSTITZ, FELIX (University of Exeter)

The Regulation of Political Participation Across Party Organizations

Over the past decades, the diversity among possible types of party membership increased significantly with the introduction of new participatory opportunities that challenge the very notion of formal party membership, widening the possibility for individuals to interact and participate in very different ways with the party (Gauja, 2013; Scarrow, 2014). The paper accounts for the growing diversity in the forms of involvement within political organizations and intra-party democracy on the basis of an original comparative database exploring the regulation of party affiliation forms in 14 established democracies (10 European counties and US, Canada, Australia and New Zealand). The main dimension of analysis concern the rights and obligation of supporters and members, the fees for different types of affiliation, the degree of decentralization of the recruitment procedure, and other variables measuring the organizational boundaries of parties. The central questions addressed by our paper are the following: who are party supporters? To what extent they contribute to party life across different party types and families? We will classify supporters based on their degree of involvement in party activities. As Maor (1997) outlined, different party types imply different types of membership. Also, since the development of the cartel party thesis (Mair and Katz 1995) scholars have linked different party types with different party member characteristics. Our database allows us to test these often theoretical claims empirically. Thus, party type will be our independent variable and regulation of "party supporter" category of dependent variable. Overall, the paper will provide insight into how the current diversity of interaction of society with parties is regulated and whether membership diversity is truly integrated into the overall party structure or remains mainly external and unregulated. Thus the paper provides a first much needed overview in order to enable future research, studying the diversity of interaction with political parties.

Close Encounters with the Same Kind: The Limits of North Korean Refugees' Imagined Communities

Migration has become an increasingly significant issue in global society, particularly as it is accompanied by problems of boundary control and contested boundaries, policies regarding illegal immigration, and family separation and dis-

integration. But a key underlying problem is that of disparity between imagined communities (Anderson) in the minds of citizens and migrants. This paper focuses on such migration problems in the context of North Korean refugees resettling in South Korea, utilizing Anderson's concept of "imagined communities" to approach migration issues from a fresh perspective. Although North Korean refugees mentally construct an imagined community in which North and South are one, South Koreans' cultural attitudes toward refugees causes such problems that some refugees go so far as to return to the North. Such phenomena calls for thoughtful research on migration to resolve these issues of resettlement.

This qualitative study draws from in-depth interviews with ten North Korean refugees (five men and five women) going through the process of resettlement in South Korea and attempting to overcome the cultural barriers they encounter. The research focuses on the conflict between imagined community and existing community while analyzing what factors lead to success in resettlement. While the sample size is small, this research takes an important first step in examining the personal experiences of North Korean refugees in order to pave the way for positive solutions to the migration issues that are accelerating and expanding in scope throughout our global society.

SANGGU, LEE* (Sogang University, tkdrn333@naver.com)

Ties That Bind or Tearing the Social Fabric? : The Integrating and Disintegrating Power of Religion in South Korea

Scholars such as Durkheim have long recognized the crucial role that social integration plays in both the public and private spheres. But as modern South Korean society shifts into a "post-secular" era, the public conflict between sacred and secular continues to intensify, threatening societal cohesion. In response to this phenomenon, this paper examines social integration through multidimensional research incorporating religious factors (spirituality, frequency of participation in worship, etc.) and social factors (political inclination, citizenship, etc.), with the goal of identifying and comparing factors that contribute to social integration versus social conflict.

This study is based on quantitative research utilizing the 2008 and 2012 Korea General Social Survey (KGSS, sample size 1,508) and data from the Korea Social Science Data Archive (KOSSDA, sample sizes 1302 [2009], 7254 [2011]). Findings indicate that patterns of closed community spirit, such as "fundamentalist thought" and "white supremacy," exert a negative influence on social integration. However, patterns of "religious pluralism" and "individual spiritual experience" are strongly associated with religious openness and exert a positive influence on social integration. Liberal churches, openness-citizenship and active participation in civil society also hypothetically exert a positive influence on social integration. In sum, important issues surrounding religion and social integration center not only on understanding dogma in religion, but also the need to create transcendental principles based on "integrative values" (Bellah) that go beyond individual religious institutions and exist in within whole meaning systems. This research offers a foundation for further exploration into the many complex factors impacting social integration and how they interact in the context of civil society.

RC06-75.3

SANTERO, ARIANNA* (University of Turin, arianna.santero@unito.it)

NALDINI, MANUELA (University of Turin)

Migrant Families in Italy: Gendered Reconciliation Processes Between Social Reproduction and Paid Work

Only recently has attention in gender studies on migration shifted from the role of migrants as caregivers in "natives" families (Hochschild 2000, Ehrenreich and Hochschild 2002, Yates 2012, Campani and Chiappelli 2014) to the transnational maternity of female migrants (Kofman et al. 2000, Erel 2009, Reynolds Solomos and Zontini 2010, Kraler et al. 2011). Still limited, particularly in the European countries of more recent immigration like Italy, is attention to the family/work reconciliation strategies implemented by migrant mothers (Chinosi 2002, Santero 2008, Bonizzoni 2014). There is a lack, even in countries with longer traditions of immigration, of longitudinal studies not only on practices but also on reconciliation desires and plans, and research focused not only on the point of view of the mothers but also on broader intra-family dynamics. Yet these are issues with major policy implications.

The paper focuses on the plans and practices of work/family reconciliation of immigrants (singles and couples) in transition to parenthood, born in Morocco, Peru and Romania and living in Piedmont, an Italian region in which the incidence of immigrants is above the national average. Analysis is made of longitudinal interviews conducted with 9 couples of migrants expecting their first child, and 20 semi-structured interviews with migrant parents with children aged 0 to 6. Information on parents of Italian origin is also drawn from examination of the literature and 64 longitudinal interviews conducted with 17 couples of middle-class Italian parents resident in the same region. Gendered reconciliation processes between social reproduction and paid work, and the gap between ideals and practices, depend on social resources, the institutional context, the migratory history,

and the employment and legal status of the migrant parents. Exit by the mother from the labour market, in a context of increased work precarization for fathers, exposes these families to greater vulnerability.

Responsabilidad Social De La Educación Superior En La Formación De Recursos Humanos

En términos de responsabilidad social, se ha discutido acerca de la pertinencia en la formación de estudiantes de educación superior. La UNESCO considera que: "La educación superior, en tanto que bien público, es responsabilidad de todas las partes interesadas, en particular de los gobiernos" (UNESCO, 2009).

La mayor parte de las reflexiones han girado en torno a la necesidad de que esta formación tenga una adecuación directamente relacionada con la realidad, con las necesidades sociales que los profesionistas deberán atender, si bien esto es un asunto importante, la responsabilidad social va más allá de ello, hay una serie de elementos que deben atenderse de manera paralela, sólo esto puede garantizar lograr el objetivo.

En el caso de las instituciones de educación superior públicas en México (con financiamiento estatal), la responsabilidad de la educación superior para la formación de recursos humanos, no ha sido entendida como un proceso amplio y de fondo, que incluye atender cuestiones de: infraestructura, acceso, garantía de permanencia de los estudiantes y sobre todo el compromiso de la institución para brindar formación de calidad, comprometerse con la generación de conocimiento con integridad académica y por supuesto, promover la vinculación.

El objetivo de esta ponencia es mostrar de qué manera dos instituciones de educación superior pública en México, la Universidad Autónoma de Chiapas y la Universidad Autónoma del Estado de Morelos, están asumiendo esta responsabilidad en la formación de estudiantes de posgrado, se trata de una investigación de corte fenomenológico en la que a través de la narrativa, se da cuenta de ello a través de la experiencia vivida por los estudiantes de los posgrados que en estas instituciones se imparten.

Palabras clave: responsabilidad, educación superior, formación, posgrado

Health and Wellbeing during the Transition to Retirement: The More the Fears the Less the Actions?

Introduction
Previous literature underlines that lifestyle and wellbeing may both improve or worsen after retirement. The main aim of this qualitative study is to increase the knowledge concerning health and wellbeing during the transition to retirement. This is an important topic to study, in order to find answers on how to reduce the deterioration of health and wellbeing once the professional life is over.

Method
This is a qualitative longitudinal study about the transition to retirement of substantially healthy (i.e. retirement was not linked to health reasons) individuals, carried out in Italy on 40 subjects (mean age 60 years). The baseline interviews were carried out in spring 2014, some months before retirement, whereas the second ones in fall 2015, about 10 months after their retirement. Interviews were transcribed and textual data were coded and analyzed using MAXQDA11.

Results
Three main themes/groups emerged concerning anticipated health and wellbeing after retirement: improvement; about the same; worsening. Especially the first group (improvement) was characterized by the anticipation of plans in the direction of a positive change in terms of lifestyle activities (e.g. physical activities, diet, etc) and social life. Third group (worsening) was characterized by fears and anxieties and, contrary to what we would expect, they had no substantial plans for health and wellbeing improvement. The study also clarifies the development of these themes after retirement.

Conclusions
Through specific strategies, stakeholders and policy makers should support older workers during the transition from work to retirement, to enhance health and wellbeing of individuals during retirement. Opportunities to this purpose should be increased especially for older workers who express health-related worries and anxieties for their future life as pensioners. Indeed, especially the latter, despite this fear, once retired could not act in the perspective of a correct lifestyle.

The Migratory Experience of Young Italians to England: A Comparison Between the Experience of Immigration before and after the Economic Crisis

Over the last five years, the number of Italian expats has increased significantly with Great Britain and Germany representing the preferred foreign destinations. This paper is based on 50 in-depth interviews of Italian expats living in Manchester (UK) in 2014-2015. The research considered both people who immigrated in England more than five years ago and people who immigrated in the last two years, when the effect of economic crisis started to be very negative for young people in Italy. The research shows how young expats plan their immigration project before leaving, which kind of strategies they implement to cope with their everyday problems (bureaucratic problems, search for accommodation or for jobs), how they recreate their Italian lifestyle in England (e.g. food) and they try to maintain their national identity and establish forms of solidarity typical of immigrant communities. However there are differences between "new" and "old" immigrants. People who migrated in the last years are more vulnerable than people who settled in England before the economic crisis. The increase of youth immigration from Southern European countries has risen the level of competition in the labour market. Graduated people are forced to get unskilled jobs and they have less opportunity to change their position on labour market. Then other credentials, like a better knowledge of the language, a higher university qualification, become important to improve one's occupational status and to settle definitively in the country

Student Grant in Public Universities: A Comparative Study Between Brazil and Portugal

This comparative study, using a case study between two public universities in Brazil and Portugal, aims to analyze the institutionalization of scholarships policies for university students and characterize the assignment guidelines, systematizing its forms of access. Scholarships are a mechanism of social response from the student aid systems that facilitates educational attainment through attendance to students from vulnerable social groups and the democratization of access to higher education (Menezes, 2012). Through methodological procedures of documental and bibliographic research, the analysis suggest that regarding the institutionalization there are no significant differences between the policies of the two countries, being part of the policy indicator legacy of the corporatist model of welfare, verified through the content of the rules, especially in the high familiarization and subsidiary degrees. Concerning the assignment guidelines, a greater responsibility of the state is observed in the Portuguese university with regards to the level of regulations than present at the Brazilian university, which had relative autonomy in the specifics rules, however shows weakness in the principles and guidelines. The legalistic understanding about the scholarships is variable, on the Portuguese side the scholarship is a joint participation between the state and students and, on the Brazilian side it is financial assistance to minimize inequalities. The largest coverage is verified as being at the Portuguese university where 30% of the total number of enrolled students have scholarships (including master degree), in sharp contrast with the Brazilian university which has just 7,3% of the total number of enrolled students with scholarships. The monthly amounts of scholarships are significantly different, but the additional aid, granted separately, at the Brazilian university offsets this. The preliminary analysis suggests that the aims of the scholarship between the two countries are conditioned by the different models of funding for educational and other public policies.

Outsiders inside the Favela: The Double Process of Being Outsider

Favela means an impoverished urban community, located not necessarily in the periphery of big cities, in which the urban services, when existent at all, are precarious as well as all other aspects of the everyday life. In the last decades social scientists emphasized the dichotomy between the poor, middle class and upper class areas, the so-called "asphalt" and the *favelas*, the so-called "hills", since most of *favelas* in Rio de Janeiro are located in the several mountains of the city. This distinction accentuates how cities, especially Rio de Janeiro, with its gorgeous landscape, are divided. This differentiation is not accurate enough to describe the everyday life of those living in *favelas*, since it implicitly assumes that there would exist a kind of homogeneity in these urban areas. Conducting researches in *favelas* of three big cities in Brazil (Rio de Janeiro, Recife and São Paulo) in the last three years, it became clear some aspects of the hierarchies and stigma in the

everyday life in *favelas*, in which some of their inhabitants experienced a double process of being outsider: as a *favela* inhabitant is already regarded as a nuisance in the city landscape; and as recent *favela* inhabitant, with weaker social bonds. Through biographical narratives of two generations of family members living in a *favela* of Rio de Janeiro, it became clear how the everyday life is in fact more complex than the social scientists and the public opinion used to assume, marked by a distinction between "hill" and "asphalt", and also between different groupings inside a *favela*. The paper explores both aspects of this distinction. Considering the experiences of those living in neighbourhood with the same characteristics of a *favela* would contribute to a better understanding of impoverished urban spaces and helps to face it.

Women As Violent? Women's Biographic Experiences of Violence

The role of female as an active actor in violent action is rarely analysed by sociologists. This situation helps implicitly to diffuse the thesis that women are *a priori* and exclusively victims in a society dominated by the masculinity. In this sense, it could seem to be senseless to problematize women as protagonists in violent action, and this way it could be understood as something against the gender equality or the struggle for women's right. Based of some influential sociologists and also on feminist literature some analysis, paradoxically, defend the women's emancipation at the same time that doesn't recognize them as able to act violently or, when it does, women do it under the domination of a male partner or to repeat male's behaviour. Refusing to problematize this issue seems to implicitly support the thesis that violence is exclusively a masculine behaviour. Recent researches conducted by the author in several *favelas* (impoverished urban areas) in Brazil concluded that male and female small children suffered the same experience as victims, and that mothers are the most important perpetrator of physical violence against children. Based on these findings and on biographical narratives of female adolescents and young women currently in prison, the paper analyses what could preliminarily bee considered as different types of women's engagement in violent action.

Dungeons and 'Democracy': Brazilian Carceral Reform in the Bureaucratic Field

From 1984 to 2004, the prisons and jails of Brazil's Espírito Santo State were characterized by the conditions that remain a reality for many Brazilian state carceral systems—they were grotesquely overcrowded, plagued by rampant violence, systematic human rights violations, and gross deficiency in basic food, medical and social services. However, from 2004 to 2014 state authorities dramatically reformed Espírito Santo's carceral system, with a new administrative structure and objectives oriented towards (1) security and (2) resocialization (the provision of social services to facilitate inmates' social re-integration). State authorities closed or entirely reformed the state's 12 old dilapidated facilities and constructed 36 new ones. Buildings were characterized by a security-oriented architecture and surveillance technologies. The military police that had managed carceral facilities long after the formative transition from 'authoritarian' to 'democratic' rule were replaced with trained custody officers. Administrators invested in systematic medical, education and social services. *How and why did this carceral transformation occur over the past decade?* I answer this research question through an analysis of multiple data sources: (1) government documents, (2) interviews with prison administrators, wardens, military and civil police, and representatives of catholic church and human rights organization, and (3) direct observation of 12 prisons and jails in Espírito Santo. I demonstrate how Espírito Santo's carceral system was reformed because the reality of carceral conditions became a political obstacle to an economic development project that emerged in 2004 by contributing to the public sense of insecurity. I argue that investment in initiatives not only oriented towards security but also social services was a political strategy to symbolically align the carceral system with the 'democratic' ideals that explicitly undergirded the state's economic development project.

In-Labour Ethnography - Challenges and Possibilities When Doing Ethnography in Our Own Work Place

Health care settings are particularly complex and enclose the potential of establishing connections between different theoretical and disciplinary backgrounds. When health professionals are performing ethnography in health institutions, this requires a wider degree of reflexivity, going beyond taken-for-granted understandings of well-known, everyday practices. The hospital is a context framed by dynamic professional responsibilities, unclear definitions of private and public spaces, shifting relations mediated by technology, and patient and professional plural expectations towards the ethnographer. The aim of this presentation is thus to explore the underresearched area of health professionals doing ethnography in their own work setting. The analysis is based on two different experiences from the authors as they undertook their research on a maternity ward, while also being a qualified nurse or midwife. The value of this "in-labour ethnography", we argue, is the capacity of bringing to light practices, knowledge, relationships, and the contribution from involved technologies that would be otherwise undercover or inaccessible to the common researcher. One of the aspects we highlight from our research experience is the productive potential of observers and observed acknowledging the specific features of ethnographers – their background and insideness, but also their research agenda and their connections to other contexts and institutions – which position them cultural and socially as belonging to the outside world and, at the same time, contribute to build a role for the ethnographers as having a place inside the hospital setting, nor as insiders or outsiders. Managing this can be a challenging task. Nevertheless, the particular position of health professionals has a peerless potential to defy the way health care is viewed from inside the health care system. As such, this presentation proposes a reflection on both the productive and on the problematic features of in-labour ethnography, although highlighting the value of this strategy.

Raising the Issue of Inequality: Comparing Home Birth Policies and Practices in Portugal and Denmark

Planned home births are part of a quite invisible reality across different countries where hospital births are dominant. In European countries like England, Denmark, and others, home births are supported by the State, and are part of the public maternal health services. But there are countries where informal but also formal limitations can be found. Placing this option within the European context, it is clear that even where there are signs of higher levels of social and medical acceptance of planned home births, they are still a minority. Also, similar results regarding the configuration of this experience as a rejection of medical dominance, framed by particular risk perceptions, were found by social scientists in very different European settings, like Portugal, the Czech Republic, Finland and Denmark. These similarities are exceptional. When comparing the access, the practices and the organization of home birth, the differences are more evident. In this presentation, some of these local differences are addressed. In Portugal, the access, the validation of practice, and the backup support is offered differently: for women who choose to have a home birth there is worst access to health care, with more barriers and more constraints; scarce discussions and no regulation concerning practices; and no formal, adequate backup support. In Denmark, there are no evident inequalities between women who choose home births and the ones who plan a hospital birth. There are established practices and guidelines, and formal networks both in practice and research. By focusing on the home birth situation in Portugal and Denmark, in a comparative perspective, I aim to explore how the existing public system in Portugal is defining health inequalities for those who opt for a home birth.

SANTOS, MYRIAN* (UERJ, myrian.sepulveda.santos@gmail.com)

The Scandal of the Brazilian Medieval Prison System

The aim of this presentation is to analyze the contrast between the theatrical media spectacles that have taken place around the demolition of Brazilian penitentiary buildings and the persistence of a system that is characterized by systematic violence. In 1962, the deactivation of a prison located in Ilha Grande, Rio de Janeiro, was largely covered by the media. In 1994, another penitentiary system also located in Ilha Grande was destroyed by implosion. Films were made about this event. In 2002, the Carandiru prison complex, in which more than one hundred inmates were shot by the police in what is called "The Carandiru massacre", was destroyed by kilos of dynamite with wide press coverage. Finally, in 2010, the Frei Caneca penitentiary complex, one of the oldest and biggest of this kind, was also destroyed with dynamite. The images were transmitted by major newspapers, radio and television. While politicians and the press create an illusion of a new beginning, allowing the forgetting of past situations, atrocities that go beyond our imagination continue to be the reality in the Brazilian penitentiary system.

The Social Construction of Inequality: The Case of Ilha Grande

This article is focused on the social construction of inequality within the penitentiary system. The argument being developed here takes seriously the contributions left by Michel Foucault about the penal and penitentiary systems. The concepts of power and domination are expanded; they cease to be restricted to economic and political issues and are understood out of a system of norms and institutions. The research is based on interviews with former guards who worked at the penitentiary called Instituto Penal Cândido Mendes, from 1951 to 1994, documents related with the prison, biographical testimonies and articles in newspapers and magazines. The author analyzes the different meanings of violent practices as well as the construction of stigmas and prejudices, which allow the classification of individuals as either people of lesser human value or dangerous one and predispose them to be arrested, tortured and killed.

Is There Coherence Between University Missions and Promotion Criteria? the Role of the Preferences of Academics

Over the past decades policy discourses and normative models proposed for the universities have promoted the integration of the different missions of universities: teaching, research and knowledge transfer. Previous research has suggested the potential disruption of these changes in universities; the transformation into an "entrepreneurial university" (Etzkowitz et al. 2000) or the movement of universities and industry "from separate systems to hybrid order" (Owen-Smith 2003).

Expanding university missions increases the complexity of human resource management. Most universities worldwide that have adopted this strategic approach now confront the challenge of hiring and selecting staff that could cope with the potential problem of role strain. Additionally, rapid change in institutions increases the complexity of the university environment and faculty members' professional lives become more difficult with the need to accept multiples roles

Our paper recovers the role theory, initially developed by Merton (1957) and applied to the situation of researchers working in industry (Box and Cotgrove 1966), to empirically analyze the opinions and personal preferences of academics regarding the university missions. We also compare the adherence of academics to the different missions and their opinions and coherence regarding the evaluation criteria for hiring and promotion.

Our research is based on data coming from a survey carried out in 2015 among more than 5000 Spanish academics in a representative sample of universities across the national territory.

Controlling for some relevant variables such as gender or age, this research will provide novel evidence on the differences in preferences and opinions of academics regarding university mission and the role of some critical variables of their careers such as national and international mobility, participation and coordination of research projects, supervision of PhD students, participation in committees, productivity, etc. We also explore the existence of differences among academics across fields and types of universities.

SAPINSKI, JEAN PHILIPPE* (Department of Sociology, University of Oregon, sapinski@uvic.ca)

Climate Politics, Capitalism, and the Governance of Solar Radiation Management

In recent years, the conversation around geoengineering as a last resort but feasible option to curb global warming has exploded. Currently, discussions point to solar radiation management (SRM) technologies – a set of interventions that aim to reflect part of the sun's heat away from earth – as the most likely candidates to rapidly and cheaply curb surface warming. Social science scholars are actively seeking international governance mechanisms that would allow experimental research to proceed without transgressing thresholds of social acceptability, and that could provide a blueprint for governing eventual SRM deployment.

A profound division among capitalist interests underpins for a good part the current deadlock in UN climate negotiations. On the one hand, fossil capitalist interests have actively blocked climate policy both internationally and for individual states. On the other hand, a 'climate capitalist' coalition has promoted carbon trading, carbon taxes and climate finance to address global warming through the ecological modernization of the neoliberal regime. How do these divergent capi-

talist factions position themselves regarding the possibility of geoengineering in general, and SRM in particular? In this presentation, I will use social network analysis to map out emerging SRM governance networks. This will allow to investigate whether SRM and other geoengineering proposals might provide the grounds for a broader climate policy compromise poised to rally both climate capitalist and fossil capitalist interests, and the role of the capitalist state in developing such a consensus.

Nature, Environment, Territories: Some Political Implications of Environmental Sociology's Discourse Categories

As sociologists, we need to use socially constructed language categories to produce a discourse about the social and material world. The fundamental categories of 'nature,' 'environment,' 'territory' and 'land' all define slightly different objects of study for environmental sociology. In the first part of this presentation I will examine the political implications of each of these categories. I will discuss 'nature' and 'environment' as binary categories and delineate some of their shortcomings for developing a comprehensive analysis of the ways humans appropriate their subsistence from the world they exist in. The second part of the presentation will focus on the categories of 'territory' and 'land,' and explore how they may open up space for integrating human economic and political systems at the core of such an analysis, and thus move beyond human-nature dualism. Building from this framework, the third part of the presentation will look specifically at the capital-state-territory nexus that under capitalism determines the unsustainable appropriation of matter and energy at the root of the current environmental crisis.

SAPIO, GIUSEPPINA* (University Panthéon-Assas (Paris 2), sapio.giuseppina@gmail.com)

Learning the Family We Are. the Practice of Home Movies in France

My research concerns the evolution in France of home movie filming and watching from the 1960s (Super 8 films) to the present (digital films) and the changes that have affected the family unit during this period. It brings together a theoretical dimension, the symbolic implications of the practice, and an empirical one, the findings emerging from an exploratory case study of six French families shooting home movies. Based on the psychological, social and cultural study of these families, the multidisciplinary approach of this piece, combined with a qualitative methodology (in the form of several in-depth interviews with the members of those families), is meant to explore how family images and conversations help individuals to think about themselves and their roles within their groups. I conceived my field survey as a form of role-play in which the subjects were supposed to show me their home movies and talk about them: I interviewed family members separately about the same home movies in order to find out how people give several interpretations of the same representation of a family event. I will argue that the making of home movies contributes to a family's sense of self-awareness by introducing a concept that I have named the *meta-family*. Thanks to the interactions in shooting home movies and the different types of verbalisation, the family is allowed to think about itself. The *meta-family* is not the real family, shooting or watching images, but represents the conscious and unconscious workings of the family members produced with, and through, the images. The evolution of the technical age and technologies in the practice of home movies has followed, recorded and sometimes predicted those conscious and unconscious changes within the family unit.

Reframing the Inner Dynamics of Urban Rent and Disaster Risk

Recent efforts in urban transformation in the areas under disaster risk in Turkey reframe particular beneficiaries and payers of the doctrine of "every crisis is an opportunity". The absence of a permanent disaster risk reduction institution and de facto regulations imposing urban transformation as an urban regime, indicate the requirement of redefining a new socio-ecological perspective. Considering risk definitions as both technical and political artifacts, clarifies the requirement of rediscovering their relations with the built environment. Risk is defined in terms of harm and loss estimates, and reduced in to costs as well as the political connotations that reproduce risk repeatedly. In recent attempts, revealing the shifting priorities from post disaster approach to pre-disaster approach, implement urban transformation as a risk reduction method. Previous experiences in Chile, Argentine and Turkey, reclaim the dichotomy that to what extent the urban transformation in earthquake-prone areas succeed to devise appropriate objectives and tools for risk reduction and to what extent they serve as promot-

ing urban rent. Risk as a commodity or a destructive good pertains the favorable conditions for extensive crises to reproduce means of production. Risk as a liquidatable commodity becomes tradable through governmental institutions, local administrations, contractors and dwellers by its exchange value.

Contesting Corporate Power: Exploring Why Individuals and Organizations Divest from Fossil Fuels Companies and What Social Factors Influence Them.

Consumer capitalism offers to many of us, mostly in the developed countries, a material abundance hardly imaginable only a few decades ago. At the same time, consumer capitalism is based on a growth-dependent economy which generates unprecedented destruction due to increasing over-exploitation of resources, pollution, and climate change. In 2015 the resources that should have lasted for the whole year have been consumed in less than seven and a half months, and if the current trends continue, we will need the resources of two planets Earth by 2030. The oceans are affected by plastic pollution and acidification, and the extinction rates of many animal species amount to what has been termed as a "sixth extinction." Finally, we may have exceeded the CO2 concentration consistent with a 2°C increase in the average temperature of the planet. In spite of the increasing urgency to act, the structural forces that define consumer capitalism keep us locked into a business-as-usual model that threatens not only the future of human civilization, but the well-being of the biosphere.

Market forces are at the heart of this business-as-usual model, but could they also be its "Achilles heel"? Could divestment from fossil fuel companies contribute, through *financial* mechanisms, to a transition toward cleaner sources of energy? Making a judgment in this matter is not easy because the share prices of the companies and the prices of fossil fuels are not governed by the same dynamics. Moreover, the motivations of those who decide to divest from fossil fuel companies may be ethical, financial, or a combination thereof. This paper attempts to study and clarify these motivations and understand which social factors influence the decisions of individuals and organizations to divest from fossil fuels. Imagining a future without fossil fuels could open the door to substantial social and economic innovation.

Challenges in Improving Local Community Livelihood: A Case Study of Villages Surrounding Conservation Forest Areas in West Java, Indonesia

Currently Indonesian government has attempted handling environmental issues through environmental green agendas. This is indicated by environmentally sustainable policies such as geothermal energy development and conservation of protected forests. As this study indicates, communities living in surrounding forest area, particularly those are close to the geothermal energy operation area have experienced negative impacts. For example, they are experiencing difficulties in assessing resources that were previously available to them who are mostly dependent on the forest. The communities also have complained on the environmental impact of the geothermal energy operation, particularly to the availability of water supply. As part of their reactions, local communities have organized protests, either directly or through civil society organizations. In order to ensure the continuance efforts of conservation projects as well as geothermal energy operation, the (local) government and the company operating in the area developed social-economic programs to improve the local community livelihood. In the one hand, those programs has stimulated local social and economic activities. On the other hand it has created tensions among local people as well as frictions among civil society organizations themselves. Findings of this study have indicated that civil society organizations seemed to lose their primary orientation to improve the local community wellbeing as they themselves have struggled to balance between their own or group interests and the community needs. In the context of conflicting interest between environment and development, this study describes dynamic relations among different parties involve in the effort of improving local people livelihood. As each party has its own interests, this study focuses on challenges faced by different parties since the efforts require close cooperation between the CSO, community, company and the government at different levels.

Happiness, Well-Being, Health and Leisure: An Experience in Guijan Ghat, Tinsukia, Assam, India

This is an empirical study focusing on happiness, well-being, health and leisure of the people residing in different villages in and around Guijan Ghat,which is located near Dibru-Saikhowa National Park, in the District of Tinsukia, Assam, India.

A conglomeration of different communities like Assamese, Bengali, Bihari, Mising and Nepalis are the inhabitants of the villages like Guijan Village, Erasuti village and forest villages like Laika, Pamua and Fasidiya on the bank of river Brahmaputra near Dibru-Saikhowa National Park. This is a tourist destination, where tourists visit these areas for cruising, boating, food and lodging, bird watching along with feral horses, wild buffaloes, river dolphins, orchids, sunrise and sunset and so on. Local tourists come here for various occasional parties, meetings and conference. There are several houseboats, resorts, eco camps and small boats in the locality. People living here has a different lifestyle. In the forest villages, the economy is mainly agricultural economy. They do shifting cultivation. Other villagers are engaged in fishing, dairy and vegetable production. They mainly pass time in different activities like boating, collecting timber for business, firewood collection from river and forest, gambling, guiding tourists, swimming and so on. They are habituated with swimming which is a good exercise for health and well-being. They spend more time with nature. They cook food with firewood. Villagers enjoy taking their local rice beer.

As they are mostly engaged with nature, they are fortunate and in a convenient position. In fact they have good health and routinely happy and content. In this paper we will collect data through observation and interview method. We will interview villagers, tourists, businessman and the senior citizens of the locality near the Dibru-Saikhowa National park.

Spirituality, Faith, Cultural Practices and Leisure: A Case Study of Azaan Pir's (SAINT) Dargah(GRAVE), Saraguri Chapori, Assam, India

There is a relationship between religion, spirituality, faith, cultural practices and leisure. 'Religion' is a social institution, consisting of a system of beliefs and practices related to sacred things, and a moral community that serves to unite its members. 'Spirituality' is something to do with religion or religious beliefs. 'Religious belief' is a system of knowledge about the divine and its relationship with the human. 'Cultural practices' and 'rituals' are acts performed repeatedly and according to custom.

'Faith' is a strong belief in a religion. On the other hand, 'leisure' generally involves withdrawal from routine activities such as work and involvement instead in a pleasurable activity, highly valued by the individual.

In this paper we will highlight the case of Hazarat Azaan Pir(Saint)'s Dargah(grave) in Saraguri Chapori in the district of Sivasagar, Assam which unites religion and leisure. Azaan Pir's Dargah is situated near the bank of river Brahmaputra. The place is known as Saraguri Chapori, a village of 145 families where all the families are Hindus except the caretaker family of the Dargah, which is a Muslim family. Observation and interview method will be used and respondents will be villagers, tourists and priests.

Sayed Shah Milaan, popularly known as 'Azaan Pir', had migrated to Assam from Baghdad and unified the people of Assam and brought harmony between

　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the religious communities. Originally he spoke Arabic and later on he mastered the Assamese language. He preached Islam with the help of devotional folk songs 'Zikirs' and 'Zaris'. The villagers of Saraguri Chapori, in their leisure time sing Zikirs and Zaris and while grazing their cattle they sing songs. They engage in agriculture and fishing activities. The place provides a unique amalgamation of religious practices and leisure activities through cultural practices based mainly on faith which unites people from all religious background.

Substance Users' Metaphorical Change Talk during Motivational Counseling Sessions in Finnish Probation Service

Past research has shown that metaphors are pervasive in language, thought and action. Metaphors are also claimed as powerful devices for change that offer new information about reality and will help generate different alternatives to perceive and organize the world. Therefore, it is not surprising that metaphors have become central to therapy where change is a definitive aspect. Change is also the goal of motivational interviewing (MI), a widespread therapeutic intervention that has become a well-recognized approach to counseling. It is designed to strengthen intrinsic motivation to specific goal with particular attention to the language of change. In recent years, several studies have demonstrated that clients' change-related language during sessions is an important part of successful MI. However, there is a paucity of research investigating the metaphorical aspects of the client's language during MI sessions.

The aim of my ongoing study is to expand on the current understanding about clients' change talk during MI. This paper explores substance-using clients' metaphorical talk about change during MI sessions in Finnish Probation Service. The analysis is based on videotaped and transcribed data consisting of 98 MI-sessions. Sessions were videotaped in 12 Probation Service offices in Finland in 2007–2009.

The preliminary data analysis reveals that the use of metaphors is common in connection with change-related talk. The most common conceptual metaphor was CHANGE IS A JOURNEY. The other conceptual metaphors of change were CHANGE IS UP, CHANGE IS IN A HANDS, CHANGE IS A CONSTRUCTION SITE, CHANGE IS A GAME, CHANGE IS A STRUGGLE, and CHANGE IS LIGHT.

In general, it is concluded that this qualitative analysis provides evidence for the value of the role of metaphors as vehicles of change in substance use treatment.

Can the Referendum As a Form of Direct Democracy Substitute the Lack of Confidence in Representative Institutions? the Case of the Greek Referendum in July 2015.

The outbreak of the economic crisis in Greece highlighted in a prominent way the crisis of the political system. The main characteristic of this crisis is the lack of confidence in representative institutions. This paper presents, through a series of research findings, (Eurobarometer, European Social Survey, Public issue etc.) the increasing distancing of citizens from the procedures of representation and the general lack of trust of the Greeks in institutions. The research data imprint a progressive crisis of the political system.

Since the restoration of Democracy in 1974, the bailout referendum that was conducted in Greece in July 2015 was the first after 40 years. The referendum seems to steer to classical Athenian democracy, and to the image of citizens flocking to the assemblies, in order to decide on the most important matters of the day. In the contemporary state it can be seen as a part of representative democracy. Given that voters were presented with a complicated and ambiguous question, they had to rely on ways to simplify their decision on their vote. The question of whether voters had to follow the parties they usually support was posed. On the other hand, the political parties were called to persuade their voters and to analyze the arguments for and against "yes" and "no".

The paper examines the political behavior both of the voters and the political parties, and attempts to answer the question of whether forms of direct democracy, such as the referendum, can substitute the lack of trust in representative institutions, and, thus, contribute to a better quality and empowerment of democracy. Is the referendum a substantial way to mobilize citizens to overpass political apathy and the crisis of the Political?

Institutional Changes of the Arts in NYC before and after WWII

Why did New York City become an art center after the second world war? European cities, especially Paris, had taken significantly important roles in global art worlds in the early part of 20th century. Yet, after the "triumph of the American painting"(Sandler 1976) including Abstract Expressionism, the situation had changed. This paper explores the transformation of global art worlds, especially focusing on the institutional changes of art production in New York City before and after the second world war.

Existing studies have dealt with art worlds in New York City (Crane 1989; Zukin 1982; Velthuis 2006), but they did not focus closely on the institutional issues of art production and transformations. Examining the causal mechanisms of the institutional change in New York City is important, because it allows us to figure out historical and urban spatial factors that lead to current global art worlds. As the sociology of arts has researched institutional and organizational issues of art production (Becker 1982; DiMaggio & Hirsh 1976; Peterson 1976), this paper particularly utilizes the idea of "institutional changes" (White & White 1967) and analyzes the changes of social relationships among art galleries, cultural policies and artist communities. As for methods, I have utilized the archival materials of art galleries, public policies and artists.

Before the second world war, there were weak art markets and public support in New York City and so the main players of art production and consumption were patrician elites and local avant-garde artists. After the war, several factors had changed the situation. The emergence of abstract expressionism made primary markets expand and the public and private funding systems were initiated. During these processes, the new middle class joined the art worlds and the institution of art production and consumption became complicated.

Does Agent-Based Modeling Survive in Sociology? a Theoretical First Step Toward "Sociological" Micro-Macro Links

Agent-based modeling, a sophisticated technique in rational choice theory, has been gaining popularity in sociology. It is a strong tool with which to study self-organization in society such as the evolution of cooperation and the emergence of trust between strangers. Thus it has found a niche in sociology. However, it is another story whether it will evolve and eventually prevail in sociology. A major obstacle to its evolution in sociology is sociological concepts that are difficult to be translated into concepts used in agent-based modeling. Take social structure for example, which is one of the main topics in this session. Conventionally, social structure has been defined in two ways in sociology. First, it is equivalent to social network structure. Agent-based modeling is a powerful tool with which to study the evolution of social networks and, therefore, has contributed to the progress of the study of social networks. A second definition of social structure is that it is relations of roles to which actors and resources are allocated. Then it is challenging for agent-based modelers to use the concept of "role" in their models. This is because a role is more complex than an actor or an agent. A role is defined as a bundle of expectations by incumbents of other roles. Thus it is necessary for a modeler to define the relationship between a role and expectations in order to define social structure and study its evolution. I will present a theoretical framework to do that. Linking such concepts as role and social structure conventional in sociology with agent-based models would help agent-based modeling prevail in sociology.

Governing through Voluntarily?: The Japanese Climate Change Policy and the Policy Networks

The voluntary action plan among the industrial groups has been one of the main Japanese Climate change policy. Even though this action does not have any regal background and has no obligation for the commitment, more than 80% of the companies calculated in CO_2 amount participated in this action and reduced their emission based on their own target. Why this cooperation among the private companies occurred in the free-market society like Japan?

We will answer this question from the perspective of constellation of the climate change policy networks in Japan, using the data of COMPON Japan survey collected by the Japanese COMPON team (PI: Koichi Hasegawa, Tohoku

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

University). We interviewed 72 major interest groups being active in Japanese domestic climate change policy formation during 2013 and 2014.

In order to understand the mechanism of how voluntary action works, we need to set two different levels of analytical viewpoints: Inter-block networks and inner-networks in a block. In the Inter-sectoral network, Japanese climate change policy network can be clustered into three political blocks which share major recognitions, policy preferences and actual ties of cooperation. These three blocks are the Environment Ministry block, the Economic Ministry block, and the peak business organization Keidanren block. Though institutionally the Keidanren block has more privileged position, each sector has almost the same political power. Therefore, the Keidanren block needs to implement the voluntary action plan in order to block other policies proposed by other blocks. The existence of these two powerful blocks also serves for Keidanren to consolidate their inner-ties to protect their collective interest. The form of the inner-network of the Keidanren block is also important. Their vertically connected network prevents the free-riders. However, this network form prevents also those companies appearing which take an initiative by their own interests.

Stratified Access to Health Systems: The Case of "Bolsa Familia" (Brazil) and "Oportunidades"(Mexico) Programs.

Throughout the twentieth century and up until the eighties, in some Latin American countries, a series of social policies that sought universalism but, however, remained primarily linked to the condition of being employed in the formal sector, were developed. Since the eighties, in countries like Brazil and Mexico, new archetypes of **targeted social polic**y were established: the **Conditional Cash Transfer (CCT)**, initially created to break the intergenerational cycle of poverty, with responsibilities aimed at developing human capital of the kids. The programs mentioned here are *"Oportunidades"* program (Mexico) and *"Bolsa Familia"* program (Brazil). These programs include an insertion package in health systems, characterized by precarious and different conditions compared to others types of insertion, for example, compared to workers with social security gained through formal employment. That is why **this research focuses on the effects on access to health that have had Oportunidades and Bolsa Familia in beneficiary households**. The data collection methods used were a survey of both a municipality of Mexico (Tonalá, Jalisco), and one of Brazil (Salvador de Bahía); and a series of in-depth interviews conducted in both countries. **The results point to a residual improved access to health systems, with different access features that build a new step down the scale of stratification of health systems, making the program beneficiaries second-class citizens in terms of access to health.**

SAUERBORN, ELGEN* (FU Berlin, Elgen.Sauerborn@fu-berlin.de)

Body Knowledge and the Shaping of Emotions

This paper seeks to explore how body knowledge impacts the shaping of emotions in social dynamics. Approaches about body knowledge differentiate between "knowledge of the body" and "knowledge about the body" (Keller/Meuser 2012). The former can be compared with Bourdieu's theory of practice and embodiment in social contexts whereas the second refers to declarative and propositional types of knowledge.

Moreover, the role of the body as well as of types of knowledge has been increasingly discussed in emotion research over recent years. Scheers (2012) idea of emotions as embodied practices broadens the analytic view of feelings as part of embodied processes whereas the analysis of the influence of declarative knowledge on human emotions has a well-founded tradition in the sociology of emotions.

However, what is often neglected are interdependencies of emotions as a type of embodied knowledge and the knowledge individuals have *about* their bodies.

Using in-depth interview data from a study on women in leadership positions and emotional labour as an example, I investigate the importance of reflexive knowledge of the body for the development of embodied knowledge and vice versa. From this research, I want to outline the power of the gendered body and its associated assumptions in ordinary practices.

'Phase Pardhis' of Central India in Search of Sustainable Livelihoods through Natural Resources Conservation

With the changing colonial-modern, postmodern and globalised conditions in India, as many parts of the world, a number of communities engaged in traditional livelihood practices turn out to be 'broken men'. The objective of this paper is to address the collective action and social change among the Phase Pardhi, the denotified, displaced nomadic tribal community of Akola, Washim districts of Maharashtra, traditionally engaged with hunting and therefore tagged as villain of nature which turned out to be the conservers of natural resources.

The paper, based on empirical qualitative data gathered from personal narratives, observations on the field, informal interviews of the tribals and the Samavenada actionists around Akola region of Vidarbha. It analyses, spaces, conditions and mechanisms where a traditional downtrodden community can design nature conservation model to strengthen alternative, sustainable livelihood activities and escape from the labels of 'hunter destroyers' and 'poachers'. The tribal community in association with Samvedana, an action group of nature, generated and conserved around hundreds of sq km area of grassland and the biodiversity around their villages to support alternative livelihood. Indigenous collective efforts of the community coupled with the traditional knowledge and civil society support is trying to overcome with an alternative model of their own to sustain, develop and live with pride. This novel case shows new avenues to small, marginal communities in India with distinct cultural and traditional economic background can build alternative livelihoods and conserve natural-forest resources. Civil societies working on the environmental aspects of sustainable development can have a lot baggage with this unconventional exercise.

Schoolscapes: Participation in Educational Spaces

Schoolscape research is a relatively recent strand of linguistic landscape research (Brown, 2005). It offers valuable insight into the linguistic landscapes of education. It combines sociolinguistics and landscape research in an educational context. This presentation addresses the role of schoolscape participants, who are not only shaped by the schoolscapes as recipients, but who also shape the schoolscapes as authors.

I have created a schoolscape specific data annotation scheme based on Barni and Bagna (2009). It is a complex multimodal data annotation scheme, which can be used to address the role of schoolscape participants as both the audience and the authors of schoolscapes. It addresses salience of languages (Kress & van Leeuwen, 1996; Scollon & Wong Scollon, 2003), translation and code-mixing (Reh, 2004) and spatial features (Barni & Bagna, 2009). It also reflects the different functions of the items present in schoolscapes: Bourdieusard power relations, Boudonian good reasons, Goffmanian presentation of self and collective identity (Ben-Rafael, Shohamy & Barni, 2010). This data driven approach makes it possible to examine different aspects and patterns of schoolscapes from large sets of data, for example, by participant, by educational stage or by space. The findings provide extensive information on educational spaces and on the active role of their participants.

A schoolscape is not a mere physical space where education takes place. It is a process, not a state. It is a reflection of the top-down socialization processes of education and language policies that shape its participants, as well as a reflection of the various bottom-up processes that shape it. In other words, the schoolscape participants have an active role in shaping the ordering of reality that in turn shapes them. A schoolscape is a process in which the participants have an important role influencing the social situation they are involved.

Gender Bias and Gender Diversity of Judiciary in Japan: What Makes It Difficult to Change

The idea of judicial diversity, especially that of gender diversity, has been widening these years from the mere problem of number to the more deepening idea that is contextual, gender affirmative which pays attention to the power and structure in the society and approves more diverse state of being.

Meanwhile in Japan, the number of women judges has become 20,0% in 2015, which is considered to be "steadily growing" by judiciary, which means not any means of diversity or quarter is thought to be needed. Moreover, in spite of the existence of strong gender bias of judges having been pointed out frequently, these bias still remains without any way to be solved.

Why does this state of things continue like this without any change? Why and how can it happen?   In this presentation, the reasons will be sought paying attention to the socialization process of judges and the power structure of judiciary in Japan.

Effect of Gender-Based Violence on Mental Health Among a Sample of Haitian Women

Background: Intimate partner violence (IPV) is a major public health issue worldwide. IPV not only has negative effects on women's physical and mental health, but also increases their susceptibility to acquiring sexually transmitted infections.

Method: A cross-sectional survey was conducted in Haiti to examine gender based attitudes and IPV among Haitian women. A sub-sample that had experienced IPV (N = 513) was selected. Structural equation modeling was used to test relationships between IPV, mental health, familial support and childhood sexual abuse, adjusting for other independent variables.

Results: The mean age was 26.2 (SD = 5.9) years among the sample. Approximately 6% were HIV+ and 4% had syphilis. Around 10% of women reported childhood sexual abuse, and these had reported 2.6 times (95%CI: 1.15–6.0) more battering than rest of the sample. The median scores for good mental and physical health were 26 (SD = 4.4, 20-40) and 10 (SD = 3.1, 4-20) respectively, indicating relatively poor states. IPV was directly associated with poorer mental ($β$ = -1.03, p < 0.001) and poorer physical health ($β$ = 0.70, p < 0.001). A current or recent partner with drinking problems was associated with battery ($β$ = 0.10, p < 0.05) and forced sex after IPV ($β$ = 0.73, p < 0.001). Though significant in bivariate analysis, childhood sexual abuse was not significantly associated with IPV ($β$ = 0.34, p > 0.05) in the multivariate analysis. Model diagnostics showed reasonable approximate fit (WRMR < 1, TLI = 0.71, CFI = 0.86, and RMSEA = 0.07).

Conclusions: Women who experience intimate partner violence have poorer mental health outcomes. These women may be coerced in risky sexual behaviors that increase their vulnerability to acquiring HIV or STI infections. Interventions targeting gender based violence are needed to prevent IPV and reduce its negative sequelae.

Engineers in Post-Soviet Azerbaijan: From One Dependency to Another?

In this study, I explore the impact of post-Soviet integration into global economy on engineering profession in Azerbaijan. In the literature on professions former Soviet Union is usually treated as a homogenous nation state, and the asymmetries inherent in its organization are rarely considered. In this paper, I argue that in the case of professions in the peripheral republics of former Soviet Union we are dealing with a transition from one form of supra-national regulation to another. Based on in depth interviews and analysis of secondary literature, I show how the professional jurisdictions of engineers in post-Soviet Azerbaijan, which used to be drawn in the Union center in Moscow, are now being redrawn by global actors, particularly transnational corporations. During Soviet period, Azerbaijan was industrialized in accordance with Soviet modernization project and the ideology of technical progress. In addition to a network of industrial enterprises, Azerbaijan also possessed a number of research and design institutions, incorporated into the union-wide vertically integrated scientific-production associations. Although industrialization in Soviet Azerbaijan was directed from Moscow, where the scope of work, production targets and more generally the direction of development was determined, Azerbaijani engineers were engaged in all stages of technological process, and felt that they were a part of the larger Soviet engineering professional community. In the post-Soviet period, the Soviet vertically integrated organizations were fragmented, and many functions, particularly R&D became redundant in the context of Azerbaijani nation-state. In addition, Azerbaijan had chosen resource-based development and pursued a policy of acquisition of foreign technologies, mostly in turn-key form. As a result, the professional jurisdiction of engineers in Azerbaijan was re-drawn, with some tasks, such as manufacturing, research and design, being excluded.

The Migration History of the Family As a Source of the Formation of Siberian Identity

Nowadays in Russian society, intensive processes of regional identities formation as a source of new national identity are observed, and there is a Siberian quasi-nationality, which stands out among them. Numerous studies reveal unbalanced, semi-colonial relationships between Siberia and federal government, meaning the one-sided exploitation of the various region's potential. The awareness of own secondary nature in economical and socio-cultural terms is the rea-

son for mass migration from Siberia with more than 1 million left between the latter population census. At the same time, scholars stress the need to change the authorities' attitudes towards Siberia for more efficient use of natural and human potential of the region in the interests of the whole country.

One of the key features of Siberia is a multi-ethnic composition of the population due to the rich region's immigration history during the last centuries. This has resulted in the formation of so-called *Siberian identity* with specific, diversity-welcome traits, such as high level of ethnic tolerance, unconditional acceptance of o*thers,* the tradition of mutual aid, and significant integration potential. In order to understand comprehensively the logic of the formation of a Siberian identity, it is important to analyze it in multi-dimensional perspective, taking into account historical, spatial, cultural, biographical, political, ideological, and other aspects.

The latest research on Siberian identity reveal that on the biographical level the key prerequisites for the Siberian identity formation are family migration history, ethnicity, personal mobility, as well as individual's involvement in the region's life.

This study is an attempt to determine the weight of the migrstion biographical factors in the formation of the Siberian identity based on the analysis of historical data, research of Siberian sociologists and anthropologists, as well as author's qualitative research in Tomsk, which is recognized as a center of cultural and historical development of Siberia.

Back to the Future. New Religious and Secular Paradigms Facing the Radical Crisis of Modern Civilization

The paper aims to explain the notion of perverse effects produced by a hyperbolic theoretical validation of evidenceless theories, elaborated in order to perform the modern civilization process in terms of its radicalization. As a result, arises in western societies a drift dynamic, going ahead along a slippery slope and consisting in an increasing violence due to a gradual weakening of axiological rationality, ethic of responsibility and representative democracy, until their substantial abolition. Otherwise the paper seeks to investigate the intellectual strategies rising up in response to this vicious cycle; they appear to share a substantial rejection of the notion of risk-society in itself. Indeed, on one side, focusing on the religious-traditional realm, the paper proposes a comprehension of the occurring transformation process inside the Roman Catholic Church, in light of Catholic interpretation of both present historical-natural contingencies, and religious-supernatural prophecies throughout the last two centuries (Marian apparitions mainly). Nevertheless, on the other side, through the investigation of the philosophical and social-historical realm, it considers and emphasizes the contribution offered by some of the major contemporary secular scholars from different theoretical traditions, in order to gain a new theoretical-ethical-political – as well as rational – synthesis, basically based on a fundamental paradigm-shift: from the radical-modern *etsi Deus non daretur* to the "after-modern" *veluti si Deus daretur* paradigm.

"a Fatherland without Fathers?" – Actors and Discourses of Antifeminist Platforms in Austria

Within the last three decades initiatives, platforms, and associations dealing with masculinity politics in some ways emerged throughout Europe. These platforms can be differentiated according to their attitudes towards gender equality. On the one hand we can find *balanced* approaches, critically interrogating privilege and power of men, while also considering costs and diversity of masculinities (cf. triangle model, Messner 2000). These *balanced* approaches are contrasted by *unbalanced* men's movements who stylize men as victims of women (and feminism), while completely ignoring diversity and privileges among men.

We can find examples for both in Austria, whereas men's movements mainly fall in three categories: institutionalized men's work (e.g. counseling centers), men' initiations groups, and father's rights movements (Brem 2012). While a body of work is emerging for the situation in Germany specifically dealing with antifeminist approaches in men's movements (e.g. Gesterkamp 2010, Kemper 2012, Rosenbrock 2012, Claus 2014), gender politics of men's and father's rights movements in Austria have not been examined until recently (Scambor and Kirchengast 2014).

This paper is based on the work of Scambor and Kirchengast (2014) and re-examines actors, rhetoric and platforms of antifeminist men's movements in Austria. The tropes we find in media and everyday culture span from "men as victim of domestic violence", to "failing boys in education" to "men as victims of divorce." Feminism (singular, sic!) is depicted alternately as anachronism or fictitious enemy. We are also systematically fact checking popular statements and contrasting them with empirical data. Based on our analysis we give recommen-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

dations for *balanced* approaches to masculinity politics that are oriented towards gender equality and suggest some strategies to counteract antifeminist activism more generally.

ZANETTE, MARIA CAROLINA (Universidade de Ribeirão Preto)

Shapewear or Nothing to Wear: Ambiguity of Targets and Allies in the Plus-Size Fashion Market Activism

Women who are fat have historically been deemed an unworthy consumer segment by fashion brands and designers (Stearns 1997). Yet, plus-sized consumers have started to engage in activism searching for inclusion in the mainstream fashion market (Scaraboto and Fischer 2013). Online, plus-sized fashion bloggers and their audiences, self-labeled *fatshionistas*, have re-appropriated elements from the mainstream fashion field and employed these to subvert the stigma of fat (Harju and Huovinen 2015).

Yet, understandings of which brands and designers are targets and which ones are allies of this movement are not clear cut among activists. Facing societal and economic pressure to include a wider range of body sizes among their clientele, brands pay token acceptance to consumers who are fat by employing plus-sized models in advertisements or extending clothing lines by a couple of sizes, while keeping the logic of thinness that guides the business unaltered. Similarly, certain consumer goods and practices entice conflicting reactions among the *fatshionistas* for offering the possibility of inclusion and validation in the marketplace while acting as enablers of the stigmatization these consumers combat.

Our research examines how stigmatized consumers fighting marginalization in a market make sense of paradoxical objects. Drawing from qualitative data collected through a 5-year netnography (Kozinets 2015) of the Fat Acceptance Movement, we examine discourses of *fatshionistas* regarding a particular category of objects: shapewear. By wearing shapewear, consumer activists can defy the stigma associated with being fat by fitting into clothing that is not "meant for them", yet subject themselves to the norms of the fashion industry where lumps and rolls protuding from under a garment are unsightly. Conversely, by not wearing shapewear, plus-sized consumers defy the stigma through making their bodies and their fat visible, albeit dressed with clothing offered by the limited number of brands and designers that cater to them.

Agricultural Technology and Gender Structure Theory: The Case of Women's Group-Fishponds in Bangladesh

In this article, we illustrate the utility of gender structure theory (Risman 2004; Risman and Davis 2013) in providing a substantive framework for practitioners and researchers to conceptualize the task of gender mainstreaming. To do so, we use this theory to analyze the impact of a fish-polyculture program introduced through women's-only groups in the Jessore District of Bangladesh. We use fixed effects regression models to study the relationship between technology adoption and the gender asset gap. Consistent with gender structure theory, we find that the effect of agricultural technology adoption on the gender asset gap is conditioned by levels of joint asset ownership (as an interactional-level characteristic) and wives' level of education (as an individual-level characteristic). By conceptualizing gender as a complex structure of individual-, interactional-, and macro-level dimensions, gender structure theory allows us to understand why gender-sensitive development schemes sometimes produce unintentional results and how we can mitigate these consequences in future initiatives that include a central goal of progress towards gender equality.

SCHACHTNER, CHRISTINA* (University of Klagenfurt, christina.schachtner@aau.at)

Social Movements in the Age of the Internet

The following issues will be covered in this lecture:
- What are the characteristics of new forms of political participation in the age of the internet?
- What role does the internet itself play in generating these characteristics?

The leading questions focus on an analysis of the interplay between media structures and participatory action in the internet age, based on the results of the study "Communicative publics in cyberspace", which investigated the behaviour of network activists during the Arab Spring. This is supported by the results of other studies on the Occupy movement, the Bersih movement in Malaysia, the Gezi Park protests in Istanbul and the Spanish Indignadas. In more recent studies on social movements, researchers are interested in both virtual and physical representations of forms of protest because political participation in the internet age does not lend itself to being exiled to one or the other space.

Typical characteristics of new social movements include emotions and concern as a starting point, interconnected experiences, translocality and togetherness. Some of these are qualitatively new; others are very familiar but have been amplified in the context of digital media and/or have taken on specific forms due to their influence.

In the lecture, special attention will be paid to the role of the internet as a space for and instrument of political participation, as digital technology helps define the layers of meaning of new forms of protest, even though the internet itself is not intrinsically democratic. The theoretical concepts behind the empirical analysis include Michel Foucault's heterotopia (1992), the Rhizome concept developed by Gilles Deleuze and Felix Guattari (1977), Stuart Hall's approach to representation (1997) and Manuel Castells' (2012) views on new forms of political participation in the context of a mediatised society.

SCHADLER, CORNELIA* (University of Vienna, cornelia.schadler@univie.ac.at)

SIRI, JASMIN* (Ludwigs Maximilians University Munich, j.siri@lmu.de)

Communication and Situated Intra-Action: Entangling Systems Theory and New Materialism

For Luhmann communication is the basic foundation of society. His notion of communication includes concepts of radical temporality (because communication has to be altered on a regular basis), process ontologies (because communication connects instable and constantly reconfiguring systems), anti-humanisms (because humans are not the sole cause of communication) and anti-dualisms (because communication is neither merely natural nor cultural or structural nor individual). Within the last decades postmodern, poststructural or non-representational theories made similar claims. Most recently a nexus of theories subsumed under the notion of "New Materialism" (Dolphijn & Van der Tuin 2012) ventures into that territory. New Materialisms (Barad 2007, Braidotti 2013) trouble boundaries and in particular human boundaries. Agency becomes a process of intra-action that is situated within material-discursive processes in constant differentiation.

In this talk we aim to discuss fruitful irritations of Systems Theory and New Materialism. Most recently a discussion about the critical potentials of Systems Theory has emerged (Amstutz & Fischer-Lescano 2014, Siri & Möller 2015) and discussed normative potentials as well as 'blind spots' of this theory of society. By focusing on Karen Barads Agential Realism (2007) and a critical reading of Luhmann's works we encounter and condense entanglements between two theoretical worlds, which seem to be severely imcompatible only at the first glance. By approaching empirical phenomenons with a mix of Luhmann's Functional Analysis and New Materialist ethnographies strengths and blind spots of both perspectives can be balanced and analyzed theoretically.

Multi-Level Analysis with New Materialist Ethnographies

A recent nexus of theories subsumed under the notion of *new materialisms* is increasingly recognized within sociology. Theories, such as the agential realism of Karen Barad (2003, 2007), the posthumanism of Donna Haraway (2008) or the deleuzian materialism of Rosi Braidotti (2002) claim to rewrite definitions of humans, overcome dualisms and representationalism, include material processes into research and redefine the relationship of structural and individual levels in research. This also includes the definition of research cases as inherently contextual and multi-layered. A multi-level analysis of a specific research interest is an integral part in research from this perspective.

My talk will include a brief introduction to new materialist thought and new materialist methodology (Schadler, forthcoming). In the following I will illustrate

the new materialist-multi-level analysis with (qualitative) empirical examples from two projects. A project on the transition to parenthood (from 2008 to 2012) concerned the entanglements of different levels and layers analysing policy documents, interviews, observations, bulletin boards and diaries (Schadler, 2013, 2014). Another example from a recent project on practices of collective parenting will show how legal discussions (custody laws), private practices (organizing family live with more than two parents), physical environments (buildings, cities, apartments) and public discourses (about family norms) are creating specific multi-layered situations and worlds of which collective parents are a part of.

Gender Specific Remittances from Germany before and after the Economic Crisis

The ongoing international and European economic crisis (2008-2015) affects the social situation of migrants. From global perspective the UN states: "Shrinking markets in high- and middle income countries have also led to job losses by foreign women migrants from poorer regions and countries." (UNAIDS 2012: 5). In certain contrast the European Commission argues that "The most vulnerable group in this crisis are male migrants." (European Union 2013: 17). So far, only few gender-oriented studies on remittances from industrialized countries in times of the actual crisis exist (for Spain Gioconda Herrera 2012). To tackle these shortcomings, we analyze gender-specific remittances from Germany. In our study, we use data from the German Socio-Economic Panel (SOEP) which includes rich information on female and male migrants and their transnational networks. The paper is organized as follows. First, we take a look at the theoretical arguments for gender specific remittances in times of crises. Second, in the empirical part of the paper we focus on data from Germany and provide some insights into the gender-specific determinants of remittances. Third, we compare our results for the years of crises (2008-2013) to those from tranquil times (2001-2006). Finally, we offer some conclusions.

Biographical and Work Narratives of German Police Officers. Implications for an Empirical Study of the Institution with Statexs Monopoly on the Use of Force.

Areas of police work which are characterized by face-to-face interaction with citizens seem to have one thing in common: it is their central goal to retain control. Retaining and establishing control are both aim of and condition for police action. Additionally, it is a condition for interactions of police with non-police citizens.

In the work-biographical interviews which I have conducted, it was obvious that the police officers did not – or were unable to – abandon these well-rehearsed and implicit patterns of actions during the interview situation. Speaking from their present perspective, they spoke in an argumentative manner. It was hardly possible for them to tell me about experiences in the past. In this connection it has also taken into account that the interview situation in work-biographical interviews is framed as 'work' due to the question which relates to the work-biography. Thus, it was a situation in which the police officers interact with citizen and in which control had to be retained. Despite a consistent narrative question technique it was hardly possible to elicit narrations. During my second fieldwork period I have therefore started to conduct biographical-narrative interviews which ask for the whole biography of the interviewee.

Referring to my current empirical research about occupational choices of police officers and their everyday police life, I want to discuss to what extent consistent narrative interviews, which tackle the whole biography, offer a possibility to overcome these difficulties. Furthermore, I approach the question if biographical interviews might be experienced as 'loss of control' in the specific context of police work. An alternative reading is that the research about an institution could be experienced as a form of empowerment by the individuals which are part of it – if they recognize that the research is aiming to understand the institution from their perspective.

Protest Between Discours and Practice - the Emergence of an Efficacious Formation of Practice of Protest in Germany in the Early 1960s until Today.

The paper focuses on the emergence of the formation of practices of protest in current German society. In a genealogical perspective it discusses the theoretical relation of discours and practice in protest studies by extending practice theory by a concept of discours orientated to a poststructural materialism (Hillebrandt 2014). It presents first findings of a research project which declines the methodological consequences of the theoretical prospective of practice theory for the sociology of formations of practice of protest. The research opens a bricolage of the emergence of formations of practices of protest from the early 1960s until today. The empirical work comprise analysis of documentary movies, analysis of associations between bodies and artefacts as well as analysis of discourses and enables me to span the relational networks between discourses, recipients, consuments, physical artefacts, socialized bodies and media which one can find between routinized practices of persistence and social change. Initial points are different unprecedented protest events with attachement potential in the german revolution of culture related to the students movement in the 1960s. From there I tell the history of current practices of protest and the emergency of routines and transformation of the formation of practices of protest. The paper plumps possibilities and boarders of doing protest studies by conceptualizing protest as a formation of practice and shows how to conquer path dependences of traditional research with focus on acteurs or ressources of protest.

Social Media-Based Far Right Movements in Thailand

Since late 2013, the split in Thai society between two contesting camps - the Red Shirts and the Yellow Shirts - has been radicalising and culminated in the coup d'état in May 2014. During the recent events, far right groups have started to play a crucial role in the political protests on the streets leading up to the coup as well as after the coup.

One prominent example is the *Rubbish Collection Organisation* - a facebook-based group, which is performing witch-hunts against people they whom consider illoyal to the Monarchy. Numerous loosely or non-organised individuals have joined this facebook group, and some of its mobbing and bullying postings reach over 200,000 likes. This virtual violence sometimes leads to actual physical violence.

The paper addresses theoretical and methodological questions in researching internet-based far right movements in Thailand. Given the global rise of far right groups - *Shiv Sena* in India, *Hungarian Guards* and the *Golden Dawn* in Europe - it is necessary to analyse Thai groups in a global context. Against this background, however, historic and post-colonial considerations become relevant: In how far can established political theories drawing on radical right-wing groups in Europe of the 1930s (such as the *Fasci Italiani di Combattimento* in Italy or the *Heimwehr* in Austria) be used to analyse such groups in Thailand today?

Moreover, social movement research has concentrated on New Social Movements, which were the predominant nonstate forces in the Western world from the late 1960s on. Only recently the research programme of Contentious Politics was developed to move beyond the narrow focus of social movement research and envisage a longer time span as well as a broader political spectrum of political actors. It will be discussed in how far this paradigm can be used to capture new internet-based violent groups in Thailand.

SCHARATHOW, WIEBKE* (University of Education Freiburg, wiebke.scharathow@ph-freiburg.de)

The Risks of Resistance. the Complexity of Dealing with Situations of Racism.

Racism is a societal imbalance relationship structuring social order with social practices of difference, construction of social groups and social meanings, and inclusions and exclusions (cf. Hall 2000). The focus of this paper will be on a reconstruction of a racist normality in Germany, constantly present in the every day life of young people to whom a migration history is attributed, as manifested in normalised practices of differentiation and exclusion, as well as on the different ways young adults choose to handle situations of racism within a racist structured society.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The analytic perspective of this paper will be on the subjective experience and interpretation of racism and consequent strategies of action and negotiation of young people (cf. Holzkamp 1983), whose everyday life is negatively impacted by racism. The paper concentrates on the one hand on the reconstruction of the societal and social reasons and terms which hinder young adults to openly address experiences of racism and racist practices. On the other hand it aims to show which strategies young adults use to handle racist situations when circumstances leave little space to speak up against racist practices.
