Roots and Fruits of Population Growth: Back to Malthus or Forward to Marx?

World population, currently approaching 7.5 billion, will probably exceed 11 billion by the end of the century, almost double what it was at turn of the present century. The growth is uneven, and the result is a redistribution of the world's population: at the end of this century Europe will have no more people than it had fifty years ago, whereas Africa's population will have multiplied 20-fold, and will have gone up from under 10 percent to over 30 percent of the world's population (1). Not only is population growing, but it is currently growing in those regions of the world that that have the least resources at their disposal, and the result is liable to be a dramatic rise in world inequality; increased conflict over access to resources; and increased migratory pressure from the poor to the richer regions of the world. Our contribution to the Common Sessions will discuss:

1. The history and sources of growth in world population over the past two centuries (in particular mortality and fertility) and its eventual stabilisation

2. Two basic approaches to world population growth: The Malthusian approach which views growth as catastrophe, and the Marxian approach, which sees the result of population growth as contingent on social conditions and responses

3. The options which humanity faces given the anticipated growth of world population and its redistribution

Biographies and the Sociology of the Future: A Proposal

This paper reflects on the various ways in which the contingency of the future is addressed in modern societies and how these ways of dealing with the future are incorporated in relatively coherent biographical narratives. Drawing partly on the philosophy of existentialism and phenomenology, we explore how people's individual and collective projects for the future (and their knowledge of the uncertainty of the future) help shape their actions in the present and how these projects are inevitably tied in with institutional constraints and opportunities.

The Ever Expanding Social Field and the (in)Capacity of Sociology to Respond to New Challenges

The "social" is ubiquitous these days. It permeates fields far beyond the human sciences: evolutionary biology and archeology, entomology, medicine…Not the least has Bruno Latour's mockery of "the social" opened our eyes to the costs of disciplinary boundary work: loosening sights of essential entities (things!) that drive social fields in a myriad of shapes.

Late in my academic career, I have come to doubt the benefits of ordering fields in strict disciplinary manners in an attempt to weigh also the costs. I am especially concerned with that matter called "the social". Various scholarly fields can be viewed on a (social) scale of their world-opening versus world-closing: extrovert vs introvert. An extrovert science such as i.e. anthropology excels in exploring new vistas and in opening up borders between humans and non-humans; an introvert science is keen on closing its doors, thus denying access to an ever-expanding social world "out there" and "inside us". I fear that academic sociology tends to evolve more towards an introvert side – I have no clear evidence, but will attempt to explore the dynamics. Could it be that the ubiquitous of the social – being everywhere and difficult to exactly pinpoint – overwhelms our discipline and puts us in a defensive? Clearly, academic pressures, citation records, and scholarly careers take their tolls; but how come that we have no equivalence to journals such as *Science* and/or *Nature* at our disposal in the social sciences? My plan is to look at the future of sociology as an important auxiliary field furnishing insights of various kinds (theory and methods) to neighboring fields in the human and natural worlds? To become a scaffolding science like logic and mathematics? To serve mankind broadly speaking – rather than being "sui generis".

Plen-4.3

BOATCA, Manuela* (University of Freiburg, manuela.boatca@soziologie.uni-freiburg.de)

Exclusion through Citizenship and the Double Standards of Modernity/Coloniality

Drawing on recent scholarship that addresses the link between inequalities and citizenship at the global level, the paper focuses on how membership in the national communities of citizens has ensured the relative social and political inclusion of the populations of Western European nation-states, while at the same time accounting for the selective exclusion of the colonized and/or non-European populations from the same social and political rights throughout history and up to this day. Recent developments with regard to citizenship allocation are used as an illustration of this enduring double standard: On the one hand, wealthy investors from certain non-Western regions are actively encouraged to purchase European

denotes a presenting author. Abstracts are organized by first presenting author's last name.

citizenship rights in an unprecedented wave of commodification of residence and citizenship requirements across Europe. On the other hand, financially strained states and non-Western labour migrants face mounting criminalisation, sanctions, and austerity measures when attempting to access the same rights. The paper argues that, taken together, these mutually reinforcing dimensions of increasing global inequalities testify to the *longue durée* of colonially charged racial and ethnic exclusions in the history of modernity more generally, and to the coloniality of citizenship in particular.

Plen-5.2

BOEGENHOLD, Dieter* (Alpen-Adria-University Klagenfurt, Dieter.Boegenhold@aau.at)

Towards a Universal Social Science. Sociology in Dialogue with Neighboring Disciplines

The last hundred years can be seen as the century of the rise and establishment of sociology. The academic subject sociology emerged, differentiated and consolidated a series of approaches, theories and paradigms, which are sometimes overlapping or even competing. Comparing sociology with economics, psychology or history shows that borderlines between disciplines have become fluid and perpetually oscillate into new shapes. Economists, especially prominent proponents in receipt of Nobel prizes, are increasingly discussing items such as motivation, rationality, norms or culture, which belong to the domain of sociology. Sociology should acknowledge this kind of "imperialism" and claim its own competencies. Against the background of these circumstances, the paper will argue from a methodological point of view that sociology is as modern and important as never before, but that it must be aware of its own strengths and weaknesses in concert with further academic disciplines. Our recent argumentation may benefit from the Austrian authors L. von Mises and J.A. Schumpeter, who gave very early lessons on how sociology must be embedded in a dialogue with neighboring disciplines.

Comparing Climate Change Policy Networks: Improving Global Transparency

Struck by the growing risks of climate change, global institutions and NGOs have issued increasingly urgent calls for carbon emissions reduction and forest preservation. However, international negotiations have been hampered by disagreements over what to do. These tensions are based in different national perceptions of the reality, risk, responsibility and priority of climate change as filtered through the political process. Negotiators and other actors lack not only a nuanced grasp of other countries' perceptions, practices and policies, but also of the domestic social and political processes behind them. The international research project—Comparing Climate Change Policy Networks (Compon)—is designed to clarify these complexities of these perceptions and processes, and to investigate what causes them. Better knowledge here will not only help negotiators, but also contribute to social scientific progress. Since inception in 2007, the Compon project has developed a common policy network survey instrument for use in multiple societies, including major emitters and significant cases. The Compon project produces highly comparable data about the political processes. The policy network survey captures networks of influence that are acted out around a given issue among engaged organizations (from state and society). This data about issue fields enables the research teams to study and compare the flow of scientific knowledge, how it gets framed, and the advocacy coalitions that bear it into the policy-formation process. Started in 2007, the Compon project now has teams in over 25 societies and invites the participation of new researchers and new cases. This talk describes the project, presents some illustrative comparative findings and sketches out its future prospects.

Good Childhood – Good Future World? Global Programs and the Sociology of Childhood

Programs to improve the conditions of growing up are most prominent when striving for a better world and uncontested due to the moral authority of the "innocent child" as a promise for the future. However, such programs are heterogeneous as to their respective goals, perspectives, actors and interests. We may distinguish two types of such endeavors. Firstly, there are the ones focusing on measurement and improvement of qualities of schooling and parenting. They are designed against the background of a universal notion of proper childhood and early fostering of development of competencies. Such notion may remain tacit, it is however assumed to be valid for all countries and all social groups in the countries. The programs promise to improve economic conditions and to reduce social immobility and inequality on a local and a global level. Secondly, there are attempts to support children's participation, to give voice to children, to advocate their agency and to consider locally different economic conditions and notions of childhood and family.

Childhood sociologists are openly in favor of this second line to improve childhood and this goes along with the concept of "child as actor" which has a central theoretical and advocatory function in this scientific community. Meanwhile, they keep distance to the mighty intergovernmental organization and well-funded research institutions implementing the first line of development. Such preferences are even mirrored in the respective research methodology.

However, when the impacts of both lines are scrutinized, it is not that conclusive which one should be favored: both may occasionally reduce inequality, but as well produce exclusion and stigmatization in other cases. For a better analysis of impacts and biases apologists of both lines – divided by institutional and disciplinary boundaries – should start to exchange

CARREIRAS, Helena* (Instituto Universitario de Lisboa, helena.carreiras@iscte.pt)

Reflexivity and the Sociological Study of the Military

This presentation aims at uncovering the meaning and importance of reflexivity for the social scientific study of the military and report on the state of the field in this regard. It starts by addressing the role of reflexivity in social scientific research, exploring academic contributions that underline the social nature of research processes and the need for incorporating a reflexive gaze over all stages of scientific practice. In a second part, the presentation explores the way reflexivity has been present or absent in military studies, namely in the subfield of armed forces and society, through a selective review of existing literature. It argues that far from being a constraint, reflexivity is the very condition for the production of social scientific knowledge and for asserting the validity and reliability of research results. While it also warns against inadequate uses of reflexivity as a rhetorical strategy or a narcissistic exercise, the central claim is that, by allowing a better understanding of the interplay between social, scientific and policy dynamics, reflexivity leads to greater awareness and conscious choices regarding the future of this study field.

CONSTANCE, Douglas* (Sam Houston State University, soc_dhc@shsu.edu)

The Future of the Agrifood System: Competing Visions and Contested Discourses

Over the past fifty years a growing consensus has emerged that the conventional agrifood system is ecologically, economically, and socially unjust and unsustainable. Alternative agrifood initiatives and related social movements such as organics, fair trade, Slow Food, local food, geographic indications, community supported agriculture, food justice and food provide an agro-ecological counter position to the hegemonic discourse of corporate-controlled, chemical-based monoculture agriculture. While some proponents view this collection of alternatives as the vanguard social movement of our time which can counter the powerful forces of globalization based on neoliberalism, others question the transformative ability of these movements as the processes of mainstreaming and conventionalization create accommodative market-based alternatives rather than radical oppositions to the dominant system. In the last 10 years as the legitimation crisis of conventional agriculture reached critical mass, the word "sustainable" has come into play as competing factions mobilize to capture the meaning of the term. Conventional agriculture proponents have counter-attacked utilizing discourses such as ecological modernization and sustainable intensification. Alternative agriculture proponents such as La Via Campesina advocate for an agrifood future based on agro-ecology and food sovereignty. The result is increasingly contested visions, discourses, and actions to influence the transition to our future agrifood system.

CONSTANTOPOULOU, Christiana* (Panteion University, christiana.constantopoulou@panteion.gr)

Communication, Media and Politics: Contradictions and Pretensions on Human 'Destiny'

The contemporary (globalized) society is characterized by profound contradictions (due to the absence of adequacy between *social representations* –essentially conveyed by *media discourse*- and the social being). Principles born together with the sovereign national states (or "the" social state) guaranteeing elementary "human rights" are still given as conductive lights of the contemporary world, although world "governance" is nowadays intimately attached to the demands of economic interests (conducing to the abolition of many rights in the "labor market"). Social inequalities increase on "local" as well as on "global" level. When the global level is involved, the problems include practically wars, "economic crisis", immigration (from South to North and from East to West) etc.

Nevertheless, although a "plenitude" of information can be possibly given by the media, the "global citizen" is captured 1) by the *modern myths* (considering "irrational" any discourse which differs from a technocratic point of view, which monopolizes the "correct" knowledge) 2) by the dominant rather "figural" than "discursive" way of signifying the world. *Cultural industries* contribute to this every-day life "prosperity" based on the "western way of life" which apparently cannot include any political thought related to the criticism of *contemporary inequalities* (although the consumption of products showing "prestige" does not really signify to be part of the "rich class", as remarked years ago Adorno and Horkheimer).

If Sociology could become (as wished by Ezra Park) a reportage of very good quality, it could make redefine some contemporary constitutive myths which ex-clude any "different" thought

Participation, Organizational Democracy and Self Management: Past, Present, and Future

RC10 involved all the members of its executive in writing a collective paper in order to engage and exchange with other RCs during the ISA Common sessions for this Forum. From its inception in 1978 within ISA, the activities of RC10 on "Participation, Organizational Democracy and Self-Management" have aimed at uniting the professional qualities, social consciousness and experience of its members for work on its field and the promotion of its topics. These seem more than ever part of the struggle for a better future, which we believe should include democracy and participation at all levels from the workplace to the political sphere. However, the responses to the crises have, on the contrary, recently entailed in many countries unpopular austerity measures decided in a top-down technocratic manner that threatened existing social and political participative schemes. Thus participation, organizational democracy, and self-management seem to be shrinking rather than increasing at the global level and increasing inequality, oppression, and ecological destruction have brought about protests and struggles for a better world.

In our contribution we will first present the perspective of RC10 regarding the common topics of the Forum, and then develop what we believe are important topics for future directions, in particularly those steaming from our sessions in this Forum, such as: Public Sociology to promote collaborative research and dialogue between the public and the sociologists on issues of social justice, equality, democracy, participation, working life conditions, and other related issues; the future of participation in organizational life with a focus on the development of capabilities, capacities and innovations; gender relations and the construction of a more participative society by looking at women's participation in entrepreneurship; unequal opportunities to participation for citizens within total institutions, in particular prisons, and nursing homes; and the need for continuing struggles for democratic participation.

Emerging and Continuing Inequalities in Education

Education as an institution profoundly affects most segments of society. It serves myriad functions from the socialization and training of the young, to preparing and retraining a competent labor force, to securing for the elderly a meaningful and enriched retirement. Around the world there are a plethora of factors that facilitate or retard educational goals. Sociologists of education focus on an array of issues, seeking to explore unanticipated and unintended outcomes of educational policies, practices, and procedures among diverse groups. Much of our work addresses issues of educational inequality. Sociology of education is both global and local in its focus and applies a broad range of sociological theory and research methods.

Here we present the current state of sociology of education globally regarding research traditions and topics that attract the interests of sociologists of education. Our focus includes continuing and emerging educational inequalities that will be salient in the coming decades. Attention will be paid to social stratification, equity and access to schooling in developing and developed nations, politics of education and multiculturalism, educational assessment and accountability, school-to-work transitions, adult and lifelong learning, teacher supply, demand, and morale, and education as a vehicle for social control. Globalization in the educational processes and contemporary differences stemming from new sources of social inequalities including the digital divide and participation or exclusion from new forms of education, as well as issues of ethnicity and migration incorporate many of the emerging inequalities that sociology of education will need to address. Finally, we note the research methodologies used and developed within the sociology of education and epistemological paradigms that appear to be favored by specific research traditions among sociologists of education.

FABIANSSON, Charlotte* (Victoria University, charlotte.fabiansson@vu.edu.au)

The Power of Risk Perception: The Discord Between Public and Scientific Perception of Risks Around Food

In the twenty-first century society, risk has become a household concept used in diverse situations - risks can be found everywhere and the societal debate about risk reignites every time a new scare is emerging, be it a nuclear plant meltdown, a climate change driven natural catastrophe or a food scare.

What is actually a risk is debatable in many settings as it depends on the context, the social and cultural milieu but it is also about who defines the situation or action as a risk, the expert or the layperson.

The risk concept is especially well grounded within food production, processing and consumption. Experts and scientific research define risks, but so too do consumers. Some common ground exists about what food is safe and what food is risky to eat, but there is also a wide gap between what the experts' assess as a risk and what a layperson considers a risk, particularly in regard to foods that are not considered "natural".

Even if food is one of the most essential life supporting features of human life, food scares do not necessarily create life-changing food consumption behaviour, as eating habits are among the most deeply ingrained forms of human behaviour well established in an individual's social and cultural environment.

In this paper, I discuss, how the gap between public's and experts' perception of food risks can be understood from the socio-cultural, risk society and the governmentality risk discourses.

How the Past Shapes Struggles for Equality: Contrasting Legacies of Reform and Revolution

How do legacies of the past – many of them cultural in nature – condition ongoing struggles for equality, leading to significant differences in the extent to which formally democratic political systems genuinely offer political inclusion to low-income and other socially marginal sectors ? Where such legacies play an important role in configuring the opportunity for socially inclusionary politics their causal impact is by nature at least somewhat case specific in ways that reflect national socio-political trajectories of change. But do large-scale international structures and global, or in any case international, dynamics limit the ability of such case-specific logics to matter in shaping political and distributional outcomes? These are the questions, to be addressed. The analysis will take up these theoretical issues through the vantage point offered by a strategically chosen paired comparison of Portuguese and Spanish democracy, but also through broader cross-national comparisons and theoretical debates.

Solidarity, 'feel good' activism and emotional domino effects in transnational social movements

There is still relatively little research on the transnationality of social movements and even less on emotions. In my presentation I will reflect on both. The transnational element is undeniable, for example, in the widespread current German mobilization for the political refugees coming to Germany from Syria and Africa, although it does not require the mobilized individuals to leave their country of residence. But, such mobilized individuals and, indeed, "Germany" at the moment, are a drop in the sea. Most Europeans, refuse to engage in similar acts of transnationality on their "home" territory. I will address emotions but also migration trends, economic structures, historical trajectories and national identities to try to explain why "Germany" seems to be exceptional to then consider the question whether such acts of transnationality express solidarity, "feel good" mobilization or well-understood self-interest. As a second, dissimilar case I will treat the Arab Spring whose transnationality involved enabling emotional domino effects. These had their own economic and historical causes, as Pearlman tells us. Finally, the movement for Justice, Truth and Reconciliation (JT&R) draws attention to transnational efforts to put an end to genocides as well as war and humanitarian crimes by bringing the political and military elites responsible for them to the court or tribunal of justice. In this case, those who debate sit in judgement of both perpetrators and their victims, calling on both to abide by the emotional regime they envision. While many African states supported the JT&R movement, they no longer back its offspring, the ICC in the Hague. The three cases taken together suggest that both transnationality and emotionality of transnational mobilizations vary from case to case and therefore call for posing case-related research questions. These - when well-posed - tell us why such transnational mobilizations become possible or sustained.

FULLER, Steve* (University of Warwick, s.w.fuller@warwick.ac.uk)

Is the Future 'Human', 'Posthuman' or 'Transhuman'

It is a postmodern commonplace that we live in times of blurred and blended social identities. However, recently the very category of 'human' has started to show some fuzzy borders, as advances in medicine and prosthetic technologies (including brain chips) point in the direction of an 'enhanced' human, or 'humanity 2.0', which challenges the able/disabled normative divide. At the same time, the privilege attached to being human is coming under increasing critical scrutiny. Thus, we see the rise of groups campaigning for the 'rights' of animals, nature more generally and, last but not least, advanced machines (so-called 'artificial intelligences'). All of these developments share a broadly 'futuristic' orientation which, in some cases, promise solutions to already existing social problems, but which in other cases displace or replace those problems. In this talk, two meta-sociological problems of this emerging world-view of 'humanity 2.0' will be considered: (1) Is the future about extending the human as far as possible ('transhumanism') or resituating the human as one among many life-forms in a common environment ('posthumanism')? (2) Will it be possible to maintain, if not re-invent, the classical liberal idea of tolerance in a world where the value of the being human – and what counts as human -- is so much up for grabs?

PLEYERS, Geoffrey* (University of Louvain & College d'Etudes Mondiales, Geoffrey.Pleyers@uclouvain.be)

Social movement studies beyond the instrumental reductionism

This contribution will focus on a debate that has structured the field of social movement studies since its early beginning and that is being reconfigured by recent research conducted and published in different continents.

For most researchers, sociological analysis and social movement studies continues to be dominated by instrumental and utilitarian perspectives that overlook the role of values as organising principles of society. Social movements are depicted as aggregations of interested individuals sharing resources to achieve certain "public goods". A great deal of the attention is paid to the nature of organizational structure and their degree of efficiency in mobilising people, regardless of the actual "content" of the politics that is proposed, the subjectivity of the actors and with little interest in the cultural, subjective and personal dimensions of social processes. To overcome this situation more attention has be brought back to the claims, political visions, values, cosmovisions, and ethos that are at the core of contemporary social movements.

It leads to revisit one of the most classic of sociological distinctions is the one between instrumental and value-oriented put forward by Max Weber at the beginning of the 20th century. People – famously argued Weber - do not act in certain ways only *in order* to achieve certain aims (that is instrumentally) but also *because* of their adherence to axiomatic values that orientate their action. This discussion of values has constituted a key theme in much sociological discussion, from Ronald Inglehart analysis of the shift from materialism to post-materialism, to the analysis of the present culture of individualism, self-reliance and entrepeneurship in neoliberal times.

We need to recuperate a view of social movements as the spaces and actors that forge new identities and values and thus the privileged place where we can observe some historical and cultural direction of society.

Social polarisation

Social polarisation and inequality characterise working life, with regard to both paid and unpaid work, in both Northern and Southern societies, and it appears that patterns and modes of working remain varied, or are becoming ore so . However, its investigation often enough departs from a notion of "normal" (full-time, regular, skilled, male) employment in the clear-cut containers of households, companies, sectors, employment systems and countries that has roots in Fordist industrialised societies.   The contribution explores both common patterns and differences between (European) societies and discusses whether in this context the concepts of centres and peripheries make sense.

Plen-4.1

HONWANA, Alcinda* (Open University, alcinda.honwana@open.ac.uk)

Youth in Waithood: Political Protest and Social Change

Young people's transitions to adulthood have become increasingly uncertain. A growing number of educated and non-educated young Africans find themselves unemployed or underemployed. They are unable to attain the social markers of adulthood, such as a secure job, marriage and a family. Trapped between childhood and adulthood, they are living in a twilight zone, a liminal space that has now become known as *waithood*. Young people in *waithood* have been reacting against the establishment: they have overthrown longstanding regimes in Tunisia, Egypt, Senegal and Burkina Faso. Disillusioned young people continue to take to the streets in various African cities. But they are also reacting in other ways: some migrate and look for opportunities elsewhere, while others are lured into joining radical organisations such as Boko Haram, Al-Shabaab, Al-Qaeda and the Islamic State. But this is not just an African story. Increased youth unemployment and social inequalities in the West led to street protests in various European and American cities. Large numbers of young people are backing left-leaning politicians like Jeremy Corbyn in Britain, Bernie Sanders in the US, Podemos in Spain and Syriza in Greece. This growing upsurge of youth protests all over the world, crystallized in the word "Enough!" needs to be understood in the context of this generation's struggles for political, social and economic emancipation. Young people are angry and they are on the march across the world. But will this generation be able to effect systemic social change?

From Citizenship to Cit(y)zenship: the changing boarders of social inclusion and exclusion

Comm-12.3

KELLER, Reiner* (University of Augsburg, Germany, reiner.keller@phil.uni-augsburg.de)

The Complex Discursivity of Global Futures in the Making

Global and transnational civil society, the proliferation of arenas and organizations involved in the definition of 'world problems' and 'standards making', the burgeoning economic power of the BRIC-states as well as general recognition of a 'post-colonial constellation' together constitute a challenging reconfiguration of transnational or global orders of discourse. The ongoing social-structural transformations linked to such processes deeply change global social relationships of knowledge. The guiding thesis of the presentation therefore states that new transnational orders of discourse emerge resp. are in the making which confront heterogeneous local and regional discourse histories. Established ways of evidence building and justification are no longer beyond question, but at stake. Their future 'Gestalt' and shape are still widely contingent, and imply far reaching social and political effects.

The *complex discursivity* of such sites and processes of discourse, communi-cation, and knowledge production is a result of the hybrid constellations of the actors and knowledge claims involved, interconnections of heterogeneous arenas of dialogue and negotiation, diverse cultural rationalities of factuality, evidence, and legitimation, and also of translation between epistemic cultures and languag-es from around the world. The concept of *transnational spaces of discourse* refers to such new discursive formations and interconnections in which social actors and politics of knowledge beyond boarders are concerned with the construction, problematization and reworking of forms of knowledge and templates for action for specific purposes. Such current (re-)orderings of discourse largely differ from the global formations of discourse established in the last centuries. In order to address these current challenges, the contribution focuses on the reach of socio-logical tools for analyzing transnational and global discourses as knowledge-mak-ing activities which will profoundly shape the global future.

Comm-15.1

KUHLMANN, Ellen* (Goethe-University Frankfurt, Kuhlmann@em.uni-frankfurt.de)

Professions, Governance and Citizenship through the Global Looking Glass

The state-professions relationship and the role of professionalism as facilitator of public sector services are key issues of the professions studies. Currently, these relationships face a number of fundamental transformations (1) state regulation expands towards 'governance' with plural actors and market logics; (2) globalization and new economies add new forms of 'state' and 'citizenship'; and (3) austerity politics curb prospering markets and public funding for professional services. This paper maps the (re-)making of the bonds between professions, governance and citizens in international perspective using thematic analysis of published case study material gathered in Arab countries, Argentine, India, Italy, Portugal, Russia, South Africa and Turkey. In the Arab countries, universal approaches to professionalism are used strategically to build a professional field and expertise, while mature mechanisms of public control and state support are lacking. Russian and Turkey show strong centralized, hierarchical state interventions to constrain professional self-governance coupled with increasing involvement of professionals in management that may target professions-users relationships. In Argentine, India, South Africa globalisation and a self-governing professional model may promote the building of new professional fields, but create different opportunities towards inclusive professionalism and equality. Italy and Portugal respond with a mix of inclusive strategies (involving professionals in organising/managing public services), market-based incentives and interventionist states to control the behaviour of professionals. In summary, the findings reveal an increasing relevance of professionals in governance arrangements, while the local type of governance and the mechanisms of public control shape professional development and emergent forms of professionalism. Studying professions in global comparative perspective contributes to better understanding transformations in public sector policy and services.

LAMPIS, Andrea* (Universidad Nacional de Colombia, alampis@unal.edu.co)

Global risk and local vulnerabilities: Considerations on the shaping of disasters in contemporary Global South

Institutional structures in cities and rural areas of the Global South have been heavily influenced by neo-liberal policies for over 40 years. International and national corporative interests that operate at the local level reproducing a number of globally legitimated policy guidelines are heavily influenced by de-territorialised decision-making process. As Sassen (2014)[1] has recently observed, the concept of 'expulsions' of risk is increasingly produced by globally relevant logics, interests and actors against a local reality often made by fragmented governance systems.

The umbrella concept of *institutional capacity* (use of information, availability of sufficient resources, existence of stakeholder participation, effective legal frameworks) is most often used to analyse the effectiveness of disaster risk management. However, besides being taxonomic and normative the analytical approach that lays behind the concept is inadequate to explain why different social geographies under similar indicators of institutional capacity generate highly uneven results in terms of disaster risk management. The goal of the paper is to reveal that both the politics and the policies related to risk management are shaped by global pressures, logics and interests that end up embedded in local institutional and social practices as much as in local culture. Disaster risk management should now be enacted not only at the local level but on another more global scale where a renewed reflection on the ethical, social justice and developmental implications is needed.

From Legitimation Crises to Movements to Power

Habermas' 1975 theory of the legitimation crises,of capitalist economies, which was informed by Weber's theories of legitimacy, power and rationality, examined interrelated yet analytically differentiated aspects of system crisis. Legitimation crises occur at the system level when 1) the economic system fails to produce and/or deliver adequate incomes, goods, and/or services, 2) when the political systems of advanced democracies see their legitimation questioned in face of economic conditions/political events, especially downturns and reversals; or 3) when cultural crises and anomie occurs, i.e., when existing values no longer serve to justify and guide behavior required by an evolving social system. The salient insight of the theory, however, is that crises of legitimation at the system level tend to migrate into the life world, where they impact identities and emotions. Habermas' theory emerged when Keynesian theory began to wane. The various dysfunctions, contradictions, and adverse consequences of neoliberal globalization that became very evident in 2007-8 prompt us to return to, review, and revise Habermas' theory for a neoliberal age. Perhaps the initial point to be made is that crises at the system level fosters alienation and a variety of discontents and "moral shocks" (Jaspers) that become channeled into social movements and social, cultural. or political action. We have thus seen a variety of political mobilizations, both left and right, following crises. In order to understand the basis, recruitment, and destinies of these movements, we should note the intersection of class, character, and emotional constellations. What specific events or conditions foster discontents and malaise, and in turn motivate recruitment into social movements? Once so formed, what factors sustain participation in such movements? Why do particular actors gravitate toward the right and others toward the left?What are the impacts and implications of social movements in terms of gaining political power and social transformation?

Making society possible: re-imagining sociology in an era of global environmental change

Climate and other dimensions of global environmental change (GEC) demand a re-imagining of sociology and its role in the apprehension and motivation of social and political change. To be sure, this challenge is not unique to sociology. While existing programs of GEC research stress have stimulated multiple experiments in multidisciplinary collaboration and engagement with policy-makers, neither the scale nor breadth of this activity are commensurate with the magnitude or complexity of the task. We know all too well, as sociologists, that collaboration and communication are not sufficient, by themselves, to unsettle the vested interests, institutional path dependencies, conflicts and prejudices, taken-for-granted practices, and so on, responsible for environmental and social injustice. Power is not so easily displaced. Doing science in a manner that helps people to comprehend environmental risk, to imagine possible and desirable futures, and to identify tangible and feasible steps towards the realization of those futures requires far more innovation yet. The question (or at least one of the questions) is what this means for sociology? It is argued here that GEC, and the social movements it has stimulated, demand theoretical and methodological development from sociology on at least two fronts. First, many more processes (chemical, biological and physical) must be brought into the sociological domain, reconceiving the subject matter of sociology as *all* the connections among people, institutions, technologies and ecosystems that make society possible. Second, sociology must ways to contribute to the assemblage of sustainable eco-social futures in ways that are empirically robust and socially just.

The Social Life of the Senses

Social science literature on the senses has proliferated in the last few decades, especially in the fields of sociology and anthropology. Departing from related works located within disciplines such as biology, psychology, and physiology, sensory studies argue for the senses as social, revealing important insights pertaining to selfhood, culture, and social relations. I delineate three interrelated sections that inform how sensory works have developed by first providing an adumbrated background with regard to the hierarchy of the senses, and the need therefore to move beyond the hegemony of vision. The second section includes not only how the senses have been theorized, but also comprises some notes on the senses and body of the researcher that is as important as those of whom we study. Another dimension of sensory methodology that warrants mention has to do with how one can articulate sensory lifeworlds with and beyond textual means. If the senses are regarded as avenues of lived experiences that at times, even respondents are not able to harness linguistic terminology with which to convey their experiences, then what resources might researchers be able to mobilize so as to pronounce data of the sensory type? Finally, a third section locates the development of sensory research in organizational terms, elucidating upon the various institutional efforts that have been pursued towards organizing sensory research and scholarly publications through different avenues. The article concludes with suggestions for the next step forward towards broadening the field of research that deliberates upon sensory transnationalism.

The Grounding Sociologies of the Future: Anthropocene Futures Emerging from the Present Burning Up the Past

The Anthropocene thesis being advanced by many scientists, social scientists, and humanists is fraught with many uncertainties, but it also demands innovation in our methods and theories. What can sociology contribute to these broad debates, since the assumptions and aspirations about the Anthropocene increasingly are influencing the daily routines and long-term collective lives of those who accept its plausiblity? There still are many risks to be identified, avoided, mitigated, transferred, and shared, and the horizons of Earth System Science or Governance as social imaginaries with definite elitist and inegalitarian agendas to shape human and nonhuman futures. What can be learned by comparing the expert and lay struggles in different countries and settings over this analysis of the future? And, what visions for alternative futures in the Anthropocene are now imaginable and perhaps achievable for the broader macro-dynamics affecting the entire planet?

Sport and the Role of Sport Sociology for Alter-Globalization

Sport has been criticized as a conservative institution subscribing airily to the aspirations of capitalism and neoliberal ideology. The study of sport has therefore been seen as politically compliant, undertheorized or even ignorant of its political significance, thereby ultimately serving the dominant political order. However, in the past decades global sport – particularly in its highly commercialized and corporatized forms – has become one key field for advocacy networks that resist both neoliberal forms of globalization and modernist backlashes against an open and equal society. Sport sociologists have not only turned to examine global social movements which reflect rising awareness of the devastating effects of global capitalism in neocolonial relationships with regions from the Global South, but also have considered the exploitation of Third World labor in the sporting goods manufacturing, the extraction of sport talent, human trafficking and athlete migration for consumption in the Global North, and the environmental damage caused by the sport industries. In many cases, sociologists have become activists that apply investigative and participatory research methods while standing up against social problems. Driven by a sense of social responsibility, ethical engagement and the vision of a better future, they have come to tackle racist and xenophobic attitudes within sport, and demonstrate the unequal distribution of gains and losses in the muscle drain. The take on sport as a facilitator for the international peace movement, and the adaptation of sport by NGOs in the field of developmental aid and international cooperation would not have happened without the intervention of a critical sociology of sport and globalization. Our presentation outlines and contextualizes the 'critical turn' in sport sociology and poses questions about its vision of future possibilities.

Arts and Imagination: The constitution of Social Interpretation

This communication aims to discuss the relationships between images and the production of knowledge as a moment of the constitution of a social imaginary. These relationships found and direct interpretations and evaluations about the world and the social phenomena that constitute it. It discusses how images construct a particular way of apprehension of social phenomena through a complex elaboration of the imaginary that is the basis of seeing the world by the reference of some specific values and perspectives. As we can see, Sociology of Arts has been changing in the past years, in order to incorporate new and old forms of expressions that were not in the original scope of arts, as arts changes itself in order to incorporate new propositions that become art updated with new social problems and perspectives. New realities instigate new conceptual and methodological approaches and promote new theoretical questions to research. Changing forms of the new arts and the spread of images in everyday relationships suggest reflections on what can nowadays be conceived as art and what is the field of research to a discipline that leads with artistic expression and its social propositions.

I intend to discuss sociological possibilities and strategies in the analyses of art works in their epistemological, methodological or analytical problems and approaches, in order to problematize art works as an important social phenomena that alludes to the observer various possibilities of meaning constitution and interpretation about reality and social organization, social groups and their relational systems of values and social structuration.

History is Not Bunk: Why Comparative Historical Sociology is Indispensable When Looking to the Future

Henry Ford famously remarked that 'History is bunk'. Too often, sociologists seem to have believed him. Although in its origins our discipline largely *was* comparative historical sociology, the decades since the Second World War have witnessed what Norbert Elias called a 'retreat of sociologists into the present', resulting in a social science that is mainly 'hodiecentric' (to use a word coined by Johan Goudsblom). 'Historical sociology' has come to be regarded as just one empirical specialisation among many – as reflected in the ISA's organisation into the watertight compartments represented by its 55 Research Committees, 4 Working Groups and 4 Thematic Groups. I shall argue, however, that the neglect of the past has jeopardised sociologists' ability to look forward intelligently to the future. Indeed, the hostility to Marxism that marked a generation of Cold War thinkers such as Karl Popper led some social scientists to link distrust in the study of the past with distrust of predictions of the future. I shall argue that this syndrome has diminished not only sociology but also the conduct of world affairs: for example, a wider understanding of the social foundations of democracy, gradually developed over long periods, might have served to curb the West's militaristic adventurism.

Sociology Between Historicity and Present-Day Relevance: The Case of Early Austrian Social Thinking

Social thought in the last decades of the Habsburg monarchy and the immediate aftermath showed specific characteristics due to the great influence of a rational-empirical logic and natural science monism, a specific form of socialism and an individualistic social science springing from political economy. It was also profoundly influenced by the special condition of the multi-ethnic structure of the empire. Looking at the history of Austrian sociology may seem of purely local and archival importance as an instance of the historicity of social ideas. But not only had Austrian social thinking some influence on international currents within the social sciences, looking at its history shows also the breadth and the diversity of sociology before it became an academic discipline centred around definitions of an ahistorical modern industrial society. The present challenges for sociology amidst a multiplicity of profound and disturbing changes require new ways of thinking about social science, its approaches in research and its role in the world. The historical situation at the end of the Habsburg Empire was, of course, very different from that of our own times, but some of the problems, nevertheless, show a certain similarity to the present ones. These are especially the problems of ethnic and cultural relations and of the increasing heterogeneity of societies, and those of market capitalism resulting in rising socioeconomic inequality and high public debts. Moreover, Austrian social thought around 1900 shows a distinct consciousness of the transformations that were going on, and of the contribution of social science to making and improving the real world through knowledge. This may - from today's viewpoint – be seen as naively optimistic and unscientifically value-laden, but in spite of this the problem of the role of social science in the transformation process of society needs to be addressed again in our days.

Looking into the Futures: Problematizing socially engaged research in Visual Sociology

This presentation advances the idea of a sociology of looking, as central to socially engaged research in contemporary visual sociology. Framed by an increasing focus on participatory visual research, particularly the growing use of participatory visual methods such as photovoice and participatory video in visual sociological practice, this paper responds directly to the politics and pedagogy of visual representation itself. Here, the term 'looking' is used as an umbrella term to refer both to the ways in which audiences might 'look' at images, but also to how participants and researchers might choose to 'show' images. This trend in participatory research raises new questions for visual sociologists. What does it mean, for example, to use visual images in the public domain? If our work is meant to be a feature of 'doing' socially engaged research, then engaging with whom and how? These are not questions that have typically been central to visual sociology although they were key in a 'who reads what, why, how, and with what effect?' of the sociology of reading in the 1960s and 70s. Typically terms such as curation, exhibiting, and screening which are associated with visual representation, are the purview of media specialists or those work in Museum Studies and not those working in visual sociology. But, even in these areas, the use of vernacular images 'of the people' is understudied. It is important that we ask, how is this work shifting the spectrum of theories that could be useful in our work? Building on the ideas of Batchen and others, particularly the idea of 'aestheticizing' the vernacular, this presentation considers the need for interdisciplinary frameworks which might, for example, help us think about 'circulating' the vernacular in a new sociology of looking that includes previous work on the sociology of gaze and iconic sociology.

Institutional Ethnography and Activist Futures

Institutional Ethnography (IE) is a distinctive approach to sociological inquiry developed by Canadian feminist sociologist Dorothy E. Smith. From the standpoint of everyday experience, institutional ethnographic inquiry seeks to explore the extended relations of ruling that organize contemporary capitalist societies. Institutional ethnographers have developed approaches to the analysis of ruling that pay particular attention to the importance of objectified forms of knowledge and the active character of texts in coordinating action across time and place. Initially articulated as a sociology *for* women, through a growing body of empirical research, Institutional Ethnography has developed into a sociology *for* people.

This paper addresses the relationship between institutional ethnography and activist practice. It positions institutional ethnography's unique contribution to activist efforts to change the world within emerging debates about and calls for engaged scholarship. Through a discussion of examples of institutional ethno-graphic research, the paper considers how institutional ethnography's empirical focus on and critique of the operation of ruling relations offers intellectual re-sources to forms of activism that seek to remake the institutional relations that shape, organize and limit our everyday lives.

Do Father-Targeted Policy Measures Improve Gender Equality and Child Well-being?

In the current global economic context the future of men's behaviour as fathers, partners and workers is uncertain. Despite the rise in the late twentieth century agenda setting ideal of "new father" as a "hands-on" direct carer of children, there are countervailing value positions and the preference for father as economic provider-in-chief remains a strong cultural force in many countries. Nevertheless, governments and civil societal actors across the world are attempting to fit fathers into work-family polices and continuing these efforts despite global economic turbulence.

In this lecture I will examine what we know about paternity leave and explicit father-targeted policy measures in different countries specific countries and assess their role in improving gender equality and child-wellbeing

Discourses of the North Atlantic: Epistemology and Hegemony

The 21st century harkens what may be an unprecedented era of paradox, peril, and promise—for social life and for social research. New media technologies both facilitate and alienate human connections. The very processes that accelerate the expansion of global scholarship simultaneously consign global knowledge *production* to the more narrow realms of English-speaking scholars. In a 21st century knowledge-based global economy, the production, distribution, and use of knowledge and information has become a dominant economic force. As scholars, we must ask what does it mean to study social structure or interaction at this particular moment in history? What does it mean to examine a "local" context? What techniques will best enable an examination of global flows of information, people, and processes? Of power, privilege, and inequalities?

The premise of this presentation rests on the assertion sociological studies of language—in all of their variations—have uniquely important contributions to make to social research at this historical moment. With *relationality* as an ontological premise, sociological studies of language demand that we pursue knowledge about the social world by examining social routes to knowledge. Of particular relevance here, is the capacity to examine the historicity of localized contexts, the technological mediation of culture, the production of absence, and the subjective processes of social research. Studies of language offer an effective means for apprehending relationality by linking together analyses of structure and agency, history and local interaction.

Studies of language have an uneven presence in Sociology that dates back to Gramsci. They surface most clearly in debates about the politics of knowledge production—as they did for Gramsci. As we abandon notions of epistemic innocence, studies of language offer opportunities to deconstruct the coloniality of North Atlantic epistemologies that occupy contemporary geographies of knowledge production.

How cultural change can contribute to welfare state change: Tracing cultural and institutional processes

Welfare states often develop along established development paths, and the institutional design and the underlying principles of welfare state institutions are not questioned in principle. However, institutional development can also lead to path departure in specific policy fields. What is the reason for path departure in welfare state institutions? It has often been argued that it is the result of economic, political, social or demographic change in a society, or of a shift in power relations between actors with differing interests. Less attention was paid to the influence of cultural change on path breaking welfare state change. The paper explores how cultural change can contribute to path breaking change in welfare state policies, and how it interacts with other relevant factors. Its theoretical framework is based on the assumption that cultural change can contribute to welfare state change only if specific types of cultural and institutional processes are initiated by relevant actors; these are either started at the political level or in within the population. The paper also introduces a typology of different types of cultural and institutional processes that can be relevant in this context.

In its empirical part the paper evaluates these theoretical assumptions on the basis of a study of six historical sequences in which paradigmatic institutional change took place in European welfare states. The main focus is on the development of labour market policies, childcare and elderly care in the time period between 1980 and 2014, on the basis of document analysis, statistical data, national survey data and international surveys like ISSP, EVS and Eurobarometer. The findings support the theoretical assumptions. The paper can make an innovative contribution to the scientific debate about the relationship between culture and welfare state, and to the debate about the future of welfare states.

Global Sociology and the Struggles for a Better World: Contributions from the sociology of organization

Organizations have proven to be an important source of social innovation for how the future can be organized in the present to reach particular ends. Many scripts for practically attaining these ends derive from organizational theorising – from the early time-motion studies of Taylor and the Gilbreths to the emergence of a broad range of organisational actors who claim to have expertise on how the future can be managed (strategists, investment bankers, emergency planners, and the like). A quick glance across the concerns and vocabulary of contemporary sociology provides evidence of the grip that these organizational imaginaries continue to have on sociological thinking across the board (social movements, intensifying uncertainties, contingent outcomes, risks, and so forth). Accordingly, in this address we will begin by reviewing some of the ways that the classics of the sociology of organization continue to matter for a global sociology that struggles for a better world. We will also build on the increased attention to time, history and markets in organizational research to assert the centrality of the sociology of organisation for understanding our shifting relationship to the future.

The Antinomies of the Current Crisis and the Futures of Complex Societies

The current European crisis brings both – the acceleration of the process of urbanization (the growth of the cities) and the opposite – the exodus of the middle class residents from the cities. De-urbanization recovering the ancestral reunion with the natural environment and upgrading the quality of life beyond the city is not only a matter of personal choice; it is becoming almost an imperative. This trend stands true for many societies in the contemporary world, including Russia. To break through the forces of urban modernity more people recognize that, by returning to the ancestral rural lifestyle, it is possible to uncover alternative ways of life – a path to a healthy, balanced and autonomous existence based on (but not involving the denial of) the latest achievements of technologies and infocommunication. The crisis and de-urbanization bring into being diverse forms of creative consumption based on a more deliberate and thoughtful use of energy and natural resources including some reminiscent 'archaic' consumer patterns implanted in the context of high-tech economy. The 'new consumption' in the time of crisis becomes a value orientation in itself for a growing number of post-urban residents.

Sociology, Feminisms and the Global South: Back to the Future

Sociologists located in and working from the Global South are caught in a vicious bind.   On the one hand, they operate in a system still governed by hegemonic Euro-American paradigms of knowledge production, publication and circulation. Yet their work and scholarship continues to be marginal and in many ways dependent (Hountondji , 2009). Recent work on 'Southern Theory' (Connell, 2013) and on Postcolonialism and Sociology (Bhambra, 2007)   reflect critically on the impact of colonial histories and continuing neo-colonial and neo-liberal realities of post-colonial societies. Yet structurally, Sociology as a system of knowledge production has proven very difficult to transform. This paper examines the gendered development of sociologies in the Global South and asks the questions - What of the feminist sociological knowledge created in the Global South by scholars of the Global South? Is a truly global and feminist future for sociology possible? What role for the International Sociological Association in this process?

ROSENTHAL, Gabriele* (Georg-August University of Göttingen, g.rosenthal@gmx.de)

Challenges of Biographical Research

What have been the challenges faced by biographical research in the past decades? In my paper, I will not only discuss different methodological and theoretical, but also practical challenges. Additionally, I will pursue the question in how far biographical research is able to contribute to people's struggles for a better world. In which ways are we able – through our research – to empower the almost powerless outsiders in our interconnected "world society"? My contribution will be based on an ongoing research about illegalized migrants in Europe who come from Syria and the sub-Saharan countries.
My focus will be on the following challenges:
- Transnational research: transnational biographies and familial histories
- International multilingual research
- Overcoming Eurocentrism (as a form of restricted perspectivity)
- Developing combinations of methods according to the requirements of the social fields which are investigated
- Getting insights into the powerlessness of the outsiders in their figurations with established groupings
- Ambivalence/balance between commitment and objectivity
- Impact of research on empowering the outsiders

SAMPSON, Helen* (Cardiff University, sampsonh@cf.ac.uk)

Shaping the future of work

In forging our futures and contemplating the kinds of lives we might imagine as possible in the societies of tomorrow, it is vital to consider the realm of work. Paid work provides a means for people to earn money to support their families and to contribute to their communities. It also has the potential to provide structure to daily lives, a social identity, access to friendships and social networks, and a sense of purpose and satisfaction. It is the central force in many people's lives and yet the world of work is transforming rapidly and unpredictably and the impact of change is being played out erratically across the globe. This paper highlights some of these changes focussing most particularly on both the impact of globalisation and the impact of innovation/new technology. It highlights the need for workers to find new ways to resist unacceptable change and for members of society to engage with politics in order to ensure that the overall impact of transformation is experienced as broadly positive across the spectrum of worldwide socio-economic groupings and is not just of benefit to those who are already members of affluent elites.

Sociology in Times of Global Changes: How to Address a New Agenda for Transnational Studies?

In recent decades, there has been a clear shift in the social, economic and political power balance, bringing novelty to our traditional understanding about societies. Many factors have contributed to this change. Emerging countries have entered the international arena as new players. Human mobility around the world has increased, improving diversity and increasing cultural exchange. The new media and technologies have intensified and accelerated communication and information exchange. We have become more connected and aware of the differences as and similarities between our societies. Unfortunately, not all effects of this connection are positive. In many cases, the outcome was less tolerance, more prejudice, and growing inequality.

These are challenges for sociology that can only be addressed by an agenda of international research efforts and transnational dialogues. It is quite clear that no country is isolated and that changes in environment, economics, politics or culture have consequences for many others. It does not mean there are no specificities, localities or national states; nonetheless analysis about local or national issues has become more complex and complete when we can see the local through the lens of the global. Experiences of international comparative analyses, diffusion of open access publications and data, as well as international meetings are ways to strengthen the transnational connections among Sociologists. As we call for international cooperation in so many spheres, such as the environment, human rights, economy, among others, it is our responsibility to simultaneously promote international cooperation in knowledge production. Nevertheless, we shall emphasize that knowledge production and exchange must be more symmetrical and equal between the center and the periphery. Developed countries and less developed countries must meet as equals in the transnational sociological arena, since we can all contribute to a better understanding of our world and, consequently, to a better future for the globe.

SCHOLTZ, Hanno* (University of Konstanz, hanno.scholtz@idemo.org)

Analyzing Current Challenges in the Mirror of the Past: The Two-Step Nature of Modernity and What We Learn from It

Global social problems as terror, migration, crises, and increasing inequalities resemble those of the early 20th century. This parallel can be understood analytically resulting from two steps to modernity. Modernity is understood here analytically as the introduction of principles as rationality and deliberation that result from the modern growth process. First and second modernity are the two transitions when these principles are introduced first around and later within organizations. And problems arise each in the stage when organizations already follow these principles while macro-social institutions do not yet offer an appropriate framework. This perspective allows to understand what changes are to be expected for the next two decades, parallel to the institutional changes that distinguished the functioning industrial society in 1950 from the state of crisis in 1930.

Globalization, Local Social Movements, and Social Transformations

Civil society groups have become major forces of change in a world that never stops changing and is characterized by high levels of economic and social inequality. They operate all over the world to advance processes they defend and seek to resist co-optations by existing political interests and structures. One way to do so is to refuse to play politics as usual. To participate in movements has become so widespread as to have a period effect of social change. Social movements have begun to act as change agents or may resist changes in given institutions. Biographies are altered by participations in movements; alternative lifestyle options may be adopted. Movements change public opinions by inserting parts of their diagnostic frames in popular discourses. They help create or alter policy because of their effects on state administrations and public institutions such as universities and churches. This paper will explain the role of global connections in social changes initiated by civil society movements that arise from the contradictions and conflicts of specific local societies. Finally, the paper will evaluate the role of social movements in transformation processes planned by states and global institutions, such as the UN.

Comm-16.2

SCOTT, Bernard* (Center for Sociocybernetics Studies, bernces1@gmail.com)

The Role of Sociocybernetics in Understanding World Futures

Sociocybernetics is concerned with applying theories and methods from cybernetics and the systems sciences to the social sciences by offering concepts and tools for addressing problems holistically and globally. With its distinction between first order studies of observed systems and the second order study of observing systems, sociocybernetics provides a unifying epistemological and methodological conceptual framework. Within this framework, sociocybernetics accommodates a wealth of specialisms in the social sciences, ranging, for example, from the drivers and effects of technological development to sustainability to justice. The shared framework facilitates communication between social science specialisms and also between the social sciences, the natural sciences and the applied, technological sciences. This paper sets out some ideas about how sociocybernetics can contribute to understanding possible world futures. A central concept in cybernetics is 'governance', the art of steersmanship. As conceived by Ashby, Beer and others, this art is concerned with the management of variety. How do we face the challenge of managing all the variety that makes up 'possible world futures'?

Six Narratives in Search of a Future: Current 'Theory' in the Sociology of Religion

The sociology of religion has long been ruled by six competing narratives. I use this term to note that these narratives are built from stories more than from evidence, though a few claim 'paradigmatic' status in an attempt to seem more intellectually secure than they are. According to these stories, religion in the contemporary world is either disappearing, resurging, individualizing, creating local communities, shaped by markets, or going global. The first two of these stories were baked into sociology from its beginning as an intellectual discipline. Nineteenth century sociology saw religion as its ideological 'other', so relegated it to the unscientific past. Both secularization theory and theories of resurgent conservative religion share this view, by equating the binaries science/religion and modern/pre-modern. The individualism and local-community narratives both proclaim the growing irrelevance of national and international religious organizations. The first portrays religion as an increasingly individual matter, while the second sees local religious communities as among the few remaining sources of social solidarity in an increasingly massified world. Market models of religion (frequently based in rational-choice theories of individual action) parallel neo-liberal worship of free markets. They typically move from the insight that religious organizations exist in markets to claims that market structure determines everything of consequence about religions. Finally, globalization theories (of which there are several) emphasize either the transnational spread of ideas about religion, the increasing role of transnational immigration in religious diversity, or the growing transnational reach of religious organizations. So far, none is able to integrate these three aspects of globalization into a coherent whole. This presentation summarizes these six narratives, emphasizing what each is unable to see in the current religious landscape.

A Social Psychological Perspective on "The Futures We Want"

I discuss future directions in social psychology that have the potential for advancing our understanding of social actors, their interaction, and the structure and culture within which they reside. These directions are divided along theoretical, methodological, and substantive lines. Theoretically, researchers are beginning to work across theoretical lines, borrowing concepts and processes from different research programs to provide a comprehensive understanding of self and society. When this is done in a systematic and cumulative manner, it can yield new and powerful insights into the human condition. Methodologically, new measures on the physiology and neurology of social actors can aid in supporting or disconfirming processes that have been theorized and tested primarily through self-reports. If the biology of individuals works inconsistent with our theory of individuals, this provides the opportunity for theoretical revision and growth. Substantively, we are living in a global economy in which individuals interact with others from different cultures in a way not seen before. Additionally, rather than interaction being face to face, communication often occurs using social media. Greater heterogeneous interaction that is technologically-mediated may require new theories that provide insight into how actors adapt (or abandon) to these new ways of communicating.

Back to the Future? Slavery, Refeudalization and the Issue of Conceptual Clarification

Are we currently experiencing a process of refeudalization? This concept has recently been revived to conceptualize the transformation social order has been undergoing as a result of neoliberal reforms. The focus has been on the emergence of a transnational capitalist class. What if we invert the perspective? Can we also describe the processes of rising inequality as refeudalization from below? One issue to investigate in this regard is the increasing trend towards precarization. What this paper focuses on, however, is the a second issue, the so-called 'return of slavery'. Slavery was long held to be an institution that has been overcome. But since the 1990s this assessment has changed. According to the human rights NGO Anti-Slavery International there are actually more slaves today than at any other time in history. Without receiving much attention in academic mainstream, contemporary forms of slavery have already been discussed under the rubric of (semi-)feudalism in the 1970s (in what is called the global South nowadays). This paper investigates in how far these debates can help understand the current transformation of the social stratification and highlights how inequalities have risen underneath the threshold of general attention, inequalities which are not adequately grasped in historical terms of feudalism, however. Along these lines, the papers simultaneously demonstrates the value of conceptual clarification which is what ISA RC35, the Committee on Conceptual and Terminological Analysis is devoted to.

LARSSON, Stefan (Lund University Internet Institute)

Law in a Digital Society: Code, Norms and Conceptions

This paper addresses the role of technology for socio-legal change, particularly with regards to digitization and the Internet and how law is challenged conceptually and normatively in its wake. Digitization is here mainly discussed and analysed in terms of a.) how the architecture and networked design includes normativity and values as such; b) how interconnectedness and digital phenomena are for their regulation depending on embodied images and conceptual metaphors often stemming from an offline context; c) and how the relatively newfound aspects of traceability and collection of human big data leads to new modes of policing and legal execution.

Arguably, a core challenge within sociology of law lies in understanding relations and interdependencies between legal and social norms . Within a digital context, the Cybernorms research group has conducted a number of surveys on norms in a digital context, where the one receiving perhaps the most attention is the so called Research Bay survey, conducted via the infamous piracy site The Pirate Bay, collecting a total of over 310,000 respondents over three occasions. We have elsewhere shown how social norms emanating from a digital context may challenge legal norms and how this can lead to various and often unintended outcomes, such as online communities utilizing tools to become less traceable online as opposed to complying with law. We have both in connection to file sharing research as well as elsewhere shown how conceptions and metaphors of digital phenomena are of relevance for both social and legal norms as well as legal development . In brief, by drawing on a number of empirical studies we elaborate on what we find to be key challenges that law faces in a digital era.

Movements and Moments: Shifting theoretical paradigms through youth-led justice struggles in the Global South

Global youth studies has historically been described in terms of binaries that include assets-deficits, belonging-exclusion, prevention-agency, pathology-aspiration, and resilience-resistance. Along with considerations of youth culture, identity, and shifting attitudes over generation, these debates have mainly emanated from the Global North. Despite the contemporary upsurge of global sociology, there remains a clear need for theory from the South to challenge or replace dominant Northern theory, whilst simultaneously complementing global sociology's frequently inadequate gaze. Using the phenomenon of youth-led social protest in South Africa as a case study, this paper interrogates these binaries and the theories that underpin them, and evaluates the necessity for a paradigmatic shift that expounds and elevates 'theory from the South'. Drawing on new empirical data and first-hand and (social) media accounts, it compares two moments - the 1976 Soweto Student Uprising and the 2015 'Hashtag Revolutions' that included social movements such as #RhodesMustFall, #TransformWits, #OpenStellenbosch, #FeesMustFall, and shows how youth-led struggles and social movements have changed over the past 40 years. These changes include shifting location of actors across generations i.e. from perpetrator of injustice to beneficiary of past injustice; differences in desired forms of justice (e.g. from recognition to restitution and restored humanity); the contested place and forms of violence in struggle; the role of individual versus collection action; the need for resistance against intersecting oppressions; and how new forms of media have allowed for greater analysis, and the ability to act against the policies and practices of a globalised environment. Each of these shifts has paradigmatic implications for global youth studies, and has the potential to better operationalize its aims, showcase its strengths, and improve upon its weaknesses.

New Perspectives about Social Control, Crime and Violence: For Another Possible World

Social Justice and Whistleblowing: Creating a Better World in the Workplace

The changing world scene in the 21st century is marked by world social questions but they retain the distinctive mark of the particular societies where they originated. We see now an internationalism based in global social problems, such as violence, exclusion, gender discrimination, several forms of racism, poverty, environmental problems, the problems of famine. We observe that the transformations in the labour world due to technological changes have been followed by a precariousness in labour, unemployment and processes of social selection/exclusion.

The period of late modernity, from 1991 through the present, is the time of "liquid fear". Changes are taking place in social institutions, such as the family, the school, the factory, religion, and the criminal justice system, and transforming processes of socialization, as we go through a process of crisis and failure of once reliable institutions.

Late modern societies also produce transformations in crime and in forms of violence. The phenomenon of diffuse violence takes on a new form and spreads throughout society. The multiple forms of diffuse violence in contemporary societies, such as violent crime, social exclusion, gender violence, acts of racism, and school violence, is expressed in a microphysics of violence. Crime itself has changed in late modernity: we are in a civilizational malaise which has led contemporary society to an obsessive preoccupation with individualism and personal safety.

Theories about crime and violence in modernity have a long history. Since the 18th century we note four important periods. The first period, the Formation of Modern Society, Crime and Violence, stretched from the XVIII to the late XIX century. The second period termed the Age of Extremes: From Crime to State Violence, the third period: the Epistemological Crisis of the Twentieth Century, the fourth period: the Late Modernity Theories of Crime and the Microphysics of Violence.

While the notion of social justice has increased in prominence in the 21st century, it is not an idea that immediately springs to mind when considering issues related to whistleblowing. However, it could be argued that the processes linked to and the outcomes flowing from whistleblowing are directly related to social justice concerns, in particular those of democratization and human rights. Whistleblowing can be defined as a disclosure of perceived non-trivial organizational wrongdoing by an organizational insider, in other words, someone with privileged access to an organization's information, to someone who is perceived to be in a position to take action. These disclosures generally result in retaliation by members of the organization where the wrongdoing is being exposed. While whistleblowing is clearly an attempt to rectify something that is going wrong - of promoting an ethical workplace - it is also an issue of rights and justice. An ethical workplace is fundamentally one that implements principles of fairness of processes, outcomes and the treatment of organizational members. The focus of the paper is on considering factors that would encourage organizational members to act against the abuse of power and corruption in organizations through blowing the whistle, and thereby restoring justice in the organization. It also considers the implementation of processes that would ensure fair treatment of whistleblowers that would ultimately result in a workplace where organizational justice reigns supreme.

TEJERINA, Benjamin* (University of the Basque Country, b.tejerina@ehu.eus)

The Ruins of the Future. a Glance into Precariousness from inside the Crisis

The concept of precariousness has gained currency in recent years as its effects have expanded from the most marginalized and vulnerable social sectors to the traditional middle class.

On the one hand, a central feature of contemporary precariousness is its displacement from the periphery of society, from the margins, to the center of modern societies. On the other, contemporary precariousness is characterized for its impacts on dimensions such as work, income, housing, environment, social and cultural capital, or health, to name some of the aspects quantified and measured systematically.

The dynamics of these processes of precariousness have come to affect the very center of society, i.e. those professional and educated medium classes who continue to experience a progressive weakening and erosion of their living conditions, although feeling privileged when comparing themselves to other social groups.

Globalization has helped increase wealth, but is not serving to improve its distribution to the point that, in fact, globalization is contributing to increasing inequality.

The crisis that began in 2007 has only increased and accelerated the redistribution process that begun decades earlier. It started in the 1970s with the implementation of neoliberal policies and, subsequently, with budgetary cuts in the social supports of the welfare state. Are these the ruins we want to leave to future generations? Will these structures of inequality of today be the ruins to be visited by sociologists of the future to understand the roots of their own society?

The Spanish case, far from being an exception, is an example that can be found in other European, American or Asian countries. From the use of statistical data from Living Conditions Survey, between 1995 and 2013, we intend to explore the processes of precariousness of the Spanish population, across different generations, with special attention to the impact of the recent crisis.

VANDERSTRAETEN, Raf* (Ghent University, raf.vanderstraeten@ugent.be)

National and Global Sociology

In the early-modern era, science was conceived as universal/global science. Often its findings and observations were communicated in Latin, i.e. the *lingua franca* of early-modern science. The nineteenth- and twentieth-century expansion of science went along with a 'nationalisation' of science, with the use of national vernaculars and the genesis of national scientific communities. Sociology, as one of many academic disciplines, established itself in different ways in different national contexts in the last two centuries.

In certain respects, the dynamics of discipline formation and specialisation nowadays lead again to global networks of science. It would be unjustified to argue that the national level will soon become (or already is) a non-existent entity in the 'world' of science. In a range of respects, the social relevance of the national level has probably augmented in recent times. The dependence of scientific research on state finance has not decreased since the Second World War, while governments have also searched for new ways to increase their influence upon the academic world. However, we may predict that the increasingly global networks of scientific collaboration and communication will make it increasingly difficult to discern distinctive national traditions in disciplines, such as sociology.

Of special relevance in this regard is the rise of professional associations and journals with a 'regional' or global focus – such as the *International Sociological Association* and its journals. Also, several national – especially English-language – journals have become global ones (measured by the composition of their editorial boards, the nationalities of their authors and subscribers, or their impact factors). A network analysis of the publication and communication formats within journals such as *International Sociology* will allow us to shed some light on the characteristics of, and opportunities for, global sociology.

VERDUZCO, Gustavo* (El Colegio de Mexico, gverduz@colmex.mx)

Refugees in the Mediterranean: How Can We Prepare a Better Future?

The present refugee's crisis in the Mediterranean is a good example of a real situation that touches several countries (and states) where people with different cultural and religious backgrounds are involved. What has been done? What has not been done? and what should have been done? We must also ask who have been the main actors? The answer to these questions can be a starting point to delve deeper into the problems, at least into part of them.

The purpose of this presentation is to briefly analyze the role of some actors (mainly states and social organizations) when confronting the present refugees' crisis in the Mediterranean. From this we can obtain several lessons that can help us to think of a better management of similar crisis not only in Europe but in other parts of the world where either refugees or migrants have to face the hardships of their fate.

Comm-18.2

WALBY, Sylvia* (Lancaster University, S.Walby@lancaster.ac.uk)

Is the Crisis Cascading into Violence?

Is the crisis – erupting in finance in 2007, and cascading through the economy, the fiscal, and the political – now leading to an increase in violence? Is the mid-twentieth century European nightmare, in which financial crisis led to economic recession, fascism and violence, being repeated today? Answering this question requires a theory of crisis and of the connection between economy and violence. What constitutes crisis is contested. The construction of government deficits as if they entailed fiscal crisis to be treated as a state of exception is not inevitable. The cascading of crisis from one institutional domain to another is not inevitable, since renewed democratic forces potentially provide sites of resilience and resistance. The connection between finance and the economy is contested. The potential of the democratic regulation of capital to reduce the instability of finance is underestimated in social theory. What constitutes a change in violence is contested. The claim that there is a continuing decline in the rate of violence is contradicted when the increase in gender based violence is made visible through new methodologies. The theorisation of crisis is developed using complexity science and a reworking of the concept of social system.

YUVAL-DAVIS, Nira* (University of East London, n.yuval-davis@uel.ac.uk)

Contemporary Politics of Belonging and Everyday Bordering

The summer of 2015 has seen a major European political and humanitarian crisis, emanating out the growing number of migrants reaching and moving into Europe from Middle eastern and other Southern countries. This crisis reflects a major global, regional and national multi-layered crisis of governability and governmentality. In this paper, however, I am focusing on one particular facet of this crisis, that of everyday bordering as a growing part of everyday social fabric of society as a whole. I argue that everyday bordering has become a major technology of control of both social diversity and discourses on diversity, in a way that threatens to undermine the convivial co-existence of pluralist societies, especially in metropolitan cities. Although this paper focuses on Britain, especially London, such tendencies have been developing in all immigration societies, especially since the drive for securitisation following the events of 9/11 in 2001. My argument, however, is that one cannot understand these developments only as an outcome of securitisation, but rather that they have to be understood as part of a political project of belonging which emerged as a counter narrative to the multiculturalist project dominant in the global North during the 1980's and 90's.

The illustrative examples which will be used in the paper are taken from the research project on everyday bordering which I've been involved in as part of the EUF7 **Borderscapes** research project (uel.ac.uk/Borderscapes) and will constitute part of our forthcoming book (n.Yuval-Davis, G. Wemyss & K. Cassidiy, *Bordering*, Polity Press, 2017). The research methodology of this research used the analytical perspective of situated intersectionality.

Gender and Coaching

Majority of professional coaches assumes that being professional means denying your gender. I propose that an awareness of the coach concerning the large scale of significances of gender in a coaching process is crucial for successful results.

Professional coaching and clinical supervision in Finland have stayed nearly untouched by the feminist research. Coaches who work with gender know-how and gender sensibility produce more satisfied employees and managers in work organisations.

My aim has been to research how gender, age, education, traditions, religion, place of residence, correlate with gender awareness and gender related practices in a coaching process of a professional coach or a clinical supervisor.

I sent a survey to the 1.800 members of the Finnish Supervisors' Association and to the 400 supervisors of the Evangelical Lutheran Church of Finland and interviewed 12 coaches/supervisors. The interviewed persons have also kept a diary of their observations concerning gender during two months. Finally, I analysed the material with an intersectional method known from gender research.

Statistically 80% of the coaches in the Finnish Supervisors' Association, and 60 % of the Church supervisors are women and a majority of their clients are women, mostly from the health and social sectors and the church. Quite few of the supervisors are aware of the significances of gender in their praxis.

Is it so that low paid women coaches coach low paid women to stay in their hard work situations and well paid male business coaches coach male CEOs to make more money? The results are guiding in that direction, but need more research. However, gender awareness and gender know-how should be added to every coach and supervisor training in Europe. In my view we still have many areas in science and work life, where being a professional means to deny your gender.

ABAZIE-HUMPHREY, MARGARET* (Office Nigeria of the Special Adviser to President on Niger Delta / Presdiential Amnesty Programme, mh4jws@yahoo.ca)

Local Cooperation As a Determinant of Conflict Resolution Success: Lessons from Niger Delta DDR Program

The purpose of this paper is to to purpose enhanced responsiveness to local needs and preparation for locally tailor-made plans in conflict resolution/DDR programme so that it's administrative procedures and responsibilities are from locally based office organisations that are outside the central government.

Establishing conflict resolution structures and mechanism that supports greater inter-agency coordination at local level for greater government accountability through local participation is a suggested strategy.

The idea is taking conflict resolution or DDR programme from the sole operation of central government (as in the case of Niger Delta DDR Project in Nigeria) to provincial (states) and districts (local government areas) to involve the direct actors and victims of conflict for the peace process by engaging them in the planning, decision-making, budget control; and holding them accountable for the success and failure of the peace accord.

Nigeria proclaimed Amnesty in 2009 for the 30,000 Niger Delta ex-militants. These ex-agitators are today the beneficiaries of the nation's managed DDR Project with sole administration by the Central government. Arguably, mediation of conflict is at higher success if the disputants jointly initiated the mediation processes. What lessons can learnt from Nigeria DDR project implementation forms part of this paper hypothesis.

Family and Social Media: A Study of Patterns of Interaction Among Family Members on Facebook

Social media can be described as a set of technologies and services that make self-publishing online very easy and allow the consumers of a particular medium to interact, most commonly through comments of some sort. Facebook, Twitter, You Tube etc. are common example of social media. The reach of these tools is global but in usage they are not universal as access is restricted by the availability and viability of communications, infrastructure, and personal device (i.e. phones, computers/laptops, i-pods), skills and most importantly the interest to actually participate in social media activity. Moreover, participation in certain networks and activities in a social media differs from country to country. It has been observed that *Facebook* is one among the most popular social networking sites for the people of all age groups. It not only connects a person with his friends, colleagues, virtual friends but also with members of his/her family. The patterns of interaction among the family members vary in terms of age, sex, sharing contents, comments, posting messages on timeline and tagging etc. The review of the existing literature indicates that: the teenagers send more friend request to their parents; Married daughters post more on timeline of their parents; Mothers are more concerned about the safety of their son. The present are explores these issues by analyzing the interaction patterns among the family members in India in an ongoing research study conducted on a purposive sample of 50 *Facebook* users who are in (Facebook) 'friendship' tie with their parent/son/daughter/spouse/brother using social network approach.

ABBASZADEH MARZBALI, MOHSEN* (University of Tehran, Mohsen_abaszadeh64@yahoo.com)

Democratic Activism: Between Organizing and Spontaneity

According to the Modern paradigm, democracy embodies in constellation of the "institutional regimes". This constellation refers to the role of "organizational mediator", between citizens and decision-makers, like parties, interest groups, lobbies, formal media (TV & Radio), and etc. This narrative stems from the empirical tradition of political analysis and positivist perspective of power, politics, and participation. Notwithstanding, this definition has been challenged by a theoretical turn in these concepts since the late 20th century. From this perspective, the present paper sheds light on the roots and dynamics of this post-modern turn with regards to Chantal Mouffe's post-modern radical politics and Jacques Ranciere's narrative of the political. Within this framework, the paper tracks down the roots of this theoretical turn with regards to two pivotal themes.

"What impacts have the Post-modern Turn had on the concept of the political representation? How has the post-modern turn been manifested?" These are the central questions that guide the main argument of the paper.

In following, the paper argues that by referring to "Difference" and calling for "Otherness", the post-modern turn is mainly explained by Radical Democracy that puts emphasis on self-expression manifested in social movements as an activism beyond the limits of "organizational mediation". These movements should be considered as main embodiment of such a new political representation. Lastly, the present research asserts that the main condition for the realization of democracy is to emphasis on Micro-politics and social movements as life-style. It is a bottom-up democratic action.

TETI, ANDREA (University of Aberdeen)

Contested Futures in the MENA Region

The Arab Spring in early 2011 stated a process of political change in the Middle East with popular uprising demanding political reforms and in some cases regime change. A process of democratisation began which challenged authoritarian rule. However, the trajectories of change have differed between countries and   a clash between sectarian and religious values.

This paper will look at differences in political and social values in five MENA counties, Egypt, Jordan, Lydia, Morocco and Tunisia in 2014 drawing on a comparative survey carried out in each of the countries. A stratified probability survey was carried out with a sample of around 2000 adults in each country using a common questionnaire. The survey collected information on social, political and economic attitudes and behaviour.

The paper will combine an analysis of place and composition looking at differences in political and social values across the five counties and for key groups in the population.   The importance of region in shaping political and social values will be considered in detail. The paper will conclude by discussing the conflicting views of the future suggested by differences in political and social values.

The Decent Society in International Comparison. Indicators of Social Quality World Wide

The paper draws upon the concept of the "Decent Society" as a way of understanding how people can be enabled to live decently good lives that optimise their capabilities as set out in the book by Abbott, Sapsford and Wallace to be published in 2016 by Routledge.   The book identifies and collates indicators for a Decent Society building on the interaction of economic security, social cohesion, social inclusion and empowerment as basic elements (derived from the model of Social Quality. The concern in the book is not so much with what nations around the world have achieved as with the conditions and infrastructure they have put in place to make it possible for people to flourish in these four respects. This paper goes a stage further to look at subjective survey orientations to the Decent Society in order to answer the questions: 'Do people *think* that they live in a Decent Society?' (using the European Social Survey) and 'Do people *want* a Decent Society?' (using the World Values Survey).

ABDULLAH, NOORMAN* (National University of Singapore, socnooa@nus.edu.sg)

Harmony As "Repressive": Sensory Politics, Religion and the Everyday

In the context of urban and cosmopolitan cities with diverse, intensified migrant flows, questions pertaining to religious freedom and rights have been circulated and debated through different social actors. The potential for religious tensions and conflict has been pitched as a source of anxiety in such sites, given that religious diversity cannot in itself guarantee racial and religious harmony. This paper unpacks the repressive character of "harmony" in multicultural and multi-religious societies through the lens of the senses and everyday life. The cases presented empirically looks at Singapore's colonial and postcolonial conditions in relation to a range of religious practices, and how such logics and discourses have been politically appropriated to institutionalise and legitimise repressive mechanisms. What happens when everyday religiosity expressed through rituals that involve sound, smell and other sensory modalities infringe on the sensory "rights" of other groups in such multicultural, multi-religious contexts? How does this 'infringement' reconfigure talk about racial and religious harmony? The paper therefore draws attention to the sensory micropolitics of friction in the everyday that often ostensibly appears less dramatic, less serious and less pressing than the spectacle afforded to religious wars, but which nevertheless is very real and challenging. At a broader level, the cases are connected to the processes of rationalisation, standardisation and bureaucratisation of sensescapes in modern, urban Singapore – invoking the discourse of the "greater good" by the state vis-à-vis the project of hegemonic consensus.

Adaptive Strategies of Russian Scientists in the Era of Reforms

According to the specificity of the place and role of science in modern society, the main purpose of our study is to assess the social impact of the reform to the scientific sphere, its current and long-term consequences especially for the scientists themselves. The main problem is the lack of a clear idea of how to react or may react Russian scientists to a fundamental change in the usual conditions for them. I am planning to research what types of behavioral strategies and why are they in this situation the most common. The very important question - the extent to which these factors are taken into account in determining the content and the pace of reforms, what can we say about the development prospects of the academic sector of science in the new environment. The paper will assess the adaptive capabilities of researchers in terms of long-term stress in the conditions of reforming the academic sector of science. Our task is assessment of the readiness of different layers of the scientific community to adopt reform measures, identify complex objective and subjective factors that will determine the actual behavioral strategies scientists to identify the most common types of such strategies.

Identity Politics or the Politics of Identity? Strategic Essentialisms and the Imaginaries of Disembodied Communities

Contemporarily, one of most challenging debates in terms of gender identity politics revolves around the impacts of queer movements, which take a position against all forms of category-based politics for their essentialism. Such influence would undermine the possibilities of a politics targeted at specific subaltern groupings, as stressed by critical insights stating the impossibility of a politics without subjects. This problem was addressed by Spivak with the notion of strategic essentialism. For her, identity, subjectless it may be, should be nonetheless strategically mobilized for political reasons. This implies a denial of identity as the basis of politics insofar as subjects are not pre-existent to politics, and reinforces the idea that politics can construct identities as strategic positionings against the dominant. Overturning the traditional ontology of the political, embodiment is only possible if a political programme precedes subjects. Narrowing down the debate and on the basis of a reflection on the construction of the category transgender, we critically reflect on the effects of disembodied strategies for doing a politics of identity alienated from subjects. Such strategies do not elude reifications. Instead, they tend to, even if unwillingly, separate what in habermasian terms we could call the world of life vis-à-vis the political. Imaginaries of disembodied communities are a powerful result of theorizations against identity, although paradoxically unable to avoid identitarian strategies, even if as a side-effect. The contradictions of such disembodied forms of politics will be discussed through the example of contemporary transgender communities (drawing on the ERC funded project Transrights) as political imaginaries vis-à-vis the strategies designed for representation in the public sphere. Such strategies for claiming rights, when compared to the reality of lives, will illuminate the extent to which the renewed production of normativities challenges present and future ontological formations of both the political and the social.

The Political Economy of Gender Politics in Trans-Related Healthcare: Between Medical Knowledge and the Global Market

This paper will examine access to healthcare related to "gender change" mobilizing a perspective that intends to reveal the political economy associated with (trans)gender politics. In the history of 'transsexual healthcare' the relationship between medical knowledge and financial profit was never linear. Since medical technologies, such as feminizing and masculinizing hormonal therapies and surgeries, became available and medical protocols were established (in some countries already in the 1950s), accessing gender transition has been facilitated, namely to those fitting the diagnostic criteria of "transsexualism" and "gender identity disorder" (substituted by "gender dysphoria" in DSM V). Simultaneous, however, treatments were made costlier for those not matching medical definitions and diagnoses of transsexuality. Two fundamental reasons underpin the inequalities in the access to trans healthcare. On the one hand, the rigid psychiatric categories for understanding gender variance, and the entailed protocols for "gender change", contributed to exclude some individuals. On the other, the historical decline of the welfare state made medical procedures inaccessible for lack of coverage by national health systems or insurances. Consequently, and along class lines, opportunities for expanding a global market of privatized trans medical-care filled the gap, reproducing inequality at the expenses of a political economy for social and gender justice. Drawing on a comparative analysis (ERC funded project Transrights, http://transrightseurope.com/) between five European countries (Portugal, France, United Kingdom, the Netherlands, Sweden), we will explore how the connections between medical gatekeeping and the commodification of health at the global level impacted institutional protocols and standards of care. Following a genealogical method and aiming at analysing the political economy behind trans healthcare, we will resort to medical literature, policies adopted by medical teams, international and national reports and recommendations and claims from trans-activists. Surveys on trans-related health and in-depth interviews with trans-people and institutional actors will also be analysed.

Learning with Children and Not Teaching Them: Pedagogy of the Refugee Children

From the aspect of access to education, there are two major groups of Afghan refugee children living in Iran; first, those who due to their illegal status of stay are deprived of benefitting from formal education system; and second group of Afghan children, who are registered and are allowed to enter into formal education system, but have been gradually eliminated and despaired due to several reasons including economic pressures, obligation to work, inadequate time to study, inappropriate mental conditions caused by war and forced migration, cultural and language differences and absence of acceptance among Iranian teachers and students. This paper draws upon our six year experience of working with Afghan refugee children in Iran, to demonstrate what the educational priorities of

these children are in order prepare them to learn along with other students, and how these priorities can be identified. Sense of belonging to education system is among the motivation factors for learning and one of the main measures which will create this sense in students is their participation in identification of educational priorities. In this paper, through emphasis on Freire's theory of "Pedagogy of the Oppressed", we critique the banking education system and its autocracy in identification of priorities and as Ransiere interprets, in the form of their ignorant school masters, explain the successes and failures of our experience based on the principal of "learning with children and not teaching them" which can result in cultural synthesis.

"Jashn-e Tklif" As a Rite of Passage in Iran's Educational System.

Jashn-e Taklif (Obligation Ceremony) is the biggest celebration for elementary students in Iran. According to the rules forced by the ministry of education in Islamic Republic of Iran, this ceremony must be held by schoolmasters for every nine year old girl and fifteen year old boy. In this ceremony students celebrate their transition from being a child to being an adult, and religious teachers announce to students that from this time they are "Mokallaf," meaning that they are at responsible age and have to perform religious duties in Islam such as wearing Hijab, saying prayers and fasting. According to "The Rites of Passage", worked by Arnold Van Gennep that explains his view on rites of passage rituals as being divided into three phases: preliminary, liminality, and post-liminality, "Jashn-e Taklif" can be one of the important rites of passage in Iran. The history of "Jashn-e Taklif" in Muslims families, the role of the educational institution in holding this ceremony, and the use of it as a tool for socialization of Iranian women are the issues discussed in the current article. In fact, in this article I am going to describe "Jashn-e Taklif" in girls' schools in Tehran as a rite of passage by the visual documentation of the event. I will introduce its phases by photo-elicitation interviews with the female students who are studying some years before and after this ceremony. my target population is the female students who are studying in specified schools I chose for my research.

Crossing Boundaries, Erasing Margins and (re)Contouring Knowledge Production:

There is an increasing awareness and growing commitment among sociologists of the need to challenge traditional restrictions on knowledge construction, to bridge research and action, engage in collaborations, and help shape meaningful pedagogy, policy, and practice to address the social justice issues of our time. This paper will explore the role that a global association such as the international sociological association (ISA) can play in creating an intellectual and organizational space that fosters more equitable sociological knowledge production, exchange, dissemination, and action across the globe. Through an examination of ISAs history, structure, activities and processes, as well as data derived from the "case study" of RC 32, the paper considers the ways that ISA both reproduces but also challenges dominant hegemonic discourses and methodologies. The dynamics of privilege and disadvantage, the fault lines and transversal politics as well as the critical role that ISA can play in (re)contouring sociological knowledge production will be discussed. Special attention will be paid to the diverse pathways in the production of knowledge that the Association enables the public to access, and the influence the Association has exerted on public policies and institutional structures addressing solutions for a more just world.

ABRAMCZUK, KATARZYNA* (University of Warsaw, k.abramczuk@gmail.com)

The Lay Users' Evaluations of Credibility of Medical Information on the Web

People often search the Web for medical information. Unfortunately this information is often misleading, incomplete, and noncredible. I present two studies on how lay people evaluate credibility of medical content on the Internet and to what extent we can support the lay evaluations.

In the first study we asked carefully selected respondents with a varying level of Internet skills to evaluate credibility of over 140 Polish web pages related to 16 popular medical searches. We gathered respondents' declarations regarding topic expertise and measured their psychological characteristics. We compared behaviour in two situations: browsing the Web content and searching it for spe-

cific answers. We analysed how these evaluations differ and when they are more accurate i.e. more in line with expert evaluations for the same set of webpages.

In the second study we used platform Reconcile to gather credibility ratings for a set of 190 medical websites in English. We compared behaviour of the lay users in a situation in which they made supported, unsupported and partially supported decisions. The support offered consisted of suggested system rating based on expert evaluations and the distribution of community evaluations. We also studied the effect of a reversed support, where the suggestions made by the system were opposite to the expert evaluations.

We learned that lay users exhibit an evaluation bias. They make decisions heuristically relying strongly on preconceptions and using only a small subset of cues. They are easily persuaded by the webpage's message even though they do show some resistance to inaccurate suggestions made by a support system. Moreover we note that a second order digital divide can be observed when it comes to credibility evaluations. This divide runs across other dimensions of social inequalities but can be tied to the general level of Internet skills.

The Construction of Excellence in Science: Problems, Challenges and Advancements from a Gender Perspective

In science, excellence is an important concept used to justify many decisions in a scientific career. This paper will look at this issue from a gender perspective, examining the different stages of a scientific career and how it is construed to arrive at the highest levels of leadership and decision making. The last 20 years have produced an important literature on women and science, and it shows that career paths of men and women are very different. It is necessary to unravel the complex interactions between institutional arrangements and personal preferences that might explain why so few women reach the top. A lot of recent research has also looked at how excellence is defined and measured, and how this affects the results for men and women. Another challenge when looking at excellence in science how this is developed in the international arena and how different countries and regions are positioned. Many international programs and organizations have shown what are the possible strategies for advancing women in science, and the paper will try to understand what are the sociological issues that support or hinder their success.

Characteristics of Youth Dating Violence and Risk Factors in Mexico: An Analysis from a National Sample

Dating violence is a significant issue affecting today's youth and can affect anyone regardless of age, gender, ethnicity, socioeconomic, racial, and religious backgrounds, and it occurs in heterosexual, gay, and lesbian relationships. This study examines and identifies the different types of dating violence, and their associated risk factors in Mexico considering the data from a national sample. In 2007, the National Institute of Statistics, Geography and Information (INEGI) conducted a nationwide survey of youth (15-24 years old), to address the problem of dating violence among these demographic group. The survey was conducted in all 32 states of Mexico, which included 4,147 males and 3,807 females. Results indicate that young females in Mexico suffered different types of dating violence from their counterpart. It also found that dating violence has a greater impact on the health status of girls. In addition, this study shows that dating violence has led many young females toward substance abuse.

ACHATZ, JULIANE* (IAB Institute for Employment Research, juliane.achatz@iab.de)

Low-Income Children's Participation in Guided Activities

Opportunities to interact with peers and to establish social relationships are supposed to play an important role regarding the social development of children and adolescents. A number of studies have found that children and youth from low-income families often are not only disadvantaged in financial terms, but in their social relations beyond the family as well. While some studies reveal disadvantages of poor children regarding social participation, others point out that a number of low-income parents nevertheless manage it to give their children the opportunity to participate in leisure activities. This leads to the question if participation is associated with financial conditions irrespective of other factors like family structure and educational background of parents. To disentangle effects of financial constraints from other factors is an important policy concern. In 2011, the German government introduced education and inclusion subsidies for children of low-income families. This policy approach implies the assumption that

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

risks of social exclusion are mainly due to financial hardship that can be effectively counteracted against by providing financial support.

This study contributes information about the gap between low-income children and youth and more affluent groups in terms of their opportunities to participate in guided leisure activities like extra-curricular music or art education, sport programs or club memberships. The main research questions are: To what extent does participation differ for children from low-income families and children from more affluent families? Which attributes of children and their families are associated with participation in guided activities? Also, using data from three waves of the German Panel Survey "Labour Market and Social Security" (PASS) it shall be explored if the participation gap changes over time. Results and policy implications will be discussed against the background of the implementation of "Education and Inclusion Subsidies" for low-income children in Germany.

ACHILIKE, ADAKU* (Niger Delta University, Nigeria, aachilike@yahoo.com)

The PLACE of High School Drop-out in the Dwindling State of Education and Economy of the Nigerian System

The issue of high school drop-out has been a source of worry to parents, students and government for over three decades. This in the past gave rise to 'mass promotion' of students at the end of terminal examinations. The idea of promoting teachers whose students passed more was muted in order to reduce High School Drop-out Rate (HSDR) and this situation has long been highly abused. But the HSDR is still on the increase. It is on this backdrop that the paper sought to identify those factors that are associated with this negative trend in the Nigerian educational sector. A 60-item validated questionnaire was distributed to students and teachers in institutions of higher learning in Bayelsa State(one of the oil-producing states) of Nigeria, with a view to establishing male, female, teacher, student opinions as to what factors impact more on HSDR and how they affect the economy that is already checkered. Implications of findings were utilized in proffering recommendations.

Quel Futur Pour L'industrie Kibboutzique?

Jusqu' a la fin des 90, prés de 270 kibboutzim fonctionnaient comme des communautés de production et consommation sous un régime de propriété collective des moyens de production. Déjà durant les années 60, l'industrie était devenue la première source de revenus des kibboutzim, devançant ainsi l'agriculture. Malgré le succès de son industrie durant plusieurs décennies, et suite a la crise des années 1985-2005, le kibboutz a largement renonce a ses principes d'autogestion, de participation et de démocratie au travail. Suite a la crise, la gestion technocratique et la hiérarchie ont été renforce, et un vent de privatisation a souffle sur le kibboutz (celle des revenus avec l'introduction du salaire, puis celle des logements, et des moyens de production avec un système d'actionnariat.)

Les conséquences de ces changements se manifestent aujourd'hui:

- Si le taux de croissance annuel des ventes de l'industrie kibboutzique entre les années 2000-2008 était de 8,4% (de 19 a 37 milliard de shekels), il est passe a -2,1% (35milliard en 2013) dans les années 2009-2013.
- 346 entreprises étaient affiliées à l'association de l'industrie kibboutzique en l'an 2000. En 2014 il n'en restait plus que 224.
- Alors que 122 entreprises ont été vendues a des investisseurs prives depuis l'année 2000, dans la même période seulement deux nouvelles entreprises kibboutziques ont vu le jour (site internet de l'association de l'industrie kibboutzique: www.kia.co.il).

Ces quelques faits soulèvent de nombreuses questions concernant l'avenir.

Les buts de cette intervention seront:

- Une présentation plus détaillée de la situation actuelle a partir des données fournies par l'association de l'industrie kibboutzique et celles disponibles dans la presse spécialisée.
- Repérer plus précisément les causes de l'évolution de l'industrie kibboutzique de ces 10 dernières années.
- Tracer les différents scénarii possibles pour l'avenir de l'industrie kibboutzique.

The "Rothschild" Group (The Third Floor): Examination of the Existential Treatment of Rehabilitating Drug Addicts According to Prof. S.G. Shoham

This study examined the treatment of drug addicts according to the Group's existentialist theory, combined with Sutherland's Theory. The therapy group consists of addicts, volunteer students, and therapists, and is aided by a variety of treatment methods. The question: How does the group participants' subjective experience in a combined group affect their lives, and how does this experience facilitate former drug addicts' integration in society?

The research was conducted using a qualitative method, analyzing 16 life stories, and semi-structured interviews with addicts, students, and therapists.

The findings indicate that the addicts undergo a deep change process, rooted in being drug-free for a length of time and being part of the Rothschild Group, which generated an experience of personal change. In the past, they had felt rejected and ostracized due to the stigma attached to them, whilst now they were socially accepted and respected by the group. During therapy they exposed to intellectual philosophical content, which encourages thought and introspection, They improved their social skills, They accepted responsibility for their actions, family matters and finding employment to social circles and integration in the community.

The contribution of this research is to present a change model for addicts. This evaluation study found that the therapy process in a combined group fashioned after the group lets the recovering addicts feel wanted, and allows their integration in normative society.

The students experience an authentic, equal, non-judgmental encounter with a population of former drug addicts, which changes their perceptions and helps to remove the stigma associated with this population.

The conclusions demonstrate the treatment's effectiveness, as well as the way in which these methods can be implemented in other deviant groups.

The Biographical Approach and the Analytic Induction for Develop the Identity-Building Processes: An Empirical Case with Young "Italian" Muslim Women

The papers aims to illustrate how the biographical approach and analytic induction can be used for develop the identity-building processes. To this end, it will present a research carried out in Florence, by collecting biographical narratives from women of Moroccan and Pakistani origin raised in Italy. More specifically, we will explore the usefulness of the biographical approach in shedding light on the role of 'agency' (the capacity of a subject to choose how to act) and 'intersectionality' (the interconnection among different social categories of belonging or identification in order to study their mutual influence) in the identity-building processes. At the same time, we will illustrate the use of analytic induction to identify, select, and combine certain features useful for defining identity profiles adequately. In brief, the biographical approach and of analytic induction will be used to identify the main ideal-typical features of such processes, thus allowing us to switch from an individual story to a sociological type into which this biographic story can be inserted. More specifically, with reference to the reported investigation on Muslim women of the second generation, analysis of the empirical materials evidenced three identity constructs: 'neo-communitarian', 'spiritualist' and 'traditionalist'.

Religious Knowledge and Muslim Women in the Information Age: A Case Study in Britain

In sociology, 'knowledge' is defined as a social frame of interpretation, which gives people a specific reality and which has a strong influence on their attitudes towards society. Religion is a kind of knowledge, which has defined people's world views and social relations, and which was produced exclusively by religious elites. The context of religious knowledge has changed dramatically because of the emergence of the 'information age', which makes information of any kind unregulated and accessible to everyone. Now people can personally retrieve and even produce religious knowledge through information technology, free from interference by religious authorities. Recent studies report that this 'democratisation' of religious knowledge following the development of information technology has changed Muslim women's attitudes to their religion and to society. This presentation also investigates what impact the information age has had for Muslim women's interpretation of Islam and their participation in the wider society. The analysis revealed that participants think that their generation has more 'authentic' Islamic knowledge than the older generation because Islam is decoupled from cultures. They argued that some of the oppressive conventions concerning wom-

en derive from Asian cultures rather than Islam itself, and they even presented Islam as a system of gender equality that supports women being educated and working. The Internet contributes to such an understanding of Islam because it provides opportunities for informants to enrich their religious knowledge and to get in touch with more diverse interpretations of Islam, some of which are more adaptable to their daily lives in Britain. These findings show that the information technologies weaken the hold of traditional Islamic understanding, which in some cases has prevented Muslim women from joining the wider society, and they provide more room for Muslim women to participate in the social systems of the Western world as Muslims.

Innovation and Organisational Culture in Small and Medium-Sized High-Tech Companies

Small and medium-sized high-tech companies (SMHTCs) are a very grateful and promising object of scientific study since they combine a market and production orientation with the logic of a research group. This is especially pronounced within so-called academic entrepreneurship. They focus on business performance as well as on the strategy of knowledge management and cognitive mobilisation. In considering SMHTCs, we will pay attention to their (specific) socio-cultural aspects of the exchange and circulation of knowledge and absorptive capacity for new ideas and information. We are interested in the link between organisational change, organisational culture and forms of social capital on one hand and strategies for knowledge management on the other. The relevance of using models of open innovation and coinnovation and identifying the potential for the expansion and growth of SMHTCs will be put under scrutiny. The study will be comparative in the sense that the Slovenian findings will be complemented and compared with the findings for Poland and Sweden. With the help of critical use of secondary data from various sources (national statistics, Eurostat, Global Entrepreneurship Monitor, Innovation Union Scoreboard etc.), we intend to complement the qualitative data and assess the extent to which the economic crisis is affecting the creation and growth of SMHTCs, and what are the trends in all three countries as well as on the level of the EU. In pursuing these objectives, we hope to obtain potentially significant insights relevant to research and industrial as well as employment policies.

ADAMS, SUZI* (Flinders University, suzi.adams@flinders.edu.au)

On 'Direct' and 'Indirect' Social Ontologies: Rethinking Castoriadis, Ricoeur, and the Human Condition

This paper considers the respective social ontologies of Cornelius Castoriadis and Paul Ricoeur. Neither thinker regarded himself as a sociologist, yet each offers rich resources for social theory. Both Ricoeur and Castoriadis articulated social ontologies that focused on social creativity and social imaginaries, but their theoretical frameworks were diametrically opposed. Whereas Castoriadis sought to directly grasp the mode of being of the social-historical and social imaginary significations, Ricoeur was convinced that only an indirect grasp of being and the social world was possible. This paper argues that their discrepant understandings of social meaning and human creation as part of their overall approach to the human condition lies at the root of this opposition, and it concludes by seeking to build points of contact between them.

ADAMS, TRACEY* (Sociology - University of Western Ontario, tladams@uwo.ca)

Variations in Self-Regulation: Understanding the Present (and reflecting on the future) By Considering the Past.

Research has explored trends in professional self-regulation, both documenting its decline, and its changing nature. However, in scholarly research robust definitions of self-regulation are seldom provided. Our knowledge of self-regulation is often based on models or generalizations made from single cases or countries. As a result our understanding of variations in patterns of self-regulation across time and place is limited. This paper explores these different definitions and understandings of self-regulation, and links them to different historical patterns of regulation across time in place, with a focus on Canada, the United Kingdom and the United States. Then it considers recent trends in regulation in each nation to reflect on how current regulatory trends have been shaped by historical regulatory traditions. Last, the paper discusses prospects for future trends in regulation, by considering how global trends combine with national traditions to shape regulatory change. I argue that we can understand current and future trends in regulation better, by understanding variations in regulation in the past.

The Power to Define That We Have Been Hurt

In our paper we compare communication and practices in sexual violence trials with procedures in alternative approaches of dealing with sexualized violence that have been developed in radical leftist communities.

Violence against women has a high prevalence in most societies and an especially low rate of convictions. In a feminist analysis the fact that women's narratives in court are heavily contested and very often not believed is put in a historical perspective, which shows that doubting women's credibility has been a century long strategy for disempowering women. To counter this, feminist groups have tried to give women definatory power (definitionsmacht) over what has happened to them, so instead of an authority or penal code she should be the one to say if what has happened to her has been an assault. In Germany's and Austria's leftist activist communities there are groups that advocate for victims of sexual violence and facilitate community processes according to the concept of definitionsmacht. These processes rely on a collective context in which alternative modes of coordination and communication are possible.

We will compare processes that are based on the concept of definitionsmacht with legal trials along a conceptual grid that we developed by engaging with material on definitionsmacht and criminal trials as well as Laurent Thévenot's social theory. This theory is based on an action theory , which is linked to certain possibilities of creating, sustaining and governing commonality between people. By connecting our empirical insights to Thévenot's framework, we want to situate the problem of dealing with sexual violence in the context of social coordination and the problems of 'living together'. Our analysis will rest on interviews with members of groups whose work is based on definitionsmacht, material produced by those groups as well as scholarly work on the treatment of sexual violence in legal trials.

Migration for Higher Education: Case of Parent-Sponsored Nigerians in Undergraduate Programs in Canada

This study investigates the attraction of Canada for postsecondary education by Nigerians, using the case of international students from Nigeria in Canada to interrogate the orthodox notion that African migration to the West is driven by economic hardship. Over the past 15 years, or so, Canada has been destination to Nigerians for undergraduate education. Most of these Nigerian undergraduate students in Canada are sponsored by their affluent parents, who pay higher tuition fees than Canadian citizens. Preliminary findings show that affluent Nigerians send their adolescent children to Canada for undergraduate education not only because they are dissatisfied with the quality of education in private and public universities in Nigeria, but also because of the discursive construction of Canada and its tertiary institutions by recruitment agents, who manage the impression of Canada by highlighting the benefits of Canada over other Western destinations, and representatives of Canadian Universities and Colleges, whose promotional campaigns in fairs in Nigerian cosmopolitan cities and on the web have effects. By and large, critical actors, especially the recruitment agents, market migration for higher education to the Nigerian affluent class as a pathway to permanent residence for their wards. Underlining these motivating factors, semi-structured interviews with parents of Nigerians studying in Canada and their undergraduate children in Canada, and recruitment agents; and participant observation show that studying in Canada, and in the West, is highly prestigious in Nigerian society.

ADKINS, LISA* (University of Newcastle, lisa.adkins@newcastle.edu.au)

Speculative Futures in the Time of Debt

This paper concerns the temporality of debt. Against the widespread claim that the society of debt has emptied out futures via the elevation of the promise to pay to a total social fact, I suggest that the time of securitized debt is speculative in form. Thus, in the time of securitized debt, pasts, presents and futures do not stand in a pre-set relation to one another, but are open to a constant state or revision: they may be drawn and redrawn, assembled and disassembled, set and reset. I track this time across changing schedules of household and personal debt – and crucially in the logics of accumulation via securitized debt – to argue that far from emptying out futures debt society demands subjects who must constantly adjust to recalibrations of pasts, presents and futures as well as to changes in the relations between and across these states.

Illegal Market Routes in the Brazilian Frontier Zones and Its Impacts in the Urban Centers

The objective is to present results from an ongoing research whose object is the illegal drug market routes in the frontier zones between Brazil and South American countries, where we examine its impacts in the growth of new urban centers, as well as the social changes in previously existent and consolidated centers. Empirically, we accompany the routes from its extremities, where illegal drugs are produced and distributed, until their entries in Brazil and local markets, and final consumers.

The theoretical justification of the proposal is based in three conceptual lines: a) a critical discussion of the category "organized crime" with the proposal of identifying its explicative limits and potentials, applied to the study of multiple markets, products, localities and arrangements and disarrangements, as well as the multiple relations with the authorities, comprising the illicit national market; b) the concept of productive chain, used to monitor all the phases of the illicit drug commerce. That is, the production, circulation, distribution and consumption; and c) the concept of frontier, whose sociological significance supersedes the limits imposed by geographical and spatial demarcations. These justifications reside in the exam of specialized bibliography on criminal fluxes and networks, frontiers, illicit markets, organized crime.

The analysis plan and exposé consists of three sections: firstly, a overview of the illicit national market, including a mapping of networks and flows of this type of organized crime in national territory; secondly, the description and analysis of the group dynamics that act in specific sectors of the illicit national economy, with focus of the commerce of marijuana and cocaine paste in the state of Mato Grosso do Sul, entry point of the drug distribution to the Southeast region of Brazil, the richest of the national territory; third, a brief outcome of the problems and questions brought by this theoretical-methodological approach.

Fraught Identities and Contentious Belongings

Recent years have witnessed an upsurge of cultural, historical and theological studies that have examined the question of gender and sexuality within Islam.

Albeit pathbreaking, studies have less frequently focused on the lived experience of Queer Muslims and even rarely on the experiences of Queer Muslim women. There is little that documents the everyday identity work done by women to negotiate, resist and respond to oppressions of Islamophobia and homophobia in their lives. By failing to document that agency, the existing scholarship additionally runs the risk of buffering the erroneous stereotypes that portray Muslim women as "helpless, backward and oppressed" and queer women in Islam as a cognitive and cultural impossibility. This paper fills that gap in literature by examining the sexual subjectivity of seven LGBT Muslim women in the U.S. Written in the shadows of post-9/11 America, this paper examines the everyday identity work used by these women to find a place between two opposing, masculinist, forces of Islamophobia and homophobia. The identity work done centers around three particular strategies – i) defying the arguments of exceptionalism, ii) opposing and distancing from neo-conservative turn in Islam and finally, iii) reconciling faith and sexuality in their own terms.

How Effective Is the U.N's Safe Cities Model?

In 1995 the U.N explicitly argued that gender based violence is a human rights violations and required all member states to take concerted action against it. The U.N and its affiliates have since proposed several international initiatives to monitor, evaluate and ultimately, curb the incidence of violence against women. One of its most recent endeavors is the 'Global Safe Cities Initiative' program launched in 2010 – which addresses the everyday sexual harassment that takes place in public spaces. The Safe Cities Initiative is the face of a paradigmatic shift as it is the first time that U.N has recognized sexual violence in public spaces as a human rights violation and designed a series of interventions in its program portfolio. Delhi, India was among the five pilot cities in which the program was introduced and is also the case study for this paper. Using a human rights approach and a feminist lens, I argue that while the initiative has been valuable in putting the issue on the international agenda, the current framework needs to be more nuanced in its treatment of gender-based violence, both methodologically and conceptually.

Developing Health Workforce Policy in the Global-National Nexus

SDG 3 aims at ensuring healthy lives and promoting well-being for all. However, many health care systems are faced with health workforce challenges that constrain their attempts to provide universal access to high quality health services. Therefore, Article 3c of the SDG 3 argues for increasing "health financing and the recruitment, development, training and retention of the health workforce in developing countries, especially in least developed countries and small island developing States". These countries face serious health workforce challenges such as shortages and unequal distribution of health staff and facilities, the functional mix and problems with training. On the other hand, health human resource management has recently moved into policy agenda of many developed countries as well as global agencies. In European countries sources of health workforce challenges differ: aging and its impact in terms of decreasing human resources and increasing demand for health services, austerity policies, and migration flows are discussed as major challenges. Focusing on the Turkish health care system and its health workforce challenges, this paper explores the influence of global policy actors such as the OECD, the WHO and World Bank. These global actors have been playing a growing role in documenting the major challenges as well as developing strategies that address a myriad of economic, professional, individual, and social factors. However, what is the impact of these global strategies on national health workforce policy? The paper aims to answer this question through a review of secondary sources such as official reform documents and statistical information from national and international databases. While the 2030 Agenda and the reports of global policy actors put clear targets for health human resource development, Turkey's health workforce policy has been shaped largely by domestic factors, especially the continuous conflict with some of the representatives of health workforce.

Overcoming Social Disadvantage and Inequality through Self-Confidence, Education, Team-Skills Development in Slum Youth-Children Collectives

Introduction: Slum children/youth are excluded from benefits of India's urbanizing economy and growth. Unequal access to opportunities for education, self-expression hamper their potential growth/development.

Program methods/approach: Children/youth's self-confidence to overcome obstacles, increases through pursuing activities they enjoy, gain knowledge, skills from (Payne, 2008). Social interactions help children and youth to free themselves from difficult situations, focus towards future, acquire ability to influence it (Vygotsky, 1978). Reasoning with one-self develops thinking skills (Hwang & Nilsson, 2003).

Children/youth groups mentored by slum-women's-groups guide project design and are central to this approach towards contributing to socially just cities and inclusive urbanization (Sustainable Development Goal-11). One boy, one girl leader per group facilitates gender-equity and lays the formative basis towards a more gender-equitable social environment. They identify opportunity gaps, inadequate stimulation/motivation faced, aspirations, ways to strengthen as groups, contribute to progressive evolution of program, and facilitate youth/children groups in neighbouring slums.

Findings: 34 children/youth groups with 450 youth/children members are active in Agra, Indore slums. Child/youth development is fostered through avenues for self-expression, team-work, excelling in performance, reasoning with self and cultivating positive self-image. Communication and leadership skills emerge. Social interaction with elders at neighbourhood level and at larger forums have strengthened confidence. Children/youth groups write petitions and submit to Municipal Corporation to pave slum-lanes, drains, clean garbage. These efforts have improved slum lanes, drains, prevented interruption of children's school education.

Conclusion, Significance: Increasing number of youth complete school education, complement family income; demonstrate gender sensitivity, engage in socially productive community actions e.g. contributing to improved hygiene and living environment, reducing school-dropout. Self-confidence, social-interaction with peers, elders, persons external to social milieu, collaborative-skills and leadership add value to life/livelihood skills. Computer literacy, expanding reach of internet, will help underprivileged communities access online Government schemes, services, thereby reducing transaction cost of access.

Empowered Slum Women's-Groups Negotiate Collectively Towards Responsive Urban Governance, Improved Access to Entitlements

Introduction: Urban-poor/slum populations represent an insecure population, socially excluded from benefits of urbanization. Women suffer more owing to lower social status, low control over household finances, decision making. Communities live without Government Picture IDs, address proof, water supply, paved streets, electricity connections, low access to healthcare.

Methodology: Urban Health Resource Centre (UHRC) works with slum communities in Agra, Indore (India) to form, nurture, motivate women's groups, strengthen social cohesion, build negotiation capacity among slum communities to increase access to rightful services and make civic authorities more responsive to needs and demand of deprived urban communities.

UHRC advocates with policy makers, influencers to bring attention to needs of urban vulnerable, and with civic authorities to influence action. Platforms are created where service providers and demand side come together to enhance mutual understanding and address challenges. UHRC's social facilitators help communities develop negotiation skills through writing collective community-petitions, reminders to service providers, learn about importance of paper-trail of to ensure responsiveness, good governance. Women's groups gain knowledge about schemes and entitlements.

Findings: In Indore-Agra, during April 2013-March 2014 negotiation power thus cultivated in women-groups led to 8422 persons to obtaining Government address-proof and picture-ID, 5600 women availing deliveries in government, private-affordable hospitals, 3350 of these availing government's Maternity-Benefit scheme and 4656 children availing immunization. Through community petitions/reminders submitted by women's groups perseveringly 37000 persons benefitted from piped water supply, 8000 population benefitted through metered electric connections, lanes in 23 slums were paved benefiting 60,000 slum population, 120,000 population benefitted from regular cleaning of drains.

Significance: Lessons from Indore and Agra, have resulted in India's National Urban Health Mission (NUHM) mandating Women's Health Groups (Mahila Arogya Samiti) as the demand side intervention. The approach of slum women's group led negotiation for services, entitlements is adaptable across growing cities of developing countries.

Understanding Organisational Change in Implementing Enterprise Risk Management: A Comparative Case Study

Risk is an inherent part of sociology and development of risk requires consistency in understanding and implementation. Previous literature has provided undue significance to inconsistent practices and consistent practices have not yet explored such as what motivates two different firms in two substantially different markets to adopt same practices. The aim of this paper is to set out the understanding of organisational change in two insurance companies across different markets from the perspective of neo-institutional theory. The article presents a debate between revolutionary and evolutionary change in literature and practice. Enterprise Risk Management (ERM) considers all risk in holistic manner and many research have reported inconsistency of ERM practices across developing and developed markets. Therefore, a comparative case study has been carried out to understand reasons of adopting evolutionary and revolutionary change in developing market such as India and developed market such as UK. Case study involves interviews of over 20 senior management in two insurance companies. Both Companies are leading insurance companies in India and UK respectively and claimed to be pioneer in adopting ERM with evolutionary and revolutionary change in differing institutional pressure. Moreover, both companies adopted resilient ERM practices to gain business advantage visible in terms of cost efficiency and improving concentration of risks by exploiting niches and balancing portfolio risk by contrasting two different and opposite risks. Companies have improved cohesion and adaptablity of risks but faced normative and behavioural resistance to change. The results indicated that adoption of revolutionary/evolutionary change is affected by institutional pressure within companies with an aim to survive in the market. Whether companies adopt evolutionary change or revolutionary change, the main objectives of the companies are to gain business advantage from the change so as to promote sustainability.

Identifying and Reducing Social Inequalities in Health: Community Informed Qualitative Adaptation of Who's Urban Health Assessment and Response Tool with Focus on Action

Background

Urban poverty is growing to represent the dominant face of vulnerability in India and the Global South. There is a need to develop working examples of adaptable, scalable methods for understanding and assessing social determinants of urban health and well-being and catalyzing grassroots demand/actions in reducing social inequalities in access to health, basic services, entitlements, also inform public policy.

Methodology

Refinement, simplification, scale-up use of qualitative adaptation of WHO's Urban Health Equity Assessment and Response Tool (HEART) piloted by Urban Health Resource Centre in Indore (2011) was done. Urban HEART's quantitative indicators, were further simplified to qualitative indicators informed by slum-women's groups' observations, to assess water-supply, drainage, access to healthcare, education, debt, livelihood regularity, governance and associated social determinants of urban-health in slums/informal settlements in Agra, India.

Results

A more replicable and scalable HEART methodology informed by experiential knowledge of slum women's groups evolved. The updated assessment and response tool uses simple local language that can be understood, used by less educated, illiterate slum-dwellers and by academics, policy makers/implementers. Posters (prepared by slum-women's group members) featuring community assessments of 40 slums on 45 indicators depict slum situation using Green dots for good performance, Yellow for mediocre, and Red for poor in different slums. This adaptation emphasizes community response for each indicator in different slums. Actionable, qualitative indicators, e.g frequency of Auxillary-Nurse-Midwife (ANM) visits instead of under-five mortality-rate, absence of toilets in most houses, have enabled communities use their knowledge to develop and implement context-responsive and cost-effective action-plans.

Significance/Recommendations

This approach facilitates communities to focus energies on relevant problems through periodic assessment. In addition to being low-cost, the indicators are similarly understood by illiterate slum-women and academic researchers. UHRC recommends that focus on community participation and leadership be a central tenet of social-sector and multi-sectoral urban poverty/vulnerability action research in the Global South.

The Impact of Gender on Informal Workers' Organizing—the Case of India

Drawing from interviews on informal workers' organizations in India, this paper examines the impact of gender on informal workers' strategies, targets, repertoires and organization forms. The paper will also examine the potential impact of gender on organization impact. The paper is based on a comparative examination across two industries: domestic work and construction. In India (as elsewhere), domestic work is predominantly comprised of women and attends to "reproductive" tasks performed in the often hidden spaces of the household. As a result, domestic work is traditionally associated with "feminine" labor. Construction in India (unlike in many places) is dominated by men across all skill levels, but includes women at the lowest skill level. This is because the vast majority of construction labor in India is based on migrant *family* labor. Therefore, construction in India provides a useful lens into the impact of women and men's labor in the "productive" sphere, operating in the public spaces of streets and unfinished construction sites. This unique gender characteristic of Indian construction labor provides a useful point of comparison both within India (relative to domestic work), but also across countries (where the construction sector is primarily male). The paper will examine how the gender composition of the workers in each industry affect the membership, leadership, and demands of organizations within each industry.

Rural Women: An Important Dynamic for Change.

While women play an important role as economic agents in India, particularly in rural areas, even there they participate in secondary rather than primary economic activites. Moreover, the nature of their labour force participation depends on the dynamics of the caste structure. There are three castes within the scheduled (untouchable) caste of the village being studied: **Jatava (the majority), Harijans, and Pasiya**. Jatava women are mainly engaged in agricultural work, in particular in the subsidiary activities of cutting and collecting crops, while men do the primary work of seed cultivation. In the few Harijan families remaining in the village, both women and men work as domestics or sweepers. When Harijan families have migrated in search of work, the women in the families encounter more difficulties than the men in finding employment. The women work as domestic helpers, on construction sites, or in the brick kiln industry, while men are rickshaw pullers, construction workers or casual laborers. Pasiya women now do subsidiary work, such as assisting men by collecting bamboo or arranging other things to facilitate men's work. The men work as street hawkers, bamboo basket makers, vegetable sellers or working on other's land as daily labour. This paper examines how discrimination and inequality differ for the rural women of these three castes, exploring how their capabilities in the labour force are untapped and undervalued, and how they experience inequality in the sharing of work in both the labour force and the household. It also suggests ways of dealing with women's marginalization.

Leftwing Politics, Social Movements and Marijuana Legalization in Uruguay: A Peripheral Democracy Challenges the Transnational Drug Policy Paradigm.

In 2013, Uruguay became the first country in the world to completely regulate the marihuana market. We analyze the process that led to marihuana legalization, stressing the crucial role played by a comprehensive rights-based social movement coalition.

First, we contextualize the emergence of this movements. Based on recent historiographical work, we argue that, unlike in Europe and North America, the youth movements of the New Left that emerged in Uruguay in the 1960s and 1970s did not represent a clear rupture with the traditional Left. Rather, the roots of the legalization demand can be traced back to the anti-authoritarian youth movements of the post-democratization aftermath (late 1980s and early 1990s).

We then focus on the contemporary pro-cannabis movement. Based on an extensive analysis of focus groups and interviews, we show how pro-legalization activists strategically appealed to a broader "new rights agenda" to frame their struggle, and how they exploited the dense ties among the governing Left party and the established civil society organizations (i.e. the labor movement). All this

was possible thanks to the long-term strategy deployed by a network of young militants, who thoughtfully went through processes of grassroots mobilization, brokerage, and professionalization, reaching out to international human rights organizations to influence domestic policymaking.

Thirdly, we turn to the transnational dimension. We conceptualize the Uruguayan legalization movement as nested within a broader dynamic in which activists from both the South and the North coordinate actions to advance their agendas. Rather than a rare, contingent event, the Uruguayan case marks out just a point, if a decisive one, of a longer, multisite, and multi-scale sequence of political contention over the construction of an alternative transnational drug policy paradigm based on human rights norms, in a time when there is enough accumulated evidence that the War on Drugs has roundly failed.

Ejercer La Suspensión Sobre La Modernidad Como Génesis De La Existencia Social Presente.

Una de las vías alternas para convertir en experiencia social aquellas formas de vida modernas, que resultan contrariar la duración de lo vivido en el presente, emergen actualmente de las prácticas relacionales que amplían la convivencia con los otros, humanos, especies y objetos de los ambientes vitales compartidos. Esta ponencia deja en suspenso una crítica de la modernidad dirigida hacia sus dimensiones hostiles como el vaciamiento de los vínculos sociales, el régimen de la aceleración y la competencia, poderío de la competencia, para excavar en aquellos lugares donde se generan modos de "experienciar" la existencia social. Para seguir esta génesis de la experiencia existencial moderna se seguirán la cambiante de la metáfora de la animalidad como clave para una revisión larga y discontinua sobre las separaciones fundadoras entre la vida de las especies. Otra clave derivada de la interrupción del sentido de la existencia en general se posa sobre el despliegue de las "políticas de la vida" (*en contraste con los esquemas biopolíticos e instrumentales sobre la vida*), las cuales plantean un reencuentro con aquellos restos y comienzos de integración de la vida misma que dejaron en suspenso los conocimientos y discursos sociales que despegaron, constituyeron e institucionalizaron saberes a partir de la escisión entre conocimiento (logos) y acción sensible (pathos) o las brechas entre bios (o forma política de la vida) y zoe (o vida desnuda/nuda vida), según una conocida formulación (G. Agamben). En esta ponencia se incursionará en ejercicio de la existencia humana cuya interrupción de su sentido moderno se plantea sobre la base de una diferencia analítica entre lo humano-lo no humano-animal.

Elderly Abuse and Stigma Avoidance through Religious Involvement Among Elderly People in a Yoruba Community, Southwest Nigeria

In Nigeria, elderly abuse and stigma are growing widely in the midst of midst of different religious doctrines around the duties and rights of the aged and possible deviations from these expectations. Mishaps and unexplainable negative life events around the elderly and their care providers are normative indicators that an elder has deviated or failed. Spirituality through religious involvement in later life thus provides a framework to avoid stigma and neglect and promote healthy ageing experiences. Within a social setting that emphasises informal social support for older people, this study explores religious involvements among elderly Yoruba people (60+years) and agency in the face of social neglect and stigmatization. Using a purposive sampling strategy, we held 30 in-depth interviews with older people from the three dominant religions (Christianity, Islam and Traditional) among the Yoruba people. The findings revealed religious involvements as social measures of improving social relations and coping with life situations. Participation in religious activities is culturally rooted in the Yoruba belief system. Thus, in old age, religious activities and spirituality provides avenues for quality self-reflections over the ageing experiences. Failure to engage in such appraisal open space for stigmatization. At such points, an elderly risks neglect and possible stigmatization as significant others would perceive their aversion to certain religious activities as a mark of irresponsibility and unsuccessful ageing. Hence, involvement in religious activities as a way of avoiding stigmatization has an impact on subjective well-being. In later life, the individual agency remains instrumental in negotiating ageing experiences and coping with stigma and elderly neglect in a social setting devoid of a formal system of support.

The Dark Side of the Marriage Squeeze: Violence Against Cross Region Brides in Haryana, India

In terms of economic development, Haryana is one of the most developed North Indian states of India. Despite the economic prosperity and increase in literacy levels there is a continuous downward trend in child sex ratios. The gender imbalance has led to in an excess of males resulting in a 'male marriage squeeze'. Scarcity of brides is a serious consequence of skewed sex ratios. Currently, at least one in every four men between the ages of 30-45 years stands to remain unmarried. As smaller cohorts of girls are born (due to fertility decline and prenatal elimination), fewer of them grow up and become part of adult marriageable cohorts. To address bride shortages, Haryanvi men have been bringing brides from distant states like Assam, Bengal, Bihar, Himachal Pradesh, Uttar Pradesh, Maharashtra, Kerala or even Nepal and Bangladesh.

Though much research has been done on the issue of domestic violence against women in general across caste, class and community, yet there is paucity of empirical research on the incidence, nature and severity of violence the long distance brides face in their conjugal families. In the present paper an attempt has been made to examine the social status, acceptance and treatment of such women who find themselves in a culturally alien setting. What is the nature and intensity of violence? How do women react to it and cope with the situation? Is there any kind of support for them from their natal family, or from the local community or from state agencies such as police?

Mapping the Social Policy Issues of Unemployed Youth: A Case Study of Kashmiri Youth

Mapping the Social Policy Issues of unemployed Youth: A Case Study of Kashmiri Youth

Young people today have emerged as a distinctive social category comprising the major chunk of the global population. Their emergence as a distinctive social category can't be attributed to their numerical preponderance only but also to the fact that they represent an essential component of demographic dividend and must navigate far more of life's crucial transitions in a short time frame than any other age group apart from their peculiar characteristics, needs, socio-psychological traits and patterns of behaviour. Though, the problems encountered by the youth as a generalized category is due to youth of state of Jammu and Kashmir as well, however, youth in Kashmir being a conflict ridden zone assume a special importance given their severe victimization in terms of their lives, career opportunities and subsistence. Turmoil has lent a momentum to the ever increasing toll of miseries of youth by blunting the already limited available incentives and, hence, the life chances due to them. This has created a burgeoning problem of unemployment as a result of which educated youth are in dilemma. This has created a heightened sense of insecurity among the youth, who face multiple problems on socio-economic front.

Based on the primary and secondary inputs, the present paper shall focus on the scenario of youth unemployment in Kashmir, the attendant problems , attitudes of unemployed youth besides evaluating the efficacy of maiden employment policy in vogue in the form of "Sher-e-Kashmir Employment Welfare Programme for the Youth". Finally, specific recommendations based on the various findings of the study shall be put forth for policy makers in order to curb the burgeoning problem of unemployment in the state apart from various suggestive measures for the improvement of various youth centric policies in vogue.

Social Construction of Migrant Women: Focusing on Status of Sojourn and Civic Stratification

This paper aims to explore the ways in which Korean 'migration laws' have classified its foreign populations through civic stratification which in turn have constructed gendered and racialized social groups in regard to three different types of migrant women: marriage migrant women, Korean Chinese women workers, and Filipino women 'singers' working at tourist clubs. With such objectives, it analyzes the laws affecting the classification of foreign populations since 1993 from which large scale target populations were taken into account as a means to resolve domestic issues. How have the laws changed? What rights and qualifications were deployed to classify migrant women into different categories? What are their ideological implications and social effects?

While all three groups are expected to fill the void of the gendered roles in order to support Korea's current social system, each group's construction is differentiated through stratified qualifications and civic rights, according to the intersecting axes of gender, nationality, and age as well as their 'purpose' in Korean society: gendered 'menial' service jobs and care work, reproduction of the nation, and/or sexual exploitation.

I recognize the law as a key factor by which target populations are defined, categorized, and situated. The law not only reflects the already existing social construction of target populations, but also creates, changes, and reinforces such construction. It is through aggressive intervention of the state in the form of civic stratification that a specific population is regulated and managed into a particular social group. This analysis on the laws affecting migrant women and their differential statuses of sojourn will be able to disclose the Korean-specific construction of migrant women as a racialized gender as well as the migrant 'other', while exposing Korea's gendered anxiety as a nation-state and a fairly new host country.

AHULE, BENJAMIN* (Benue State University, Makurdi, bgahule13@yahoo.com)

Millenium Development Goals: Assessing the Efforts to Enhance Socio-Economic Status of TIV Women in North-Central Nigeria

The need to evaluate the impact of MDGs activities on the socio-economic status of Tiv women of Benue State in the North-Central Nigeria area, informs this study. Specifically, the study identifies the programmes available for the eradication of extreme poverty and hunger, achievement of universal primary education, promoting gender equality and empowering women, reducing child mortality rate, improving maternal health, combating HIV/AIDS, malaria and other diseases, and to ascertain whether the said programmes have achieved their aims of reducing poverty and hunger among Tiv women. Data were collected through the questionnaire and in-depth interview methods. Findings revealed that a number of projects in health, education, poverty reduction and agriculture have been executed at various points in the study area. However such MDG activities have neither empowered nor eradicated poverty among Tiv women in the study area. This means that the desired objectives of the MDGs have remained a mirage. Accordingly, the study reveals that lack of political will to genuinely address the plight of women, corruption and lack of adequate funding have been the major obstacles to achieving the success of MDGs in the study area. Consequently, this has continued to sustain the exploitation and marginalization of women in politics, education, agriculture and formal employment in society. The study recommends, among other things, the political will to intensify the execution of more and relevant MDG projects that can address the plight of women, the need to tackle inherent corrupt practices in governance and the pursuit of MDGs, and adequate funding of MDG projects in the state. The study also recommended the development of agro-based economy in Benue State as an area where women are predominant to effectively address their poverty, and the need to encourage more girl-child education among the Tiv women of North-Central Nigeria, among others.

Maternal Outcomes in the Context of Free Maternal Healthcare: Perception and Realities in Nigeria

Most maternal deaths are avoidable if quality life-saving interventions are available and accessible. However, inequality in access remains a major hindrance, particularly, in low and middle-income countries. Many countries introduced free maternal healthcare with the aim of addressing concerns about inequality and to improve the utilisation of skilled birth facilities in Sub-Saharan Africa. Despite this, inequality in access to maternal healthcare still persists. Some challenges related to policy implementation were identified as reasons for poor utilisation of maternal healthcare services; these challenges do not sufficiently explain why inequality persists. Using empirical literature this paper traces the barriers to maternal healthcare utilisation in low and middle-income countries and the various interventions to improving maternal health. Focusing on Nigeria this paper examines maternal outcomes in the context of free maternal healthcare. Specifically, this paper explores the impact of free maternal healthcare services on maternal healthcare utilisation, ideographic narratives related to free that could impinge on maternal healthcare utilisation and perception and experiences of users of free maternal healthcare services. In the main, the paper argues that barriers beyond financial exist and addressing issues related to culture and contextual differences might be crucial to reducing inequality in access to maternal healthcare.

Morther's Time-Use and Daughter Welfare: Implication for Developemnt

The African culture promotes education that is initiated early in life through the process of socialization. One of the foremost value a girl-child learn from her mother is the importance of celibacy. The value placed on a girl-child is priceless in the Nigerian culture if discovered to have kept her virginity until marriage. Besides, this culture play a significant role in enhancing delay in sexual intercourse with corresponding probability of not contacting sexually transmitted infections (STIs) including HIV/AIDS. However, the culture is gradually waning due to mother's passiveness on sexuality education and the transference of the same responsibility to the school. While the Nigerian girl-child is exposed to sexual intercourse as early as 8-10 years (NDHS, 2013; Ursula & Nwobodo- Ani, 2010), Malaysians experience the same at a much older age of 23 years. Similarly, an average Indian girl-child would likely experience first sexual intercourse at 22.9 years, Singaporeans at 22.8 years, Chinese at 22.1 years, Thais at 20.5 years, Hong Kongers at 20.2 years and Japanese at a slightly lower 19.4 years (The Economic Times, 2015). While the timing of the actual lost of virginity might not be important, it might be important to know if first intercourses are pressured. This underscores the relevance of effective involvement of mothers' as partners and custodian girl-child's welfare. Thus, the study will examine the influence of parent especially mothers in delay sexual experience of girl-child which could invariably serve as fundamental panacea for reduction of numerous sexual health problems in Nigeria and human development. This will be carried out through the use of secondary and primary data. The secondary data will be extracted from Nigeria demographic health survey of 2013 and the primary data sourced through focus group discussions conducted among girls in ten randomly selected secondary schools in Nigeria.

AKAHORI, SABURO* (Tokyo Woman's Christian University, akahori@lab.twcu.ac.jp)

Society As an Observing System: A Perspective By Incongruity?

It is not limited to Niklas Luhmann's case, systems thinking has been one of the most important sources of sociological insights. At the same time sociological systems theory sometimes tends to be blamed as unintelligible. However, generally speaking, abstract theory makes things clear. If things become more complex because of sociological systems theory, it must be dysfunctioning. From such a viewpoint, we focus on the notion of society as an observer (or, observing system) in Luhmann's theory, especially on the connection between systems theory and sociological theory. The main points are as follows: (1) To discuss the notion of meaning-constructing system in contrast with living system. (2) To distinguish between social systems (systems of "the social") and a societal system (system of "society"). (3) To distinguish between sociology as second-order observer and the functionally-differentiated modern society as second order observer. After reviewing these points, we conclude that, systems theory would be a very useful tool to see things sociologically if it is properly connected to sociological theory.

Freedom or Safety, the Dilemma of Technology-Based Surveillance Systems in the Context of E-Government Applications: A Case Study of Citizens' Perceptions on the Surveillance in Aydin– Turkey

"Surveillance" is one of the highly examined topics of today. It is not a new practice and specific to these days; but it has come to the fore more with the development of technological tools. Depending on the development trend of information technologies showing a boundless ascending, all daily life and social relations both in private and public areas have been affected by this process. The problem of surveillance is seen as a topic in the interest of sociology because it affects the regulation of the society.

As also Foucault puts in a striking way, the concept of surveillance means "a systematic investigation or monitoring of one or more person's communication or action" and it has gained a special importance in parallel with the development process of technology-based systems in recent years. New technologies increase the potential for surveillance.

In this context, this paper aims to assess following questions: Do information technologies strengthen citizens 'position` against state more? Does the society get a more democratic governance due to the E–government applications? Or is it vice versa? Could people be tracked, be monitored and be received under surveillance easier? Is the tendency to be able to budge from some rights and freedom seen in question of "security"? When the "security" is in question, the "consent" state for budging from personal freedom and privacy will be analyzed.

Examining the surveillance matter due to technology-based systems is a sociological necessity. With this study which is based on field research, it is attempted to put forward how this subject matter is perceived by the citizens. The paper will draw on quantitative questionnaire (N 650) in Aydın (South-West Turkey).

AKPINAR, AYLIN* (Marmara University, Department of Sociology, aakpinar@marmara.edu.tr)

Intergenerational Conflicts and Daughters' Resistance to Unwanted Marriages in Turkish Society

The qualitative research conducted by using in-depth interviews with 48 divorcées in three big cities of Turkish society in relation to marital lives and reasons for divorce has revealed the perpetual patriarchal domination in women's lives. In the narratives of 17 women of lower-income classes with rural backgrounds aged between 34 and 55 which this abstract is based on, one can trace the arranged marriages in early ages as a means of control of younger women's sexualities. Narratives reveal women's resistances to unwanted marriages which eventually lead to their divorces. Under the guise of extended family ideal, both intergenerational conflicts and daughters' resistances are hidden. Women whose marriages end in divorce most often have been raised in families by mothers who have also been subordinated by their husbands and thus these women lack role models. Narratives of women also reveal Turkish mothers' relaxed socialization of their sons who are not given family responsibilities. On the other hand, daughters are usually considered as burden on parents despite their contribution to household chores. As a result of these gender and age biased family dynamics, younger women are faced with real challenges upon marriage as they have to cope with husbands who do not take their share of responsibility in family life as well as parents-in-law who try to dominate younger women. Thus, getting a divorce as a final step can be understood as a sign of daughters' resistances against patriarchal domination and their search for individuation.

Blind Spots in Employers' Practices: How Institutional Ethnography May Help in the Rethinking of Labour Market Inclusion Policies for Persons with Disabilities

This paper reviews the social scientific research on labour market inclusion policies for persons with disabilities and argues in favour of institutional ethnography (IE) in the subject area. More specifically this paper explores the missed opportunity to show how inequities in labour market participation for persons with disabilities actually happen, reviews the state of the art in studies of labour market inclusion policies for persons with disabilities, and provide examples from Norway of how IE adds a different perspective to the study of labour market inclusion policies for persons with disabilities. First one strand of the literature has examined and compared the national policies, including policies to ensure or encourage employers to recruit and retain persons with disabilities, and the policy outcomes. Second, other scholars have examined the experiences and practices of employers. A third strand of the literature has examined the adjustments of persons with disabilities themselves to the labour market. Fourth scholars have analysed the organization of the social services provided to job-seekers and employers to enhance the labour market participation of persons with disabilities. Yet, surprisingly little is known about how the institutional relations work and how they might be resisted by employers; i.e. the interaction processes between employers, the public welfare administration and the employees with disabilities (reduced working capacity). The paper argues that IE offers a method of inquiry to unpack how employers relate to institutional expectations to persons with need for accommodation in the workplace. The paper concludes that IE has the potential to enrich the research area on labour market inclusion as it explores the connection between the local setting of recruitment processes and the institutional or translocal order that shape these processes.

Mhealth and Maternal Care: A Winning Combination for Healthcare in the Developing World ?

The recent multiplication of mHealth worldwide illustrates the overall trend towards the globalization and technologization of biomedicine. The widespread idea that digital technologies improve the quality of care, reduce health disparities and optimize health systems takes shape in a diverse set of technical devices : eHealth, telemedicine, or mHealth. Yet, very little *research has been conducted on the use of mobile phone and wireless technology within health programs in the global South, or in development contexts.* This new wave of mobile technology applied to health in developing countries thus raises complex issues in terms of economic organization, governance, and control. Especially when millions of dollars are being invested in mHealth projects in countries where poor health systems are failing to meet the needs of the population and where the lack of legal framework may leave the door open to experiments. It calls for sociological questioning on the implementation in developing countries of projects that are sometimes entirely designed and funded by developed countries. These mobile technologies also point out important issues in terms of data safety, confidentiality and "privacy" in the context of collection and analysis of health data that is "globalized". They also highlight the dynamics of how foreign ethical and financial practices adapt – or not - to local economic and political contexts, customs and traditions, health organizations and health professionals. This communication aims to explore how mobile connectivity gives raise to new forms of power, of control and friction through the study of a particular maternal mHealth project deployed in Ghana and India. We propose to focus more specifically on North-South relationships involved by those programs. We will also analyze the gender issues at stake in those specific maternal mHealth programs.

Transnational Strategies of Education for Social Mobility By Young Migrant Women in Germany

This paper proposes looking at the educational and social mobility strategies of migrants' children in transnational social space as a product of their social location rather than examining these strategies in terms of the deficiency approach, which explains the lower professional and educational success of migrants as being linked with their cultural origin. The social location, in turn, should be conceptualized as the interplay of the enabling (inclusionary) and constraining (exclusionary) structures, norms and values in migration contexts. In this sense, migrant transnationalism, in the form of diverse networks and educational/professional strategies, might become a resource which helps migrants to circumvent the constraints and restrictions put on them as they seek to improve their socio-economic status in the context of globalized economies. Based on a comparison of two biographical narratives from a young Kurdish woman and a Turkish woman, both living in Germany in the third generation, the paper shows that the construction of certain forms of belonging is accompanied by corresponding forms of transnational biographical orientation and upward mobility strategy. Moreover, the paper highlights the potential of migrants' transnational practices and constructions of belonging for contesting and critiquing the limits of the citizenship regimes of nation states. The interviews stem from a research project conducted at Goethe University in Frankfurt am Main between the years 2010-2011, in which 18 biographical narrative interviews were done with the children of migrants in the second and third generations.

Functional Disintegration of Institutions (FDI) and Crime in Iran

The number of crimes increased tremendously during the early 1990s in Iran. One approach maintains that the roots of this phenomenon can be found in the negative impacts of the First and Second Economic Development Plans, which include poverty, unemployment and inequality. This hypothesis will be tested empirically. The second hypothesis is: the reason was Functional Disintegration of Institutions (FDI) between economic, political, social and cultural institutions. This hypothesis will be tested within the framework of Emile Durkheim's theory of division of labor during the time of rapid economic reforms as well as within the framework of the theory of unbalanced and rapid development. Besides the said period, the two hypotheses have been tested for all the years between 1984 to 2008. The variable FDI is not merely a theoretical one, but its empirical measurement indicator has been defined for the present study. *Segmented regression analysis of interrupted time series* has been employed to test the hypotheses.

Functional Disintegration of Institutions; From Theory to Indicator

Functional Disintegration of Institutions(FDI) is studied in evolutionism and Functionalism- especially in transition period's discussions- and sociology. The purpose of this article is presenting a suitable indicator in macro experimental studies in sociology for measuring the Disintegration of Iranian society's institutions and its validity. Systemic integration and balance in functionalist theories has conceptual ambiguities, so measuring and building index will have some problems. Therefore at the first of this article concept of integration in Parsons Sociology is criticized on the basis of social entropy theory and finally legal discrepancies as a suitable indicator is proposed.

Contrasting Depression Among a Sample of African Americans with Major Depressive Disorder in the DSM

Research has consistently explored cross national variations in how people express depression. In the United States (U.S.), depression and other mental illnesses are often conceptualized and measured based on Western psychiatry. Researchers have suggested that some measurement instruments might not necessarily capture the experiences of African Americans and persons who belong to race and ethnic minority groups in the U.S. The current study identifies symptoms that constitute a shared model of depression among African Americans, and compares them to symptoms of major depressive disorder (MDD) in the fifth edition of the Diagnostic Statistical Manual of Mental Disorders (DSM –V). Data were collected in a disadvantaged urban neighborhood in Minneapolis, MN and analyzed using cultural consensus analysis (CCA). Indicators of depression were elicited using a free-listing technique. 40 key informants were selected to rate how common each indicator of depression was among African Americans. Factor analysis was performed on key informants and their factor loadings were used to identify significant indicators of depression. Results suggest that key informants were drawing from a shared belief system about depression. The most significant indicators of depression included classic symptoms in the DSM-V such as sadness, lack of motivation, low self-esteem, and hopelessness. However, there were other significant indicators inconsistent with classic symptoms of MDD such as paranoia, violent behavior and rage. These differences might be due in part to contextual factors that shape the expression of distress. An important implication of these findings is that expressions of depression that are not in the DSM-V might be overlooked in clinical assessments. Therefore, mental health providers might benefit from a better understanding of how context shapes expressions of depression.

Acknowledging Language Work. a Study on Public and Private Call Centers.

One notable aspect of informational capitalism is the increasing importance of worker's language skills and abilities. Language becomes a commodity and a raw material in the production process, potentially objectified through scritps and protocoles. This means new strugles among social partners about how surplus is produced within companies. This paper analyzes language rationalization in the workplace as an element of negotiation between trade unions and business organizations within contact centers in Spain. While business organizations try to homogenize and deskilling the contact centers jobs, unions try to build a professional career by introducing industrial-related arguments based on work autonomy as source of productivity. Our research aims: 1) to identify the different processes of linguistic rationalization aimed at increasing the efficiency of communication, 2) to analyze the position and bargaining arguments used by trade unions and business organizations to achieve collective agreements regarding regulation of linguistic profiles and performance of workers. In the Spanish case, as we show in our paper, the outcome has been the creation of new job categories based on the linguistic autonomy criteria. Research funded by Ministry of Education and Competitvity (FFI-2012-33316).

Language Practices of Telephone-Level Bureaucrats. Analysis of a Gender Violence Helpline.

Our research departs from a sample on in-depth interviews in Spain with 42 phisicians, social workers, psychologists, nurses and administrative workers working in a telephone helpline aimed to deal with victims of gender violence. Although their work is constricted by several regional and state laws, we have observed that their daily practices show high levels of professional autonomy, which frequently differ substantially from those legal precepts governing the helpline settings. This workers should face -as street-level bureaucrats (Lipsky, 1993)- to a number of tensions, observable through scripting of language practices. This practices are negotiated among groups of workers, team leaders and managers, showing relevant tensions between a strong sense of deontological professional exercise and external political rules. We analyze how these tensions are objectivized in conversational scripts and in interactions with women who suffer gender violence.

Life in Military-Connected Families: A Glimpse into Adolescent Men's and Women's Experiences during the Afghanistan Missions

Military families resemble other Canadian families: their members care for one another, support each other economically, and raise children. However, military families are also different (Crum-Cianflone, 2014). While families in general experience a range of stressors, military families experience more than their share. Adolescents in military families face especially unique stressors whenever they experience a parental deployment. The heightened risk accompanying Canadian Armed Forces (CAF) deployments over the last 15 years has also heightened the intensity of military families' deployment-related stressors. We conducted two-hour interviews with 61 adolescents with parents in the CAF. The interviews covered a range of topics unique to military life, including geographical relocations, deployments, PTSD, family functioning, and participants' perceptions of how their school was supporting them. This paper focuses on some of the experiences of youth growing up in military families living on or near a base that vigorously participated in the Afghanistan missions. We focus on the lives of youth while they assist often stressed and over-worked non-deployed parents (usually mothers). We present and discuss adolescents' complex and gendered responses to the extra instrumental and emotional work that they assume during deployments.

ALBER, INA* (University of Goettingen, ialber@uni-goettingen.de)

Care Workers in Transnational Polish-German Spaces

Taking care of elderly people is an urgent task for society. One social practice evolving from the need of 24/7 care in private homes in Germany is hiring (mostly) female care-takers from a Polish agency specialised in transnational care work. Practically, these Polish women are employed in Poland, but they are allowed to work as 'delegates' for three months in Germany within their Polish work contracts. However, they must spend the following three months in Poland again in order to retain their 'delegate status'. This grey zone of il/legal transnational work within the EU allows many Polish women in economic crisis to earn a living for their families – thereby challenging traditional gender roles. But at the same time they expose themselves to bad working conditions and lose contact to their families at home. In the Polish discourse this transnational female work is connected to slogans like „modern slave work", „alarming (mental) health conditions" of the female care workers, and „Euro-orphans". The social practices lead to a life of commuting and living in a transnational Polish-German space. The questions I`d like to discuss in my paper are: how do Polish women working in Germany address these problems in their biographical narrations and how do they integrate these experiences into their biographies? How do they cope with their transnational lives and how do they make use of social networks and civil society organisations like Caritas for support? And how can all actors involved like German and Polish families, care takers, organisations as Caritas, and politicians create "the future they want"? The paper will present preliminary results from my project on Polish-German relations in care work for the elderly building on biographical-narrative interviewing and discourse analysis.

RC38-443.1

ALBER, INA* (University of Goettingen, ialber@uni-goettingen.de)

Your History and My History - Doing Biographical Research within the Framework of German-Polish Relations

In my paper I'd like to argue that doing biographical research in a transnational context affects the biographical construction of both the interviewer and interviewee and leads to new research questions. The argument is based on my biographical experience of doing social research as a German scholar in Poland and with Polish people in Germany. Being involved in the German-Polish context sooner or later raises the issue of history. These patterns of interpretation also frame the situation of the biographical-narrative interview. This situation of narrating once life story is on the one hand side shaped by the relevancies (in the Schützian sense) acquired through experiences people have made. On the other hand side it is shaped by the relevancies applying in the interview situation, in which the role of researcher and biographer are negotiated among the participants.

To take these interactively produced meaning of nationality, family history and the political history of these two countries into account is important when analysing the interviews. It can be shown in the analysis that certain discourse fragments are found that relate to the historical, political and European dimensions of Polish-German relations like occupation and violence, forced labour, collaboration and communist images of the ,class enemy' – all of them interlinked with the face-to-face situation between German interviewer and Polish interviewees. I'd like to illustrate that a strong reflexivity and sensitiveness for historical and cultural contexts is needed in these global contexts in order to understand the biographical constructions. One positive side-effect can be that the reflexivity and interest in contexts may lead to new research questions and future common, global projects.

Investigación Interdisciplinaria En Conocimiento y Gestión Ambiental: Una Reflexión Desde La Sociocibernética Sobre Una Experiencia Formativa..

Resumen:

El proceso de construcción de conocimiento es un proceso complejo, más aún si se plantea intencionalmente hacerlo de forma colectiva e interdisciplinaria, como se hace en el marco del Doctorado en Ciencias y Humanidades para el Desarrollo Interdisciplinario (DCHDI). Esta presentación aborda una experiencia empírica de construcción de conocimiento colectivo en el contexto del DCHDI y, en concreto, del grupo de investigación sobre "Conocimiento y Gestión Ambiental".

Para abordar objetos de estudio como sistemas sociales complejos, el grupo de investigación desarrolla un proceso formativo en investigación interdisciplinaria del cual destacamos tres niveles de actividad cognoscitiva: 1) INTRA: hacia el interior, es decir, a nivel de individuos, enfrentados a teorías, conceptos y metodologías que se ven contrastadas y reflexionadas a partir de la relación con los otros miembros del grupo; 2) INTER: con el grupo, definiendo complejos cognitivos correspondientes a los objetos de estudio individuales pero interdefinidos, y que responden a una construcción interdisciplinaria; y 3) TRANS: contrastando conocimientos y procesos de construcción de conocimiento con otros grupos de investigación al interior y exterior del doctorado.

Entre los principales resultados de dicho proceso, destacamos la construcción de una comunidad de conocimiento en la que compartimos e integramos la perspectiva conceptual de la Epistemología Genética y la sociocibernética y los sistemas complejos, como base conceptual, la investigación interdisciplinaria y la Cibercultur@, como base metodológica común y la ecología política y los debates de la relación naturaleza-sociedad para construir nuevas propuestas en el campo del "Conocimiento y Gestión Ambiental". Este complejo teórico-metodológico articula cada uno de los proyectos de investigación y la relación entre ellos. Orientados por la sociocibernética, enfatizamos el camino hacia la generación de un marco epistémico, un lenguaje y un metalenguaje comunes, a partir de las reflexiones de segundo orden y la construcción de un sistema de información colectivo.

Figurational Sociology and Methodological Relationalism – on the Ontology and Methodology of Nobert Elias

The paper reconstructs the methodology of Norbert Elias against the background of his ontology. Thereby Robert van Kriekens thesis will be defended that Elias is a proponent of a "third sociology". His ontology shows that figurations are integrated wholes. Human beings form the parts of this wholes and necessarily build up social relations based upon their "relational properties". This model of social wholes builds the finishing part of a mereological ontology of layers of the natural and social world. Physical-chemical wholes can eductively explained, biological and sociological wholes are ontologically and epistemologically irreducible because of phenomena of emergence. This ontology of Elias serves as a background for his methodology which does not favour individualist but moderat holist or relationalist explanations. With a new definition of social emergence it can be shown that relations are central factors of sociological explanations which can be found in Elias' historical-sociological studies.

Social Scientists and Humanists in the Health Research Field: A Clash of Epistemic Habitus

While science policymakers in Canada have been pushing interdisciplinary research and greater collaboration between the social sciences, humanities (SSH) and health research, SSH scholars face several cultural and material hurdles that limit their ability to participate fully in the health research field. Three questions guided our investigation: Do SSH scholars adapt to the medical research environment? How do they navigate their career within a culture and an expertise system that may be inconsistent with their own? What strategies do they use to have their our expertise acknowledged? The study builds on three concepts: decoupling, doxa, and epistemic habitus. Twenty-nine semi-structured interviews were conducted with SSH scholars working in 11 faculties of medicine across Canada. For most of our participants, moving into medicine has been a challenging experience, as their research practices, expertise, and views of academic excellence collided with those of medicine. In order to achieve legitimacy more than half of our participants altered their research practices. This resulted in a dissonance between their internalized appreciation of academic excellence and their new, altered, research practices. Only six participants experienced no form of challenge or dissonance after moving into medicine, while three decided to break with their social science and humanities past and make the medical research community their new home. Our research suggests that for SSH scholars to succeed in the health research fields, they often have to adapt to their new field and transform their work to align with the doxa and expertise system of medicine. This necessary adaptation clashes with their epistemic habitus, leading to perceived changes in the quality of research and to professional dissatisfaction. Conversely, the medical field has not changed its rules of the game to adapt to its new occupants, thus reproducing previous hierarchies that give SSH scholars low legitimacy.

How Professions Narrow Their Horizons: The Impact of the Professional Definition of Social Problems.

Contrasting deliberative and standardized decision-making implies that professionalism is principally characterized by a general responsiveness for complexity and contingency, threatened by constrains of standardization, especially when applied by external agents, e.g., by superiors, political interventions, or external funding bodies. However, rigidity in approaching social problems might also be a constitutive part of a profession's mandate, that is, the profession's own definition of its task and the original stocks of knowledge incorporated by said profession. As socially recognized claims of responsibility, mandates are the basis for the case work of professional practitioners and cannot be easily overruled or abandoned.

Germany's child protection social work will serve as an example to discuss the impact of the professional mandate of social work. Although explicit case deliberations for reviewing allegations of child abuse and neglect have been established, case narrations (given by frontline workers in child protection) show that the professional routines are rather rigid.

Firstly, they routinely focus on the mother as the central client, who is portrayed as overwhelmed with her day-to-day management. Secondly, violence is seldom problematized and only attributed to the fathers or male partners who in return are never addressed as a client. Thirdly, children remain the blind spot, as they are only marginally considered in case investigations and as addressees of interventions. We conclude that the professional mandate of social work applies a rather narrow mode of repairing the private life, leaving further aspects of the problem aside.

"Nostalgia and Deracination in the Latin-American Immigrants Music"

This presentation was prepared in the context of a three years research funded by National Commission of Science and Technology of Chile(CONICYT) which aim to understand the relations between the topics of music and immigration taking into consideration the increased arrival of Latin American immigrants to our country(Chile) whose comes mostly from Perú, Colombia and Equator.

We are interested more specifically in develop an approach to the artistic and migratory trajectories of the immigrant musicians and also their repertoires. We think that music can be itself a mediator(Antoine Hennion) between two worlds, the country of origin and the one of arrival, between two temporalities, the past and the present, in the consideration of the immigrant subject as an inhabitant of two realities (Marta Torres). In order to conduct this research we'll use the contributions from Sociology of emotions, Sociology of art and Musicology.

Several studies shows that music might be a privileged field to explore the interfaces of the intimate and the social (Hesmondhalgh) as also the individual identities and the collective ones, so It's perceived as a dispositive that is easily connected to the emotions. We'll seek for the way in which the repertoires chosen by these musicians would be closely related to the feelings of nostalgia and deracination, and how is that the repertoires exacerbates or conjure them, what would allow to create new social bonds through the emergence of musical communities(Becker).

The analytical corpus considers 42 interviews to musicians (already made), field notes and audiovisual materials of ethnographic observation.

We look forward to contribute to create knowledge about the migration experience beyond the usual sociodemographic approach to see in-depth the sociocultural dimensions and its sensible and existential elements.

Defining Social Cohesion Research Design and Indicators

Despite the extensive use of social cohesion research in recent years, little attention has been paid to its use and conditions in developing and transitional societies. Therefore, this study complements the researches to date of social cohesion which tend to focus on world's richest countries.

The case of Mongolia appears particularly interesting. With its 'most remarkable political transformations' (Fish 1998, 127), rapid economic growth 'faster than any other in the next decade' fuelled mostly by the mining sector (The Economist 2012) and deteriorating social conditions and modernisation process far from being complete (Oleinik 2012, 3), Mongolia serves as a natural laboratory for social scientists.

This paper attempts to define a valid, reliable and robust measurement of social cohesion based on a framework that is comparable across societies, in the case of Mongolia. In this respect, modern social and policy theories and frameworks related to social cohesion are compared, assessed and a set of indicators were selected. The bases for this selection and definition of social cohesion were the following:
- Minimal in scope
- Close to ordinary usage
- Allowing to test a series of hypotheses and can be tested empirically
- Free from researchers' subjective values and judgements
- Clear and separate from causes and outcomes of social cohesion
- As a result, a total of three elements that constitute social cohesion were selected:
- 1) Belonging and interdependence
- Sense of belonging and shared values
- Recognition vs rejection
- Belief to achieve collective goals through cooperation
- 2) Trust
- Particularised trust
- Generalised trust
- Trust in political institutions
- 3) Cooperation
- Voluntary work

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

- Involvement in civil society
- Involvement in political institutions

This framework and set of indicators allow to determine the state and change of social cohesion at macro level of society. It can measure both horizontal and vertical as well as subjective and objective cohesion.

ALEXIOU, ARISTEA* (University of the Aegean, aristea_alexiou123@yahoo.gr)

Challenging Political Hegemony, Unseen Community Assets, Poverty and Its Regulation Under Duress. Social Asset Building Innovations for Greece.

Assembling sociality by means of social economy enterprise empowerment and regulation, has been a key policy issue for EU member states and the EU administration. Reference is being made to recent agenda setting as Horizon 2020 among others. Assembling sociality issues have been instrumental in developing community employment capacity by addressing the problematic of inclusion for youth, women, people with disabilities and immigrants. The social economy has been established as key to employment development as it addresses the community cooperative capacity which has been key to eroding private informal "capital" engaging in usurious money lending, and engaging as private "mediators" who control markets from the "communal" producers themselves.

Social economy expresses the social capital formation relationship and as a concept may refer to its density within a community (it is a collective property), and/or its weak ties with institutionalized actors, local political and civic agencies. Such weak ties engaging "rent-seeking" political actors may also be defined by general conditions setting legal parameter enforcement expressing the general interest.   Sociality is the general interest expressing itself by means of basic anti-poverty, social cohesion policies. Population security issues (health, work, secure food production, child and elderly care) may form the basis for the facilities of general interest thus constituting the essence of communal sociality.

Ongoing EU-Greece institutional   interaction shows many deficiencies that impede sociality and mainstreaming that address the combinatory of social economy building and their application for poverty eradication. Greece lacks an Anti-Poverty Agency. Two cases will be presented testing this relationship. One regards the establishment of the guaranteed basic income mechanism and the other the fate of a proposal to deal with the problem of absolute poverty by means of food delivery by the state using existing stocks stored in agricultural coops. Social Innovation in times of crisis demands attention.

ALEXIOU, ARISTEA* (University of the Aegean, aristea_alexiou123@yahoo.gr)

The Resilience of Social Economy in Times of Crisis and Its Contribution to Community Capacity Building

The on-going crisis has accelerated the need for rethinking the respective roles of the market, the state, the "third" sector and the individual. According to the literature review it has been demonstrated that social economy organizations can be more resilient than investor owned enterprises and that the model of economic organisation solely based on the actions of two types of institutions (investor-owned enterprises, public organisations) produce shortcomings. Additionally, it is widely accepted that social capital and the social economy have an important role to play in community capacity building. Countries providing high quality jobs, effective social protection and moving towards a social investment approach have proved to be more resilient to the economic crisis by various studies. At a time of increasing global competition, major demographic and public budget constraints, new forms of organisation and interaction between public sector, civil society organizations private enterprises and citizens are needed, creating crisis-resistant models for effective operation.

The aim of the present work is to shed light on the crucial role social economy has played in times of crisis based on historical evidence across the Europe. Furthermore, the links between social economy organizations and there territories in which they operate are investigated in relation to the reinforcement of social capital and local development.

How to Study Intersecting Processes of Mobilization in Different Social Spheres? a Comparison of Process Tracing and Sequences Analysis

Recently, many scholars in the social sciences have emphasized the importance of time and process to understanding society. However, in an ever more complex world undergoing globalization and differentiation, a renewed emphasis on process creates conceptual, methodological and empirical challenges. How are we to conceptualize and study phenomena such as mobilization in transnational activist networks that shift between and span across different places and scales? How can we analyze institutional change that is brought about by overlapping processes of subnational and national contestation? Such phenomena are often addressed through the concept of multi-level analysis, applied in a quantitative or qualitative manner. The multi-level approach, however, has its shortcomings because it tends to assume a hierarchical form of social organization, suggests a separation between social spheres and neglects interaction effects. In this paper, we propose that it might be more useful to think of processes cutting across different social spheres without assuming hierarchy and separation between them. The purpose of the paper is threefold: Theoretically, we critically asses the multi-level concept contrasting it with the concept of "social fields" and "social worlds". Methodologically, we introduce two methods used in the social sciences to analyze social phenomena over time and discuss how they can be used to capture overlapping and intersecting processes: historical process tracing (frequently used in political sociology) and sequence analysis (common in life course and career analysis). Empirically, we apply these concepts and methods to two illustrative examples drawn from indigenous mobilization over land tenure in Brazil.

MULVIHILL, PETER (York University)

Towards a Critical Environmental Management

This presentation explores the question of how theoretically-informed sociological analyses of the environment may be useful in developing innovative and critical environmental management perspectives. That is, to foster environmental management as a force of change and not as an enabling agent for business as usual practices.

We start by identifying the limitations of "conventional" state and industrial environmental management strategies that prevail today. These limitations involve: the adoption of a reactive orientation, the emphasis on the "correction" of single issues rather than a broader consideration of overall environmental health and sustainability, and the adoption of a technical paradigm that lacks consideration of the social, economic, political and economic context. Such limitations ultimately contribute to the emergence of the common fallacy that certain formal tools or processes such as Environmental Management Systems or Environmental Impact Assessments, as well as other auditing and regulatory policies, are up-to-the-task of achieving environmental management goals.

We argue that these types of environmental management limitations may be analyzed through the incorporation of insights from critical sociology. For instance, Horkheimer and Adorno note that the Enlightenment tradition has meant that the natural environment has come to be valued only in instrumental terms, and is thought to possess value only because it is usefulness to humans. Many of the limitations of contemporary environmental management could probably trace their origins back to this ideology.

We conclude by demonstrating how work from contemporary environmental and disaster sociology could be used to reposition the philosophical orientation of environmental management. This would move environmental management in a more innovative and decidedly alternative direction premised on a critique of the restrictive prescriptions of conventional environmental management that rely upon a technocratic paradigm and/or performance-based standards. The case of exploratory scenario development and weak signals research is used as an illustration of this potential.

Theory of Action: Post-Parsonian Development

Although after Weber appeared several versions of the theory of action (R. M. MacIver, F. Znieckí, H. Becker), but only Parsons' theory of action has came between them as the leader. Thanks to the synthesis of some of the main approaches of the classical sociology (M. Weber, E. Durkheim, V. Pareto) , of the neobehaviorism (E.Tolman), of the psychoanalysis (S. Freud) , of the social anthropology etc. Parsons was able to offer the richest model of action. It has contained the categories: the goal, the means, the situation and the norms. Later he has added the category of the motive.

Further development of the theory of action took place partly in the context of interpretive sociology, which had not the nature of en explicit theory of action, but was based on the action, not on the behavior. The process did not go by the addition of new categories into the model of action, but in the form of articulation of the central principles, that fundamentally changed the direction of research. The symbolic interactionism of H. Blumer, for example, has stressed the subjective dimension of action. The social dramaturgy of E. Goffman has transferred the

emphasis from the achievement to the expressivity of the action. Finally, the eth-nomethodology od H. Garfinkel has replaced the interest of the theory of action from the motive to the method, the procedure of action etc.

Difficulties of the EU As a Common Object for Identification

In order to understand and explain the current situation of the European Union one has to study the long-term development of this institution, created mainly by political, economic and intellectual elite 'from the top'. The main thesis of this presentation is that the transition of the social habitus of the majority of Europeans has been lagging behind the transition of national institutions towards European supra-national institutions.

From a process sociological point of view, I will discuss about the reasons of this asynchrony between different habitual, functional and institutional dimensions of this rather a project than a process. European Union could serve here as an paradigmatic example of social differentiation without accompanying processes of social and political integration.

Especially, the emotional aspects of social integration and disintegration will be called into consideration. There will also be discussions about some difficulties of the emergence of a new 'survival unit' in more democratic societies in comparison to authoritarian societies, with regard to the question of legitimacy.

Iran and Challenges of Aging Population - Complicated Problem of Childbearing and Population Golden Opportunity Window

Population aging in the developing countries is moving faster. Because on the one hand, fertility rate in these countries is decreasing and on the other hand life expectancy is increasing. Meanwhile, Iran has a special international position. We may refer to the special report of Population Reference Bureau (PRB) in 2011 in which Iran was declared as the fastest country in changing demographic structure in 2050 by (-30) before Tunisia (-18) and Lebanon (-15) in terms of decline of young population in Middle East and North Africa (MENA). In addition, this issue has taken on more complex dimensions after national census of 2011. Sharp decline in fertility rates in the last decade and incorrect demographic predictions have created new concerns among policymakers. In this article, while using the most important international tables and diagrams showing this situation, tries to analyze the demographic changes process of Iran by studying the most important available demographic data. For this purpose, we are using the Agent- Based Computational Demography (ABCD) framework to integrating the micro and macro analytical levels. The results show that, with regard to the cultural and social conditions of Iranian society on the one side, encouraging policies of probable increase of marriage shall be followed instead of focusing on the number of children in families. On the other side, the reply to increasing growth of old population in our country requires balance of needs of this group with other groups and also design of protective programs for them. It seems that population golden opportunity window provides the possibility of appropriate investment for the next few decades.

ALIZZI, JOE* (University of New South Wales, Sydney, joealizzi@yahoo.co.uk)

The Construction of Common Understanding and Its Interplay with Lifeworld – Objects, Taken-for-Grantedness, and the Human Space of Action

The handling of problems, risks and conflicts usually occurs from individual and group 'bases', namely, lived structures and dynamics that locate people, and through which humans manifest bonds with nature and culture. But how are these 'bases' visualized and constructed – what 'adorns' their conceptual walls? And how do numerous individualized worldviews interact and construct a common understanding regarding social and environmental relations? This paper seeks to analyse certain taken-for-granted elements of individual and group 'life-world' (Seamon) – symbols that have become 'invisible' but play a strong role in the decision-making process due to the meanings they convey. While all humans fundamentally seek individual and collective security, representations of security vary and affect imaginaries differently, and approaches to achieving security differ according to socio-cultural positionings and worldviews. This shapes the type of action on environmental issues a society takes, with the prevailing discourse usually controlling the emergent approaches. This paper argues that the construction of what is valued is strongly influenced by representations emanat-

ing from a dominant but taken-for-granted 'attitude' toward what is commonly termed 'nature', as is the *overall* process of relation between humans and other human and nonhuman entities. This taken-for-granted 'attitude' promotes individual values and autonomy as the means to achieve security, making the countervailing attitude of interdependency less visible, and thus inhibited from shaping action. By clearly visualizing what 'adorns' and what is used to construct value in the individual and communal 'bases' of action, choices are more easily made regarding why to adopt an alternate way of relating, and how to incorporate it into future action.

RC22-262.7

ALIZZI, JOE* (University of New South Wales, Sydney, joealizzi@yahoo.co.uk)

The Radicals and the Radicalized – Placeless Souls in the Illusive Search for Heroism and Meaning

Implicit in the term 'radical movements' is the under-analysed idea of a physical and conceptual shift from one locus to another. What encourages individuals to move from a particular centre of experience to another? What is attractive about joining a group such as ISIS, where often one will potentially face life-threatening situations and an unclear future? This paper seeks to explore the points of movement – the constructed centres of identity and security, examining reasons why individuals and groups 'move' from what is considered 'moderate' positioning to what is considered a 'radicalised' locus. The paper utilises phenomenological reasoning that arises from geographical concepts proposed by Edward Relph and expanded upon by David Seamon to sociologically examine the construction of individual and social group identities connected to spaces and contingent places (locus) of security, and how a disrupted 'existential insideness' leads to a loss of meaning. To facilitate an understanding of the human search for meaning, the paper also utilises key concepts such as heroism and socio-cultural construction of meaning put forward by Ernest Becker to explore the construction of 'place' as a centre for action. It is argued that when a secure locus is disrupted, so is the possibility for individuals and communities to pursue meaning. This prompts individuals and/or groups to restore their existing locus or make 'moves' to re-establish their 'significant centres of [their] immediate experiences of the world' (Relph 1976:141). Through culturally constructed conceptualisations of heroic acts, 'radical movements' are effectively individual and group efforts to seek meaning through heroism and to restore a locus of security where the pursuit of meaning is possible for the rest of the group.

ALKAN USTUN, CEREN* (Maltepe University, ceren.z.alkan@gmail.com)

Hope and Revolution in a Critical Dystopia: The Hunger Games

The Hunger Games, by Suzanne Collins, is an example of the newly emerged category of critical dystopia which challenges the assumed dichotomy of utopian and dystopian literature, and despite the significantly dystopian elements it entails, evolves into a revolution narrative. This paper presents an analysis of The Hunger Games in terms of hope and revolution. Acknowledging hope as an ambivalent concept, I approach The Hunger Games beyond the framework of currently introduced sub-genres of critical utopia and critical dystopia, and treat hope as embodying two different meanings: (1) as a means of manipulation in favor of the existing system working hand in hand with "cruel optimism" (Berlant), and (2) as a revolution trigger operating together with "militant pessimism" (Bloch). Building on such multi layered understanding of hope, I examine the role of solidarity in transition of individual hope to collective hope and emergence of a revolutionary subjectivity. Finally, I ask, whether The Hunger Games as an element of the popular culture could forge a critique in opposition to the system it emerges from, or would it work to commodify and hegemonize the radical criticism it presents.

Everyday Activism in Different Socio-Political Context: Cases of Estonia and Finland

Young people today are engaging in politicised activities and are more attuned to the concerns of their own generation, as opposed to issues more relevant to their parents. Youth socio-political activism takes less overt and more individualised approach and is partly perceived to have transitioned into spheres of everyday activity. Participation can take place in diversified ways and mean different things in different temporal and spatial contexts.

This paper focuses on young people's social media practices which could be defined as everyday activism in two countries, Estonia and Finland. The central research problem is the meaning that young people attribute to their own inter-

net-related participation as well as the potential to more demanding activism in two different contexts.

Empirical part of the paper is based mostly on material collected in the framework of the large-scale European project MYPLACE. An in-depth micro-level analysis is based mostly on interviews (60+59) with young people from Estonia and Finland, contextualization is based on survey data that includes all MYPLACE partners (14 countries), additionally data from internet based material on Facebook is used for analyses.

According to MYPLACE survey there is contrast between Eastern and Western European countries both in conventional participation and intentional grassroots activism. While in Finland 73% of young people belong to some organization, in Estonia the corresponding percentage in 58%. A difference in participation is lower regarding online activism, where Estonia was roughly on the same level with Western Europe. However, question remains if liking, sharing and commenting political topics and signing petitions is something that can be seen as 'gateway activism', which will lead new generations of people towards participation and here the historical and political background may have crucial importance.

ALLEN, HENRY* (Department of Sociology and Anthropology, Wheaton College (IL), hank.allen@wheaton.edu)

Social Justice, Police Shootings, and Abusive Social Encounters with Unarmed African Americans

For many waves of immigrants and tangential admirers, the United States social system stands as a symbol of freedom, justice, and equality. Not so historically for the bulk of disadvantaged indigenous African Americans who continue to suffer unpredictably from the nation's simultaneous legacy of slavery, racism, and structural oppression (see Patrick Sharkey's book, **Stuck in Place**, 2015). Recent examples of how prejudice and discrimination stimulate social injustice can be observed from police shootings or abuse of unarmed African Americans. Moreover, many incidents of police abuse fail to receive any sanctions or criminal penalities despite internal, domestic political rhetoric by policymakers about global human rights abuses elsewhere. In no way has the Civil Rights Movement or the Kerner Commission report about police misconduct curtailed the most lethal woes of impoverished African Americans in Ferguson (Missouri), New York City, Chicago, and other cities in the United States.

A variety of scholars and sociologists have examined police deviance and misconduct for decades, even if their findings have been ignored by key policymakers. Using qualitative and quantitative data, this paper analyzes the social factors involved in the use of deadly force by police against unarmed African Americans during the past decade. Role behaviors, cultural competencies, police corruption, tactical training, and related policy matters will be addressed. Lastly, the research will describe tangible, yet undisclosed, efforts undertaken by the FBI Academy's Behavioral Science Unit and its Project BeSTOW (2003-2011) to prevent recent waves of police abuse in society. Where feasible, comparative data from other societies and ethnic groups will be included in the analysis.

The Educational Benefits of Student Diversity in U.S. Law Schools

The US Supreme Court affirmed "the educational benefits that flow from a diverse student body" and ruled universities have "compelling interests in securing the educational benefits of a diverse student body." Yet, questions remain about the "educational diversity rationale" and whether racial/ ethnic diversity and educational benefits. Empirical research shows: interventions are necessary to improve racial harmony among race-ethnic groups; student educational outcomes are enhanced in diverse learning environments; educational diversity improves learning outcomes for law students; college diversity experiences have lifelong consequences and universities can help reduce racial prejudice, discrimination and conflict in our society.

The Educational Diversity Project (EDP) collects longitudinal survey and focus group data from 8,000 Law students at 64 Law Schools to understand the benefits of educational diversity. www.unc.edu/edp/ We conduct multi- level modeling on EDP datasets: 2005 Baseline Survey; 2007 Exit Survey; IPEDS institutional data and supplemental student data from the Law Schools Admissions Council.

We test the long- term effects and benefits of educational diversity within Law Schools. We ask whether diversity is a "game changer" not only for classroom learning, but also for life outcomes (i.e., socio- political attitudes, educational experiences, professional trajectories, neighborhood and school choices, and community engagement)

We ask: "Does educational diversity really matter?" Our findings convincingly support the view that student diversity does matter and makes positive contributions to the educational experience for law students.

ALMACK, KATHRYN* (University of Nottingham, k.almack@nottingham.ac.uk)

Navigating Personal Networks: Lesbian, Gay, Bisexual and Trans Older People's Networks of Support Towards the End of Life

This paper examines how sexual and gender orientation can impact on experiences of support and care towards the end of life for the oldest generations of LGBT people. The heterogeneous needs of 'older people' towards the end of life are often neglected within research. There is however a burgeoning body of work that explores broader questions about health and well-being for older LGBT people. This identifies institutional and historical barriers that mean these older generations may be reluctant to disclose central aspects of their identity. Attendant impacts include reluctance to access formal care services and reliance on single generational networks of support. Older LGBT people are likely to have managed their personal networks across their lives to minimize exposure to stigma and discrimination. This may change in old age, with increasing frailty, ill-health and towards the end of life when care needs may increase. We know little about these transitions in the lives of older LGBT people.

The paper discusses findings from the qualitative strand (60 in-depth interviews) from a large two year mixed methods UK project investigating the end of life experiences and care needs of older LGBT people (aged 60 or over), funded by the Marie Curie Research Programme. Findings revealed a number of barriers and stressors impact on well-being and care experiences, related to respondents› LGBT identities. These included anticipatory and/or real fears and experiences of discrimination; hetero-normative assumptions and lack of recognition of relationships. Many expressed a preference to rely on personal networks rather than formal care services. Respondents› networks varied from those who were extremely isolated to others who had strong connections incorporating friends, families and kin. It is clear that older LGBT people›s histories and pathways have profound influences on well-being and access to support towards and at the end of life.

The 'Localised' Dimension of Professionalisation: A Comparative Analysis of Acupuncture and Homeopathy in the UK and Portugal

Sociological research on complementary and alternative medicine (CAM) has focused on CAM practitioners' efforts to professionalise within biomedically-dominated healthcare systems. Structural changes and alterations in the knowledge or content of work have been main aspects of CAM's professionalisation process. This research emphasises a third, often overlooked, aspect: the role of the geographical setting and its distinct context.

This research has four objectives: (1) to compare the evolvement of the professionalisation of CAM in two European countries, the UK and Portugal; (2) to identify parallels and differences to this process in these two countries; (3) to discuss the role of political, historical, economic and cultural context in explaining such parallels and differences; (4) to contribute to a multi-layered analysis of CAM's professionalisation in Western societies. Acupuncture and homeopathy will be used as case-studies. The analysis draws on empirical data gathered between 2008-2015 in the UK and Portugal. In-depth interviews with traditional acupuncture and classical homeopathy practitioners and educators, documentary analysis of regulation policies, and participant observation of teaching, have been the methods of data collection.

A preliminary analysis of the data suggests different levels of state intervention and control in CAM's regulation in the UK and Portugal. There are also considerable differences in terms of stages of formalisation of education in both countries: while in the UK CAM's undergraduate programmes were established already in the 1990s but have recently witnessed a significant rejection and decline, in Portugal, prompted by government regulation, they have recently been created.

This comparative approach can help identify country-specific forces to CAM's professionalisation. Furthermore, it can extend national-level ideas about what is possible within CAM's professionalisation process and contribute to developing a typology of CAM's professionalisation in Western societies.

Vous, les autres: L'altérité dans les discours aux Nations Unies

L'un des moyens pour construire et véhiculer l'identité reste le langage : les discours et leurs périmètres deviennent des réalisations sociales qui performent la réalité. Cette étude vise donc à repérer les stratégies de la classification de l'Autre dans les discours des chefs d'Etats et de gouvernements aux Nations Unies

Est-ce que les dirigeants du monde arrivent à dire le monde sans un Autre ou ont-ils tendance à diviser le monde en Eux/Nous ? Le cas échéant, qui est cet Autre pour eux dans le discours ? Serait-il une autre Nation, autre race, autre couleur, autre religion, et donc après tout, « l'autre n'est que Nous » ? Ou bien créent-ils un Autre figuratif tel que le terrorisme, la pauvreté etc. ?

Cette contribution s'inscrit dans le cadre de l'analyse du discours mais ajoute qu'une approche quantitative des discours est sinon nécessaire en tout cas utile.

La logométrie qui sera utilisée ici est une méthode d'analyse statistique du vocabulaire assistée par ordinateur, en l'occurrence via le logiciel Hypberbase (CNRS – Université de Nice Sophia Antipolis) ; elle encourage une interprétation objective et contextualisée des discours.

Le corpus étudié est composé des discours à l'Assemblée générale de l'ONU d'une occurrence de plus de 600,000 mots.

Migration Narratives Juxtaposed: A Sociological Analysis of Photos, Letters and Biographies of "Guest Workers" from Turkey Living in Austria

The proposed paper is part of a PhD thesis with the underlying research question of w*hat do "guest workers" photographs and letters show/tell about life in Austria to (extended) family members and acquaintances back in Turkey?* From a retrospective viewpoint, this project deals with "guest worker" biographies and documents (primarily photographs and letters) that were sent back to (extended) family members and acquaintances in Turkey from ca. the mid 1960s to the late 1980s. The documents of "guest workers" are increasingly used in media and exhibitions in Austria but sustained analysis is still missing. The project follows a reconstructive approach by triangulating interpretative methods such as biographical case reconstruction and visual segment analysis. Further, ethnographic observations also play an important role in the project. The aim is (i) to find out how these narrations complement and differentiate from each other, (ii) to determine whether and how these narrations corresponded with the actual situation, and finally (iii) to gain a differentiated visual representation of migration which goes beyond stereotypes and consequently provides a better understanding of how these groups experience(d) and (re)presented migration to those in Turkey. Analysis is done with a case study approach and according to theoretical sampling. Sampling takes into consideration the urban, rural, gender and ethnic aspects of the target group as these aspects play a very important role in Turkey. Consequently, the aim of this study is to draw attention to the heterogeneity of the group. In this paper, the first results of one case study will be presented.

Modernity, Social Change and Despair: A Nursian Perspective

The basic aim of this paper is to explore on the rising of despair and hopelessness in social life. Humanity continues to move forward in science and technology, but seems to have forgotten the fundamental principles of essential human values. People live to acquire more and consume more, but have forgotten the spiritual and moral needs of their human selves. Their homes have grown larger, but families have grown smaller and have even dispersed. Even though more people are rich and possess good welfare, many still suffer from mental illness and even sometimes commit suicide. Why? Is it because they do not have hope anymore?

At the beginning of the modernization of the societies some famous sociologists tried to find the problems which existed after industrial revolution. Karl Marx spoke about the problem of alienation as one of the major problems of humanity. Max Weber also talked about human conditions, as he believed that humans are enslaved by roles and regulations. Emile Durkheim maintained the problem of Anomy. It refers to the condition of humans becoming enslaved by depression and desire.

Today, religious faith and modernity are among the most powerful forces shaping the world. As is generally understood, from the beginning of human societies people have always been searching for happiness. This study will focus the role and place of belief, hope and optimism in Modern Capitalist Societies.

Said Nursi is one of the famous thinkers and theologian of Turkey, in his Damascus Sermon stressed the problem of the rising to life of despair and hopelessness in social life in the Muslim Society which is also relevant for today. He also suggested some solutions to this problem. In paper I have elaborated Said Nursi's social theology which can be considered to be a theology of reform.

Localizing Rebellion – International Development Agencies and the Rising of the Indigenous Movement in Ecuador

Between 1990 and the first years of the 2000s -and to a lesser extent until today-, the indigenous movement in Ecuador was without a doubt the strongest social and political actor in the country and one of the strongest of the continent, able not only to destitute two presidents and press for a new constitution (in 1998), but also to change discourse and thinking in society profoundly. This strength was possible due to a decade-long organizational fight on local and regional levels, the establishment of small-scale institutions and the slow development of a coherent and innovative discourse. Even if the main actors always were indigenous persons, international development agencies -state-funded, church-based or NGOs- had decisive influence in this process. In fact, the history of the indigenous movement in Ecuador is also a history of inclusion and expulsion of external agents such as the international development agencies, containing both moments of almost sectarian seclusion and wide and open treaties involving those agencies.

This paper will explore how international development agencies took influence in the organizational and discursive development of the indigenous movement in Ecuador and its organizations. On a structural level, the support for the establishment of indigenous institutions -in education, traditional medicine and development- and the engagement into internal organization processes will be analyzed. Here, the text will focus on concrete actors and their relationship with concrete organizations, the success of their efforts and the general strategy visible behind given actions. On a discursive level, the support of certain political tendencies within the movement -namely, the more ethnicist and less socialist ones- will be interpreted and with it the influence on the diffusion of determinate demands or political concepts. Here, the diffusion of demands for autonomy and of concepts such as interculturality and Good Life will be in focus.

The Indigenous Movement in Ecuador As an Exercise of Self-Inclusion – a Luhmannian View on Social Movements in the Global South

The exclusion from one social subsystem can lead to the exclusion from other and maybe all social subsystems. This gives a new meaning to the old dictum that the subaltern cannot speak. Actually, he (or she) cannot – because he is excluded from most communicative systems. This is the situation of a considerably large part of the population worldwide and especially in the Global South. This presentation argues that self-organization –for instance as a social movement- can serve on the long run as a means for self-inclusion. The indigenous movement in Ecuador is a good example for the possibility of self-inclusion: a vast number of people lived for centuries almost completely excluded from economy (relegated to subsistence activities or semi-feudalism), politics (without the right to vote and political visibility), education and so on. In the early 20th century, this very people starts to organize in worker unions that with the time establish clandestine schools, later production and credit cooperatives, church communities, sports clubs and finally a political party. Until the 1990s, the moment of high visibility of the movement, it already established a wide range of structures that put the indigenous peoples in the possibility to communicate in virtually every subsystem.

This presentation will develop another approach to the study of social movements in the Global South by applying Luhmannian ideas. By this, an alternative to the mostly Eurocentric theories of social movements will be developed.

On Becoming a Young Blue-Collar Worker: Classed Transitions in Working Life

Looking at public debates it seems to be common sense nowadays that everything is possible for the younger generation. Compared to their parents and grandparents young people in Austria are free to choose their way of life out of multiple options and are no longer bound to the limits of social class, gender or ethnicity. However, this approach does not only seem to be hegemonic in the public discourse but is also present in the social sciences. Since the 1970s socio-economic factors, like class background, are getting less and less important in theoretical and empirical works (Kraemer 2008). Ulrich Beck's (1986) declaration of the end of class society due to processes of individualisation, but also the cul-

turalisation of social inequality research have surely contributed to this development.

Contrary to that notion, the proposed presentation will show what can be gained by sticking to social class as analytical category in sociological analysis. This will be done by looking at a social group that has been suffering from a lack of attention in recent years: young blue-collar workers. Drawing on first results of an on-going PhD-project the paper will deal with Austrian industrial workers aged between 20 and 34 years old. Using the theoretical framework of Pierre Bourdieu (1987, 1998) it shows how social class and habitual dispositions shape their transitions from school to work, their trajectories in working life but also their perceptions, hopes and expectations. Going beyond Bourdieu, the paper will explore how societal changes might induce ambiguities and tensions in young workers lives.

Thinking about Decent Work in Capitalism in Terms of a 'concrete Utopia'

Approaching Utopia can either be done in the way Thomas Morus (1516) did, who developed an alternative model of society based on fantasy, or, on the contrary, by following Theodor W. Adorno (1951), who pleads for extracting ideas and notions for utopian projects out of untapped potentials which can be found in the history of societies. The proposed presentation draws on Adorno to discuss criteria for decent work by reading the contemporary history of capitalism against the grain. It is referring to three key aspects of decent work. First, there is the integrative function of work, which bonds people to reality and also gives them social identity and status (Jahoda 1966). Second, workers are not to be seen only as labour power but as citizens with manifold needs and responsibilities. Work, therefore, has to be organised in a way that allows combining different spheres of life. Third, decent work is about conferring dignity to employees who are doing their job under conditions of asymmetrical power relations (Sennett 2000).

Arguments will be unfolded by taking data from a sociological-ethnographic study (2009-2012) in one of the tobacco plants of the former state-owned monopolist Austria Tabak in Austria. Until 1999 Austria Tabak was under majority public ownership and practised something Robert Castel refers to as 'social economy' (2008, 224f.). Relations between employees and management were not reduced to strict economic logic. They were framed by a collaborative social order (Kotthoff/Reindl 1990) in which aspects of decent work were widely implemented.

In our presentation we are going to discuss what might be gained in taking this case study as significant piece of historical reality and take it as starting point to develop a 'concrete utopia' of decent work for modern societies.

ALVARADO, ARTURO* (El Colegio de Mexico, alvarado@colmex.mx)

"Urban Mobility and Gender Inequality in the Modern World." an Assessment of UN Habitat -- UN Women Programs to Eradicate Sexual Harassment Against Women in the Urban Transportation System.

Urban transportation is an axis of the productive and reproductive urban system. Is an archetypical manifestation of the quality of life, accessibility of public services and (in)equality in our every day life in cities. This includes, metro lines, buses and several other types of transportation, such as taxis. Transportation in contemporary cities is organized around a centralized, massive system to support productive activities, with a strong dominance on male activities. Women in this system are subordinated to male dominant activities even taught their necessities and types of mobility are different from males. (Nava, 2015) proposes that women trips are associated to multiple purposes, more associated with their household or tasks related to family reproduction, domestic task and to the sexual division of work. They tend to use marginal forms of transportation which limits to mobility.

Transportation is link to insecurity and violence against women. Alvarado (2015) shows that the transportation system is a space where several types of aggression and violence occur quite often. Some of this problems are related to the structural characteristics of the transportation system (saturation, reduce and inconvenient spaces, and ergonomic system design for men, several routes are unsecure with lacks of police surveillance), which in turn converts the system in opportunities to commit illicit and violent activities. Women are more likely to be victims of several types of sexual violence. The study will show how the contemporary transportation is both a space and a context to exert sexual violence against women. Iis base in both quantitative analysis using some new geographic and sociological Gender orientations. It is also based in a set of interviews with women to analyze the types of incidents and risk they are subject in the transpor-

tation. The paper will also show some new programs design to eradicate these types of violence.

The "Pintadas" like a Way of Citizen Communication. the Case in Downtown Bogota (Colombia)

The purpose of this paper is to analyze several painted messages that can be found on the walls in the centre of Bogota and how they constitute an alternative way of social communication for the citizens. Supported by the Communication, Government and Citizenship line of research from, the Master in Communication, Development and Social Change,, this research considers relevant to take some distance from the traditional graffiti concept, since graffiti studies focuses on the image represented (its aesthetic quality) and the authors, more than on the content or messages which the image itself might transmit. Due to this, we will use the so-called term "pintadas" from the Spanish language, as this term not only conveys the aesthetic quality of the images, but also reflects on the social or political meaning or signification expressed by the authors through the images painted in public spaces. "Pintadas" also assumes artistic works like graffitis but only if they have a communicative component about social or political revindication. Based on a visual sociology method, this research used fieldwork as a essential process for recollecting information. All along this field work, we have recognized and observed the urban space, taken photographs and written a field journal. As a result, we have identified that the "pintadas" are positioned in Bogotá as a dynamic way of publicizing the citizens demands and are an alternative way of communication. Several messages were classified into categories such as: Education, Peace, Resistance and Peasantry, which reflects another way to communicate through and which citizens appropriate as part of the public sphere, making their participation visible and expressing their opinion. Demonstrating how big city walls collect citizenship expressions that most of the time don't feel represented and that neither hold nor have a place in the mainstream news media.

Albert Einstein's Enigma of Relative Space- Time:a Sociological Approach

TItle: Albert Einstein's Enigma of Relative Space-Time: A Sociological Approach of Einstein's conceptual ontology. In this work, the main goal is to discuss **conceptualization and figuration of Relative Space-time in Albert Einstein's Relativistic Mechanics**. In order to accomplish this target, I take Norbert Elias's contributions in the fields of Sociology of Knowledge and in the Sociology of Figuration, in his work,namely: On Time: An essay, in order to discuss Albert Einstein's innovative contribution in our Sciences. To accomplish this main objective, I discuss Einstein's concept of experience at a distance according to Norbert Elias's concept of experience. It is also important to remind that Einstein's scientific contribution was measured and confirmed in 29 May 1919, in Sobral, Brazil, when a total eclipse of the sun was taken to confirm and to measure Albert Einstein's Relative space-time.With this scientific contribution, Einstein introduced a new conception of relative space-time in Modern Physics. In a second aim, I discuss the conception of action at distance in Einstein's Relativistic Mechanics according to Elias's conception of Social time. In order to a better understanding of this aim, I present some diagrams to visualize Einstein's innovative conception of Relative Space-Time.

ALVAREZ-BENAVIDES, ANTONIO* (Centre d'Analyse et d'Intervention Sociologique (CADIS-EHESS), alvarezbenavides@gmail.com)

The 15M (indignados) Take Power: The Case of the City of Madrid.

In this paper I analyze the processes of political institutionalization of the 15M or indignados movement in Spain.

In other previous works I have analyzed how new parties as Podemos, have born and grown before arriving into the public institutions. On May 2015 Podemos and others political formations from the 15M won the municipal elections in cities such as Madrid, Barcelona, Cadiz and Santiago de Compostela. They have also entered in the government of some regions as Valencia, Aragón or Valladolid and have representations in almost all the local parliaments.

This time I will discuss how they are translating the 15M political demands and claims into real politics articulated from the new municipal governments.

The proposed paper aims to make a comparative analysis between the demands expressed by the 15M, both in the demonstrations in the square and in the subsequent mobilizations since 2010, and the real political measures taken after several members come to power through the new parties and political coalitions.

To do this I will focus on Ahora Madrid, party emerged in 2015 from the confluence of different social and political movements, all of them related with the 15M, which won the elections of the City Council of Madrid. We'll see how the demands of the new social movements, as participation, real Democracy and dignity, translate into new formal policy after a year in the local government. I also analyze the reactions of the traditional parties to these new formations and governments.

En Los Márgenes Del Canon Sociológico. La Cuestión De Las Masas En Los Umbrales Del Siglo XX: Gustav Le Bon, Gabriel Tarde, Georg Simmel y Robert Park.

El problema de las masas emergió como preocupación principal de la sociología, no tanto en los autores "clásicos" de la disciplina, en quienes pueden encontrarse sólo referencias incidentales, sino en autores algo más marginales al *canon*. En esta dirección, debe mencionarse en primer lugar a Georg Simmel en Alemania, con su esfuerzo de instalar el concepto de "masas" como una de las formas fundamentales de la socialización. En segundo lugar, corresponde señalar a Robert Park en EE.UU, por la centralidad de su preocupación por las relaciones entre "masas" y "público". Por último, cabe destacar a Gabriel Tarde y Gustav Le Bon en Francia, el primero por realzar los conceptos de "imitación" y "sugestión", y el segundo por ser una figura sumamente influyente y por sus aportes desde el campo de la "psicología de las masas". De las múltiples contribuciones que esos autores hicieron al debate sociológico sobre las masas, en esta ponencia ponemos en discusión un conjunto de lecturas que versan sobre una serie de "textos claves" – *Las leyes de la imitación: estudio sociológico* y *Creencias, deseos, sociedades. Ensayos para otra sociología* (Tarde), *Psicología de las masas* (Le Bon), *La masa y el público. Una investigación metodológica y sociológica* (Park), *Sociología. Estudios sobre las formas de socialización* y *Cuestiones fundamentales de sociología* (Simmel). Las mismas están organizadas en torno a cuatro ejes: a) identificar los diversos vocabularios que se utilizan en esos textos para aludir a los problemas de las masas; b) describir los problemas sociales (migraciones, urbanización, democratización, etc.) en respuesta a los cuales, desde tres contextos nacionales divergentes, se produjeron reflexiones en torno a las masas; c) circunscribir y explicar las principales tensiones conceptuales que las atraviesan (masas-individuo, masas-élites, etc.); y d) explicitar los diversos registros de análisis (descriptivo, explicativo y/o normativo) presentes en los textos.

Leisure: Pathways to Sustainability

In the current context of large social transformations, where humans experience a new relation of time and space, leisure and participation become key issues in the debate relating to sustainable development and life quality. It is important to consider that leisure and participation, while individual options arise in the dynamics of society and express themselves in their own everyday reality of various segments of the population, and may be understood as a social and cultural issue. Social because it concerns the man in society, namely, the relationship between the man and his peers, and also, with the environment, which dynamic is reflected in the cultural complex of certain region. It is cultural once approaching humans and their subjectivities, their habits, traditions, singularities and social habits.

The definition of leisure is dynamic and changes according to the social-cultural habits of mankind, as well as the perspective of different theoreticians. We have outlined the thought of Joffre Dumazedier because we consider him a thinker whose ideas and questions are important for the current discussions. In our view, Dumazedier was a visionary when dealing with the question of leisure from the perspective of a better life quality. Some leisure roles may be the rest, fun and human development – social and personal. It is stressed that the human develop-

ment is associated with the development of the physical, biological and psychological capabilities, but, above all, the development of the sociability, freedom, autonomy, creativity, and the exercise of citizenship.

Considering this perspective and in order to contribute to the discussion regarding leisure and life quality, this study approaches the leisure as an important instrument in the conduct of the individual to their full development, which is a condition for a more active participation in society and, consequently, for a better life quality.

ALVES, BENNO* (Universidade de Sao Paulo, bennowa@gmail.com)

Racismo, Democracia Racial y Blanquitud: Un análisis De Trayectoria En El Sur De Brasil

La conexión entre vida individual e historia es un problema clásico de la sociología. La noción de trayectoria se constituyó como uno de los puntos de partida para abordarlo y luego originó numerosas perspectivas diferentes. Aunque muy criticados en los últimos años, sobretodo en favor de una mayor atención a los aspectos subjetivos de las historias individuales, los estudios de trayectoria todavía pueden rendir aportes analíticos únicos si incorporan y reflexionan sobre esas críticas. Basado en un estudio empírico sobre la excepcional trayectoria de ascensión social de un militar y empresario negro en el sur de Brasil a mediados del siglo XX, intento dimensionar las potencialidades y límites del método, con especial atención para los problemas relacionados con el racismo y la discriminación. Argumento, a partir del caso empírico, que la reconstrucción y el análisis de trayectorias individuales (en este caso, combinando varios tipos de materiales, como documentos, noticias, entrevistas y fotografías) es un método privilegiado para desvendar aspectos micro-sociológicos de la discriminación racial en el interior de las instituciones; bien como para ilustrar aspectos macro-sociológicos más o menos evidentes del racismo y de una estructura social racializada. Por fin, reflexiono sobre las especificidades del racismo en un contexto regional que desafía los estereotipos sobre la situación racial a mediados del siglo XX en Brasil. Si a nivel nacional la "democracia racial" era prácticamente consenso en los años post 1945, en el sur se consolidaba la formación de una identidad regional blanca y europeizada.

Coping with Precariousness in Austerity Times

Precarious employment has been the main obstacle in the transition of the Portuguese youth into adulthood in the last decades. This problem has been significantly amplified by the economic crisis and budget cuts affecting the Portuguese economy and society since the beginning of the global financial crisis. Continuous cycles of unemployment, precarious employment, underemployment and persistent low standards of living fostered by continuous waves of austerity measures have substantially eroded any glimpse of foreseeable hope on a better future for a significant part of the Portuguese younger generation.

Meanwhile, different strategies were devised and put in motion in order for this generation of young people to cope with this harsh present and probable future. This includes staying at the parent's' home for longer than envisaged in an assisted-autonomy condition and hoping for a reversal of the current conditions; the mobilization for political action (institutional and/or direct) among other precarious workers in order to put some pressure for change; migrate to another country with more favorable conditions to earn a living and complete other steps in the transition to adulthood. However, for a significant part of the affected, precariousness has not been a transitory stage on their lives; it has evolved to an enduring condition lasting for a significant part of these people's economic/professional activity. And this is a rather new circumstance for western post-war societies.

This paper is based on almost 100 interviews on young people's precariousness done for different research projects, including a number of follow-up interviews with protagonists of long precariousness 'careers'.

Children Playing with Narratives. the Relevance of Interaction and Positioning in the Study of Cultural Identity Construction.

This paper focuses on narratives related to cultural identity that children, engaged in learning Italian as a second language, generate in interactions amongst them and with adults in a school setting.

The relevance given to the observation of interactions allows to reflect on cultural identity and sense of belonging as positioning modes, focusing on pro-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cessual, relational and contextual aspects that guide the production of different narratives.

The analysis of interactions and positionings represent therefore relevant perspectives both for the comprehension from a linguistic point of view of narratives' production in communication processes and to widen reflections on children as active participants in social processes. In particular, through this paper it will be possible to observe how positioning strategies activated inside the group by children on one side and narratives concerning their traveling experiences on the other, are interrelated and create an interactional play through which children together with adults becomes co-constructors of meanings linked to identity, culture and belonging.

Based on video recordings of workshops with children, living frequent international mobility experiences, realized during a research year in two italian primary schools and one first grade secondary school, this presentation aims to reflect on how children deal with and play with transnational experiences in their daily school life. The analysis of the ways through which children intertwine stories to sustain particular and never fixed identity positionings represents an opportunity to introduce reflections on the relationship between essentialist and non-essentialist treatment of concepts like culture, identity and belonging.

Desafíos De La Movilidad Internacional De Jóvenes Universitarios Mexicanos

En las últimas décadas, los organismos mundiales, regionales y nacionales han impulsado políticas, estrategias y acciones de cooperación para promover la movilidad internacional e impulsar la formación de jóvenes científicos mexicanos en América del Norte y Europa. Un estado del arte de las investigaciones sobre la problemática, entrevistas a profundidad y análisis del currículum vitae de jóvenes universitarios mexicanos, que han realizado estudios de doctorado, estancias de investigación y/o posdoctorado en países desarrollados, revelan los desafíos de la movilidad internacional. La presente exposición destaca los desafíos de la movilidad internacional, de la permanencia en el extranjero y/o del retorno al país. El primer desafío de la movilidad internacional y la permanencia en el extranjero de los jóvenes universitarios mexicanos, para formarse como científicos sociales en universidades del extranjero, es participar en grupos de investigación consolidados en las instituciones receptoras. El segundo desafío es el retorno al país de origen con el título de una universidad extranjera, con frecuencia sin garantía de encontrar trabajo en instituciones públicas de educación superior y/o de investigación científica. El tercer desafío son las políticas de los organismos nacionales y las universidades públicas que, habiendo financiado la formación de los jóvenes científicos mexicanos en universidades del extranjero, no garantizan su integración profesional de retorno al país. Frente a la falta de oportunidades, los jóvenes científicos mexicanos con grados en el extranjero enfrentan problemas de marginación, exclusión y vulnerabilidad cuando regresan al país. Se requiere la formulación de políticas y directrices éticas que contribuyan al desarrollo personal para la vida y el trabajo de los jóvenes científicos, al fortalecimiento de los campos de conocimiento, y al desarrollo institucional y nacional de la ciencia y la tecnología en México.

AMARAL, GIVERAGE* (University of Campinas, tagivera85@gmail.com)

The Institutionalization Process of the Environmental ISSUE in Mozambique, 1980-2000.

In Mozambique in the late 80s, began a process of transition from a centrally planned economic system to a market economy, this process was marked by a gradual decentralization of public administration and the cross consideration of environmental issues.

Based on the fact that globally in our times, the research and environmental studies present themselves as central to the multiplicity of knowledge fields, we reflect on the process of environmental issues institutionalization in Mozambique, having as our main goal, the understanding of the political and economic contours, that what we consider to have been the beginning of this process, 1980-2000.

As a result, we found that the beginning of the environmental issue institutionalization process in Mozambique from 1980-2000, was the result of government initiatives and the requirements inherent in the development process, and this process was marked by rhetorical strategies of different styles and motifs, pierced by political and financial conflicts, both at state level and civil society, poorly existent.

This exploratory research makes use of qualitative methods of analysis and data collection techniques that range from the literature review, documentary research, semi-structured interviews, to discussion groups. Thus, this research presents and describes the socio-historical circumstances that interspersed the process of institutionalization of environmental issues in Mozambique, indicating

exogenous and endogenous factors, which proved decisive for the current environmental institutional Mozambican state.

From Tension to War: A Fuzzy-Set Analysis on Levels of Civil Conflict in the Middle East and North Africa

In this article, we study the conditions and combinations of factors that lead to different levels of civil conflict in the Middle East and North Africa. For the most part, previous quantitative studies have focused on the civil war onset. Scholars of conflict have yet to examine the combination of factors that give rise to different levels of conflict. Therefore, the scholarship on civil war lacks empirical justifications for isolating what factors are most prominent for high-intensity conflicts. Given this gap in the literature, this paper seeks to present an approach that can both theoretically and empirically articulate the contours of conflict intensity in a given case or cross-case analysis. In order to move beyond the current framework of civil war studies, we code levels of violence on a continuum from "low levels of tension" to "civil war". We adopt a Qualitative Comparative Analysis (QCA) approach (based on fuzzy set-theoretic relations (fsQCA)), to demonstrate what combinations of causal conditions lead to the different forms of violence on the continuum. We argue that an fsQCA research approach is needed in order to advance the scholarship of conflict on both theoretical and empirical grounds, and in order to identify the combination of conditions that define different levels of conflict. The study uses 47 cases of intra-state conflict in the Middle East and North Africa from 1946 to 2013 and tests the interaction between the following five causal conditions: 1) state capacity 2) dissident groups' access to political power, 3) the size of military, 4) foreign intervention and 5) threats to the status or identity of groups. We argue that the causal combination of increased military size, multiple forms of foreign intervention and severe threats to group identity is the most consistent in explaining conflict escalation in the Middle East and North Africa.

AMATRUDO, ANTHONY* (MIDDLESEX UNIVERSITY SCHOOL OF LAW, T.Amatrudo@mdx.ac.uk)

What Bit of 'urban' Is Being Socially Controlled and Why?

Following the UK riots of 2011 there has been a sustained emphasis upon social control , especially in London. The capital city has rapidly gentrified and now social control is routinely used as a tool and as part of the ongoing process of re-modelling the urban landscape. A cursory glance will show that police tactics such as 'stop and search' and 'offender profiling' represent an aspect of this process of gentrification. They represent an assault upon black, Islamic and working class citizens in an effort to move them on and out of the urban space they call home. This police attention these citizens receive is as much an assault upon a settled community as the ever-rising rents and child-care costs that make London life increasingly difficult. This paper will draw attention to theways in which the policing, rising rents, gentrification nexus makes urban life increasingly problematic for huge numbers of citizens. The paper will flag up data and recent policy developments to make its case. It will also look at recent scholarship concerning the ways in which black, Islamic and working class citizens are coming under attack simply because the homes they live in are now so valuable. It will argue that the policing, rising rents, gentrification nexus is a threat to many Londoners and how this 'London model' is being rolled out in cities around Europe.

AMBROSINI, MAURIZIO* (university of Milan, maurizio.ambrosini@unimi.it)

From Illegality to Tolerance and Beyond: Irregular Immigration As a Selective and Dynamic Process

Immigration defined as 'illegal' is a typical area where the dominant representations differ from social phenomena. In particular, actual policies differ from declared policies, and the behaviors of many actors, including public authorities and civil servants, diverge from declarations and formal rules. Within this framework, this article deals with two issues. The first is the selective treatment of irregular immigration by receiving societies: some forms of irregular immigration are widely tolerated, others are more actively rejected. The second, and related issue, is the easier transition to a legal status of some irregular migrants, especially those who encounter some forms of tolerance in receiving societies.

　　　***denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Focusing mainly on Southern European and the Italian setting, the paper will start by discussing how some immigrants are labeled as illegal and thus stigmatized (the case in point are now asylum seekers), while other immigrants, even when living in the receiving society without the necessary authorization, are neither perceived nor treated as 'illegal': the main case in point are women, hired by native households as domestic and care workers.

The paper will then discuss the passage to a legal status, in particular through regularization processes, concerning mainly 'tolerated' irregular immigrants. To explain first tolerance and then the passage to a legal status, I will focus on actors that enable immigrants' survival and progression, and in particular on the intermediaries between the receiving societies and irregular immigrants.

In conclusion, the paper will highlight: 1) the relations between the social recognition and formal authorization of migrants; 2) the devices that immigrants can use to acquire legal status; 3) the main intermediaries who support immigrants in entering a new country, integrating into local society, and acquire legal status

RC06-83.1

AMBROSINI, MAURIZIO* (university of Milan, maurizio.ambrosini@unimi.it)

Latin Women and Italian Families: Agency Beyond Structural Constraints and Exploitation

Latin immigrant women and also men are largely involved in Italy, as in Spain, in Greece and in other countries, in the supply of care services and they are especially so in elderly care. Their work is embedded in a specific care regime: it is undertaken mainly in the recipients' households, often around the clock, and on a live-in basis, so that it supports a system in which the family remains the central locus of care delivery to frail people. Secondly, it employs a large number of workers irregular in regard to the employment relationship, and often also to their legal status.

The conditions of Latino women are particularly heavy: they are often young mothers, in many cases single mothers, who leave their children at home, struggling to care them at a distance, and they face many difficulties if they decide to reunite their children with them.

The paper will present the results of various research studies on the topic carried out in Italy within the time-span of a decade. It will discuss how irregular migration is in fact tolerated, when inserted in care work at the service of the growing needs of native families; how the system that I call "invisible welfare" works; and how Latin care workers find possibilities of agency, despite the constraints of the legal order and the exploitation they often experience at work. Several resources will be highlighted, ranging from support from their networks, to "reverse remittances" they receive from their families, from relations with their employers, to the action of trade-unions and NGOs, from marriage alliances to the aasertion of social utility of their work

SCHEIBELHOFER, ELISABETH (Department of Sociology, University of Vienna)

Social Protection: Practices and Experiences of Mobile Europeans. the European Promise of Portability of Social Rights Revisited

This contribution is based on an internationally comparative research project with the title "Mobile Welfare in a Transnational Europe. An Analysis of Portability Regimes of Social security Rights" (acronym TRANSWEL; project coordinator: Prof. Anna Amelina). This four-country, comparative, and interdisciplinary project addresses the issue of social rights of EU citizens beginning their mobility from the 'new' EU member states and who move to live and/or work in 'old' member states. Empirically, the project traces the migration of regularly and irregularly employed migrants and their family members, and their social security rights between four pairs of countries: Hungary-Austria, Bulgaria-Germany, Poland-United Kingdom and Estonia-Sweden.

The contribution for this session will outline the overall research agenda in order to provide an input how to research questions addressed in this session such as (global) social protection, the institutional actors involved, and the actual access of migrants to welfare provisions in transnational terms. Furthermore, we will present results from our case studies that highlight the limitations of the practices migrants engage in when accessing their portable social rights within an EU context. We will do so by drawing on different data sources and triangulating research methods: Expert interviews, and document analyses for the case of Hungary and Austria show for example how these two inherently different administrative logics interact. We will show how the opaqueness and heterogeneity of the social security systems hinder the access for migrants. Also, based on a quan-titative survey and first qualitative interviews with migrants, we will confront these analyses with the actual practices of and experiences with portability of migrants.

AMIN, PIRZADA* (Kashmir University, pirzada.aminkashmiruniversity@gmail.com)

Tourism and Development: Integrative Perspective in Kashmir Context

*Dr. Pirzada M Amin: Professor, Department of Sociology, University of Kashmir, Hazratbal, Srinagar (J&K), India. Email: *pirzada.aminkashmiruniversity@gmail.com* Cell+91 0 9419015036

**Javeed Ahmad: Sociologist, Department of Community Medicine, SKIMS, Soura, Srinagar (J&K), India.

Tourism as a major tool of development holds a global significance. This is true of the state of Jammu and Kashmir especially the Valley of Kashmir .The valley has remained an internationally acclaimed tourist destination and has contributed significantly to the (GNP) Gross national product and (SGDP) State Gross Domestic Product besides generating huge employment avenues in the tertiary/service sector. Owing to its huge role in the all-round development the tourism holds a strategic importance in the state. The tourism assumes an imminent significance , given the fact that this sector remains the only conduit between the state and the outside world during the course of turbulent times. By virtue of the gainful employment, and regional development etc., this sector has enhanced the participation of the people both at micro and macro-levels alike and, hence, has gone a long way in maintaining and restoring the social order in the valley besides fostering the national integration. The primary and secondary sources shall focus on the impact of tourism and its ramifications on the social fabric of society in order to identify how the development contributes in receeding the threat to society in terms of poverty, vulnerability to the deviant behavior etc. The development of tourism plays a key role in the maintenance of social fabric as advocated by the theory of broken windows. Thus the paper in the context of Kashmir will offer deep insights of the role and essence of tourism in order to help the State for its developmental agenda.

Key Words: Integration, Nationalism, Poverty, Development, Employment, Tourism.

GEIMER, ALEXANDER (Universität Hamburg)

Communicative Knowledge and Multi-Level-Analysis. Ideas on the Relation Between Discourses and (Social) Milieus Based on Empirical Data.

In German qualitative social research different perspectives of combining research methods are being discussed recently (Kelle 2008; Flick 2011). However, studies applying a *comprehensive approach to multi-level-analysis* are still rare (cf. Helsper et al. 2010; Nohl 2013). Within this context, Helsper et al. (2010) stress the importance of *conceptualizing* the different social levels *and* the *systematic relations between them*.

Following these considerations, the purpose of the presentation is twofold: First of all, it presents thoughts on how to conceptualize the relation between the meso-level of social milieus (Bremer/Lange-Vester 2014) and the macro-level of social discourses (Keller 2011; Diaz-Bone 2005). The main argument here (following Bohnsack 2014 and Geimer 2012) is that it is important to take a differentiation of categories into account. The so called "implicit knowledge" (Loenhoff 2012) is therefore considered, on the one hand, as a collective and embodied form of knowledge, which guides action (cf. Bourdieu`s "sens pratique", Bourdieu 1992); on the other hand, as a collective knowledge that takes the form of an interrelated system of statements that implies norms (cf. Goffman`s "identity norms", Goffman 1963). Referring to the terms of Mannheim, the latter can be considered a "communicative" (Mannheim 1980|1922), the first a "conjunctive knowledge" (ibd.).

Second, empirical material from a current research project on occupational careers of politicians and artists (Geimer 2013) will be provided. The study focuses on the question in how far the interviewees in their answers relate to anything like "an identity norm of authenticity" (Geimer 2014). We will show that the very same material can be analyzed either with regard to the milieu-related and the discourse-related implicit knowledge. This will be discussed in regard to the question of a multiple contextualization of single cases (Nohl 2013) that allows for an insight into the relations *between the two levels*.

Educación y Complejidad: Hacia Una Articulación Interdisciplinaria

La exigencia de formas multidimensionales en el ámbito de una educación orientada a la formación integral no solo de estudiantes, sino de maestros, coordinadores y directivos de instituciones académicas, exige de nuevas perspectivas para la comprensión de su dinámica compleja y una mayor potenciación de su reflexividad, orientada a toma de decisiones. Dos atributos de dichas formas son la articulación disciplinaria y la transversalización de conocimientos comunes a ellas. Ambos atributos implican un entramado que puede tomar diversas formas dependiendo de su contexto.

Estos retos los enfrentamos desde una perspectiva Sociocibernética, que además de formular una organización inteligente de sus partes y relaciones, nos permite enfrentar los retos de una metodología orientada a la sucesiva aproximación en la definición de un objeto de conocimiento compartida por varios especialistas.

En este trabajo sintetizamos una unidad de análisis multidimensional que nos permite formular dicha transversalidad. En ella incluimos un componente epistemológico, uno social y uno cultural engarzados y acoplados desde una propuesta de correspondencias e isomorfismos en el marco de la epistemología genética piagetiana. La concepción sistémica se caracteriza por tener diversas posibilidades para adaptarse a las necesidades articuladoras propias de la dinámica en la educación superior. Posteriormente describimos un caso de estudio, derivado del trabajo de campo dentro de la Universidad Veracruzana en México, y más adelante presentamos los retos y hallazgos que hemos encontrado en la conformación de un equipo de trabajo interdisciplinario orientado a dichos fines. Concluimos sintetizando algunos productos de la investigación, en el marco de una Cibercultur@, entendida como una forma de desarrollo integral ante problemas complejos.

AMPUDIA DE HARO, FERNANDO* (CIES-IUL, fernando.ampudia@europeia.pt)

WHAT CAN WE Learn about Financial Crisis with Norbert Elias?

The aim of this paper is to offer a preliminary approach to the current financial crisis using the sociology of Norbert Elias as a theoretical reference. More specifically, this paper focuses on the financial system as a global figuration in order to analyze its social logic of functioning and its connections with certain models of sociability and behavior.

As a global figuration, the financial system can be considered the result of the confluence of a triple vector of forces:

a) The formation of competition spirals. The participants in financial markets, according to a criterion of maximizing profitability, determine a context where competition gradually increases.

b) The constitution of a complex web of interdependences which connects an undetermined number of individuals and institutions around the world.

c) The constitution of a set of limits and obstacles for the action of external constraints over the participants in the financial system.

This triple vector is related to a concrete model of sociability and behavior based on:

a) The social production of indifference as an effect of the decivilizing effects of the high levels of financial interdependency.

b) The logic of free-rider and the lack of attention over the social consequences of the individual action.

c) The promotion of des-identification patterns between the financial established (states, countries, corporations, individuals, communities...) and financial outsiders.

In sum, this paper proposes a framework of a figurational approach to the financial system; an approach which, inherently, includes historical and comparative considerations in order to fully understand the social problems linked to the financialization.

Children's Rights or Child Protection? Policy Translation and Institutional Change in Post-Soviet Kazakhstan

While much of conventional analyses of Western welfare states suffers from "methodological nationalism" (Wimmer & Glick Schiller 2002), the study of post-so-cialist social policy identified a crucial role of global policy actors early on (Deacon 2000). Post-Soviet social policy reform is often constructed as a replacement of 'old', Soviet policies with 'new', global, and, essentially, Western policies. Challenging this assumption, this paper applies an Agency, Structure, Institution, and Discourse (ASID) framework (Moulaert & Jessop 2006; Deacon & Stubbs 2013) to the study of the introduction and translation of the global children's rights framework in the context of post-Soviet Kazakhstan. The main research question is as follows: What are the roles of transnational policy actors and global discourses in the post-Soviet child welfare transformation? Drawing upon key informant interviews conducted in 2012 and various texts, I examine the following dimensions of transnational social policy. First, I approach "*agency*" by identifying distinct roles and the relations of power and interdependence among three categories of transnational policy actors: (1) global organizations; (2) national state agencies; and (3) domestic NGOs. Second, I look into competing and shifting policy *discourses* as the drivers of *institutional* change. While the Soviet child protection system was based on the premise of a paternalistic and benevolent state, a policy idea which I refer to as "Soviet welfarism", the post-Soviet child welfare reform was driven by the children's rights discourse transmitted by global policy actors through global policy instruments. My main argument is that the change in child welfare institutions was a function of the "embedded agency" of interdependent transnational policy actors who played distinct roles in the transmission and translation of global policy discourses.

Informal Sector As an Instrument of Job Creation

The Paper examines the structural functional characteristics of the Informal Sector in India with special reference to Handicrafts in Orissa, Construction Workers in Delhi and Rag-pickers and Recycling Industries in Poona. It analyses the size, capital outlay, mechanization, skill levels, borrowings and labour structure of the Informal Sector in the selected areas of enquiry. It focuses the spotlight on certain inherent weaknesses in the Sector and seeks to discover ways and means of overcoming them. It also examines the kind of infrastructure and institutional support services which the Government, academic & technical institutions, banks and advisory organisations can play in strengthening this sector. It also seeks to take advantage of the inherent resilience of this sector and its low overhead expenses with a view to exploring opportunities for its economic growth. Further, it examines carefully the possible threats to micro-enterprises in the Informal Sector from competition posed by enterprises in the organised sector and seeks to carve out niche areas where these micro-enterprises can have a competitive edge. In this manner, the Paper adopts an integrated approach towards converting a sector with a high incidence of morbidity and mortality amongst its micro-enterprises into a sector which creates "decent jobs" and has the potential of entering the organised sector. The paper attaches critical significance to Appropriate Technology which does not displace labour but reduces drudgery in informal sector enterprises while at the same time enhancing their productivity. The Paper also dwells on possible linkages between the formal and informal sectors which are symbiotic rather than exploitative. In a nutshell, the Paper seeks to make a contribution towards the international debate on job creation.

Gender and Youth Citizenship in Contexts of Postcoloniality: The Marginalisation of Muslim Youth in Ghana

Since first gaining its independence from British colonial rule in 1957, the institution of democracy in Ghana is recognised as having been fraught and contentious. At different points, those in power have been determined through military coups, rather than through the ballot box. However, although sharing many of the demographic characteristics of its neighbouring states, such as its significant youth population, little attention has been given to youth's religious affiliations and how this may constrain their active citizenship. While the majority of the population is Christian, Ghana nevertheless has a significant Muslim minority (over 18%). However Ghanaian Muslim youth have recently gained prominence in local media, both in relation to protests about anti-Muslim discrimination in Ghanaian schooling, and within higher education, through the revelation that a Ghanaian student had left the country to join the organisation known as 'Islamic State'.

In the context of wider concerns about youth's radicalisation, this paper will report from a recent research project exploring Muslim youth identity construc-

tions in Ghana, focusing in particular on the intersection of nationality, religion, gender and ethnicity. As in Dunne et al (2015), identity is conceptualised through post-structural, post-colonial and feminist theories, as a discursive production within which difference is constitutive (e.g. Hall, 2001). Focus groups were conducted separately with male and female Muslim youth, and those who were in higher education, in school, or out-of-school. The study was conducted by researchers from two universities in Ghana and was further supported by local 'youth researchers', in order to facilitate the articulation of youth's identity affiliations and their 'constitutive others'. Our analysis will illuminate Muslim youth's sense of marginalisation, in particular foregrounding the intersection of gender with nation and religion as important sites of inequality.

Angry or Bored? Understanding the Acts of the "Gaza Rioters" in Oslo, Norway

The Israeli invasion of Gaza in late December 2008 triggered demonstrations – or as several commentators termed them, *riots* – in downtown Oslo, as it did in other European cities. Many young people from the "immigrant dense" suburbs of Oslo participated in these protests. While peaceful protests are common in the capital of Norway, the demonstrations in December 2008 were followed by unusually violent actions on January 8 and 10, 2009. Downtown Oslo turned into a battlefield with vandalized shops and "war-like" clashes between the demonstrators and the police. A central point in the media coverage of this extraordinary situation was that most of the "rioters" were youth with an immigrant background. Commentators speculated that this demonstration offered these youth the possibility to vent their frustrations towards Israel, as well as towards mainstream Norwegian society. Based on ethnographic research in Oslo prior to, during and following these demonstrations, it is argued that several of the rioters in the streets of Oslo were not motivated by a more or less "marginalized" position in the larger Norwegian society. Instead, "rioting" was a spur of the moment act. Many were tempted to go downtown in search for "fun" or "excitement" as they received text messages or heard from friends that something extraordinary were going to happen: It was not something they had planned or thought much about. When finished, the "angry rioters" resumed their ordinary or banal everyday life as friends, students, workers, or young men looking for a job. Even if it is convenient to categorize rioters as "excluded", "marginalized" or "angry", speaking to and observing these individuals can reveal very different attitudes and experiences that may help us explain the (particular) conditions for such extraordinary acts.

Risk and Change in Everyday Food Habits

This paper analyses the relationship between food, health risks and society. The paper is based on four separate fieldworks over a period close to 35 years (from 1981-2015) in a small coastal community in northern Norway. The village was earlier an isolated fishery community where people got most of their food from the sea and from their small farms. Some years before my first fieldwork, they got a road that connected the village to the municipal center. The women started to work outside the home, the farms were shut down and people started to buy most of their food.

During my study period, there has been a tremendous change in food habits in the village, from more traditional to semi-manufactured food, and in the last fieldwork more local grown food. Preventive medicine and risk for disease have gradually been integrated in their everyday food choices. The women were the drivers to change the families food habits in accordance with official health advises. Sometimes the women had to "force" the men to change their diet. For men food was not only about health, they wanted food that tasted good, and they liked traditional, "unhealthy" food. During my last fieldwork (2014/15), the men in the village were the drivers for implementing more local grown food. They said that local food tasted better. They also argued that it is healthier since it is "cleaner". Men has also started taking up fishing, hunting, and they have invested in expensive equipment in order to preserve food.

In this paper I will discuss the changes in food habits in this village in relation to their perception of food, risk and health. The relationship between the genders will also be discussed.

Age Negotiation and Active Bodies at Senior Camps in Sweden

Since the beginning of 2000 senior camps have been established on several places in Sweden, with the purpose to decrease social exclusion and improve health amongst elderly people. These senior camps build on notions of what it means to age and to "be old" in relation to activity, health, functional abilities and participation in society. In a cross-scientific and holistic study at CASE, Lund University these senior camps have been studied from three perspectives 1) History of ideas: What is the cultural meaning of senior camps?. 2) Ethnology: How is age made visible and important at senior camps? 3) Occupational Science: What are the individual social and health aspects of the senior camp? In this presentation we focus on findings from part study 2, that is, how age is performed and made meaningful at senior camps. The data consists of ethnographical field notes collected from two central senior camps. We are going to show examples of how and when the participators use "age negotiation" and "perform age" in social relations at senior camps and discuss how this negotiation can be interpreted relative to societal norms about older people and health and what is considered "age appropriate"; but also how the seniors use age performance to object to images of older people or to claim their independence. In the perfomance of age the body and functionality becomes central and bodies are compared, evaluated and discussed in relation to age and ageing.

"We Are All Digging Our Tunnels": Health Professionals' Strategies for Managing (Work-related Mental Ill Health in) the Swedish Welfare System

This presentation addresses the topic of professional work, through an empirical study of health professionals' efforts to manage people suffering from work-related mental ill health. Focus is directed towards the dilemmas facing the many interrelated professions engaged in this area. Therefore, the study examines various negotiating strategies that different kinds of health professionals employ in relation to organizational frameworks, national economic incentives and the social security system.

Mental health problems are a growing global concern. In Sweden, the welfare state's cost of mental health has been particularly high since the 1990s. Dealing with mental health issues has therefore received political attention, not least in regard to how it is related to the working environment. Due to its political embeddedness, work-related mental ill health is a useful starting point for drawing attention to the complex and intertwined relation between professional work, policies of health and illness and the organization of care within the Swedish welfare system.

The presentation is based on qualitative methodology, consisting of fieldwork and 30 semi-structured interviews within Swedish primary health care and occupational health care. Informants are health professionals involved in the diagnosis and/or treatment of work-related mental ill health: physicians, therapists, counsellors, occupational therapists, nurses and behavioral scientists.

In performing their professional roles when managing work-related mental ill health, results point towards health professionals' employing primarily four strategies. These strategies are often locally articulated, individual solutions. Yet, there is a common structural character to the type of dilemmas the various professional groups encounter. Furthermore, while some structural aspects are negotiable through tampering with diagnosis, or redistributing resources, others, as abiding to the Swedish Insurance Agency's rules, are not. Finally, while health professionals often stay within the given structural frameworks, on rare occasions, they consciously go against them.

Discussing the Uses of Public Space By Children of Bangladeshi Immigrants in Portugal: A Small Urban Square in Porto

The immigration of Bangladeshi to Portugal is a recent phenomenon and quite different from the other immigrant flows to this country by more 'traditional' immigrants from Portugal's ex-colonies. Since 1986 the flow of Bangladeshi immigrants to Portugal has been growing in numbers compared to previous years. A lot of immigrant families from Bangladesh live in one of the most touristic and historical zones of Porto. In this area exists a small urban square close to Porto's main train station where their children frequently spend their free time.

Based on the Actor-Network Theory (ANT) approach of Latour, the interactions of these immigrant children in/with this area, seen as a network in action, have been mapped through observations, interviews and interactions with 16 children proceeding since July 2015. Episodes under analysis will focus on the connections between heterogeneous context elements like immigrant theories, praxis, ob-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

jects, culture, human, non-human, religion, places, space, etcetera. In all occasions, the children used the area only in their own ethnic groups. Their presence and actions are strongly divided by gender: the girls prefer to use the place more to chat, the boys are always playing football or Beyblade.

Despite the vast theoretical literature which draws the distinction among space – homogenous and measurable element – and place – existing by the meaningful relation with people or other places - for Latour there is no sense to talk about this opposition, because every space is in constant and impermanent association with human or non human.

Once Portuguese children do not use the urban public space like Bangladeshi immigrant children, does this space represent an extension of their (private/domestic) place? Furthemore, what kinf of places and childhoods are being built through this interaction?

Teaching with the Flipped Classroom Model!

Statistics, a branch of mathematics, plays a central role in many fields of study, including the social sciences. However, many students who attend statistics courses experience feelings more of horror than of joy. In addition, students who fail in these courses often have to drop out. The present concept presents different teaching methods in an attempt to constantly improve the statistics courses and increase the quality of teaching. A key component is the analysis of didactic concepts and expert interviews. Prof. Spannagel, an expert on mathematical didactics, is well known in Germany as a pioneer of flipped classrooms. In an interview, he explained the method, and sparked my interest. It seemed time to test the concept of flipped classrooms.

Instead of face-to-face (or frontal) teaching, video lessons are made available to students as preparation for the course. Seminars give students the chance to work with others—for example, it helps them solve tasks and take part in discussions. Additionally, the learning platform records the meetings, and gives numerous exercises and self-tests.

In order to evaluate the concept, the choice fell on a combination of qualitative and quantitative methods: Guided interviews and standardized questionnaires. The first results show a positive picture: For all the seminar participants who were questioned, the self-learning phase posed no problem. They all had had a look at all videos before the presence phase.

The free time division did not cause any difficulties. For example the students were able to make their ideas clear without asking questions, as is otherwise usually done in seminars. The concept seems to be suited to students with good as well as poor knowledge of mathematics. With the videos, the inhibition threshold in dealing with statistics apparently sinks, even though it is judged to be difficult.

ANDREEV, ANDREY* (Institute of sociology, sympathy_06@mail.ru)

Images of Past and Present in Modern Russian Society

Perception of history is a very important topic because historical images participate in determination of political orientations and axiological predispositions. Taking that in mind a group of Russian sociologists lately carried out a special empirical investigation aimed to describe and analyze the representations of past and future in Russian mass consciousness.

As the poll showed, nowadays the Russians are not inclined to seek for their social ideal in the past. Even in 2000 not more than 15 % of respondents asserted that "a good life" began with the transition to market economy, but in 2012 about 30 % of them supported the opinion that the time when "the Russian dream" can be realized is the modern period of national history.

But what can be said about those who associate "the Russian dream" with the unrealized historical alternatives? Such a position is also popular, it is shared by approximately one third of population. But the social profile of this part seems to be rather vague and indefinite.

The favorite historical hero of the Russians is Peter the Great. The second in this rating goes Catharine II. All the Soviet leaders from Lenin to Gorbachev strongly drop behind them. The lowest position occupy Eltsin who is favored by no more than 1.5 % of the sample. Paradoxically, the correlation between political orientations of the Russians and their sympathies to different historical persons is very weak. The only exclusion is Lenin. The communist voters 2.5 times more frequently than the others see him as an incarnation of national dream. But today even among the left-wing people Peter the Great is much more popular than the leader of October revolution (36 % of the respondents vs 24 %).

Ethnicity Conflicts and Nationalism in the Former Soviet Union Countries

The objective of the paper is to discuss empirical research and findings (2012-2015) as well as theoretical and methodological frames of studying nationalism and ethnic conflicts that were discussed during a number of summer schools developed by InterComCenter in 2005-2010

On the basis of socio-political analysis, current sociological and anthropological theories the paper will identify the patterns and underlying causes of success and failure in market making and its interlinkages to growing wave of ethnical tensions and conflicts between nations and inside one nation. Economic transformations undertaken by nation-elites in Eastern and Central Europe mostly under the banner of 'Europeanization'/ 'Westernization' have largely disregarded the role ethnic relations have played in the socio-economic development and the evolution of ethno-national identities during supra-national market integration in Europe. Better understanding of the logic of the evolution of ethnic identities and nationalistic issues in Eastern part of the continent, Caucasus and in Central Asia might contribute to the better understanding of the social and political regulations of new economic and political regimes and the developmental potentials of the European model of institutionalized or social capitalism.

The paper will consist of two distinct parts. Part one deals with theoretical and methodological discussion of how ethnicity and nationalism have been studied in the social sciences during the time of the USSR and aftermath. Part two is a discussion of empirical results and outcomes of the three field researches that was conducted in 2012-2015.

ANGEL, STEFAN* (Vienna University of Economics and Business, stefan.angel@wu.ac.at)

Persistent Household over-Indebtedness and Exits from over-Indebtedness. Evidence from EU-SILC

Whereas the literature on persistent poverty and poverty transitions in European welfare states is continuously expanding, there is much less research on consequences and dimensions of income poverty in a longitudinal perspective. This paper focusses on the dimension of (persistent) household over-indebtedness. Although a range of definitions for this concepts exists, the core element refers to illiquidity resulting in payment problems (arrears and/or defaults).

By using EU-SILC panel data 2010-2013 for 25 European countries two main research questions are addressed. First, the conceptual difference and degree of non-overlap of over-indebted households and households living in relative income poverty is investigated. Indicators of persistent poverty and persistent over-indebtedness (as measured through self-reported illiquidity and payment problems) are compared. It is analysed if (and how) these groups (income poor and over-indebted households) differ in terms of their socio-economic and socio-demographic structure. For whom is over-indebtedness only a transitory status and which groups face persistent illiquidity?

Second, by using statistical tools from survival analysis and complementary log-log models it is analysed which factors affect the likelihood of exiting over-indebtedness and how these effects differ compared to explaining transitions out of income poverty.

From a macro-sociological perspective it is also asked if over-indebtedness dynamics resemble the dynamics for income poverty if different welfare state regimes are compared. Particularly for exit rates from poverty, consistent country differences according to welfare regimes are not always found in the literature. For instance, if a welfare regime emphasizes active labor market policies, lower entries into and higher exits out of poverty should be expected. Such policies in certain states might elevate households above the poverty threshold, but may not translate into higher exit rates from over-indebtedness if wages, for instance are not sufficient to cover current expenses and (increasing) costs resulting from payment problems (interest rate).

LAMEI, NADJA* (Statistik Austria, nadja.lamei@statistik.gv.at)
HEUBERGER, RICHARD (Statistik Austria)

Using Register Data in Income Statistics in the Austrian EU-SILC: (Why) Do People Get Poorer?

EU-SILC (*European Statistics on Income and Living Conditions*) is a widely used household survey in in Europe. Several comparable indicators on social inclusion, among them the Eurostat poverty rates, are calculated from this source.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

In Austria, the national poverty threshold and headcount used to be calculated based on income data derived from SILC questionnaires. Since 2012, however, register data for selected income components is used instead. The transition to register data increased the at-risk-of-poverty rate (AROP) in Austria by about 2 percentage points.

In our paper, we take advantage of the fact that for the Austrian SILC 2011 to 2008 both register-based and questionnaire-based income data is available. We aim at providing explanations for changes in different aggregate poverty indicators by investigating the underlying changes in the distribution of household income as a consequence of using register data. It is asked which component (income type, weighting) contributes most to the change of the poverty headcount if register data is used instead of questionnaire data. We also look at overall and group-specific differences in measured household income and poverty headcounts between the two data source. Furthermore, by estimating multinomial logit and linear models with covariates referring to the interview situation (f.i. CATI vs. CAPI) and household characteristics we try to explain which households tend to underreport respectively overreport their household income.

Preliminary results show that the distribution of most income components at the personal and household level become more unequal if register data is used. We find that mean reverting errors - particularly for employee income - seem to drive the change of the poverty rate most: high income households tend to underreport whereas low income households tend to overreport their income. An open question remains to which extent this is due to social desirability and/or cognitive errors.

Social Cohesion and Hyper-Diversity in Milan, Italy: A Case Study

This paper aims to analyse the participatory dynamics in a hyper-diversified area of Milan, Italy, stressing their positive and negative effects in the incorporation of different waves and groups of international migrants.

How is social cohesion influenced by the action of grassroots associations and civil initiatives in a highly diversified context? Which role do they play and what are their potentialities in fostering immigrants' participation and social inclusion? What's their general effect in fostering social cohesion and participation of different social groups, from an immigrant background or not?

These research questions will be discussed based on a research campaign framed within the European project "Divercities". In particular, we will analyse 30 interviews to policy makers, officials and representatives of grassroots associations, and 52 interviews to inhabitants of our case area -- including their interactions (if any) with the above-mentioned associations and initiatives.

Results highlight the coexistence of different trends concerning social cohesion and participatory dynamics, influenced both by the activism of civil society and by the plural characteristics of the inhabitants. In particular, inclusionary effects may be quite segmented, jeopardizing the participation of more vulnerable migrant groups due to the high informal entry barriers some associations and initiatives can have. In this respect, tolerance and civilized attitudes by natives and long-term residents may well be coupled with weak ties and limited support, trust and cohesion, while close-knit kinship networks may result in a spiral of segregation that prevents participation.

Thus, civil action in hyperdiversified contexts – if not reflexive enough – may have little effect on social cohesion. We will discuss how much this is due to a poorly supportive national and local policy (in the Italian case still poorly considering diversity as an issue to cope with).

ANIMENTO, STEFANIA* (University of Milan Bicocca, s.animento@campus.unimib.it)

"Should I Stay or Should I Go?": Interrogating Online Forums about the Time and Tempo of Migration

This paper investigates methodological approaches to explore how concepts of time, tempo and future emerge within the discursive field of migration. Research agrees that migration, far from being a mere movement from A to B, is rather a work-in-progress phenomenon, in which fixed temporal and spatial boundaries are blurred and contaminated by simultaneity, non-linearity and transnationality. More specifically, with regard to time, migration begins in a future migrant´s mind long before she or he physically moves. The mental process of gathering information, evaluating options and weighting out possible destinations and futures belongs to the migration process inasmuch as it influences the migration´s future lived experience. Diverging temporalities and tempos are mobilized, produced and challenged when people elaborate their migratory paths. This work aims to analyse discourses of migration by interrogating online forums, such as Italiansonline and others, which are used by young Italians willing to move to European cities like Berlin, London and Paris. These forums are virtual arenas, in which people, at different stages of the migration process (undecided, wannabe-,

newcomer, as well as experienced migrants), share knowledge, resources and opinions that might help them and other members to draw future paths. In these discussions, discourses about the material experience of migration, such as looking for jobs and finding flats, intertwine with narratives about present conditions and future expectations. For instance, I identify common narratives of migration as a way to "speed up" the own biography as well as a means for social acceleration. Building on the mixed-methods approach adopted in the research, I propose a qualitative methodology to analyse online data which enables us to investigate the discursive field of migration before migration actually takes place.

ANIMENTO, STEFANIA* (University of Milan Bicocca, s.animento@campus.unimib.it)

Heading North: Unraveling Subjective Strategies of Young Migrants to Face Precarity

In this paper I investigate practices of spatial mobility developed by young people in the Global North as a response to growing precarity and uncertainty about their future. Work precarity has further expanded into their lives since the recent increase of youth unemployment across several countries. Many young people living in the European South paralysed by the crisis have moved to the North, where unemployment rates are lower and hopes for an adequate job can be rekindled. Such mobility is more fluid and flexible than traditional forms of work-driven migration. However, even when taking place within a favourable legal framework such as the inner-European one, spatial mobility does not necessarily result in lower precarity. Many young South Europeans end up working precariously in low-wage segments of hosting labour markets. While research shows that the paths of incorporation of intra-European migrants diverge depending on the resources to which they have access, there is a lack of knowledge about what resources are more relevant to young migrants and why it is as such. Today´s European mobile youth are mainly middle class and well-educated. What elements mostly affect their ability to anticipate future paths and thus face precarity? I tackle this question by analysing the case of young Italians who have moved to Berlin since 2008. Based on a set of 40 interviews, an online survey and a discourse analysis of data taken from online forums, my research sheds light on strategies of mobility under conditions of work precarity. Building on empirical evidence, the analysis challenges conventional understandings of class, gender and ethnicity. I claim that we need to seriously consider the restructuring of labour markets that is currently taking place in the Global North and I finally propose new ways to conceptualize the relationship between work and mobility.

Architects Designing for Care: Knowledge Brokers in Times of Change

Architects who design for health and social care are a relatively unexplored professional group. Yet they are an exemplary example of a group working to maintain professional values and ideologies within complex context-dependent conditions. We explore this process through the lens of architects as 'knowledge brokers', drawing on data from in-depth interviews with architects working in the UK social care sector (mainly elderly care homes), conducted as part of ongoing ESRC-funded research *'Buildings in the making: a sociological exploration of architecture in the context of health and social care'*.

The analysis explores how architects seek to bring the various interests of a stakeholder set into alignment in the process of embedding health care knowledge into the design and build of care settings. This alignment is ever shifting through a project's life. Stakeholders consist of: the client (e.g care home operators, local authorities), 'end-users' (e.g elderly people, care staff, other care home workers), contractors/builders, and local planning authorities. In particular, we explore how architects mediate the desired – but always fluctuating -stakeholder alignment necessary to deliver a quality building. Stakeholders are envisaged by architects in the course of a project as embodied and virtual; as more or less present; and as more or less easy to predict in their capacity to exert influence. Amongst other things architects' seek to broker stakeholder knowledge by investing emotions and needs in the (often virtual) group of resident end-users; by using their expert knowledge to unite differently distributed and situated knowledges and expectations of workers (e.g care staff, cleaners, cooks); and by 'educating' clients (e.g. care home operators) in what is possible and desirable. We also consider how this process in turn is influenced by factors such as cost concerns and planning regulations which often are highly dynamic during the course of a project.

ANNER, MARK* (Penn State University, msa10@psu.edu)

Worker Resistance in Global Supply Chains, Wildcat Strikes, Transnational Campaigns, and International Accords

Proponents of a race-to-the-bottom argument would suggest that production goes where wages are lowest, but that argument cannot explain why China continues to dominate apparel production while its wages are four times higher than in Bangladesh. At the same time, those who suggest that production goes where logistics are the most efficient and economies of scale are the greatest (as in China) cannot explain why Vietnam is one of the fastest growing major apparel exporters in the world, or why Honduras is the largest Latin American exporter.

Where apparel production has concentrated in the last decade has as much to do with labor control regimes as with wages and other economic factors. This article first argues that there are three main labor control regimes in the apparel sector: state-party control; market despotism; and repressive employer control. In then argues that labor control regimes, and the political context upon which they are based, shape patterns of worker resistance. Specifically, the three systems of labor control are conducive to three patterns of worker resistance: wildcat strikes, international accords, and transnational corporate campaigns.

The article explores these arguments by examining patterns of resistant among apparel in Vietnam, Bangladesh, and Honduras. Workers in global value chains are finding new strategies to addresses harsh working conditions in global supply chains. These strategies are shaped not only by the exigencies of hyper-competitive global production regimes, but also by state structures and local market conditions. The highly statist system of Vietnam with its party-controlled official unionism has engendered a powerful wildcat strike wave. The weak state and harsh, despotic labor market conditions in Bangladesh have pushed activists to pursue international accords. Hegemonic labor control in Honduras built on a political regime that is permissive of factory-level repression has motivated labor organizing and transnational corporate campaigns.

RC09-114.4

ANNER, MARK* (Penn State University, msa10@psu.edu)

Worker Rights and the Pricing and Sourcing Squeeze in Global Supply Chains

Myriad state and non-state social compliance programs have sought to address worker rights violations in global supply chains. Yet certain practices persist and in some cases have become more pronounced. Notably, wages remain chronically low and forced and excessive overtime remain endemic. We argue in this paper that some of the root causes for these problems can be found at the top of the supply chain in how lead firms price their production contracts and administer their sourcing practices with their global suppliers. We first explore this argument by examining the price paid per square meter of imported apparel to the U.S. by the top apparel exporting countries in the world. What we find is a decline in real dollar terms of prices paid by lead firms to suppliers of over 46% since the late 1990s.

These quantitative findings are complemented by field research in Bangladesh, which allowed us to explore in detail how declining prices paid by lead firms appear to have contributed to a lowering of the price paid to labor per unit produced and a lowering of supplier factory profit margins. We also found evidence of how short production order lead-times and dramatic fluctuation in contract volumes contributed to chronic overtime, as well as unauthorized outsourcing. This is not to say that all employers are struggling economically, or that all worker rights abuses are the result of lead firm practices. Certainly, there are many employers who have accumulated significant wealth in the sector, and workers' rights violations are often the result of abusive local employers and state representatives. But the evidence suggests that lead firm pricing and sourcing dynamics are also a very significant contributing factor to worker rights violations.

The Computational Psychology of Digital Shop Assistants

This proposal describes a project lying at the intersection of Computer Science and Social Sciences whose goal is to state and investigate some basic questions concerning **recommender systems** (henceforth RS's).

The advent of the internet has changed cultural markets in profound ways. The global volume of online purchases of music, books, movies, video games and other forms of cultural products has reached the 1.5 trillion dollars mark in 2014, and the trend is increasing. Today, an estimated 1.22 billions people acquire cultural products through the internet. RS's are a key component of these online markets. In the old days, a regular customer of, say, a music shop, could get the advice of a knowledgeable shop assistant with whom s/he had developed a relationship of trust. Based on the knowledge of the customer's taste and of the music world, the assistant could offer insightful suggestions to the customer, providing useful advice. Roughly speaking, a RS is a digital, algorithmic analogue of the shop assistant that, on the basis of the past online behaviour of the current customer and of the entire collective behaviour of online visitors, helps navigate the huge catalogue of online choices by providing suggestions in a purely algorithmic fashion. Thus, a visitor to the YouTube home site will be presented with a list of videos that, hopefully, will match his/her interests, and a person looking for a book on Amazon will likewise see a list of other interesting books to buy.

In spite of the fact that RS's are fundamental actors of online cultural markets, their power to shape and influence is still largely unknown. The goal of this proposal is to investigate the extent to which a cultural market can be affected by RS's and the interplay between computational and psychological mechanisms underlying them.

A Sociological Approach of the Educational Dimension of the National Security in Romania

The purpose of this paper is to analyze the concept of educational security and its practical implications on national interests through a case study of the Romanian educational system. Until now several dimensions of security - military, economic, environment, cyber - were fully described by the analysts. However, educational dimension of security is not theoretically developed.

Analyzing the educational dimension and its issues makes it possible getting a complementary image on security and answers at what extent the educational system is prepared to respond to the biggest current threats to national security. A permanent challenge for the military higher education institutions is to prepare sufficient high quality trained people for the new missions. In this regard the paper will try to describe the present situation in relation with different aspects such as effects of the new changes inside of the military educational system or of the structural and organizational adaptations of the military organization.

ANTONELLI, FRANCESCO* (Università degli Studi "Roma Tre", fantonelli@uniroma3.it)

New Molecular Intellectuals and the Making Sense of Action in Social Movements

The aim of this paper is to analyze the transformation of the Public intellectuals and their relationship with the social movements: instead of an organic intellectual (Antonio Gramsci) or an intellectual vanguard, a widespread network of knowledge workers is in action at the moment. These "molecular intellectuals" are both a global critical force who express their opinions and political attitudes through Internet and the basis for the formation of the social movements (for example how happened in Arab Revolution and in Occupy Wall Street).

The differences between the critique and the political actions, knowledge workers and political intellectual function, are declining in the global world. Dignity as focus of the action and the critique, autonomy by big bureaucratic political machines, the opportunity to communication without the intermediation of mass media, self-organizations, are the main features of them. So, if it is going to analyze and understand intellectuals in contemporary world, it need to focus on intellectual actions (both critical and practice) and the social conditions of them.

First, the paper is going to analyze briefly social theory on public intellectual, particularly focusing on the transition from a sociology about intellectuals and their sociopolitical function (Antonio Gramsci) – typical in Industrial society – to a contemporary sociology focus on intellectual action. Second, the paper is going to rethink this approach, showing how it is insufficient to understand contemporary intellectual action, based on new molecular widespread intellectuals: it need to focus on the social identity of actors. Finally, on the basis of the sociology of the Subject by Alain Touraine, the paper is going to analyze how the distinction between critical action and political activism – both on-line and off-line – is pointless by now.

Making the Body Present. Breathwork As Holistic Practice

　　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Table of Contents

On the one hand, it is a sociological truism that our body in various practices of everyday life often remains a tacit operator. That is, it does not get, for instance while doing routine work, discursively thematized or even consciously experienced. On the other hand, during the last decades different forms of therapeutic and spiritual practices that, for different purposes, aim to make the body ‚present‘ experienced a considerable upturn. Therapists and clients for instance try to evoke specific bodily and emotional experiences which would enable access to our ‚authentic‘ self. These practices, based on different techniques of the body, can be understood as specific forms of relating to ourselves and the world in general. Interestingly, in spite of the increased dissemination of such practices only few sociological studies tried to get to the core of the phenomenon. That is, attention is often exclusively given to bodily *representations* or to discourse *about* the body. Seldom bodily practice *itself* has being addressed.

Using an autoethnographic research design as well as building on a pragmatist and actor-network theory inspired conceptual framework I want to illustrate, exemplified with the case of so-called breathwork, how different forms of bodily experiences are interactively established and evoked practically. The guiding thesis is that we experience our body not as a self-given entity in a passive way, but rather via actively participating in specific practices that can be empirically reconstructed. In the presentation three types of making our body present will be discussed: 1.) the establishment of unlikely attentions through verbal instructions; 2.) establishing presence by means of irritating bodily habitualizations; and 3.) attempts to let bodily processes quasi-autonomously ‚happen‘ in order to evoke affective experiences. At the end of the presentation I will argue for the necessity of an empirically informed action theoretical conceptualization of experience.

Connecting Research into Practice and Policy: A Case Study of Health Equity Research in Thailand

In Thailand, the commercial utilization of science and technology research is accelerated by the Thailand science park, which is fully integrated R&D hub and managed by the National Science and Technology Development Agency (NSTDA). On the other hand, the concept of transferring social science knowledge into effective and innovative solution of social problems does not taken place systematically. JuSNet (Just Society Network), is the recent collaboration model to bridge gaps among researchers, social workers and policy makers to tackle the health inequity problems. This paper explains the two years project and its aim to connect research into practice and policy and expand researcher networks based on three kinds of research: theory, policy and communication researches. The study observes the knowledge linkage, networks actions and policy process. The conceptual framework conducted by a group of multidisciplinary researchers indicates that the policy research should identify the policy causing marginalization and the policy recommendations for ensuring the health equity of marginalized group should enable various levels of structural intervention.

Furthermore, the two policy researches, homeless and informal labor topics, conducted by two groups of young researchers with participation of the social workers and communities, empower the movements and increase the acceptance of the policy recommendations. Additionally, the communication research provides more understanding of society's contextual influences in decision making process. Hence, integration of theory, policy and communication researches enables the transfer of knowledge to policy process more effectively. Although connecting of researchers from various universities and research institutes enable a critical mass of conversations and leads to emergence of innovative ideas, the lack of common physical space have a risk of maintaining of sustainable conversation and the newcomers in marginalized research are recruited only from universities. Also, this working model should be developed into a new kind of institution located within a university.

Welfare State Is Not Enough: Health Care Disparities of Homeless People and Informal Workers in Thailand

Thailand has three public health insurance schemes covering almost all of its population. Everyone with Thai nationality has an access to health care services and is protected from catastrophic health spending. However, the health disparities among marginalized population still remain. This paper examines how homeless people are treated different from normal people and why informal workers have to pay for basic health service, which even non-worker could have access for free. In general, homeless people have poor health because of the lack of good nutrition and access to social service. Since homeless issue is quite new for Thai society, homeless people are understood as poor and lazy individual people rather than the evidence of policy failure against social poverty. Hence, the structural intervention using welfare strategy preventing homelessness is less spoken. The recent social safety net could not foresee how it could avoid sending people to

homelessness. As well as the informal workers, who work harder than formal workers, but 2 millions of 24 millions informal workers are living in poverty and 6 millions of them are lower paid. Therefore, their incomes are not enough for living and have to co-pay in public health insurance scheme. Welfare system alone has less impact to health disparities among marginalized people. Thailand need more reform in income redistribution as well as wealth distribution.

Cha(lle)Nging Perspectives: Sustainable Urban Development of Medium-Size Cities in China

Over the last decades China has recorded remarkable economic performance through a steady integration with the global economy, even if at cost of intense industrialization and urbanization.

Challenged by the emerging side effects of this trend, local governments have been encouraged to develop 'eco' or 'low carbon cities' to achieve energy-saving and emissions-cutting, or to promote urban sustainability in the form of 'green' technological advancement. Nonetheless, all these directions strongly rely on the belief in technological innovation to provide solutions to any problem, which indeed, too often, bypasses deeper reflection on the cascades of unexpected consequences this can provoke (e.g. also in terms of imaginaries, behaviours, vision of the future).

The paper focuses on the urban growth of medium-sized Chinese cities and the issues they raise in terms of sustainability. The first outcomes of the EuropeAid project *New pathways for sustainable urban development in China's medium-sized cities (MEDIUM)* will be illustrated.

Indeed, MEDIUM hypothesis are that medium-size cities deserve a particular attention (by planners, scholars, policy makers, etc.) since they might allow more innovative ideas and job opportunities to emerge, as well as more appropriate system of governance, and more holistic and "human-centered" models of development and lifestyles to be adopted.

Moreover, medium-sized cities in China are equivalent to large regional or small national capitals in Europe. As such, they could benefit from Europe's past experience in confronting with intense industrial structural change and foreign/internal migration, but also with *rurbanization*or, more recently, the return or movement of populations to rural areas.

rom that standpoint, theories and methods available within/outside the discipline (including ethnography, participatory, visual and multisensory techniques), experimented in the project and that can support mutual learning and understanding, capacity building and knowledge co-creation about sustainability and urban management - especially in rapidly changing times and contexts - will be discussed.

Energy Choice Differences Among Publics, Analyzing Social Inequality Point of View.

In this paper we discuss about the people's support for nuclear power and renewable energy. From its results, we are able to see how people see their "desirable" future society.

Our data is from our nation-wide public opinion survey of October 2014. Effective responses were 1548 out of 3000 sampled based on Basic Residents Register.

Our results show that people who are higher in income, secure in their job status, and higher in education tended to support resuming nuclear power generation, and also tend to choose economy over environment. On the other hand, people who are not tended to support renewables, and to choose environment over economy.

How can we explain this "twisted" situation? People who are not better off put priority on safety over wealth, as they are more fragile when disasters happen. People who are better off put priority on economy over the environment, as keeping business as usual is the most risk-avoidable choice of theirs. Another explanation is the de-growth scenario. People who are currently not in better situation have already faced de-growth situation and have to accept it. But people who are currently in better situation want to keep their current lifestyle standard, and they actually can do it. This means that social inequality issue is behind the energy choice issues.

Thus, through choice of energy, we can see how people see their future image of their society.

IPCC Reports on Climate Change and Media : Comparing Media Coverage of IPCC AR4 and AR5

This paper compares and discusses two IPCC reports, AR4 in 2007 and AR5 in 2013~2014 with their media exposure and public perception on them in Japan. According to newspaper coverage database by University of Colorado (http://sciencepolicy.colorado.edu/icecaps/research/media_coverage/index.html), media coverage in 2007 and 2013~2014, though peaks were longer and higher in 2007, newspaper coverage for climate change increased in both periods in the world as a whole. But in Japan, we could see none or very small peaks in 2013~2014, while we could see huge peak in 2007. We explore the reason why there were very few media coverage compared to 2007 media coverage on IPCC report in 2013~2014. Our hypothesis is its relationship of revising the Japanese Basic Energy Plan, which is deeply connected with Japanese economy.

Japan government submitted 2020 Greenhouse gas reduction target (-3.8% compared to 2005) in November 29, 2013. The revised Basic Energy Plan was approved by the cabinet and released April 11, 2014, just after Japan government hosted IPCC WG2 general meeting on late March in Yokohama. This was followed by the Greenhouse gas reduction target for 2030 (-26% compared to 2013) in July 17, 2015, Interestingly, the Prime Minister Abe was governed both AR4 and AR5 were released. During this period, so called "Abenomics" was implemented and it seemed to be worked well. Unemployment rate had been improved.

We analyze the background of changes of these target level, Japanese economic situation, media coverage on climate change and public attitudes towards the climate change.

Permeable Boundaries Between German Federal Police and Airport Operating Company?

Maja Apelt, Jana Hunnius, David Kraft: **Permeable boundaries between German Federal Police and Airport Operating Company?**

Organizational theories have developed different concepts on cooperation between organizations namely markets, networks, partial organizations and sometimes meta-organizations. All these concepts maintain different ideas of organizational boundaries. Based on these differences we want to discuss our empirical research on airport-security and argue that the concepts mentioned above are insufficient to describe the structure of interorganizational cooperation.

Our empirical research at four German Airports showed that the operating organizations (in particular German Federal Police and the airport-operating companies) are exposed to contradictory expectations regarding the cooperation across their boundaries. On the one hand, the legislative understands the airport as labor-differentiated unity, on the other hand responsibilities and accountabilities are attributed to several individual organizations. We can observe that boundaries seem to become more open and are to be strengthened at the same time. This finding challenges established ideas of organizational boundaries.

An in-depth analysis reveals five dimensions of boundary relations. First, customers and other agents perceive the airport as a single unit ignoring the boundaries between different organizations. Second, the Aviation Security Act leads to the fragmentation of operational processes at the airport. Third, the translation of law into organizational programs changes accountabilities and consequently clearing and stabilizing organizational boundaries. Fourth, through collaboration in joint meetings and informal contacts the permeability of organizational boundaries increases. Nevertheless in some cases informal contacts between employees of different organizations are restricted. Fifth, in case of conflict, all parties either draw back on law as a media of communication or refer to a higher level of organizational hierarchy, in both cases emphasizing the limitations set by their organizational boundaries.

Different Forms of Regulation and the Formalization of the Prostitution Sector

The study of prostitution provides an illuminating case for analyzing the regulation of a sector characterized by a high degree of cross-border and within-country mobility. One of the central regulatory measures was the German prostitution law in 2002, which included the abolition of the categorization of prostitution as immoral, so as to normalize business and work relations and to strengthen the legal position of prostitutes. While this reform can be seen as an attempt to formalize this sector, it left several aspects of working in prostitution unregulated, only some of which are addressed by recent reform plans. In addition to national legislation on prostitution, regulatory attempts include a variety of actors and measures at the supra-national, the local and the sectoral level with different aims (such as curbing trafficking and other crimes, curbing tax evasion, or normalizing business and work relations) and ideas about what should be regulated, and how. These regulatory attempts are shaped by controversial discourses on prostitu-

tion. They also face the challenges of coping with the spatial mobility of actors in the field, and with grey zones that were established within the field to cope with the risks which were so far not addressed by law. This paper attempts to contribute to understanding the interplay of different levels, targets and forms of regulation and the actors as well as the ideas behind these regulations.

Ética 2.0. El Caso De Las Facultades De Comunicación En España

En el actual entorno digital, la enseñanza universitaria en comunicación se enfrenta a importantes desafíos tecnológicos que restan protagonismo a la antigua exigencia de la presencia de la ética en los planes de estudio, hoy aún más necesaria dadas las nuevas formas de desarrollo y de comunicación social.

En el marco de un I+D integrado por trece universidades españolas, se presenta el análisis de contenido de 126 planes de estudio y guías docentes de las facultades de comunicación en España para observar las asignaturas sobre ética o deontología y desde qué planteamiento se abordan (Ferrés y Piscitelli, 2012). También se han efectuado entrevistas en profundidad a sus responsables académicos.

Los resultados indican carencias importantes, y señalan la necesidad de una formación en ética no como la observancia de un repertorio de normas (objetivo de conocimiento) sino para de promover modificaciones de actitudes, como un particular ethos moral (Bonete, 1995).

Floating Narratives: Digital Storytelling and Transnational Families

Among South American countries, Colombia has the highest number of emigrants, with some two millions Colombians living abroad (World Bank 2011). Many of these immigrants may experience what Vertovec (1997) labels as Diaspora Consciousness: a new sense of identity in which memories and new maps of attachment are created and recreated. Within this context, family storytelling constitutes a critical intersection at which families create and recreate themselves. Today, much of this process is digitally mediated via ICTs that enable an array of nearly instantaneous communicative exchanges. It seems plausible, therefore, that traditional family narratives and stories exchanged via these mediums are likely being altered through the multimodal, interactive, hypertextual and co-production affordances ICTs provide. With this in mind, the central question guiding the study I would like to present is: *How do ICTs inform and constrain storytelling among transnational families?*

In order to address this question, the study looks at the technologically mediated interactions and digital storytelling of six Colombian families who immigrated to Canada from Colombia in order to investigate how they co-construct their social realities. The findings to be presented will be drawn from in-depth semi-structured interviews conducted in August and September 2015 with 12 adult Colombians residing in Montreal, and six of their respective family members who remain in Colombia.

A preliminary analysis of the interview data suggests that the nature of family communication has indeed changed in the eyes of the interviewees. The nature and flow of the family storytelling is revealed differently thanks to new platforms that allow for permanent interaction. In presenting my findings, I will be placing emphasis on the new dynamics of communication and storytelling emerging from their digital interactions. The description and interpretation of these practices is crucial for identifying implications of ICTs in building new sociabilities in the global world.

International Union Networks As a Strategy of Resistance to the Power of MNCs

This paper has the objective of discussing the formation of Union Networks International and how these networks have been articulated on an international scope. It can be said that the union networks have been an international trend that developed, firstly, in countries of central capitalism, mainly in western europe, due to the fragility that the unions were facing because of the actions of

transnational companies. These actions, due to a competitiveness of speech, were implicated in massive layoffs, attacks on social benefits, and reductions of wages and greater increases of the working day. as a result of these factors, the networks were created as a way to set solidarity up among workers that suffered the direct damages of the structural adjustment process. Because of this, we will focus on debate about the process of resistance that these networks can offer before the power of MNCs in the actual stage of capital, based on in some observations in the specialized literature. We understand that networks are evolving as a possibility for action at the international level, once increasingly, unionism has inserted in its agendas the discussion of the growing challenge of creating appropriate and effective mechanisms for coordination, organization and articulation of union action on an international scale, mainly because this is the sphere of capitalism action and the transnational companies and their internationalized production and subcontracting networks. The idea of global networking can be a promising possibility to the future of the union movement, as long as they are firmly in tune with their rank-and-file. Some researchers tend to list these kind of movement, that seek to resist the harmfull effect of "economic globalization", and the power of MNCs, as one the main novelties in the political arena due to its form of articulation in networks, with global extension.

ARAUJO, KATHYA* (Universidad de Santiago de Chile, kathya.araujo@gmail.com)

Forget Modernity? Social Theory Anew

The discussion about the pertinence of social theory's core concepts – individualization, bureaucratization, commodification and secularization, among others – directly leads to the problem of the analytical place Modernity took in the construction of this field of knowledge. Modernity, as a historical process and as a source of an ensemble of conceptual tools, assumed an exceptional (and problematic) normative character as long as it was used as a reference for comparison, an ideal measure of value judgments, and a hegemonic analytical model in social sciences. Concepts which were created departing from the socio-historical humus of Western societies, that is the structural, normative and interactional solutions found for the problem of living together by this group of societies, have worked and continue to do so, as frameworks for the understanding of other social realities. Thus, despite the fact that those solutions should be seen as a contingent outcome of a particular historical path, they have been offered as general models due to their construction as abstract concepts. The awareness of this fact has led scholars to question this construction and has given new momentum to comparative and historical sociology. Despite the criticism developed by these approaches, nevertheless, they have kept Modernity as a reference and on the horizon. Departing from empirical studies focused on Individualization processes in the so-called central and non central societies, the aim of this paper is to discuss critically the current scope of the concept of Individualization and in so doing to question the *methodological* pertinence of using Modernity as a basis for comparative sociology, which might be considered currently a privileged source for theorizing.

Working Longer? How Being Employed/Self-Employed in Later Life in the UK Relates to Health and Increasing Gender and Income Inequalities

Background: Recent UK employment and pension policy changes have affected people in their sixties. State pension ages have increased for women from 60 to 66/67, and mandatory retirement age at 65 has been abolished. The paper addresses government assumptions that older men and women will continue to work in their late sixties, and examines the health of workers over age 65, as well as gender differences in jobs undertaken and income received.

Methods: The paper analyses 'Understanding Society' for 2012-13 (wave 4), which interviews all persons in a large sample of British households, focusing on men and women aged 60-79 (n=11400), particularly aged 65-69 (n=3400). We analyse participation in paid employment and self-employment, the nature of employment, factors that predict being employed/self-employed, and income from employment/self-employment.

Results: At ages 65-69, 21% of men and 18% of women are economically active. Employee jobs are more likely to be part-time, hourly paid and in the service/sales sector. Nearly half of men aged 65-69 who are economically active and a third of women are self-employed. Health and being more educated are key predictors of being employed/self-employed. Levels of income inequality from employment, and especially self-employment, are very marked. The top 10% of self-employed men earn 10 times more than the lowest 25%, and earn 20 times more than the lowest 25% of self-employed women.

Conclusions: Being employed/self-employed in the late sixties is associated with better health and educational advantages. Substantial income inequalities are evident among the employed and self-employed in their late sixties. Continued economic activity may compound gender and other inequalities in later life.

ARBOGAST, MATHIEU* (Ehess/IMM-Cems ; Paris-ouest Nanterre/Cresppa-GTM, mathieu.arbogast@orange.fr)

Nailed ! a Quantitative Study of Gender and Racial Representations in Cop-Shows

Legal boundaries between male and female occupations faded, but the social representations of gender traits and gender roles division between men and women die hard. Police women hence seem to be the ultimate « tough girls » (Inness) who definitely « trouble » gender boundaries (Butler, Tabet), in the utmost virile job (Pruvost).

How do tv series show police women (Mizejewski), and what does it say about social norms representations ? Are female characters different according to their race (Beauboeuf-Lafontant)?

Nurtured by a tradition of quantitative surveys on tv programs (Gerbner, Lauzen, Macé...), and population surveys improvements (Westbrook & Saperstein) we question how intersectionning gender and race relations work in the 21stcentury television cop-shows. Such shows add up to 24% of programming slots of French Prime Time networks (2010, our data).

The complexity of appearance description is central in our work (Holt & Ellis, Thoma & alii). Our questionnaire includes several items about gender and sexualisation, along with a categorisation of the perceived race, as implemented in demographic survey « trajectories and origins » (Ined) : either coded as part of the « majority » or « minority » population. Such a binary code fits in with programs from any country and allows comparative analysis.

Our doctoral research corpus (36 series) allow quantitative analysis and regressions, on a particular year as well as a pseudo-cohort longitudinal analysis over the seasons. One third of female characters is too high and too low a proportion to rule out tokenism hypothesis. Our hypothesis are that crossing physical appearance (racial, sexual, body shape), personality, and behaviour (gun use, relation to violence, parenting) would confirm gender inequalities on one side, but show a broad range of individual settings on the other (Connell, Halberstam).

Our research combines gender studies and cultural studies, focussing on the characters considered as a population (Chalvon-Demersay, Brugeilles), in a particular industry (Gitlin).

Innovating food assistance practices towards food and nutrition security

In recent years, severe challenges related to crisis, unemployment, immigration and political instability are affecting food and nutrition security. In this context of change, a growing number of people seek for food assistance, increasingly often in high income countries (Lambie-Mumford, Dowler, 2015). Different actors are trying to respond to the emergency faced by the most vulnerable groups of the population, and at the same time are under pressure to reframe food assistance in a "right to food" frame. Operators involved in food assistance activities are re-thinking their role to address changing needs; private companies are increasingly involved in food assistance operations and adjust their operations and their strategies accordingly; public institutions re-think the boundaries between charitable assistance, welfare system and market-based food system. The present study explores the food assistance mechanisms through the lens of social practices intended as "routinized types of behaviour which consists of several elements, interconnected to one other" (Reckwitz, 2002). Constitutive elements are represented by meanings, materials and rules. We aim at identifying and mapping practices and investigate their innovation potential or, alternatively, their tendency to disappear. Innovation in practices occurs by changing or introducing new elements and/or by establishing new links between them (Shove and Pantzar, 2010). We adopt a case study approach to illustrate food assistance in Tuscany (Italy) by integrating semi-structured interviews, on-site visits and primary data collection to scenario analysis dedicated workshops. Results show that encouraging responsibilities on food choices, including upstream actors of the food system (e.g. farmers), addressing "nutritional" needs and diminishing stigmatization are the key innovations in food assistance. Context specific innovative solutions and synergies among practices need to be implemented to trigger successful pathways of innovation.

Future Practices and Social Innovation

Digital Culture, understood in its broadest sense as the things people create, make, say, think, experiment, develop or exchange with bits (Horst & Miller, 2012) is nowadays at the core of most meaningful social transformations, creative practices and innovation processes. In this paper we aim to contribute to untangle how "social innovation" in digital creation occurs, which role are playing the "future practices" -material, imaginary and narratives- in these creative processes, and how citizens are called to participate in their future through technology design. Our goal is to critically analyse how innovation occurs from a social perspective in the field of digital design creative spaces, projects and practices. Taking a social, generative and relational understanding of creativity and innovation (Ingold y Hallam, 2007) social innovation does not refer only to the creation of "something new" but to ways of doing and "new" ways of intermingle values, materials, affordances and expectations. Through our ethnographic fieldwork, we will look at how social innovation is linked to models of citizen participation (leaded by public institutions, companies, associations or collectives, from social movements to government policies), addressing issues such as democratic participation, living conditions, energy sustainability, etc. And more specifically, we will analyse the "future practices" embedded in technological innovation that seek social transformation and the role of the notion of citizenship in these processes (Ratto et al, 2015). We conclude that the visions of future (and anticipatory practices) that are key to digital design (Balsamo, 2011) are nowadays also part of the ways of producing culture and socialization, as we see in the emergence of cultures of 'making' and in the social projection of design as a form of intervention in the world (Pink, 2015).

ARELLANO MORLAS, FERMIN* (RC51,
farellano@comfia.ccoo.es)

The Society of the Brain: An Introduction

The development of neuroscience has advanced importantly in the last decades. It consisted in overcoming the internal physiological brain and the nervous system, to reach a practical application in other sciences. This lead to the appearance of new fields such as neuroeconomy, neuromarketing, neurolinguistics, and also neurosociology.

We part from the knowledge we have reached from the way our brain functions to apply it to other sciences. We also have to bear in mind that we do not have an accepted model of the brain itself.

It is for this, that we suggest what it would be another step forward in the development of neuroscience. Using the knowledge of sociology, we will approach, using its tools and methodology, a new model of the functioning of the human brain. We are talking about social neuroscience.

Some classical authors have defined the object of study of sociology as the search and interpretation of a social fact or a social action. Here, we suggest that is more useful to our purposes to consider communication as a nexus of both fields. This leads us to Luhmann´s theory of social systems. The mind/brain can be observed through complexity perspective. It can be considered as a way of penetration that accompanies the assimilation and accommodation inside the learning process.

In this introduction, some examples will help us in the consideration of the brain as a society. Among them, we will point out the theory of the moral panic of Stanley Cohen and its relation with the investigations of Antonio Damasio about emotions. We will also study the attention process and the options selection in a world of scarce or the framework of conformity and its cognitive aspects.

Hodgson, Gellner and Eisenstadt As Pioneers of Islamicate Civilizational Analysis

Robert Redfield's comparative Social Anthropology of Civilizations Project at the University of Chicago in the 1950s had its immediate impact on the study of Indian civilization. Its impact on the study of the Islamicate civilization was delayed, however, partly due to the premature death of Marshall Hodgson (1968) whose *Venture of Islam* was edited and published posthumously in 1974. Hodgson coined the term 'Islamicate' to describe the civilization that grew around Islam in the "agrarianate-citied" world region from the Nile to Oxus rivers, and "Persianate" to counter the heavy Arabist bias in the prevailing reading of Islam, integrated the study of heterodox Shi`ism and mainstream of orthodox Sunni Islam, and offered a number of useful historical typologies, notably, 'caliphal absolutism', the 'military-patronage state' and gunpowder empires. Hodgson's blind-spot was the role of nomadic polities and empires of conquest in the expansion and development of the Islamicate civilization. Meanwhile, the anthropologist Ernest Gellner was focusing on just that problem, drawing heavily on the work of Ibn Khaldun (d.1406) on the cycles of state formation, dynastic change and Islamic movements in nomadic Islamicate empires. In the 1980s, while developing his paradigm for

axial civilizations, S.N. Eisenstadt tried his hands at producing a model of Islamicate axial civilization, combining the Khaldunian cycles of dynastic change with periodic oscillations between an Islamic primordial utopia and the historical reality of nomadic patrimonial sultanism, unexpectedly coexisting with an autonomous public sphere dominated by the *ulema*.

Infectious Disease (EBOLA) Management: A Challenge for Public Administration in USA

This research examines the challenges for public administrators in tracking and responding to the 2014 Ebola threat in the Dallas-Fort Worth (DFW) metropolitan region in USA. Data collected from a mixed methods approach including 24 face-to-face interviews with city, county, hospital and university emergency managers, healthcare professionals and epidemiologists in DFW and E-survey data from a similar larger sample of 119 was analyzed. Social Network Analysis was used to map established and ad hoc communication networks between first response organizations. Findings underscore the benefits of bonding networks from longstanding close knitted collaborations between city emergency managers and county health departments in the four big counties in DFW. Simultaneously, the nontraditional ad hoc, spontaneous collaborations between the Texas Department of State Health Services (TXDSHS), the Dallas County Judge's office, Dallas City Mayor and Dallas County Office of Emergency Management disaster is evidenced. This demonstrates that when faced with an unfamiliar, rapid onset infectious disease (Ebola) event, oftentimes new organizations may occupy a central position to manage scarce resources and information. Despite immediate frustrations and challenges for smaller adjoining cities and county health departments, the timely response is laudable. This research concludes with takeaways for researchers and practitioners on how to effect better infectious disease emergency operations planning and public administration.

ARLINI, SILVIA* (National University of Singapore,
arisma@nus.edu.sg)

Labor Migration and Migrants' Aspiration: Analyzing the Migration Pattern Based on Social-Economic Status of Households in Rural Indonesia

Despite the current attempt from the Indonesian government curtailing migration of unskilled labour to several international migration destinations, labour migration is still highly prevalent among the poor Indonesian as one of the important livelihood strategy for alleviating poverty especially in the rural area. Although the nature of the migration is not permanent and relatively precarious, people are still keen to migrate and leaving the family behind. This paper aims at observing the migration pattern in rural Indonesia and examining who migrate and what their migration aspiration is. Drawing on the quantitative survey among 1203 households in rural Ponorogo, Indonesia and also complemented with the findings from intra-household dynamic qualitative survey among 24 households in the same location, this paper focuses on analysing the migration aspiration among households from different social and economic status, that are measured from income and education level. The finding shows that the households with low social-economic status have higher probability to migrate because they view migration as a necessity for their economic betterment when there is very little opportunity available in the area. In contrast, the households with high social-economic status have lower probability to migrate and they view migration not as a necessity but as an option to achieve their aspiration. This paper argues that government need not to restrict the migration of the poor, but facilitate the safe migration and encourage the attainment of higher education for their economic betterment. Once they are better-off, they would be inevitably less willing to become labour migrant.

Religious Universities Between Gaining Legitimacy and Maintaining Identity

Religious universities are hybrid organizations that combine scientific and religious logics, which could be contradictory. To demonstrate that, we present the

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

case of the private YMCA University in Kassel; a newly established religious university that struggles to be seen as a legitimate actor within the organizational field of higher education. In order to get legitimation the YMCA University has to fulfill institutionalized scripts and it also has to be officially recognized by an accreditation agency. However, these scripts and institutional requirements are designed to shape the structures and activities of non-religious universities. Hence, they refer solely to the scientific logic. One could even say these scripts are trying to curb the religious logic. As a consequence, the YMCA University has to demonstrate the ability to handle religious issues scientifically (e.g. balanced presentations of dissenting religious opinions). At the same time, the YMCA University has to affirm its identity as a religious organization. This is a challenging task because since "the religious sector is very weakly institutionalized" (Chang 2013: 130) it cannot rely on institutionalized scripts when organizing the religious aspects. Available are only general cultural orientations with a strong moral content which can conflict with scientific scripts.

Our paper addresses the tension between gaining legitimacy by applying to non-religious (and even antireligious) institutional scripts and maintaining the religious identity: How is the YMCA University combining the religious and scientific logics in its decision-making processes? Relying on interviews with members of YMCA University, we stress the internal dynamics of a hybrid organization. By combining neo-institutionalism with system theory (Besio/Meyer 2014), we focus on decoupling, the difference between talk and action, the role of traditions, and the importance of the personnel selection (e.g. all staff members must be of Christian faith).

ARMBRUSTER, ANDRE* (Helmut Schmidt University, andre.armbruster@hsu-hh.de)

The Process of Radicalization: Transforming the Habitus to Become a Religious Radical

A religious radical is not born as such; he or she is being socialized to become a radical. Relying on Pierre Bourdieu's theory of habitus, becoming a religious radical implies a change in the personal habitus. The habitus of an individual structures his or her actions by enabling some and by barring others. Bourdieu (1984) distinguishes between a primary and a specific habitus. The primary habitus depends on the family, the possession of the different kinds of capital (economic, cultural, and social) and the position within the class structure (e.g., lower-class worker). The specific habitus is by contrast related to a field; for example, the habitus of an experienced broker allows her to know where to invest next. My hypothesis is that being a religious radical is strongly connected to a specific habitus. In this paper I will examine the process of radicalization, and more specifically, how the primary habitus of an individual transforms into the specific habitus of a religious radical. In addition I will focus on what kind of primary habitus (e.g., middle class) is necessary in order to transform it into a specific habitus of a religious radical.

Empirically I will focus on the recruitment process of the Lebanese militant organization Hezbollah. Becoming a member of Hezbollah is a lengthy process of religious and political education that usually lasts for years. By conceptualizing the Hezbollah as a "greedy institution" (Coser 1974), I will focus on the various strategies that Hezbollah utilizes so that the recruit will finally adopt the classificatory schemes of Hezbollah. These strategies affect all domains of the social life of the recruit: the personal relationships are regulated, the life style is determined (e.g., clothing, food consumption, etc.) and personal habits will be changed (e.g., how to speak or to behave).

ARNAL, MAUD* (EHESS, McGill - IRIS, CERMES3, SSOM, mml.arnal@gmail.com)

L'essence Des Douleurs Des Femmes Lors De L'accouchement En Quête De Sens

Les modes de traitement des douleurs de l'accouchement soulèvent des tensions entre un naturalisme biologique de la capacité des femmes à accoucher seules, sans technique, et l'inutilité de ces douleurs jugées dangereuses par le rationalisme médical (Carricaburu, 2005). En partant de ce paradigme médical et social, cette communication analyse la manière dont les représentations et les enjeux du traitement des douleurs des femmes sont construits par les acteurs (usager.es et professionnel.les) ; et la manière dont les femmes se trouvent impliquées par leur sens, dans un travail corporel et émotionnel spécifique pour devenir de « bonnes mères » (Gojard, 2010). L'organisation des soins des douleurs hors anesthésie est en décalage du cadre légal, qui recommande un traitement médicamenteux. Cette interaction relève d'un « ordre négocié » entre professionnel.les de santé et usager.es, qui implique de considérer les femmes comme coproductrices de leurs propres soins (Goffman, 1973; Strauss, 1992). L'organisation des soins repose sur un triple travail: celui des sages-femmes dans la mise en forme émotionnelle de l'expression des douleurs (Hochschild, 1983), celui des femmes et de leur partenaire sur eux-mêmes et entre eux. La procréation est alors envisagée comme une activité socialement organisée et régulée dans

laquelle sont pleinement engagées les femmes enceintes : leur corps, leurs sens et leur subjectivité sont « mis au travail ». Il s'agit d'une « production humaine » où la mise en forme des sens dépasse l'enceinte des corps et des structures hospitalières. Nous verrons que le "travail de patiente" consiste également en une surveillance du corps et une interprétation des signes corporels : saignements, douleurs et sensations diverses. L'interprétation des sensations (physique, mentale et émotionnelle) liées à la grossesse et l'accouchement, fait l'objet d'une traduction institutionnelle normative et standardisée, dont dépend l'organisation du système de prise en charge des femmes en maternité hospitalière par un processus de régulation normative des sens.

ARNAL, MAUD* (EHESS, McGill - IRIS, EHESS, SSOM, mml.arnal@gmail.com)

Le Traitement Médicamenteux Des Douleurs De L'accouchement, Une Boîte De Pandore ?

Le traitement médicamenteux des douleurs de l'accouchement – circonscrit autour de l'anesthésie péridurale- est devenu, aujourd'hui, une norme sanitaire dominante dans les pays industrialisés (Akrich 1999). Les douleurs de l'accouchement se situent dans un interstice médical et social, au sein duquel se confrontent, selon les contextes (culturel, géographique, social ou encore politique) des représentations et des pratiques qui mettent en tension la manière de catégoriser ces douleurs, selon un continuum qui s'étend de la physiologie à la pathologie (Rey, 1993). Cette communication analyse les conséquences médicales et sociales de l'introduction de l'anesthésie péridurale en obstétrique, et la manière dont se sont construites les normes médicales et sociales de ce traitement pharmacologique, progressivement généralisé, de ces douleurs. Comment la standardisation de l'anesthésie péridurale en obstétrique, depuis son introduction, amène, au regard des restructurations sanitaires et des revendications sociales et professionnelles à reconsidérer les frontières entre, ce qui relève de la "nature" et ce qui en sort? Nous proposons d'éclairer cette question à partir d'une recherche qualitative menée par entretiens et observations en France et au Québec. Avec, respectivement 80% et 70% des femmes qui accouchent avec une anesthésie péridurale, contre 35% aux Pays-Bas (Blondel, 2011), la France et le Québec s'illustrent par des injonctions contradictoires en termes de représentations de la santé des femmes, des fœtus et des nouveaux nés, des politiques publiques et des attentes sociales qui se cristallisent sur la prise en compte de la douleur par l'anesthésie péridurale. L'anesthésie péridurale n'est pas seulement perçue comme un outil d'émancipation mais aussi d'oppression (Vuille, 1998). Entre un contexte de médicalisation exponentielle nécessitant la mutualisation des moyens techniques et humains, des revendications de professionnel.le.s de santé soutenu par des usager.es militants, la péridurale et ses conséquences médicamenteuses et sociales se trouvent au coeur de ces tensions.

Learning from Experience? the Role of the "Lessons" of the Fukushima Accident for Nuclear Safety Regulation

"Learning the lessons" for European nuclear power plants is an immediate concern after the large-scale nuclear accident of Fukushima Dai-ichi in March 2011. Officially initiated by national governments, the process of analyzing the causes of the accident, conducting safety reviews and revising regulatory norms is carried out by nuclear safety regulators and experts. This resource-consuming process extends far beyond the end of the official crisis management phase and decline of public attention. Through an analysis of the Fukushima lessons learned in France and in the European Union, this paper shows that the primary aim of these activities cannot be reduced to reassuring public confidence in nuclear energy. Instead, regulators use "lessons", understood as narratives of the causes of a nuclear accident translated into extended risk assessment procedures and scenarios, as a major leeway to enforce and extend the regulation imposed on the operators of nuclear facilities, in a context where regulators dispose of limited resources and uncertain legal authority to amend existing regulatory requirements. At the same time, the regulators' extensive work, conducted in order to cope with an extended definition of potential hazards, normalizes the occurrence of nuclear accidents and the risks attached to the production of nuclear energy. It reaffirms and "demonstrates", through multiple review mechanisms, the capability of the regulatory system to control the exploitation of nuclear energy. In addition, it contributes to the depoliticization of underlying energy policy choices through the sharp distinction between political and technical (regulatory) matters.

Regulators at Risk ? the Experience of the Fukushima Dai-Ichi Nuclear Accident for French Nuclear Safety Regulators

A large-scale nuclear accident such as the one in Fukushima Dai-ichi in March 2011 potentially challenges the legitimacy and trust in the capacity of nuclear regulators to ensure the safe production of nuclear energy. After an initial phase of shock and confusion immediately after the accident, French nuclear safety regulators currently interpret the nuclear accident as a positive experience and its management as a major success in their careers. This paper analyses strategies and mechanisms through which French nuclear safety regulators overcome this adverse outcome to regain trust in their own past work and their capability to manage the risks related to the use of nuclear energy with the help of the European cooperation among nuclear regulators. We argue that in a context of high uncertainty surrounding the daily work of nuclear regulators as to whether the national safety measures based on a distinctive set of accident scenarios effectively contribute to prevent accidents or render them manageable, regulators rely on organizational and relational, rather than technical, indicators to evaluate the successes and failures of their occupational activities. The cross-country comparisons of nuclear safety regulation in the European safety reviews ("stress-tests") confirm the status of French regulators as particularly proactive and engaged actors. The introduction of a new safety objective and extension of the normative guidance in a favorable way for French regulators emphasize the impression of a commonly approved substantial improvement of nuclear safety in Europe. The multiple interactions among European colleagues in this intensified cooperation reinforce a common group identity as "regulators", characterized by the fundamental belief in the controllability of nuclear energy through the existing methods of the regulatory process. Through these rather inward-looking mechanisms, the French regulators contribute to normalize the risks attached to the use of nuclear energy and legitimate its continued predominance in France.

ARNON, SARA* (Tel-Hai College, arnons@mgamla.co.il)

Incorporating Internal Social Responsibility As Part of the Third Mission of Higher Education Institutions

This paper presents a rationale for expanding the vision of the 'third mission' in higher education institutions (HEIs) Hitogggto incorporate social responsibility towards its internal communities - students, academic and administrative staff.

The two traditional goals of HEIs are focused around the distribution and production of knowledge through teaching and research. In recent years, demands for a fundamental shift toward greater cooperation between HEIs, the state, and society at large, forced HEIs to leave their ivory towers and become involved and engaged with society: their local neighborhoods, the national arena, as well as global partnerships. This changing agenda of HEIs was defined as their third mission and was based on ethical and moral considerations concerning promoting equitable social change, contributing to poverty reduction, and protecting political and cultural human rights. Recognition of the significance of the third mission has rapidly expanded and gained support among various HEIs, NGOs and education systems.

We claim that HEIs should expand their third mission vision to include an internal social responsibility policy and practice. By turning their attention inside, the third mission will become a comprehensive approach to social responsibility, providing a solid ethical ground for justice in higher education by promoting the social and financial well-being of their internal community of students and staff.

The paper presents initial mapping of HEIs' tasks as part of this extended concept of third mission. For example, the 'Students' domain includes: financial support, scholarships, housing, and employment-related issues; academic assistance, dropout prevention, and emotional support; affirmative action for new immigrants, minority students, and students with special needs, and the provision of academic assistance, learning aids and environmental accessibility; corrective actions for gender issues, including prevention of sexual harassment or abuse. A concrete example of implementing internal responsibility toward students with learning disabilities is demonstrated.

Anti-Trafficking Partnerships - Meanings, Practices and Challenges

At the European level, human trafficking and modern forms of slavery have become a priority area, often deployed as part of wider securitisation processes, where migration has been constructed as a security threat. Significant legislation focuses on human trafficking, including the 2005 Council of Europe Convention on Action against Human Trafficking and the EU 2011 Directive. Both emphasise prevention and prosecution processes over the protection of victims and have consolidated our understanding of human trafficking and related modern forms of slavery as a form of transnational organised crime of substantial and increasing proportions. To tackle human trafficking in all its forms, bodies such as GRETA (Group of Experts on Action against Trafficking of Human Beings) at the Council of Europe, responsible for overseeing progress of Member States party to the Council of Europe Convention call all Member States to adopt the so-called 4-P framework. This involves engaging in not only preventing the crime of trafficking and prosecuting perpetrators and their aides, but also on protecting victims and 'vulnerable' populations. The fourth-P stands for partnership. It is this last element that has been slower in being adopted by all anti-trafficking parties. This paper compares and systematically examines anti-trafficking partnership discourses and practices in two European countries: the UK and Slovakia. The UK is considered as a country of destination for most (officially so identified) victims of trafficking from Slovakia, which in the recent past, has also become a country of transit. The paper considers the challenges of anti-trafficking partnership practices and how the meanings attached to such activities are linked to wider historical, political, social and cultural positions of individual nation-states. It also analyses how the anti-trafficking agenda is used strategically in moments of crises, such as with the refugee crises in Europe in the summer of 2015.

ARSENTYEVA, NINA* (Institute of Economics and Industrial Engineering, ars@ieie.nsc.ru)

Adaptation of Young People in the Labor Market

People aspire to improve their education and professional skills for self-realization in work; however, the conditions for achieving this goal appear to be insufficient and ineffective in a competitive labor market. What are the reasons for this situation?

In today's Russia, the system of professional education and the sphere of application of professional skills are developing in different directions. The education system is aimed at modernization based on European standards, orienting itself toward postindustrial society with the prevailing services sector, science intensive industry, information technologies, and international education space. The postindustrial employment model is targeted at a wealthy society as a services consumer characterized by both high demand and high purchasing power. In Russia the demand for these services is low because people are generally not wealthy. Moreover, the modernization processes in the economy are unstable, and there are visible signs of reindustrialization. As a consequence, there is an apparent inconsistency between the market for educational services and the labor market.

The long and difficult adaptation to the workplace is accompanied by the low satisfaction of employers with the professional competencies of university graduates (which is not surprising) and high demand for training programs to develop simple practical skills. As a result, the "output" of this system is of little use for the labor market. The inconsistencies and disproportions found in the study represent, in fact, considerable economic and time costs both for individuals and society as a whole.

Role of Technology in Leisure Activities Across Three Generations – an Exploratory Study

The concept of leisure as a distinct activity gained prominence in the West with the onset of industrial mode of production in the late 19th and early 20th century. Due to Western influence through colonial rule, economic changes, urbanization, technology development and information technology revolution, the western concept of leisure is fast becoming an important social institution in more urbanized regions of India. How has this change taken place over the last three generations? The present exploratory study is based on comparison of the leisure activities across three generations. A historical-theoretical approach is used to analyse the leisure practices and their relation with the social change, with a focus on use of technology. A survey method was used to collect required information from young students of two premier engineering colleges in the age group 17 to 25 along with the leisure activities of their respective parents and grandparents when they were in the age group 17 to 25. The observations indicate that there has been a major shift in the identification and nature of leisure patterns among last three generations. Concept of leisure as a separate activity was not recognised by most of the grandparents and found the question itself irrelevant. Watching television, movies, reading books and some outdoor activities were very common forms of entertainment for parents. Finally, increasing engagement with mobile and computer technology, blurring of leisure and work among present generation are some of the important findings. The pattern of leisure activities are explained with reference to the corresponding socio-historical and economic conditions of pre-partition British colonial period, post independence times and the recent information and communication technology revolution.

ARUN KUMAR, DURU* (NSIT, DU, duruarun@rediffmail.com)

Use of Information and Communication Technologies (ICT) in Higher Educational Institutes – Some Concerns

Importance of communication and information technology (ICT) in education is recognized the world over. Efforts are made to provide the modern information technology tools in educational institutions at all levels in the belief that it makes the learning and teaching process efficient, effective, faster, enjoyable, with a wider reach and more inclusive. Higher education institutes in India, both private and government funded (state and central government) have made huge investments in making institutes ICT enabled. However educational effectiveness of ICTs depends on various factors, such as, their use, purpose and socioeconomic support system.

This research paper investigates the use of ICTs in two premier government funded engineering colleges located in a city in India. It is observed that even though a large amount of money is invested in the purchase of equipments by these institutes, they are not optimally utilized. This study tries to identify the factors which pose problems or hinder their effective use in educational activities. The study is based on experiential sharing and focus group interviews obtained from students, educationists and administrators. Some of the important findings based on analysis of these observation are: 1) a highly bureaucratic and hierarchical system poses constraints on need-based and timely procurement of and access to ICT equipments for organizations; 2) all digital technologies, equipments and facilities need regular maintenance and upgrading which is not carried out due to lack of trained and dedicated manpower, resulting in their obsolescence. An institutional approach is applied to explain the above findings and some of their implications in a broader socioeconomic context.

Expanding Participatory Resource Management in the Western Forest Complex of Thailand: Lessons from Civil Society

Western Forest Complex, with its 17 national parks and wildlife sanctuaries, is one of the well protected forests in Thailand. The core area of the complex named Thung Yai - Huai Kha Khaeng Wildlife Sanctuary has been inscribed as the Natural World Heritage Site since 1991. The forest complex has also been home to many indigenous Karen communities since hundred years ago and recent migrants from other regions of Thailand in the past decades. At present, there is a threat of forest degradation and fragmentation due to the promotion of cash crop like corn, tapioca and plantation of para-rubber trees and palm oil. This Western Forest Complex is bordering Myanmar, so the status of trans-boundary forest with great potential for retaining biodiversity is very significant. Nevertheless, the dominant international and national policy on regional integration places more weight on economic growth rather than on regional effort for environmental conservation, for example, the aspiration of Greater Mekong Region "economic corridors" and plan and implementation of "connectivity" of ASEAN countries. In addition, Myanmar is opening up for economic opportunities which means the intensification of resource extraction for future prosperity. In counteracting to the threat, civil society groups try to develop a network of community forest around this Western Forest Complex covering 135 communities in 6 provinces. This paper traces the development of the effort, problems, challenges, and success stories, extracts lessons learned and analyze how the effort can be expanded and transferred in a way that can support participatory management and protection of trans-boundary forest in the future.

Between Liturgy and Performance: A Dispute over the Symbolic Space in Mexico.

The Mexican Federal Government's Education reform in 2013 mobilized resistance from the National Coordinator of Education Workers (CNTE), who for several months took over one of the most iconic political spaces in Mexico: the city's center square called the Zocalo. The dispute over this space became more intense because the Zocalo is a key part of the independence celebration, which for over 100 years has represented the call to arms against the Spaniards. The paper analyzes the dispute over the use of this space by the federal government to conduct the ceremony and the CENT's resistance to vacate it. The dispute for the Zocalo faced different motives rights and political visions, and a dispute between the supremacy of society or the State in the use of national spaces and symbols. The conflict essentially marked the contrast between two forms of manifestation and expression, and the competition surrounding the recognition of the authenticity and credibility of the representations involved. The performative capacity of a group of civil society intended to compete with the liturgical ability of the Mexican state with the result of this conflict being resolved in favor of the latter. However,

the aftermath of the dispute over authenticity in the use of the Zocalo marked the subsequent conflict, in which the state liturgy can be seen to function as a performative mechanism that undermines the performative ability generated from social movements in Mexico. This makes it necessary to consider how far civil and political spheres move within the context of authoritarian regimes with weak democratic institutions as is the case of Mexico and other Latin American regimes.

Complementary and Alternative Medicines: Towards a Holistic Healthcare System in Africa

This paper responds to two key issues: the concept of CAM in the context of Africa's and global value systems that imposes a form of health practice as a dominant (and therefore mainstream) healthcare system and other forms as alternative to it; and second, the place of CAM in Africa's health policies. Within the context of Africa's health system, the conceptualization of indigenous medical knowledge and its value in relation to its history, practices, traditions, and cosmology as CAM, undermines the heritage of a people and denies the multiple realities of a polyvocal world. Any society that was populated with healthy people before modernity set in, illuminates its possession of an effective medical knowledge and a responsive healthcare system. The dismal health indicators of contemporary sub-Sahara Africa speaks to the challenges inherent in its health policies that undermine the reservoir of indigenous medical knowledge and systems. Using case studies of different forms of endogenous health practices, this paper discusses the potential benefits and constraints associated with indigenous medical knowledge and practices in Africa.

An Analysis of Online Testimonies of Healing and Cure By Members of Nigerian Based Religious Bodies

The role religion and spirituality have played in the health care terrain of Nigeria has become quite significant with the proliferation of churches and other religious bodies. Within the shores of Nigeria are some of the largest churches boasting of thousands of devoted followers. A major attraction to these religious bodies is the claim to be able to heal a variety of physical as well as spiritual ailments. The process of healing is quite varied and range from prayers, exorcism, ritual performances and the laying of hands to the use of water, oil and images. Due to the diversity and large number of such religious bodies, a number of them have turned to the internet to create a sense of assurance (in order to increase the faith of their followers) and increase their credibility (for the sake of people outside the fold). Testimonies of healing posted on the internet by followers is presented as a confirmation of the power such religious bodies have to heal the body and the spirit. This paper takes a look at this phenomenon through an analysis of online testimonial claims of healing. Through qualitative research methods, the paper analyses emergent themes with the aim of interrogating the claims of the healing and curing process.

Interrogating Gender, Sexuality and the Body through Selected Nigerian Musical Videos

The Nigerian leisure context has witnessed a significant transformation and a lot of this has been due to the influence of the mass media. Unlike the 1980s-1990's when the Nigerian populace depended on the Nigerian Government to entertain them through traditional media forms of the television and radio; the coming of independent and private mass media stations opened the floodgates for diversity and choice. The mass media terrain did not only change in terms of number but also in terms of nationally produced programs and artists who introduced innovation to mass media entertainment. One of such innovative changes is in the area of music. Through musical videos, Nigerian artistes have not only entertained audiences within and outside Nigeria but have also been able to significantly redefine what leisure should look like. In this redefinition, sexuality, gender relations and the body are projected. It is based on this phenomenon that this paper considers selected Nigerian musicals in order to interrogate how gender, sexuality and the body is presented within leisure. The paper uses qualitative data methods to analyse the lyrics of songs as well as body movements, physical spacing and clothing to discuss the identified concepts.

Leisure and Environmental Education in Japan

Rural activities as leisure pursuits are changing historical trends in Japan. Before the Green Tourism Law of 1994 was enacted, tourist-oriented agricultural activities such as fruit picking and livestock experiences on farms were popular among urban residents. Rental farmland near urban areas was also already popular.

In addition, some more remote rural areas such as Touno (Iwate Prefecture), Ajimu (Oita Prefecture) and Iida (Nagano Prefecture) developed rural tourism by using farmers' houses. However, the enactment of this law spurred the nationwide spread of green tourism development.

Educational rural tourism is also being developed throughout Japan. Some small communities such as Ojika (Nagasaki Prefecture) and Suo Oshima (Yamaguchi Prefecture) already invite high school students to experience the rural way of life. After their success, many rural municipalities are following the same path.

The rural way of life could be used to attract international tourists as well. Ojika already accepts international excursionists from the US, Korea and Taiwan, and provides international volunteers to assist them. Though Suo Oshima already accepts more than 4000 domestic excursionists each year, it also accepted some participants from the World Scout Jamboree in Yamaguchi in 2015.

A Puzzle of Happiness of Japanese Youth

This presentation challenges one puzzle of Japanese youth: why Japanese youth feels happier than before. The reason why this is a puzzle lies in the contrast between the deteriorating socioeconomic conditions surrounding Japanese youth and the rising rate of happiness among them. On the one hand, the rate of both unemployment and unstable workers among youth has been increasing since the late 1990s. 'Freeter' and 'NEET' have been hot issues in the mass media. Their parents also have been getting poorer and young people, particularly university students, can get much less support from them. Their life conditions have been getting worse year by year. On the other hand, however, the rate of young people who feel happy or satisfied with their current situation has been rising, according to some surveys. The time series survey by Cabinet Office shows respondents in their 20s are more likely to answer they are satisfied with their current life than before and than older respondents as well. The time series survey by the Japan Broadcasting Committee shows the rate of high and junior high school students who answer they are happy is soaring. Adding weak and strong affirmative answers, around 90% answer they are happy. Some sociologists have tried to solve this puzzle. They proposed some hypotheses, but did not test any of them with empirical data. Two of well-known hypotheses are:

1) As they have a darker perspective over Japan and themselves, they feel their current situation as better than that.

2) As they put much more importance on peer relationships, they can feel happier thanks to their friends even when their socioeconomic conditions are worse.

In this presentation, I will examine what kinds of factors have an impact on their happiness or life satisfaction, with dataset collected in Tokyo and Kobe in 2012.

From the Indignados Movement to "Barcelona En Comú": Continuities, Identities and Challenges

In June 2014 emerged 'Guanyem Barcelona', a new citizens' platform for municipal elections born out of the Indignados movement (and previous movements linked to it), later transformed in February of the following year into 'Barcelona en Comú' (BeC) through the support of other political formations and parties on the left side of the political spectrum. Less than one year after its original constitution (May 2015), BeC won the city council elections. It represents, together with Podemos, Ahora Madrid, or Marea Atlántica, a new wave of political parties and confluences emerged out of and weaved together with the Indignados movement (or 15-M movement).

This paper aims to explore the continuities between 15-M in Barcelona and BeC, focusing on the relationship between institutional and non-institutional dynamics, party and movement. More than analysing the emergence of the party, we want to focus on the evolving relationship between the movement and the party and what does it mean for BeC to be a "movement-party". What influence has BeC got from the 15-M movement in terms of frames, organization structures, and political actions? How is BeC keeping a continuous relationship with its 'indignant base' and negotiating its double identity? How is BeC managing its participatory democracy component in governing the city? To shed light on these questions we have drawn from in-depth interviews, participant observation and focus groups with Indignados participants and BeC representatives and rank and file activists between the start of the occupation to nowadays.

Societal Wellbeing in Europe before and after the Economic Crisis. Monitoring Societal Change with a New Multidimensional Measurement.

Eight years after the financial collapse, starting in the United States, the European Union is still in a state of crisis; we can even observe an accumulation of contemporary challenges for the EU. All those critical outbreaks of events (e.g. the Greek Euro-crisis, the conflict in Ukraine or the contemporary refugee flows) have led to the emergence of new cleavages across Europe threatening the solidarity between EU member states and social cohesion within European countries. Therefore it is necessary to develop new concepts of quality of society taking the crises perceptions of the citizens more adequately into account. In my own conception I propose a new multidimensional concept of *societal wellbeing* to understand and evaluate new cleavages in societal embeddedness, social recognition and social belonging.

The empirical approach presents this new operationalization strategy of societal wellbeing using indicators of two waves of the European Social Survey (2006 and 2012). Societal wellbeing is designed as a second order factor (based on various subjective evaluations of quality of society) and the whole operationalization strategy is evaluated using the method of Multi Group Confirmatory Factor Analysis. The second part of my empirical analysis refers to the evolution of those potential feelings of discontent within Europe in recent years. All European countries participating in the European Social Survey were grouped based on welfare state typologies to measure different developments of societal wellbeing separately across major European regions. Thirdly, multiple OLS-regressions within those regions were computed to justify the use of a final multi-level model. This model explores which contextual factors together with certain limitations of individual living conditions are able to explain different magnitudes of societal malaise across Europe.

ASHENDEN, SAMANTHA* (Birkbeck College, s.ashenden@bbk.ac.uk)

Cross-Border Surrogacy, Conflicts of Law, and Conceptions of Perosnhood

Practices of kinship are currently being re-written by reproductive technologies. In particular, the development of the practice of international surrogacy raises some difficult challenges for legal practice and for sociological theory. Different jurisdictions provide different rules for the recognition of parenthood. Children born as a result of cross-border surrogacy agreements may thus be deemed stateless and parentless because of divergent designations of parenthood, on one hand in the state where they have been commissioned and on the other hand in their commissioning parents' home state. UK law, for example, determines that the mother of a child is the woman who gave birth to the child (mater sempa certa); there is no enforceability of pre-birth agreements between surrogate mothers and intended parents. Thus children commissioned by UK couples with surrogates in Ukraine and India, where surrogacy contracts are enforceable, have turned up at the UK border stateless and parentless. Similar cases have arisen in Belgium, France, Germany and Italy.

This paper takes a number of recent examples of such cases and traces the ways in which courts have sought to make judgments of parenthood. Examining such examples shows us in detail the importance of sociology of law approaches. Such cases reveal that beneath conflicts of laws surrounding international surrogacy are markedly different conceptions of personhood and filiation that lend intractability to the conflicts at hand. In these conflicts, the very idea of personhood is up for grabs: anthropological and philosophical questions concerning identity intersect with legal and administrative categories in the handling of children born through cross-border surrogacy.

Keywords: conflicts of laws, international surrogacy, personhood, sociology of law

International Laboratory in Russia As a New Form of Reproducing Scientific Elite

Over the last decade, the academic world in Russia has seen significant changes. One of the government initiatives includes establishing new types of international laboratories under the guidance of a leading scientist. More than 160 laboratories engaged in promising research have been established. This paper presents study on the examining such laboratories. One of the main questions of the research: "Are young scientists potential academic elite and in which country are they going to build their academic career?" Our analysis is focused on weakly structured in-depth interviews with experts, leading scientists and heads of laboratories, as well as with young researchers from international laboratories in several Research and Education Centers of St Petersburg, Moscow, Rostov-na-Donu, Ufa. The theoretical and methodological background for verifying the hypotheses is actor-network theory by Bruno Latour and the concept of scientific elite by Harriet Zuckerman, Michael Mulkay, Grit Laudel.

The results of the study demonstrate, that the idea to invite leading scientists to the Russian laboratories is efficient. Laboratories under the guidance of leading scientists are incubators for young hopefuls. With the theory of scientific elite we diagnosed certain social process – the formation of potential scientific elite in international laboratories in Russia. We have found that there are significant prerequisites for it, and under certain circumstances young scientists could form "crème de la crème of the world elite" in a specific research area.

The paper is prepared withing the framework of the Russian Foundation for Humanities.

Paradox of Visibility

The paper will offer a contextualised account of Muslim women's identities in Britain. It aims to explore and compare the construction of identities, and also how to get positive recognition in various generations of British Muslim women. The empirical research will explore the construction and reconstruction of research participants' identities and their dimensions and processes. The politics of recognition /misrecognition will be employed to analyse the research participants' experiences in the various arenas of their social, cultural and individual life. Multidimensional aspects of self and their mobility between traditional and modern will be explored; the fluidity of identity also is another aspect that will be discussed in the paper. Then it will examine manifestations of Muslim women's agency, and identity formation in modern Britain. Therefore, gender discourse will explore the religious and cultural practices of those women. The intersectionality of gender, religion, and ethnicity will be emphasised.

Qualitative research was chosen in order to explore the theoretical model of the relationship between ethnicity, narrative, and identity within the British Muslim women in Newcastle-upon Tyne. The ethnographic intergenerational research will include various aspects of ethnic minority women with Islamic heritage and reflect on the themes of identities, and belonging. The research utilizes oral history interviews, which are concerned with meaning and understanding to arrive at an interpretation. Therefore valuable life experiences can be revealed to be shared with the wider society, and breaking the invisible social barriers among people from different communities. A feminist approach to ethnographic methodologies is adopted to share the richness of research participants' experiences in order to empower those women. The research also adopted a participatory method though creative writing workshops and also images which will also contribute to a wide range of debates on gender, visibility and empowerment.

ASIS, JONNABELLE* (University of Brescia, jonnabelle.asis@gmail.com)

Growing Gap While Growing Grey: Ageing Non-EU Migrants' Social Networks and Economic Well-Being

While migration studies on ageing countries in Western Europe and North America abound, the recognition that the migrant population itself is ageing and studies that focus on ageing migrants are relatively recent. As a recent immigration country, Italy's first generation migrants are now entering their old age. These are mostly economic migrants who came to Italy in their early working years or some who decided to work abroad or join their families late in life.

This research explores the economic dimension of well-being in terms work trajectories and (the lack of) pension eligibility. The disadvantaged state that ageing non-EU migrants occupy is especially salient given the characteristic of Italian labour market: highly segmented and large informal economy. Using a social network approach, the research investigates the extent to which personal networks promote or constrain economic well-being. Differences in the composition of the job search network and social support network across non-EU migrants from different countries will also be analyzed and its implications to the outcomes.

The retrospective longitudinal data comes from face-to-face egocentric network surveys and qualitative interviews of 105 non-EU migrants, 50 years old and above, and residing in Brescia. Brescia is an important field site since it is one of the Italian cities which has a good number and diversity of migrants, ranking fourth in terms of the number of migrants, after Rome, Milan, and Torino. While the social network component captures the respondent's job search history and persons who helped them land the job throughout their working life, as well as their social support network, the thematic analysis of the narratives will provide context and insights regarding the ageing non-EU migrants' (changing) migration project(s), circumstances surrounding network formation and maintenance, work experience and satisfaction, and reflections as they near their retirement/old-age.

RC19-232.3

ASIS, JONNABELLE* (University of Brescia, jonnabelle.asis@gmail.com)

Not All Paths Are Paved: The Role of Social Networks on Ageing Non-EU Migrants' Economic Incorporation

Demographic changes brought about by improved life expectancies, decreasing fertility rate, and increasing migration to more developed countries all happen within the context of growing social inequality. Against this background, it becomes important to study the situation of the ageing migrant who encounters a double jeopardy: dealing with social consequences of relocating to a new country, and renewed insecurity and risks that accompany the ageing process.

Taking the meso-level analysis of the social network approach, the research investigates the extent social networks play in enhancing or inhibiting economic incorporation. Strong ties based on homophily are fundamental to access information and various resources for migrants, but can also constrain access to more diverse information and resources (which weak ties can bring) since they serve more bonding than bridging function. While networks play a positive role of offering employment possibilities, they also restrict them to the same labour market. Through social network analysis, the study seeks to answer which network typologies give rise to certain types of work trajectories/histories.

The retrospective longitudinal data comes from face-to-face egocentric network surveys and qualitative interviews of 105 non-EU migrants, 50 years old and above, and residing in Brescia. Brescia is an important field site since it is one of the Italian cities which has a good number and diversity of migrants, ranking fourth in terms of the number of migrants, after Rome, Milan, and Torino. While the social network component captures the respondent's job search history and persons who helped them land the job throughout their working life, as well as their social support network, the narratives will provide context regarding their migration and work experience, and a zooming in on the process of network formation, and the factors and circumstances explaining the direction of the paths.

ASOCHAKOV, YURY* (St.Petersburg State University, yasochakov@yandex.ru)

Digital Liberation and Inequality: How New Is the New Digitalized World?

This paper aims at discussing possible approaches to understanding the shifts in social and power structures of information societies. At the turn of the 21t century social theorists analyze the emergence of a *creative class* as a new, progress-bringing element in the social structure of the post-modernized capitalism (Florida, Richard 2002). The key driving force of this new economic class – its "super-creative core" – is formed by the informational technology innovators: Silicon-Valley-like *knowledge communities* working for the advancement of the *knowledge economies*. From the point of view of anticipated social prospects of information revolution, communications and governance in times of Internet are visualized as "flattened" (horizontal interconnectivity of countless digitally empowered equals) and potentially taken over by the control of citizens digitally networking on the basis of peer progressivism, citizen journalism, and technologies of liquid democracy. In this way the abstract post-modernist idea of non-hierarchical multipolar structures finds its base in the mass/class consciousness of digital citizens and is applied to social reality.

At the same time, the concept of digital divide is used for pointing out the phenomenon and the statistics of economic and social inequalities emerging along the lines of the access to and usage of information technologies. Following the discussion of these questions and based on the political economy analysis of the forms of participation in data/content consumption, production, and ownership, we can characterize three different levels of digital divide as traditional social-hierarchy-based forms of inequality.   To understand and conceptualize structural shifts in information society we need to develop a new approach on the basis of

Gender, Entrepreneurship and Public Policies in Portugal

In the 2000s, fostering entrepreneurship became a priority in the public discourse of the OECD and the European Union as being a means of creating new jobs and promoting innovation. The crisis has boosted this view and its assumption that the entrepreneurial potential of all sections of society should be used in order to achieve economic growth and development. Portugal has not been indifferent to this trend. A number of public policies have been devised to promote entrepreneurship among women and other segments of the population.

This presentation reflects on the contribution that sociological research can give to the development of public policies aimed at increasing women's participation in entrepreneurship in Portugal. The reflection begins with an analysis of the way in which entrepreneurship has been used by policymakers to promote gender equality in this country by examining the content of the successive National Plans for Gender Equality. This is followed by a discussion of the impact of these Plans and the role that sociology can play in assessing the measures that have been put into practice and formulating better informed public polices in this domain.

The Impact of Migration on Sexual Relationships Among Iranian Immigrant Couples in London

In this paper I investigate the factors contributing to changes in sexual relationships among Iranian immigrant couples. Transformation of attitudes, expectations, and behaviors regarding immigrants' sexual lives is explored by applying the segmented assimilation theory and social perspective on sexuality. The former recognizes a multipath process and different patterns of immigrant Iranians' integration into the host (British) society (Joppke and Morawska 2003). The latter conceives of sexuality—in this case, sexual norms and practices--as a social phenomenon (re) formed by the social circumstances of people's lives (Seidman et al. 2006; Rise 1967). My study is based on 36 semi-structure interviews conducted with married and divorced Iranian men (15) and women (21) in London. As my findings reveal, immigrants experience a significant change in their sexual relationships in the new environment, and they re-construct their sexual views and behaviors through critical reassessment of their past orientations and practices and a selective mix-and-match of 'traditional' norms and values with 'modern' options during their assimilation process (Shahidian, 1999). In comparison with non- or less religious, modern liberal couples, however, the traditional religious immigrants, especially women, have been much more affected by the challenge of new/different sexual norms and expectations encountered in the host/British society, and have experienced more severe crises in their sexual relationships which in some cases lead to separation or divorce.

Sonic Ecologies of Political Protests

In this paper I will explore the sonic dynamics of selected political protests which took place in Belgrade during 2014 and 2015. I am particularly interested how sonic events provoke the emergence of political subjectivity *in situ*. The protests I analyse are can broadly be described as protests aimed at demanding Lefebvrian "right to the city", whether they are conducted by the anti-gentrification initiatives, cyclists' activists, or LGBT community. Thus, they directly challenge the physical order of the city imposed by the hegemonic power relations. I firstly identify the sounds of policescape (defined in Rancièrian terms) on this protests, which includes not only the obvious sounds of policing, but also wider system of urban sounds and noise which serve to maintain the relations of inequality, perform the acts of classification and identification and structure the social space through the paradigm of "security". Tracing the political subjectivity residing in the resilience of the carnal body of the protesters, I show how the protests can escalate when the sounds of policing is being recognized as a physical threat to protesters' body itself. Examples of this include reactions to church bells on Belgrade 2014 Pride, employing police sirens on 2015 protest "Ne da(vi)mo Beograd" ("Don't drown Belgrade / Don't give up on Belgrade", aimed against gentrification building development "Belgrade on Water"), etc. I am particularly interested in exploring the importance of the intensity of this sonic events, arguing that both the

sounds of poliscescape and the sounds of resilience are not primarily discursive events, but function as sensual "vibrational body", whose capacity to affect protesters, provoke different sensory experience of the event and acquire political (non-human) agency is directly tied to the material properties of the sound itself.

"She's a Spy!" - Trust/Mistrust Relations in Social Movement Research

Much has been written about the importance of integrating emotions in the study of social movements over the past 20 years. Even more has been written about methodological approaches regarding researcher–subject relations during fieldwork. But largely missing is a critical discussion of emotions triggered by the challenges, risks and practicability regarding fieldwork in the politically sensitive environment of protests. By addressing the content of such a discussion in our paper, two aspects particularly come into focus: the role of feelings related to trust and mistrust – which are mobilized through the situation of „being researched" – and researching under challenging conditions. Researchers collecting empirical data in various protest events that have taken place around the globe within the past four years have faced crucial challenges in establishing trust in the field, on the one hand, and evaluating the potential risk and working on mistrust issues on the other hand. This paper is based on three qualitative research projects in the field of protest movements in Egypt´s Tahrir Square, Turkey´s Gezi Park developments and the aftermath of Germany´s Stuttgart 21 protests. All three researchers have faced mistrust as well as the challenge of risk evaluation and management in the field. The researcher´s confrontation with mistrust in the field makes it clear how dominant trust/mistrust relations are in politically sensitive fields. Therefore, a close look at different dynamics and dimensions of trust and mistrust is worthwhile, not only regarding researcher-subject relations, but also regarding where and in which ways these emotions are negotiated and to whom or to what they relate to.

Atheism, Moral Panics, and Struggle in the Religious Field in Post-July 2013 Egypt

Amidst the post-July 2013 Egyptian regime's crackdown on Islamist 'terrorists' and other political dissidents, a new putatively national threat has emerged: the depraved atheist. Regarded by various media outlets, religious authorities, intellectuals, and some political elites as a threat to the social and moral fabric of Egyptian society, self-proclaimed atheists have been the victims of a public smear campaign, physical harassment and social marginalization, arrests, and even harsh prison sentences. The "atheism phenomenon," as it is called, has especially gained discursive prominence in light of the "religious revival" announced by Egyptian president Sisi in January 2015. Drawing on ethnographic, interview, and newspaper data, this study deploys a Gramscian-Bourdieusian conceptual framework to analyze the rise and form of the atheism phenomenon. In particular, it draws on Gramscian approaches to the moral panics literature and Bourdieusian conceptions of the religious field. In doing so, it argues that the atheism phenomenon must 1) be situated in relation to Egypt's current economic, political, and religious configuration, and 2) understood as a symbolic contest in an elite-driven struggle to (re)constitute hegemony. But whereas the moral panics literature, including its Gramscian variants, often regards ruling elites as a single, unified organism, I use a Bourdieusian fields approach to contend that equally consequential – for analysis and explanation – are the struggles within elite circles. In this way, I demonstrate that moral panics are not only attempts to reorganize state-society relations by imposing discursive meaning *from* the top, but also about renegotiating power *at* the top. In the Egyptian context, the atheism phenomenon has become a symbolic site and struggle for state and religious institutions to designate, negotiate, challenge, and set (however tentatively and inconclusively) their respective roles in the nationwide project of "religious revival."

"Digital Socialization" and the "New Political Culture of Resistance" in Sub-Saharan Africa: The Case of Youth Politics.

In the era of digitalized communication, the internet has proven to be a vital platform through which citizens have mobilized, participated in politics of their countries, expressed discontent or resisted undemocratic policies of government and poor public service delivery. In 2011, Africa experienced the first ever digitalized and internet driven political revolts in North Africa in what is termed as the, "Arab Spring". The reality is that Sub-Saharan Africa was affected by this wave of resistance though with less magnitude. The effect depended on the distribution of the internet, digitalized equipments and the level of consciousness of the participating population mainly the youth. Politically, digitalization has generated, preserved and transmitted new political knowledge thereby producing digitalized political culture which is dominant among the youth.

The diffusion of the new political culture is global, 'faster', 'cheaper' and 'deeper'. In effect, digitalization has produced a new avenue for recruitment, socialization, and mobilization for social action including resistance as an expression of social and political discontent. However, unlike traditional forms of resistance that are built on formal social organization, movements, popular revolutions, and demonstrations which are often suppressed by the coercive force of the state, the emergency of info-communication networks have transformed political activities into covert off-street agitations, thereby shaping a new digitalized political culture of resistance. In a nutshell, this paper answers three important questions; How has digitalization socialized the youth into a new political culture and forms of social resistance? In what aspects have new forms of social resistance impacted on youth politics in Sub-Saharan Africa in particular Uganda? And, how effective is digitalized political culture of resistance and the associated forms of counter resistance.

Contradictions of Social Investment Strategies for Disadvantaged Youth in Times of Crises

The crisis tendencies since 2008 have put new pressures on the adaption of welfare systems. Debates are focusing on the necessity to replace activation (based on welfare cuts and pressurising the unemployed) through so-called social investment strategies, which aim at improving the quality of the workforce through an expansion of (certain) social policies (education, childcare etc). These debates have also come to influence the dynamics of social policies (education, labour market policies, VET) for young people in Austria, as these groups present a testbed for the reorientation of the welfare system. The situation of youth in Austria is increasingly described in educational and labour force categories as "early school leavers", "low educated", "difficult to place" or NEET.

Based on data with gathered in the FP7-project SOCIETY (2013-2015) our findings show that social investment strategies legitimise a deepening of the scope of welfare activities and its grasp on young peoples subjectivities and their behaviours. Through a specific construction of the "deficits" of young people and their family background, social policies for young people are more and more reorganised to "optimise" the transition from school to work and to adapt the latter to the alleged requirements of the market. Social investment oriented strategies have not simply led to welfare retrenchments but to qualitative changes in social policy interventions (the so-called Austrian training guarantee – soon to become mandatory - is an example for this). The goal is to make young people to adapt their subjectivities to demands of a smooth transition to employment. Interviews with policy makers revealed that a pathologisation of family backgrounds as well as deviant behaviours allows these policies to re-legitimise themselves as rational forms of support. This raises the question whether social investment really offers an alternative to activation.

Access Bias in the Swiss Labor Market

Active Labor Market Policies (ALMP) play an important role in the attempt of most industrialized countries to (re-) integrate unemployed people into labor markets. In particular for people who face disadvantages in the job market, such as low-skilled workers or migrants, ALMPs should increase the success in finding a new job. However, by using a complete registry dataset of all unemployed in Switzerland in 2014 we identify, first, biased access to ALMPs for particular disadvantaged groups. That is, responsible institutions in Switzerland, predominantly the regional job placement centers, discriminate people against accessing ALMPs in the sense that unemployed with a migration background or other labor market-related disadvantages have a lower probability of attending a public measure than others. What is more, disadvantaged people usually attend shorter and less costly measures, which raises the suspicion of an ``alibi policy". This

finding is particularly striking, since ALMPs as ``enabling interventions" were initially tailored to ease the labor market integration for exactly these groups. Second, we find that the degree of institutional discrimination in terms of an access bias differs between the twenty-six Swiss cantons and is even absent in some of them. Although the legal framework for active labor market measures is relatively coherent in Switzerland, the cantons enjoy some freedom in their assignment policies due to their role as the central subnational jurisdictions. In a subsequent effort, we try to investigate potential underlying mechanisms that could cause these differences, such as public sentiments towards migration or budgetary constraints as well as the overall economic environment. In sum, our findings question whether active labor market policies can life up to their intended goal as an important integrative tool for disadvantaged groups, since access to ALMPs is not entirely driven by individual- and group specific supportive needs of the unemployed.

'Hybrid-Professionalism' in Professional Service Firms: The Case of Compliance Officers in English Law Firms

The changing relationship between professionalism and management is a topic that continues to generate much debate in which recent scholarship explores the question of how some professionals have become increasingly implicated in management work (Gleeson and Knights, 2006). Often referred to as hybrid professional-managers' (Kirkpatrick, forthcoming), such roles have been the subject of considerable research in the public sector (particularly health) but not so in professional service firms where their emergence has attracted much less attention.

Drawing on a qualitative study, this paper addresses this gap by focusing on the emergence of a new statutory role in English law firms – Compliance Officers for Legal Practice (COLPs). The regulator for the solicitors' profession (Solicitors Regulatory Authority) made these roles compulsory as part of a broader set of regulatory reforms with the new regime marking a significant move towards 'management-based regulation' (Parker et al., 2010). The SRA views the COLP role as pivotal to ensuring firms realize mandatory regulatory outcomes by introducing robust management practices and supporting law firms to "make the mental transition from profession to business" (Still and Calvert 2012: 33). As the SRA has made it compulsory that such roles be performed lawyers – who risk losing their practicing certificate if found to be negligent in their duties– this paper explores how the COLP roles are being enacted in practice. We examine lawyers' motives for becoming COLPs, how they rationalize their activities, and the challenges they encounter in combining professional and organisational modes of working. In so doing, the paper furthers our understanding of the nature, rationale and motives of hybrid professional-manger roles in professional service firms.

How Much Indonesian Conditional Cash Transfer Reduce Poverty Rate?

Conditional Cash Transfer (CCT) is one of the well-known poverty reduction programs that has been widely adopted by many countries in both developed and developing countries. The program that usually focus on improving the health and education aspects for beneficiaries has been a subject of research study by many scholars and donors, yet only a few of them relating the impact of the program directly to the poverty rate. Despite the impact of this program that usually can be seen in the long term, a program simulation is pivotal to do to decide whether the government need to raise the benefits for the recipients or to expand the coverage or to do both. CCT in Indonesia has been designed so the recipients are expected to escape from poverty after 6 years. Many studies regarding the CCT program in Indonesia have been done by the World Bank concluded that the CCT has increased per capita consumption by 3.3 percent. However, this number is not significant compare to that in Colombia which had 14% impact of CCT on consumption. This program has also had an impact on health and education in Indonesia, but one question has emerged, how much this program can reduce the poverty rate? This paper is trying to answer the question as well as to discuss the strengths and weaknesses of the program by using an ex-ante simulation with many scenarios. The simulation program in Indonesia surprisingly shows that the current program does not reduce the poverty rate, yet this program reduce the inequality among the poor. Government has also created other programs as the continuation of CCT to help the graduate people

Factorial Surveys in Social Psychology: The Role of Economic and Cultural Threat for Explaining Support of Immigration Control in Switzerland

Discussions about feelings of threats and their impact on attitudes towards migration have a long tradition in social psychology. By using data from a factorial survey experiment among around 1,100 respondents with Swiss citizenship (conducted shortly after the successful initiative to restrict further migration to Switzerland in 2014), we analyze the role of economic and cultural threat in explaining support of immigration control in Switzerland. Economic threat is assumed to be high when migrants and natives have similar levels of education, and perceived cultural threat is assumed to be high when nationally pride natives are confronted with migrants unwilling to adapt culturally. Furthermore, it is analyzed whether threat varies across immigrant groups that differ in size, aggregate skill level and cultural background. Results show that both economic and cultural threat play a role in explaining support for immigration control. In line with previous studies economic threat seems to be an issue for highly-skilled natives when they are confronted with large groups of migrants with similar skill levels to their own. Likewise, nationally pride natives seem threatened not only by culturally distant migrants, but also by large migrant groups who are not willing to adapt culturally and at the same time not being dissimilar enough to stay culturally apart. The paper can also contribute to some new methological discussions about factorial survey experiments (e.g. possible mode effects in online panels).

Role of Non- Governmental Organization in Environmental Conservation: A Study of Vanarai Organization, India

Abstract

Role of Non- Governmental Organization in Environmental Conservation: A Study of Vanarai Organization, India

Today Government and Non- Government Organizations are making efforts for environmental conservation. Vanarai Trust is located in Pune district, India. Dr. Mohan Dharia formed Vanarai organisation in 1982. Vanarai is working in more than 250 villages with the objective of making them self-reliant. Vanarai organization insists on clean, green, self-reliant villages, afforestation, and agriculture with modern methods, animal husbandry, latrine and gobar gas for every house, eradication of illiteracy, family planning and creating local employment opportunities.

The objective of the study is to find out the contribution of Vanarai in environmental conservation in selected village. The paper is based on primary and secondary data. Vanarai in Pune district is working with many villages such as Gokawadi at Bhor Taluka, Gawdewadi and Chandoli in Ambegaon Devdi in Purandar Taluka Koinkarwadi in Khed Taluka .   The data was collected in Gokawadi village at Bhor Taluka. 70 respondents from Gokawadi village and high level authorities of Vanarai   were   interviewed. The main finding of the study is that Vanarai has effectively and efficiently worked for the environmental conservation in rural area in India. It has contributed as planner, as implementer, in creating awareness, and developing alternative technology regarding environment conservation in rural area.

Graduates of Lebanese Institute of Social Sciences: Which Equality in Learning, Which Equality in Job Market?

Graduates of Lebanese Institute of Social Sciences: which equality in learning, which equality in job market?

The Lebanese Institute of Social Sciences was established in 1959. This institute teaches Social Sciences among four private universities in Lebanon. In its mandate, research and teaching were the two components which have directed its work.

This Institute was working in light of this aforementioned direction till the Lebanese civil war erupted in 1975. This institution between others, exposed to many negative effects. During this time, under the umbrella of the increasing impact of globalization, higher education witnessed a lot of structural transitions at the world level and local one.

In 1990, Lebanon has restarted his workshop of reconstruction, the institutes of Social sciences like other educational institutions, has subjected to many structural mutations. For example, since 1990, it turned to mass education; it is stamped by the highest level of enrollment among the same universities which teach Social Sciences in Lebanon. Another feature, this institute is the only one which has not adopted the LMD system yet in The Lebanese University. In the same context, the curricula have no substantial transformation to keep pace with the job market.

In light of this fact, a main question rises up; does the equality of chances in enrollment in higher education provide the same equality in job market?

Other pressing question, it is possible to the local tertiary institution which has no opportunity to coin its own conditions of graduation and its own job market to make a fair integration in the labor division of the scientific world?

'Membership Categories', Stocks of Knowledge and Social 'Figuration'

Conversation Analysis has attracted attention primarily thanks to its detailed analyses of everyday conversation: the analysis of the sequential structure of the conversation, the interactive production of turns, the negotiation of turn transitions, etc. However, it is a less well known fact that Harvey Sacks is also the originator of a methodological approach for the analysis of social categories and their use known as Membership Categorization Analysis (MCA). Sacks develops this approach with the help of examples, such as "In the last year and a half 26 Negroes were killed in the South, in unsolved murders". We hear and read this sentence in a specific way: the terms referring to places and people establish an interpretive framework which suggests that the crime has a racist background.

Since then, MCA has been employed primarily in ethnomethodology and applied to conversations as well as written material, e.g. by Silverman, Francis, Hester, and Wolff. It is to these studies that the presentation will be connected. It will do so by expounding, in a first step, the terminology and principles used in ethnomethodology to date ('membership categorization devices', 'category bound activities', 'economy rule', 'consistency rule', etc.), and the findings it has drawn from them. In a second step, the presentation will then demonstrate how MCA can be further developed with respect to both theory and method. In doing so, the presentation will purse the following questions: can MCA be incorporated into general sociology of language and its methodical approaches? Which elements of its repertoire of instruments can be, and need to be, refined? What are the stocks of knowledge that 'membership categories' draw on? What degree of context sensitivity do they possess? Which figurations (Norbert Elias) – i.e. which networks of interdependence – are generated by membership categories? Which 'social topic' is thus created?

AYASS, RUTH* (University of Klagenfurt, ruth.ayass@aau.at)

"Tsunami Girl": The Genesis of an Iconographic Picture

Many historical events have imprinted themselves on the collective memory via one or only a few pictures. We all know images of this kind. Raising The Flag on Iwo Jima, Willy Brandt's Warsaw Genuflection, Mahatma Gandhi sitting cross-legged at his spinning wheel, Martin Luther King in front of hundreds of thousands of listeners at the Lincoln Memorial in Washington D.C., etc. etc. In an iconographical way, these photos encapsulate an entire time period or a major event in one single image, many of them with a strong focus on a particular person or a particular symbol. But which features must a picture have to become such a key image?

The presentation analyses the photographs produced and circulated during the March 2011 tsunami and earthquake disaster in Japan, which show destroyed buildings, flooded landscapes and desperate people. Particularly one photo was printed again and again, the picture of a young woman wrapped in a blanket (sometimes referred to as "Tsunami Girl").

The presentation provides a visual analysis of disaster photography. The analysis shows that the disastrousness of disaster is (also) created through the pictures of the disasters disseminated by the media. Disaster destroys existing order. The photographs of disaster depict the dissolution of such order, however, they do this in an orderly manner. Providing a qualitative analysis, I will demonstrate key features of this ordered structure. The presentation will discuss why and in what way certain pictures reveal themselves to be iconographic of disaster and how they enter the visual memory as its representatives.

Online Leisure Communities: The Case of Tennis Spectators

For decades, leisure providers have been interested in various aspects of community and leisure participation (e.g., citizenship development in Glover, 2002 and social capital in Shaw, Arai, & Pedlar, 2003). We are particularly interested in online communities; those virtual spaces where people come together to share experiences (Preece, 2001). These spaces are increasingly popular because they are readily available and easy to use (Chayko, 2008). We seek to explore the nature, meanings and motives of tennis spectators as they engage in online communities. We intend to clarify how online communities might develop around tennis events, why spectators use them and how their involvement might influence their overall tennis experiences and actions (e.g., equipment or ticket purchases, gaming, playing). Interviews (e.g., online, in-person, instant messaging) with approximately 14 adult tennis spectators are being conducted. Readily available data (e.g., forum threads) will also be used to help understand online dynamics and commonly discussed topics. Guided by symbolic interactionism, study's insights on the motives, nature of participation and its meaning can help understand how spectators relate to and engage in sport related communities. We suspect that spectators' engagement extends far beyond simple spectating. Indeed, our results may extend notions of spectating itself. Results will also have implications for tournament providers (e.g., online presence strategy) and other spectators (e.g., available resources). Enhanced understanding of online communities (e.g., behaviour) can have implications on conceptualization and research design in future studies.

Examining the Relationship Between Social Determinants of Health and Substance Use for Urban American Indian Adolescents in the United States

Most American Indian (AI) families in the USA now live in urban areas, but rigorous research is lacking on the social determinants of their health. Urban AI youth (UAIY) report higher rates, earlier initiation, and more severe consequences of substance use than their non-AI counterparts. Family disruptions, stresses related to moving, and difficulties in establishing and sustaining social and cultural connections are frequently mentioned as contributing to adverse health outcomes for UAIY. Ecodevelopmental theory is useful for understanding how social determinants operating at peer, family, school, and neighborhood levels interact to influence substance use among urban AI youth. This presentation examines how negative peer and family influences act as social determinants of health to influence substance use among UAIY, as well as how positive familial and peer influences can moderate (buffer) these risky determinants. Data come from the 2012 Arizona Youth Survey, a state-wide self-report survey of 8th, 10th, and 12th grade students, which includes 2,407 UAIY. Confirmatory factor analysis (CFA) and structural equation modeling (SEM) tested the direct and moderated effects of last 30-day alcohol, cigarette and marijuana use. The CFA results comprised four latent variables: two negative influences- substance users in the family and associations with anti-social peers; and, two positive influences- supportive family environment and involvement with pro-social peers. SEM results indicate that the negative constructs significantly increased substance use, however tests of moderation showed that the positive family and peer influences significantly buffered the negative effects on substance use. The emerging patterns and relationships between ecodevelopmental factors on substance use help to identify issues that urban AI youth face when navigating within larger socio-environmental contexts that influence the youth's vulnerability to health disparities. Understanding possible moderators can be useful in designing and delivering strengths-based prevention programs that enhance health and wellbeing of urban AI youth.

How the Parent-Adolescent Acculturation Gap Impacts Youth Risky Behavior in Latino Immigrant Families

The push-pull framework formulated by Everett Lee (1996) postulates that, at a micro-level, families choose to migrate to provide a better life and increase well-being. However, once in the destination country, children often acculturate more quickly than parents, leading to distress and conflict that deteriorates family functioning and promotes adolescent maladjustment, coined the Acculturation Gap-Distress Model. This model theorizes acculturation as a unidirectional process (i.e., assimilation), instead of a bidimensional process, which neglects the culture-of-origin dimension that can be protective to well-being. To further refine the Acculturation Gap-Distress Model, we examine the unique impact of both dimensions on parental monitoring and adolescent risky behavior. Dyadic Latino parent-adolescent data (N=375) were collected from middle schools (n=16) in a large southwestern city in the United States. The majority of parents were immigrants (94%), living in the U.S. >10 years (88%). Using the two subscales of the Acculturation Rating Scale for Mexican Americans-II, adolescents scored significantly higher on Anglo orientation than on Mexican orientation, while for parents these results were reversed. Controlling for SES, parents' education level, length of residence in the U.S., and sex, a path analysis model indicated that the parent-adolescent Mexican orientation gap was associated with less parental monitoring, which then predicted greater adolescent risky behavior. However, the Anglo orientation gap was not associated with any significant direct or indirect effects. Building on the Acculturation Gap-Distress Model, findings help clarify the nature of the relationship between parent-adolescent acculturation gaps and adolescent well-being. While adolescents were more Anglo-oriented than parents, the results suggest it is the Mexican orientation gap, rather than the Anglo orientation gap, that contributes to youth maladjustment through reduced parental monitoring. This may reflect the more Mexican oriented parents' reliance on indirect ways of monitoring their children, which may not work as effectively in a U.S. setting.

Performing Energy Policy. Reconsidering the Role of Energy Forecasts in Policy-Making

Recent debates about the necessity for a transformation of the global energy system (WBGU, 2003, Rifkin, 2011), as well as ongoing energy transitions on the national and subnational levels, have brought the role of forecasts in energy policy-making to the fore. Indeed, energy modeling and the scenarios they produce play a key role in discussions about the objectives and instruments of energy policy. While such debates have historically concentrated on the "knowability" of the future (e.g. Polak, 1973), as well as on the way such futures are constructed and the need for more inclusive approaches (Raimond, 1996), they have recently aimed at understanding the social, historical and cultural context in which such futures are embedded and in which they come to be enacted (Jameson, 2005, Appadurai, 2013, Andersson et Rindzevičiūtė, 2015), or turned to a "hermeneutics" of future-making practices (Grunwald 2014). We aim to complement such approaches by a *performative* approach (Callon 2007) attentive to the ways in which models and scenarios format and construct the social reality that they claim to represent.

Empirically, my proposal builds on a historical study on the use of forecasts and modeling in German and French energy policy and debate. I aim to show that the emergence of energy modeling is intimately related to the emergence of "energy policy" as a new field of public policy. The focus on the performative function of energy modeling also allows for a new understanding of sociotechnical controversies on energy policy. These are analyzed as "struggles of representation", in which new actors and their problem-framings seek epistemic representation in energy models and political representation in the institutions of energy policy-making. Finally, I discuss the implications of such an approach for analyzing processes of institutional change in energy policy, as well as ongoing debates on energy transitions.

Composite Indicators for the Family Change: 'familism' Versus 'individualism' in the International Context

The aim of this paper is to propose a composite indicator to measure 'familism', conformed by two main dimensions: values on one hand (duty to take care of the family, importance of the family, sacrifices for the family...) and behaviours, on the other (predominance of married couples instead of cohabitant couples, high fre-

quency of contact among members, family support...). In contrast to this idea of 'familism' we find that of individualism, that defends the independence of family members, tolerance to new family models, cohabitation instead of marriage,... , that implies less frequency of interaction among relatives and more governmental intervention towards children and elderly care.

We observe that a higher degree of 'familism' does not always match with a lower degree of individualism when both dimensions, attitudes and behaviours, are considered. For instance, we find countries which are individualist in values but not in behaviours (such as Spain), whilst others, such as Japan, are 'familist' both in values and behaviours and finally, others, such as Sweden, are individualist with regards to both perspectives.

We propose two different methodological approaches to the question. First, we use microdata from the Family, Work and Gender Roles module of the International Social Survey Programme-ISSP (years 1994, 2002 and 2012), in which 45 countries have participated. Information for the three rounds is collected for 17 countries with very different family values and welfare systems (for instance, Sweden, Japan, Russia, Spain, United Kingdom or the United States). From this data source, we create a first index on familism that can be related to individual sociodemographic characteristics. Second, we complete it through the inclusion of macro data (such as the divorce rate per country), in order to refine comparison at a country level by adding new variables to the previous index.

Lats By Choice in Europe. Determinant Factors of Their Evolution

Couples Living Apart Together (LATs) have developed in the last years in Europe as a consequence of an increase in family individualization, job mobility, feminine autonomy, difficulties accessing the housing market, etc. This phenomenon has been interpreted in southern countries as a consequence of the delays in family emancipation and, in northern and centre countries, as a sign of an increase in autonomy and independence. There are many types of LATs as reasons that justify the fact of not living together. In this paper LATs by choice are studied. In other words, LATs that aren't forced by the circumstances; but they still decide to live this situation by choice. We use information coming gathered through the *Gender and Generation Survey* related to Bulgaria, France, Germany, Romania and Russia. We analyze a sample of 3.842 interviewees in LATs. Results indicate that LATs by choice, prevail especially in Germany and France. They are over-represented in medium ages, with high educational levels, and especially, dependent on the negotiation between both partner. High levels of contact increase the probability of being LATs by choice.

Migrants' Languages: Assets or Liabilities? an Empirical Study of a Russian-Speaking Community in Tarragona, Spain

The large-scale European project on multilingualism MIME: Mobility and Inclusion in a Multilingual Europe, tries to identify the best language policies that include both "mobility" and "inclusion". Our research group that belongs to Work Package 4 "Mediation", has carried out a research project in the Tarragona area, Spain, where some 50 respondents from ex-Soviet countries were interviewed on their language background, but not only that. Questions were asked about how these individuals deal with simple, day-to-day issues, such as going to the doctor, lawyer, government offices, since many of these individuals have very limited (sometimes null) knowledge of the local languages. This fact necessarily creates social inequalities, since the majority of these individuals are permanent inhabitants of Spain who have no access to basic services because of their language limitations. These social inequalities become even more apparent since the respondents feel excluded from the host society, and this puts social cohesion under real threat.

Languages of one country can be seen as assets of that country. It does not matter whether these languages are local or brought from abroad: each of them can contribute to the general well-being. In our research, it is obvious that Russian (the language shared by all of our respondents) is an asset rather than a liability. Since Russia entered the lists of emerging economies, there is high demand of people who can handle intercultural relations: translators, interpreters, multilingual professionals in all spheres that do not need any specific training in that language. This in conditions of monolingualism would suppose certain monetary investment. If it is so clear that languages are assets and not liabilities, how can they be better employed? Will that usage result in higher prestige of migrants' language and culture that will consequently lead to higher level of social cohesion?

AZAR, RIAD* (London School of Economics and Political Science, riadazar1@gmail.com)

Spatialities of Alienation: Deskilling and Precarious Labor in 21st Century London

London is swallowing immigrants as it grows to secure its place in the hierarchy of global cities, strategically positioned as the European Union's largest metropolis and with a colonial history that has carved avenues across the globe. A deciding factor in this position is the ease with which new immigrants have been able to find work, with employment levels now higher among new migrants than British born whites. Not much talk is given to what sorts of work these migrants take, the deskilling inherent to low-wage work, and the function of the service sector within the development of the precariat as a core labor pool of neoliberal capitalism. My paper seeks to continue this discussion by asking the question: How do downwardly mobile migrant professionals experience deskilling, and what can their experience tell us when contrasted with Marx's theory of alienation in a neo-liberal context?

Based on ongoing research in the form of in-depth qualitative interviews, I utilize a theoretical framework of alienation drawing on Marx (alienation), Durkheim (anomie), and Tönnies (gemeinschaft / gesellschaft). My empirical findings, grounded in the revolutions of political economy in the past forty years, show the results of deskilling as it takes a toll on migrants' identities, character, and subjectivities. I go on to argue that deskilled migrants experience two distinct yet related forms of alienation: role and value alienation. The migrants' reflections on the 'alien' culture of work in London speaks clearly to how domination has been able to mask itself as workplace practice.

I conclude that neoliberal globalization is a force as revolutionary as industrialization when it comes to changes in the lived experience of workers. A spatial consideration of the theory of alienation – along with a return to critical theory – is necessary to understand the implications.

AZERBAEVA, NATALIA* (Tula state University, azerbaevan@gmail.com)

Competence Approach - a Blessing or a Tragedy for the Russian Education

The national education system is influenced by the structural transformations of society and globalization processes occurring in the country and associated with the dynamics of development of the information society.

Transition of the education system to competence training is caused by the Bologna Process, for integration of national educational standards, which led to a shift in focus from the learning process (the formation of knowledge) on learning outcomes.

It may be noted that the competence approach to education meets the present realities, namely the emergence of the information society.

The competence approach in the information society, on the one hand, makes the existential tension of informative nature - constantly learn new information that plays a key role in the strategy of development of the society, on the other hand, enhances the philosophical and methodological problems of provocative role of information as a consequence of the fact that it took the place of traditional knowledge.

Almost the competence approach only exacerbated the problems of the Russian education and does not solve the problems facing them. It does not contribute to the formation of new knowledge, but merely creates the appearance of the process, it does not help the constant educational process, but only creates the conditions for the "final education", which exacerbated the problem of functional illiteracy, unemployment and emergence of knowledge.

The competence approach is developed to integrate the Russian education in the information society and partly meets its requirements. But, in fact, it teaches to work with "raw material" (information), which is used for the production of knowledge, so it is preparing "information natives" - "a man who knows, but does not realize; moralizing but immoral; educated but uncultured".

AZEVEDO, ELAINE* (Universidade Federal do Espirito Santo/ Federal University of Espirito Santo, elainepeled@gmail.com)

Heathy Food: To Whom?

The aim of this conceptual study is to discuss the new dimensions incorporated into the contemporary concept of healthy food. The concept of the menu is used to define the set of guiding principles for the selection of foods. People still eat under the influence of the modern rational menu based on scientific principles and calculation and measurement elements and involve criteria designed to achieve specific goals – weight loss, physical or mental well-being, disease prevention, or health promotion. The guidelines of the moral menu, which recognises the ethi-

cal, political or environmental factors in food selection is growing in importance as well as the incorporation of socio-environmental and cultural dimensions to the concept of healthy food. This approach dialogues with the traditional menus, which based their combinations and rules for selecting foods on culture, daily practices and nature. The question "what is a healthy food today" must meet the challenging proposal of being healthy for everyone (and everything): for those who produce it, for those who eat it, for animals and plants, and for the environment. The experience of eating healthily promotes diverse social experiences and antagonistic feelings as freedom of choice, guilt, doubts and fear to eat. Given the large supply of food and diet guidelines and, consequently, the variety of choices that this supply represents to consumers, the food consumption pattern that individuals define as healthy can be considered to symbolise not only their identities but also what they wish other individuals will think of them, taking on peculiar forms of social distinction via eating.

Socially Engaged ART As a Methodological Strategy in Social Science

This study is based on relational discussions on Socially Engaged Art (SEA), cultural activism, and sociology. SEA (or social art) can be defined as the artistic practices of an interventional nature that are participatory and procedural and that can occur in public or private, formal or informal spaces, transforming art into a specific form of sociability. This article aims to problematize those practices and to promote a dialogue with sociology. To fulfil this objective, the text draws on authors involved in the discussion about SEA, cultural activism, and relational art, along with contemporary artists' projects that mobilise social and environmental issues in their poetics. The idea is to explore and discuss more fluid and creative forms and methods of addressing socio-environmental problems in social science through an interactive method that can help complexify the visual element.

AZURMENDI, ANA* (University of Navarra, aazur@unav.es)

Audience's Participation in Regional Televisions: An Essential, but Still to See, Element for the Gobernance of Public Tvs

Introducción: La participación de las audiencias en las televisiones ha sido objeto de estudio en los últimos años no sólo como una de las claves de la televisión pública en la era de la digitalización y convergencia (Castro, 2012) y (Kjus, 2007) sino también como un indicador de transparencia en la gobernanza de los medios de comunicación (Hasebrink, Herzog y Eilder, 2007, p.75). A pesar de la atención que desde el ámbito teórico se viene prestando a este tema, son muy pocas las televisiones públicas europeas que ofrecen unos cauces institucionalizados para esta participación de la audiencia, algo que llama más la atención en el caso de las televisiones regionales –autonómicas en España- que por su propia misión pública, están llamadas a ofertar unos contenidos de proximidad, es decir, más pegados a la realidad social-política-cultural hacia la que se dirigen. Metodología y objeto: El paper partiría en primer lugar de los planteamientos teóricos de las últimas publicaciones sobre participación y medios de comunicación públicos. De ellos se obtendría una serie de indicadores de servicio público relacionados con la participación de la audiencia. Con esta serie de indicadores se abordará el estudio comparativo de los casos de los Audience's Councils y vías semejantes de participación del público de la BBC –Escocia, Gales, Irlanda del Norte e Inglaterra- (en particular la reforma que se ha propuesto para mejorar la participación del público en la actual Reforma de la Royal Charter de la BBC para 2016,), la TG4 de Irlanda y las españolas autonómicas CRTVG de Galicia, TV3 de Cataluña y EITB del País Vasco.

Higher Education, Science and Innovation in Eastern Africa

The paper focuses on global ideas of higher education, science and innovation and their adaption at universities in Eastern African countries (Rwanda, Kenya, Ethiopia). Theoretically the project draws on the new institutionalist concept of travel of ideas. According to Czarniawska & Joerges (1996) ideas and concepts can become global models, when they are disembedded in one time and space, transformed into objects and reembedded in a different place. The entrepreneurial university (Slaughter & Rhoades 2004, Clark 1998, 2004, Etzkowitz 2008) is such a global idea which is translated into research articles, policy papers and prescriptions and reembedded in higher education systems all over the world. Eastern African higher education policy-makers, university leaders and academic staff have adopted this idea with the goal of spurring income generation, technological innovation and national development. This has led to an increasing commercialisation of teaching and research at Eastern African universities (e.g. Babyesiza 2015, Bisaso 2013, Johnson & Hirt 2011, Mamadani 2007, Wagenge-Ouma 2012). As Czarniawska & Sevon (2005:8) point out:" a thing moved from one place to another cannot emerge unchanged: to set something in a new place is to construct it anew." I will therefore discuss how the idea of the entrepreneurial university which is embedded in discourses of the knowledge economy and the triple helix is constructed anew, how it changes the self-image of university organizations and how governments, university leaderships and academics define the current and future role of university research in society. The presentation will be based on an analysis of the national development plans of Rwanda, Kenya and Ethiopia, the strategic plans of selected universities in those countries and expert interviews.

Getting Squeezed: Spaces for Youth Engagement

Youth participation, for many years broadly understood as "young people being represented in political processes and decision-making," is rapidly losing its meaning. As an enshrined right, a global priority and a popular declaration for young people and politicians alike, this catchall term is in dire need of being redefined for an era of structural distrust and rapid globalisation.

The mantra of "more youth voice" and "youth need to be around the table" isn't just clichéd; it is now disconnected to the reality of how young people see the world, the way they seek to engage, and the goals they want to achieve. In the past few years, the UN Secretary General's Envoy on Youth was appointed, the largest youth council in the world was established, the number of national youth policies has risen – but the spaces where young people engage have fundamentally shifted, away from institutionalised arenas that are controlled by others. This shift, and the underlying tensions, have been laid visible online, on the streets, and on the world stage.

In our contribution to "The Future Is Not What It Used to be: Young People's Future Visions in Youth Styles and Spaces of Engagement" we would like to share the findings of "The Case for Space", a global research project carried by multiple civil society stakeholders, that seeks to understand the components of an enabling environment for youth action and youth-led civil society for the shifting conditions outlined above. The currently ongoing research contrasts a global survey of youth activists with qualitative pieces by 20 young researchers across the globe and will shed additional light on the growing disconnect between those that organise spaces for youth participation and those that are meant to use them.

Nice Words but Little Action?

Nice words, but little action? A global overview of transformations in governments' approaches to youth work

Public policies for young people have undergone a remarkable shift in the past years. In October 2014, 127 of 198 countries had a current national youth policy,

more than half of them less than five years old. As these frameworks are changing, so is the role of youth work in relation to youth policy.

Youth policies vary remarkably in approaches, frameworks and implementation: some are built around the notion of youth rights, while others rely on the needs of young people; some can barely conceil the attempt to control young people, while others mean to encourage independence; some treat youth work as the carrying notion, while others consider it an afterthought.

Through the fact sheets for every country that our research team has developed over the past three years, we have for the first time assembled a wealth of data about the approaches of governments to youth policy and youth work that covers the entire globe. In our contribution to "Connecting with and Confronting Inequality - the Role of Youth Work" we would like to present first findings from our cross-cutting analysis of this unique data set with a focus on the competing understandings, roles and functions of youth work around the globe and map these findings against a set of socio-political aspects for comparison.

Local Determinants of Educational Inequalities: Example of Poland

Education is a way to attain higher social positions. Unequal access to education is both a manifestation of social inequality and one of the reasons for maintaining them. In our paper we present the results of analyses on educational inequalities associated with place of residence, which can be observed in Poland. The presented results are derived from a nationwide panel survey "Determinants of Educational Decisions – Household Panel Study", conducted in 2013 and 2014 in over 20 thousand households (almost 60 thousand people took part in the study).

We will discuss the diversity of learning opportunities for children aged up to 15 years depending on the type of place of residence. Then we will show how institutional conditions, i.e. the availability of educational institutions, influence the decisions taken at the individual level, e.g. the choice of a type of school or decisions concerning attending or not attending preschool. It turns out that the place of residence affects the range of options considered by the parents very strongly, and in fact, many people, especially in rural areas, do not have any choice at all. In other words, the characteristics of the place of residence not only determine if the parents of small or school-aged children have a choice, but these local factors also limit the range of available options. Other factors, such as financial and cultural capital of the parents, also affect the choices they make concerning their children's education. In our presentation we want to analyse inequality in access to educational institutions and its effects in terms of specific educational decisions.

La Destrucción De La Idea De Lo Colectivo y El Diseño Institucional Neoliberal: Fundamentos y Consecuencias De La Des-Colectivización En Chile.

La ponencia presenta un proyecto de investigación actualmente en ejecución y que aborda el problema de la des colectivización del diseño institucional chileno en las últimas décadas. Desde la sociología analítica, sostiene que el problema de la des colectivización en Chile proviene del rompimiento unilateral del contrato social entre clases a mediados de los 70, y que ello habría traído consigo una serie de consecuencias observables en el terreno político, económico e institucional. Dicho rompimiento, que desde el estudio del diseño institucional entendemos como un problema de acción colectiva entre clases o sectores sociales determinados, habría traído consigo el vaciamiento político de la esfera económica y la social, la caída de la actividad colectiva como forma relevante de acción social, y resultados socioeconómicos de éxito relativo entre las diferentes categorías socioeconómicas: resultados de altísimos beneficios agregados para algunos sectores sociales respecto de otros que claramente pueden mostrar resultados mucho menos ostentosos. Su objetivo es: contribuir al conocimiento tanto de la naturaleza como de las consecuencias que tal rediseño institucional ha venido teniendo sobre los diferentes dimensiones de la sociedad chilena, dejando planteados algunos elementos de diseño institucional y de reflexión normativa. La ponencia entregará algunos resultados parciales, principalmente en lo referido a análisis constitucional y sus efectos en los modos de relacionamiento de la población con el Estado y entre particulares.

Cognitive Rationality As a Cultural Issue Versus One-Linear Evolutionary Approach

Theory of information society is doctrine of autonomous technology. It presented as information technologies, the prime movers propelling the economics, culture and politics of the future, which seen as positive end. Followed by technocracy ideals, widely accepted thought in economics become: ethnicity, religion, and perceived social class will be eliminated through development of science. Meanwhile, as a contrast, the discourse, saying subjective meaning becomes a social fact, recently emerged within debates in the field of science and technology studies (STS). The STS scholars put forward the methodology of social action theory- sociological understand of rationality- as looking at the production of scientific knowledge, which is an analytical tools can be extended to other arenas. The contrast bring importance to look at methodological and philosophical foundation of Parsons' theory of action. Parson claimed influence for the societal community had institutional functions similar to power for the political systems. Institutional functions of influence by and for scientific development that is technology, economy or etc. should be the current subjects of social science to analyse their driven forces. Therefore; this article aims to use Parsons' theory of action together with the STS analytical tools to look scientific development of economics by (i) exploring the determinism hidden in information society theory and its possible effects on creating only certain types of influence on society. (ii) Investigating how influence of economic developments on society can form in cybernetic hierarchy of control that limits the possible influence of society-based interest on economic development (iii) Analysing the influence of society on economic developments as a potential driven force for the rise of autonomous, self-organized and self-interest social movements. The goal of this article is to contribute with the revitalization of Parson's understanding of rationality in academic fields as well as in societal level as social movement studies.

From War Front to Home Front: The Role of Company-Based War Veterans' Organizations in Industrial Relations in Croatia

"Headquarters for the defense of company" presents a unique phenomenon in the system of industrial relations in Croatia (Grdešić, 2007). This military inspired form of self-organization of workers in contesting the privatization, bankruptcies and other potentially harmful decisions on the company's operations has become the dominant repertoire of workers' protests in post-war Croatia. Several case studies showed that in their establishment and operation an important role, along with trade unions as traditional representatives of workers' interests, played the veterans' associations. Although the war veterans are one of the most powerful groups in Croatian society, comprising over 10 percent of the entire population, and in spite of the public salience of company-based war veterans' organizations, their role in labor relations has not been previously studied. Thus, the aim of this paper is to explore the role of veterans' organizations in commercial businesses, their modes of operation and linkages with trade unions. The paper is based on an analysis of key structural elements of veterans' organizations and semi-structured interviews conducted with representatives of company-based veterans' organizations and trade unions that operate in the same companies. The analysis will focus on the nature, goals and main visions and divisions of these organizations as well as their possible conflicting and/or productive interests and relations. By unfolding the matrix of relationship between these two contrasting paradigmatic figures, i.e. war veterans and workers as subjects with distinctive positions in different fields of political and economic division of labor, we will provide some important insights into nature of hegemonic relations in transitional societies.

Border Figurations – Comparing Different Groupings with Ethnographic and Biographical Research Methods

In this paper we want to discuss methodical approaches and fieldwork experiences of our collaborative research project "The Social Construction of Border Zones" headed by Prof. Gabriele Rosenthal and funded by the German Research Foundation (DFG). Our ongoing research on borders and migration in the Spanish exclaves of Ceuta and Melilla is based on sociology of knowledge and figurational sociology and is conducted with a combination of biographical and ethnographic methods.

In the research project, we aim to reconstruct the perspectives, the respective collective histories and unequal power relations between different groupings that are involved in "doing border" in the Spanish-Moroccan border region. Ceuta and Melilla constitute the European Union's only land border on the African continent. High fences – increasingly fortified since the 1990s - surround both cities. Yet, a

variety of interacting and interrelated actors, patterns of migration as well as different mobility patterns are constituting the reality of this border 'on the ground': Policing forces, migrants from very different societal and cultural contexts, local population on both sides of the border, NGO workers, and others. To reconstruct the diversity of perspectives, histories and interactions between these groupings, we apply a comparative approach.

Hence, we would like to present our methodological assumptions and examples of our fieldwork and discuss comparisons on two different levels: Firstly, how do we combine the different methodical approaches in our comparative research framework and what are the challenges and benefits of this combination. Secondly, we want to highlight in how far the comparison of members of very different groupings resp. the comparison of groupings is crucial for our fieldwork, for our theoretical generalizations and required in order to reflect on the "production of comparability" (Niewöhner/Scheffer 2010).

Outsiders in the Moroccan-Spanish Border Zone: Life Stories of Juveniles in Ceuta and Melilla

In this paper I want to explore life stories of Moroccan juveniles in Ceuta and Melilla, Spanish Exclaves in Northern Africa. It is based on my field research in the postcolonial border zone between Morocco and Spain, which is part of my PhD research and embedded in the project "The Social Construction of Border Zones", funded by the German Research Foundation (DFG).

In recent years, Ceuta and Melilla have received a considerable amount of media attention – mainly because of the high fences that surround them and because of being a "hotspot" of migration towards Europe. But additionally, important transnational movements between the two Spanish cities and the neighboring country Morocco can be observed. Hundreds of unaccompanied minors from Morocco make their way to Ceuta and Melilla each year: young men – most of them between 14 and 17 years old – often flee the Reception Center and try to travel to the Spanish mainland as stowaways. Young women are more likely to work in households. Although their residence permits and protection status expire when they become 18 years old, many of them stay in the border zone after they have reached adulthood.

My empirical project is based on biographical research, which is informed by sociology of knowledge and figurational sociology. I argue that the precarious situation of these Moroccan juveniles and their transnational biographies are constitutive for the Moroccan-Spanish border zone. They are in a complex outsider position within the figurations of Spanish-Christian and Moroccan-Muslim local populations. Drawing on Elias's concept of established-outsider relations I will discuss the social and discursive practices of marginalization and how (shifting) asymmetrical power balances are interrelated with the construction of belonging and we-images.

BAHNA, MILOSLAV* (Institute for Sociology, Slovak Academy of Sciences, miloslav.bahna@savba.sk)

From International Students to International Migrants: Cultural and Economic Capital and the Career Paths of Slovak Foreign Students in a Visa Free Europe

Typically, studies studying mobility of international students focus at return and stay intentions of international students at their place of study. The decision to stay in the country of study has been described as a particular form of brain drain typically affecting third world countries. However, no academic research exists on international student mobility under the conditions of free movement in the EU. Our presentation focuses on international students from Slovakia, a country ranking third in the OECD in the share of tertiary students enrolled abroad. Our quantitative study is based on a survey of 200 parents of international students from Slovakia who finished their university study outside of Slovakia at least two years before the 2014 fieldwork. Available information about the family background of the students enables us to use structural equation modelling to describe the interplay of educational and economic background of the family of orientation and the study choices and decisions to return to Slovakia of the students. We demonstrate that high cultural capital explains the preference of Western Europe over universities in the neighbouring countries (e.g. Czech Republic) and increases the probability of staying abroad after finishing university. On the other hand, high economic capital has no impact on the place of study, however, it increases the probability of return to Slovakia after finishing studies. As it is mostly the students from families with high cultural capital who study abroad who at the same time also have a higher propensity to stay abroad after their studies we speak of a cultural elite drain from Slovakia. We hypothesise a positive impact of this phenomena on vertical mobility in Slovak society as prestigious positions – traditionally better accessible by the "cultural elite" - become available for the ambitious offspring of families with lower levels of cultural capital.

Issp National Identity: Pitfalls in Measuring Nationalism Across Countries and Across Time

Using the example of measuring and comparing nationalism in the two countries of the former Czechoslovakia, we demonstrate the pitfalls present in measurement in international comparative surveys across time. Using five items used to measure nationalism or chauvinism in the International Social Survey Programme (ISSP), we construct a nationalism index and compare the levels of nationalism in the Czech Republic and Slovakia. We construct several models explaining the individual level of nationalism in both republics in 1995, 2003 and 2013. Besides finding individual level variables explaining the level of nationalism we also evaluate changes occurring in the connection between nationalism and other related concepts like xenophobia or anti-internationalism during the 18 years covered by the ISSP National Identity surveys. We observe a gradual weakening of the connection between nationalism as measured by the index and the related concepts, as well as changes in independent variables which explain nationalism between 1995 and 2013 in the two ex-Czechoslovakia counties. We conclude that the ISSP survey questions intended to measure nationalism are context dependent and gradually – in a new and changing context – fail to measure the very concept they were developed to measure. We conclude with a discussion on how to formulate time and national context invariant measures of nationalism.

Think Tanks Between Science and Politics: The German Governmental Research Institutes

Science is about truth, politics about power. Of course, this comparison is too simple. More elaborately, many studies based on various theoretical approaches highlight the differences between science and politics, and point to difficulties, when scientific knowledge is transposed in order to support political decisions. Think tanks bridge the gap between science on the one hand and politics on the other. They are characterised by the aim at influencing public debates and political decisions by providing knowledge to political actors. There is a myriad of different types of think tanks. A specific type of think tanks is represented by the German governmental research institutes. A governmental research institute is part of a (federal) ministry. It conducts research and gives policy advice. More than other think tanks, governmental research institutes have to balance the tension between science and politics because their policy advice is rooted in scientific research and the issues of their scientific research are oriented towards political use. In his widely recognised book "The Honest Broker", Roger A. Pielke analyses both the role of science in society and the role of experts in policy and politics. He argues that a linear model of policy advice is not an adequate description of reality. The linear model postulates a flow from basic research to applied research to political consensus and political decisions. Rather, feedback loops and interactions between policy advisors and decision-makers have to be taken into account. By taking Pielke's honest broker as a point of reference, we will show how governmental research institutes tackle the tension between science and politics. The honest broker represents an idealised type of policy advisor who acts ideologically neutral and expands policy alternatives in a way that allows decision-makers to choose from different policy measures on the basis of their own preferences and values.

HAARICH, SILKE* (Haarich Regional Research and Development, silke.haarich@gmail.com)

Innovation Governance in Chile – a Methodology to Measure Cultural Elements in Innovation Systems

Innovative and competitive regional development processes involve tangible and intangible assets. Hard factors such as infrastructure, etc. can usually be identified and measured quite easily. On the other hand, intangible factors, such as cultural and organizational (networking, leadership, trust, cooperation, etc.) assets needed to promote innovation, still challenge researchers and policy makers. Thus the increasing interest by funding entities (e.g. European Commission, Development Banks) and policy makers in finding ways to measure impacts at the cultural/organizational level in the innovation systems.

To assess the quality and non-quantifiable impact of these factors is a complex task. Although there are some successful examples of how to measure intangi-

ble assets, most approaches are based on complex scientific research, requiring time-consuming field work and analysis, thus rarely applied in real capacity development programmes. The challenge is to find a methodological approach to measure intangible assets that does not ignore the complexity of the innovations system process at a regional level, but provide at the same time a simple and handy enough tool to be used in the assessment of innovation systems that will provide the meaningful feedback that the decision-making process requires.

This article presents the GOA Governance and Capacities Assessment Tool©, a new method that has been tested during the implementation of the first Regional Innovation Strategy (according to the RIS methodology) in the Region of Aysen in Chile. The case of Aysen is also interesting from the point of view of promoting new types of innovation (non-technological, social, eco-innovation, innovation for sustainability), as the development paradigm of the region is based on its natural resources and on sustainable development rather than on industrial or technological growth.

Activation Trajectories: Tracing the Role of Social Media in Civic Mobilizations in Bulgaria and Canada

The growing sociological and communication-studies literatures investigating the role of ICTs and social media in civic and political mobilization typically take activists and activist organizations as their starting point. Research aims to assess the utility of social media for achieving the goals pursued by such actors. In political science, a common approach to questions of political participation is to try to determine the demographic and/or psychological characteristics of the individuals who become involved. ICT use is often included in those inventories as another variable affecting individuals' engagement.

In this study we break with both these conventions and focus on the process of becoming engaged as it unfolds in the case of ordinary citizens who do not qualify as activists at the starting point. Our theoretical premises include insights from social constructivism, radical-democratic theories of citizenship and multi-sited ethnography. We ask what place/s social media occupy on the activation trajectories that bring individual citizens from a state of relative disengagement to active involvement in civic and political causes, collectives and mobilizations. We examine in-depth two cases of protest mobilization that occurred in two distinct social and cultural contexts – Bulgaria and British Columbia, Canada. We focus on the dynamics that propelled individuals central to these mobilizations from their private everyday worlds to the role of participants and drivers of collective political action. We identify the various turns and stations that these individuals' activation trajectories have in common; we pinpoint how social media become enmeshed in the process; and we account for the differences produced by the distinct material and cultural ecologies in which these trajectories take shape. We believe that along with the specific lessons learned from the comparative analysis, our study offers an example of a grounded way of understanding the role of social media as catalysis of civic mobilization.

BAKER, ZOE* (The University of Sheffield, z.baker@sheffield.ac.uk)

'Making Their Way through the World': Socioeconomically Underrepresented Youth Perceptions of Future Education and Employment Trajectories.

The purpose of this paper presentation is to provide insights into the considerations of future education and employment options by socioeconomically underrepresented Further Education (FE) students in England. The research employs a longitudinal narrative inquiry approach to understand the reasons, influences and attitudes informing students' decisions for their futures over the final 12 months of their FE studies. This was achieved through the use of paper and audio diaries as well as periodic interviews. I consider Margaret Archer's (1995) morphogenetic framework in which she posits that society and culture now exist in a state of 'contextual incongruity' leading to ever increasing variety. This requires young people to plan their own path with no knowledge of the results; they need to 'experiment, to migrate, to innovate and to elaborate' (Ibid., p. 42). Through the application of Archer's (2003; 2012) reflexive typologies to participants' narratives, intricate understandings of individual action and responses to structure emerged; these illustrate how young people intend to make their way through the world in such circumstances (Archer, 2007). The presentation will focus on how particular modes of reflexivity exhibited by these young participants resulted in views of fractured career trajectories, an acceptance of delayed stability and detachment from their natal contexts to be regarded as foundations for their futures.

Compliant and Oppositional Control in Norm Enforcement Institutions

Recent research on normative conflict in public good games shows that members of a group often disagree about appropriate levels of contributions and the appropriate methods of contribution enforcement. Not all group members consider maximal contributions to be normatively appropriate, and not all group members support enforcement of such contribution norms. Other recent studies have observed that, given the opportunity, targets of peer punishment frequently counter-punish. These actions have been explained as emotional acts of revenge, or strategic deterrence of punishment. However, given the frequent disagreements on contribution norms and their enforcement, counter-punishing may also imply disagreement with the enforcement of contribution norms as a matter of principle. If so, a substantial subgroup of people will invest in non-enforcement of contribution norms. In an innovative experiment, we investigate whether these individuals invest to undermine contribution enforcement. We employ three types of repeated public good games. In one, there is no punishment institution. In this case we expect declining contributions. In the second there is a punishment institution. The effectiveness of the punishment institution depends on the support it receives. Group members can improve the effectiveness of the punishment institution by investing in compliant control. Initially the punishment institution is ineffective, punishing 0% of all below-average contributors. Every point contributed in support raises the effectiveness of the punishment institution, punishing up to 100% of below-average contributors. In this treatment we expect significant investments in support of this institution, leading to increasing contributions. In the third treatment the same punishment institution exists. In this treatment the punishment institution can be undermined by investing in oppositional control. Every point contributed to oppositional control lowers the effectiveness of the punishment institution. In this treatment we expect less effective contribution norm enforcement and lower contributions. We will present the results from these experiments.

Challenging Notions of Food Sovereignty – The Case of Hungarian Agri-Food System

Social innovation (SI) in the agri food systems is a fairly new concept in Hungary that recently gained acknowledgment from civil society organizations and support for promoting among policymakers as well. In this paper we attempt to identify the emerging actors and networks around food sovereignty. We present a SI case study of an organisational member of Via Campesina with good relations to the ruling political coalition and government as well as a loose bottom-up network of civic organisations that pushes forward the issue of food sovereignty for long. We map the main issues that have been promoted by these initiatives in Hungary such as e.g. exemptions for small scale producers, land privatisation and land grabbing. We build on our own qualitative inquiry to identify common threads and paradoxes in the complex understandings of social innovation. Our results also point to different understandings of the "social" and "innovation" component as interpreted by various stakeholders. The paper analyses the dynamics and agency of social innovation by looking at the genealogy of these initiatives, connections to other networks, related actors and also their practices on the everyday and political level. Our analysis highlights how the issue of food sovereignty is framed differently by the top-down and bottom-up initiatives in the agri-food system.

BALDI, TERESA* (Sapienza Università di Roma, teresa.baldi@uniroma1.it)

Becoming Adults. How the Transmission of Inequalities Changes in a Time of Work Uncertainty

Young people are paying individually both the weight of the global crisis and the consequences of macro-structural dynamics of long term which increased the work uncertainties.

This paper inquires how this phenomenon influences the phase of the transition to adulthood. In particular, from one side, this change means an extension of this process, with a substantial postponement of the key-events of this life phase. From the other side, however, this fact may increase the transmission of inequalities between parents and sons.

The aim of the paper is to examine how the process of transmission of inequalities changes when the labour, especially for young people, seems to have lost its centrality in the social stratification. If we assumed that work as an agent of emancipation (and social mobility) failed, other factors become more influent (such as the housing factor): as a consequence the transmission of inequalities becomes an inherited factor.

I will explore this topic presenting the most relevant evidence from the research I am conducting in Florence. My investigation uses a mix-methods approach and a purposive sampling; the questionnaire examines both structural aspects and the subjective strategies of young adults with scarce economic resources. The data allow to rebuild the biographical paths and to inquire the nature of the more relevant factors on the transition to adulthood. However, in order to collect data I use "face to face" interviews that give a more comprehensive view of the different life choices. Moreover, the interviews may be an attempt for the interviewed to rationalise hir/her personal condition and to reflect about the dyad rejection/identification of their generation.

BALLANTYNE, GLENDA* (Swinburne University, gballantyne@swin.edu.au)

New Media, Ageing, and Migration: The Impact of Digital Technologies on Melbourne's Elderly Immigrant Irish Community

New media and migration is a growing research area in a number of academic disciplines. However, most studies focus on transnational households or younger users (Madianou and Miller; Baym; Banerjee, McGuinness, and McKay). This paper reports on a study of new media use among a group often dismissed as falling on the other side of the digital divide: elderly migrants who travelled prior to the emergence of new media. It draws on surveys and semi-structured qualitative interviews conducted with 60 Irish immigrants to Australia who left Ireland during the mass departures of the 1950s and 1960s. It explores the extent to which participants have embraced new media; obstacles to new media use; the impact of new media use on maintaining links to the homeland; and the impact of new media use on social integration and well being in Australia.

BALLESTEROS LEINER, ARTURO* (Universidad Pedagógica Nacional, aballesl@hotmail.com)

Cuerpos Académicos y Clausura Profesional En La Universidad Pedagógica Nacional (México)

Las universidades mexicanas públicas se han inscrito en un proceso de reorganización académica que ha perfilado con mucha precisión la alta especialización en los saberes (conjunto de conocimientos y destrezas adquiridas por los académicos en su experiencia profesional) de los grupos profesionales que desarrollan las funciones sustantivas de esas instituciones.

El modelo de reorganización parte de integrar colectivos de trabajo, denominados cuerpos académicos, que definen su materia a partir de la confrontación de sus conocimientos: en el origen de nuevos grupos, en una mayor delimitación, en la recategorización de aquéllos, en el reforzamiento de las cohesiones comunitarias tradicionales, en la recomposición o expresión de fragilidad de temáticas trabajadas previamente en redes nacionales e internacionales, o bien, en la desaparición de grupos o segmentos y en la aparición de otros nuevos motivados por discusiones disciplinarias locales, regionales o globales.

Los campos de trabajo definidos en tales procesos muestran una compleja variedad de temas y problemas de intervención en diversas áreas de las ciencias, lo cual se expresa en una sofisticada sobre especialización de cada área, disciplina o profesión. Una serie de temáticas específicas han resultado de la confrontación

de dichos conocimientos en el ámbito de los colectivos de trabajo, en el caso que nos ocupa, Universidad Pedagógica Nacional (UPN); los cuales son agrupados organizativamente en instancias definidas conforme a temáticas generales.

En este trabajo se presentan las repercusiones que tendrían para la UPN, las exigencias del alto nivel de especialización en cada colectivo académico, debido a la reorganización académica que perfila un nuevo modelo, coincidente con la política estatal en distintos niveles y alineada a recomendaciones de organismos internacionales, la que ha sido orientada a la conformación de cuerpos académicos y sus formas de evaluación y obtención de financiamiento.

BALOGH, ESZTER* (University of Vienna, eszter.balogh@univie.ac.at)

Social Security of Hungarian Migrants?

Social security of Hungarian migrants?

The presentation shows some results of TRANSWEL[1] research project, which analyses the portability of social security rights in eight EU countries. In this session the Austrian - Hungarian portability system and its ambivalences will be demonstrated by a case study performed between 2015 and 2016.

The case study focuses on the provocative question how far the right of free movement and the social security rights can prevail or can be injured when Hungarians migrate. The crucial idea of the presentation is that limitation in portability varies by social categories of migrants and can promote an unequal acquisition to social benefits. The presented research results essay to identify those migrant categories which face limit in acquisition to social provisions and feel mismatch between the expectation of migration and its outcome and those migrants categories, which are able to auspiciously enforce their social rights. The case study also attempts to identify and discover those social and regulative conditions when the enforcement of social rights can be successful and when it failed.

By the help of the applied triangulating research method, (which includes document analyses, expert interviews and surveys) we are able to present some opaqueness of the regulative and administrative system, which potentially cause unequal eligibility to the rights, and moreover some practices and strategies, which migrants apply to acquire social benefits.

In the presented analysis the ambivalences of acquisition to family and unemployment benefits will be emphasised, which are probably the most relevant social benefits for migrants in order to be able to manage life risk and maintain their families.

BALOURDOS, DIONYSSIS* (National Center for Social Research, dbalourdos@ekke.gr)

Multidimensional Poverty, Multilevel Governance and Poverty Reduction Strategies in Times of Austerity

Poverty is a complex, multidimensional phenomenon, and responses to poverty need to be adapted to a wide range of circumstances. Different aspects of the problem ask for interventions on a different scale and the involvement of local, provincial, regional and national government.

Fighting poverty involves targeting when resources are limited and the role of the state is diminishing. The shift towards more governance in the way social policies are developed implies the enhancement of the actors involved on different policy levels.

Also, due to demographic change and increased service costs on long-term care; rising unemployment, especially amongst the young; and a desire for greater independence and choice for all in need of social care, many countries in Europe are faced with problems in the financing of public services.

Increasing cut-backs of national state funding have a great impact on national and the local level. As a reaction, there is an increasing need of cooperation between state and non-state actors on the local level and the European level.

This paper explores the challenges of service delivery to those in need in times of austerity. It seeks to provide answers to the question of what type of approaches, and under which conditions, may be most effective in order to improve outcomes for poor and vulnerable people especially in those countries affected by the crisis.

This paper presents evidence EU SILC about the impact of the economic downturn on social services. It examines social transfers' performance over time in defending people from the worst effects of rising unemployment and falling incomes.

Local and regional government is responsible for managing this situation and ought to re- examine, re-target and re-prioritize social expenditure as a result.

Livability and Children's Happiness: Challenges for Public Policies

Numerous studies show there is a strong correlation between the wealth of nations and happiness of their adult members. This is mediated by societal factors associated with national wealth which contribute to subjective well-being (which Veenhoven (1993) name 'livability'). However, a recent study in 15 countries (Children's World (www.isciweb.org), financed by Jacobs foundation, n> 35.000, age 8-13) fails to find a correlation at national level between GDP and subjective well-being of children. Moreover, in high-income countries (South Korea, United Kingdom) children are the least satisfied with school and also with life as a whole, while in medium-income countries (Columbia, Turkey, Romania) score very high in school and life satisfaction. At a first glance, these results seem to challenge the conventional wisdom that investments in education and improved educational policies contribute to a better education and, in the end, to a higher well-being. However, at a closer look, this may confirm the dual nature of the concept of livability: not only the offerings of society matters for individual happiness, but also its requests (Veenhoven, 2000). This would explain why in countries with highly demanding school systems (South Korea, UK), children are under strong competitive pressure, which lowers their levels of satisfaction with school and their subjective well-being. This interpretation may urge for a change in a paradigm of childhood studies advocated by Ben-Arieh (2008): children should be valued for what they are now (*well-being*) they are and not only for what they promise to be in their adult lives (*well-becoming*). Ben-Arieh also calls for a switch to new child-centered domains in quality of life research. Starting with these premises, we will discuss how social indicators research should adapt in order to be able to inform and inspire changes in educational policies and also in happiness policy regarding children.

The Human Security in the Euro-Mediterranean Relations: Contradictions on Migration to the Countries of Southern Europe

The approach of human security seeks to conceptualize the changings centered on States and their own safety to a new approach focused on people. This also leads to a new centrality of questions about identity, diversity and citizenship. In a world increasingly interconnected, opportunities and threats do not know borders.

We propose is to discuss the link between security and the Euro-Mediterranean cooperation, and therefore to explore the European policy framework on migration.. At a time when international opinion examines the circumstances in which the successive tragedies occurring in the Mediterranean Sea, the critical tone about the role of the EU turn out to be stronger.

We live in a time marked by the tragic images of thousands of refugees in various parts of the world, looking for a safe place to live. Paradoxically, the more this tragedy grows, the doors of Europe seem to become more impenetrable. We are facing a situation that contrasts with the relative tolerance revealed in Europe after the end of the Second World War, when the majority of immigrants and political refugees were welcomed.

To understand the historical process of Euro-Mediterranean cooperation, we will analyze the trajectories within southern European countries regarding issues of security and borders within the European Union. What role is played by countries of southern Europe? How to respond to large waves of immigrants running away from war, persecution and poverty?

The context of strong migration waves and the restraints to them facing links both worlds: the rich countries, defied to the population decline and poor countries with explosive demographic vitality.

This series of issues will be discussed, using statistical data, reports produced by the European Union and its Member States and other sources of documents, including the expression of these issues in the media.

Play with Weapons from the Perspective of 7-10 Year Boys.

Children's play with toy weapons is a sensitive issue in the contemporary world of growing violence and insecurity. The topic of children and weapons is ambivalent. From the perspective of responsible parents and educators children's weapon play poses several challenges: how to develop self-control in children, how to channel the content of violent imaginative play into socially acceptable form, how to avoid real harm. Incidents of school shooting by pupils are examples of alarming misuse of weapons. On the other hand, battles and gun heroes are part of popular culture that are attractive to boys at certain age. Boys identify with heroes and they often report gun carrier professions as their preferable choice for future.

We approach the topic from the viewpoint of children as active agents of socialization and play. We want to know what is the role of weapons in the boys' lifeworld today.

What do boys know about weapons and their use in general? Which feelings are related to weapons? What is the significance of weapon handling skill? Which toy weapons are used in play? What are the rules and restrictions of using them in play? What is the preferred content of games with weapons? What are the role models and examples for using weapons? How is play with weapons regulated by adults and how is this regulation perceived by children? How do children perceive risks related to weapons?

Our study focuses on the meaning of weapons among children. Empirical material is based on group interviews with Estonian 7-10 years old boys in 2015. We use projective technique of drawing a weapon as a tool for catalyzing group discussion and for eliciting accounts of the playing practice. Complementary information from the parents enables to contextualize our findings.

Environmental Compensation As a Strategy to Deal with Environmental Risks in Urban Development Projects: Interdisciplinary and Cross – Country Perspectives

This presentation will address the issue of environmental hazards within urban infrastructure projects from the interdisciplinary and cross country perspective.

The development of urban infrastructure projects (like road infrastructures, water supply infrastructure, recreation facilities etc.) often intrudes into natural environments; however compensation of damage caused by such projects usually takes economic or social measures. Environmental compensation remedies a damage caused to nature, which is often not considered in urban infrastructure projects.

This presentation has several goals. Firstly, we will look at the multi-disciplinarity of the concept of environmental compensation and its perception. The question what values are to be compensated is important for landscape planners and the perception of these values in the communities affected by the projects and by the stakeholders are in the focus of sociological research. Secondly, we will discuss the cases of Sweden and Lithuania looking at selected projects that are related to environmental hazards and we will analyze how the idea of environmental compensation is perceived in these countries and how the responses to the hazards are related to different cultural contexts and policy traditions.

The research is based on project "The Perception and Practices of Environmental Compensation: Urban Infrastructure Projects in Lithuania and Sweden" (EnCom) which is funded by a grant from the Research Council of Lithuania. The research data comes from document analysis, group and individual interviews with stakeholders of urban infrastructure projects and representatives of local communities.

Spatial Inequalities, Decentralization and Schooling Practices in Democratic South Africa: Some Ways to Understand Educational Inequalities

Post-apartheid South Africa has adopted the international principles and semantics relating to democratic schooling: right and access to free and quality basic education for all, decentralization, freedom of school choice and community participation, among others. Yet too many children do not have access to quality education.

Based on an ethnographic study conducted in the primary schools of a semi-rural community in the province of KwaZulu-Natal, this article analyses the deep spatial inequalities remaining from apartheid and jeopardizing access to quality education in a context of decentralization.

Data was collected in all the six primary schools of the locality by interviewing school staff, parents, SGB and community members and through questionnaires given to each primary school learner.

By showing the social backgrounds of the pupils and their social distribution amongst the schools, evidence has been made of the ways access inequalities occur within the locality. Moreover, the state mechanisms to promote equity are challenged by its own definition of a local community, alongside schools' strategies that are not necessarily conducive to democracy and equity. Although all children have theoretically the right to access quality education, only those from high socio-professional origin effectively enjoy it. Poor children of the locality remain disadvantaged and, de facto, social and spatial discrimination still takes place.

The educational policy takes into account people's juridical ability to move within a free geographical, institutional and social space but neglects major spatial issues involved in implementing access to quality education for all. A compre-

　　*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

hensive approach of schooling practices would prevent from dissociating schools from their social environment and from ignoring their role in shaping social dynamics that yet need to be understood in order to promote equity, social justice and cohesion.

"Bring Back Our Girls": Voices Crying in the Wilderness

More than a year has passed since the kidnapping of 276 girls by the Boko-Haram militants of Nigeria of the Chibok school girls on the 14th of April, 2014. With reports of some of the girls escaping but another 219 is believed to still being held captive and converted to Islam. Several voices has spoken and are still speaking, the government of Nigeria, activist groups, NGOs, United Nations, African Union, United States of America etc. All saying the same thing "bring back our girls" but to who is this statement directed too? The government of Nigeria or the Boko-Haram militants? Seemingly not too clear. Amnesty International says the Boko-Haram militants have abducted over 2000 girls and women to be used as cooks, sex slaves and fighters. Why are these 276 girls so special? Is it because there is a religious drama to it? According to Times, 28 April 2015, 200 girls were rescued from Boko-Haram militants but the general consensus is that they were not the Chibok girls. Several women and children have been rescued since then but still not the Chibok girls. This same saga and drama of the Boko-Haram constituted to pulling down an incumbent president to a rival party. Is there more to these stories than meet the eye? This paper seeks to uncover using a thematic content analysis of news reports and a critical discourse of power relations in the Nigerian context, to shed light into the news behind the news and the implications to the development of a nation, Christian-Muslim relationship and evolving politics of opportunists using an unfortunate event to rise to power as voices for the masses. Are they voices of the masses? Who is benefiting more than a year after? Thus a journey into the voices crying in the wilderness.

Economic Attitudes of East Europeans

After twenty-five years of turbulent changes in Eastern Europe, which happened during a particular socio-historical moment of neoliberal globalization, financialization and economic crisis, how do East European experience their lives? What are the sentiments of people about their quality of life, about what it takes to succeed in their country, rule of law, and pervasiveness of informal economy? We ask these questions using the data from the Life in Transition Survey for 2006 and 2010. This survey included almost 39,000 households in 33 countries, including 28 postsocialist East European and Eurasian countries and 5 West European countries, to assess public attitudes, well-being and the impacts of economic and political change. We use hierarchical models with country level and individual level predictors. On average, we find that the importance of effort and hard work is believed to have decreased over time, the importance of political connections is believed to have increased in postsocialist countries and stands twice as high as in Western Europe, and that only about a third agree or strongly agree that law and order exist in postsocialist countries. Moreover, the belief that informality rules is widespread and almost ten-times greater in postsocialist countries than in Western Europe. Still, the individual level predictors point to significant differences in how postsocialism is experienced among different groups of people, in particular based on socio-economic background. We link these findings to the understanding of the character of the socio-economic order that has become established in the past 25 years.

Percepción De La Pobreza: Una Mirada a Su Concepción y Atribuciones Causales En México

Este trabajo tiene como objetivos analizar desde una perspectiva sociológica las percepciones de la pobreza en México e identificar las diferencias entre perfiles sociodemográficos. Se inserta en la discusión sobre la conceptualización de la pobreza vista desde la población a fin de aportar elementos en para su medición y elementos útiles para la generación de políticas públicas. Las hipótesis de partida son i) que el marco analítico propuesto por Feagin (1972) es relevante para el estudio de las percepciones de la pobreza en México, ii) que analizar las atribuciones de la pobreza permite inferir qué idea de justicia social comparte la población, y iii) que tomar en cuenta esta dimensión es pertinente para identificar a los actores relevantes de una política social. Se hace uso de una encuesta levantada en 2014 con representatividad nacional y regional (aplicada a 1,200 mexicanos mayores de 18 años). De la revisión bibliográfica realizada, se encuentra que son pocos los trabajos que utilizan encuestas a la población general. Se realiza un análisis factorial confirmatorio para probar la pertinencia de este marco analítico. Los resultados permitirán relacionar las atribuciones causales de pobreza entre diferentes perfiles sociodemográficos. Entre los resultados preliminares se encontró que para las tres preguntas guía: 1) qué identifica la población como un sujeto en condición de pobreza; 2) cuáles son las causas de que un mexicano sea pobre; y 3) de quién depende la solución del problema de la pobreza; existen diferencias significativas entre perfiles demográficos, condiciones socioeconómicas y regiones.

Events, Actions and Narrative in Video Analysis

Technically, video consists of a plurality of snapshots, but does not represent merely and simply the sum/set of images. Repeated or prolonged observation can be decoded in written documents (transcripts, then transformed into the narratives), which are a special kind of stories about social *events*.

Recently important attempts have been made to change the very nature of the video analysis. A detailed study of video's short segments allows to see what any normal observer or participant interactant does not notice (Heath, Luff, Hindmarsh). It occurs to be much more practically sophisticated, than the formal-logical account of action – «intention-purpose-visible act-outcome». Besides, the very method of observation is to be considered in a more reflexive mode – it makes a difference to see something while making video-recordings (via camera) and to watch the same thing as a video. The difference is in the modes of immersion into the «scene», in the multiple co-existence in the same reality. What then should be the report of the observer? What could be the modes of symbiosis of these two experiences of surviving reality in «making» and «watching»? Is it possible to make the story of these brief occurrences, which action is divided into, such as of the action itself?

We address two very different approaches to the problem introducing the outcomes of our research on the interaction between man and technological device. One of them is based on the concept of "non-representation" in video analysis (Nigel Thrift), stressing the reflexivity (and affectiveness) of the observer and narrator; and the other - the concept of narrative itself as an outcome of the visual analysis (Ricoeur). We conclude that the possible overlap and the definite contradictions of both approaches give the opportunity to build a more insightful observations' descriptions and more effective narration strategy.

BANKOVSKAYA, SVETLANA* (National Research University-Higher School of Sociology, sbankovskaya@gmail.com)

Living in-Between: The Ontological Turn Via Other-Stranger-Marginal Nexus

The modern ontological turn in social theory addresses the liminal categories of "social being" -- the Other, the Stranger, and the Marginal among them. It may seem that the concept of marginality has already been thoroughly studied and sometimes even considered as a useless and obsolete theoretical notion. however-er, I develop the notion in a way with regard to the logical nexus of "Other-Stranger-Marginal" and social implications of shifting borderlines in the contemporary world. The notion of "marginal man" introduced by Robert Park is central for my approach since it embodies the "spatial—social" interaction. I construct and use the nexus of space, time and movement to account for the analytical capacities of this concept. The article covers mainly the spatial aspects of marginality and its connotations. I outline two main approaches to the ideal type of the "marginal man" in the paper: 1) the spatial-functional approach (traced back to Simmel's notion of Stranger), which focuses on the essential functions of stranger for a group border, and 2) "formal"— making approach to multiple borders (and particularly shifting ones) that shape "marginal's" identification as placed in-between borders and challenge the orderliness of bordered space. The central task of the marginality research is not to classify different "strangers" and "marginals", or to describe their conditions, self-identities, and psychological controversies, but to depict social processes responsible for "marginalization", exclusion, and enabling liminal positions. I argue that the analytical vista of the "marginality" concept can be extended beyond the individual/personal framework and include social institutions (in the example of citizenship).

BARALDI, CLAUDIO* (University of Modena and Reggio Emilia, claudio.baraldi@unimore.it)

Facilitating Narratives of Memories in Classroom Interactions

This presentation is based on the analysis of interactions that were video-recorded during 24 meetings in 8 multicultural fourth, fifth and sixth grade classrooms . These meetings were part of an Italian project aiming to: collect private photos regarding children's memories, with teachers and parents' support ; use these photos to facilitate the production of shared narratives of children's memories in classroom interactions; store photos for future use in schools. The classroom interactions were facilitated by an expert. The interactions were video-recorded and transcribed to analyze children's ways of participating, the production of narratives of memories, and facilitation techniques. The analysis is based on four basic concepts. First, memory is a social construction in communication processes. Second, this construction is visible in personal and collective narratives. Third, experts' facilitation can effectively promote narratives in dialogic interactions with and among children. Fourth, understanding of interactions and narratives in multicultural classrooms requires a non-essentialist approach to cultural differences. Against this background, the video-recorded interactions have been analyzed with particular attention to : (1) the ways in which, describing their photos, children produce narratives concerning themselves, their families and their contexts; (2) the variety of facilitation techniques, including questions, minimal responses, repetitions, and different types of formulation; (3) the effects of these techniques on the interactional production of new, more complex narratives, following the initial one; (4) the ways in which narratives highlight children's personal, social and cultural identities. In particular, this presentation focuses on the ways of transforming children's personal narratives into new, more articulate interactional narratives involving the facilitator and other children. This analysis offers an opportunity to understand how, in educational contexts, the use of images (in particular, photos) and dialogic forms of communication can support each other in giving meaning to children's narratives, memories and identities.

BARALDI, CLAUDIO* (University of Modena and Reggio Emilia, claudio.baraldi@unimore.it)

IERVESE, VITTORIO (University of Modena and Reggio Emilia)

Narratives of Memories As a Way of Changing Children's Future

The traditional way of observing children describes them according to a linear conception of time, in which they "grow" and "develop". In this way, as sociologists have observed, children are positioned in their future, as developing beings, while their present is ignored. Against this background, the sociology of childhood shares the interest in children's present social relationships. What is missing in both these observation methods is the importance of the past in creating children's perspectives on their present and future. Evoking children's past is a difficult task, as memory of past events is quickly replaced by present relational conditions and by a continuous pressure on future development. An effective way to give meaning to children's past may be the use of images that evoke it. Here we present a reflection based on a project that included the collection of private photos regarding children's memories, and the use of these photos to produce shared narratives of children's memories in classroom interactions.

Historians use images as documents that help construct memory as a basis for future perspectives on the past. This operation requires distance from the past; the images are stored and used as a repertoire to create "history", i.e. to fix the memory of the past. In our project, the use of images of the children's past had a different meaning. First, memory was an interactional construction in classrooms. Second, interactions among children reduced time distance, deconstructing memory and creating new narratives, rather than a repertoire of fixed memories. Third, this interactional construction of narratives of memories enhanced a future of knowledge and dialogue; in particular, these narratives changed the ways of giving meaning to children's relationships. Memories were used as a source of surprise and innovation, therefore they were used to change the future of children through communication processes.

BARAT, ERZSEBET* (University of Szeged, zsazsa@lit.u-szeged.hu)

The Migration Crisis on a University Chancellor's Facebook Page

There is debate for and against the empowering effects of the social media either in terms of its liberating effects for the identity formation of the individual user or regarding its potentials for activism – yet little discussion of these dimensions as intersecting areas. My analysis may demonstrate the productivity of such an intersectional approach. The event I explore is the fall of the Chancellor in the wake of the media's report of the outrageous photo uploaded on his Facebook page on September 15th, 2015. The photo represents a boat full of 'beautiful'

white young naked female bodies apparently having great fun with the caption: 'At long last normal migrants!" The page was noticed on September 24th by one media site only called oktatas.atlatszo.hu (education.transparent.hu), a watchdog NGO established in 2011 in response to the Government's systematic take-over of the media. My analysis will partly discuss the intersection of sexism and xenophobia reiterated in/by the photo and show how it is embedded within the national order of predominantly hostile discourses to migration. I shall also try to explore the productive raptures that resulted in the resignation of the Chancellor on September 28th. As the official statement of the University Senate is still in the making, it will effect my analysis. Yet, the question I would like to address is still concerned with the factors leading to the fall of the Chancellor who tried to distance his 'self' from the photo as hostile media act against him yet a day later made him 'offer his resignation' to protect the University's reputation. How does this case make us conceptualize identity as a discursive site of competing discourses, thereby going beyond the collective/individual binary?

BARBALET, JACK* (Hong Kong Baptist University, barbalet@hkbu.edu.hk)

Wealth Migration from Mainland China: International Investor Residency Schemes and Illegal Money-Moving As a Special Case of the Migration Industry

The current literature on Chinese business migration stresses a number of connected themes. One is the link between ethnicity and entrepreneurship, typically emphasizing family structure, the mobilization of *guanxi* obligations, and Confucian ideology. Another is transnational networks, generally focused on regional South-east Asian and East Asian connections, but with a growing awareness of European and North American nodes. What is typically ignored, though, is Chinese business migration that results not from the relative lack of opportunities in China but is a strategy for the preservation of wealth generated through the rise of China since the 1980s. The significant movement of capital out of China that is invested in North American, European and Australasian economies is achieved by new regimes of residency and citizenship schemes developed by neo-liberal Western states, often with implicit reference to the needs of Chinese nationals to expatriate funds from mainland China in defiance of domestic anti-corruption policies. The investor-residency schemes offered by Western governments are one element of the 'migration industry' serving wealthy Chinese national emigrants. The other pertinent element for this group is the illegal structure developed to overcome the stringent regulations designed to limit the movement of money out of China, permitting expatriation of enormous wealth to facilitate Chinese investor-residency visa holders taking up legal domicile in the US, Europe and Australasia.

BARBETTA, TOMMASO* (The University of Tokyo, bluephilia@gmail.com)

A Posthumanist Approach to Electronic Gambling

Working on the topic of contemporary electronic gambling, I had to face the centrality of the human-machine interaction in the emergence of gambling addiction.

Both an intersubjective approach and a deconstructionist approach have proved to be inadequate in dealing with such an interaction. On one hand, theories of intersubjectivity fail in recognizing the impact objects may have in the development of subjectivity. On the other, postmodernist approaches neglect the material agency of machines and reduce the subject to a discursive construction.

On the contrary, by focusing on interobjective relations, a post-humanist approach provides more effective tools to investigate the human-machine connection. From a post-humanist point of view, the subject articulated in the human-machine relation, has to be considered ontologically different to the subject which existed previously to such a relation, i.e. the human-without-machine.

Adopting a post-humanist approach we are able to enlighten how designers, projects, industries, economies, laws etc. have shaped machines and how machines have been shaping the players' subjectivity. Through posthumanism we are able to understand addiction as a network which embraces both human and non-human entities.

Departing from such a specific case study, the present work also intends to remark some of the crucial shortcomings of the "ontological turn". Despite providing strong analytic tools, posthumanist theories may in fact lead to an "ethical precariousness".

What are our aims? What kind of subject are we protecting and why? Moreover, how can we design an affirmative political agenda in a world where humans and non-humans are symmetrically perceived?

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

RC13-164.7

BARBETTA, TOMMASO* (The University of Tokyo, bluephilia@gmail.com)

Problematizing Electronic Gambling

Considered as a morally dangerous activity, since the rise of modern nation-states gambling has often been marginalized through time and space legal limitations. Nevertheless in the last decades such a negative perception has been slowly mutating. Legalization and normalization of gambling activities have been taking place in different geographical areas at the same time. The rise of electronic gambling is one of the crucial element which has supported such a mutation.

Due to informatization and technological developments, since the eighties gambling industry has in fact undergone a radical transformation. In few decades computerization has changed the structure of gambling devices such as slot machines and pachinko, producing as a consequence, an exceptional expansion of gambling market. In 2013 the Japanese electronic gambling turnout has exceeded 200 billion euros. It is a huge economy which sustains and is sustained by a complicated network of powers and interests. which vastly depends on the participation of the so called "problem gamblers", player who are addicted to gambling.

The fundamental problem is that from the market point of view, addicted customers are the perfect customers.

How should we address the issue of addiction, avoiding to fall into the consumption-overconsumption dichotomy? How should we deal with increasingly addictive leisure technologies and environments?

In order to face these questions, the present work adopts Bruno Latour's *interobjective* theory, focusing on the impact environment, technology and designs have on the emergence of addiction.

BARBOSA, MARIA LIGIA* (Universidade Federal do Rio de Janeiro, mligiabarbosa@gmail.com)

Policies for Expansion of Higher Education and Practical Institutional Barriers

This paper proposes an analysis of Brazilian system of higher education, which expanded significantly in last years. It tries to show that traditional or patrimonial institutional models work as barriers to effective democratization of educational opportunities. These barriers act as obstacles even in a context of public policies directed to social inclusion and very significant increase in enrollments in higher education.

Two institutional factors will be considered. The first would be the higher or lower permeability of different careers to social inclusion policies. More prestigious professional's careers have more difficult selective process and show more clearly the social privileged positions of their students. Moreover, access and retention of students in these courses are hampered by the different funding mechanisms used in each professional area.

The second factor, the operating rules of the various modalities of degree, includes an analysis of segmentation in public and private sectors, of courses duration, opening hours and the qualification of teachers. Each of these items can be considered as a kind of indicator of the quality of courses and institutions. Public institutions are the most prestigious, proportionally receiving more students from the elite. The private sector, larger and more socially diverse, organizes more appropriate access conditions to its audience.

A preliminary assessment indicates that institutional factors act as a regulatory mechanism of access to higher education. They make a social distribution of students at the higher education system. Efforts, abilities, skills or vocations are secondary in this distribution. Through this mechanism, the system opens formally for the entry of students from the "popular" classes and ensures that they stay at the lower quality side of tertiary education. Contrary to expected, the expansion of HES didn't result in a equalization of opportunities: it seems to work as a "regime of effectively expanding inequality" (Alon, 2009).

BARBOSA DOS SANTOS RAXLEN, JUSSARA* (The New School for Social Research, juraxlen@aol.com)

My Home Is Someone's Workplace: The Challenges and Possibilities of Careworkers' Employers Organizing for Change

In the fall of 2010, the state of New York ratified a Domestic Workers' Bill of Rights, which extended basic labor protections to child and elder homecare workers. This legal victory was the result of more than a decade of activism by workers themselves through their own organizations and through the alliances they built with other civil society activist organizations, which, important to note, included employer-based organizations. Thus, contrary to traditional notions of an inevitable struggle between workers and employers, employers have been key allies in workers' organizing efforts. In fact, since domestic care work takes place inside employers' private homes, employers are now of strategic importance in order to

make the law a reality. Acknowledging this challenge, in April of 2014, two employer organizations launched a campaign called "My Home is Someone's Workplace." As part of the campaign, both organizations have developed training programs to teach actual and prospective employers about their new legal responsibilities and fair employment practices, and also, to convey to employers values about mutual caring and interdependence. Reflecting on these goals, an employer organizer summarizes: "Our challenge is to pass on the information about the bill, but also to build the values and ideas that will bring about a political paradigm shift."

Based on participant observation research, this paper examines the contents of these programs and asks: Can this training be an effective strategy to bring about change or does it simply reinforce the status quo? Understanding these programs' challenges and possibilities, the paper focuses on the contradictions that emerge for employer organizers as they struggle to pass on instrumental information and, at the same time, encourage political discussion about care, careworkers, and about the complex relationships between employers and careworkers.

BARBOSA DOS SANTOS RAXLEN, JUSSARA* (The New School for Social Research, juraxlen@aol.com)

Talking about Care: Communicative Tensions That Make or Un-Make the Practice of Caring

Feminist thinkers have theorized "care" either as an ontological (Puig de la Bellacasa 2012) or as a normative ethical concept (Folbre 2014; Kittay 1999; Tronto 1993). Both conceptualizations argue that practices of care could remedy the social ills of late capitalist societies and the shortcomings of universalizing political projects that abstract political subjects from the social relations that constitute their own subjectivities. In the midst of such theorizing, in everyday life, "care" figures prominently and repeatedly as a hegemonic multi-purpose signifier to denote the provision of quotidian needs or to promote and legitimatize often un-caring practices. And, interestingly, right now, in New York City, two activist organizations of employers of care workers have started to use the concept of "care" as a central organizing principle. Evoking notions of mutual respect and interdependence between employer and worker, these organizations coordinate education programs that teach employers about how to be "caring bosses" inside their own homes. In coalition with workers' organizations and with their efforts to transform home care work in ways that would mutually benefit workers, employers and care recipients, employers and workers jointly attend these programs, creating unique situations in which conversations about "care" occur. Considering New York's global urban context, these joint sessions are remarkable and rare encounters in which middle class employers and minority/immigrant women talk about the meaning and work of "care."

Using participant observation research, this paper examines the goals and contents of these programs and asks: What are the challenges and possibilities that such conversations about "care" hold? Analyzing the communicative tensions that emerge between universal-abstracted and specific-contextualized language in these exchanges, the paper argues that to talk about "care" without emptying it of meaning requires ongoing, attentive, responsive and time-consuming listening. That is, talking about care demands its constant application to its own enunciation.

Can Digital Technology Enhance Social Connectedness Amongst Institutionalized Older Adults? Computer Science Meets Sociology for an Action Research Project

Social isolation and loneliness are emerging risks for older adults (65+), particularly for those institutionalized and frail. Social isolation and loneliness predict cognitive and functional decline, mortality, and social disengagement amongst this population. Since research suggests that opportunities for social connectedness through digital technologies can help alleviate both social isolation and loneliness, we developed an accessible tablet-based app called *InTouch*. *InTouch* supports asynchronous communication with relatives and friends and has four messaging options: picture, preset text, video, and audio. The user can also receive multimedia messages. It does not require typing, because it was designed for older adults with motor impairments. Its development was based on participatory design and field studies conducted by a team of computer scientists and sociologists.

To test the adoption and feasibility of InTouch to increase social connectedness, we conducted a two-month deployment study in a long-term care facility

(n=4, 80+) and a three-month deployment study in a retirement home (n=12, 74+) in Canada. These studies included semi-structured interviews with our participants and relatives, field observations, and usability and accessibility tests. Drawing on Rob Stones' Strong Structuration Theory, our results show that the feasibility of InTouch to enhance perceived social connectedness depends on: the involvement of at least one strong tie, perceived usefulness and functionality, adjustment periods, and the management of different intergenerational norms and expectations. For half of the participants, the app had also a positive impact on their perceived well-being, namely in terms of self-efficacy and comfort with technology (digital literacy). It had, however, a negative impact on two participants, making them more aware of their digital "inadequacy" or impairments (speech-related). Our findings further demonstrate that older adults are far from a homogeneous group. We conclude by discussing critical factors (structural and agentic) for the design and implementation of any similar digital technology.

"It's Not What You Know, It's Who You Know"? Social Capital in Transition(s) to 'Early Adulthood' – a Longitudinal Study

Social capital captures the benefits of our relationships. Although a large body of research has examined social capital among adults, relatively little attention has been paid to social capital among young adults in a longitudinal perspective. Social capital is a useful social construct to study transition(s) to 'adulthood', because it predicts educational achievement, employment, status attainment, well-being, and social mobility. In fact, the sociological literature suggests that those with higher levels of social capital have greater social and economic opportunities. Following a Bourdieusian approach, we define social capital as the resources that are potentially available in our social ties. These resources can be mobilized for instrumental (e.g., help finding a job) or expressive (e.g., emotional support) purposes and are captured by two dimensions of social capital: bonding and bridging. Bonding corresponds to the resources potentially available in strong ties, that is, family members and close friends, whereas bridging relates mainly to resources available in weak ties, such as acquaintances. Bonding social capital is usually associated with expressive resources, while bridging social capital with instrumental resources.

So, we asked: does social capital change in transition to early adulthood? And how do young people actively generate, negotiate, and use their social capital? To address these questions, we use data from the EPITeen cohort study of young people in Portugal to examine the social capital of individuals surveyed at ages 17, 21, and 24 (n=1650). In a mixed-methods approach, we also rely on 70 semi-structured interviews. The preliminary findings show that respondents report receiving more emotional than financial support from their networks, but that both emotional and financial support statistically increase over time. Likewise, bonding and bridging also change positively in transition to adulthood. We contextualize these results with our qualitative data and discuss its implications for family and youth studies.

Fertility postponement could reduce child mortality: Evidence from 228 Demographic and Health Surveys covering 77 developing countries

Annually, 6 million children under age five die and over 80% of these deaths happen in the developing world. Reducing under-five mortality by two-thirds was a key Millennium Development Goal, but four out of five developing countries lag behind this target. Here we show that postponing fertility could increase child survival. Using data covering 3.3 million births, 77 developing countries, and 228 Demographic and Health Surveys collected from 1985-2014, we are the first to show that secular declines in under-five mortality completely outweigh the risks associated with reproductive ageing. For an individual mother, having a child at an older age means placing the child into a later birth cohort in which survival is higher thanks to secular declines in mortality. Strikingly, there is no limit, as children born to mothers aged 40 or above have the best survival. If fertility in the DHS countries was on average postponed by as little as 1 year, 2.2%, or more than 100,000 of all child deaths per year could be avoided. If expressed preferences for longer birth intervals were realised with an increase in birth spacing by 1 year, child mortality would drop by 3.0% per year. Postponing fertility is not only the expressed preference of women, but would also help save children's lives.

Women in Modern Agricultural Families –Its Politico –Economic and Social Impact

The post nineteen nineties globalization and liberalization in India had changed the position of rural women. Under the traditional social structure ,she had to take up agricultural work as her profession .The Post globalization policy intervention like   the 73rd amendment of the constitution (1992). Associated with it the Central Government Program on Swarna Jayanti Gram Rojgar Yojona (1997) and the policies on Women Empowerment (2001) offered enormous opportunities to the rural women in involve in decision making in the family and the community work .Her active involvement in politico-socio-economic work encouraged her to take important position in family as well as in community decision making .   Her participation in policy decisions as ensured through 73rd amendment Act has authorized her to actively involve in Agricultural activities too. Her economic status was also ensured through micro finance program . The present paper trough empirical surveys will analyze the changing role of women in the village families. by focusing her status as an earner , policy maker and as a social leader in the village environment

Rice Production Sustainability and Livelihood Improvement in Rice Farmers of Fragile Environment in West Bengal, India.

West Bengal located in the eastern India is a major rice producing state . Rice is the staple food of the state and produced by small and marginal poor farmers for their livelihood under harsh abiotic and biotic conditions. Out of total rice area 5.8 million hectare, 4.2 million ha of rice grown under rain fed condition in different stress situations viz. flood and drought prone , salinity and pest severity .Thus variability of rice production is often visualized influencing livelihood of the farmers.

Traditionally farmers in fragile environment cope or avoid stresses with age old management practices (known as indigenous technologies) which involves traditional   varieties, establishment period adjustment and other agronomic manipulation. Resulting low productivity and negative impact on livelihood.   Agriculture is sustainable when current and future food demands are met with out unnecessarily compromising economic,ecological and social/political needs. Recent genetical manipulation in rice for stress tolerance increased sustainability of production with utilizing minimum natural resources and social and political destabilization.

Farmers   often adopt risk prone unsustainable agriculture for economic improvement , classic example is high input and resource consuming potato and boro (dry season)rice cropping in West Bengal. A ten year time period data revealed   production of both the crops registered less than average in half the years .   But higher productivity and market price supports livelihood improvement reflected by rapid increase in Potato area and Boro rice coverage in irrigated area.

The present study   concludes that new generation genetically manipulated rice bestowed rice agriculture more sustainable   with higher production and profitability in fragile environment replacing indigenous technologies.

The Symbolic Dimension of Social Protection: Unequal Expectations in Transnational Social Relations

Inequalities in the nexus of global social protection and migration are widely analyzed from the 'formal' perspective of welfare state analysis and/or 'informal' perspective of migrants' protective networks. While these dimensions of social protection (formal and informal) have recently been analyzed as interrelated instead of separated, the far largest part of research investigates the 'material', i.e. tangible or economic, aspects of social protection, such as financial remittances, social support and caregiving. The 'symbolic' dimensions however largely influence the exchange of and access to 'material' aspects, because they legitimize expectations and actual flows of different resources. Legitimate expectations toward each other are influenced by the social contexts, in which social relations are embedded. In transnational social spaces, this means that the social expectations are influenced by the different national location of members in social networks, i.e. the different formal protection systems they are subject to. This situation

exacerbates migrants asking for help from their relatives and friends in those countries with perceived worse formal protection. It also leads migrants to be pressured to be (or display) that they are well-off. In cases, where they are not, they often engage in forms of 'symbolic social protection' directed to the emigration country with low material value, which they legitimize as having a high symbolic value. The empirical results stem from research on two transnational social spaces: Kazakhstan-Germany and Poland-Germany. Based on 70 semi-structured interviews conducted with migrants from Kazakhstan and Poland in Germany and their significant others in Kazakhstan and Poland, we elucidate how the symbolic dimension of social protection is involved in the inequalities in the provision of social protection in transnational social relations.

BARI, DORA* (Corvinus University of Budapest Doctoral School of Sociology, baridora@gmail.com)

The Impact of Education on Work Attitudes in Hungary

Over the past few decades examination of work attitudes has become one of the central themes of scientific research in the field of economics, psychology and sociology. The importance of measuring work attitudes lies in their close interdependency with various fields of social and labor market behaviour. In addition, the transition from industrial society to post-industrial society conveyed several changes in world economy, in labor market, and in the meaning of work. This transition have started later in CEE countries and shows significant differentials compared to Western countries. For this reason, this research studies the work attitudes in Hungary in the context of this transition.

Based on the results of several empirical studies, Hungary has a particular position among European countries: compered to other European countries, the impact of educational level on work attitudes is much higher. On this basis, the aim of the research is to explore how the level of education of employees affects their organizational commitment and job satisfaction, which I regard as two aspects of work attitude, and how it changed over time. Another important part of the research is the examination of the impact of work values and job attributes on work attitudes. Job attributes consist of position, task characteristics, job rewards and social bonds, which are embedded in organizational structure.

The International Social Survey Programme Work Orientation Module (from 1997, 2005 and 2015) data are used for the analysis. The main methodological steps are the analysis of the interaction between work values and job attributes over time, their effect on work attitudes, and finally, the determination of education on them.

The main societal relevance of the research is that it not only examines the imapct of education on work attitudes, but also embeds it the transition from industrial society to post-industrial society.

Breeding "Debilitating" Blood and Bodies: Building Bridges Between Queer and Disability Studies By Comparing Voluntary HIV Acquisition and Voluntary Disability Acquisition

Cross-analyses of sexuality and ability in queer and disability studies/movements are under-theorized (Clare 2009; McRuer and Mollow 2012; Kafer 2013). This presentation, anchored in the sociology of the body, health, and deviance, hopes to encourage alliances between queer and disability movements and create more inclusive activist spaces by comparing two cases of "extreme" body modification: voluntary acquisition of a disability (transability) and of HIV (bug chasing). Transability, or Body Integrity Identity Disorder (First 2004), is the need of a person identified as able-bodied by others to transform his or her body to obtain a physical impairment/disability. Bug chasing is practiced by men who have sex with men without condoms with the intention of contracting HIV (Dean 2009). While most researchers in sociology, criminology, and psychology interpret these practices as forms of mental illnesses and condemn them as deviant, destructive bodily practices to be prevented, I present a comparative analysis of the two phenomena from a non-pathological perspective. Although bug chasers and transabled people share the desire to transform their bodies in ways that modify their ability or health, the phenomena are never discussed together. Research on bug chasing ignores transability and studies of transability neglect voluntary HIV acquisition. This presentation explores what makes this so and asks: What are the possibilities opened up by combined analysis of bug chasing and transability? Without denying the specificities of these two practices, I argue that placing them on the same continuum has heuristic value. I examine academic works addressing bug chasing or transability and maintain that the "impossibility" of their continuities relies on ableism in queer studies/movements and heteronormativity in disability studies/movements. I suggest that under-theorized links between bug chasing and transability prevent us from analyzing the interconnections between ableism and heterornormativity that remain poorly documented in intersectional works on stigmatized groups.

What Does a "Better World" Mean for Suicidal People? Social Movements' Response to Suicide

This presentation demonstrates that suicide is interpreted from either a medical/psychological or social perspective, with no third view. The medical/psychological perspective reduces suicide to an individual pathology curable with chemical therapies and/or psychotherapy and erases the role of structural oppression in the desire to die. The social perspective conceptualizes suicide as the effect of systemic factors, like homophobia, transphobia, and ableism, that diminish quality of life. Despite significant differences, the medical and social models agree with prevention campaigns that "*suicide is not an option*" because it is an irrational answer to suffering. Inspired by anti-ableist critics of both the medical and social models (Crow 1996; Wendell 1996; Kafer 2013), I use a subjective-social model of disability to reflect on the phenomenological and social experiences of suicide and argue that suicide can sometimes be a rational, acceptable option for depressed people. I demonstrate that mental ableism (or sanism) is the pre-condition that renders suicide "not an option" (Hewitt 2010). Combining critical discourse analysis, genealogy, and deconstruction, I analyze queer, trans, and disability studies/movements' discourses on suicide. I show that, despite legitimate concern about the over-representation of marginalized groups in suicide statistics and the need for structural changes to eliminate oppression, social movements' insistence on the social overshadows suicidal people's subjective experience. I call for a politics of compassion, responsibility, and accountability capable of accompanying suicidal people in their desire to die. This approach is meant to complement, not supersede, the fight against systemic oppression and the quest to find alternative solutions. Because they are delegitimized, stigmatized, institutionalized, and criminalized, I argue that suicidal people constitute a marginalized group. I show that despite intersectional analyses and the desire to build solidarities between marginalized populations, social movements consider suicidal people irrational and fail to take them into consideration.

KRINSKY, JOHN* (City College New York, jkrinsky.ccny@gmail.com)

Theorising 'Movement Waves' and the Making of Collective Subjects

The metaphors with which we try to make sense of social phenomena are liable to occlude significant features. When we discuss what we have learned to call either 'cycles of protest' or 'movement waves', we risk thinking of them in naturalistic or mechanical terms, making their exploration and explanation more difficult. 'Movement waves' appear to offer heightened opportunities for social transformation 'from below'. However, they vary in scale, in longevity, and in their capacity to mobilise different social sectors. At one extreme, they seem little more than brief 'ripples' on the surface of capitalist society, mobilising transient minorities. At the other, they verge on and may indeed presage social revolutions. How might we account for the range and variety of possibilities they reveal?

Rather than following similar trajectories, as some accounts suggest, their developmental paths seem to be marked by inner conflicts, dramatic encounters, moments of strategic divergence, turning points and other features that seem to demand 'narrative' rather than purely 'mechanical' or 'structural' accounts. Every 'wave' of protest involves its own dynamics of diffusion, which in turn, involve interpretation, argument, etc., that suggests adaptation and reworking, as well as joining claims to others in new contexts and across contexts. Importantly, in order for a movement 'wave' to be a movement wave, of any size or scale, it must also be an expansive project of collective subject-making; there must be some centripetal force drawing together the collective subject. Drawing from dialogical approaches to social movements and from theories of distributed cognition, this paper proposes a new approach to understanding why protest seems to spread and scale up at some times rather than others, and remain constrained and localized at others.

It's a Small World after All: The Nature of Risk and Science

We examine lay claims concerning the 2015 measles outbreak traced to Disneyland, CA through a content analysis of more than 2500 online reader comments sent to the three U.S. newspapers with the largest number of digital subscribers (i.e., *The New York Times*, *The Wall Street Journal*, and *USA Today*). Nearly all social science research related to the vaccine debate has focused on the anti-vaccination movement and its conceptualization of vaccine risk. Our analysis points to a large group of social stakeholders who express a variety of concerns about anti-vaccination as an abrogation of the social contract and the risks associated therein. Not only does this group discredit the means by which risk is calculated by *anti-vaxxers*, but they also challenge the level of analysis (i.e., individual versus social) at which *anti-vaxxers* calculate risk. Our analysis further highlights the particular ways in which these stakeholders align their position with that of *science*, so imagined, to legitimate their concerns and discredit claims concerning vaccine risks. These stakeholders are highly defensive in the face of perceived personal and communal catastrophic risks. Even as they evoke science, their claims were less a reflection of established medical knowledge and more emotive, exaggerations of negative consequences in unique scenarios. Far from disparaging or distrusting science, the overwhelming majority of online reader comments, to liberal and conservative newspapers alike, align themselves with a pro-science and pro-vaccine position. At the same time, their alliance with science is as much emotive as rational. Our analysis contributes to a growing trend in the Science and Technology Studies literature that shifts away from the imagined, widespread eschewal of science to an empirical focus on the actual claims made by laypeople about their understanding of science.

Rape Myths: Exploring Gendered Norms, Culture and Context to Promote Understandings

Research and anecdotal evidence into the crime of rape continues to suggest the persistence, and powerful impact of the existence of rape myths throughout the world. Such myths may exist at a number of different levels in society from individual beliefs to how systems perceive and respond to victims and perpetrators (Stern Report 2010, Smith & Skinner 2012). Much of the focus of extant literature has been on the criminal justice system, and support and provision for the victims (Westmorland & Gangoli 2012). Within such literature, there is evidence of the existence of rape myths which attribute blame onto the victim (Ellison and Munro 2009, Barn and Kumari 2015). So – beliefs such as 'the majority of rape allegations are false', or that 'the majority of rapes are committed by strangers' are not uncommon. Some researchers have asserted that rape myths can create cultural norms that may perpetuate sexual violence against women (Burt 1980). Research carried out in the USA suggests that men are more likely to demonstrate high levels of rape myth acceptance (Aronowitz et al 2012). In Britain and in India, we lack similar research evidence to develop nuanced understandings.

This paper draws upon a new study that sought to explore the persistence of rape mythology among university students. Through a range of mixed-methods, a total of almost 500 students contributed to the data collection for this study. An analysis of the quantitative and qualitative data help promote understandings in a range of key areas including consent, victim-blaming, help-seeking, gender equality, and social justice. These themes are discussed within the framework of gendered norms, culture and conext. The paper also discusses the role of higher education institutions as sites that could help shape prevention and policy responses in challenging gender-based violence across the globe.

BARNES, TOM* (Australian Catholic University, tom.barnes@acu.edu.au)

Industry and Informality: Assessing Work and Labour Movement Strategies in India's Auto Industry

The automotive industry is a sunrise industry in India—it is relatively high-growth, technologically-sophisticated and plays a central role in Indian governments' manufacturing and economic development strategies. The large historical literature on auto firms and auto workers in the West often assumes the positive socio-economic impact of the industry. Today, some scholars who see the developmental importance of auto production to value capture via Global Value Chains or Global Production Networks equally assume that auto industrialization in the Global South will produce Decent Work outcomes, including an ongoing role for trade unions. But this has not been the case in India. There is now a convincing body of work which shows that global and domestic auto firms have pursued a 'low road' approach to employment relations in India, commonly involving direct manipulation of products and prices in the supply chain, the mass employment of low-wage migrant workers, widespread evasion of protective labour laws and a multi-layered 'contract labour' system. This paper focuses on the trade union response in this challenging environment. It uses a comparison of case studies from industrial sites nearby the major cities of New Delhi, Pune and Chennai. Based upon multiple interviews with workers, union activists, employers and labour contractors, it shows that unions have struggled to cope with this transformation. Perhaps controversially, the paper frames the mass of auto workers as part of the continuum of 'informal work' in India. Unions have tended to focus on the defense of labour-related security rights, although there is some variation in union approaches in different regions which are also addressed in the paper.

BARREIRA, CESAR* (Universidade Federal do Ceará, cbarreira8@uol.com.br)

Cruelty and Diffuse Violence within the Current Brazilian Context

This work aims at contributing to a reflection on the cruelty issue within the current Brazilian context by registering radical felonious practices related to unexplained but evident violations of the victim's body amounting to weird irrational uses of violence. The theme dealt with by other disciplines, such as Arts and Psychoanalysis, where one finds several formulations and reflections, is a challenge to sociological endeavors. Based on *native* usage of the word cruelty, the work assesses the use it is put to by the media, encompassing the common sense and its juridical meaning. Considering diffuse violence, the word cruelty seems to express practices originating in several explaining ordainments within which are inscribed not only individual marks from agents but also the repetition of tragedies or unexpected reactions that make up the structure of human beings. In summary, the article articulates cruelty and diffuse violence by evaluating some symbolic categories that characterize unexpected reactions occurring out of a situation of social acceptance as an upshot of criminal acts.

Keywords: Cruelty, Diffuse Violence, Crime, Violent Deaths, Body

Qualitative Methodology on Research about Childhoodin the Field of Brazilian Physical Education (2010-2014): Research in the School Spaces and Times from the Perspective of Social Sciences

This study aimed to identify the different theoretical and methodological approaches to qualitative research in the early years of elementary school, in the field of Brazilian physical education, as well as map the contribution of social sciences in order to understand the relationship between childhood, culture and society presented in the researches. From a historical review of the constitution of studies of childhood in different disciplines, especially in the twentieth century, it is noted that adults sense children as mini adults in preparation for becoming. Based on the assumptions of the sociology of childhood, which consider the child as a subject social, cultural and historical possessor of rights and not just receiving passive teaching-learning processes, a systematic review was performed in 08 (eight) revised the pedagogical area the field of Brazilian physical education in the last five years (2010-2014). A total of 2513 articles in 08 (eight) magazines from the field of physical education, 172 treat of the childhood theme. Among these, 63 they used qualitative methods, and 27 focus on physical education in the early years of elementary school. The results indicate a predominance of studies related to teaching practices. It was identified more likely to research exploratory and descriptive nature. It is observed that is being consolidated in the researches, a perspective that considers the contextual dimensions, the child as an active subject in a sociocultural context. You can infer the need for research focusing on organization of school knowledge (curriculum) and in teacher training, especially analytical and experimental nature, based on a methodological approach theory in the social sciences.

BARRETT, DAMON* (University of Stockholm, damon.barrett@juridicum.su.se)

Bridging the Global and Personal: International Drug Control Law and Behavioural Compliance

Drug control represents an early example of multilateral efforts to respond to health concerns through international law. Traditionally, international law regulates the conduct of states. But as treaties enter ever more into the realm of complex social phenomena, their effectiveness is determined more by their ability to solve the problems through which they gain their legitimacy. Compliance is no

longer merely that of states, but that of the private individuals whose behaviours are the subject matter of international agreements.

In this paper behavioural compliance as an aim of the UN drug control treaties will be explored as will the 'command and control' approach legally enshrined within them, involving proscriptions on various behaviours buttressed by the criminal law. This approach is tested against four propositions for the prediction of compliance failure using Professor Kent Weaver's comprehensive framework for understanding barriers to behavioural compliance. This incudes sanctions and incentives (deterrence, social opprobrium), monitoring and enforcement problems, willingness to respond (e.g. peer effects and behavioural heuristics), capacity to respond (e.g. autonomy problems), and the social construction of target populations.

Adopting this framework we can see that compliance failure was predictable when the command and control approach within the treaties is assessed against barriers to behaviour change. Negative outcomes in terms of human rights were also predictable. However, as internationally binding law, the drugs conventions operate as a legal 'default' and policy anchor inhibiting change.

The insights gleaned from this approach reinforce charges of systemic human rights problems within the UN drug control system and calls for states to more fully utilise the flexibilities within the treaties, even where this creates tensions with the suppressive aims of the regime. They also suggest the need for a reassessment of the idea of 'compliance' in international drug control law.

BARROMI PERLMAN, EDNA* (Kibbutz College of Education, Technology and Arts, edna.barromi@smkb.ac.il)

Using Photographs of School Buildings in Visual Diaries As a Reflective Tool in Teacher Training

This paper presents a study aimed at exploring the use of photography as a basis for creating a visual reflective diary for students in teacher training programs. The study investigates the advantages in creating visual reflective diaries, based on still photographs of a high school building in Tel Aviv, Israel, during various stages of the students' placement. The study is based on participatory research methodologies, in which the students contribute to the construction of knowledge, by introducing personal narratives to the visual diaries.

The study will focus on analysis of selected photographs taken by the students during the course of the semester, in conjunction with written narratives. The aim of the proposed model is to create an alternative approach for modelling student supervision in their second year of teacher training, allowing freedom of expression that encourages the students to engage with their emotions and inhibitions through an introspective process of visual and verbal articulation. The paper will present and analyze the visual samples of the students and related narratives and will discuss how the implementation of visual diaries in a teacher training process empowers students and enables a successful socialization and acclimatization with their future roles as teachers.

BARRON-PASTOR, JUAN CARLOS* (National Autonomous University of Mexico (UNAM), juancho_barron@yahoo.com)

Critical Sociocybernetics and Mediascapes in North America: Prospective Scenarios

The broad goal of the research is developing the field of "Critical Sociocybernetics". This incipient field intends studying social systems considering power inequalities and seeking the critique and transformation of those systems for so-

ciety's viability (Barron, 2014). It is based on the one hand that social systems can be captured by very exclusive sectors of societies aiming to enhance its power in order to control territories and populations. On the other hand, it is affirmed that social systems perform in complex ways that can be studied using sociocybernetics' tools; but not to describe neither naturalize its functioning, but all the opposite: to exhibit its forms of control and the mechanisms it uses to reproduce its power impairing societies.

Mass-media is an adaptive social system of communication that excludes corporeal presence among interacting actors (Luhmann, 1996). Mass-media perform a fragmented collective imaginary, which is autonomous and parallel to individual and collective imaginaries (Castoriadis, 1998). Hegemonic mass-media system is performing autopoietically for the better of its owners, not of society; hegemonic mass-media is an adaptive system seeking the reproduction and expansion of its power (Barrón, 2014). Mass-media could be arguably considered an anticipatory system. "An anticipatory system is a system containing a predictive model of itself and/or its environment, which allows it to change state at an instant in accord with the model's predictions pertaining to a later instant" (Rosen, 1985: 341). Rosen, and more recently, Poli (2010) have explained that anticipatory systems enable certain controllers that allow them forestalling.

How do the North-American mass-media system perform in manners that allow us to infer those controllers? This paper aims to identify how controllers would work into the mass-media system, and eventually identifying if controllers could be emerging nodes inserted in other systems in North America, and/or within media corporations.

BARROS, MARFISA* (Faculdade de Ciencias Humanas de Pernambuco, marfisa.cysneiros@gmail.com)

Fundamental Social Rights, Access to Justice and the Democratic State of Law in Brazil

The constitutional positive prescription of social rights in the Brazilian Constitution of 1988 have their fundamentality garanteed by its relation to values and goals of human dignity and constitutional democracy. In the transition from authoritarian to constitutional democracy and following a tendency observed in other societies, the Constitucional Assembly has included the demands of groups organized socially and politically into social movements, non-governmental organizations and other forms of participation. The positive prescription of social rights expanded expectations and created new ones inducing to a significant expansion of demands for legal justice by unprivileged groups with the correspondent hope for access to justice. The judicial system became protagonist with an important role to play, and the courts of law responsible for individual and collective rights was expected to be reinforced with the objective goal of dispensing justice. In relation to the State, fundamental social rights implied a relevant goal to it in providing social infrastructure and response to social expectations through effective public policies. Almost three decades have passed from the promulgation of the brazilian constitution and the world has not changed as expected. In relation to the access to justice, in spite of public initiatives oriented to a better functioning of the legal system and the provision of social justice, the results have not been successful due mainly to the complexity of social conflit and the belief on an autonomous normative system oriented exclusively by the rule of law. With respect to the role of the State, legal pluralism make us see more clear how globalization has changed the role of the state in contemporary societies and how conflicts can be solved through a combination of public and private interests.

BARROS MACIEL, TANIA M.FREITAS* (Universidade Federal do Rio de Janeiro, taniabm@gmail.com)

Human and Social Sustainability: Development of Man As ' True ' Development.

The Human and Social Sciences, originally put aside from the discussions relating to the ' environment ', are from the new perspectives of development, intrinsically implied in the issue. If, on one side, it is not possible to think of Development, referring only to the uncontrolled progress, at the same time it does not fit the concept of sustainability any longer only with the purposes of environmental protection. By engaging the culture, social participation, education and health, the concept of Development widens towards the Human and Social Sciences.

To relate the environmental subject to issues such as sustainability shows us a path towards a development based on the use of the natural resources. Within this context, the
psychology and sociology have much to contribute in the methodological and political confrontation when proposing that the development of man is the real development.

The initiatives aiming the discussion of the development processes and the search for alternatives to a model in crisis date back to the second half of the 20th century. It is a social construct, with advances and setbacks. During the decades that separate the United Nations Conference on Environment, held in Stockholm in 1972, and the United Nations Conference on Sustainable Development in 2012,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

in Rio de Janeiro, the issues surrounding the sustainable development have led to important advances. Some concepts influenced the construction of development models that consider the importance of culture, social environment and ethics. The creative and inventive power of man becomes to be placed as a key issue facing the sustainability.

When we talk about new possibilities of development, such as sustainability, the promotion of culture, the local space, the participation of civil society, social relations, ethics, solidarity and the environment, we are talking about new values, new ideas and, why not say, new beliefs.

Urban Community Gardens in Hungary: Part of a Social and Environmental Movement?

Urban gardening is a relatively new phenomena in Hungary. In my analysis I would like to investigate to what extent urban community gardens can be considered to be part of grassroot activism and if and how they are influenced by the global trends of environmental movements. I would demonstrate the multidimensional roles that community gardens can have: they are grassroot, self-help, community-based initiatives through which citizens tend to solve social, economic and environmental problems of communities.

I would argue that unlike the more traditional forms of collective actions like mass demonstrations or street protests which have claims more of a political nature, the small-scale community-based initiatives like urban community gardens target apolitical, every day, smaller scale and sustainability problems. However, based on my research I would argue that gardens are sites of social action and have the capacity to generate social capital, and also to foster local and participative forms of neighbourhood level politics. I would show cases where community gardens act as catalysts of politics at the local level.

Community gardens can contribute to a low-carbon future in many ways. I see their importance less in the responses that they can give to food supply issues, but more in the awareness raising through which they can have an impact on the wider community.

In countries like Hungary where there is a high level of distrust in public institutions and a low level of generalised trust within the society, such bottom-up type projects can provide the citizens with the possibility to enter the public arena and to address the issues of ecological and environmental awareness at the same time.

Social Connectedness Among European Migrants

A common perception regarding immigrants is that they typically experience decreased social connectedness after migration, at least temporarily. Difficulties of language and cultural difference might impede the formation of social ties; at a minimum, making new friends in a new location takes time. This picture, however, emerges mainly from qualitative research investigating a limited range of specific migration streams.

This paper develops a broader analysis of sociability among migrants moving within Europe, using data from the European Social Survey enabling comparison of migrants to stayers in the countries the migrants left. While migrants in some streams do experience lower levels of sociability and higher rates of isolation (compared to rates among stayers in the corresponding origin countries), migrants in other streams experience significantly higher sociability and lower rates of isolation. Analysis of patterns across specific streams suggests that migrants adapt to general practices in the destination countries: when migrants go mainly to countries where rates of sociability are higher, they tend to experience greater sociability themselves -- and vice-versa.

The consequences of migration for sociability, then, are by no means as uniform and unfavourable as previous research might suggest.

Some Reflections on the 'Creativity' Among the Secondary School Students : Case Study of a Kendriya Vidyalaya (School) in Delhi

The secondary education system in India functions through two broad levels; one the Public Sector and the other - Private Sector. Under the Public Sector, the Government schools are established and managed by the State whereas under the Private Sector, the Private Schools are owned and run by non-government groups and organizations. Private Schools can again be grouped into two sub-divi-

sions – those which do not receive any government grants-in-aid and those which receive regular grants-in-aid and are also bound by grants-in-aid code. Kendriya Vidyalayas are government schools in which secondary school students along with routine curriculum learning are also engaged with various sorts of vocational activities known as SUPW i.e. Socially Useful Productive Work (students of Class IX onwards). Such activities include various creative learning engagements such as embroidery, knitting, cooking, painting, pottery, bamboo work, various other craftworks etc. through which students get a forum to show their inside talents and creativities. The idea of learning activities through different craft works or the value of work experience in education system was first discussed in the Kothari Commission (1964-66). Such activities which are based on Gandhian educational values also help in developing individual skills among the children. At the same time children also get to learn how to work in a team and engage in community activities with a practical outlook. With the emphasis of National Policy on Education, 1986 on the promotion of creativity among school children, SUPW activities have got a new momentum. In this context my paper will reflect on some of the creative learning experiences of the students of a Kendriya Vidyalaya (school) in Delhi within the 'learning by doing' framework. The paper will also emphasize on teachers' approach to involve students in these works from the lens of the school teachers of the mentioned school.

Changing Roles of Fathers in Turkey: Example of (Pro)Feminist Fatherhood

This study aims to reveal how (pro)feminist fathers construct their fatherhood in familial relations during the process of construction of their masculinity. It also tries to find out the impact of the roles of these fathers on socialization process of their children about gender equality. In Turkey, it is possible to talk about changing roles of fathers in comparison to traditional roles mainly represented by patricentric family structures after 1980s, especially with the impact of growing feminist movement. However, it is still argued that some traditional roles have a continuing effect on men's construction of their identity and in their family relations. In this sense, (pro)feminist fathers who support gender equality and women's movement, and who participate in child rearing process become crucial role models for "new fatherhood" in Turkey.

We have interviewed 20 fathers who live in different regions of Turkey. Some of these fathers identify themselves as (pro)feminist and others are supporters of the women's movement and a part of child rearing but they don't prefer using the word "(pro)feminist" because of political concerns. We will discuss three main points in the light of in-debt interviews: (1) What is the role of being (pro)feminist or supporter of gender equality on masculinity construction, (2) how these men construct their roles of fatherhood in familial relations, and (3) how they play a role on their children's behaviours. With this way, "being a (pro)feminist man" and "new fatherhood" will be discussed in the context of Turkey.

The Attitudes and Orientations Towards Sociological Practice in Sociology Faculty Members and Graduate Students in Turkey

The aims of this study are mainly 1) to investigate the approaches of faculty members and graduate students in the departments of Sociology in Turkey to practical works in the field of Sociology; and 2) to promote and to contribute to increase the recognition and acceptance of Sociological Practice (s.p.) in academic community.

This paper is based on an ongoing exploratory research accompanied by a type of intervention using semi-controlled interference involvement, planned to be wholly completed as of May 2016, on attitudes and orientations (a.&o.s) common in the academic community in Turkey, which have presumably impact upon the academic and professional advancement of (s.p.). The required data will have been collected in qualitative approach, through focus groups and depth interviews, in order to explore the (a.&o.s) taken into account. In the first step of qualitative study, it has been generated a set of topics, to be used 1) as a guideline in focus groups and semi-structured form to be used in depth interviews, regarded with the areas of (s.p.), in order to identify the components of these (a.&o.s) and 2) to intervene into agenda of senior and junior academics towards improving the awareness and the acceptance of (s.p.), by putting in circulation and encouraging to discuss on the topics in (s.p).

The (a.&o.s) gained by academic praxis related with the (s.p.) will have been questioned in the focus groups in which graduate students and research assistants have been included. Depth interviews will have been conducted with the academics, working in especially the applied sociology main branch.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The most important finding of the study is to be expected that a somewhat negative, discontented, and/or even cynical (a.&o.s) showed by academics towards diagnosis and intervention, as the significant components of (s.p.) is the main obstacle to the advancement of (s.p.).

The Environment in Question: A Arena Analysis of Public Debates in Marica / RJ - Project Port of Jaconé

The port project in Marica, far from being a consensual development project, makes the city of Marica, an important platform of environmental, political and ideological struggles in the state of Rio de Janeiro, Brazil, constituting an arena of public debate, mobilizing various actors (among which stand out, environmentalists, residents and friends of Marica, entrepreneurs, agents and state politicians, fishermen etc.) around the environmental issue. This research on the Port in Marica construction project was carried out during the period 2013-2014. The port project presented, as a proposal for progress and development of Marica region, jobs for local people, and this made secondary the prospect of Jaconé Beach destruction, even though a fish and whales nursery. However, the project brought up debates about social and environmental issues, supported by the performance of the environmental movement SOS *Jaconé Porto Não* and also the public prosecutor, which is a partner in this process of struggle in Marica against the construction of the Port of Jaconé. We investigate the relationship established between the municipalities and the industrial exploration projects related to the logistics of Petrochemical Complex in Rio de Janeiro, COMPERJ, where the port is located, seeking examples of other Brazilian cities that have gone through similar processes. From the environmental sociology of Hannigan (1997) and Mario Fuks approach (2001), we follow the shaping of public arenas debates and the construction of the environmental problem. We use qualitative research, speeches analysis, strategies, interests, and mobilized intentions of various social actors in the construction of arguments and processing of relevant topics in the debates arenas, and in the construction process of the environmental problem.

Under the "Cloak of Invisibility": Gender Bias in the Classroom in Chile

This paper presents findings from videotapes of teacher-pupil interaction and its implications for gender equality in education. We coded 190 videotapes of Chilean fourth graders recorded for non-gender purposes and found a ubiquitous (although not uniform) bias in teachers' actions that always resulted in less attention to – and quantified time spent on – girl students. We call this "under the cloak of invisibility" because the fact that all subgroups of teachers short-changed girls was not detectable by the research team: four coders operating in three countries on three continents, as well as the principal investigator, were surprised when the quantitative results showed us that on every conceptual variable we coded, girls received less attention from teachers than boys. Furthermore, on time spent, recorded in seconds, minutes and hours, the results showed mostly the same or higher levels of de facto teacher bias – in the form of under-attention to girls – than the conceptual variables. Many studies have documented specific areas of under-attention to girls but we found it across the board. We will discuss the policy implications of these findings and possible pathways to overcome these challenges.

Identifying Human Resources in an Immigrant Community: The Role of Natural Helpers in the Implementation of a Community Based Intervention

The role that "natural helpers" play as links that bring neighborhood residents and researchers together in implementing an effective community intervention is explored. Natural helpers are distinguished from "promotoras" (lay health workers) in that the former emerged naturally as group leaders in the research study; while the latter are selected and trained to support a study or a specific community wide effort. Data are drawn from an obesity and diabetes prevention intervention conducted with 1056 Mexican American participants at 16 different community sites. Most (75%) were foreign born, migrating to the US at different points of their life course. Qualitative data gathered through ethnographic observations and interviews are presented on the influence of 11 natural helpers who emerged as site leaders while participating in a community based intervention study, known as Beyond Sabor. Findings from two data collection points are employed in the analysis. The first draws from ethnographic observations gathered at each site for twelve consecutive weeks. The second draws on open –ended interviews. Seven women and four men shared their experiences on intervention results and changes in their and family lifestyles; they also discussed their twelve month effort at disseminating their learning experiences with neighborhood residents. Ethnographic and interview narrative data were transcribed and analyzed. Important themes emerged resulting from a personal sense of moral obligation and community responsibility, their personal and social construction of health, network inclusion and their willingness to engage in capacity building efforts. Findings are compared against quantitative results for each of the natural helpers' sites indicating their mediating "protective" effect against attrition and increasing program success. Recommendations are made on how to identify and encourage natural helpers' contribution to community based research and the role that social capital plays when intervention staff bridge these disadvantaged communities with larger social organizations.

A Study on Transgender Persons and Their Family Reactions

On 24th January 2015, the upper house of Indian Parliament passed The Rights of Transgender Persons Bill, 2014. It contains provisions to prohibit discrimination in education, employment and prevent abuse, violence and exploitation of transgender persons. It is very surprising to the transgender activists that 55,000 transgender are identified as age group of 0-6yrs by the census. Parents did not hesitate to declare their children as transgender. In this context, the present study wants to know the parental reaction to their transgender young and their choice of making family.

In-depth interviews were taken from 1) the transgender young and 2) their parents. The present researchers reached those youth and their families through NGOs. Interviews focused on family history, sexual orientation and gender identity, religious belief, family response and reaction, adaptation or rejection, experiences from relatives, neighbourhood and school, victimization, stress and coping, sources of support, future aspiration, and choice of partner. The research was done in Kolkata, a metropolitan area. Respondents varied from lower economic class to middle class. Their education level varies from illiterate to post-graduation. Family reactions also widely varied regarding their sexual orientation. In some cases these reactions also affect the transgender persons' mental health. A very few cases , transgender persons got family support in making choice of their own partner.

Data are analysed through SPSS. It is observed that family's responses towards their transgender young are related with the income and education.

BASU, CHANDNI* (Albert-Ludwigs University of Freiburg, chandni.basu@jupiter.uni-freiburg.de)

Deviance in Childhood: Inbetween Structure and Agency

Sociological debate on structure-agency within the discourse of childhood recognises the inter-subjective zone of social structures and individual agency in which childhood remain embedded. It foregrounds children's agential capacity

thus forwarding their political recognition as equal partners in society. Such recognition however does not limit the scope of intersectional discrimination and its impact on the structure-agency formulation in childhood.

Incidents of deviance like reported cases of criminal offence involving children and adolescents (young people) as perpetrators within the juvenile justice system in India brings forth intersectional discrimination of young people at multiple levels. On one hand, increased reporting of incidents from peripheral locations of society perpetuates the projection of young people from such locations as deviants. Deviance is then associated as a class, caste, religion, gender specific phenomenon. In other words, intersectional discrimination results in increased criminalisation of young people from peripheral locations of society. On the other hand, an attempt to locate constructions of deviance within a postcolonial framework, as in the Indian context, urges one to interrogate functioning of the juvenile justice system. The recent set up of this legal infrastructure in India under the influence of contemporary international mandates brings forth neo-colonial aspirations of a global governance regime.

This paper aims to establish intersectional discrimination of young people as a determining factor which influences constructions of deviance along with their projection as perpetrators within the Indian juvenile justice system. A postcolonial lens helps to interrogate constructions of deviance as a colonial endeavour in its linkage with notions and practices of modern childhood. In this, the paper attempts to provide a critique of modern childhood based on the epitome of innocence. A suggestion for accommodation of deviance within the boundaries of childhood is laid forth thus forwarding an epistemological reformulation of childhood.

Growing-up in the Global South: Theorizing Education-Employment Nexus, Youth Scholarship, and Methodologies in the Philippines

This paper theorizes a specific significant dimension of growing-up process in contemporary world, the "education-employment nexus" in the context of the life histories of disadvantaged cohort of Filipinos born in the 1970s locally known in the country as "istambays". It challenges the prevailing view of seeing istambays as merely unemployed-disconnected individuals by demonstrating how this phenomenon is shaped and negotiated during their growing-up years, specifically observable during schooling and first years of employment. Using household and life history data from four research sites, carefully designed and modified to best capture local contexts, istambay thesis offers alternative-localized views on the relations between youthhood and structured forms of marginalizations, and how this understanding may have significant implications on introducing new dimensions in the current education and labor policies and practices in the Philippines. In essence, the paper demonstrates how istambay phenomenon contributes to theorizing Global South phenomenon using youth scholarship and methodologies that are localized, creative, and sociologically-sound.

Dynamic and Regulated: About the Permeability of University Boundaries Via the Governance of Studying and Teaching

The governance of studying and teaching in public universities in Germany has changed from a kind of static system using teaching framework regulations to a more dynamic system of external quality assurance. This development is part of what Power (1997) calls "the audit society". With the introduction of an accreditation scheme new actors (e.g. council and agencies) as well as new processes (e.g. accreditation of study programs) were established for the governance of studying and teaching in universities. In addition to the federal states and university representatives stakeholder participation has been formalized in consultation and decision making throughout the accreditation system. For instance, the federal states have a majority of votes in the accreditation council; with university representatives being the second in command. Representatives from the world of work and student representatives fill up the remaining seats. The groups mentioned above are also represented in review groups of accreditation processes, w representatives of the professoriate are the majority with three out of five members.

In the presentation we want to argue, that the dynamics of processes, the involvement of new actors and now formalized integration of stakeholders in quality assurance and the governance of studying and teaching make boundaries of universities as organizations more permeable. However the relatively detailed accreditation regulations and processes settle this permeability of borders in different ways. As a result, the effects of the participation of representatives of the world of work and students are limited. Conversely, the grip of the professoriate on the governance of teaching has increased.

The theoretical basis is a combination of Luhmann's theory of procedures (1983) and neo-institutional research highlighting the legitimation function. Empirical data was generated in a research project (duration 2014-2017) by document analysis, interviews with stakeholders and representatives of accreditation agencies, a survey among reviewers, and participant observation.

BAUMELER, CARMEN* (Swiss Federal Institute for Vocational Education and Training, carmen.baumeler@ehb-schweiz.ch)

The Translation of Swiss Vocational Education and Training into Other Cultural Contexts

Currently, we are witnessing international interest in vocational education and training (VET). This is due to the fact that in the present global economic downturn, countries with well-developed VET systems face much lower youth unemployment rates. Worldwide, around one in eight young people between the ages of 15 and 24 is unemployed. While the importance of prioritizing job creation is acknowledged, the opinion is also that many young people lack the right skills for the labor market. Therefore, adequate skills are demanded, and policymakers currently seek to borrow concepts from countries that successfully integrate young people in their labor markets. These countries include Switzerland (with an average youth unemployment rate in 1999–2008 of 6.9%), Austria (7.5%), Denmark (8.2%), and Germany (10.9%) (ILO, 2012: 5). They are characterized by a high proportion of young people following the vocational education track and, furthermore, have implemented dual VET systems (i.e. combining classroom instruction with work-based training) and the pursuit of competence-based education.

Within this context, this paper considers whether competence-based education, as defined from a western European perspective, is transferable from one cultural context to another. First of all, the paper introduces the topic of international policy borrowing and lending in the field of education (Steiner-Khamsi & Waldow, 2012). Afterwards, the concept of competence-based education is defined as a new educational paradigm (Wesselink, Biemans, Mulder, & van den Elsen, 2007) and situated within its cultural context. Next, the paper introduces the case study of an educational transfer from Switzerland to India a country actively engaged in reforming its VET system (Singh, 2012). Detailed insight into actual experiences will be given on the basis of two interviews with the main actors. The conclusion discusses the cultural context sensitivity of competence-based VET.

Learning from the Past: Urban Ways to Reduce the Daily Complexity in Economic Practices

We like to present findings from a comparative study carried out on the hairdressing market in four cities – two in Germany (Dortmund and Frankfurt) and two in Great Britain (Birmingham and Glasgow) – mixing ethnographical research with historical case studies and a mixed-mode survey.

Focussing on economic practices we studied how hairdresser manage their hairdressing salon successfully in different cities. Many aspects has to be considered on a daily basis such as the ranges of products and offers, opening hours and work schedules, interior decoration, training contents and needs, advertising and so on to achieve this goal however, it is not possible for one to continuously reflect on these aspects every minute of the working day. Thus, we found evidence that the practical knowledge of the place enables entrepreneurs and staff members to overcome this dilemma while utilizing their knowledge of approved routines and practices.

Adopting the idea of the Intrinsic Logic of Cities that tells us that cities cultivate their own specific constellations of knowledge and expression shown in their practices that make them distinguishable we construct the space of local economy as a figuration that is developed processual and depending on the hidden structures enscripted in the place over time. Comparable with an imprint one can track the conditions that pre-structure the figuration from a historical perspective. In particular the comparative study on the economic development of the city persuaded us that the specific way how complexity in economic practices is reduced builds on the cumulative texture which evolve over time and can not be ignored when discussing the present or future.

Socio-Labor Precarization in Russia: National and Subnational Features

Socio-labor precarization is one of the modern phenomena expanding all over the world and cause much alarm among state officials in many countries. The experts warn that the spread of the socio-labor precarization brings systemic risks not only for socio-labor sphere but for the whole society as well. It has disastrous consequences for fundamental social institutes (family, education, public law, etc.), dehumanizing and destabilizing effect.

Nowadays, the aggravation of the problem of unstable and insecure employment in the world pushed a new wave of investigations provided by ILO and international teams (SUPI, ESOPE Projet etc.).

The specific feature of precarization processes in Russia is that it is mostly determined by inner factors. Among the most significant of them are: liberalization of the economy (and almost complete denial of labor standards in 1990s); uneven regional development and high level of labor market differentiation by territorial, sectorial, professional, demographic and other specific features.

The authors examine challenges of socio-labor precarization and insecure employment diffusion in one of the regions of the Russian Federation - in the Republic of Bashkortostan. On the bases of sociological and statistical data the authors provide analysis of prerequisites, symptoms and aftereffects of insecure employment extension in Bashkortostan; identifies national and regional peculiarities of socio-labor precarization and suggest instruments for measuring and monitoring it.

Back to the Land Ethic? Sustainable Food Futures in the Age of Austerity: Perspectives from a British Case Study

This paper draws upon empirical research undertaken with 'alternative' and 'local' food networks in Lancashire, England, in aiming to explore the discourses and practices employed by lay actors in constituting their moral relation to food in the context of economic austerity. Since its onset in Europe, it has become clear that austerity ought not to be merely understood as a neutral backdrop to sociality but must instead be interpreted as an active political programme reconfiguring subjectivity and lived experiences in diverse ways. Indeed, food occupies an unusual position in the social sciences: in one sense, it is one of the few anthropologically universalisable aspects of life in that everyone requires nutrition in order to live. In another sense, it is a hugely volatile category and understandings around food vary drastically over the course of history. As such, it remains an important device in thinking through the ways in which social, political and economic orderings and regimes intersect the moral questions and implications that are complexly interwoven into our affective experiences of food. Drawing particularly on perspectives from Marxian political ecology and my own empirical research, I argue that austerity has served to create new ways of thinking about the moral dimensions of food in the creation of divergent futures. As such, food has become awkwardly balanced both as a tool that serves to explicate people's moral responsibility and generosity to (tangible and intangible) Others but also a field in which discourses of asceticism, thrift and self-sufficiency are drawn upon and privileged at a cultural level in the creation of better, seemingly more sustainable, food futures. I conclude this paper by discussing these ambivalences around food with relation to wider identifiable shifts in global agro-food systems.

BEAMAN, JEAN* (Purdue University, beamanj@purdue.edu)

France's Racial Project: Banlieues, Social Exclusion, and the North African Second- Generation

Based on ethnographic research in a Parisian banlieue, including interviews with the North African second-generation, I address how France has been involved in a "racial project," per Omi and Winant's (1994) formulation. In this racial project, residential location is often code for racial and ethnic origin, as race and ethnicity are not legitimate as a basis for identity. In other words, the marginalization individuals face as banlieue residents is circumscribed by their racial and ethnic status. By centering France's colonial history and post-colonial legacy in understanding contemporary experiences of minorities, I also address how living in the banlieues, with its associated stigma and negative imagery, particularly following the 2005 uprisings throughout France, shapes the identities of its residents. How banlieue residents relate to where they live is also instructive for thinking about how they make sense of their social location and marginalization from mainstream society.

Rolando García's Complex Systems Theory and Its Relevance to Sociocybernetics

Complex Systems Theory by the Argentine-Mexican physicist and epistemologist Rolando García provides a comprehensive framework to approach complex issues or complex problems requiring an interdisciplinary approach. In this work its theoretical framework, proposal for methodology and constructivist epistemology are summarized and evaluated in accordance to their relevance for sociocybernetic. In our opinion, García's proposal not only shares core principles of sociocybernetics but also make several contributions to its major challenges: a dialectical analysis of the interdisciplinary praxis based on differentiations and integrations and supported by a strong reflexivity on research questions, observables and system variables; a discussion of how central the researchers' political viewpoint is to framing the questions-guidelines and constructing the system; making observables and inferences explicit along with outlining the empirical complex.

BECKER, JOHANNES* (University of Göttingen, johannes.becker@sowi.uni-goettingen.de)

Outsiders' Silence about Their Past in the City

In this presentation, I analyze how narrations about life and family history are subdued in self-presentations of outsiders who are not considered as authoritative representatives of their place. Argumentations of social closeness or individual constructions of belonging to the city might instead serve to reassert spatial belonging.

Palestinians in the Old City of Jerusalem often talked little about their families' past and their personal history during the biographical-narrative interviews I conducted there. Instead of, they focused on current circumstances and hardships. This is connected to the history of a majority of Old City inhabitants who are descendants of poor migrants who moved there from the countryside. They are devalued in an inner-Palestinian discourse as criminal and socially conservative. This outsider positioning in contrast to 'authentic' Jerusalemite families prevents them from the right to produce an authoritative text as 'Jerusalemites'. In their self-presentations, 'not telling' about their past in Jerusalem mirrors the lacking acknowledgment of their history and memory.

But at the same time, they perceive the expectation to safeguard the holy places and the Palestinian character of the Old City in the face of Israeli occupation policies which seek to increase control over this place (e.g. through support for the settler enterprise and the legal and infrastructural discrimination of the Palestinian population). Thus, their task of reaffirming the national character of this place remains unconnected to a historical outlook which, for many, increases fears of the being discovered as 'non-authentic' citizens and of being driven out.

The lacking presentation of biographical memories in and attachment to the city is in the self-presentations often overwritten by the presentation of a functioning social (neighborhood/urban) community or, on a more individual level, by paralleling one's own fate with the fate of the contested city of Jerusalem.

BECKER, SUSANNE* (Ludwig-Maximilians-University Munich, beckers@mmg.mpg.de)

How to Incooperate the Category Language into Sociological Analysis of Social Inequalities

In my presentation, I will discuss the importance of language(s) in the production of social inequalities. Therefore, I will argue that the sociological studies of inequalities need to consider language as an important category. I will argue this based on the empirical finding of my Ph.D. project that was concerned with the links between social inequalities and language(s). I will argue that the classification of the linguistic other is an important factor in generating and legitimizing economic inequalities in society. Keeping in mind that citizenship and the entitlement to corresponding rights are one major catalyst of global inequalities in a globalised world in combination with the increase of ensuring citizen rights through language testing, language needs to be more central to the sociological analysis of global inequalities. In my presentation, I will also present some ideas how these sociological analysis can be enriched by linguistic methods of researching language in society. In general I will argue for a more interdisciplinary approach to researching language and society and discuss what sociology can learn from

The Construction of the Linguistic Other – Constructing the Other By Classifying Language(s)

In my presentation, I will discuss empirical findings from my Ph.D. project, which deals with the links between language(s) and social inequalities. One major factor in the production of social inequalities is the process of classifying and othering along the line of language(s). I am therefore not only interested in language as a medium of othering but also in how the category language is important as a category of classification. My empirical findings show different processes of othering along the line of language(s). Firstly, there is a construction of the internal other, which is present on a territory that is constructed as "ours". Here European immigration and integration politics as well as European language testing regimes functioning as restriction for immigration and naturalization are a major factor within these processes. Here there are links made between the categories of nation, ethnicity and language.

On the other hand there is a construction of the external other, which is discursively located somewhere else. Here categories like an Indian or an African language play a major role within these constructions of the other. In addition, discourses about colonial languages are part of these othering-processes. I will discuss this construction of the linguistic other on the basis of my empirical data which was conducted in a ethnographic research in two wards in the City of Munich, Germany. Theoretically my argument is informed by the concept of (neo-)linguicism, which is understood as a form of linguist racism and argues that language(s) become an import factor in othering-processes to legitimizing exclusion and discrimination.

The Legitimacy of Euthanasia in Europe: Socio Cultural Heritage, Law and Religion As Boundaries of Personal Autonomy in a Multilevel Analysis

In this contribution we analyze the attitudes on the legitimacy of euthanasia (described as "terminating the life of the incurably sick") as an example of end-of-life issues and assisted dying. We use data from the most recent European Values Study 2008/09. We present results from hierarchical linear random intercept only models (REML estimation) using data from the European Values Study 2008. Within and between country differences (N'=25) will be discussed from a modernization and secularization perspective with a particular and innovative focus on the simultaneous effects of religious and value orientations on both levels of analysis and a focus on both normative and structural determinants extending the analyses of Cohen et al. (2006) and Verbakel and Jaspers (2010).

On the individual level, religious orientations (measured by Siegers' latent classes; 2012) and self-determination values show substantial but converse effects in the expected directions even when controlling for religious denominations. As compared to atheists (as well as to people with a holistic individualized belief) Muslim believers are most critical of euthanasia; all other Christian denominations also show negative effects. The acceptance of euthanasia is also reduced by higher subjective health, more confidence in the health system and for older respondents.

On the country level, we control for context effects of both postmaterialist value orientations (positive effect) and religious climate (low average church attendance and Protestant countries being most liberal). Furthermore, health systems and patient rights are controlled (no significant effects). Finally, the legal situation concerning end-of-life treatments is strongly reflected in people's attitudes; and in an extended model (N''=44) the former Communist heritage has a large negative effect even when controlling for all other variables. Overall, institutional and normative criteria are the boundaries of preferences for personal autonomy at the end of life.

ZAIDMAN, ANNA MARIA (Université du Québec à Montréal)

Moving from One Professional System to a (seemingly) Similar One: Surprising Challenges and Issues of Policy and Governance

Health professions currently appear to be under more scrutiny, especially regarding their interactions with management, other professionals as well as their governance. Among all discussions about global mobility, few analysis look at national variations in these domains, and their repercussions on contexts of entry into professional practice as a foreign-trained professional. This presentation will use data collected among French health professionals in Quebec, as well as professional orders and other institutional actors of the professional system, in a research project conducted from 2013 to 2015. Health professions included are doctors, nurses and pharmacists. Our research looked at how French professionals entered professional practice in Quebec, identifying factors facilitating or hindering their entry in the professional system. French health professionals have used mutual recognition agreements (MRAs) since 2010. Since 2014, use of these MRAs has generated sufficient data to allow for analysis and conclusions. We will use further data from an ongoing research on professional orders' strategies to implement public protection while facilitating admission of these foreign-trained professionals. Our main objective will be to describe how (and if) actors of the professional system, and their institutions, learn in this process. For instance, although analysis has suggested some adaptations that would ease their entry, issues of equity with local-trained professionals can limit the feasibility of such innovations. Elsewhere, problems of coordination and budgeting result in shortage for compulsory training measures. Among future trends, taking into account the role of political impetus and comprehensive inclusion of all main actors appear as the main lessons to be drawn from the experience of these MRAs. Finally, this overview illustrates the importance of considering specific contexts characterizing entry to a professional field as a foreign-trained professional, taking into account the professional systems of origin and destination.

RC52-598.4

BEDARD, JEAN-LUC* (TÉLUQ - Université du Québec, jbedard@teluq.ca)

Mutual Recognition Agreements for Foreign-Trained Professionals. Lessons and Challenges for Regulation from the France-Quebec Experience.

Differences between regulatory professional systems are increasingly examined, notably through implementation of mutual recognition agreements (MRAs). MRAs between France and Quebec illustrate many challenges facing global professional mobility. The differences between professional practice contexts need to be carefully described and understood not only by regulatory bodies, but other actors intervening in the professional systems. Quebec's professional system as a whole has evolved a lot since its elaboration in the 1970s. There is a trend, attested elsewhere (Freidson, 2005; Champy, 2012; Evetts, 2011) towards more control of professional regulating bodies. This movement can be described as a shift from autonomy to hybrid regulation (Noordegraaf, 2007), presenting opportunities and challenges for professionalism (Evetts, 2011), resulting from external and internal pressures. In the case of MRAs designed to facilitate professional mobility between France and Quebec, analysis of their evolution shows the importance of political actors' (governments) input on conception, implementation and adjustments following the first cohorts. Furthermore, institutional actors (regulating bodies, professional associations, etc.) came to play a progressively important role, only after the conception phase. This presentation will focus on 3 contrasted examples: lawyers, nurses and pharmacists. Analysis covers an evolution occurring between 2008 and 2015, from conception and negotiation to actual agreement between governments and regulating bodies, implementation and adjustments following empirical experiences of entry into professional practice in Quebec. Analysis also includes comparison of economic climate and job markets between France and Quebec during this period, and characteristics of niches invested by French professionals in their new country's job market. An overview of perception by actors of the professional system complements the analysis and allows for a comprehensive overview of main issues and lessons that can be drawn from this ongoing experiment.

Characterization of Development Models and Its Impact on Policy Implementation

The Global Models to explain human development on the planet have been conceived to be important and useful. They are the result of simulation methodologies and paradigms for viewing the world in their macro dynamics, considering a large number of possible causes of the problems that arise, and that, based on historical data, shows how the world will behave in a determined future in different possible scenarios. They were born due to the global concern about the impact human actions have on the environment, for the unsustainability of population and economic growth and for the disappointing results of recurrently approved government's programs to combat those problems. The aim of the global

models is to provide the necessary tools to formulate alternative answers for humanity steer toward the best-case scenario. They have made many, but others need to be developed that serve to analyze specific contexts such as South America or Colombia. This work takes stock of a representative set of global models of the past sixty years to characterize and identify the paradigms and assumptions that support them, their structures, results and, particularly, components that may be useful for future design and construction of a system dynamics model to study the performance of the implementation of development policies.

The International Baccalaureate Career Programme (IBCP). Young Peoples' Career-Decision Making within This New Approach to Combine Academic and Vocational Education.

A new qualification called International Baccalaureate Career Programme (IBCP) was launched recently to overcome the divide between academic and vocational education. IBCP students are expected to study up to four IB Diploma courses together with a careers-related study.

The paper draws on both quantitative and qualitative date to evaluate the impact of the new qualification to the careers-decision making and future pathways of students. It is important to bear in mind that many factors influence the long-term process of careers-decision making. During the course of their IBCP, they could acquire cognitive (knowledge) as well as functional (skills) and social (behaviour) competencies

To a certain degree, all students engaged with the vocational content to identify own potential occupational pathways. However, the role of the IBCP differed across the students. Some who had already been clear about their career paths before embarking on the IBCP were able to select academic and vocational courses according to their occupational interests. They managed to gain specific vocational skills together with functional and cognitive competencies that could benefit them in their further vocational training or study. Others used the career-related study to test equivocal vocational ideas and, after graduating with the IBCP, either pursued these ideas in their further academic or vocational studies or modified their occupational ideas. Depending on them continuing their occupational paths, they are able to use the specific vocational skills and cognitive competencies they gained during the programme. Those who altered their vocational ideas used the IBCP as a test bed and had still acquired functional and cognitive competencies.

As a result, the personal approach to careers-decision making impacts the kinds of skills students acquired during their IBCP. However, whilst some did not gain specific vocational skills for their chosen occupational path, they could benefit from functional and cognitive competencies.

Hybrid Cultural Consumption of Young Brazilians: Mechanisms of Cosmopolitan Encounters within Digital Media

This article will present some of the guiding concepts and the empirical data that we have been using to problematize the hybrid cultural consumption, focused on digital media, as mechanisms to contexts of cosmopolitanism. This discussion is part of the research project "Youth cosmopolitanisms. Brazil project", linked to the international project "Young People´s Cultural Cosmopolitanism". The emphasized proposal is anchored on a reflective base over (1) the cultural consumption and its relationship in contemporary society with entertainment ; (2) cyber culture as means of the mass self communication and ubiquity. The analysis of empirical data is developed through a triangulation of qualitative and quantitative data from our research correlated to the "Brazilian digital youth" study of IBOPE (2012) and "Connected Youth" survey from Telefónica/USP Foundation (2014). As mechanisms of cosmopolitan encounters, the hybrid cultural consumption of young Brazilians can be analyzed both by its connection to different cultures and the possibilities of belonging and mobility, even if only technological/virtual and not necessarily physical; and by its exposure to a ubiquitous reality, where communication and encounters may have different logics than those of the mass entertainment industry. These mechanisms can be a response to the urge to belong, coexist, co-create and feel part of something bigger, but they can also reproduce models of distinction, meaning that the digital divide also maintains certain logics of the cultural and social contexts where these individuals live. Through our data analysis, we find that the hybridization of cultural consumption for these young people is focused on the hybrid reality of cyberspace and of cyber culture, but does not necessarily provide encounters that form a 'glocal' culture, or what we call an aesthetic and amateur perspective of cosmopolitanism.

BELEK ERSEN, UMUT* (Independent researcher, umutbelek@hotmail.com)

Gender Perceptions of Women from Different Social Categories

The subject of the presentation is to examine the attitude and behaviour of two different categories of women in Turkey regarding womanhood roles, and to identify the similarities and differences. The purpose is to analyse to what degree the women with certain qualities –education, financial independence, career etc. – necessity for achieving equality of which has been argued and emphasized in the literature, differ from the women who do not have such qualities in realising equality and breaking the gender-based labour division. In order to compare the perception of these two categories of women, face-to-face semistructured interviews were held with 26 women of middle-upper socio-cultural structure having at least a university degree, prestigious positions in work career on one hand, and 26 women of lower socio-cultural structure, at most high-school graduate, employed in lower levels of hierarchy, on the other. Gender structure and gender perceptions which is dealt in this study is formed according to the ideological views of L. Althusser, is legitimised by the concept of "Masculine Domination" by P. Bourdieu, and is regularized by "Hegemonic Masculinity" by R. W.Connell. This three dimensional structure is followed in conducting the interviews and evaluation of the findings. The outcome of these interviews is that the underlying structure basically remains the same although there are divergences between two women categories. This underlying structure is traditional gender-based definitions of man and woman and labour division thereof. It is believed that this underlying structure can be rebuilt by women through questioning this structure and finding answers to these questions by themselves. Even though solutions such as education and employment in order to manage the superstructure is just as important, it is considered that making small changes in daily lives of women and reshaping their perceptions are the crucial elements to overcome masculine domination.

Digital Media and Youth Mental Health: "It Just Takes over Everything"

Emerging technologies have the potential to support mental health promotion, illness prevention, and mental health treatment for youth; however, they also introduce new dimensions into young lives that may present challenges for youth mental health. As young lives continue to be marked by increased use of technologies and youth-focused e-mental health initiatives are developed, it is imperative that the intersections of technology and mental health in young lives are better understood. In this presentation, we will present findings of research study that richly describe the impact of technology on young lives, particularly with respect to youth mental health.

Research was conducted with Aboriginal, immigrant, rural, and 'in risk' youth (16-20 years of age) in Canada, Scotland, and Australia to examine the impact of technology on young lives. Innovative qualitative methods including in-depth interviews, dyadic interviewing of participants and their 'digital shadows,' and social media data capture were used to create digital profiles of participants. Thematic analysis was conducted to identify data specifically relevant to mental health.

Speaking with young people about their experiences with digital media reveals both anticipated and unexpected connections between technology use and mental health. Young people are struggling to balance their 'real' and 'virtual' selves/lives, to manage the pressures of constant connectedness, and to master new forms of interpersonal communication. Increased clarity about the contradictions youth themselves experience will enhance program and policy development in media and mental health literacies, as well as interventions addressing mental health promotion, mental illness prevention/treatment, and stigma.

Patient Journeys in Youth Mental Health: Arts-Based Methods for Exploring Youth, Parent, and Service Provider Perspectives

We know much about the alarming trends in youth mental health in Canada; however, we know far less about the paths youth take toward better mental health. In this presentation, we will discuss a methodological approach to youth mental health research that emphasizes the journeys and voices of youth in an effort to better understand their stories and experiences.

Atlantic Canada Children's Effective Service Strategies in Mental Health (AC-CESS-MH) is a 5-year research study, funded by the Canadian Institutes of Health Research. It aims to deepen understanding of child/youth mental health in Atlantic Canada (a region made up of the four most eastern Canadian provinces). The project employs the newest knowledge on youth journeys and arts-based methods and melds it with analysis of statistical data. In this presentation, we will describe our qualitative patient journeys approach to research with children and youth experiencing mental health challenges, parents, and service providers (sample of 240 individuals). Grounded in critical ethnography and Complex Cultural Nesting theory, we incorporate visual mapping and photo-elicitation into in-depth interviews as a way to further engage participants and give emphasis to their often long and complex stories of struggle.

We will present early learnings from this longitudinal study and discuss how arts-based methods such as patient journeys can engage young people and families in a conversation to inform youth mental health research, policy, and action. It is now recognized that people with firsthand knowledge and experience have the most insight into the ways services and supports can be improved to foster recovery. Patient journeys and arts-based research methods are important tools for improving understanding of youth mental health from the perspectives of those most affected.

Different Routes out, Different Routes in: Practicing Health after Arriving in the US

Most studies of the global distribution of physicians and nurses focus on members of the health professions from middle- and low-income countries (as defined by the World Bank) who are recruited by high income countries. The present study explores the resources for and experiences of internationally educated refugee physicians and nurses in the United States. It asks, first, what happens when internationally educated health professionals seek employment after arriving in the United States as refugees and asylum seekers? It draws upon the examples of two states: Maine (pop 1.33 million) and Pennsylvania (pop 12.79 million). What governmental and nongovernmental programs of assistance are provided to internationally educated health professionals? What is the reskilling process for them? What pathways can they take and (how) can they work? Second, how do refugee regimes intersect with national regulations for health professionals? The paper situates the experiences of individual health professionals in the context of national and international refugee policies. Finally, it considers the relationship of refugee health professionals to internationally educated nurses and physicians that are recruited by the United States. According to Frenk et al (2010), the health professions workforce is distributed unequally and this distribution exacerbates global health inequality. How does the global flow of refugee physicians and nurses affect global health inequality?

DI PAOLANTONIO, MARIO (York University, Toronto)

Re-Emerging Pasts: Forums for Telling in Contemporary Argentina and Chile

This paper arises from on-going research, funded by the UK's ESRC, into the aftermath of the State violence that took place in the 1970s and 1980s in Argentina and Chile. Although that period of violence is now 'past', many facets of it are still unresolved. Beyond the legal mechanisms that continue to unearth new aspects of the last military dictatorship in Argentina (1976-83) and the Pinochet dictatorship in Chile (1973-1990), there are several sites at which these unresolved issues emerge for debate and verification. The research has studied a range of diverse sites that we call here 'forums for telling' (Weizman, 2011). Its premise is that the importance of telling the past is intimately linked with Justice, but that this 'juris-diction' is not confined to legal forums, since the work of speaking justice (and justly) also takes place elsewhere (Nancy, 2003; Fitzpatrick, 2004). Seeking something beyond an affirmation of the socially constructed nature of truth, we follow Stengers, to consider how truths pass through different processes of hypothesising, 'testing' and reflection before they are affirmed and allowed to emerge as true. Thus the production of truth at a museum of memory such as a museum of memory differs, both in process and in terms of the truths it seeks and can affirm, from the production of truth by the law courts, or by the Argentine Forensic Anthropology Team's attempts to establish identities through the testing of human remains or DNA. We ask: which truths emerge at the different sites? Which form to they take (images, objects, speech, blood)? How are they understood as relevant to the forum that debates their status? What 'tests' must they pass in order to attain their status as true? How are emergent truths presented, arranged and mediated for consumption (including aspects of digitalisation)?

Borders and Bodies: Eritrean Asylum Seekers' Biographical Narratives of Their Journey of Escape

Much of the recent literature on irregular migrants and border-crossing focuses on governmentality and biopolitics. To use Agamben's term, the bare lives of irregular migrants are often viewed from a vertical angle, as objects of study and as masses. However, in this paper we look at migration through the migrant's eye, as a subject, from a horizontal perspective, through the embodied experience of the voyage and the sense of proximity between life and death.

We focus on the journey's adversities to the migrant's body – hunger, thirst, being hidden in packed pickup trucks and airless containers, and for those less lucky, being sold to owners of torture camps established to raise ransom money. Migrants describe a journey in which their condition shifts between two opposite ends -- on the one hand, being in total control, making use of their accumulated knowledge, bodily fitness and natural resourcefulness, while on the other hand, being entirely out of control, merely an object handled by others. Our paper explores the voyage through biographical narratives on the body and the senses, and explores the meaning attributed to those in retrospect.

The paper is based on over twenty interviews in Tigrinya and English, conducted between 2013 and 2015. The interviews were conducted with Eritrean asylum seekers who arrived in Israel illegally, through its Southern border, between 2007 and 2011. These asylum seekers walked to Ethiopia or Sudan, and then were smuggled through Egypt and the Sinai. In addition to analyzing the interviews, we incorporate media reports, Human Rights Organizations' publications, court affidavits and films, well as observations from Tel Aviv's migrants' district, *Holot*'s detention center, and the border through which the asylum seekers arrived.

La Valoración De La Calidad Del Trabajo Docente Universitario

Este trabajo se inserta dentro de un proyecto más amplio sobre la Excelencia de la docencia universitaria, dirigido por la Dra. Anita Hirsch Adler. En este caso, se exponen los resultados de investigación acerca de la valoración que los profesores universitarios otorgan a su trabajo, específicamente referidos a la docencia. La excelencia es un atributo característico del desempeño profesional, pero al transferir esta cualidad al trabajo docente genera significados éticos, pues traspasa con mucho la individualidad del docente, hasta involucrar los demás ámbitos sociales. El reclamo por un trabajo de excelencia proviene del ámbito económico y se refleja en el acceso, permanencia y desarrollo profesional en el empleo en los mercados tanto nacionales como internacionales. El estado mexicano personifica las demandas de calidad docente a través de la ejecución de políticas que siguen las líneas marcadas por los organismos internacionales, por lo que la educación superior se presenta como el campo de encuentro delas políticas del estado y del desempeño docente. Los profesores perciben esta situación como una exigencia externa al sistema educativo, la cual, sin embargo se tiene que enfrentar desde la educación. La docencia, al pretender la excelencia se vuelve reflexiva, pues se desempeña como interacciónque origina significados compartidos en una nueva cultura del trabajo docente. Metodológicamente se siguió el enfoque cualitativo, a través de entrevistas a profundidad aplicadas a siete profesores de diversas facultades de la Universidad Autónoma de Nuevo León. Las categorías de análisis que se obtuvieron y que posteriormente se analizaron fueron: excelencia, ética, calidad, liderazgo, institución, formación, valoración, profesionalismo y crítica. Los resultados muestran de una manera general la valoración que los profesores otorgan a la excelencia.

Job Placement at the Beginning of 21st Century: Precarious Work of Young People

Prolongation of youth, which has been analyzed many times (e.g. Bendit; 2008; Roberts, 1997; among others), was related to different phenomena such as a greater life expectancy, the prolongation of the educational careers and the metamorphosis of labor markets. These factors make educational careers and of labor market integration processes longer and non-standardized (even partly

reversible) jobs stabilization takes place close to the age of 30 years old (Miranda, 2015; Cuervo y Wyn, 2015).

However, over the past years, a set of works started questioning some trends to towards naturalization or reification as regards the prolongation of job placement by arguing the removal of an extraordinary "plusavalia" of the new generations (Cote, 2014). while, on the other hand, studies carried out in Latin America showed that in certain groups of young people no stabilization labor process occurs, generating trajectories characterized by precariousness and contingency (Mora Salas y de Oliveira, 2015).

The aim of this presentation is to deal with job placement processes arising from the analysis of empirical (quantitative and qualitative) proof gathered in Argentina within two different economic contexts: One of them is characterized by the final stages of the neoliberal economic program favoured by the International Monetary Fund (IMF) and the other one is contextualized during the term of a heterodox-oriented model actively promoting job and social protection. The information introduced is part of two follow-up panels of high-school graduates (1999 and 2011). The comparative outcomes regarding the first year after graduation are exhibited herein, highlighting continuities and ruptures between both periods in order to deepen the discussion on the transitions between education and employment which are historically and socially placed.

Leisure Time and Youth Well-Being

It is rightly said that while children are the future of the country, youth are its present. The energy, enthusiasm, dynamism, innovative ideas and creative thinking they possess make the youth population an important asset for any country's accelerated development. With regard to youth resources, India has a distinct edge over the developed nations most of which will be facing the burden of a fast ageing population in the coming decades. India is experiencing a youth bulge. Around the world, young people are proving that leisure represents a prime opportunity not only for individual development, but also for contribution and change. The amount of leisure time available to young people varies considerably according to age, gender and culture. How young people spend their leisure time is also linked to pressing threats to their well-being and to issues of globalization and interdependence. Given these interconnections, it is critical that leisure be discussed as a context for the development of young people and their participation in the development of community and society.

Participation in organized leisure and recreation by young people is also seen as having positive benefits for society since it reduces the amount of time available for engagement in anti-social behavior. It is important to understand the ways in which young people think about leisure, their beliefs about, and attitudes to leisure, the meaning of leisure to them and the forces that influence and shape their involvement in leisure activities.

The purpose of this article is to examine the empirical evidence and describe theoretical perspectives that address under what conditions and how leisure acts are essential for youth opportunities and well-being.

Programme-Based Lifestyle Counselling in Hungary – Network, Protocol and Training

Several researchers emphasize the importance of individual choices in forming our lifestyle. At the same time they admit, that life chances, indicated for example by the environment of living, level of education or income, exercise a strong influence on the range of possibilities we can choose from. Choices are also influenced by rationality, tradition, social pressure or fashion. Making a choice alone could be very hard. There is a strong need for professionals who can help the individuals make the most healthy choice.

Since January, 2015., approximately 60 such professionals, called Lifestyle Counsellor Programme Assistants were trained in Hódmezővásárhely and Makó in Hungary, financed by grant TÁMOP-6.1.2-11/3-2012-0002, and grant TÁMOP-6.1.2-11/3-2012-0036. The aims of the programme-based lifestyle counselling training are to allow participants to analyse relevant elements of their lifestyle in terms of nutrition, leisure, social relationships and time management as an "umbrella"; to reinforce healthy lifestyle practices through own experience and to make them aware of actual risks; to strengthen their commitment to healthy lifestyle and show the possibilities of moving forward; carrying all this out among

a positive group atmosphere. Complete fulfilment of the training aims were reflected by the participants' feedback.

From among the lifestyle elements discussed, our presentation would focus on the "Leisure and health" module of the training. The module has content and methodology pillars. In content it focuses on the versatility of practiced and desired leisure time activities and the actual and needed experiences these activities can fulfil. Processing the content is carried out by revealing participants' leisure status, and apply the newly acquired lifestyle elements to their own situation. Content and methodology is then integrated into counselling situations. Group work is promoted with the help of a manual and worksheets prepared by the sociologist and psychologist trainer professionals from the University of Szeged.

BENNETT, JULIA* (Manchester Metropolitan University,
j.bennett@mmu.ac.uk)

Whose Place Is This Anyway? a Tale of a Hill, a Heath and Some Big Weeds

This is a story of community protest, natural landscape and ancient history. The setting is Bickerton Hill in the county of Cheshire, UK. Based on the premise that landscape and the story of the landscape, its history, are key elements of a national and local identity, the paper observes a community protesting against accepted cultural tropes around landscape and conservation. Taking an ethnographic approach, this research examines contested perceptions of an area of countryside used mainly by walkers but with the national and European designation of a 'site of special scientific interest' (SSSI). Visits to the site over the course of 12 years, extensive use of photographs taken during this time and an investigation into the history of this conflict over the management of nature, show that there is a disjuncture between policy-oriented 'official' interpretations of the site as a SSSI needing conservation and local people's sense of belonging to the place as it has evolved through benign neglect. There are particular discourses of nature and conservation that allude to an often unquestioned moral superiority of the conservationists. By fixing on a particular point in the past, conservation tries to stop time and in doing so often infers, in a nostalgic way, that something was implicitly better in the past. But the images of the past here are not recognised by all stakeholders and there is a gap between acknowledgement of the place's past use and how it is used in the present. Conceiving the site as a Deleuzian rhizome and using an actor network theory (ANT) based approach to the analysis, this paper looks at the power inherent in the conservationist discourses surrounding such sites and questions the moral superiority of 'conservation' in the UK and across Europe today.

BENNETT, JULIA* (Manchester Metropolitan University,
j.bennett@mmu.ac.uk)

'I Can Feel It, That's Where I Belong': Using Nostalgia and Authenticity in Telling Stories of Belonging in Place

Belonging in place is perhaps increasingly hard to achieve as people are more likely to move away from their place of birth than in the past. In urban areas especially residential mobility is a feature of, particularly, Western lives in the twenty-first century. However, for those who do remain living in the same place throughout their lives, changes to the built environment can also cause disruption to a sense of belonging. One of the ways in which the self/place relationship is created is through telling stories of the place and one's own place within that story. These stories tend to draw on tropes of both nostalgia, to evoke empathy and tap into standard story-telling tropes, and authenticity, to position the storyteller as a proper, or most, member of the local place/community.

This paper examines how people evoke themes of nostalgia and authenticity in stories of places over time in order to negotiate change and create a continuous story of belonging. Individuals place themselves in an explicit moral relationship to a past community through eliciting memories that are distant enough to create a distinct sense of 'otherness' with the present. 'We' then become the group who can 'remember', and 'they' are those who cannot. Only the authentic 'we' can draw on the nostalgic tropes of memories of 'our' past. Whereas nostalgia positions the present in opposition to the past, authenticity brings past and present together through ongoing, inalienable relationships often embedded within objects and places.

A collection of biographical narratives and photo-elicitation interviews with people who have 'stayed put' all their lives will be used to show how discourses of both nostalgia and authenticity are used to justify affective belongings through material objects, buildings and specific places in order to create an 'authentic' belonging to the community.

Gender, Precarity, and the Professions: African Women Scientists As Transnational Migrant Workers

According to Guy Standing (2012), the precariat are characterized by instability in their labor market participation, lack the work based identity other sectors of the labor force possess, and can be used and discarded by their employers without any sense of security or obligation. Feminist scholars such as Judith Butler (2012, 168) stress that "we have always to link "precarity" with forms of social and political agency where that is possible". This paper examines the experiences of African women who are skilled migrant workers, drawing on a qualitative study of four Sierra Leonean women scientists. I examine how their lived experiences as migrant workers make them vulnerable to some of the tendencies which inform an understanding of "precarity". I discuss how their racialization and vulnerable status as skilled migrant workers have heightened their awareness of global economic disparities, including their marginalization as scientists from global South countries. I also show how their lived experience in precarious employment engender their involvement in social networks with their families and professions in their nation state as a way to exercise political agency and to maintain their sense of identity and belonging as professional transnational migrants.

"the French "Study of Individual and Conjugal Trajectories" Survey (2014)"

This paper presents the new survey on couple formation in France. It was conducted by the National Institute for Demographic Studies and the National Institute of Statistics and Economic Studies in 2013 on a representative sample of 7825 persons aged 25-64. Focusing specifically on the couple formation process, the survey will be used to study couples formed from the early 1970s up to today. It follows on from two previous studies on couple formation. The first took place in the late 1950s and concerned persons who married in or after 1914. The second, in the 1980s, focused on persons who were married or in a consensual union. The economic, legal and social context has changed dramatically since these first surveys were conducted: fewer people are in couple relationships, time spent in education has increased, more women are in employment, divorce is more common, and new forms of union – including the PACS civil partnership – have emerged, along with new ways of finding a partner, such as online dating for example.

The new study aims to update our knowledge about the lives of people with a partner, in a family or living alone, from youth to old age. It offers retrospective information on individuals' trajectories by covering all of the couple or romantic relationships that have counted in the respondent's life.

We will use the initial findings of the "Study of Individuals and Conjugal Trajectories" to show how this new survey will shed light on continuity and change in couple formation and living arrangements, and also reveal how attitudes to couple relationships have evolved by age and by cohort. In this way, we would like to promote future collaboration and develop new opportunities for comparative research.

BERHEIDE, CATHERINE* (Skidmore College, cberheid@skidmore.edu)

The Effect of Gender Stereotyping on Undergraduate Student Ratings of Faculty Teaching Effectiveness

In the United States, the careers of women faculty in STEM are affected by student ratings of their teaching effectiveness. This paper examines three questions. First, does gender bias exist among incoming first-year students? Second, does gender bias among incoming students differ by gender? Does this gender bias affect students' ratings of the teaching effectiveness of women faculty in STEM?

We created a gender bias survey to be used with first-year students. Items were taken from Liben and Bigler's (2002) OAT scales, which include subscales measuring attitudes about appropriate occupations (O), activities (A), and traits (T) for women and men. Our survey included 24 items, 8 to assess each of the three subscales (OAT). Of the 8 items for each subscale, 3 were stereotypically feminine, 3 were stereotypically masculine, and 2 were neutral. Respondents indicate on 7-point scales whether men or women should do particular jobs and activities and have particular traits.

We conducted an anonymous on-line survey of first-year students at two colleges in the United States. At one college, we received 405 responses out of 632 invitations, or a 64.1% response rate. At the other college, we received 295 complete responses, representing 53.8% of first-year students.

Results show strong evidence of gender bias among incoming students that is consistent across the colleges and statistically significant at the 1% level on most subscales. Moreover, the bias occurred among women and men in attitudes toward occupations, activities, and traits. In the combined sample across colleges, men reported stronger gender bias than women at the 1% level regarding stereotypically masculine occupations, activities, and traits and stereotypically feminine activities. This gender bias is related to the lower effectiveness ratings that women faculty in STEM receive from their students. Therefore, there is a need among first-year undergraduates for increased awareness of bias.

Uncovering Women's Invisible Volunteer Work: The Role of Women's Work in an Episcopal Church in the United States

The labor of volunteers is an essential yet often invisible part of non-profit organizations, especially churches. In a church, laity perform many critical functions, some of which parishioners see during worship. Other functions occur behind the scenes, particularly those of women. This paper considers the various forms of volunteer work that women have performed at an Episcopal Church over the course of its 200-year history. Church archives, newspaper articles, and public records provide only fragmentary evidence about this 200-year history of volunteer work. Only when the invisible work became visible, for example when the priest thanked a woman for her years of service, was there even any record of a woman's volunteer work. To make visible women's more recent contributions, I also conducted oral history interviews with 13 women who were long-time active members of the parish.

For most of the 200 years, women were excluded from the decision-making roles. Instead, they engaged in highly gendered work. They cleaned the church and the parish house, sewed vestments, washed and iron the vestments and linens, visited the sick and elderly, and prepared countless meals. They baked and sewed for fundraisers that paid off the church's debt, bought coal to heat the parish house, and purchased new choir robes. Yet it was not until 1938 that women could vote in parish elections and not until 1968 that the first woman was elected to the governing board of the church. While the previously all-male domains of parish life, such as the governing board and the ushers, are now sex-integrated, the invisible work that women have historically done, especially the cleaning, washing, ironing, and sewing, is still done only by women. The gendered knowledge and skills passed on to each successive generation of women have proved vital to the well-being of this church.

Modernities in Conflict

This paper takes into account the concept of "modernities" in its plural aception. Instead of assuming the production of a modernity in Europe which is copied world wide, I assume the production of several types of modernity along the time and in different spaces and locations. These processes occur with different social embodiments such as the nation-states, or only the nations, but the point is that these social constellations are in conflictive interaction among themselves, that is to say, the are "defensive modernities". I will show these processes in a comparative way analyzing the European modernity, the northamerican modernity, the japanese modernity, the chinese modernity and the latinamerican modernity.

Beyond Satisfaction and Happiness Scales: The Socioemotional Well-Being Index (SEWBI)

Social scientists have been studying happiness for more than thirty years, but most of all this empirical research has been carried out using the simplest models of measurement, that is, satisfaction and happiness scales. From 1984 on, two pioneers, psychologist Ed Diener, and sociologist Ruut Veenhoven, together with many others social researchers have been making very significant contributions to the advancement of the scientific study of happiness. However, it is evident the

denotes a presenting author. Abstracts are organized by first presenting author's last name.

need for a substantial improvement of the models with which we are estimating nowadays the happiness of the people.

To improve the scientific study of happiness we need to go beyond these simple, direct, and univariable measures and create new multidimensional models. The most promising way to improve the models for measuring happiness is to return to the origins and follow the path initiated by Norman M. Bradburn with his work, published in 1969, The Structure of Psychological Well-Being. This approach considers that happiness or unhappiness is a meta-emotion, which emerges from the specific but complex affective structures that individuals experience in their everyday lives.

The Socioemotional Well-Being Index (SEWBI) is a composite indicator which assumes a purely socio-relational and hedonic approach of happiness, and that offers an indirect estimation of its level by taking into account the frequency with which the interviewees have felt ten different emotional states during the last two weeks. The conceptual definition of the index is based on Thomas Kemper's social interactional theory of emotions and on Randall Collins' theory of interaction ritual. This measurement model of happiness is composed of 4 dimensions and 10 emotional states, and it has been created applying Factor Common Analysis (FCA).

Disruptions and Detours – Methodological Challenges and Opportunities of Interaction Effects in Qualitative Interviews with Young Researchers

Interviewing scientists about their careers, biographies and future aspirations is full of methodological challenges. In our empirical research project "Trust and young researchers" funded by the German Federal Ministry of Education and Research (BMBF) we follow a mixed method design to investigate careers of scientist in Germany with a special analytical focus on the relevance of trust (e.g. in the relation between PhD students and their supervisors). In contrast to higher education research that tends to discuss scientific careers in terms of performance indicators, such as publication output, our research focuses on the scientists themselves and the logics of the academic field. Therefore our project includes qualitative interviews on job biographies of up-and-coming researchers in different disciplines and career stages.

In qualitative research methodology interviews are considered as dynamic and social situations. Of course, interaction effects need to be taken into consideration when analyzing the interviews. But in contrast to the discussions in quantitative research we do not intend to "control" interaction effects in our qualitative interviews. Instead we argue that disruptions and detours in interview situations should be considered as chances for additional insights. For instance, there are cases when our interviewees turn the table and interview us about our own careers in science. What can we learn from these instances? Also we have to explore the question what effects can be observed in regard to the hierarchical positions of interviewer as well as interviewee. To sum it up: our presentation explores questions of interaction effects in qualitative interviews. In other words, we want to discuss methodologically how to think about interviewing (young) scientists while you are one ofthem.

BERNATH, KRISZTINA* (Partium Christian University, natikrisz@gmail.com)

Motivation Factors of Pursuing Higher Education in the Hungary-Romania Cross-Border Area

One of the main challenges and tasks for young people is that they have to reflect and define their most important goals, hopes and expectations regarding their future. These decisions include pursuing higher education. In the thesis, the decision to continue studies was analyzed as a landmark in the quest for status and as a consequence of the expansion of higher education, highlighting the influence of different variables such as the type and personal motivations, value systems and dimensions of attitudes towards learning, in addition to the social context of the individual. The decision to continue education is inextricably linked to young people's desire to build a career,to the future direction of social mobility. Becoming an intellectual is one possible solution to obtain a social status and upward social mobility, graduating from a higher graduation institution is often considered as a guarantee for a successful future. Educational theory and research from countries other than Romania remain focused on social class disparities, incorporating factors from the human capital investment framework, while Romanian research on the theme is also interested in more psycho-sociological approaches of the motivations for entering higher education. The aim of this paper is to analyze the decision to pursue higher education, as well as career choice, in correlation with the individual and social motivational context. The source of the data used in the research is the result of the cross sectional study carried out wihtin the HERD cross-border project in 2012; a sub-sample of undergraduate students from five higher education institutions was selected (N = 2120). The

main purpose of the thesis was to study the issues related to student motivation in pursuing higher education, in choosing a HEI and a major.

BERNBURG, JON GUNNAR* (The University of Iceland, bernburg@hi.is)

Protest Motivation in an Economic Crisis: The Role Relative Deprivation in the Icelandic "Pots and Pans Revolution"

The recent wave of protest associated with the global financial crisis provides an opportunity to address under-studied theories about the link between economic crisis and participation of citizens in political protest and other forms of political contention—in the context of affluent democratic society. I use the opportunity and study the predictors of individual participation in one of the first large-scale demonstrations that the crisis triggered, namely, the "Pots and Pans" demonstrations in Iceland, in January 2009. Here I use a survey representing the adult population of the Reykjavík area (N = 610) to examine the effects of perceived economic loss on protest participation and support. I find that *perceived economic loss predicts both protest participation and support, but only if individuals believe their losses to be greater than the losses of others*. These interaction effects hold while controlling for the political beliefs and allegiances of individuals, and their social, economic, and demographic positions. The study indicates that in times of crisis the process of *relative deprivation* may motivate a part of the population to take participate in protest. But while relative deprivation is an important process motivating some individuals to participate, although the major actors organizing protest events and performances are motivated by their political beliefs, allegiances, and identities.

BERNINGER, INA* (University of Cologne, Institute of Sociology and Social Psychology, berninger@wiso.uni-koeln.de)
SCHRÖDER, TIM (University of Bremen, SOCIUM)

Occupational Segregation, Trade Unions and the Gender Pay Gap

One reason for the gendered division of paid and unpaid work is unequal pay. In Germany, the gender pay gap is particularly high (~22%). Social mechanisms on the occupational level and collective bargaining are able to explain the inequality to some extent. On the one hand, wages in female occupations are often lower. Some researchers argue, that these jobs offer a better opportunity to reconcile work and family life, which might justify the smaller wages. On the other hand, union density reduces wage inequality and also the gender pay gap. Thus, labour union policy can also be seen as policy on gender equality.

It is yet unknown how the two mechanisms – occupational segregation and labour unions – are related. Which role do labour unions play at the trade-off between wages and reconciliation in female and male occupations? Heinze and Wolf (2010) show that the coverage of collective wage agreements in industries with a high share of female union members is associated with a higher gender pay gap. They conclude that women in unions are rather involved in negotiating reconciliation plans than wage increases.

The contribution's aim is to shed more light on the connection between occupational segregation, union density and the gender pay gap. In doing so, the socio-structural category "occupation" is specified through reconciliation characteristics and, related to this, the role of union density within jobs.

Using the German Socio-economic Panel (2000-2013) combined with data of the "BIBB/BAuA-Labour-Force-Study" (2006) we describe several reconciliation characteristics as well as union density in female, male and mixed occupations. It is shown, if those jobs with higher share of female union members are indeed associated with a better reconciling of work and family life. Further we test, which combinations of occupational characteristics and union density enhance or reduce the gender pay gap.

BERNY, NATHALIE* (Sciences Po Bordeaux, n.berny@sciencespobordeaux.fr)

Times of Change, Times for Change: The Environmental NGOs in the 'brussels Bubble'

The main trends affecting the advocacy activities of the environmental NGOs established in Brussels reflect the challenges green movements face today in terms of modes of action and targets. The paper analyses the changes in decision-making procedures, funding and agenda of the first established NGOs in Brussels. All advocate on a large range of issues and have expanded in terms of staff and numbers of member organisations.

Brussels is often viewed as the main capital for lobbying after Washington, attracting advocacy organisations, also from the environmental movement, since the very beginning of the European Economic Community. The growing number

of environmental NGOs in Brussels is indeed parallel to the development of a public policy in this field. The EEB was set up in 1974 by several leaders of the new-born national environmental organisations in Europe. More than a decade later, Friends of the Earth, WWF and Greenpeace, recently reorganised, set up their own offices in Brussels. All three adapted their organisational charts to create a regional representation, with specific rules of decision-making. They also aligned with the conventional style of politics on the EU stage, thus contrasting with the strategies at the domestic level.

In the aftermath of the Copenhagen conference in 2009, the former ways of operating in Brussels (the focus on lobbying and the EU institutions) appear no longer adequate in the light of the current problems, from the priority given to the economy by the present Commission at the expense of the environment to the deadlock international negotiations on climate change. The paper will address how the various challenges have been met by the four NGOs mentioned, with a focus on the recent changes they underwent in terms of agendas and decision-making processes.

BERRA, MARIELLA* (University of Turin, mariella.berra@unito.it)

Building a Socio Technical Network for the Dissemination of Qualified Knowledge. the Portal of Science and School

The dream of a global ecosystem for the dissemination of science and education finds today the main obstacle in the rules of intellectual property. For example, the "Massive Open Online Course" does not allow full use of its learning objects. Because the correct concept of fair use does not apply in the majority of cases, it would be necessary a new cultural change in order to induce researchers and teachers to adopt license "Creative Commons ". This would allow other authors to use all or part of the fruit of their labor. Fortunately, many other instruments are taking their first steps. The so called projects "Portal of Science and School", promoted by the Polytechnic and University of Turin, represents a good example of a socio technical network for the dissemination of qualified knowledge. The project has three goals. The first is the creation of a large archive, mainly based on interactive tools, scientific or didactic units that can be freely printed or converted into files for "e-book". The second objective is represented by the creation of a range of technological tools aimed at the construction of training and teaching courses based on teaching materials in the archive. Finally, the third objective will be the creation of new courses and new interactive multimedia learning tools. Though in an experimental stage the portal is already equipped, thanks to the work of volunteer, teachers and scholars, with more than 1000 "learning object" including adult courses in English language of many subjects (mathematics, computer science, physics, chemistry, social sciences, etc.). It is also at an advanced stage the development of technological tools, that will make it possible for other institutions to create identical portal in order to build a cooperative socio technical network for the dissemination of qualified knowledge.

BERRA, MARIELLA* (University of Turin, mariella.berra@unito.it)

New Productive Technological and Relational Models. a Survey on ICT Entrepreneurs.

The intertwining of social and telematics networks gives rise to a socio-technical system, which makes it easier to boost forms of activation of individuals and groups and to build networks for producing and exchanging knowledge. This provide new and different organizational and relational approaches useful for the growth of technological, human and social capital. In particular it is growing a new mode of innovating, based on less competitive logic that traditional industrial one which is especially useful for the growth of the digital economy. The importance of new organizational and relational models as leverage to promote economic and social innovation will be discussed on the basis of the results of a qualitative research conducted in Piedmont on a sample of 64 ICT entrepreneurs. Among the surveyed entrepreneurs, those from the ICT sector who develop open source software and Web 2.0 services, products and applications tend in particular to embrace a collective, cooperative and open innovation strategy. For these entrepreneurs, more than for others, innovation has been an opportunity to respond to the economic crisis, overcoming difficulties, obstacles and uncertainties through co-working and co-innovation practices. It would highlight that the ability to combine technological innovation with social innovation by instituting a communication process that is open to dialog and sharing with other actors and users could create a virtuous circle that can benefit an area's growth. In fact, the combination of technological and social density could give a competitive edge to innovative businesses, which could thus set up networks with customers, other firms, and research centers, nurturing an atmosphere that is favorable to innovation. This could be beneficial for not only innovative entrepreneurs, the communities around them and the settings in which they operate, but also for the broader group of subjects who work in a given area.

BERRUECOS, LUIS* (Metropolitan Autonomous University, Xochimilco Campus, berruecos.luis@gmail.com)

The Future We Want in Mexico and Its Struggle for a Better World

Since the 1980s the neoliberal policies were introduced in Mexico, the country's economy has been in decline, poverty has increased and the current situation in the country is truly alarming in the political, social, economic and even cultural fields.

To confirm this, recently the Inter-American Development Bank said that Mexico is facing alarming levels of poverty, high levels of inequality, weak institutions, weak rule of law, a growing informal economy and low levels of educational quality, tax collection and productivity, so no macroeconomic stability and structural reforms implemented by the current administration without success, are sufficient to ensure themselves economic growth.

Therefore, the only peaceful option left to the country is to regain power through the ballot in the next election for a drastic change in government; eventually the newly established reforms will be reversed, which provide gradually recover level of growth needed for development.

Brics's Countries in the Webometrics Ranking of World Universities

The purpose of the study is the characteristics of higher education systems of BRICS based on the results of the Ranking Web of universities. The proposed indicators of mass higher education: 1) number of national universities in the ranking starting with the top 2000 - N_{2000}, N_{3000}, N_{4000}, N_{5000}, N_{10000}, N_{20000}; 2) the percentage of N_{5000} in the total number of ranked universities - N_{20000} (a conditional parameter of quality of mass universities).

BRICS account over 30 % of ranked universities. There are only 5 countries in the world with more than 1,000 universities: the USA and four BRICS countries (China, India, Brazil, Russia).

By set of six indicators (N2000, N3000, N4000, N5000, N10000, N20000) China takes first place – it's among the top ten countries for each of the indicators under review. Brazil in 2014 and 2015 is in the top by five indicators. India in July 2015 for the first time entered the top ten by five indicators. Russia, on the contrary, in July 2015 drastically worsened its position, entering the top ten only by three indicators.

By conditional indicator of quality (percentage of N5000 to N20000) China stands out among all countries with large-scale systems of higher education, including the USA, (first place in 2014 and in January 2015; second in July 2015). Brazil, India and Russia in particular have low indices indicating an insufficient quality of mass universities.

The study of network activity of Russian universities, which for eight years was characterized by positive dynamics, for the first time showed a sharp decline in July 2015: Russian universities for the first time are in the top ten starting with the top 5000 only. It's appropriate to consider the reasons for the deterioration of Russian position only after analyzing two or three consecutive rankings.

Professional Standard As the Basis for the Interaction of Education and the Labor Market

The interaction of Russian education and the labor market, not easy at all times, is currently complicated by a large number of agencies and companies

seeking to receive a specialist from the university according to their own ideas about the required competencies of the graduate.

Settlement of the relationship between education and the labor market in Russia is particularly important for relatively young kinds of activity such as the organization and carrying out sociological research.

In Russia the establishment of common requirements is achieved by the development of professional standards as a basis for the interaction of vocational education and labor in order to increase the competitiveness of Russian specialists in the domestic and international labor markets.

Do the representatives of education sector have to participate in the development of the professional standard? The expediency and even the necessity of participation of educational organizations in the development of common requirements for professional activity is confirmed by the experience of our team of developers of the professional standard «Specialist in the organization and carrying out sociological research.» The group consists of both - employers and university representatives including the developers of state educational standards in sociology.

As a result of collaboration the problem zones of interaction of education and labor market in the field of sociology are revealed: the lack of an agreed and settled vocabulary, the insufficiency of the regulatory framework, the lack of a common understanding of "the structure and content". Based on the study of these problem areas there was developed a functional map of activity for organizing and conducting the sociological research with a detailed examination of labor functions , as well as the knowledge and skills to implement them. There was developed the draft of the professional standard for this type of activity.

Public Restrooms As Conflict Arenas

Bathrooms are considered to be, in daily routine, the most private place one can imagine. Ironically, public restrooms are spaces that are temporary excluded from public sphere. At the same time, they are still, analytically speaking, a social space, crossed by interactions and conflicts.

Entering public restrooms, we could notice the flourishing of writings and drawings upon the walls. Dundes (1966) defined them 'latrinalia', referring to those inscriptions found in public restrooms. The phenomenon is widespread throughout the western world (Kinsey 1953).

Our research is a study of latirinalia in University of Firenze and aims to add something to these classical perspectives: we are not only interested in their graphic content, but in dynamic interactions and conflicts between strings of text, and, indirectly, between their anonymous authors. Public restrooms become a conflicting space, where different social and political visions interact and collide. Even if this place is transient, we could see diachronic interactions, performed over months of collecting. This space could be considered as some kind of network of practice (Brown and Duguid 2001), inside which there is a series of fights for setting the hegemonic narration, which is bound to stay open, due to the specific nature of the locus.

We observed forms of narrating identities and of exposing conflicts. We built a double segmentation, based upon sex and departmental location of bathrooms trough the University, and verified a strong difference in both quantity and quality of inscriptions and interactions. Latrinalia are far from being just a sign on the wall: they are carriers of a series of meanings and narrative relations. In this process, anonymity plays a great part: public restrooms offer both the chance of a vast audience and the secrecy of one of the last private places, where "pure self-expression" is granted.

RC54-JS-73.2

BERTOLO, MARIA CARLA* (University of Padova, carla.bertolo@unipd.it)

The Embodied Practices: Spirituality As a New Cultural Category

The qualitative research I've done in latest two years (designed to examine the meanings assigned by individuals practicing to their mind-body practices, in particular those inspired by the tradition of Yoga), have enlightened, with evidence, the concept of spirituality as a new cultural category.

Contemporary spirituality exceeds the classic dichotomy between religious and secular, worldly and transcendent; instead, it concerns the achievement of self-transformation and self-awareness (through the body as a "medium"), to overcome constricting social conditions and hegemonic cultural representations, imposed and embedded (with reference to a dynamics interpretation of the Bourdieu's concept of habitus).

Therefore, the "non-social" but cultural time/space of embodied practices is experienced as container for processes of re-existing; transformations, that are shaping a transnational counter-culture, connecting individuals and collective.

In fact, the survey results allow us to hypothesize that Spirituality, as cultural category, may provide an analytical tool for understanding how individuals are improving and\or re-actualizing meanings in the spheres of ethics and moral responsibility. A shift towards a vision of world and life as outcomes of interconnections and interdependencies, beyond the anthropocentric vision (Edgar Morin: 2015).

As other researches realized in other Western countries on similar topics confirm (Paul Heelas: 2005, 2007, 2008; Linda Woodhead: 2005, 2007) we are seeing embodied spiritualities as a phenomenon forging a new modus vivendi, that starts through what we can recognize as "anthropotechnics" (Peter Sloterdijk: 2013), useful for replacing basic needs, emotional and relational sphere, consumption practices. Paths for re-shaping, inventing, contexts of existential wellbeing and new ways for economic production.

Diversification of Fatherhood Figures in France As a New Trend That Follows Depatriarchalisation

The decline of patriarchal fatherhood (Hobsbawn, 2005) and of the "rule of the fathers" during the last third of the 20th century goes hand in hand with new forms of fathers' commitment (Le Camus, 2005). Since the 1970's, the dimensions of parenthood (biological, social and legal) are no more necessarily associated: parenting roles can be assumed by several persons (Théry, 1998). Therefore, the diversification of family patterns leads to a new definition of the roles within the couple from a double point of view: symbolical and practical. The symbolical power of the father concerns two dimensions: the legal institution of the "paterfamilias" with parentage and genealogy and the lacanian concept of the "name of the father" in the psychanalytical theory. The practical level concerns the real daily division of domestic and parental tasks.

Our research, at a micro level, highlights different figures of fathers by crossing these symbolical and practical dimensions. Besides the traditional figure of the breadwinner and the tragic figure of the socially failing father, we will draw attention to new patterns of involved fathers, illustrating each figure by a portrait. We will show how these figures are being built in interaction between families' experiences and social policies. For instance, we can observe a voluntarist policy towards single mothers in order to restore fatherhood within the family.

This work is part of a research project about parenthood financed by the French National Family Benefits Fund. We interviewed 60 families of different types: large, with step-mothers and step-fathers, migrant or bi-cultural and same-sex families and 25 early childhood professionals. We chose families with a new born baby because birth situations put at stake family roles and the links between families and institutions are reinforced at children's birth.

BESEDOVSKY, NATALIA* (University of Bremen, besedovs@uni-bremen.de)

Risk As Practice: The Calculative Practices of Credit Rating Agencies and Their Underlying Conceptions of Risk

While much discussed in other subfields of sociology, the concept of risk has gotten surprisingly little attention in economic sociology. Risk is often regarded and dismissed as pure fiction of (neo-classical) economics that overestimates the calculative abilities of market actors. This perspective has shifted the focus of most economic sociology from risk to studying uncertainty and the institutions, networks, and cultural artifacts that supposedly help individuals or societies dealing with it. But declaring risk a fiction neglects its central role as an organizing category of knowledge in the economy and especially in financial markets.

This paper takes a practice perspective and studies calculative practices of risk assessment as social phenomena that shape the current conceptions of risk of financial market actors. By studying the calculative practices of credit rating analysts, I identify two fundamentally different methodological approaches for producing ratings, which in turn shape the respective conceptions of credit risk that co-exist and compete within rating agencies. While the first sees risk as only partially calculable and predictable hazard that should be avoided or minimized, developments in rating practices since the 1980s conceive risk as calculable and controllable, implying that risk should not be avoided but managed and exploited for increasing profits.

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

My theoretical argument is that calculative practices are inherently intertwined with the knowledge they produce. Through the decisions of which aspects of a phenomenon are measured or left out, what is compared, and through the specific calculative manipulations, the object that is calculated is created in practice. In order to understand the de facto meaning of risk concepts, it is therefore necessary to look at the calculative practices that construct them, because they represent the concrete manifestations of ideas of risk in financial markets, which fundamentally shape financial (and more generally: social) action.

The Changing Face of the Global Financial Elite a Relational Perspective on Power Configurations in Transnational Finance

Since the financial crisis of 2007/2008, there is increasing interest in the social structure underlying transnational finance. Conceptual debates center on elite, class and communities beyond the nation state in trying to understand the role of the transnational financial elite. However, empirical evidence does not give clear indications of how to interpret global finance's social structure. We therefore suggest conducting an in-depth longitudinal analysis to answer the question of how to conceptualize the specific social configuration in global finance. In this paper we study the effects of different power resources at the actors' disposal. In particular, we are interested in the changing control of command posts, as well as potential cleavages and divisions of labor between different subgroups (e.g. managers, professionals and analysts, capital owners) within the financial elite, and specific sources of influence, e.g. capital, expertise, or organizational power.

In our paper, we aim at contributing to recent debates with an analysis of changes in elite configurations of global finance over the last two decades. We take a dynamic perspective on financial elite development by accounting for the emergence and evolution of personal ties of financial actors, as well as the relations between organizations established through such personal links. Using board interlock data of the world's 30 largest banks and exchanges since 1995, we seek to identify patterns of social relationships between these organizations and their environment. In addition, we analyze biographical data of the core individuals and the organizations' senior staff that complements the network analysis. With our analysis, we aim to contribute to debates on transnationalization and shifting power configurations in finance focusing on changes in elite composition.

From Micro to Meso to Macro and Back: A Systems-Theoretical Framework for Understanding the Relation Between New Organizational Forms (NOFs) and Society

Today, there is an increasing emergence of NOFs, such as market organizations or partial organizations. Although numerous research streams deal with the question of how distinctive societal logics affect organizations and vice-versa, so far, none of them have adapted in a noteworthy manner to NOFs. Against this backdrop, we elaborate upon a theoretical framework able not only to understand the functioning of NFOs, but also their relationship to society. To address this issue, we build upon modern systems theory (MST) by Niklas Luhmann, and illustrate our approach by using examples from film industry and social work. We see three major advantages in this approach:

First, MST is of increasing interest in organization studies, especially when it comes to NOF (Schreyögg/Sydow 2010; Ahrne/Brunsson 2011; Ahrne et al. 2015). Scholars embrace Luhmann's radical idea of seeing organizations as operatively closed systems of recursive communication processes; this definition also fits NFOs, even if they differ from the classic organizational model. Second, MST offers an encompassing theory of modern (world) society, which is described as differentiated into subsystems such as politics, economy, or mass media. Third, it provides an integrated framework for the micro-level (interactions), the meso-level (organizations), and the macro-level of analysis (society). They are linked through the basic operational element of social systems; namely, communication. Communication is multi-referential, simultaneously existing in multiple forms of organization and differing societal subsystems (e.g. a conference is a scientific event, but it also involves face-to-face interactions and various organizations). Analyzing communication processes opens the way for a deeper understanding of how differing societal logics affect (new) forms of organizations, and vice-versa (e.g. how modern science is organized and how this affects the selection of scientific topics).

Generational Precarity and Youth Politics in an Age of 'Anti-Politics'.

Generational Precarity and Youth Politics in an Age of 'Anti-Politics'.

Many people in both the Global North and South born since the early 1980s have experienced unprecedented socio-economic disadvantage. In many countries, an already bad situation was exacerbated by the 2008 Great Recession and by the subsequent imposition of 'austerity' policies. There is increasing evidence of declining returns for young people who spend more and more time in education while adding to their burden of education-related debt. Equally basic aspirations like accessing affordable decent housing or achieving employment and economic security needed to start their own families are moving beyond the reach of many young people. In this paper we report on our study of the way young people in the USA, United Kingdom, France, Spain and Australia are affected by inequality and how they are responding to it.

We note firstly, that governments and many researchers point to factors like new labour-displacing technology, 'globalisation' and 'risk society' as the primary sources of generational disadvantage. Against this tendency, we argue that it is public policies, developed by states wedded to advancing market capitalism, that first promoted age-based inequality and adversity in the 1980s, while more recent 'austerity' measures have exacerbated the situation for many young people. We offer a heuristic for making sense of often complex policy developments in each of the five countries.

Secondly we argue against the popular idea of youth as 'anti-political' or 'apolitical' by documenting the many and varied ways young people are engaging politically by responding to particular forms of injustice. Attention is given to 'new' forms of political actions that typically are not recognised as political because they do not fit conventional ideas of what constitutes politics.   We explain how these actions are political and identify their capacity to promote social and political change.

BESTE, JONAS* (Institute of Employment Research, jonas.beste@iab.de)
TRAPPMANN, MARK (Institute of Employment Research)

Explaining Differences Between Income Poverty and Deprivation

Poverty research often relies on household resources as measured by equivalised household income. This approach implicitly assumes that a household rationally uses its income to improve its welfare and that there is no considerable regional variation in price levels. Evidence suggests that these assumptions may not hold. An alternative approach directly measures a household's standard of living and defines households below a certain threshold as deprived. This study focuses on the inconsistency between the two approaches. Which households are deprived despite having sufficient income and which are able to achieve a sufficient standard of living despite income poverty? Data from the German panel survey "Labour Market and Social Security" (PASS), which focuses on welfare receipt and labour market participation, are used to investigate mechanisms leading to these two types of incongruity. The findings indicate that education, social networks, personality traits and individual health influence poverty transmission and that the influence of regional price levels is surprisingly small.

BEYCAN, TUGCE* (University of Neuchatel, aysegul.beycan@gmail.com)

The Multidimensional Nature of Poverty in Developing Countries: A Comparative Study of Mexico, South Africa, and Turkey

Poverty is still one of the major challenges of contemporary societies, both at the national and the global level. How to conceptualize and to measure poverty, however, is much debated. Traditionally, poverty has been considered as monetary deprivation and has been measured using metrics focusing on income or consumption. But over the last few decades, alternative perspectives have been developed conceptualizing poverty as a deprivation from multiple aspects of life, such as Amartya Sen's capability approach (1981, 1987), the United Nations' "End Poverty Millennium Development Goals and Beyond 2015", or the recently launched Multidimensional Poverty Index (MPI, 2010).

However, current multidimensional poverty indexes such as the MPI (2010) suffer from serious shortcomings, notably regarding target groups, indicators, thresholds, weights and aggregate functions. In particular, there is no consensus on poverty thresholds and on the dimensions of poverty to be included in

these multidimensional approaches. Furthermore, most multidimensional poverty studies are selecting indicators as a function of the availability of data, and due to differences in the dimensions included, it is not possible to compare poverty rates among countries.

My paper demonstrates that, from a sociological perspective, the use of multidimensional poverty indexes is not based on a robust method. The paper, therefore, proposes a pattern based approach focusing on poverty statuses and not on a binary classification of poverty (poor or non-poor). These patterns designate different forms of poverty, conceptualized by a combination of 'relative needs' (due to interaction of individual's behaviors in society), 'survival needs' (to distinguish absolute poverty) and 'well-being related subjective psychological needs'. Finally, poverty is measured and empirically analyzed based on this pattern approach by using micro data from Mexican (Socio-Economic Conditions Survey, 2012), South African (General Household Survey, 2011), and Turkish (Living Conditions and Income Survey, 2011) surveys.

Precarity and Surrogacy: An Untold Tale of Assisted Reproductive Technologies of India

Motherhood and ideology of motherhood has gathered new momentum in this heyday of assisted reproductive technologies (ART). This has corroborated Gene Corea's prediction in *The Mother Machine* (1985) that wombs of "nonvaluable" women are used as "breeders" for the embryos of "valuable" women. This prediction is difficult to discount when one looks at the fact that India's rent a womb enterprise has become a two-billion-dollar industry. This paper examines a trajectory and addresses the ways in which precarity as an ontological condition of human vulnerability for surrogate women in India through the process of 'unequal exchange in reproduction' and flexploitation along with existential precariousness have affected all service sector workers but especially women. In the zenith of neoliberal globalization and within the context of technologization of reproduction, India has surfaced as a neo-colonial market of cheap female body parts especially 'wombs'.

This paper, thus, articulates the interrelation between surrogacy and precarity through India's huge commercial surrogacy industry and reflects on the following issues: Do lived experiences of surrogates and their precarious existence forms the *precariat*, the alleged emerging class composed of people experiencing precarity? Does there now exist another variety of 'division of labour and concomitant inequality' in reproduction—between precariat women who 'sell eggs or rent their uteruses' and affluent women who pay for them? Are precariat Women of the South increasingly reduced to numbers, targets, wombs, tubes and other reproductive parts only? Do these technologies discriminate between women in terms of race, social class, and developed/developing nations where the surrogate women suffer from failing social and economic networks of support and become differentially exposed to injury, violence, and death? Finally, have these called for a revisiting of discourses within the feminist theorizations, particularly in the Third World on women's fast growing precarization and its unexplored forms?

Social IMPACT Assessment of Urban Transport Projects

Urban Transport Projects, be it transport networks, terminals, hubs, nodes have impacted the environment, people, properties all over the world. Both the regional networks as well as city based projects have had both desirable and undesirable impacts as also direct and indirect impacts. The prime and the most significant of the impacts of the transport projects have been the social impacts. Social impacts relate to the impacts on people, land, property, livelihood and economic activity, health, safety and security, cultural heritage, social values and community cohesiveness and mobility. While in many cases the mobility has increased, people have been displaced, losing their land, property, livelihood and so on. The project-affected people have been directly and indirectly affected or displaced families, vulnerable groups of varied indigenous and ethnic communities. It also includes elderly, socially and economically backward people, old and the sick, women, differently abled people.

Though many policies and legislations are there in India, there is no approach or methodology of assessing the benefits and losses of the project affected persons for the assessment of social impacts.

The paper puts forth a methodology or a toolkit for Social impact assessment of urban transport projects in India.

Connected Sociologies: From Cosmopolitan Europe to Postcolonial Europe

Standard understandings of 'cosmopolitan Europe' acknowledge only the diversity *between* states and do not account for the diversity *within* states as expressed through multiculturalism. This diversity, I argue, can only be properly understood if we take seriously the colonial histories that constitute 'postcolonial Europe'. Such an analysis is increasingly urgent in a continent that faces a growing humanitarian crisis at its borders. In this paper I argue that the failure to properly account for Europe's colonial past cements the political division between legitimate citizens with rights and migrants and refugees without rights and without even the basis to claim rights. If belonging to the history of the nation is what traditionally confers rights upon individuals (as most forms of citizenship demonstrate) then it is incumbent upon us to recognise the wider histories that would see migrants /refugees as already having claims upon the states they wish to enter. It is this approach - one that I call 'connected sociologies' - that would enable different ways of addressing the crises that we currently face.

BHAMBRA, GURMINDER* (University of Warwick, g.k.bhambra@warwick.ac.uk)

What Is the Theoretical Purchase of 'the Global' in Global Sociology?

Analytically, 'the global' has often come to be substituted for 'the modern' in sociology; in doing so, it effaces the history associated with the modern and is presented as a simple descriptor of the current condition. The history, and the developmental schema associated with it, is no longer in question; and, no longer being in question, becomes naturalised. Once the question of 'history' is removed from consideration, the global simply becomes a seemingly simple descriptive space within which different tendencies and processes can be observed. There is no necessity for coherence across the different analyses and, indeed, coherence is seen to be one of the problems identified in earlier modernist discourses. The turn to the global, then, both perpetuates the earlier analytical frameworks that structured sociological thought, and, by rendering those frameworks invisible, displaces critique of them. By subsuming the analytical to the descriptive, the global is also able to become the space for the play of postmodern narratives. In this way, 'the global' is at one and the same time the continuation of a modernist analytical framework and sympathetic to the postmodern turn. It is this, I argue, that means that such instantiations of sociological concepts and categories are repetitions of inadequacy rather than a resolution of what had been identified as problematic. In contrast, I argue for 'connected sociologies' as a more adequate way of addressing the challenges associated with 'global historical sociology'.

[1]Biological Anthropology Unit, [2]Economic Research Unit, [3]Sociological Research Unit, Indian Statistical Institute, 203, B.T. Road, Kolkata 700 108
Abstract
Background: The future well-being of our society depends on the health and nutritional status of the children of our present society. Thus it is necessary to see how the health of children can be improved.

Objective: This paper reveals the growth and nutritional status of 0-59 month's old children in India and also tries to delineate the responsible socio-economic factors behind nutrition.

Methodology: The sample size of this study is 30,105 which have been collected by the third National Family Health Survey (NFHS-3). Data on socio-economic backgrounds are gender differences of the children, place, religion, education and age-group of mothers, wealth index and impact of colostrums on children's growth and nutrition. Under nutrition has been assessed through the cutoff point of -2 of the z-score value corresponding to weight for age and height for age.

Results: The data show that there is considerable inequalities in heath status of children across states in India. In India, 35.7 per cent children are undernourished. By age-group distribution, the maximum occurrence is noticed in the age

between 24-35 months. More than 50% occurrences of underweight and stunted children are found in the states of east to central belt of India. It is found that the distributions of weight and height around the means remain remarkably stable over age. The study also reveals that mother's education, economy, age-groups, and religion has a great impact on using of colostrums.

Conclusion: Mother's education and family welfare are the prime factors to regulate the nutritional status of children.

Socio-Economic Inequality in Childhood Obesity in a Metro City in India

Childhood obesity is an emerging problem especially among the urban children. Childhood obesity may persist and develop into adult obesity which affects the likelihood of persistence of hypertension, diabetes, orthopedic disorder, heart diseases etc. The reason for obesity is not clearly understood but it is believed that some environmental factors, life-style and cultural factors have a pivotal role behind it.

The main objectives of the study are to see – (i) the prevalence of obesity among 6-9 years children; (ii) the gender difference in obesity and (iii) the relationship of obesity with socio-economic factors and TV watching.

In the present study, we have restricted our study to randomly drawn school-going children of classes I to IV from 20 different schools in Kolkata. The sample size is 4956, of which 2595 are girls and 2361 are boys. Body Mass Index (BMI) is considered as a measure of nutritional status as well as obesity. To determine the relationship between obesity with different socio-economic variables and Television watching, categorical logistic regression has been carried out to establish the probable reason for cause and effect on obesity.

The result shows that overweight and obese children are only 32.7 percent. These percentages are 36.9 and 28.9 percents separately for boys and girls respectively. Thus, boys are more obese than girls. Socio-economic variables like gender, medium of school, parent's education, occupation, income and Television watching and its duration are directly responsible for increasing the obesity.

Besides socio-economic factors, TV watching is thought to influence intake of more junk food items induced by advertisement. Less of physical exercise is a direct reason. Attention to children should be given the first priority, if we want to see the next generation to be healthy.

Akshardham Temple in New Delhi: Conjuring 'Heritage', 'Strengthening' Community

This paper seeks to demonstrate how some of the modern religious sects attempt to create a social, cultural, and political identity that personifies its uniqueness on one hand and stresses on a continuity with the past on the other. In the lives of contemporary societies religion is thus strategically used as a political and social act. In the newly built Akshardham temple complex in New Delhi, a religious discourse is created through images, texts and architecture that curiously simplify contestations within Hinduism to produce a seamless narrative of Swaminarayanis and the legacy of Sahajanand Swami in the deistic realm of a Hindu India. Remaining true to the league of grandiose that is the hallmark of the BAPS, this temple project may be interpreted as a powerful attempt to re-claim heritage in a time and space when as a sect it is mostly identified with the Gujarati diaspora. It focuses our attention on the strategic use of religion to promote a position or diminish the assertions of others. It raises the uncomfortable questions of a co-option of the political and economic capital of one religious sect in further creating, strengthening and managing the discourse of Hindu heritage. Moreover, the blurring of boundaries of faith and tourism, of politics and market, of religious solitude and exhibitionism is what makes Akshardham a unique sociological space that may be worth exploring from a critical theory standpoint.

Analysing a Spectacle: Durga Puja and the Possibilities of a Temporal Art Form

Durga Puja in Bengal underwent a change in the late 1980s and early 90s with the advent of '*Theme pujas*'. This paper seeks to establish that though "Theme Durga Puja" as a spectacle, a "controlled visual production" has opened up the possibilities of artistic creativity in public space, it has also opened up the ques-

tions of the contestation and cooperation of several distinct groups; of the artist, the producer and the owners, and the consumers of art, each trying to define the meaning of art. Various forms, types and technologies have been introduced in the making of the idol and the installation of a pandal that involves not only the traditional idol-maker but also a host of other professionals, from structural engineers to event managers. What is more unique is perhaps the question of why it garners such contestations and interests given the temporary nature of this art, a life cycle of only 4-5 days. Despite its fleeting presence in public space "Theme pujas" brings in the need to understand the relationship between producers and consumers of art, the meanings that the artists may strive to create and the perception of this art among the ordinary viewers. The involvement of Corporate Sponsors, media professionals, movie actors, creates a complex public phenomenon where capitalist market and commodification, social hierarchy, cultural forms and people all come together to challenge definitions of popular art and popular culture. The popularity of such installations in public space opens up a debate on the relationship between art and popular culture, and the questions of domination and reproduction. The paper aims to explore three important questions of relationship of art and the publics, relationship of artists and the owner, relationship between artist and the capitalist market by relying on critical theory and cultural studies perspectives.

Marginality Perception of Women Techies in Kolkata: A Bottom up Approach

Many scholars think that usher of globalisation holds the potential praxis of Utopian promises of 'inclusive development' with shared mission of attaining empowerment, individualism and egalitarianism across the globe and in different arenas. This paper attempts to test the above claim by analysing the cases of women software professionals in the much-hyped Information Technology sector which is supposed to be an offshoot of new globalisation having progressive ideology of being a non-discriminatory workplace. This paper brings forth women techies' anecdotes and tribulations on their path of achieving career progression within the highly acclaimed egalitarian workplace where gender equality is perceived to be a business imperative. The said research captures the contemporary workplace context, by articulating both the organisional approach as well as the employees' perspectives towards the prevailing gender equation in the concerned industry. The objective of our study is, therefore, to explore the extent to which the discrepancy is experienced by the female software professionals in terms of the above-referred dimensions vis-a-vis their male counterparts. Field observations encapsulated through using anthropological mode of inquiry from among 250 women software professionals from the sundry software firms located in Kolkata, during the period 2010-2011. The outcome of the research revealed that there is definitive existence of discrepancy in relegating female employees to marginalised position, in a subtle and implicit manner in this industry. However, the study paradoxically unfolds the way women techies in this industry gets empowered sufficiently to break age-old jinx notion for being excluded from participating in the technological sector but gets entangled in various stereotypical typecast within the industry rendering them to subsidiary roles in the workplace without having much promotional prospects. The study evolves the intersectional feminist theoretical underpinnings for understanding the marginalised position of women employees in this new-age industry.

BHOI, DHANESWAR* (TATA INSTITUTE OF SOCIAL SCIENCES, MUMBAI-88, dhaneswar.bhoi@gmail.com)

Participation and Success of Scheduled Castes in Higher Education: A Neoliberal Discourse on Indian Experience

India is the one of the largest higher education system in the world. Widening participation in higher education is still not inclusively achieved in this larges education system. Inequalities are persisting in many ways to access and participate in higher education. The inequalities are seen on the basis of interstate or regional disparity, rural-urban disparity, economic disparity and social groups' disparity. Promising an opportunity to all for widening participation in equitable mode is blocked with inequality, exclusion, globalisation and international competitions. Contextualising international completion in the neoliberal era, this paper enquires the participation of *Scheduled Castes* (SCs) in higher education setting. It also tries to know the effects of neoliberal policy on the success of SCs in higher education. It is attempted to know the new challenges faced by the SC students at higher education level in the neoliberal era. Theoretically, this paper tries to link the neoliberal discourse with experiences of SC students on their participation and success at higher education level. This paper is based on both empirical and theoretical data, the data were analysed and interpreted through quantitative (descriptive statistics) and qualitative (case study-thematic analysis) methods. The findings of the study argued that in the neoliberal era the reduction of public finance, increasing levels of cost recovery, decline of welfare and philanthropic

activities, rapid privatisation, introduction of self financing courses in public educational institutions, structural changes in fee adversely affect equitable accessibility of SCs in higher education. The policy of neoliberal era does not allow the SC students to attain and participate in quality private higher education. Only few well-off SC students' parents can afford the private higher education and their success in higher education is stocked with the new challenges of neoliberal higher education.

CARDENAS TOMAZIC, ANA* (Institute for Social Research (ISF), actomazic@gmail.com)

The (re)Invention of Labour, the Worker, and Social Domination

In capitalist societies, under the discursive abstraction of the labour market as a space for commodity exchange and the buying and selling of labour power, two groups have been differentiated: employers and employees. While these groups have been asymmetrically regulated over time, during the postwar era the predominance of capital could be moderated by the worldwide convergence of social democratic, socialist and populist regimes under which the structural and institutional foundations of that asymmetrical social relationship was partially redefined to establish a new social contract. Since the '70s and especially during the '90s, neoliberal reforms have been widely introduced around the world and the relationship between capital and labour has once again become extremely asymmetrical. In Latin America, this process has led to a new scenario of social conflicts, which are expressed in the electoral, legislative and judicial arenas, but also by different social movements. Considering this background, we propose to discuss the current meanings of work by sketching challenges and possibilities of the Sociology of Labour in the Global South. To do so, three analytical foci are proposed: 1) A discussion of contemporary centres of labour domination from the point of view of the Latin American critical approach, 2) A critical review of the concepts of free and forced labour in light of contemporary labour conditions, and 3) A diagnostic and prospective evaluation of the possibilities for a transition from a mode of production centered on the use of forced labour to one based on reciprocity between freely associated producers. Based on this reflexive exercise, we will explore the possibilities and challenges of a global labour sociology.

CERVIA, SILVIA (Pisa University)

Wellbeing in Old Age from a Gender Perspective

Epidemiological data show an apparent paradox of increased longevity in women combined with a greater rate of morbility in their lifetimes. Scientific research in this area has focused on what has been defined as feminine "resilience", the absence of risk and preventive lifestyles, which translate into increased longevity and a postponement of ageing, without considering the interaction between working conditions and home life (Hunt & Macintyre 2000; Fan & Frisbee 2009).

From this point of view, the increasing presence of women in the workplace, the raising of the retirement age, together with current social transformations and a drop in past forms of reciprocity and solidarity will affect welfare models, and lead to important consequences for the well-being of the elderly.

By adopting the life course approach to studying "health trajectories" in the ageing process, the research takes into account the paradigm of gender and the ensuing differences. These may be seen as crucial elements of those dynamics linking several multidimensional factors that play a relevant role in health outcomes. In our paper, we have considered gender role construction as having a double significance that could explain the ambivalence of the epidemiological data. By analysing the life story and medical history of certain witnesses – females and males over the age of 75 – the research results show a possible connection between the worst health outcomes (in terms of both disease and illness) and overburdening deriving from a "double presence", and the positive effect on the "re-establishment" of identities (Beck 2008) in the continuity of care.

BIAGAS, DAVID (College of Wooster)

The Social Construction and Enactment of Newcomers' Race/ Ethnicity: The Case of Chinese Students at the University of Iowa

With the advent of globalization, movement of individuals from one society to another has risen dramatically. When newcomers are introduced into a social system, social psychological processes are affected. For example, if the newcomers

are perceived as a threat to those in high status social groups, there may be social identity processes involving competition for the position of "high status social group". If the newcomers are perceived as being low status, then individuals who may not have been low status in their societies of origin now face social psychological processes during which they are treated as being "less than". We are examining these ideas at The University of Iowa by using the current case of the large influx of students from the People's Republic of China, a trend presently happening at most "Big Ten" universities. The administration at UIowa predicts that by 2020, about 10% of the undergraduate population will be from the PRC – a sharp increase from the 2000's. We are interested in studying the social psychological aspects of this phenomenon. For instance, how are the White students at UIowa understanding this influx? Are they using the cultural belief systems about Asians and Asian Americans to negotiate their interactions with the students from the PRC? Are they using the perceptions of the "model minority" for these newcomers, and are they perceiving them to have higher competence and social esteem, and therefore affording them more influence during group encounters? Or, are they socially reconstructing cultural beliefs about the rank order of social groups within the social structure, and are perceiving these students to be low status, and thus are affording them less influence within group encounters? We present experimental studies designed to answer these questions about the interactions between Whites and Asians at this moment in history at UIowa.

BIBI, RASHIDA* (University of Manchester, rashida.bibi@postgrad.manchester.ac.uk)

'Wherein the Women?'- Gendered Notions of Citizenship, British South Asian (BSA) Muslim Women and a Case for the Extra-Ordinary...'

In a post 9/11 and 7/7 societies, British Muslims have become increasingly centralised in discourses on citizenship and belonging. The 'hypervisible' (Archer, 2009) Muslim communities face an increasingly hostile and Islamophobic atmosphere, characterising them as 'suspicious' and the 'fifth column' in British society. Consequently issues of citizenship and loyalty to the nation have gained increased precedence; yet discourses of citizenship remain highly gendered. Characterised as a largely 'public endeavour' performed in a 'public' setting, citizenship experiences of ethnic minority women, for whom citizenship is not only different but unequal (Yuval-Davis, 1992), have been largely overlooked. Drawing on empirical research and focussing on the intersectional nature of discrimination faced by BSA Muslim women this paper relates the experiences of citizenship for BSA Muslim women living in Oldham, United Kingdom. As the site of race riots in 2001 and the subsequent policy shifts from multiculturalism to 'active citizenship', the experiences of BSA Muslim women in Oldham were noticeably absent in policy documents (Ritchie, 2001 & Cantle, 2001).This absence highlights the 'blind spot' ethnic minority women occupy within policies of race relations.

The public/private dichotomy in citizenship discourses have reinforced gender roles of public 'active males' and private 'passive females'. However this research shows that 'everyday' practises of citizenship and belonging are practised on the micro, intimate level in the home through adaptation of food and dress. Highlighting these practises of 'everyday' and 'ordinary' allows us to explore how discourses of citizenship and 'anti-citizenship' impact on notions of 'belonging'. In seeking to blur private/public distinctions (Lister, 2003) this paper draws attention to the understudied nature of ethnicity/gender in discourses of citizenship, as well as providing a means to counter accusations of 'loyalty' to the nation.

BIDIKHOVA, IYA* (Saint Tikhon's Orthodox University, bis_1010@inbox.ru)

Models of the Population's Attitude to the Sacred Orthodox Objects in Contemporary Russia (survey results conducted in the city of Sergiev Posad, Russia)

The last two decades have been characterized by an enhancement of the church's role as a social institution, as well as the importance of holy Orthodox objects. Trinity-Sergiev Lavra, in the city of Sergiev Posad, (Laura, Place of Worship - monastery), is one of the **most important** of the Russian Orthodox Shrines. It attracts pilgrims from all over Russia and also around the World.

The question arises: how the population's attitude towards sacred Orthodox objects changes with the increasing role of religion, while this is leading to the formation of specific infrastructure around them,increasing both tourism and commercial businesses? What are the relevant models for the peoples of Sergiev Posad's attitude toward the Lavra, which is considered to be one of the most important centres of Orthodoxy in Russia? These questions are particularly valid in a post-secular society, to which Russia can be attributed.

In order to answer these questions, in July 2015, the Faculty of Social Sciences of Saint Tikhon's Orthodox University conducted a survey on the citizens of Sergiev Posad.

　　　* denotes a presenting author. Abstracts are organized by first presenting author's last name.

The study revealed the following patterns characterizing the attitude of the city's population toward the Lavra:

- Lavra is considered to be some sort of an "asset" (economic, symbolic, spiritual, cultural);
- Lavra is considered to be a treasure (cultural, sacral, historical);
- Lavra is also viewed as a factor in the formation of a latent conflict;
- Indifference towards the Lavra.

Moreover, the prevailing attitude toward the monastery (Lavra) was as to some sort of "asset." This example gives reason to believe, that, in a post-secular society, well-known and significant sacred objects are largely a means of obtaining some benefits, as an implementation of desired needs and goals, both personal or public. However, this conclusion needs to be verified in a larger scale study.

Family Care in the Transnational Families: Love, Blame and Obligation

Currently, in the era of globalization, migration movements include an increasing number of families, more and more frequently a new type of family, a transnational family. Accordingly, the functions of the family and family practice of everyday life, the relationships between members of the group change together with the roles they play in the context of caregiving. Caregiving function is most frequently exercised by women: mothers and daughters. In case of migration, they need to develop strategies to reconcile the role of a caregiver with the role of a working migrant. This article discusses the dilemmas that migrant women and their families need to address in the scale of micro-social relationships, strategies of coping with care deficit in case of children left behind and the old parents. The paper will present the analysis of semi-qualitative studies of Polish families of female migrants: children, old parents/ grandparents and their caregivers (N=100). The main problems presented will be: areas of care deficit, relations with female migrants working abroad, relations with caregivers and emotional and social problems they meet in the situation of care deficit (f.e feeling blame, being abandoned).

Too Week or Too Strong Social Bonds? the Narratives of Migrants on Feeling Alienated

For the XIX sociologists alienation was linked to the disappearance of traditional social bonds, the disintegration of traditional structures, and anomie (Comte, Toennis, Durkheim, Weber) analyzed "from above". Alienation from the perspective of the individual is the result of dissonance felt by the individual between his own self-identity and the identities attributed to her/him by the social environment, the difficulty in building social bonds, and this problem often appears in the analysis of social exclusion (based on race, age, gender). For the analysis of link alienation-anomie it could be fruitful to research the case of a stranger-migrant. It is a figure located in-between, with the weak links that connected her/him with the host society, and sometimes too strong relationships with the sending country and/or other strangers- migrants. How is the feeling of being alienated associated with strong social networks? What makes difficult to build those networks? What types of alienation emerge from the analysis of social ties? How the neoliberal discourses of individual achievements influence the feeling of being alien? The basis for answering these questions will be 15 narrative interviews with migrants who have just arrived to Poland. On the one hand I will try to build the typology of subjective ways of experiencing alienation in various areas of social life and strategies for dealing with anomic vacuum in a situation liminal transition between cultures and societies, on the other hand I will analyze networks, which connect the subjects with other members of the community, the types of the networks and their power.

Mobilising Against Austerity: Greek and Portuguese Labour in the Resistance Against Water Privatisation.

European capital and governments have used the Eurozone crisis to impose further restructuring onto the EU's peripheral member states through bailout agreements in exchange for austerity. In addition to cuts in funding of essential public services, cuts in public sector employment; and the undermining of industrial relations and trade union rights through enforced cuts in minimum wages and a further liberalisation of labour markets, this has also included pressure towards privatisation of state assets.

And yet, workers have not simply accepted these restructuring pressures. They have organised and fought back against austerity and enforced privatisation. Set against the background of the structuring conditions surrounding the Eurozone crisis, in this paper, we will critically assess the struggles against enforced water privatisation in Greece and Portugal. We will analyse the dynamics and strategies of labour movements in organising resistance in both countries and compare the different levels of success. The paper is partly based on semi-structured interviews with Greek and Portuguese 'water activists'.

Rethinking Durkheim's Social Regulation. Theoretical Reconstruction, Indicators and Empirical Test.

The goal of this paper is to reconstruct and empirically test Emile Durkheim's social regulation theory. I conclude that Durkheim only casually treated that part of his theory which refers to oppressive regulation. This contributed to confusion and ambiguity in the concept of anomie. Reconstruction of Durkheim's theory involves such modalities of social regulation as under-regulation (chronic and acute progressive anomie) and over-regulation (severe fatalism and alienation, chronic fatalism).

Empirical analyses are based on data from a survey conducted by TNS in 2011 on a representative sample of Polish population over 15 years of age. The sample size was 1005 respondents.

Using structural equation models, I demonstrate that reconstructed Durkheim's theory is well reflected in empirical data. The estimated CFA model of Durkheim's theory shows that the observable variables correspond with latent constructs accordingly to theoretical predictions.

The second-order factors - anomie and fatalism - served as dependent variables in the formulated regression models. The investigation has shown a correlation between individual-level social regulation disturbances and respondents position in the social structure (age, rural-urban place of residence, social-occupational position, legitimacy of the political system, assessment of one's own material situation, etc.).

A Dynamical Model of Innovation? the Case of the Cooperation Between a Laboratory of Mechanics and Aeronautic Industry

Innovation obsess both, science and industry in our case of study mechanics and aircraft manufacturers. According to the whispered idea among the industrials, the more a company is in a competitive sector, it must do more "Research and Development" (R&D) and the "Technological Research" (R&T). The article is based on the fieldwork for the thesis intituled Les rapports science-industrie au prisme des nouvelles dynamiques de l'innovation. This thesis is based on the case of the cooperation between the Laboratory of Mechanics and Technology at the ENS Cachan (LMT-Cachan) and aeronautic industry (notably the companies Airbus and Safran). One of the central questions emerged during the fieldwork is, considering both –science and industry- are (in ideal terms) motivated by different interests, are they thinking about the same subject when they say "innovation"? As they pursue different interests, they can't have an identical concept of innovation. Innovation for scientists will mean to produce new concepts and tools to make easier the work of design engineers; innovation for industrial engineers means to develop new products in order to introduce such products into the market. Even when we had identified two different notions of innovation, we realize that in both cases the horizon of innovation is always the market. Science and industry cooperate to improve production processes, to build more efficient and secure devices. Our central thesis will be that the cooperation between science and industry in terms

of innovation introduce the dynamic of a pre-innovation. This pre-innovation aims to prepare the conditions for innovation but it is included in the boarder dynamics of innovation. Our aim is to develop a dynamical model of innovation that take in account the interaction of both systems with their own notion (and interest in) innovation.

Welfare Restructuring and Philanthropic Elites. the Case of Milano

The paper focuses on the relationship between welfare and philanthropic elites to unravel the logic of mutual changes in the more general picture of current transformations of welfare states. The hypothesis is that nowadays elites find important devices and mechanisms for reproduction of power in the reorganization of welfare. In the first part of paper we explore the key issues related to the spread of neo-philanthropic principles and mechanisms in the European welfare state. Developed in the context of the Anglo-American neo-liberalism, neo-philanthropy has variously taken hold in the perspectives of reorganization of the welfare based on marketization and public-private mix. In the second part we focus on the relationship between elites and philanthropy and, in particular, on the role played by elites as sponsors and policy-makers, analyzing the implications of this role for welfare policies and services as well as for the elites power reproduction. In the third part we present the first results of a case study on Milan, in Italy, trying to identify trends in the interweaving between evolution of local welfare and philanthropy. The research, just started, should include at a later stage the comparison with another European city. Milano has been often called a "heart in hand city" to underline its long lasting philanthropic vocation. Beyond rethorics, our mail question is: how do discourses and practices of milanese philantropic elites influence local welfare agenda? Empirical research – carry out through main data-bases analysis and in-depth interviews to members of elites, typologically selected in relation to key characteristics of philanthropic organizations – aims to identify: the "Bourdieusian" field of philanthropic elites (main actors, networks, power distribution); its connections to other fields; the logic of action and discourses underlying philanthropic practices; the way in which philanthropic elites affect city policy agenda and decision-making.

BIFULCO, LAVINIA* (Department of Sociology, University of Milano Bicocca, lavinia.bifulco@unimib.it)
BORGHI, VANDO (University of Bologna)

What Is Social in Social Innovation?

As pointed to by several processes affecting European welfare systems, e.g. marketization, there is a tendency towards expansion and at the same time towards the loss of salience of the 'social' domain. Even social innovations can be incongruent or reductive with regard to the social, especially if they refer to a regime of justification that reduces social relations to a moral virtue.

The paper focuses on three fields of tension between these two dimensions (social realm and innovation), in order to better understand the ambivalences and contradictions characterizing the social in itself:

- The rescaling processes. The localization of welfare, and the questioning of the features of standardization and uniformity of welfare national space, triggers at the same time generative social potential and risks of social fragmentation.

- The transformation of social bonds. Capitalism always expanded itself through a growing extension of market type relations to not yet marketized social spheres of life. Contemporary phase of capitalist expansion is based on unprecedented processes of value extraction from social relations and the social is reframed as a systemic prerequisite of the economy. How is changing, in this context, the social root of innovation?

- The informational basis of social innovation. According to Amartya Sen, informational basis structures the terrain which any policy and project is going to intervene on, as it incorporates definitions of problems and targets and activates systems for assessing actions against objectives. Nowadays informational basis of policy undergoes processes of radical abstraction, mechanical objectivation, privatization and moralization, whereas citizens capacity for voice is weakened.

The paper develops an analytical framework that, focusing on the connections between these three fields of tension, may help to investigate conditions, variety and implications of social innovation. We therefore will try to answer the question: What is social in sociali nnovation?

BIGLER, CHRISTINE* (University of Bern, Switzerland, christine.bigler@izfg.unibe.ch)

State Driven Agricultural Transformation and Its Impact on Gender Roles in Rural Rwanda

The Rwanda's Vision 2020 development policy focuses on the transformation of the agricultural sector. At the same time, gender equality and the integration of women into the labour market is given a high consideration. The Northern Province of Rwanda is a high potential agricultural region. The transformation from agricultural subsistence to a market oriented agricultural production is in full swing. Throughout this development, different income opportunities and income classes have built out during the last decade. Both women and men are integrated into this new production system and this leads to new gender roles. Traditionally, women were involved into productive field work, housework and care activities. With this economic transformation, women are a part of the paid rural labour market and have better access to cash income.

The main objective of this study is to examine how women and men are integrated into the market oriented agriculture production. Furthermore, under what conditions this new production system leads to new gender roles. A mixed-methods design is used and it involves quantitative results from a household survey and in-depth qualitative data collected from March to October 2015.

The first results indicate that constraints and opportunities from a market oriented agricultural production are not similar for women and men. The agriculture sector is highly gendered with women being overrepresented in low paid casual labour jobs. Additionally, in many cases the work burdens for women have been increased while the care work has been shifted to other female household members or domestic workers. Men's involvement into household chores and care work are still on a low level. This leads to the conclusion that the social and economic transformation does not go simultaneously.

Human Rights, Bricolage and Social Change: The Israeli Spousal Covenant Revisited

Bricolage, the crafting by actors of new institutional solutions through recombination of elements of the social order, is a process through which institutions change (Levy-Strauss 1962; Carstensen 2016).

In this paper, based on official data, recent research and NGOs reports, I analyze the shift in the family institution that is occurring in Israel, following the bricolage of former Soviet Union (FSU) immigrants to promote their basic human right to marry, after the Spousal Covenant Act passed in 2010.

I first explain why in Israel, where marriages can only be contracted via religious laws, religion being a source of national identity and marker of inter-groups differences, the 2010 law creates ethnoracialized boundaries between orthodox Jews and one third of the 1,000.000 FSU newcomers. The reason is that though accepted as citizens, they are not accepted as Jews by the religious establishment. Thus, according to the 2010 law, they cannot marry orthodox Jews but can only marry one another.

Second, I point out the fact that till 2015, only 112 couples have married under the 2010 law. Actually, the FSU newcomers have taken, along with other Israeli citizens, existing alternative paths, like cohabitation or marriage abroad, both recognized by the Israeli law.

Third, I refer to the fact that this wide scale bricolage institutionalizes de facto civil marriage - a process that has highly contributed to the split in the Orthodox establishment, between "conservative" and "religious national" rabbis - the latter supporting "creative solutions" to the marriage issue in the context of a "liberalized Orthodoxy" to maintain power and authority.

I argue however, that this evolution, by fueling the privatization of religious processes, may open new avenues for the ethnoracialized family institution in Israel.

My conclusion deals with institutional bricolage, International Law, INGOs and Human Rights in the global era.

RC32-371.1

BIJAOUI, SYLVIE* (College of Management Academic Studies, sylvieb@colman.ac.il)

Twenty Years after Beijing in Israel: An Intersectional Approach

Intersectionality is a way of conceptualizing the relations between systems of oppression which construct identities and social locations in hierarchies of power and privilege, (Crenshaw 1989; Carastathis 2014).

In this paper, applying an intersectional approach, I analyze , how, following the Beijing Platform for Action (PFA), gender (in)equality , has been advanced among different /hierarchized groups of Israeli women .

My paper, based on data from the U.N., the Central Bureau of Statistics of Israel and the Israeli NGOs' sites and publications, is divided into four parts.

I first document the positive changes that have occurred in the position of Israeli women in the last two decades and their reflection in the 2014 Gender Development Index, where Israel is ranked 19th.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

I then point out to the fact that the highly NGOized feminist movement in Israel, in order to promote the PFA, mostly engaged in feminism training and/or academic and/or cyber feminism , addressing international law , state feminism and political parties - practices chiefly tailored for 'urban white middle-class women'.

Further, referring to the ethnic and socio economic divide between the geographical center and the geographical periphery in Israel, I emphasize the fact that women at the center of Israel ("The Tel-Aviv Bubble"), mostly Ashkenazi, have made much more significant steps toward gender equality than those at the country's geographical periphery, where Mizrahi and Arab women together with immigrant women from the Former Soviet Union or Ethiopia are over-represented. I also draw attention to the fact that basic rights of non-citizens, migrant women or refugees, have been frequently ignored.

As a conclusion, I argue that intersectionality , by making women's social locations and experiences visible, acts as a theoretical and methodological corrective against hegemonic discourses   and appears as a prerequisite to advance the human rights of (all) women.

New Media, Old Issues: Political Economy of Online News in Croatia

The global internet is witnessing increasing concentration of power in the hands of only a handful social media companies. Despite the sublime promises of digital technologies for social change (Mosco, 2004) in digital discourses (Fisher, 2011) of online liberation, creativity and freedom, digital possibilities are mostly shaped by market realities (Murdock, Golding, 2002). Additionally, political interests in shaping debates and directing public opinion expand to the internet. However, this unidirectional thesis cannot always be described in terms of conspiracy or conscious intent (Murdock, Golding, 1973). In other words, control of media production is a complex interplay between intentional action and structural constraint (Murdock, 1982). The goal of this paper is to explore how these structural constraints shape online news media in Croatia. We will study the reporting on motorway monetization in Croatia in news production of exclusively online media organizations. The motorway monetization case displays strong government attempts to privatize publicly owned infrastructure with open resistance through organized civil society campaigns. An analysis of online news reporting of established print, radio and television media in Croatia showed a tendency of political parallelism (Bilić, Balabanić, 2015) and alignment between the editorial views of their off-line organizational policies and ownership structures. Based on interviews with editors and journalists as well as content analysis of articles published on the topic of motorway monetization, we will focus on: (1) the influence of advertising and citizen engagement in discourses of media production; and various aspects of online news reports including (2) headline tendency, (3) cited persons and (4) mentioned actors. The goal is to explore whether there are any differences, or similarities, between various ownership structures in terms of political alignment of attitudes towards government policies and/or civil society and whether the lack of pre-existing, offline ownership structures affects the type and style of reporting.

BINDER, WERNER* (Masaryk University, werner.binder@mail.muni.cz)

Structural Hermeneutics Reconsidered

In my talk, I will provide the outline of an interpretative methodology that is suitable for all kinds of data. Following Jeffrey Alexander and Philip Smith, I will call this methodology *structural hermeneutics*, because it combines a Geertzian "thick description" of the "surface" with a structuralist explanation referring to a "cultural depth". I will further argue that we have to go beyond the model proposed by Alexander and Smith, whose main flaw is a certain disconnect between surface and depth rooted in their structuralist linguist assumptions.

I am suggesting reconsidering structural hermeneutics in the light of Karl Mannheim's early essay on interpretation, where he distinguishes three levels of meaning, which correspond to the dichotomy of surface and depth. The dialectics between surface and depth requires a particular type of interpretation which Mannheim dubbed „documentary interpretation". The surface has to be interpreted as manifestation of a deep structure, whereas the deep structure is only accessible through the interpretation of the surface. We can understand this structure as a "cultural background" that constitutes intentional acts and renders them meaningful. In terms of the research process, I advocate the use of "abductive reasoning" (Peirce, Timmermans & Tavory), which allows us to make an "educated guess" about underlying deep-structures, which can be tested empirically afterwards.

Panofsky's iconological interpretation of images (which he owes to Mannheim), Bourdieu's concept of habitus (which he adapted from Panofsky) as well as Fou-

cault's understanding of episteme (derived from structuralism) can be regarded as specifications of the proposed method. Drawing on these classics and more contemporary contributions to qualitative methodology, such as the "reconstructive method" of Ralf Bohnsack and the "objective hermeneutics" of Ulrich Oevermann, we arrive at a general model of structural hermeneutics that can be used for the interpretation of images, interviews and discourses.

BINDER, WERNER* (Masaryk University, werner.binder@mail.muni.cz)

The Contested Heritage of Mistr Jan Hus

In my talk, I address some results of an ongoing research project investigating the public commemoration of the Czech reformer Jan Hus in the context of the 600th anniversary celebrations of the Council of Constance (2014-2018). Informed by approaches in cultural sociology and memory studies, we analyze commemoration practices, public discourses and museum exhibitions in Germany as well as in the Czech Republic. In this talk, I will focus on our ethnographic fieldwork conducted in Constance, the place were Hus was burned 600 years ago, in the first week of July, 2015. While participating in a variety of events and visiting different exhibitions, we witnessed tensions resulting from different appropriations of Hus. I would like to address how this religious heritage was appropriated by different parties involved in the festivities and how the meanings of Hus were debated and negotiated. There were, for example, difficulties to incorporate the tragic burning of Jan Hus into the general celebrative framework of the Council Anniversary in Constance. In a speech, the mayor treated the city's heritage of Jan Hus as mere commodity and cultural capital, effectively disowning Hus – to the surprise of many guests. Among the Czech participants, the conflict between religious and secular meanings of Hus was predominant. The nationalist reading was criticized by all religious representatives, which did not prevent them from fighting over the heritage of Hus among themselves. The Catholic Church as well as various protestant groups claimed Hus as one of them, including the members of a small Pentecostal church in Constance, who celebrated Hus as a religious martyr and local figure representing the second reformation to come. All in all, our findings show that the heritage of Jan Hus is far from being settled.

Co-Constituting the Process of Schooling: A Sociological Inquiry of Interrelationships Between Parents, Learners and a Township Secondary School in the Tshwane South District, South Africa.

Interrelationships between schools, parents and communities are important for facilitating a conducive learning environment. In South Africa, the South African School's Act No. 84 of 1996 (SASA) and Schools 2025 set out *guidelines* for school (i.e. principals, educators and officials), parent and learner partnerships. Although SASA and Schools 2025 envisage productive interrelationships in the schooling process, research focusing on school governing bodies, a forum for school partnerships, has shown that interrelationships between parents and schools in South African townships and rural areas are often limited, contentious and fractured. Also, community protests widely covered in South African media show how 'strong' parent/school/community partnerships may not always be beneficial to the schooling process. Additionally, the role of learners as stipulated in SASA and Schools 2025 does not seem to be taken seriously. Drawing on data from an on-going doctoral study in the Tshwane South District, South Africa, the paper demonstrates how a township secondary school, parents and learners co-constitute the schooling process. About 30 learners, 10 teachers and 10 families are participating in the ethnographic study. Early results indicate two things: First, existing school/family/community models do not sufficiently account for the role of secondary school learners in influencing education partnerships. Second, a context characterised by diverse cultures, high levels of poverty, fractured relations of authority between teachers and learners, and between learners and parents as well as an entrenched culture of school disruptions by learner representatives, requires varied intervention strategies to achieve workable interrelationships for developing a conducive learning environment. The paper concludes by offering suggestions on how to strengthen school/family/learner/community partnerships in the secondary school.

Professions Under Pressure: Conflicting Demands in Academic Work and Child Care

Professions under pressure: Conflicting demands in academic work and child care

The restructuring of the public sector in the OECD-countries has reached universities and the child care sector as well. In both fields processes of deprofessionalization can be witnessed.

In academia precarious career tracks are introduced and internal power relationships of universities are reorganized as well. Committees of academic self-government lost influence in favour of the decision-making competencies of vice chancellors and deans. Furthermore producing 'excellent' academic output is demanded in a new extent. It goes along with controlling and evaluating academic work by new public management tools.

In child care new 'professions', with lower educational-demands are established and an increasing number of helpers is introduced in institutional day-care. At the same time kindergarden-pedagogues are increasingly controlled by new public management tools and they are confronted with new demands by politics and parents, which lead to new public debates about professionalization.

Instead of using the term of 'deprofessionalization' to describe the current changes in the professions, we want to propose to use the frame of 'conflicting demands'. It enables us to identify shifts within the professions, that couldn't be captured as a trend to 'deprofessionalization.'

By presenting results from our qualitative research projects, which are conducted in Austria (interviews and focus groups with experts and employees) we want to work out which conflicting demands are emerging in both fields, and in what way they are differing or resembling.

Focusing on conflicting demands enables us to shed light on endangering tendencies within the professions, but on new tendencies of professionalization, too. We argue that those entangled processes are linked to developments and contradictions on societal level.

Rising Demands and Varying Perspectives on Early Child Care

The case of early child care is a vivid example for the re-organization of care and care work. Since the late 1990th the 'Child-Centered Social Investment Strategy' is establishing in the OECD-countries. Hence early childhood education and care is becoming policy priority in many of these countries. It is assumed that the changes are leading to an upgrading of early child care. Along with *demands and obligations* in the sector arising.

By presenting our findings, observed in a qualitative multi-method triangulation[1] we want to shed light on demands set by different groups (parents, politics and employees). By observing these different perspectives of demands we want to point out which are conflicting and which are alike. Furthermore we will show which conflicts and burdens are arising for care-workers in this specific (three-way)-constellation of demands.

Our research focusses on Austria, regarded as conservative welfare state currently undergoing processes of this reorganization. Most of early child care is still provided for free by the (grand-) mothers. Although women are increasingly participating in the labor-market the traditional gendered division of labor is nearly untouched. Austria is an economically powerful western country, with a specific migration regime offering a pool of high qualified migrant workers, what is shaping child care provision as well.

[1] Qualitative interviews with experts and parents, documents-analysis and focus groups as well as observations.

The Silences of Agrarian Change in Two Indigenous Communities in Chaco Province, Argentina

This paper analyses the multiple forms in which state policies, the actions of dominant classes and the everyday practices of subaltern groups interact and shape the dynamics of agrarian change at a local level. Taking a long-term historical perspective, the paper shows how those processes are perceived, experienced and acted upon differently according to the various ways in which displacement, negotiation and resistance are inscribed in local collective memory. The ethnographic work that underpins this analysis focuses on two indigenous communities in the province of Chaco, Argentina: the Qom community of Pampa del Indio and the Moqoit community from Las Tolderías. Exploring the memories of past periods and the concrete mechanisms through which agrarian change occurs, the work analyses the multiple perceptions and positions that members of these communities adopt in relation to the model of industrial agriculture linked to the expansion of soybean cultivation, and how in so doing they give rise to different process of rural transformation.

Constrained Choice: Gender Bias and Quality of Routine Care for Cardiovascular Disease

Some medical decisions are so clinically accepted that they are structured into guidelines and used as measures of the quality of care delivered. In the case of quality of routine aspects of care, the focus is on decisions where care has been shown to be cost effective in improving outcomes. Quality of routine aspects of care for cardiovascular disease (CVD) is not merely the product of individual provider-patient encounters. The decision processes of clinicians and patients are shaped by assumptions about risks and benefits, as well as other costs including the expense, side effects, and convenience. Here we consider how examining Constrained Choice can facilitate or impede efforts to improve quality of care. In this framework responsibility for health is allocated between individual agency and various higher units of organization including, family, workplace, community, and social policy makers. We examined gender and racial/ethnic gaps in routine aspects of care for cardiovascular disease in the United States. Data from a large US health insuror on quality of care for CVD and diabetes suggest that many (but not all) of the factors that enhance or impede health and healthcare often extend beyond the control of individuals. We discuss the nature of the disparities and approaches to addressing the gaps in care.

Health and Safety after Marikana: The Impact of Union Rivalry in South African Mines

Unprecedented union rivalry followed the massacre of 34 mineworkers at Lonmin's Marikana mine in 2012. A number of studies have looked at the reasons for the demise of the National Union of Mineworkers (NUM) and the rise of the Associated Mining and Construction Union (AMCU). However, very few studies have documented the impact of this shift on the less glamorous and politically charged day-to-day operations of mines, specifically matters related to health and safety. These less spectacular aspects of mining are important, given South Africa's dismal health and safety record and the historical importance of this in mobilising mine workers into unions. In this paper we explore this theme based on a survey conducted in four of South Africa's provinces, including some of the country's most prominent platinum, gold and coal mines. We find that the impact of union rivalry is highly uneven and that the NUM's operations have not been affected in some parts of the country. In others, though, companies have used the vacuum of representation to roll back gains made my the NUM over decades. We also found evidence where the provisioning of health and safety equipment is used as a bargaining tool by the two unions in order to outmaneuvre their rivals. The paper concludes with a number of recommendations on potential for future research.

Provincializing Frankfurt. Towards a Conversation Between Habermasian Critical Theory and Postcolonial Critique

Much like feminism, postcolonialism poses a great challenge to all established theories of society. Today any social theory – particularly if it deems itself 'critical' – has to face the question, to what extent its presumably universal assumptions, observations, conceptions, or conclusions about human society are Eurocentric or indeed generalizable.

In my paper I perform such a postcolonial interrogation of Habermasian social theory. With reference to Chakrabarty's Provincializing Europe I refer to this move as Provincializing Frankfurt. Chakrabarty emphasizes that the provincialization of Europe is no polemical or relativistic project. It is no attack on universalism in the name of incommensurable particularity, rather its purpose is to question the self-evidence and swiftness with which European ideas and developments are taken as universal without sufficient justification.

My interrogation focuses on three aspects of Habermas' work. In each of these cases I demonstrate that his theory does indeed prove to be highly problematic from a postcolonial perspective. However, I also show that there are ways to over-

come these problems within the Habermasian framework and that it does in turn offer important insights for postcolonial critique.

First, I discuss Habermas' conception of social evolution; building on Spivak's Derridean reading of Marx I criticize his swift generalizations and suggest reading the decoupling of the economic and political sub-systems as a pharmakon. Secondly, I turn to Habermas' theses on modern culture and life-world rationalization; picking up Chakrabarty's work I suggest that Habermas is too quick in identifying specifically metropolitan processes as generally modern. Thirdly I take up Gilroy's critiques to problematize the absence of colonialism and anti-colonial resistance from Habermas' model. Despite of all these criticisms I hold that Habermas' idea of communicative reason can be highly useful for postcolonial critique which continues to make strong normative claims without being able to account for them.

Searching for Saviors: Neoliberalism and the Persistence of Economic Protectionist Demands

Neoliberal capitalism exacerbates existing economic inequalities and deepens existing material hardships, while at the same time facilitating economic growth. This contradictory reality ensures that two poles inevitably solidify in liberal capitalist societies: Beneficiaries who seek to legitimate the upward transfer of wealth and non-beneficiaries who seek to protect their material interests (employment, wages, costs, etc...) from those same adverse eventualities. Using the Polanyian concept of the *double movement* and Bourdieu's understanding of neoliberal *doxa*, this paper examines the influence of persisting economic protectionist demands on neoliberal political legitimacy. Specifically, this paper examines how advanced capitalist states respond to protectionist demands, particularly in times of exacerbated material hardships or economic crisis. The relationship between nationalist politics and the effects of protectionist resistance are examined in more contextual detail.

Translanguaging As Pedagogy and Practice Among Muslim Immigrant Students in Urban U.S. Classroom Settings: Toward Social Cohesion or Social Inequality?

Many studies on literacy have revealed that children of U.S. Muslim immigrants engage in "translanguaging" through specific language practices due to the expectations and roles they assume in their family, school, and community as well as the fluid nature of bilingualism itself.

The literacy practices of children of Muslim immigrants are often hybridized and syncretized. In the U.K., research showed Muslim immigrant children engaged in literacy practices where different cultural forms interacted in the same space. The children blended the knowledge learned at school into knowledge practiced at home and in the community that were reflected through play, dialogue, artifact creation (writing, drawing) and the identities they assumed when given a choice to do so (Kenner, 2004; Gregory, 2000; Wallace, 2008). They also created further hybridity through the making of texts, which represented their complex cultures.

Other studies suggest that immigrant children engage in 'glocal' literacy practices, a description for the economic phenomena where people use local and global connections to adapt and adopt new literacies (Blake, 2004; Sarroub; 2008; Sirin & Fine, 2005) and "translanguaging," a perspective that views language as a social resource without clear boundaries, and places the speaker at the heart of the transaction. These complex, mobile language repertoires help shape the identities of these children, particularly in a school setting. In addition, these immigrant children create opportunities for interconnectedness by intertwining local and global cultural, social and academic knowledge and experiences.

Examining actual pedagogy and practice in several urban U.S. classrooms where Muslim immigrant students engage in "translanguaging" show a greater sense of cohesion in identity formation linked to the fluidity of their language practices situated in a global urban youth culture.

Social Movement Unionism: from the IWW to Wisconsin and the World

Neoliberal political dynamics in recent years have pushed the labour movement towards a 'silo mentality' (e.g. UK legislation outlawing solidarity and politically-motivated strikes). Despite roots in a movement which set out to shape the social, economic and politic context, it has to a large extent accepted an elite-sanc-

tioned role as a 'functional' part of the corporate environment, confined to maintaining industrial relations.

This paper examines two examples of labour organizing in the US and UK that moved beyond such defensive strategies and engaged in a global dialogue with social movement opposition to neoliberalism and austerity economics. The first examines the experience of Wisconsin public sector workers in the 2011 Wisconsin 'uprising', with its wave of occupations, rallies, community interventions and support networks in opposition to the removal of collective bargaining rights. The second example is the growth in syndicalist forms of organizing in the UK, particularly the emergence of the International Workers of the World (IWW) in a number of UK cities.

These examples highlight the potential of 'social movement unionism' as a means of moving beyond silo approaches. The extension of traditional workplace rights approaches to include broader social justice agendas (Chesters and Welsh, 2010: 156-57) can provide a tremendous resource for social movement struggle, and engagement with a wider range of activists can help innovation in union activity. Like neoliberalism, these forms of unionism seek to transform the wider context for the production and distribution of social and economic goods. They are therefore oriented to a more strategic and long-term commitment to struggle. We suggest that this approach is evolving rapidly, as legislation on both sides of the Atlantic diminishes the arena for more conventional union activity, prompting a return to older forms of collective action and a desire to learn from repertoires of struggle deployed internationally.

BLAMIRE, JOSHUA* (University of Liverpool, j.blamire@liv.ac.uk)

Militant Ethnography with the Anti-Austerity Movement: Co-Producing Radical Discourses on the Crisis

The problematic of ably and appropriately coupling research with committed activism has plagued radical scholars in the academy over the past few decades (see Routledge, 1996; Fuller, 1999; Autonomous Geographies Collective, 2010). Amidst this broader 'participatory turn' within geography, scholars have wondered both; how does one navigate the dual positionalities of activist-academic, *and*, how can activist research co-exist within the neoliberal university (cf. Halvorsen, 2015; Russell, 2014)? Routledge's (1996: 400) seminal text suggested creating a 'thirdspace' between academia and activism, whereby "neither site [...] holds sway, where one continually subverts the meaning of the other" (Juris (2007: 165), instead, has advocated *militant ethnography*, whereby the researcher deploys collaboratively produced ethnographic methods, which aims to dissolve the chasm between research and practice by co-producing knowledge as an active participant within the movement milieu and by facilitating "ongoing activist (self-)reflection regarding movement goals, tactics, strategies and organisational forms" (cf. Russell, 2014). The method of *militant ethnography*, therefore, represents the identification of some problematic or contradiction inherent within a social movement and then "striving to understand and contribute to the collective surpassing of this paradox" (Russell, 2014: 225). Reflecting upon my experience as a doctoral student and activist within the anti-austerity movement in Liverpool, I consider some of the methodological contradictions inherent in these approaches. The research constituted eighteen-months of politically-engaged ethnographic research, and represented something that was epistemologically-sensitive to militant research, but perhaps could be characterised as existing 'in-between' these 'third-space' and *militant ethnographic* methods. In this case, the movement problematic concerned the necessity to develop more radical conceptions of crisis, and to imagine and (re)produce a more affirmative, future-orientated discourse of economic alternatives. This paper encourages renewed theoretical thinking about emerging methodological techniques approaching social movement research, and implores us to move beyond the current tendency to fetishise participatory research.

Analyzing "Return Migration" and Suffering Among Italian Returnees in the Alpine Area from 1970's Crisis until Today

Return migration, rather than being a marginal phenomenon, concerned the majority of Italian migrants. More than half of the 27 million Italians who emigrated since the unification of the peninsula (1871), returned to Italy. Migrants' departures and returns in the Italian Alps alternated over the past 150 years, overlapping with the well-established comings and goings typical of the old temporary and short-distance migration.

Based on long-term qualitative researches in Italian alpine areas, our paper will not exclusively deal with the return of retirees (first-migrants), but with different generations returning from France, Chile and Argentina.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

In a first time we shall question what we mean by return migration. We shall decompose the category of return in an attempt to clarify it: who are the returnees, i.e. those who migrated, their children, their grand-children?

In a second time we shall analyze deeper the experience of suffering in return migration. When does return induce suffering, why and for whom? Return migration does not generate the same kind of suffering depending on the place the individual occupies in the social scene in the countries of settlement and origin, on the generation he/she belongs to, as well as on the success of his/her social and economic path.

In a third time we shall analyze how the historical and economic context in which mobility takes place may influence the conditions of return migration and the suffering possibly linked to it.

Juggling with Moving Sexual Norms: Senegalese Women's Attempts to Make Their Way Trough Migration

The current discourse, both in Senegal and in migration, depicts women migration as a potential danger, entailing the loss of decent women for the community. It implies that women will experiment new opportunities and embrace the loose sexual behavior of the West, especially if they move to secular and licentious France.

So, even though extra-marital sex is not exceptional in Muslim Senegal, when women migrate, social control over their sexual behavior outside the sacred ring of marriage becomes very constraining. In Marseille, a highly puritan Senegalese community advocates for an even stricter sexual behavior than in Senegal. Both men and women participate in promoting new restrictive norms for women's sexuality, which are a product of migration but which are said to be ancestral.

Nonetheless, ethnography shows that women have a multiplicity of sexual behaviors, which they use as means to achieve their social and economic goals in migration. These different behaviors also vary according to generation, with older generations being more flexible than younger ones. I.e., while women who migrated independently in the 70s often conducted a sexual life that some assimilate to a form of semi-prostitution and are now given the pejorative name of "free women", those who came through family reunion in the 90s promote a strict sexual puritanism.

Based on a long-term ethnographic research conducted in Marseille, this paper aims at examining how, in response to the repressive collective discourse, women negotiate their social position in the immigrant community, in the broader local society but also in their origin society through an individual interpretation of the different sexual roles of prudish or "free women". It will also appreciate how the collective construction of stricter norms of feminine sexual behavior is related to the different ages of Senegalese migration in the specific socio-economic context of Marseille.

Sociological Reactions to Uncertainty: Comparing the Political Projects of Risk Society and Actor-Network Theory

The breakdown of the modernistic narrative and the rise of the discourse of political and scientific uncertainty challenge sociology to re-consider its position towards society and its aspirations. In order to understand sociology's reaction to this crisis, we examine two related yet conflicting approaches: the Risk Society Thesis, and Actor-Network Theory (ANT). We discuss how these approaches are rooted in the rise of uncertainty and how they offer to deal with it.

Our comparison shows that both Risk Society and ANT reject modernistic dualisms such as nature/society or objective/subjective, and stress the role of technology in shaping social life and identities. Politically, they both call for "democratizing democracy", particularly the creation of new layperson-expert relationships. However, they differ on how to reach this goal. Risk Society is focused on increasing democratic participation on the level of global civil society and improving the accountability of experts for the knowledge they produce. ANT scholars, alternatively, suggest a problem-focused approach that allows for new voices to be brought in.

We show that by focusing on the global, Beck tends to disregard the fact that cosmopolitan identities emerge from concrete linkages. This position assumes, instead, an ideal polity of equal citizens, all interested in and capable of making informed decisions. In contrast, ANT's problem-oriented approach ignores the issue of uninformed individuals still desiring to have an opinion that counts.

In this light, we suggest a middle road, consisting of three potential tasks for sociology: first, promoting 'communities of interest', equivalent both to Michel Callon's inclusive "research collective" and Ulrich Beck's "global publics". Second, such 'communities of interest' should be encouraged to produce accessible accounts that embrace –rather than reject- uncertainties. Finally, sociologists can take part in experimenting with designs to generate the interface between such communities and existing or emerging democratic institutions.

BLASKO, ANDREW* (IPHS, BAN, abvm-con@blasko.se)

Adopting the Role of the Other-in-Submission: Colonialism Today within Modern Societies

This presentation investigates how the work of W.E.B. DuBois and Franz Fanon concerning the character of European colonialism and the psycho-social results of slavery in the United States may be useful in an effort to understand how structures of domination operate in contemporary societies. Fanon's studies of how European colonialism generated neurotic and psychotic states in both colonizers and those colonized, coupled with DuBois' concept of double consciousness, casts important light on how power is exercised in developed countries such that citizens become inclined to willingly submit to those in power over them. The relations which previously obtained between the colonial metropole and the others who were colonized are analogous in a certain sense to relations in advanced societies between elites and those whom they control. There are masters and servants, and the wealth of elites is constructed through the power they exercise over those who serve them. However, a substantial difference exists between the two sets of relations noted insofar as the colonized slave acknowledged that others exercised power over him, and eventually came to struggle against them, while the citizens of modern societies believe they are sovereign individuals, even as the power and wealth of those who rule expands. European-style colonialism was exercised in the international arena by nations who regarded themselves as superior to the other nations they controlled as their own property. In contrast, the analogous forms of domination that exist in today's advanced societies are exercised in the domestic arena by elites over those who regard themselves not only as free, but also as essentially equal with those who control power. The present discussion endeavors to cast light on how what may be termed an internalization of the power exercised by another leads those who are controlled to both seek and approve of their submission.

Cultures and Catastrophes - a Theoretical Framework to Evaluate the Social Context of Catastrophes

The success of new strategies and technologies for disaster management relies on their ability to function within the existing structures and patterns of social behaviour. Research findings show that many measures to promote disaster preparedness fail due to their lack of alignment with everyday routines. In return, successful existing mitigation structures reveal much about convictions and priorities within a society. It is assumed that a catastrophe never happens in an isolated space or vacuum but rather must be understood in the cultural context in which it happens. Therefore the specific context is most important and must be included in the analysis of catastrophe.

Within this session a framework will be presented that on the one hand allows the evaluation of different cultures and catastrophes. On the other hand the framework allows adjusting the efforts of disaster management organisations and development actors to the given organisational and cultural context. In this way resilience can be fostered and the realization and sustainable usability of the solutions developed by these actors can be facilitated. This framework focuses particularly on climate-imposed hazards and is tested through empirical surveys of past floods in Germany and India. Within this presentation the research findings of the case study in Germany will be presented. Transport infrastructure as a material good for example plays a critical role in the supplying and evacuating of civil populations. Through the Cultures and Catastrophes framework the cultural context can be analyzed in order to help implementing these technological solutions successfully. Overall, the results and insights of this research serve to deepen the understanding of the cultural foundations and operating conditions of the disaster management services in general.

The presented framework of Cultures and Catastrophes is developed within an international joint research project with partners in India and Germany.

How Violent Right-Wing Extremists Leave Racist Groups in the U.S.

There is little research to date on how and why racist extremists leave white supremacist groups. This gap in research is surprising, especially given the increase in violent racist and right-wing radical groups in the U.S. We address this gap by examining the varying dimensions of the process of exiting violent racial extremism, including desistance from racist groups, deradicalization from racist ideologies, and exit from racist actions (such as assaults). We are conducting intensive and lengthy face-to-face interviews with 50+ former violent racial extremists across the U.S. that have been identified in a respondent-driven sample done in collaboration with a community-based network of former extremists who are dedicated to helping people leave racist groups. Our study, which includes men and men who were formerly involved in neo-nazis, Ku Klux Klan, and other racially extreme groups, will pinpoint the dynamics of exiting these highly insular and violent racist cultures.

When Public and Science Form a Community of Practice – Organizing Participation in Technology Development in a German Mining Region

In the last decades many scholars in STS have identified a loss of trust in scientific expertise and an erosion of authority of scientific institutions. Based on this diagnosis a rethinking of the relationship of science and society as well as a democratization of expertise has been required.

However, more recently the diagnosis of lost trust in science recently has been criticized by several authors. Within this presentation we will take an example in which trust in science is still high and explore the relationship of local experts, scientists, and engineers in the context of projects for developing innovative technologies, notably deep geothermal energy technology and technologies for secondary mining.

Taking the example of a former mining region in Germany we will show how the acknowledgement of scientific authority is rooted in social structures and ask how this hampers or facilitates democratic involvement of none scientific expertise in scientific knowledge production. More precisely we will exploit how local expertise in mining technologies and practices of research and technology development interact. We will show that none scientific experts and scientists form a community of practice and how this community hampers involvement of expertise beyond mining expertise. Thereby we will shed light on the role of coalitions between citizens' experts und scientists, of hierarchical social structures, of shared understanding of the roles of science and public, as well as on processes of evaluating knowledge of local experts by scientists. Several mechanisms of boundary drawing will be revealed.

Theoretically our work will employ the idea of community of practices and try to make a fruitful contribution to the politics of science and technology.

Digital Weight-Loss: The Mechanisms of the Construction of Beauty in the Russian-Speaking Weight-Loss Online Communities

We look at the online communities dedicated to beauty-treatment and losing weight in the Russian-speaking part of the Internet in order to determine the ways beauty is constructed in Russia. Using the netnography method, we find that the weight-loss discourse is the focal point of the majority of discourses about beauty: women in Russia have to be thin in order to be considered beautiful. We analyze the way beauty is produced and constructed in these digital communities via the forms of sociality they produce and the structure they possess.

New forms of sociality exist in these communities (liking and reposting photos and diets, commenting, advising and criticizing other members' bodies, posting photos online for others to admire and to criticize, and finding persons to lose weight together). This sociality produces its heroes (those who successfully lost weight), identities (beautiful, thin, ugly, fat), forms of moral courage and bravery (losing weight, engaging in fitness activities). This sociality is riddled with inequality and lookism, separating women with different types of bodies and labeling them as "good" or "bad".

The reproduction of the aforementioned forms of sociality is controlled by the members of the group itself. The community does not have a high degree of hierarchy; the authority is dispersed among the community members. The difference between the private and the public is blended. Thus, these communities can be conceptualized as "bunds", a term introduced by Herman Schmalenbach.

The bund structure allows the "beauty myth" to exist. Becoming a member of such community is an act of the free will, but it conceals the existence of the repressing beauty myth which is not a matter of choice; the myth forces women to be beautiful by losing weight. The popularity of the aforementioned online communities shows the proliferation of the beauty myth in Russia.

BLOKKER, PAUL* (Charles University, paulus.blokker@fsv.cuni.cz)

A Sociology of Constitutional Claims-Making: Transnational Movements and the Re-Imagination of the Common

The paper focusses on legal and constitutional mobilization by transnational social movements. In this, it explores bottom up constitutionalism beyond the state context. Constitutions are relevant on the transnational level in that a variety of social actors actively uses constitutional concepts, conceptions, and language to describe and act in a transnational reality of constitutional 'law-in-the-making'. But while there is widespread attention for the formal-legal dimension in the formation of post-national constitutional regimes, the transnational social-civic dimension of post-national constitutionalism is relatively unexamined. The paper proposes to investigate a transnational social-civic dimension by focusing on the role of transnational movements in using a constitutionalist language and making constitutional claims. Forms of constitutionalism 'from below' shed light on new, alternative constitutional imaginaries, including different ways of imagining the common. Such claims have become more evident since the financial and economic crisis. The paper will take a pluralistic perspective on constitutions and discuss a significant variety of movements. The paper will particularly discuss the Commons as well as the democratic movements.

BLUMBERG, RAE* (University of Virginia, rblumberg@virginia.edu)

From Bonobos and Chimps to (Human) Gender and Development

In this paper, I first consider gender stratification among humans, bonobos and chimps, with whom we share 98-99% of DNA. Then I use the three principal variables that emerged in the bonobo-chimp-human comparisons to examine gender and development from a new perspective. First, among bonobos, females (especially older matriarchs) invariably rule. Why? I argue that it's because (1) they're more organized than males, and this helps them (2) control the food supply – the bonobo equivalent of female **economic power**, which my theories of gender stratification and gender and development posit to be the most important (though not the only) variable affecting relative male/female equality. Additionally, (3) they use non-violent means (sexual touching/sex) to defuse conflict within the group as well as to promote intergroup harmony. Second, among chimps, males are the more organized sex - but they're less organized than bonobo females. Nor do chimp males control the food supply. Though there are checks and balances on violence, male chimps resolve sexual issues with power; in contrast, bonobos resolve power issues with sex. Chimp males relate to other groups with conflict, vs. bonobo harmony; humans used peaceful intergroup trade long before organized conflict emerged. Moreover, my theories posit female **organization** as one way that they can turn their contributions to key subsistence activities into power. How does this relate to development, including gender and development? In the remainder of the paper, I argue that economic power (measured by control of economic resources, e.g., income, credit, property/ land) is not only the strongest variable affecting gender equality for women but also the strongest gender variable affecting development. Then I consider all three variables to examine differential development by region. Currently, male conflict is highest where women's economic position is lowest. But worldwide, more women are earning and - at least partially - controlling income, while women's organizations also are rising. Overall, both female trends have a broader impact on development than current male conflict.

The Development of Competency in Taiwan Teacher Education: A Historical Review

This article, applying documental analysis and historical study, explores and reviews the history and construction of competency-based teacher education in Taiwan. The development of competency notion in Taiwan teacher education could be divided into three periods, they are: construction period, neglect period and pressed period. Firstly, construction period, competency-based teacher education as the mainstream discourse during 1970s-1980s, build the criteria of teacher student performance. Critics, however, about the conflict between traditional Confucius culture and effective behaviorism are aroused at the same time.

Secondly, neglect period, in the beginning of 1990s, education was under reform movement in Taiwan. While the PISA is investigated by OECD in this period, the focus was on the nine-year curriculum. But the concept of competency was not mentioned in the teacher education. Thirdly, pressed period, from the beginning of 21th century, policy of teacher education mainly adopted standard-based approach. Studies show that the teacher professional competency was over by some standard criteria.

Multiple Europes and the Negotiation of European Borders. a Post-Colonial Perspective on Negotiations of Power Between Nation States, Investors and Labor

During the process of nation building from the middle ages to the 19th century, nation states were constructed as having a clearly defined territory and outside borders; an ethnically, culturally and homogenous population with a shared common language who are granted citizenship rights and a government having sovereign power inside its borders. The resulting competition between European nation states resulted in colonialism. After World War II, most former colonies became successively independent, and at the same time, the process of European integration has started. In most research on denationalization and europeanization, the major boundary drawn is typically between "Europe" and "Non-Europe", with Europe continuously expanding. However, there are also indications that there are internal struggles and differentiations within Europe, and at second glance, it is not clear what "Europe" is – depending on the criterion of definition, the number of states ascribed to be "European" varies widely.

In this paper, we address the question of "Europe" from a theoretical perspective combining postcolonial and figurational theory. We argue that the location of states as political actors in the figuration is itself historically produced and linked to different positions of power, such that the issue of belonging to the European space is not constructed primarily on the basis of geographical or cultural criteria or of formal EU membership, but via their geopolitical role in the structure of (post)colonial power relations. Thus, at least five types of "Europes" can be identified and distinguished from the Non-European: heroic Europe, decadent Europe, epigonal Europe, contested Europe and marginal Europe.

We further argue that the power relations within and between these groups is driven by complex power games between nation states, capital, the indigenous labour force and labour migrants. These complex dynamics change Europe over time and give it its present form.

Active Ageing and Third Sector Organizations in Italy

The work explores the opportunities that ageing actively offers at the individual and collective levels, focusing the analysis on older adults (aged 65-74) engaged in voluntary activities in third-sector organizations.

As amply evidenced by recent sociological reflection as well as by specific initiatives sponsored by the European Union (European Year For Active Ageing 2012), the number of volunteer and pro-social activities offered by the elderly for other elderly persons and persons belonging to different generations has increased markedly over the past decade. The concept of activity related to the social role that the elderly can play through participation in such third sector associations will also be explained.

To outline this social role played by elder volunteers in Italy we performed synthetic indexes and a cluster analysis (with SPAD software) on a stratified randomized sample, representative of the Italian active older adults aged 65-74 years (N=146) engaged in pro-social activities in third-sector organizations. The analyses show that, in providing aid to others, these active elders establish a strong support network for themselves. We have also found that Italian third-sector organizations are intergenerational, in terms of co-existence of young, adult, and elderly volunteers, which contributes to the well-being of all the stakeholders involved. Coming together on a regular basis stimulates the activation of behavioral, material, interpersonal and communicative resources. Volunteering in later life is associated with reinforcement of self-fulfillment and formation of one's social identity. Furthermore, thick networks of social relations at the micro and meso (ie. community) levels facilitate older people's inclusion in voluntary work.

Home Tours: A New Way of Comparative Investigation into 'Post-Migration' Everyday Life

This paper assesses the promises and pitfalls of 'home tours', i.e. in-depth ethnographies and go-alongs in dwellings and ordinary living milieus, as an innovative way of studying the daily life experience of immigrant newcomers, compared with long-settled natives (and, transnationally, with their significant others left behind). Methodologically, this research option requires particular sensibility in negotiating access to the domestic realm, in grasping its material bases and the ways of using domestic spaces, as necessary to appreciate natives' and aliens' ways of making themselves (more or less successfully) at home. Substantively, a comparative and cross-cultural ethnography of the spatial organization of home enables a unique understanding of migrants' attitudes and expectations towards receiving and sending communities, and of the material resources available for them to negotiate such relations. What is displayed in home spaces, where, and why; how people orient functionally and symbolically their interior spaces; how such spaces are differentially occupied and experienced along gender and generational lines; what kind of memories are displayed, and what specific rituals are performed – on similar micro-underpinnings of post-migration everyday life, little insight can be gained unless through ethnography in a variety of settings and scales. While taking stock of the emerging literature on migration and home, this paper builds on an extended research programme in which home tours are both a source of micro-data and of macro-insights, once replicated across multi-ethnic societies.

BOCCAGNI, PAOLO* (University of Trento, paolo.boccagni@unitn.it)

New Wine in New Wineskins? the Emergence of Superdiversity and Its Mixed Potential for Theory, Policy and Research

This paper analyzes the discursive, conceptual and practical interface between the notions of diversity [D] and super-diversity [SD]. What does the latter term add to the former (if anything), under what conditions, and why? While this interface may apply to diversity studies as a whole, it is particularly salient in the debate on immigrant and ethnic minority incorporation. Against a background of pervasive rejection of "multiculturalism", the notion of SD points to the need to move beyond all narrowly ethno-cultural readings of diversity. Theoretically speaking, though, this lexical innovation seems to be ended in deadlock. Much of the discussion on SD has so far resulted in a simple split between its supporters and sceptics. Much more remains to be done in order to interrogate the distinctive analytical value added of SD, its implications for everyday boundary-making (on ethnic lines or otherwise), and its suitability as a representation of the majority-minority field. This mapping exercise is critical to assess the contribution of SD in terms of theory-, policy- and research-making. Politically speaking, the jargon of SD has a potential to relaunch a progressive agenda of minority recognition without over-culturalizing or ethnicizing difference. Sociologically speaking, nonetheless, its foundations are unclear. Does *super* stand only for an increase in societal diversity, or does it hold a theoretical value in itself? Does it really point to a changing configuration in majority-minority relations and in the underlying alignments and identifications? What "units of analysis" are more consistent with a SD perspective, when it comes to empirical research? It is on this threefold terrain – what the super label adds, what its policy implications are, how it feeds into fieldwork – that the SD approach needs to be interrogated further, to assess its innovative potential within diversity studies.

Citizenfour: Internet Publics and the Imaginary of Privacy. a Content Analysis of Twitter Commentaries Around the 2015 Oscar Winning Documentary

The paper analyze the Twitter conversations produced by networked publics during the TV premier of Laura Poitras's documentary Citizenfour (2014). The documentary deals with the case of the computer analyst Edward Snowden who, in 2013, leaked classified documents he had obtained from the National Security Agency detailing the extent of government surveillance of U.S. citizens. It was aired by HBO in USA (East and Pacific time) and Channel 4 in UK respectively the 23th and 25th of February 2015. We focused on the type of representations produced around the relationship between privacy and the Internet, ie the imaginary related to privacy conveyed by Snowden case. The paper thus attempt to answer the following RQ: what are the privacy's imagery around Snowden case emerging from double screen audience of documentary Citizenfour? Based on a complete corpus of 129,000 tweets containing either the hashtags #citizenfour or Snowden or Poitras and created between 22th and 26th of February 2015, the study identified peaks in the Twitter activity (through a 'breakout detection') as well as what accounted for those peaks. Finally, a sample of tweets was content analyzed - using a codeset derived by DeCew*. The analysis identified the most discussed excerpts of the documentary and the way the online discussion articulated around informational, accessibility and expressive privacy during this excerpts. At the same time, we also observed significant differences between the imaginary of privacy created around the documentary by US and UK audience.

BODDY, JANET* (University of Sussex, j.m.boddy@sussex.ac.uk)

Troubling Meanings of 'Family' for Young People in Care: Connecting Perspectives

This paper draws together reflections on the meanings of 'family' that arise from three research projects in Europe, all of which have been concerned with young people who are placed away from home (sometimes described as 'in care' or 'looked after'). The first study, *Beyond Contact*, examined work with families of children in care in England, France, Denmark and the Netherlands, combining policy review with interviews with professional stakeholders. The other two studies – *Everyday Lives and Transitions to Adulthood* (in France and England) and *Against All Odds?* (in Norway, Denmark and England) – use qualitative methods (including interviews and photography) to explore the perspectives and experiences of young people in care and care leavers. Taken together, the three studies provide a resource through which to trouble the concept and discourses of 'family'.

Studies of care leavers (eg Ward 2011) have highlighted the importance for young people of 'a sense of belonging and connectedness', yet there has been a surprising lack of attention to the meaning and importance of family relationships for children and young people in the care system. Looking across four European countries, the Beyond Contact study considers how family is constructed in policy and professional discourse, illuminating variations in reference to rights (of parents or children) – and what those rights entail – alongside understandings of risk and the best interests of the child. By considering these findings alongside data from interviews with young people, the paper will reflect on the (dis)connections between policy rhetoric and lived experience, considering how young people value and practice family relationships through the complexity and discontinuities of care systems, and how family is positioned in their understandings and expectations of their own lives and identities.

Triangulating a Global Form

Gated communities are everywhere: in civil-war-torn Iraq, in post-apartheid South Africa, postsocialist Budapest, in the peaceful US countryside, in places with soaring crime rates as well as in safe neighborhoods; in gentrifying transitory areas and traditionally bourgeois districts. They have become a veritable global form with a capacity to adjust to local conditions and display remarkable variations.

The research attempts to capture theoretically both the solidity and the variability of this global form in a three-city comparison of Chicago, Berlin and Budapest through a multilevel and multidimensional examination of public-private linkages. It treats the spread of gated communities as the outcome of the shared conditions of global neoliberal urbanism as well as of the mobility of neoliberal policies, ideas, images, tastes, and urban forms, negotiating thus the fine line between a macro-structural analysis and a more actor-oriented processual one. An ambition is to study connections and processes without retreating to a simple view of the diffusion outward of a new form from the US, which underline the prevalent Americanization argument in urban studies. Historical continuities, horizontal connections, Europeanization and east-west development-envy complicate the story.

This theoretical endeavor requires a layered comparative design: a combination of symmetrical comparative analysis (Skocpol and Somers), incorporated comparison (McMichael), the extended case method (Burawoy) and the morphological method (Ginzburg). The paper will discuss such maneuvering between cases, disciplines and strategies.

Oil Palm Boom and the Fate of Oil Palm Small-Holders in Sumatra-Indonesia, 1965-2015

In recent decades, oil palm industry, with its spectacular growth has contributed significant foreign exchange earnings to a number of countries in Southeast Asia. The current oil palm boom is a direct result of the changed global context, namely the response of capital accumulation strategies to the convergence of multiple crises and the emerging needs for resources by the new centers of global capital (Borras, Jr. 2013). In Indonesia, the imported plant from West Africa was developed into large scale and commercial plantations in 1911 (Jiwan, 2013) where Deli's plantation belt in eastern coastal plain of Sumatra was opened around 1866 (Stoller, 1992). During the colonial era the plantations were largely controlled by large foreign private companies while in the first fifty years of independent Indonesia it was largely dominated by state plantation companies. After the Indonesia-IMF agreement in 1998 the industry has undergone radical transformation (Okamoto 2001, Jiwan 2013). While the production in Indonesia is concentrated in Sumatra, it is characterized by foreign ownerships and a large number of smallholders. Amidst its social and environmental impacts, as with the previous logging industry, the industry represents a vast economic opportunity for the Indonesian government. The strategic role of the industry is due to the Indonesian comparative advantage in labor and land costs (McCarthy 2010) and its expansion was justified under the principle of the "right to development". The Indonesian development is characterized by biased toward economic development (Salim 2005) and can be categorized as an extractive regime (Gellert 2010). Through the perspective of political economy, this study focuses on the mutual relationship between social structure, social change and biophysical environment (Hannigan 1995) in the context of neoliberal globalization. Particular attention is given to the fate of oil palm small-holders in Sumatra during the New Order and Reformation Era of Indonesia.

BOELHOUWER, JEROEN* (The Netherlands Institute for Social Research, j.boelhouwer@scp.nl)

Disparities in the Netherlands – Are They Growing?

Compared to other countries, quality of life in the Netherlands is at a high level. This is combined with low levels of inequality: for example income inequality (gini coefficient) and happiness inequality (standard deviation) are low and rather stable over time.

Looking more in depth to income inequality (income deciles, top 1% income) reveals a less stable picture and even growing inequality between some groups.

We also look more in depth to a broad concept of quality of life, as measured by the SCP life situation index, which combines indicators on housing, leisure time, health, mobility, participation and social networks. There are also huge differences in life situation between groups in society, though varying though time.

In the presentation we shall focus on the effect of the recent economic crisis. In general, the crisis did have an effect on the disparities and inequalities, but it was a limited effect both in duration and in depth. But are vulnerable groups, with less resources (like income, education and health), hit harder by the crisis than groups which are well-off? What about the middle class? Did the crisis have the same impact on income-related domains as on social domains? Are people actually less happy?

In the presentation we will show results on these matters, using the social report Social state of the Netherlands (to be published December 2015), looking back 10 years and show that the impact of the crisis in the Netherlands is less severe as some feared for.

Weapons of Countervisuality? Street Art As a Practice of Rule or Resistance

Street art is becoming a frequently used medium in recent protest movements related to the global capitalist crisis. Media reporting on the Occupy movement and on the European financial crisis is often characterized by pictures of civil society protest in the form of slogans, murals and stencils on the walls. Due to its visual and symbolic language, street art is able to deliver political messages to a transnational public and to generate solidarity in social movements. With no doubt, the often colorful und expressive pictures have the potential to catch the viewers´ attention and to draw it to the subject and the protagonists of the protests.

At the same time, it would be naïve to consider street art as a genuine "weapon of resistance" for the subaltern and the oppressed. This genre of art is increasingly being used by powerful actors such as governments and companies to spread messages of advertisement and propaganda.

In my PhD thesis, I am investigating the potential of street art as a means of visual political communication for both protesters and powerful actors. How does the appearance of street art in the mass media change the perception of the crisis and the protests against it?

In Visual Culture, images are seen as a "constantly challenging place of social interaction" (Mirzoeff 1999). Going further into Critical Visual Theory, I am discussing Nicholas Mirzoeff´s ("The Right to Look", 2011) concept of "countervisuality", as used by resistance actors. In terms of method, I am utilising Gillian Rose's (2012) method of critical visual (discourse) analysis to analyse examples of street art images. Rose analyses images in three steps, namely 1) the site of the production, 2) the site of the image itself, and 3) the site of its audience. Within step 2), also Panofsky's iconological approach is applied.

Familial and Life (Hi)Stories in the Context of Established-Outsiders Figurations

We suggest that case studies of life and family (hi)stories are able to greatly contribute to the analysis and explanation of figurations of established and outsider groupings as well as the collective discourses (and counter-discourses) that are intertwined with social figurations. We shall try to clarify the methods and means required for this purpose. On the other hand we shall also seek to show how a combination of figurational-processual sociology with research into collective discourses can contribute to better research and better understanding of the interweaving of individual life (hi)stories with 'objects' at the so-called macro and meso levels of social and historical research.

We shall pursue these questions on the basis of our current empirical research into the life trajectories of former child soldiers of the "Lord's Resistance Army" in Acholiland (North Uganda) before and after their transition into civilian life. In our analysis, which is focused on biographical case studies and family histories, we shall show how the everyday experiences of discrimination that these "returnees" encounter in families and local communities are different from and interrelated with the discourse on amnesty and reconciliation that is dominant in Acholiland.

The Museum As a Space of Social Relations. the Museum of Oskar Schindler's Enamel Factory in Krakow and the Museum of the History of Polish Jews Polin in Warsaw.

Museums are ambiguous spaces. On the one hand, they provide some models built on social perceptions, and on the other, they are places open to interpretation. They are relational spaces. Spaces of various types of relations like institutional, interpersonal, international, intergeneration or intercultural relations. They are also places of relations and dialogue, establishing and negotiating meanings. In any event, museums are also, and perhaps above all, stories about people, events and the effects of their meetings.

Museums are primarily social concept spaces. As noted by Bronis³aw Baczko «to determine your collective identity is yet to designate its» territory «and its boundaries, define their relationship with the» other «, to create images of friends and foes, rivals and allies». My argument is that museums are those social spaces that offer social ideas, which usually fit within certain models.

In the case of Polish communism, for many years the museum space was reserved for events accepted by the authorities. And organized exhibitions usually served to enhance propaganda power. However, after the fall of the communist system there was a need to tell the story, running memory, and recreate historical events which were relevant and important to the Polish nation. There was a huge gap, with its reduction becoming a more and more apparent need for Polish society.

In my presentation, I would like to present the results of qualitative research devoted to the reception of the museum, which was conducted in two museums the Museum of Oskar Schindler's Enamel Factory in Krakow and the Museum of the History of Polish Jews POLIN in Warsaw. The project was titled My way, my choice. "I" am in the museum. In presenting the results, I would like to pay special attention to the imaginative and relational character of the museum space.

EU Integration Policies and Real Experiences of Romanian Migrants

This paper proposes a double comparative approach to integration policies within the context of the present-day phenomenon of labour migration from Central and Eastern Europe towards the West of the European Eunion. It attempts to address the need of enriching research on the social problems faced by the new diasporic communities. These communities originated in the relatively recent search for jobs that has pushed migrant workers to leave their Central and Eastern Europe countries, since the beginning of the '90s.

Through discourse analysis, we first compare the European Union migration policy, in terms of "migrant integration" (Hugo Brady, 2008), as it appears in a survey of European integration policies funded by the European Commission, to the opinions on integration of Romanian immigrants who are active communicators online and thus make confessions about their life experience abroad. The integration legislation, such as laws on family reunion, residence rights, labour market access, political participation, access to nationality and antidiscrimination (Hugo Brady, 2008: 18), is confronted to the public opinion voiced by the Romanian users of online platforms.

The second comparison refers to the perspectives on integration into the host societies of the Romanians who are living and working in the United Kingdom and in Spain.

The research corpus is made up of the verbal comunication / texts posted by the Romanians on "Spania Romaneasca" [Romanian Spain], *http://forum.spaniaromaneasca.com/*, under the

category "Viata in Spania: Spania între mit si realitate..." [Life in Spain: Spain between myth and reality...] and "Romani in UK" [Romanians in the UK], *http://romani.co.uk/*, under the category: "Forum: Romani in UK" [Forum: Romanians in the UK], about the topic: "Greselile tipice ale noului venit. Evita-le!" [Typical mistakes of the newcomer. Avoid them!]

A Study of How Labour Market Institutions Affect within- and Between Occupation Wage Inequalities in Norway in the Period from 2003-2014.

Wage inequalities in Norway are small compared with other Western countries, but inequality is rising. In this article, we will investigate whether the wage returns to institutions of occupational closure, such as licensure, credentialization and unionization, can account for (growing) earnings differences between occupations. Occupationally based wage differences have received more scholarly interest in the past few years, and an increasing number of studies document that these institutions raise mean wage levels. Have the significance of these institutions changed in Norway during the 2000s? So far, little attention has been paid to how occupations are internally structured with regard to inequality among incumbents, and there is a lack of studies on how closure institutions affect the wage dispersion within occupations. It has been shown that unions raise mean wage levels and compress the wage distribution, resulting in greater earnings equality among union members compared to non-union members. According to Bol and Weeden, to grasp the link between closure and income inequality requires an investigation of how closure affects internal distributions of income. Thus, the second research questions guiding this article are: what are the effects of occupational closure on the dispersion of wages within occupations? We use Norwegian register data to investigate the effect of licensure, unionization and credentialization on between- and within occupational wages. The register data has yearly records on education, employment and income, which allows for a longitudinal design. The results show the significance of licensing and credentialization has increased during the period 2003-2014. Moreover, unionization tends to decrease wage dispersion, but there is no significant effect of licensure or credentialization.

BONAZZI, MICHELE* (Alma Mater Studiorum University of Bologna, michele.bonazzi@unibo.it)

For a Critical Theory of the Digitalization of Everyday Life

The process of digitalization of our daily lives is becoming increasingly invasive, providing to the network users new and innovative ways to increase and share their own social, cultural and economic capital. The connection opportunities allow to the individuals to have a rich framework of solutions, based on a collective intelligence (Lévy), that improve the individual and collective wellness within a global and systemic vision but, at the same time, scholars and researchers are trying to explore the dark side of the network to identify the negative externalities of this process and give life to a real critical theory (Fuchs) of the information society and the social media. At the dawn of this new digital age (Schmidt and Cohen) is establishing a vision linked to a digital risk society (Beck, Lupton) in which are highlighted new forms of coercive power (Bauman, Lyon), risks of social anomie (Durkheim, Turkle), collective obsessions (Lovink), dystopian drifts (Morozov) and forms of social alienation (Marx, Carr) due to the excessive dependence on the tool. The objective of this paper is therefore to analyze the apocalyptic theories of the network, understand the results at a social level in order to photograph a world that is changing and to identify what are the risks to be faced in the near future.

BONELLI, MARIA DA GLORIA* (Federal University of Sao Carlos, gbonelli@uol.com.br)
HARTMANN, IVAR (Law FGV Rio)

Brazilian Lawyers and the Globalization of Legal Practice

The paper focuses on the impact of globalization in legal counseling in Brazil. The hypothesis is that the homogenization produced by global processes enables an articulated fragmentation of practices, reordering social differences without eradicating inequalities. Difference and inequalities have been observed also in legal education, with the proliferation of private Law schools, the expansion of female participation and now that of Afro-Brazilians undergraduated. In 2012, there were 1.157 law schools in Brazil – 957 of them private, 182 public. This growth imparted change on faculty. In that year, in a total of 40.828 professors, 38,4% were women and 22,1% were non-whites.

The internationalization of legal practice has produced new forms of professional organization, which compete with family practices and those shared by few partners, as well as in-house counseling. In addition to elite large and medium-sized law firms, we see mass litigation and in-house corporate counseling by legal executives. This diversification was also accompanied by changes in the social composition of the profession. In 2012, the Brazilian National Bar Association counted 696.864 active lawyers, of which 55% female. In the state of São Paulo, the State Bar had 248.712 active lawyers, of which 54.2% male. Increase in the participation of Afro-Brazilian lawyers is more recent. Since 2013, around 1.300 non-white lawyers monthly have joined the National Bar.

In recent years the increase in internet penetration in Brazil has accelerated the creation of legal startups. In a traditional, guild-oriented job market such as Brazilian legal practice, legal professionals are concerned with the commoditization of legal counsel, unprecedented efficiency in the provision of legal practice and, as a result, the job loss.

The paper shows the increase of stratification based in marks of difference, such as gender, new forms of legal practice and the expansion of organizational professionalism.

BONIFACIO, GLENDA* (University of Lethbridge, glenda.bonifacio@uleth.ca)

Global-Local Structures and Care Migration

Care migration is a complex process that involves the intersection of local realities with global forces or vice versa. The structural adjustments in place in many developing countries are consistent with the regulations set forth by global institutions like the World Bank and the International Monetary Fund, and have resulted in the promotion of national policies attuned to the demands of the global market. Migration is thus one byproduct of the shift in the international division of labour, where care workers come mostly from the global South to serve the needs of the global North. Remittances boost national accounts and the transfer of public accountability on welfare provision into the hands of migrant workers. As well, there is a corresponding shift towards the internationalization of education to produce a flexible and mobile workforce that fosters the development of supply of migrant care workers. Arguably, in the global North, the availability of this human resource at a cheap cost enables private agencies to absorb the care deficit instead of the state. This discourse will be the focus of this presentation with examples from developing countries like the Philippines.

BONIZZONI, PAOLA* (University of Milan, paola.bonizzoni@gmail.com)

Good Families, Good Tenants, Good Homes. Cohabitations, Housing Standards and Immigration Controls in Italy.

The paper aims to explore how immigration controls increasingly extend into the private realm of the family and the home, through the superimposition of specific conceptions of "good" homes and "proper" family life vehiculated by national and local regulations, meant as critical devices mediating access to civic membership and the rights that follow. A first kind of controls explored in the paper aims at regulating membership rights claimed on the grounds of family belonging. Efforts to distinguish "true" families from the "sham" trigger intrusions into the private sphere of the home aimed at verifying the effectiveness of kin cohabitation, seen as the essential condition of a "proper" family life. A second kind of controls concerns instead proofs of adequate housing for regulating immigrants' and their relatives' access to civic membership on the grounds of integration performance. In this respect, housing standards play a critical role in mediating crucial status transitions (such as legalization or access to long-term residency) also making migrants' access to fundamental human rights (such as the right to family life) increasingly stratified in terms of social class. The proposed research, focused on the Italian context (and, especially, on Northern Italy), combines an analysis of immigration regulations with interviews with migrants, experts and privileged observers.

RC06-JS-23.1

BONIZZONI, PAOLA* (University of Milan, paola.bonizzoni@gmail.com)

Italian Families in London Facing Social Reproduction Dilemmas: Issues of Gender, Ethnicity and Class.

The paper explores, through the lens of social reproduction, the experiences of Italian families with small children in London. The concept of social reproduction aims at bringing together a varied set of activities entailed by reproducing human beings as cultural, social and physical subjects, tasks increasingly taking place in different sites (both inside and outside the family) and at different geographical scales (both locally and transnationally). Facing the challenges entailed by reproducing their families in an institutional context entirely new to them, families have to solve dilemmas (in terms of work-family reconciliation strategies, choice of school, care and health services), which call into question issues of gender, class and ethnic identity. Reproducing families in a transnational context entails, as it will be shown through the narratives collected, negotiating boundaries of belonging in an increasingly diverse and unequal urban context, a challenge faced drawing on varied forms of social, economic and cultural capital.

BONNEVILLE, LUC* (University of Ottawa, luc.bonneville@uottawa.ca)

Les Mises En Scène De La « Crise » à Travers Les Discours Publics Et Les Médias : Le Cas De La « Crise Décrétée » Des Services Publics Au Canada

Voilà une bonne vingtaine d'années que des représentants du milieu des affaires autant que des autorités publiques clament haut et fort la nécessité de transformer structurellement les organisations publiques et, en leur sein, les services publics (santé, éducation, etc.). Tout cela pour solutionner une « crise » de l'interventionnisme étatique, considéré comme « trop coûteux » et faisant « obstacle » à la croissance économique. Tour à tour sur la place publique, plusieurs dirigeants d'entreprise, entrepreneurs, représentants de différentes corporations vont tour à tour affirmer qu'il y a « urgence » d'augmenter les gains de productivité dans les services publics en réduisant les dépenses publiques et en rationalisant davantage. Tout cela afin de réduire la « dette publique » et le « fardeau fiscal » (terme qui n'est pas évidemment pas neutre). Or, si l'on suit l'histoire socio-politique et économique des 40 dernières années, on s'aperçoit que cette « crise » a d'abord et avant tout été décrétée à des fins politiques et idéologiques. La « crise » dont on parle tant dans les médias ne serait en fait que le résultat d'un discours visant à mettre de l'avant une autre vision de l'économie, celle d'une économie (néolibérale) fondée sur la réduction des impôts, des dépenses publiques, etc., censée favoriser la croissance économique et le « bonheur » du plus grand nombre. Dans cette conférence, nous souhaitons montrer comment ce discours est mis en scène sur la place publique et révélé à travers certains promoteurs et porte-paroles qui ne sont absolument pas « neutres » bien qu'ils présentent la crise et sa solution comme étant inéluctables. En partant du cas de la « crise » du système de santé, nous proposons ici une réflexion critique sur les discours et récits véhiculés sur la place publique.

Professional Bodies and the Regulation of Four Key Professions in Post-Apartheid South Africa

The aim of this paper is to answer the question, how professional bodies shape the professional milieu and labour markets for law, engineering, medicine and accounting professions in a post-Apartheid South African context. Historically the regulation of these professions by both the Apartheid State and relevant professional bodies occurred through strategies of racialised and gendered gatekeeping, professional closure and the manufacturing of professional boundaries. This resulted in a racially skewed labour markets in these professions, as well as hostile professional cultures towards black South Africans wanting to enter these professions. More than two decades after the dismantling of Apartheid, little is qualitatively known about how professional bodies have shaped the professional milieu and labour markets for engineers, doctors, lawyers and charted accountants in South Africa.

This paper makes empirical claims about how professional bodies are changing the historical patterns of these professions' demographics. Second, we claim that professional bodies may experience unique challenges in a developing state context, chief of which is balancing the need of the State to 'massify' the production of certain professions with the professional bodies goals of controlling access to these professions. This is particularly apposite for medical doctors for example.

These claims are an outcome of an exploratory qualitative case study of four professional bodies in South Africa. In-depth interviews were the main data collection tools. Interview data was triangulated with documentary data and labour market statistics. The process of data analysis was iterative with transcripts and documents coded for themes. The paper ends with some implications for the ways in which we theorise professional regulation in a developing state context as well as suggestive policy implications.

BONVIN, JEAN-MICHEL* (Université de Genève, jean-michel.bonvin@unige.ch)

LARUFFA, FRANCESCO* (Humboldt University, francesco.laruffa@hu-berlin.de)

The Contribution of the Capability Approach to a Theory of Sustainable Welfare Society

Since the crisis of post-war social compromises started in the 1970s, the main challenge for European welfare states has been that of finding normative principles capable not only of orienting the direction of reforms but also to generate the democratic support needed to implement them. After three decades of neoliberal hegemony, since the late 1990s the discourse on welfare reform in Europe has been increasingly influenced by the social investment approach (SIA). This seems able to tackle some of the most pressing challenges of European welfare states such as the emergence of new social risks and the transition to a post-industrial economy. Yet, the SIA seems to ignore another crucial challenge, namely the ecological one. Indeed, the main goal of the SIA is to re-find the lost path to economic growth, despite the fact that this has proved to be ecologically unsustainable. This article contributes to the conceptualization of a "sustainable welfare society" exploring the extent to which Amartya Sen's capability approach (CA) can constitute a valuable alternative to the SIA in providing a normative framework for welfare reform that reconciles the social and the ecological dimensions. In fact, the main advantage of the CA is that of focusing on human wellbeing rather than on economic growth in assessing social progress. This allows asking a different question from the SIA: instead of looking for a return to economic growth the issue becomes that of finding ways that allow the achievement of human flourishing *without* economic growth. Sen's critique of mainstream economics, accused of "commodity fetishism", will be the starting point for criticizing those dominant economic approaches to welfare reform such as the SIA. These are narrowly focused on the material dimensions and thus tend to ignore those aspects linked both to environmental sustainability and human wellbeing.

Critical Perspective on the Influence of Professional Organizations in the Construction of Curricula of Undergraduate Courses in Accounting

Admittedly, the characteristics that underlie a profession possess, as a base, the connection between the actual work activities and for which there is market demand, the higher education obtained in an educational accredited system that qualifies the individual, and preferential access for trained and skilled workers for the job, which institutionalizes the relationship between the higher education system and the labor market. In this context, professional associations act to maintain a captive labor market, with a set of requirements, among them, the abstract knowledge of higher level.

In Brazil, the Law of Guidelines and Foundations of National Education, together with Resolution. 10/2004 of the National Council of Education, expresses that universities have the autonomy to outline the syllabuses of university courses in Accounting. However, access to the accounting profession requires the attendance of a course recognized by the respective Professional Order and the overcoming of an entrance exam.

This study aimed at verifying, in the context of professional regulation, if Brazilian universities maintain their autonomy when defining the curricula of higher education aimed at graduating the professional accountant, from the Accounting coordinators' perceptions .

In the theoretical approach, it was used, as a conceptual framework, the sociology of professions and their theoretical currents: the functionalist, the interactionist, and the critical approach. It is an exploratory, descriptive and bibliographical study, combining quantitative and qualitative methods. The population studied included all the coordinators from Colleges of Science in Accounting in Brazil, with validated sample within the statistical probabilities.

The results show that the coordinators perceived that Brazilian universities have lost their autonomy in the construction of curricula of undergraduate courses in Accounting, which are subject to legal and contributory influences from Federal Accounting Council, Ministry of Education, contributions of the course's teachers themselves and International Organizations.

Cosmopolitanism and the Niyamgiri Movement: The Role of an International Constituency of Support for a Social Movement in India

This paper explores the trans-national aspect of a social movement in India. It analyses the international support for this social movement, primarily in terms of normative cosmopolitanism, which it differentiates into moral, legal and political cosmopolitanism; it also analyses the Indian government's response to the movement, in similar terms. The social movement that is the focus of this paper is the movement against bauxite extraction on the Niyamgiri Mountain in the state of Odisha in India, by a multinational mining company called Vedanta Resources. Concerns regarding the violation of the cultural rights of the indigenous Dongaria Kondh community which lived on the Niyamgiri Mountain and worshipped it, were central to the Niyamgiri Movement. The paper uses normative cosmopolitanism to explore the withdrawal of financial investment in Vedanta Resources by international financial institutions that wanted to register their protest against the mining company. It also analyses the use of international soft laws to indict Vedanta Resources and the diplomatic power politics that resulted in the Indian government's banning of the mining project, with the help of a similar theoretical framework. Finally, the paper reviews it own analysis critically and queries whether 'soft power' could also be a useful framework for an analysis of the support for the Niyamgiri Movement by governmental institutions. It analyses in this regard the role of the Norwegian Government Pension Fund and the acknowledgement of the role of this institution, by the Indian Supreme Court. The paper argues that the Indian Supreme Court's verdict on the Niyamgiri case was an attempt to showcase India's democratic traditions, and goes on to argue that this showcasing of India's democratic traditions was an attempt to enhance India's soft power in the trans-national public sphere. The paper explores how international relations played a role in the outcome of the Niyamgiri Movement.

La Investigación Acción Participativa y La Construcción De Una Sociología Global

La Investigación Acción Participativa y la construcción de una sociología global

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

El propósito de la presentación es dar cuenta de las posibilidades que ofrece la Investigación Acción Participativa (IAP) para la construcción de una sociología global que forje la convergencia del conocimiento entre el sur y el norte. La ponencia realiza una mirada a la respuesta que la IAP da al conocimiento forjado en la sociología europea y estadounidense. Toma como eje de análisis la IAP para destacar la manera cómo ha contribuido en la desconstrucción del pensamiento colonial y la construcción de un conocimiento endógeno en América Latina y otras latitudes, haciendo un énfasis especial en la forma que se inscribe en la sociología crítica. La IAP brinda enormes posibilidades para establecer redes de comunicación con los desarrollos de la sociología a nivel global, y de hecho así sucede, como se puede registrar en sus congresos internacionales y medios de difusión que reúnen sociólogos de las diferentes partes del mundo. La IAP al plantear cambios epistemológicos como la convergencia entre el saber popular y el conocimiento académico y el papel de las comunidades en la reflexión alrededor de la realidad y el cambio, induce una transformación en la sociología cuya primera característica tiene que ver con las características de la producción del conocimiento, el cual deja de ser dominado por escenarios intelectuales cerrados, para establecer el diálogo entre las comunidades científicas y no científicas, entre el saber académico y el popular, en fin, para generar un diálogo de saberes y una sociología global: sur-sur, sur-norte, oriente-oriente, oriente-occidente, etc.] NOTA: La presente ponencia fue enviada al pasado congreso de sociología en Japón, pero finalmente no se puedo presentar. Aspiramos a presentarla en el Tercer Foro de Sociología que se llevará a cabo en Viena en 2016.

Commercialisation of Land and Resources, Land Alienation and Issues of Identity: A Study of the Tiwa Tribe of Assam

Assam is an abode of several communities each having their own socio cultural idiosyncrasies. Different groups have moved into this region at different points of time and contributed to the rich and vibrant cultural diversity of the region. However, today the region is ill famous for ethnic violence and bloodsheds. It is understood as a vortex of identity politics. The diversified landscape of the region hosting a myriad of different communities, each with its own tradition, culture, practices etc, has been often held as the prime cause of all the ethnic troubles that the region is beset with. But, the roots of these rampant identity assertions and ethnic conflicts lie more in the issue of land, its access, control and distribution. Land is precious because of its economic and socio cultural significance and hence alienation of land inevitably leads to antagonisms and conflicts. It has been witnessed over the years that the State encroaches the land belonging to the indigenous communities in the name of development but these communities are hardly developed in this process. They rather become marginalised and impoverished. Thus land alienation and displacements due to developmental projects, privatization of communal land etc has led to ethnic clashes and mobilisations, thereby turning the region highly volatile.

This paper attempts to understand the impact of commercialisation of community holdings on the indigenous communities and their social relationships. It would analyse the case of the Tiwa tribe of Assam who have been incessantly asserting their identity and striving for autonomy due to land alienation, displacement and underdevelopment. Thus by highlighting the case of the Tiwas, the paper would analyse how elite centric development exploits and deprives common people thereby triggering ethnic movements and how the issues of land and identity creates a divide among people and fractures their social relationships.

Subjectivation Analysis in Discourse Research – an Interpretative Approach

Many empirical studies of human subjectivities focused on the self, identities or biographies which are entangled in local milieus like specific neighborhoods, families, youth or deviant cultures, organizations like hospitals, factories, schools and so forth. In doing so, these studies implicitly stick to an 'ecological perspective' (Vankatesh) which is originated in the Chicago School. The assumption behind this kind of research is that researchers just have to intertwine deeply into the institutional and organizational contexts of the groups or individuals they are studying. Researchers have to observe and talk to all the relevant persons and at the end they will get an appropriate insight on how the subjectivities in this specific field are constituted.

Clarke does not criticize this ways of gathering data, on the contrary, she applauds the developments in qualitative research like auto-ethnography. Nevertheless, regarding the emergence of a 'society of spectacle', and considering the global distribution of new media and people 'floating' (Vankatesh) in and around cities all over the world, it becomes clear, that self-relations are no longer only bound to local 'ecologies'. In this respect one has to take into account that "we and the people and things we choose to study are all routinely both producing

and awash in seas of discourses" (Clarke 2005: 145). This paper proposes a methodological grounding for the empirical research on the discursive situatedness of the self. For this I have developed a concept of subjectivation that is located in a Sociology of Knowledge Approach to Discourse and which considers the post-structuralist assumptions of the 'decentered subject' as well as Mead's, Goffman's and other's theories of identities. Finally I argue that an understanding of subjectivation as a 'sensitizing concept' (Blumer) establishes a broader perspective on human subjectivities in a globalized world.

BOSCARDIN, LIVIA* (University of Basel, livia.boscardin@unibas.ch)

Greenwashing the Animal-Industrial Complex: Sustainable Intensification and Happy Meat

While organic, local, or community supported agriculture are important steps towards a de-industrialized, more ecological and just agricultural system, these initiatives per se do not tackle the most destructive form of food production: animal agriculture. Besides killing more than 60 billion nonhuman land animals every year, animal agriculture, or the animal-industrial complex, is the main driver of climate change, ocean acidification, biodiversity loss, and of the crossing of almost every other planetary boundary, as well.

This presentation firstly portrays the animal-industrial complex and its ecological and social repercussions from the perspective of Critical animal studies, hereby positing the commodification of nonhuman animals as a political problem.

Secondly, current green trends within the animal industry are examined: on the one hand, we have sustainable intensification, which should enable the sector to double production by 2050. This increase is called the "livestock revolution" and can, according to the FAO, be attributed to a growing demand for animal products in the Global South. However, a more critical account states that international lobbies and Western corporations are trying to capture new markets in view of stagnating turnovers in the industrialized part of the world.

On the other hand, we have novel products like "happy meat" or "organic milk." Not only do they not fulfill their ecological pledge, and thus instrumentalize their green label for generating profits, they also reform, naturalize, and legitimize animal exploitation. Furthermore, they foster questionable reactionary worldviews.

Both trends have their common denominator in the continuing marketization of life and nature, albeit in a green, "sustainable" way. While ecological modernization discourses mainly sustain profitability, anthropocentric counter-movements maintain the oppression of countless sentient individuals and the environmental crisis. In the age of the Capitalocene, we need new sociological approaches to sustainability that confront both green capitalism and the animal-industrial complex.

VINCENTI, ALESSANDRA (University of Urbino Carlo Bo)

"They Dance Alone". Children Between Poverty and Social Rights

Children are mostly excluded from the analysis of poverty. The reasons are cultural and structural:

a) children are not considered in their own rights because it is assumed that their poverty can be well explained by the poverty of their family. It is supposed that their interests and their well-being match with those of the latter (family mainstreaminig). This is in contrast to the approach of childhood studies and sociology of childhood according to which children are social actors to be studied in their own rights (James, Prout 1997);

b) welfare reforms that, since the 80s of the last century, focused on the concepts of choice and activation – leaving in the background the social structure –, and have excluded children as persons to whom it is not possible to attribute responsibility for the choice (Saraceno 2015).

These statements have made children invisible in statistics and among the recipients of public policies.

Data and research, however, have highlighted that:

a) improved family conditions does not necessarily correspond to an improvement in the condition of the children;

b) the assessment of child poverty needs of specific indicators (Belotti 2011, Save the Children 2014);

c) in many Western countries child poverty – together with inequality - is on the rise for 20 years and even in countries that have enjoyed economic growth, children do not seem to have benefited.

The aim of the paper is to think critically on children's social citizenship in Italy starting from the conceptualization and measurement of poverty.

Our hypothesis is that children's social citizenship cannot be promoted if policies are focused exclusively on family. For breaking the bonds of the socioeconomic inheritance, children's rights to welfare should be faced through policies disconnected from their family conditions.

Practices, Dilemmas and Reflections Among Environmental Representatives

In examining environment and society relations, representation will always be at the core. The environment or "nature" cannot plead its own case but must be represented. Numerous actors claim to speak on behalf of nature while at the same time they may represent a country or region, an organization, a scientific or expert community, certain vulnerable groups, animals, and/or future generations. As a consequence, it is important to focus attention on the role of environmental representatives, as well as on their practices and reflections. Today, we know a great deal about formal procedures and principles of representation, but little about what it means to be a representative, particularly in a context of globalization and in transnational environmental politics and governance. The aim of this paper is to illuminate how environmental representatives in various organizational and professional contexts understand their own role as representatives. Who or what do the representatives claim to represent? How do they justify their positions? What kind of dilemmas, if any, do they experience? How are these potential dilemmas handled? The study is based on 15 qualitative interviews with representatives from five organizational/professional contexts: state, civil society, business associations, expert society, and journalists in the environmental field. The analysis reveals the importance of considering the varying social and organizational context that the representatives face including the everyday practices they are embedded in. The empirical material shows a number of dilemmas, which relate to multiple organizational/professional belongings and accountabilities. However, the magnitude and character of these dilemmas differ significantly among the focused categories. Based on these results, the paper can feedback to practice in a way that may enhance capacity for self-reflection among environmental representatives.

Policy Fragmentation As a Bridging Concept in Institutional Analysis of Gender Regime Change - the German Case

It is undeniable that the formerly conservative German gender regime has seen seminal change through the reforms in German family and equal opportunity policies over the last two decades. However, a transition to a new gender model, the adult-worker, or a dual care-giver-model, is yet not to be seen. Rather, new conflicting incentives are being institutionalized, which represent different normative and causal, sometimes contradictory assumptions and which can be ascribed to totally different gender models.

The German gender regime is a good example to demonstrate that its fragmentation is a typical but not unavoidable side-effect of institutional change. Basing on the concept of gender regime (as longtime debated in feminist welfare state research), the concept of fragmentation highlights the idea that in order to adequately assess institutional change, we need two axes, a horizontal and a vertical axis of analysis: While horizontal

fragmentation denominates inadequate coordination between policy fields and results in inconsistent institutional regimes, vertical fragmentation point out the consequence of tensions between institutional regulation and actual social (gendered) practices. As such, fragmentation indicates a current phenomenon in institutional social policy change. Conceptually, the paper offers a fruitful framework for analyzing incremental and eventually paradigmatic change as well as the evolution of gender regimes. Empirically, my arguments are based on a short analysis and interpretation of the present German gender regime.

BOTTERO, WENDY* (University of Manchester, wendy.bottero@manchester.ac.uk)

Ontology and the Subjectivities of Inequality

What questions does the 'ontological turn' raise for understandings of power and inequality? This paper examines these issues by considering work on the subjectivities of inequality. Conventionally, such work - adopting a realist or critical realist approach - has been more successful in explaining why people fail to acknowledge or recognise inequality than in accounting for when they do. This paper looks at different approaches to the subjectivities of inequality, and argues that it is important to understand what shapes everyday 'views' or framings of inequalities in terms of their practical, situational and strategic significance. It argues that we need to examine everyday forms of protest, dissent and misbe-

haviour from the point of view of a (Deweyan) pragmatist analysis, seeing the subjectivities of inequality within a broader framework of people's attempts to grapple with their practical problems and so engage in ongoing reconstructions of their social experience. However, this also raises questions about how power, and its 'recognition', is understood within 'flatter' ontological approaches to subjectivity.

BOTTNER, MIRIAM* (Bergische Universität Wuppertal, boettner@uni-wuppertal.de)

Placing One's Self in an out-of-School Learning Facility – Videography at a Children's University

In Germany, participating in out-of-school learning facilities has become more popular. Nevertheless, there has been little qualitative research on this issue. In a quantitative and qualitative project about different socialization contexts ("SEBI – Self-Orientation and Self-Directed Learning", University of Wuppertal) we focus on - amongst other things, a - children's university. This is an institutional context where children can participate voluntarily on different thematic courses. Based on video data collected at a children's university we discuss how generational order is produced and shaped into different constellations. Our video analysis of this out-of-school learning facility shows three findings: First, how children grasp, work out and modify rules in this unfamiliar context and how they become accomplices in the production of generational order. Second, how children paradoxically are 'doing pupil' even in this out-of-school setting, revealing the dominance of 'school order'. Third, by contrasting different courses, a variety of ordering processes can be found. This concerns the ways children are addressed and the way they present themselves. As theoretical reference point we use the concept of socialization as 'generational ordering' (Bühler-Niederberger). Thereby we gain further insights in producing and reproducing differences between adults and children and elucidate children's contributions to processes of social ordering. Methodical insights into the process of analysis will be given and results will be discussed.

BOUCHER, GERARD* (University College Dublin, gerard.boucher@ucd.ie)

WATSON, IARFHLAITH (University College Dublin)

Ireland's National Diaspora Centre, Fortress Europe and Europe's Migration Crisis

Austerity in Ireland led to a revival of interest by Irish governments in the Irish diaspora, particularly for capital investment and tourist expenditures from wealthier North Americans. This was exemplified in *The Gathering* in 2013, which ignored poorer emigrants in British and American cities, the dispersal of over 200,000 young Irish since 2009, and Ireland's 500,000 or so immigrants and naturalised citizens from around the world and their diasporic communities. This very selective gathering with its combination of an ethnic and wealth-based conception of Irish national identity was largely reproduced in the government's proposal for a National Diaspora Centre. Interestingly, the feasibility study for the centre, commissioned by the National Tourism Development Authority, provides striking visual images of a core-periphery layered model of the Irish diaspora. The images are epiphenomena of a wider national discursive structure in Europe. It reveals increasing levels of inclusion closer to the core. The layers of the images are explained in terms of a 'core' consisting of the diaspora of current national emigrants, the more distant ethnic based generations of Irish descendants, and more diffuse Irish influences on world culture. These images are remarkably similar to Andrew Geddes's diagram of a layered core-periphery model of Fortress Europe (2000), which, in terms of inclusion and exclusion, are discursively similar. This model focuses on the use immigration policies and peripheral European borders to protect national cultures and a 'western' European identity from physically and culturally different immigrants from outside Europe. The parallel between the Irish and European core-periphery images is all the more salient in the context of Europe's 'migration crisis' of 2015 which has led to a return of Fortress Europe border controls. This paper explores the links between these core-periphery images and nationalist, ethnocentric and racist ideologies applied to images of the European migration crisis.

Santé Mentale, Migration, Et Violences Faites Aux Femmes: L'accompagnement Psycho-Social Des Femmes Excisées Au Centre Françoise Minkowska (Paris)

La question de l'accompagnement psycho social des femmes excisées est au croisement des questions liées aux inégalités de genre, au statut migratoire et aux déterminants sociaux en santé physique et mentale.

Cette intervention se propose d'analyser ces interactions au prisme de l'accompagnement psycho social des femmes excisées en situation migratoire en France, leur accès aux soins et, plus précisément dans le cadre de la santé reproductive.

L'excision est un traumatisme sexuel et un psycho traumatisme. Le but de l'accompagnement psycho social est d'évaluer l'impact traumatique de la mutilation et permettre l'énonciation de ce qui a fait traumatisme.

La chirurgie réparatrice doit être abordée avec la plus grande des prudences. La « réparation » psychologique est un préalable nécessaire à la réparation physique d'où l'importance d'écouter, d'entendre de comprendre l'indicible sans jamais stigmatiser.

Ce propos sera illustré par des cas cliniques.

BOURNE, CLEA* (Goldsmiths, University of London, c.bourne@gold.ac.uk)

Reconfiguring Creativity and Expert Labour: Darwinian Struggles Between Advertising, Marketing and Public Relations

Advertising, Marketing and Public Relations (PR) have experienced phenomenal occupational growth throughout the past century. Their emergence as separate professional projects is a story of interprofessional tensions (Abbott 1988) in the struggle for dominance as 'trusted advisers' to client-organisations.

All three are, notably, entrepreneurial professions – governed by market mechanisms and highly responsive to the organisational cultures they serve (Muzio et al, 2008). Their legitimacy has evolved through efforts to assuage producer anxiety. Each field promotes itself as the most appropriate for "controlling, influencing and predicting" what stakeholders want or what consumers are prepared to buy (Lury & Warde, 1997: 92).

Marketing long ago 'won' the battle against Advertising and PR for legitimacy as scientific, managerial 'efficiency experts'. But the interprofessional battlefront has shifted. The speed of change is moving faster. Revolutionary technologies have transformed communications management and delivery, exposing all three fields to new sources of pressure and control.

Science still matters. But today's clients valorise creativity more than ever. Creativity offers 'newness', the ability to break new boundaries and establish new genres (Nixon 2003). Creativity fuels the design of ever-new products, ever-more sophisticated campaigns and everlasting 'buzz' across digital and traditional platforms.

Advertising once ruled the creative 'roost'. Now its jurisdiction is under threat from both Marketing and PR. PR is 'reclaiming' creativity as a specialism; hiring creative directors and 'creative catalysts', even entering the prestigious Cannes Lions creative awards (Rogers, 2014). Meanwhile, Marketing's once 'scientific' managers are now pressured to become 'brainstorming experts'.

The site for this empirical study is London, one of the world's largest 'creative economies', home to thousands of promotional professionals. The paper will explore their latest Darwinian struggle through a narrative analysis of news stories published in UK-based trade publications; thus contributing new understandings of hybridization and disruption in the evolution of expert labour.

RC02-30.2

BOURNE, CLEA* (Goldsmiths, University of London, c.bourne@gold.ac.uk)

Sensemaking While Speculating: Collective Understandings of Financial Risk-Taking in Jamaican Online Communities

"Deborah, it has nothing to do with being educated. Life itself is a risk and many... who made it to the top have taken great risks..."

"...it's up to the individual if they choose to risk THEIR money. I have decided to risk mine, if I lose so be it."

These quotations are extracted from conversations on 'WealthMax', one of several online financial communities formed by Jamaicans to share information about investing in informal schemes.

Krige (2012) describes the proliferation of such schemes as part of the logic of financialisation of everyday life, transforming finance 'into a field of dreams as well as a field of schemes' (2012: 73), opening up spaces for financial tricksters to flourish, particularly in areas of rampant structural inequalities.

Between 2004 and 2008, the Caribbean island of Jamaica cultivated its own field of schemes as scores of unregulated 'investment clubs' promoted the allure of global capital markets. At the height of the boom, schemes delivered annual returns as high as 728% (Carvajal et al, 2009). Jamaicans from all walks-of-life risked their lifesavings to invest in the schemes.

This paper will offer insights into how online social relationships help people collectively come to understand themselves as 'investors', by exploring the storied experiences of individuals marginalised by limited access to global markets. The paper draws on data gleaned from conversations posted from 2007-08 on 'Wealth Max', the online financial community (*http://wealthmax.wordpress.com/*). Investment is itself a social activity where people often make decisions collectively (Tarim, 2012). To this end, online financial communities serve as relational mechanisms where members can access and share investment information, reducing the ambiguity of diverse messages (Herrmann 2007). Through narrative analysis the paper will explore sense-making by 'WealthMax' members as they discuss the risks and rewards of speculating in the CashPlus scheme before its 2008 collapse.

BOUTSIOUKI, SOFIA* (University of Macedonia, sofiab@uom.edu.gr)

Experiences from Student International Internships: Taking a Step into the Real World?

Internships are designated as instruments that facilitate the transition of young people to employment and have great potential to contribute to the confrontation of youth unemployment. An intern is offered a unique opportunity to gain a hands-on work experience under close supervision and guidance in a corporate environment. Through such an experience interns are able to test their knowledge and skills and to develop their competences further, thus being able to integrate in the labour market easier. This paper approaches the issue of international internships for university students. It presents the findings of a survey which focuses on the experiences of university students who participated in such schemes. These internship opportunities were promoted and supported by a student international association. Students' affiliation with this organisation introduces them in a global network of universities, which aspires the enhancement of youth leadership and civic qualities. Besides describing the particular programme's structural details, the paper analyses the participants' incentives in terms of space, content and expected prospects. Furthermore, it attempts to define the challenges that were confronted by the students during the internship, as well as the benefits they gained from their experience at professional, educational and social level. The understanding of the students' perceptions and attitudes regarding their overall experience would be very useful. It would create awareness of the factors positively affecting the engagement of young individuals in similar experiences and, thus, would increase the probability of more students being attracted by a professional experience programme. Finally, the paper aims at determining policy interventions which would potentially reinforce the effectiveness and the inclusiveness of the particular international internships programme in favour of the students. The implementation of the appropriate policy measures would leverage the experience acquired through such schemes in order to improve youth transition to the labour market.

ILIEVA-TRICHKOVA, PETYA* (Institute for the Study of Societies and Knowledge, BAS, petya.ilievat@gmail.com)

The Social Embeddedness of the Influence of Higher Education Expansion on Graduate Employability

The paper aims to explore how higher education expansion and social and economic transformations in nine post-socialist countries (Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Lithuania, Poland, Slovakia, and Slovenia) influence on graduate employability. Drawing on data from the European Social Survey (2010) and the official statistics (Eurostat), it investigates different dimensions of graduate employability and combines macro-level and micro-level factors in explaining national differences in it. It is argued that employability refers to graduates' abilities to find an employment of a specific quality and that these abilities have two sides: agency-related and structure-related. Two aspects of graduate employability are outlined: vertical mismatch and unemployment and the analysis focuses in particular on the first one.

By using descriptive statistics, bivariate associations and logistic regression the study reveals that higher education expansion has created new conditions and challenges for graduates' employability. It does not allow drawing the conclusion that the expansion itself automatically translates into worsening of the employ-

ability. Rather, it provides evidence that this relationship is mediated through the state of the economy in each country. Thus, graduates' employability depends on other factors such as the state of the economy, the structure of the graduate body and how it matches to the labour market demands.

The paper shows that in the era of mass higher education and knowledge-based economies, the development of higher education of a given country is an important part of its specific 'institutional package'. It also demonstrates that the problems that graduates currently experience on the labour market may be viewed as a sign that in the context of higher education expansion higher education has characteristics of a positional good. This raises new questions and arguments in the ongoing discussion if and when higher education could be defined as public or private good.

BOYADJIEVA, PEPKA* (Institute for the Study of Societies and Knowledge, BAS, pepka7@gmail.com)

ILIEVA-TRICHKOVA, PETYA (Institute for the Study of Societies and Knowledge, BAS)

Working or Studying: (Re)Shaping Students' Transitions after Leaving High School

The paper aims to explore the influence of the horizontal differentiation of upper-secondary education on students' transitions after leaving high school. The study uses Bulgaria as a case study and identifies five distinct patterns of students' transition upon completion of high school: a) being in a temporary employment, b) being in a significant employment, c) attending higher education institution, d) attending higher education institution and working, and i) being neither in education, nor in employment. The paper applies a theoretical framework which builds upon institutional perspective to upper-secondary education. The empirical basis of the study is the Bulgarian School-Leavers Survey (2014). It is a nationally representative for people aged 15–34 who had left education for the first time in the previous five years, preceding the survey for more than one year. By applying multinomial logit regression, the study demonstrates the importance of taking into account the horizontal differentiation in explaining the young people's transitions after leaving high school. The analysis shows a considerable variation in graduates' patterns of transition after completion of secondary education according to the type of secondary education they have finished. It also reveals that the type of secondary education programme moderates the effect of the academic achievement and of students' socioeconomic background on students' patterns of transition after leaving high school. The study identifies three main theoretical reasons why school-leavers who graduated from different types of secondary schools follow different patterns of transition: socialization effect of teaching process, institution's socialization effect and a signalling effect. Last but not least, the study shows the usefulness of incorporating additional divisions, between selective and non-selective upper-secondary programmes and between non-profiled, semi-profiled and profiled ones, which fit better to the analysis of students' patterns of transitions in highly stratified and differentiated educational context as the Bulgarian one.

Development of Global Professional Groups in Dignity Protection before the European Court of Human Rights

The paper concentrates on the analysis of judgment delivering process in the European Court of Human Rights. The process is subjected to influence of various parties. In order to evaluate the involvement of judges, registry servants, government representatives, and applicants before the Court we examine the protection from dignity infringements before the Court in Strasbourg. First, the paper provides criteria for the comparative analysis of those professional groups including emerging sub-groups, size, legal status, main functions, etc. Next, within the investigation of the Court's case law concerning protection of human dignity we identify typical potentially vulnerable groups of applicants including children, women, representatives of ethnic minorities, prisoners, the disabled, the deported, etc. Furthermore, we explore non-typical cases of human dignity protection before the Court. Finally, we observe the mechanisms of interaction of the groups of applicants with the other professional groups through the judgments referring to protection from dignity encroachment before the Strasbourg Court.

Engineering Work: The Intersection of Gender, Immigrant Status and Credentialism

Globalization and the knowledge economy mantra mean that post-industrial nations are now competing for "the best and the brightest". Internationally trained engineers are central in this race, working in the ICT fields and resource extraction areas as well as offering consultation services globally. In Canada for example, annual permanent visa records show that at the start of the millennium approximately four out of ten of those admitted who were between age 25 and 64 and gave occupations were engineers.

In the broader literature, the fields of science, technology, and engineering are often deemed as culturally neutral, open, and mobile. But, research shows that highly skilled immigrants, including engineers, often do not work in jobs that are commensurate with their training. Furthermore, women who are trained in engineering in general face employment disadvantages, facing significant penalties in earnings and in promotions to management and experiencing barriers from androcentric work environments.

Our research combines the two dimensions of inequality: gender and immigrant status , adding a third contextual factor, notably the role of licensing requirement that are mandated by the state and upheld through professional associations. Our analysis of the 2011 National Household Survey, which replaced the 2011 Census 2B survey, demonstrates that being internationally educated and being female carry penalties for those trained in engineering. Internationally educated immigrant women are more likely than their male counterparts or Canadian-born women and men not to be employed; they are less likely to hold occupations directly related to their engineering training, and they have the lowest average earnings. Moreover, the earnings penalty of not being in occupations related to engineering training is highest for immigrant women. These findings are consistent with the "double negative effect" in which gender and nativity related barriers intersect with destination country re-accreditation barriers .

Cross-National Public Support for Mental Health Policies: The Influence of Stigma, National Culture and Political Landscape

Health inequalities are created and sustained in various ways. While individual advantages or disadvantages play a role in determining health outcomes, the social policies of welfare states have received increased attention as a mechanism that creates health inequalities. Multiple factors impact the design of programs, the provision of services and financing mechanisms for a nation's health care system, but it is clear that public support is a major determinant for ongoing and transformations in health care policies. We know that the public is generally supportive of health policies, but government responsibility for mental health and behavioral health care has received significantly less public support than for comparable health policies cross-nationally. The current study uses nationally representative data for Belgium, Germany, Hungary, Iceland, Spain, Great Britain and the United States drawn from the Stigma in Global Context-Mental Health Study (SGC-MHS). Although prevalent cultural stereotypes are associated with policies and practices that disadvantage persons with mental illnesses, no methodologically coordinated study has demonstrated the extent to which mental illness is stigmatized and results in inequalities in policies cross-nationally. Our results show cross-national variation in public support for government responsibility for mental health policies ranging from 39% in the United States to 86% in Iceland. Variable dimensions of stigma capture multifold expressions of the public's view about mental illness that impact governments' assuming responsibility for mental health care along with other influences including literacy about mental illness, shame associated with receiving public support, political affiliation and support shown for minority racial/ethnic groups with a mental illness. The results provide insights into the public pressures policymakers face when making decisions about mental health policies that ultimately have consequences for how vulnerable groups with mental illness are treated and the inequalities likely to exist within and across societies.

"Brotherhood" for Survival: Homosocial Solidarity Networks of Afghan Unaccompanied Young Male Migrants in a Shantytown in Istanbul, Turkey

With the conflicts in Afghanistan after the Soviet invasion in 1978, one of the directions of the fleeing Afghan migrants was Turkey. One of the aspects of the current Afghan migration is the existence of the undocumented migrants. Many of those migrants are young males many of whom are under the age of 18. As a result of this forced migration, the Afghan boys were forced to start to work at earlier ages, as undocumented and informal laborers.

This study investigates the solidarity networks of Afghan unaccompanied young male migrants in Karasu, a shantytown located in Beykoz, Istanbul, where the migrants live in houses composed of males from four to twenty people, grounding on a qualitative field study with 28 young male Afghan migrants conducted in 2015.

Here we present that, young Afghan male migrants develop multi-faceted homosocial solidarity networks for their survival. On the one hand, in order to escape from Afghanistan for migrating to Turkey, find a job and housing, provision their living, and provide security for other Afghans in the neighborhood, they construct patriarchal codes of masculinities. On the other hand, for their social reproduction in the domestic sphere, they practice duties that are attributed to the women in such patriarchal relations. As a result, this study presents that the relations surrounding migration, young male migrants execute social roles as youngsters in their private lives, patriarchal male laborers in the public sphere and gender-role-stretchers in their migrant households for their survival.

The Missing, the Present and the Hoped: Three Different Family Modalities of Afghan Unaccompanied Young Male Migrants in Karasu Neighborhood, Istanbul

Istanbul is the primary centre of attraction for migrants from Asia, Middle East, and Africa in Turkey; and one of the largest of those migrant groups is the younger Afghan males, who come as unaccompanied migrants (UNHCR, 2015). This presentation is grounded on the data collected in the qualitative field study conducted in Karasu Neighbourhood, Istanbul during summer 2015. These migrants predominantly work in construction and textile sectors in vulnerable employment conditions. This study discusses how unaccompanied young Afghan male migrants construct family imaginations in terms of survival, accommodation, employment, interpersonal relations, and time and space.

In this study, collecting life stories of 28 unaccompanied young Afghan male migrants via in-depth interviews, we identified and focused on narratives of three different family modalities, each of which were told with diverse time and emotion references. The first modality, which we call "the missing family" represents families of the migrants which were lost in conflicts in Afghanistan; left in the past; fallen apart in the process of migration; spatially distant; missed; in other words the migrants' families of their lost childhood days. The second modality, which we call as "the present family", represents families of the migrants which they share with their other fellow young male Afghan migrant in shantytown households, which they go to their workplaces from, which they supply personal emotional care, healthcare, security and food to other members of the household and do other domestic duties and provide social reproduction. The third modality which we call as "the present family", is "the hoped family", which the migrants dream and plan to start, by marrying a girl from Afghanistan, managing to pay their expensive bride price, and constructing a happy life, establishing their personal integrity. In conclusion, we observed that the migrants distribute their earnings to these three modalities.

Is There a Cyclical Movement in Environmental Concern in Europe?

Common sense, many journalists or politicians, or even some social scientists, spontaneously think that environmental awareness in Europe has increased continuously since the emergence of the environmental movement in the early seventies. We propose to test this assertion, and show that it is not obvious.

To do this we will rely on major European surveys, EVS, ISSP and Eurobarometer, comparing the situation in different countries of the European Union from 1971 to 2012. We suggest distinguishing on the one hand the concern for the environment as such, on the other hand the fact of giving a great importance to the environment, including putting it ahead of other values of social life. We will see at first that concern for the environment as such is a consensual value, which excludes a progression, since it is already unanimous from the beginning of environmentalism. Secondly, we will show that the priority concern for the environment is following a cyclical movement from the seventies. We will try to prove further that this movement is synchronic in different European countries, which confirms the strength of this evolution in cycles. Finally we conclude by questioning about the causes of these successive ebbs and flows in recent decades in EU.

These results will be very useful in order to argue about the existence of a European public space, to guide practical measures regarding the environmental behavior of citizens, and to determine the type of communication that would allow implementing these measures.

BOZUKOVA, KATYA* (Royal Holloway University of London, kbozukova@hotmail.com)

Close Friends or Virtual Strangers: Interrogating Young People's Conceptualisation of Online Friendships

The advent of communication technologies – email, intstant messaging, social media – has given rise to a curious form of long-distance relationships: friendships where neither parties have ever met face-to-face, nor are they likely to. Despite contradicting what Andrew Sullivan (1998) considers to be a key feature of friendship: "one's friends are simply those people with whom one spends one's (physical) life," there are many cases of online friendships developing to be as important, if not more so, than those one has with one's physically accessible acquaintances. Sometimes those friendships turn into love and prompt both parties to cross great distances to be together. Others, the people involved invest a great deal of energies and resources into helping one another.

Though the dangers of online life are widely known and discussed, both in academia and outside of it – dangers such as cyber-bullying, catfishing, revenge porn, identity theft – studies about how people (predominantly young people) conceptualise their online friendships, and what they get from them, are less known. Through qualitative surveys and secondary sources, this paper aims to be an exploration of online friendship – how does it begin, how is it maintained, and why does it end? In what aspects is it similar to face-to-face friendship? Should our concept of friendship evolve to accommodate this technological advancement, or have social networks served to demonstrate what the essence of friendship actually is?

Precarious Researchers in Italy: Gender Asymmetries in a STEM Department

Over the last years, the Italian academic system has been characterized by several reforms, which strongly modified the recruitment system and the current academic population. Despite these substantial changes, the gender gap – especially in STEM disciplines – seems instead to be stable over time. Although there is a (slow) increase in the presence of female PhD candidates and post-docs, women continue to be highly underrepresented among the highest academic positions.

In this paper we discuss part of the results of the GARCIA project – Gendering the Academy and Research: combating Career Instability and Asymmetries, financed by the FP7 Programme of the European Commission. The project, with a three-year duration (2014-2017), involves seven countries (Italy, Belgium, Switzerland, Austria, The Netherlands, Iceland, Slovenia) and focuses on gender differences in the early phases of the academic career, in which the presence of temporary positions, not included in tenure track paths, has enormously increased in recent decades. Adopting both a quantitative and a qualitative approach, we analyse a case study conducted in a medium-sized university located in the northeast of Italy.

From a quantitative point of view, we disentangle the above-mentioned gender gaps within STEM disciplines, looking at the individual and family characteristics.

The qualitative analysis is instead based on twenty in-depth interviews conducted in a department of Information Engineering and Computer Science. The interviews involved both male and female post-docs and fixed-term researchers currently working at the University, and PhD holders who worked in the past with temporary positions in the studied department, but who are now continuing their careers elsewhere, in academia or in other fields.

In the conclusion we discuss the implications of recent changes in the Italian academic system, from a gender perspective, highlighting how the current processes are not able to encourage female scholars in constructing a successful scientific career.

BRACARENSE, PAULO* (Universidade Federal do Parana, paulo.bracarense@humboldt-viadrina.org)

Economic Policy: Development Economics, Green Jobs, and Employment of Last Resort

Development economics contains two main public policy guidelines. First, and currently, an "outward-oriented" program based on exports of primary commodities. Alternatively, for a few years following World War II, a domestic industrialization from *within* strategy was supported. This intermission is partly due to the UN's 1945 goals to promote "higher standards of living, full employment, and conditions of economic and social progress and development." Post-Keynesian economists have lately supported the revival of the latter strategy, arguing that underdeveloped countries tend to have an abundance of labor resources, whose potential is untapped. The possibility of employing these resources to promote development from within, along with the tendency of a modern capitalist economy to sustain unemployment and instability, justifies the implementation of an employer-of-last-resort (ELR) program. While the current paper supports those efforts, it contributes to the debate by, first, arguing that discussions about employment cannot be divorced from the broader social and environmental systems. The current paper, first, proposes ways in which implementation of ELR may incorporate the UN's proposal for green jobs. According to the ILO (2013) "jobs are green when they help reduce negative environmental impact ultimately leading to environmentally, economically and socially sustainable enterprises and economies. More precisely green jobs are decent work that": Reduce consumption of energy and raw materials; Limit greenhouse gas emissions; Minimize waste and pollution; and Protect and restore ecosystems." Secondly, the paper suggests that most jobs are not completely green, introducing then a metric that can measure how green is a job in a scale of 0 to 1, as proposed by "fuzzy logic." Each job is attributed values that inform the "degree of membership." In fuzzy logic one element can belong to more than one set with different degrees of membership, representing a "paradigm shift" (Kuhn 1962) from Cartesian logic.

BRADY, JOHANNE* (University of Sydney, jbra7852@uni.sydney.edu.au)

Bodies Ageing with and without Parkinson's Disease

An Australian study has examined how in later life men and women, as either the person diagnosed or partner-carer, constructed experiential meaning from living with a Parkinsonian body. This empirical study has collected illness narratives from nine people diagnosed with Parkinson's disease and their partner-carers. A thematic analysis describes participants' objectification of a medicalized body in the socio-historic context of their lives and particularly their marital relationships.

People diagnosed described why they became increasingly focused on controlling a symptomatic body as they lived through the effect of disintegrating and reintegrating the Self: Varied and spontaneous bodily symptoms were sensed and felt, and intensified and faded within multiple medication cycles each day. Contrastingly partner-carer narratives described their lived experiences of social interaction with the person who performed an embodied illness. Each couple had constructed their experiential knowledge of Parkinson's disease from different perspectives towards the symptomatic body: The person diagnosed objectified the Self in disease-body-symptoms whereas the partner-carer had objectified the Other in disease-body-behaviour.

The illness narratives in this study provide evidence of how intertextual and intersubjective meanings of Parkinson's disease were constructed between the person diagnosed and partner-carer; they each interpreted the biographical disruption in their everyday life, which through time had intensified and could be interpreted as having greater significance in being an ontological disruption for the body. This study will present the nuanced differences between participants' interpretations of biological bodies that are ageing with or without being medically diagnosed with Parkinson's disease, and will argue why it is important to recognize they are also social bodies that encase identities, perform socially, and inscribe an individual life history.

Strategies of a Green Economy, Contours of a Green Capitalism. Sociology Meets Political Economy

In recent years, a re-politicization of the ecological crisis has taken place in the global North. It is our argument in this paper that the various strategies pursued under the Green Economy umbrella are in the process of establishing what may develop into a new capitalist formation, potentially taking the place of the crisis-ridden post-Fordist-neoliberal formation. For this eventual formation we propose from a critical perspective the label of Green Capitalism. The question, then, is how the processes of change set in motion by Green Economy strategies, and potentially leading to a Green Capitalism, can be understood and explained. Which strategies are politically, economically, and culturally feasible, and under which conditions can they be expected to be successful? We are primarily interested in those processes that may result from a 'historical chance discovery', a profound mutation that redefines socio-economic, cultural and political practices, structures and power relations but which in its unfolding will necessarily remain highly uneven, both temporally and spatially. Our theoretical frame is critical Political Economy—we are going to refer to Regulation theory, Gramscian hegemony and critical state theory—supplemented by Political Ecology. The premise is that such a broad theoretical perspective will allow us to address the problems associated with this issue most effectively. Initial research along these lines has addressed the extent to which a green project is feasible and whether a 'green power bloc' and potentially forms of 'green corporatism' are being established. But beyond that, any social science research seeking to understand the current dynamics of social and socio-ecological transformation must also look at the contradictory socio-economic, political, cultural and subjective social conditions which, in their mutual correlation, will have to be stabilized for a certain period of time to make the project viable.

Reimagining Our Cities: Feminist Vision of Smart Cities for a Better World

This paper explores the need for reimagining our cities from a feminist visioning perspective to recreate them as 'Smart Cities' for a better world. It advocates the urgency for evolving a human rights-based urban planning model — which is inclusive, caters to a life-cycle approach, is citizen friendly and gender responsive.

This paper redefines and decodes 'SMART Cities' to cater to the following dimensions :

Safety Specifics for all age groups, genders and ethnicities.

It invokes the need for switching to participatory and gender-friendly Methodology of City-Planning through use of tools like social mapping, brainstorming, focus-group discussions, opinion polls and moving from 'Blueprint Master Plans of Cities' to 'Pink Print pro-people Plans' of the cities of our dreams.

It also flags the agenda for Affirmative Action for redesigning of our cities to nurture positive spaces and support structures for peaceful co-existence of all communities.

An attempt is made to Review existing gender-gaps in our present day city-planning and identify gender-responsive needs for cities of the future, aspiring to become 'Smart Cities'.

The need to foster greater Transformative Potential by recognising the gendered nature of public-space and bridging this divide through institutionalizing greater accountability checks and transparency by way of promoting social and gender audits for concurrent review of city plans from their conception to creation.

British Born Female Caribbean Registered Nurses: Can Group Identity and Occupational Identity be Reconciled?

For Christiansen (1999, p. 551) occupational identity provide an important central figure in a self-narrative or life story that provides coherence and meaning for everyday events and life itself. 'Hall and DuGay(1996) and Brah (1992) argue that as ethnic identities lack fixed meaning the actual content of an ethnic identity is dependent on the context'. This highlights the importance of context and identity as a social category for black nurses of Caribbean heritage in nursing, being context sensitive, a social category and a group (Tajfel and Turner 1979; Turner, Brown, and Tajfel, 1979; Turner, Oakes, Haslam, and Mc Garty, 1994)

The past and present for British born Caribbean nurses (BBCN) is one of colonialism, from cultural imposition, the all-powerful British 'motherland', to nurses being asked to come over and 'help' the new National Health Service in the mid-20th Century to train as nurses. This recognises a 'power identity nexus' of white dominance and supremacy (Marsh and Macalpine, 2002, p.8). "Whiteness" propagates a negative and unequal and less powerful 'other' assumption of Caribbean women's gender, ethnic and cultural identity (Mirza and Sheridan, 2003, p. 11-12). This can have a significant bearing on the social and occupational identity of the descendants of these black Caribbean nurses. The BBCN are their daughters and granddaughters born in England.

Using the social identity theory of group interaction by Tajfel and Turner (1979) there is a theoretical space to use nursing as an occupation; professionally and in the clinical environment, to conceptualising the impact that inequality between white nurse as an in-group, that is dominant and one of privilege, in 'opposition' to the unequal subordinate group of disadvantage (Powell, et al, p.508) that comes with being a member of the out-group that is the BBCN, considering their ethnicity, culture and gender.

RC52-JS-31.7

BRATHWAITE, BEVERLEY* (Univesity of Hertfordshire, b.brathwaite@herts.ac.uk)

The British Minority Ethnic Nurse and the Future of the National Health Service in England

The history of black Caribbean women coming to the British 'mother land' to work is interwoven with the National Health Service (NHS) in England. From post war to the 1960s (Many Rivers to Cross n.d.; Olwig, 2007) to today British minority ethnic (BME) women including those British-born still choose to nurse in the NHS and hold enduring presence in the modern NHS. The narrative of the BME female nurse in the 1970s and1980s (Lee-Cunin, 1989) observed that the Black nurse experienced overt racism and lack of advancement. Gendered stereotyping of the black women also had its part to play. By the late 1990s Iganski and Mason (2002) discovered the demise of the black nurse of Caribbean origin due to under representation. In the 21st Century their continues to be inequality of treatment compared to white nursing colleagues and an awareness of equal opportunities at work in relation to legislation falling well short of the reality (Dhaliwal and McKay, 2008; Rogers 2014).

What is needed now and in the future for the NHS and BME nurses is for initiatives such as the Race Equality Action Plan (DH 2004) that acknowledges BME nurses 'skills are often underused'; the BME network continues to offer support to BME staff including nurses, NHS England and the NHS Equality and diversity council to be seriously utilised when planning strategically and locally to make real changes in the culture of the NHS and to focus on workforce discrimination and race inequality more overt, and consistently deem this as unacceptable and is dealt with appropriately. This will then demonstrate to black British born Caribbean or any other BME women to continue to choose nursing as a career, that they can flourish and move within at all levels of nursing equally. Providing quality care for patients.

BRAULT, MARIE-CHRISTINE* (Universite du Quebec a Chicoutimi, mcbrault@uqac.ca)

Mental Health Inequalities Among Youth: The Importance of the Quality of the School Environment

Educational attainment stands among the principal social determinant of health. However, this traditional indicator of education is not relevant for young people as they haven't yet reached their highest level of schooling. Other educational indicators may thus be best suitable for them, and would at the same time give a more complete picture of the complex relationship existing between health and education.

This presentation aims at discussing school environment indicators that could be taken into account when studying mental health problems and inequalities in youth. Researches in sociology of education have shown that each school is unique and distinct from one another, through notably their structural elements (social composition, physical environment, etc.) as well as their organizational processes (values, culture, climate, leadership, etc.). Schools create inequalities on various outcomes, including mental health. Between-school differences were already observed with regards to emotional health, suicide and psychiatric diagnoses. As youth spend at least "fifteen thousand hours" of their life in school, it is important to understand if, how and which element of school environment can impact their health in general and mental health specifically. Examples of useful school environment indicators will be presented in association with ADHD, depression and body satisfaction.

BRECKNER, ROSWITHA* (University of Vienna, roswitha.breckner@univie.ac.at)

Visible Life Histories on Facebook? Biographical Implications of a New Form of Communication

The use of photographs, especially their distribution and arrangement in photo albums, seems to undergo deep changes brought about by the technological developments of computer, internet, and specifically so-called social media (van Dijck 2007, 2013; Pauwels 2002, 2008). Even though the traditional way to create family photo albums especially for the following generation(s) (Hirsch 2002) is still an usual and for the respective families important social practice (Rose 2010), the question is at stake whether the shift to so-called new media is changing the biographical meaning and relevance of these practices. Furthermore, the specific biographical implications of this kind of communication are still to be understood since it is not obvious in what way they become significant in the long run of a life. Given the fixation of interactions in an ongoing facebook-communication, life histories become visible however, even though they were not intentionally performed as life stories.

My paper wants to introduce a specific combination of visual and narration-based methodologies as in-depth case reconstruction with which we can grasp how facebook-interaction is embedded in biographical processes and vice versa, how images of a biography emerge when looking at and following the stream of communication.

Outcomes of Recent Reforms of Supported Employment Programmes. a Comparative Study.

The proposed paper refers to article 27 of the United Nations Convention on the Rights of Persons with Disabilities and focuses on recent developments in labour market policies with a special focus on supported employment programmes.

Supported Employment here is understood as publicly subsidised forms of employment for people with (learning) disabilities in sheltered work places in social companies and the transition to the regular labour market. This involves vocational profiling, training and assistance in finding and staying in paid work.

Key objective of the presented study is the comparison of supported employment programmes in the countries Sweden, Germany, The Netherlands and The United Kingdom in reference to the Austrians`s federal state Upper Austria. Most of those counties have been reforming their programmes to increase mainstream labour market participation of the target group and to reduce expenditure on disability benefits. The presented paper identifies strengths and weaknesses of the various employment schemes and inform about outcomes of recent reforms experienced in the given countries.

First the social law and labour law context of Supported Employment was examined and the specific arrangements were analyzed concerning aspects like funding, payment, accessibility, support process and transition to the regular labour market. In interviews with experts, the authors found out contradictory effects of reforms in supported employment targeting inclusive employment. Service providers deal in different ways with an environment of cuts in funding by an austerity policy and a tight labour market. When sheltered work places in social enterprises were reduced, results of the analysis show a creaming effect: while the most job ready persons within a target group get an employment on the mainstream labour market, an increasing number of people with disabilities stay out of work and employment, most of them inactive at home with basic social transfers.

Human Dignity As a Dependent Variable: Introductory Results from the Sociological Survey "Religion, Youth and Human Rights" in Belarus

Together with the comparative analysis of secular and theological approaches towards human dignity in Russian Orthodox Church, this paper will bring empirical evidence about the attitudes of young Belarusians towards the human dignity. The first findings from the international research project "Religion, Youth and Human Rights" reveal how far the position of young people in Belarus is in consensus with the convictions of the Russian Orthodox Church on the human dignity issues. The empirical data will demonstrate the perception of human dignity concept by the young Belarusians in correlation with the individual dispositions of respondents, religiosity, family socializing impact, and values of the political culture. The individual disposition towards human dignity will be examined with the multidimensional psychometrical scales measuring personality traits and interpersonal awareness. The data on individual religiosity and disposition towards empathy will be observed as predictors of human dignity at the personal level. The influence of family socializing process on human dignity attitudes of young Belarusians will be observed with the characteristics of parents' education and religiosity which, we assume, are the predictors of human dignity as well. The position of Belarusian youth towards authoritarianism, openness to multiculturalism, and public role of religion will be analyzed as the wider socio-cultural and political context which influences the understating of human dignity phenomenon.

Sociocultural and Linguistic Integration of Students of Immigrant Origin in Catalonia: A Longitudinal Perspective

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

One of the challenges faced by knowledge societies is how to manage successfully the growing ethno-linguistic and cultural diversity that are found in such societies as a result of the populations' geographical mobility. After a century of immigration, Catalan society has developed its own model of education based on the principles of intercultural inclusiveness. This model is based on the premise that linguistic and cultural integration is essentially built from engaging in common activities with peers rather than as a result of exposure to purely academic teaching content (Vila 2012).

The results of the Catalan education system in terms of sociocultural integration may be considered contradictory in some respect. On the one hand, available studies confirm that initial differences in linguistic competence by different groups are blurred considerably by the end of secondary education, at least for those students fully schooled in the Catalan education system. However, several studies (Benito and Gonzàlez 2007, 2009; Sánchez 2009) indicate that the degree of school segregation based on ethnicity and cultural origin remains considerable.

The database for this study is based on a survey on language competence and use in Catalan and Castilian. The participants were 1,050 students of diverse origin and residing in various locations throughout Catalonia who were followed longitudinally over a period of 7 years (from 6th grade of primary education until the second year of post-compulsory education).

This paper aims to analyze to what extent the bilingualization of the different groups of immigrant origin is coupled with a significant lowering of intergroup boundaries. More specifically, the study analyzes the evolution of the integrative process of a sample of immigrant students on the basis of four main variables: the composition of their social networks, their patterns of cultural consumption, their attitudes towards Catalan and Castilian and their ethno-national identification.

BRICHZIN, JENNIFER* (Ludwig-Maximilians-University Munich, jennifer.brichzin@soziologie.uni-muenchen.de)

Democratic Citizenship: Beyond Payer's Privilege and Nation's Unity

The development of the idea of citizenship and the rise of capitalist economy were closely intertwined from the beginning. The gradual emancipation of the townspeople was based on the power deriving from new monetary resources – a power which ultimately promoted the awareness that citizenry action counted. That way democracy and capitalist economy are closely connected, at least seen from a historical stance. The question I want to explore here is: To what extend do we still see this common origin in attitudes of citizens towards democratic practices today? And: Is there a problem?

To date, many political surveys show that the political knowledge of the average citizen is restricted, and that her/his political conceptions are contradictory. They oscillate between the demand that voters' wishes should be followed and a high esteem for brave, even unpopular decisions – in other words, between the idea of the independent political leader and the notion of a strictly dependent people's agent (e.g. Schüttemeyer 2003). To emphasize the need for "true" political leaders, economy is often pointed at: Where would we be, if companies were managed like the state? But for the opposite notion of good political representatives, economy also serves as a role model: Who pays the prize (meaning: the tax) may decide the purpose.

Based on an ethnographic study in which German parliamentarians on four different parliamentary levels where followed throughout their working days, I want to show the problematic logic that lies behind the interaction between citizens and politicians. It becomes obvious that both common interpretations of political practice – either economic analogies, or a classically democratic trust in "the people/nation" – are inadequate to grasp the tasks of modern globalized politics. Following Hannah Arendt's ideas, I plead for the development of a new desubstantialized pluralistic version of democratic theory.

BRIGUGLIO, MICHAEL* (University of Malta, michael.briguglio@um.edu.mt)

Digital Activism, Physical Activism: Malta's Front Harsien Odz

This paper will analyze the activism of a newly-formed citizens' movement in Malta which relies on both digital and physical activism. Since its founding in 2015, Front Harsien ODZ has regularly held press conferences and organised Malta's biggest ever environmental protest. The build-up and follow-up to these physical events has been carried out through digital media, both in terms of internal communication, as well as in terms of propagation of the Front's goals and statements. The physical-digital interaction is also characterized by regular face-to-face meetings of core activists as well as public meetings, which are advertised through the digital media and social networks.

This paper draws on literature on Information Communication Technologies and movements, social networks, online mobilization, media performances , modular repertoire, media ecologies, media strategies and networked social movements to analyse the role of digital media in environmental mobilization.

The research presents qualitative data through interviews with core activists within the Front, showing the impact of digital media in the Front's recruitment, networks, activism and mobilization, as well as the Front's interaction with its adversaries.

Police Forces at Work: Going through Management?

The police are one of the traditional sources of power for public administration. They can be seen as a paradigmatic example of public administration because they refer to a sovereign duty (the monopoly of legal force). However, during the last decades police forces have been restructured along the neoliberal logic of rationalization. Police, as the main argument of this paper goes, turn into the executing power of an "economically driven state monopoly of force" (Briken 2014). Such a business management is characterized by a professionalized production of evaluative knowledge and by strategic targets (Mately and Mouhanna 2007).

So far not much is known about the consequences for the changes of the police profession and the new police identity within the police forces. Based on case studies including expert interviews and group discussions with Police officers in three Western European Police forces (France, Germany, Sweden), the paper will outline the peculiarities of what we call New Police Management. We focus on the changing police profession and investigate in how police staff reflects on their new role within the Police. We will argue that NPM can lead the police in extending towards delivering social services, or to restraint it task to law and order strategies. Whatever these changes, what is supposed to be 'real police work' seems to be at stake for the police officers. We will show that the Police resist the idea of managing the streets and show a strong alignment to traditional policing. They use their leeway and discretion to execute their tasks following their own professional understanding. Ironically, the new organizational requirements are both bypassed by making use of them and by 'cooking the books'.

Social Actors and Latin American Social Thought: Contributions for Decentring Social Movement Studies

Unlike the debate in United States and Europe, the study of social movements in Latin America has never had a well-defined field of study in the social sciences to enable systematic discussion on notions, categories and controversies. However, social movements have been treated in a transversal way within a wide range of topics, approaches and discussions within Latin American sociology and, particularly, regional social thought. This paper seeks do build bridges between social movement studies and the Latin American social thought in order to contribute to decentre the research agenda on social movements. Particularly, we will identify and analyse the main actors, conflicts, regional frames and socio-political and ideological matrices (such as indigenism, agrarism and anti-racism), as well as key concepts and notions elaborated by Latin American authors and actors, that is, social movements themselves. The update of this regional tradition can enrich social movement theories and stimulate comparative dialogue with other regions of the world, especially peripheral ones.

Social Movements, Digital Activism and Patterns of Global Contestation

This paper seeks to characterize and analyse the main patterns of contentious collective action used by social actors who acts globally during the latest decades and their respective appropriation of information and communication technologies. We suggested that since the fall of the Berlin Wall up until today four main patterns of global contestation have coexisted: the internationalisation of territorialized social movements (as the Zapatistas and the Landless movement), the transnational advocacy networks; the alter-globalization movement; and a more recent pattern associated with a geopolitics of 'global outrage'. The discussion of

denotes a presenting author. Abstracts are organized by first presenting author's last name.

these different patterns will be made utilizing a set of four variables: the spatialities (which includes the scales of action and the territory-network dialectic); the temporal profile (historicity and relationship to specific cycles of global mobilisation); the social actor (or subjects underlying each one of these patterns); and, finally, the repertoires of collective action used by them. The centrality of digital activism will be discussed in a transversal way in all of them and may contribute in two ways: firstly, revealing the key issues of the reconfiguration of transnational activism and internationalism in our current epoch of contention; secondly, suggesting some lessons learned from the effects of the appropriation of information and communication technologies within these patterns of global protests. In this regard, we point out some key challenges from contemporary social activism: the dynamics of diffusion of information, ideas and symbols; the redefinition of the scales of action and the scales of meanings; the transformation of solidarities, interactions and the organizational routines; and, at least, the ability to create autonomous spaces of communication.

Social Implications of Spiritual Turns in Korea: Moral Clashes on Homosexuality

Amid ongoing debate over contemporary society's extent of secularization or desecularization, scholars acknowledge that religion and spirituality continue to heavily influence public and private attitudes about morality. Few social issues have been as hotly contested in recent years as homosexuality and homosexual marriage, and religious individualization has been proposed as a key factor in changing views of what constitutes moral or immoral behavior as it shifts the locus of moral decision-making from religious canon to the individual believer. This study explores the extent and impact of religious individualization on Korean youth in their attitudes toward homosexuality and related policy issues such as homosexual marriage.

Although Korea's traditional Confucian value system and conservative cultural tendencies of Korea's three major religions (Protestantism, Catholicism, and Buddhism) have long engendered reluctance to embrace homosexuality on both a personal and societal level, Korean university students are dramatically more accepting of homosexuality than older generations.

This study utilizes qualitative interviews with 40 university students residing in Seoul, representing all three religious groups and religious non-affiliation. Findings indicated that youth who fit patterns of "believing and belonging" in these religions are experiencing a tangible shift towards individualization in their religious practice, perhaps best described by Wuthnow's reference to the shift in American religiosity post-1950s from a "dwelling" to a "seeking" model that takes the form of a quest and emphasizes subjectivity and autonomy. We examined correlations between the degree of expressions of religious individualization and participants' responses regarding homosexuality, ranging from vehement opposition to acceptance and support. A distinct pattern also emerged as the majority of respondents mentioned ethical standards or making right versus wrong choices as a key life impact of their religious beliefs, undermining the notion that highly individualized religion is overall less morally oriented than traditional forms of religion.

Subjectivized Spirituality As Empowerment: Youth Responses to Life Course Uncertainty in South Korea

Undergoing industrialization over the course of a few short decades and experiencing revolutionary changes at all levels of culture and societal structure, South Korea is an archetypal case of "compressed modernity" and its accompanying social challenges. Korean youth in the 21st century face unprecedented uncertainty in the form of fierce academic competition, high youth unemployment levels, and a changing life course trajectory in which milestones such as marriage and children are delayed or skipped entirely. At the same time, Korea's traditional Confucian value system has been usurped by increasingly individualistic attitudes that foster the desire for self-expression and autonomy. This study employs Swidler's "toolkit theory" to examine how Korean youth utilize religion as an empowering mechanism to cope with insecurity on a personal and social level.

This study utilizes qualitative interviews with 40 university students residing in Seoul, representing the three major Korean religious groups of Protestantism, Catholicism, and Buddhism as well as religious non-affiliation. Their responses to questions regarding their religious practice, beliefs, stress management and goal orientations were analyzed to examine patterns of security-seeking. Findings indicate three distinct categories: those who seek security through the social bonds and shared commitments of religious community; those who seek security through personal, transcendent spiritual experiences; and those who seek security outside the context of religiosity. A broad pattern emerged in which the majority of participants referred to their forms of religion belief or participation as "unique," "personal," or "different from others," suggesting high levels of sub-

jectivization even among traditionally practicing believers. A pronounced theme among Protestant and Catholic respondents was theodicy and the use of religion as a means of empowerment following personal failure. These results call for further exploration of how youth utilize religion to resolve the unique tensions of their desires and circumstances in the era of late modernity.

Women and Law: (Re)Building Democracy and Justice

The process of (re) democratization in many parts of the Americas was a long, painful and non linear experience in which the regional and local legal bodies had and have a fundamental role in empowering all human beings, in deepening the democratic institutions and practices and in underlining the role of Law as a motor to enlarge rights and not a tool to diminish them. This struggle to have Democracy as a daily practice and not a noun without content is not linked to age, gender or any other aspect. If one analyses three paradigmatic cases in the Americas that showed the fundamental role that women had in the History of the American continent (case Mirna Mack Chang versus Guatemala (InterAmerican Court of Human Rights), case Maria da Penha Fernandes (Brazil - InterAmerican Commission of Human Rights) and case Claudia Poblete (Argentinan legal system)), it will be clear that the roots from Democracy start at home, in the streets and in political and social institutions. These cases among many other showed the synergy that exists among the InterAmerican Court, the InterAmerican Commission fo Human Rights and many national legal systems allowing the possibility of enlarging the concepts and deepening the perspectives about Law and Justice in societies marked by a not empowerement of women.

What I Am Not. Violence, Displacement, and Liberation from 'origin' in the Kurdish-Turkish Conflict.

In my presentation I am going to analyse a biography told by a female Kurdish refugee from south-eastern Turkey. Following unjust accusations of collaboration with the Kurdish PKK (listed as terrorist organization), the woman's native village was destroyed by the Turkish military.

Refusing to use any Kurdish, the woman narrates her story in the majority language Turkish. Initially, she provides a myth-like tale identifying herself as being of Non-Kurdish, yet unknown origin; only the male family members 'are Kurdish'. Dry descriptions of male domestic violence follow. Simultaneously, experienced accusations of political violence, i.e. terrorism, are passed on and re-ascribed to the family's males.

At the core of the narration, the register changes radically. We are now told the emotional story of a woman: the narrator's mother. It is her who withstands domestic and political violence, thus embodying the myth of Non-Kurdishness in flesh, blood and (Turkish) language. Inmidst a life story, we are witnessing an ethnopoetic key event, with lines, stanzas and chorus, and of emotional beauty: a poem singing of the mother, and of liberation from origin.

This self-representation is made up of what 'must not be', reinterpreting deprived 'origin' as 'guilt' and as 'male', to be overcome by 'Turkishness', 'morality' and 'female voice'. This is specifically relevant for the interdependence between individuality and collectivity: discourse and narrative analyses of multiple parents' and children's biographies show the wider, transgenerational modellings of (in) justice and conflict, and might allow for an assessment of the conflict's future course. My study is thus driven by the idea of a biographical-sociolinguistic contribution to peace and conflict studies, here on the example of Turkey and the Kurds.

Comparing Climate Change Policy Networks: Project Overview and Comparison of Japan, Germany and the United States

The international project on Comparing Climate Change Policy Networks (Compon) analyzes the social and political causes of variation in carbon dioxide

emission trajectories from different societies (1990-2013). The Compon teams collected policy network survey data to study the political mobilization of coalitions advocating different responses and their relative effect on outputs and outcomes. The teams include South Korea, Japan, Taiwan, Australia, New Zealand, Canada, the United States, Brazil, Sweden, Finland, Ireland, United Kingdom, Germany, Portugal, Switzerland, and India. Starting with an introduction to the whole project, the present paper also presents an initial comparison of policy network advocacy coalitions in three developed countries: Japan, Germany and the United States.

Man, Reflexivity and Gameplay: On Deriving a Sociology from Games

This article interrogates the work of Roger Caillois and, in particular, one of his foundational arguments found in *Man, Play* and *Games*: that a plausible explanatory account of social action ('a sociology') can be derived *from* an analysis of games. For Caillios, an explanatory account of social action may be derived from the way that play (as *paidia)* is disciplined and institutionalised through games (as *ludus*). In other words, games are seen to provide the ideas from which people develop practices that reach beyond the game into the everyday life. It is the contention of this article that Caillios' position obscures an elemental dimension of social reality – the natural capacity for people to reflect in thought, and be reflexive in action. Indeed, it appears that what Caillios offers in *Man, Play and Games* is a model of social reality that is 'Elisionist' (Archer, 1995) in its claims about how games shape culture through player practices. In this article, we intend to show just how important reflexivity is in mediating the relationship between *Man, Play* and *Games*. We deploy a cross-national comparative ethnography of male players of the popular sports video game *FIFA* to show how Caillios' conception of game-types take on very different meanings when players are situated in Brazil and the UK. What we find is that *FIFA* takes on a variety of meanings that speak as much to the spatial, temporal and contextual nature of these players' lives than Caillios' game-typologies permit. This not to deny the possibility of non-rational play but to elaborate on Caillios' original intention: to derive a sociology *from* games that also has a robust conception of personhood.

BROCK, TOM* (Manchester Metropolitan University, t.brock@mmu.ac.uk)

Play As Craftsmanship in Computer Game Consumption: Towards a Sociology of Gaming As Craft Labour

Explanations of computer game consumption have tended towards a focus on the relationship between play, narrative and its context to explain consumer behaviour. The dominant narrative that underwrites these explanations is that play, through gaming, is often undertaken to escape reality and that games are consumed to help people actualise desires and fantasies that are otherwise unattainable in their everyday lives. Thus, it has been argued that games offer a variety of 'imaginative escapes' from routine life, such as the collection of in-game items or achievements, which are seen to provide players with a sense of 'progress' that is otherwise lacking from their work lives (Molesworth, 2009; Molesworth and Watkins, 2014). In this article, it will be argued that what is missing from these accounts is a discussion of what Richard Sennett (2009) calls 'the craft of play' - where play inaugurates the *material* practices of repetition, modulation, and consistency that are constitutive of craft labour. This paper intends to explore the relevance of Sennett's thesis to a sociological analysis of gaming, and uses ethnographic research into the computer game *Destiny* to unpack the ways that making an online avatar might be considered an example of craft labour. The study reveals that players get great satisfaction from negotiating the relationship between pleasure and rigorous practice in *Destiny* and identifies that, for some, it has become a *vocation* that has called into question their pre-existing relationships to work and employment. The paper concludes by suggesting that gaming is not simply an escape from reality, but rather a way of understanding how reality is being re-appropriated through play as craftsmanship.

Street Level Bureaucracy Under Pressure: Job Insecurity, Business Logic and Challenging Users

Public administrations are currently affected by different sources of pressure. In Italy, recent governments have attempted to rationalize public spending through top-down cutbacks, the introduction of managerial principles, and the reorganization of public services. Civil servants are undergoing a major transformation also in the relationship with users. The latter express differentiated needs and require greater consideration for their personal situation as a consequence of the process of individualization. At the same time, public opinion remains particularly critical, strengthening negative and stereotyped images of civil servants. Since Lipsky's study of street level bureaucracy (1980) the presence of leeway due to the variety of requests and regulatory gaps is well known. However, there is little evidence on how this is changing nowadays considering the pressure 'from above' to adopt a business logic, the one 'from below', and the growing scarcity of resources. Preliminary findings have shown the persistence of significant variations to the standard procedures, in which the discretionary power of public operators still plays an important role. Analyzing everyday practice, a huge effort for the absorption of institutional changes and for mediation between contrasting goals seems to emerge. In this background, we show some preliminary results of two case studies that are part of a broader project covering different fields (social work, healthcare, education, public security, housing and employment centres). Drawing on ethnographic observations and interviews with bureaucrats and managers of public offices (specifically, housing organizations and employment offices), the paper aims to analyze how the new managerial regime, on one hand, and the challenges in the relationship with users, on the other, are reflected in the work cultures, but also in the strategies public servants employ daily. Some questions have driven our work: is the introduction of managerial practices actually reducing discretional power? Is a new organizational culture emerging?

BRONZINI, MICOL* (Department of Economics and Social Science, m.bronzini@univpm.it)

The Language of Illness and the Evidence-Based Wor(l)d: A Possible Integration

Illness narratives are a form of sense-giving to random, incomprehensible events. Narratives provide "wounded storytellers" (Frank 1995) with a means to redefine their present identity and to regain control over their life. On the other hand, they help health professionals to understand the patient's point of view - what was important for him, and what is still important for the future - as well as to find out needs, informal resources, coping strategies, expectations and the degree of satisfaction with health services. In this background the paper presents the main outcomes emerging from the collection of the illness narratives of patients with multiple sclerosis and their care givers. Five patients were recruited among those in treatment at the University Hospital of Ancona (Italy); their illness narratives were jointly collected by health professionals and social researchers in the hospital setting. Further five patients were recruited among the members of the local patient association and their narratives were collected by social researchers in their homes. Special emphasis was placed on the relational perspective, investigating how patients and their relatives perceive the disease and how they cope with it, how they relate with their "changing Self", the relationships within the family, with health professionals and social relations. The aim of the study is manifold. First of all, we intend to analyze the changes occurring in their life experience as a consequence of the diagnosis of MS and the language with which they are expressed. The second aim was to integrate evidence-based medicine with narrative competences in order to improve health services. In particular the design of health care pathways for chronic diseases must consider the experience of illness in the perspective of a co-production of care narratives.

Gender Stereotypes in Modern Russia: Between Traditionalism and Postmodernism

A gender stereotype is summarized information on roles, appearance and fields of activity for each gender. Visual research methods play a special part in the gender studies, the basic understanding of women and men are established by the means of different types of visual data.

The gender stereotypes most prevalent in modern Russian advertising research was carried out in 2014. The research is based on the methodology provided by visual studies (firstly, founded on theories of Maffesoli, Latour, Goffman, Urri and others; secondly, founded on the method of discourse analysis of visual objects).

The first stage of the research included the examination of the data consolidated by Russian Public Opinion Research Center, the data related to Russian attitude towards the gender roles, the family, the women involvement into politics and government.

On the basis of these data the research hypothesis was formed: gender stereotypes are self-contradictory, they are developed around two axiological points - traditionalism and postmodernism.

The aim of the second stage of the research is confirmation of the hypothesis by the investigation of gender stereotypes in advertising mostly appeared on the central Russian TV channels. The roles of advertising characters demonstrating one of the highlighted trends were distinguished.

A list of features was formed as a result of the investigation of advertising images by the method of discourse analysis (features belonging to external aspects of gender – such as color, scene position, emotions expressed, also features fixing dominate functions and activities of women and men) that mark either the traditional or postmodern gender orientations.

The traditional type images predominated though postmodern gender orientations (for example, the male involvement into traditionally female occupation) aren`t rarely encountered.

It was concluded that Russian gender stereotypes combine both directions including traditional and postmodern elements though the most prevalent one is traditionalism.

The Representation of Fear in Contemporary Russian Cinema:the Fear of Everyday Life

States of fear and anxiety are often typical and common representations of consciousness in contemporary Russian society. Studies conducted by the Russian Public Opinion Research Center have found that fear, as experienced by Russians, is associated with feelings of uncertainty.

We have hypothesized that the fears of Russians should naturally manifest themselves in popular culture and cinema in particular. This seems to be especially true regarding one of the most recently acclaimed films released in 2014, Leviathan, by Andrei Zvyagintsev (film won the award for best screenplay at the 67th Cannes Film Festival, and was the only Russian winner at the Golden Globes). These circumstances determined the choice of this film specifically for the discourse analysis concerned with the study of fear in modern Russian life. The aim of this study was to define this anxiety in a concrete way, and analyze its manifestations in cinematic material.

During the study, the use of discourse analysis was implemented on three levels: these were textual, contextual and interpretive with an on-going process of interconnection found between each of the levels. On the textual level of the analysis certain concepts were discussed, specifically the concepts concerning identity. At the contextual level various references were made concerning how the symbolic systems outside of the film were recorded. The interpretative level of discourse analysis involves the study of the frame of reference chosen by the director.

As a result, some overall conclusions can be drawn about the nature of fear. Namely, these are the fears associated with the wellbeing of loved ones, the fear of betrayal, and the fear of those in positions of authority. Another special kind of fear was also identified: so-called "fear of everyday life", that is the fear of the unchanging dull monotony of the routine in daily life.

Integrating Datasets Supporting Ageing Populations and Workforces

Background and aims

The project objective is to assemble an integrated dataset that can inform interventions linked with population-level health goals of supporting the social determinants of health, well-being and 'active' ageing. It aims to build a population-level dataset analysed by age and gender which aligns workforce interventions with these population-level goals. The dataset links the Finnish Workability multidimensional theoretical framework, consisting of health and well-being, competence, values and attitudes and workplace structures, to contextual enabling influences of the 'Liveability' theoretical framework, including transport, housing, and social infrastructure. The project formed an aged care employment demonstrator in two large metropolitan regions of the Victorian Health Department.

Methods

In Stage 1 a consultation was conducted with regional health and aged care stakeholders to identify critical population-level vulnerabilities. In Stage 2 the Australian Urban Infrastructure Research Network geospatial modelling tool was used to collect population-level data linked with the theoretical frameworks. Demographic data from the Australian census and community indicators sources were analysed at multiple levels of granularity including micro-level data. Demand-side ageing vulnerabilities and supply-side ageing workforce challenges were linked. In Stage 3, interventions based on identified social epidemiological

vulnerabilities and environmental contextual influences were implemented in collaboration with regional stakeholders.

Results

The project assembled an integrated dataset consisting of population-level data to explain dynamic demographic and socio-economic challenges as the basis for planning responses. Retaining the older aged care workforce in an environment of escalating demand aligned with aged care supply emerged as a critical problem. Population-level intersectionalities identified age and gendered patterns of social and economic participation, housing, care requirements and safety concerns. Workforce retention vulnerabilities identified included care responsibilities, lack of flexibility and retirement pathways. Thus, integrated social epidemiological datasets linked with conceptual frameworks both enabled and demonstrated a program of interventions supporting ageing populations and workforces.

Gender, Precarity and Sexuality: The Intersection of Gender, Ethnicity, Sexuality and Class in Relational Precarity in Neoliberal Society-the Influence of Lauren Berlant

Lauren Berlant has theorized gender and precarity within a range of texts highlighting the intersection of race, sexuality, gender and class. She focuses on precarity as a relational concept and draws on historical and contemporary examples to show how precarity in relational terms can be challenged and resisted. Berlant's (1993) "The Queen of America Goes to Washington City: Harriett Jacobs, Francis Harper, Anita Hill" focuses on three women writers who have all represented in their writings, their failure to secure control over their bodies and who challenge America's judicial system. The three writers represent historical and contemporary cases of slavery, citizenship and sexual harassment. Berlant draws attention to the intersection of personal and national life *vis a vis* sexuality. She shows how all three women have made: "the nation listen to them, to transform the horizons and terms of authority that mark both personal and national life in America by speaking about sexuality as the fundamental and fundamentally repressed horizon of national identity, legitimacy and affective experience" (Berlant 1993: 552). A number of feminist theorists have highlighted how women have responded to relational precarity, including Vilalobos (2014) *Motherhood* and Cooper's (2014) *Cut Adrift*, Stacey's (2011) *Unhitched* and Pugh's (2015) *The Tumbleweed Society*. This paper focuses on precarity as a relational concept and an aspect of intimacy, and considers relational insecurity and resistance in neoliberal society in the Global North. The influence of Berlant's work is considered for relational precarity more broadly as a significant contribution to feminist debates in the area of gender, precarity and neoliberalism.

GALE, NICOLA (University of Birmingham)

Theorising the Experiences of Professionals in Their Handling of Uncertainty through 'Risk': Towards a Sociology of Risk Work in Healthcare

The handling of uncertainty is in many ways defining of professional power and of experiences of professional work. In health and social care, the proliferation of political drives for evidence-based (population-level and preventative) approaches to handling uncertain health futures via 'risk' has resulted in changing roles for existing healthcare professionals and an increase in new types of workers (lay, peer, and para-professionals) tasked with intervening in 'at risk' or 'risky' communities and individuals. The literature has, to date, focused on organisational processes, accountability structures and the impact of risk knowledge on the experiences of patients, service-users and publics. More neglected, however, are the experiences of professionals and other health workers within these new approaches to healthcare and how they make sense of and practically accomplish the various forms of 'risk work' required of them. Located at the intersection of sociological studies of professions, work, risk and health, this paper develops a theoretical framework which will inform future research into risk work in various settings. Forms of risk work in health care vary – for example, screening and risk assessment, health promotion and education, and community outreach work– yet certain common experiences and related tensions are apparent: a) interpreting and applying probabilistic knowledge based on tendencies across populations within the contexts of individual cases; b) conveying this interpretation of risk to patients/public or colleagues amidst the moral consequences of such judgements; c) building rapport or relationship with patients/public which is vital for, and yet challenged by, ongoing assessments and/or communication of risk. Located within post-phenomenological scholarship, our framework focuses on how these tensions are practically negotiated, and the nature of the embodied, lived experiences of these tensions in everyday work. Recently collected pilot data

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

drawn from risk work practiced in contrasting settings are drawn on in informing and illustrating our framework.

BROWNE, CRAIG* (University of Sydney, craig.browne@sydney.edu.au)

The Dialectic of Control: From the Past to the Future of Critical Social Theory

The notion of the dialectic of control has a venerable position in the history of critical theory. Hegel's formulation of the dialectical conflict of lordship and bondage is often regarded as the major theoretical influence upon Marx's interpretation of the historical dynamic of class conflict and the distorted social relations of alienation. The dialectic of control illuminated subordinated classes resistance to domination and it disclosed the contradictions inherent in the owners of capital's dependence on the exploitation of wage-labour. In some respects, the history of critical theory can be understood as an encounter with the vicissitudes of the dialectic of control. The work of the Frankfurt School attempted to elucidate the complications of the dialectic of control attendant upon capitalist rationalisation and how the conflicts intrinsic to capitalism were being rendered latent, especially through the effects of the culture industry and mass consumerism. Nevertheless, the work of the Frankfurt School implied that the dialectic of control could be repressed but that it received indirect expression beyond the paradigm of production. It could be argued that the later turn to intersubjective communication in Critical Theory restored the dialectic of control to a central position. Habermas argued that the grammar of social conflicts had changed in late-capitalist societies, whereas Honneth's theory of struggles for recognition sought to explain how responses to experiences of injustice precipitated progressive changes. In this paper, I will then, first, suggest that the notion of the dialectic of control is relevant to each of the contrasting paradigms of critical theory: production and communication. Second, that this dialectic's contemporary expression necessitates a revised conception of social contradictions and alienation. And, third, that explicating dialectics of control enables an effective mediation of theory and practice, particularly because it contributes to a sociologically compelling conception of social freedom.

Policing Student Activism: An Institutional Ethnography of Administrative Techniques of Surveillance

With the increasing corporatization of Canadian universities over the last three decades, student activism and their ability to occupy space on campuses has been increasing diminished. Through technologies of surveillance (such as CCTV cameras, security personnel and student surveillance through the use of smart phones), the political landscape of student activism on campuses has substantially changed.

In May of 2013, Students Against Israeli Apartheid (SAIA) at York University students were subjected to surveillance by security personnel and CCTV technologies during an 'unsanctioned' rally in Vari Hall rotunda, which resulted in the revoking of the student group's club status and a year-long trespass notice of suspension of York alumnus, Hammam Farah. During the rally, security personnel were dispatched to report on and video record incidents of transgression to the Student Code of Rights and Responsibility (2009). While the university administration informed security personnel not to intervene in the unsanctioned group's activities, they were directed to gather visual and written descriptions of the 'going ons' of participants in the event.

Drawing on Kevin Walby's work on surveillance (2005, 2014), this institutional ethnography (Smith 1999, 2002, 2010) examines how the material relations of surveillance of student activist activity is mediated by visual representations (texts) that help coordinate the social monitoring and regulation of their work. In doing so, I hope to explicate how, from the standpoint of student activists, their everyday interactions with surveillance authorities and technologies that the social organization of knowledge behind monitoring practices can be revealed. In doing so, I hope to provide a means for student activists to use this information to subvert such practices and potentially reshape them.

Spilling over? Policies, Practices, and Supervisor Influence on Employer Flexible Work Arrangements

Economic shifts have restructured workplaces in ways that fundamentally alter employee work and family experiences. Greater demands at work put more pressure on families, and in turn, work-family conflict can lead to high turnover, burnout, and job-related stress. Businesses are reexamining workplace conditions to accommodate working families, but policies and practices are still implemented in a market-driven model to maintain efficiency, productivity, and profit. This paper examines the link between flexible work arrangements and the gendered division of paid and unpaid work. Using in-depth, qualitative interviews with women and men employees in professional, managerial, and executive level positions at U.S. multinational corporations in the Detroit, Michigan metropolitan area, I find tension between corporations' intent to mitigate work-family conflict and the ever-present standards of the "ideal worker norm" – long hours, visibility, and work before family. These work pressures make it difficult to change the household division of labor. Employee narratives show how policies/practices are uneven and arbitrary, even within the same company, revealing the consequences of gendered paid and unpaid work expectations for both women *and* men. Consequently, employees struggle to find greater balance. Employee experiences also raise questions on the effectiveness of parental leave and other flexible work arrangements. That is, policies alone do not reshape how families navigate paid and unpaid work; supervisors play a key role in the process, exacerbated by the lack of U.S. federal standards for parental leave such that employees are left to rely on flexible work arrangements. This study calls for more consistent policy development and implementation to effectively promote gender equality at a broader level.

Stalling out? Women and Men Navigate the Gendered Workplace in the "New" Global Economy

Economic shifts have restructured workplaces in ways that fundamentally alter women's and men's work experiences. Employees in the U.S. today are tethered by technology, expected to be flexible and adaptable, and change jobs more frequently. Workplaces are less hierarchical and based on teamwork, with multi-faceted job descriptions. Greater demands at work put pressure on families, and in turn, work-family conflict can lead to high turnover, burnout, and job-related stress. Some U.S. workplaces have flexible work arrangements and other programs to mitigate work-family conflict, but the policies exist within a market-driven model and lag behind European counterparts. Debates on how, when, and which employees work send conflicting messages about leaning in, opting out, and balancing career and family for both women and men. This paper examines women's and men's experiences in the workplace to uncover the meanings attached to work and career, and how they balance this with family responsibilities. I draw on data from in-depth, qualitative interviews with employees in professional, managerial, and executive positions at multinational corporations in the metropolitan area of Detroit, Michigan. Preliminary analysis suggests a variety of ways that workplaces remain dominated by an economic organization structured to disadvantage women and some men. Employees describe long hours often requiring them to "be on through technology" after hours and the weekends. Flexible work arrangements are contingent on management or supervisors, rather than implemented consistently and throughout the company. Networking is important, but privileges face-time over flexibility. And, men's career aspirations are tempered, in part because men understand they would be passed over for promotions if they put family before work. This study contributes to the discussion on gendered workplaces by examining how expectations of the 'ideal worker' shape the experiences of both women and men in the "new" global economy.

Vocational Education and Training (VET) and Innovation: Impact of the VET Centres in the SMEs in Catalonia (Spain)

Two important aspects of the economic model for the Spanish case are: the low level of intermediate skills compared with the average of the OECD countries, and the predominance of SMEs in the industrial sector. Education and innovation are part of the answer to be given to current challenges. However, SMEs have limited resources to innovate. The vocational education and training system can contribute to this innovation through greater cooperation between both actors. To this end, we have studied a Spanish region- Catalonia with a high rate of industrial enterprises and experimental cases of cooperation between VET institutions and SMEs. Our approach, linked to the prospect of Regional Innovation System, allows the study of the relationships between these actors and how these relations shape the local environment and how the local environment and the relationships that occur in it are key to understanding the level of interaction between the training system and the business network of SMEs. For this purpose, we have combined case studies with structured interviews and exploitation of a survey to SMEs. The results point to the existence of significant obstacles to such cooperation. However, other factors that allow for greater collaboration between the training system and the business network of SMEs could be observed.

Energy Consumption and Social Inequality. Fuel Poverty As a Socio-Ecological Problem

While (unlimited) availability of energy is the norm for some social groups in industrialised countries, other parts of society are faced with the problem of not being able to afford energy in sufficient quantities or having to limit their use of energy services. In recent years, the analytical focus has shifted from global inequalities towards inequalities and vulnerabilities in the Northern countries, bringing forward evidence that financially weaker households are more vulnerable to climate change than better-off households, although – compared to the more affluent – their contribution to climate change is usually lower (e.g. due to lower mobility rates). What is more, socially less privileged groups are notably more frequently hit by fuel poverty. Fuel poverty arises from the interaction of low incomes, high energy prices and energy inefficient homes or appliances. It is characterized by high costs of energy, energy debts, disconnections, restrictions on fuel consumption at the cost of health or by choice coercion whether disposable incomes are spent in food or for heating. Fuel poverty touches questions of socio-ecological inequalities, power relations within the energy system and society, but also questions of how to transform energy systems towards sustainability in a fair and just manner. But so far, fuel poverty has rarely been discussed within an environmental sociology framework. The proposed paper will do so in discussing recent theoretical developments in the study of fuel poverty. Results from 2 research projects on fuel poverty in Austria will form the empirical basis.

Organization Among Organizations

The metaphor that describes organizations as having boundaries to an environment is becoming less useful. In contemporary society organization happens both "inside" and "outside" formal organizations and organizations are engaged in organizing not only themselves but also other organizations. These developments require new ways of theorizing the phenomenon of organization.

Discussing New Modes of Neighborhood Governance: Evidence from Lithuania on Mayors Support to Local Community Involvement to Decision-Making Processes

In this presentation we discuss mayors' notions on the local citizens' inclusiveness in local democratic decision-making processes. The idea of more transparent and accountable local government is often related to broader understanding of participatory democracy (Dahl, 1994; Heinelt, 2014). The argument also implies the discussion on how local government support and maintain neighbourhood participation which gives the power to act for public interests and increase the quality of life on neighbourhood level. On the other hand municipalities' power under the control of financial recourses, services and community assets generates the tension among local citizens' voice and complexity of mayors' perceptions on civic engagement and communal solidarity. Consequently this pressure causes the mismanagement of public services, growing fragmentation of socially excluded local communities and the threat of politicization of local issues. We are focusing on changes in the nature of relationship between local municipalities and local communities in terms of establishing inter-communal networks, encouragement of citizens' participation and greater responsiveness to local decision-making. Furthermore the discussion includes the new forms of interaction among local authorities and local citizens which open the new innovative spaces for communication, debates and interests negotiation. We are using empirical evidence from research on mayors in Lithuania which is a part of a broader "Political Leaders in European Cities (second round) 2014-2015" survey. The main empirical questions are how mayors perceive the opportunities to foster local community engagement, what are the main empowered channels to foster participatory action for local citizens, what communication forms are used by mayors to enable effective interaction with social stakeholders of municipalities. It also opens the space for a broader discussion on innovative tools fostering the mutual understanding of public interest among the broad variety of local actors.

Meaningful Participation As an Additional Motivation to System Justify

System Justification Theory (SJT) predicts people in lower status to perceive the social system as more legitimate than those in higher status. Extant research using representative data has provided mixed support for the hypothesis, with Brandt (2013) questioning the very existence of the proposed phenomena. Findings from experimental designs suggests differences in effects of objective and subjective socio-economic status (SES) on system-justifying attitudes. The present paper elaborates on possible pathways translating actual status into system-legitimizing attitudes and suggests an operationalization capturing subjective interpretation of SES using accessible secondary data. An elevated motivation to legitimize the system is found among those with lower SES in a global sample (World Values Survey). When subjective status and well-being were controlled for, residual effect of actual position turned negative, indicating that while higher status leads to higher confidence in societal institutions through positive experience and perhaps positive expectations, lower status is associated with additional motivation to see the societal institutions as worthy of having confidence in.

With data supporting only on the 'weak version' of status-legitimacy hypothesis, possible interpretations of the findings are discussed. The second analysis presents support for a notion that motivation to perceive own continued participation within the system as meaningful may motivate endorsement of system-justifying beliefs. Controlling for multiple measures of status, self-assessed status and satisfaction, the relationship between household income and support of participation-justifying beliefs remained in negative association - suggesting that those with lower salaries tend to utilize additional justifications to explain and rationalize their continued participation within the system.

From the European Financial to the Humanitarian Refugee Crisis. Visualized Imagination of Crisis.

A visual research project at a saxonian Gymnasium aimed especially at the subject and the abilitiy of self-reflection in the context of localities. The localities regarded are the city Chemnitz were they went to school and the vague and elusive entity – the continent Europe. During the project in 2010 the eruption of the islandic volcano Eyjafjallajökull happened and the US subprime crisis began to effect the European financial system. These historical occurrences influences the pupils in a way we didn't predetermine and got clearly visible in the pictures the pupils in the age of 11 to 19 years drew. The pupils not only integrated these topics in the pictures, the depictions are connotated differently and adress the feelings regarding these crisises and visualize imaginations of the humanitarian implications (Appadurai 2010).

With this visual power in mind we got the opportunity to start a new visual research project with refugees of different states of origin that just landed in German detention camps 2 months ago. We used a similar research design, following our hypothesis, that when the crisis is not directly addressed and we instead give them basic instructions, we'll get more personal, unbiased and deeper insights. Our object was to get to know the experiences in the escape and long journey they had and also the expectations for their stay. The results affirmed the hypothesis and it was shown, that there is a big difference in the visual and verbal mode especially when you think of cultural differences and the emotional feelings of the refugees, which they weren´t able to address verbally.

For both projects we use a Blog and Twitter account to publish the results, which is an easy way to spread the detailed and colorful pictures and to enrich them with content, comments and hashtags.

Inclusive Innovation: A Systems Theoretic Perspective

Inclusive innovation is nowadays a catchword in political strategies such as of the OECD, the World Bank, and the European Union. Because of its diverse use, the underlying theoretical foundation is somewhat blurred. This contribution aims at clarifying the concept of inclusive innovation on the basis of social systems theory (N. Luhmann, R. Stichweh). Inclusive innovation can thereby occur on several system levels: basically on the level of interaction systems (face-to-face), followed by the level of organization systems (membership) and – most close to

the above mentioned political concern – on the level of function systems such as education, economy, health etc. Therefore, the focus will be on the latter. Inclusive innovation on the level of function systems can unfold in four steps. First, identify weakly included (or even excluded) societal groups (elderly people, unemployed youth, migrants etc.). Second, ensure that weakly included groups do have a reasonable chance to be included (good education, reasonable jobs, optimal health-care etc.). Third, consider the (possible) necessity of innovations especially designed to better integrate the weakly included (i.e. social innovations such as micro-credits or product innovations such as easy useable, cheap equipment especially designed for the weakly integrated). Forth, enable participation in the development of future benefits and services which these function systems provide (via 'open innovation', 'distributed innovation', 'user innovation' etc.). From a systems theoretical perspective it is most striking that a person (i.e. an embodied psychic system with a social 'persona') is usually not fully integrated in every function system (e.g. as it may be true for the science system). Therefore, the concept of inclusive innovation may also not be treated as a universal demand. This contribution will discuss the above mentioned four steps of inclusive innovation in relation to the specific conditions of different functions systems.

The Restroom As a Room to Rest: Territories, Hegemonic Masculinity and Intersectional Practices of Belonging in an 'inclusive' Schoolxs Spaces

This paper is concerned with the interplay of educational spatial regimes and hypermasculinity, forcing female students to create spaces of belonging - and at the same time excluding other girls from these refuges, constructing intersectional rules for inclusion. In my presentation, I will refer to aspects of a case study of an 'inclusive' secondary school in Austria. This case study is based on qualitative interviews with students and field notes I took during a participatory research project. Reading the data was guided by a theoretical framework inspired by Butler and Foucault.

In the first part, I will outline institutional practices relating to performed masculinities of boys during break times: the construction of spatial territories relating to the age of students, supervised and (ostensibly) controlled by teachers. As I will show, boys and teachers developed different spatial and bodily techniques to undermine these measures, maintaining masculine hegemony. Girls were the 'losers' of this assemblage, being forced to inhibit spaces at the margins of these territories, exposed to the boys´ terror. Hence, girls often sought for spaces offering protection from the sexist bullying of male students. The girl´s restroom is one of these and was adopted in a specific way, as will be shown in the second part. In their narrative accounts, girls constructed the restroom as a 'safe place' where they could do "girl things". The physical borders of the restroom and practices, reciting hegemonic discourses of femininity, created a space of belonging - but not for every girl, as will be shown in the third part: the case of Natascha, who was considered as not fulfilling parameters for belonging, as she avoided "girls talk", could not afford stylish clothes and was labelled as having special educational needs, illuminates practices of exclusion based on intersections of ableism, poverty and heterosexual femininity.

BUCHS, MILENA* (University of Southampton, m.buechs@soton.ac.uk)

Conceptualising Implications for Human Welfare of Socio-Economic Transformations to a Sustainable Steady State

If degrowth scholars are right in assuming that current societies need to transition away from economic growth to prevent environmental collapse and maintain human welfare in the long term, we need to ask how this *transition* will impact on human welfare. The degrowth literature has argued that economic growth is not a condition for maintaining or improving human welfare and wellbeing because they do not depend on material consumption, at least not beyond a certain level of standards of living. Examples for human needs and capabilities that are thought to be relatively independent from material consumption are autonomy, security and safety, and social integration. Many of these arguments are plausible, especially when we are thinking of these relationships under conditions of social stability. However, if we are to transition to a no-growth society, this is likely to require a rapid phase of economic contraction and social change. What has been discussed less systematically in the degrowth and sustainable welfare literatures is the question of how phases of rapid socio-economic transition impact on these vital conditions for human welfare and flourishing. This transition will not only mean a rapid reduction of material consumption – and thus possible distributional conflicts – but also require a fundamental transformation of practices of how we work, consume and live our lives, all of which are closely connected to our identities and values. If changes in these different spheres happen on different timescales, they may still have negative implications for human welfare in the short to medium term. This paper will review the theoretical and empirical literature with the aim to conceptualise a possible range of implications for human welfare of transitions to a sustainable steady state with particular attention to the role of social context and institutions in mediating these implications.

BÜCKER, MEIKE* (University of Rostock, meike.buecker@gmail.com)

Institutional Re-Employment Determinants for the Elderly Unemployed – an International Comparison

Recent unemployment research mainly focused on youth unemployment while the unemployment of the elderly lost its prominent role. However, statistics show that persons over 50 years are still a vulnerable labour market group. While they tend to become unemployed less often, once unemployed they face severe re-employment difficulties resulting in longer unemployment durations. In the first quarter of 2015, 60% of all unemployed aged 50-74 in the EU 28 countries were unemployed for over a year. This is noticeably higher than the overall rate (15-74 years) which averaged out at 48%. But the official statistics also show that there are large country-specific differences in the long-term unemployment rates of the elderly: The rates range from 33% in Sweden to 83% in Greece. These big discrepancies cannot solely be explained by individual characteristics. Though (long-term) unemployment can be largely attributed to gender, educational background or the employment history, the highly varying unemployment rates across Europe suggest that there are also institutional settings – e.g. unemployment benefits, pension regulations and the economic state – that influence the re-employment likelihood of older individuals. Therefore, this study aims to identify crucial institutional determinants of (long-term) unemployment for people above 50 years. Using qualitative Fuzzy-Set analysis, institutional settings of ten European countries will be investigated. Those ten countries will consist of two countries for each regime of Esping-Andersen's extended welfare typology (Conservative, Social-democratic, Liberal, Southern and Eastern), thereby covering a wide range of institutional arrangements. The strengths of Fuzzy-Set analysis lie in the focus on the individual case and the equifinality principle, because it considers that different institutional combinations and path-dependent trajectories can lead to different or even similar outcomes. The findings contribute to a deeper understanding of how different institutional settings, and especially their combination, influence the (long-term) unemployment rates in the chosen countries.

Developing Age-Friendly Cities: A Tool to Guide Efforts to Promote Healthy Ageing in Urban Settings

In the context of rapid population ageing and urbanisation, there has been a growing recognition of the need to ensure that cities are places that foster active and healthy ageing. The WHO has been playing a leading role in supporting relevant endeavours, for example through developing indicators of urban age-friendliness (WHO, 2015).

This paper presents an assessment tool that can be applied in different contexts to guide efforts to make urban settings better suited to an ageing population. Its development was informed by research in Liverpool/UK as a city that has made a commitment to an age-friendly agenda. This involved a mixed methods approach that included interviews and focus groups with older residents and key informants in policy and practice, as well as an analysis of secondary health data. A review of the literature in relation to the findings in Liverpool helped shape the tool.

The tool identifies ten key areas where evidence is required to assess efforts intended to make cities more age-friendly. These include political commitment, leadership and governance structures, availability of resources, and involvement of older people. Rather than serving as a checklist, it offers a recording facility for the evidence gathered. A scale for scoring the initiatives considered on the basis of the available evidence enables the identification of strengths as well as areas for improvement.

In addition to its evidence-based nature, a key strength of the tool is its adaptability. It is being pilot-tested in other urban settings. Designed to be user-friendly, it can be applied by policy makers, service commissioners and practitioners to existing as well as planned initiatives to ensure that cities respond well to demographic change.

What We Ask about When We Ask about Sex: Measuring Non-Heterosexual Behavior and Identity in Survey Research

Demographic surveys both illuminate and reflect the social worlds they measure. In particular, scholars have recognized the measurement of identity categories in survey research as a site of political and social contestation and consequence. In this paper, I examine the largest national longitudinal demographic surveys from the United States to illuminate how they measure non-heterosexualities. I analyze when and where questions about non-heterosexuality were introduced, the question wording, and available response options. I contrast these with two large-scale surveys focused explicitly on sexuality that integrate a more social constructionist approach. I find: (1) the construction of sexuality in demographic surveys does not closely align with contemporary theories of sexuality (using language that participants themselves do not use and placing questions along other stigmatized aspects of sexuality); (2) federal funding plays a significant role in setting the research agenda, guiding what questions can be asked; and (3) there are substantial disciplinary divides in questionnaire design and primary outcomes studied, especially between public health (which privileges behavior, asking questions about risk in disadvantaged populations) and sexualities research (which privileges identity, asking questions about pleasure in privileged populations). Demographic surveys have the power to unveil important aspects of difference in the lives of sexual minorities, but they can also reproduce existing inequalities. Given their prominence and privileged position in the world of social science, demographic surveys are an influential place where people's lived experience are translated into categories of knowledge and governance. They can help us interrogate research methodologies (including design, inclusion, and practice) and understand the role of experts in constructing knowledge. The measurement of nonheterosexualities presents a particular problem for survey research, especially when there is a mobilization against fixed categories and simple dichotomies, and current measurement practices both betray assumptions about sexuality while simultaneously contributing to their reification.

Wellbeing, Health, and Welfare Regime: A Qualitative Analysis of Dealing with Health Problems Temuco, Chile and San Jose, Costa Rica.

Chile and Costa Rica have similar health indicators on the macro level, even though the health systems are organized by different welfare regimes: the liberal and social-democratic. We ask: To what extent do the logics of opportunities as shaped by welfare regimes (the interplay of markets, the state, communities and households) play out in everyday life for households and for their wellbeing? We analyze the way households practically deal with health issues, and what repercussions these have on their wellbeing and other life domains. We focus on households in precarious prosperity defined as a position of material wellbeing between secure prosperity and poverty. Such households usually belong to socially heterogeneous (lower) middle-income households, as economic growth has enabled some poor households to make their way out of poverty over the past decades, whilst changes in the way social security is organized linked to the abolishment of the Import Substitution Industrialization model has led other middle-income households to experience an increase in insecurity and downward mobility. We expect households in precarious prosperity to be particularly context-sensitive: Recent research has highlighted their socio-economic volatility; they do not have sufficient financial means to cushion unforeseen events, such as health problems, and are generally not target of social policies. They struggle to maintain or improve their level of wellbeing or avoid slipping into poverty. We analyze how health problems are dealt with by means of qualitative interviews with the same households in 2008/09, 2013 and 2016 in Temuco and San José. Results suggest that the interviewed households in Chile are constantly preoccupied with how to deal with health issues and the consequences. This furthers their anxieties and spills over into other life domains. In Costa Rica, the national health system of sufficient quality limits the spillover of worries into other life domains.

The Overburdened Mother – How Social Work Conceives of Troubled Families

For social workers in child protection families seem to be the main target of intervention and their academic discourse stresses the complexities of the family system. But on the street-level, child protection workers have to deal with individual clients and are confronted with the task to identify the troublemakers and their problematic behavior which may result in child abuse or neglect. Our analysis of 70 case narrations of social workers shows that their interventions mainly focus a mother who is deemed incapable of managing her everyday life, while fathers/male partners are either portrayed as violent or completely absent from those narrations. In this way, the professional program of child protection is strongly gendered and organized around mother-focused routines. Such routines aim at a concept of the family, which – in the way it is fenced in and asymmetric in regard to its gender and generational order – is out of step with broader conceptions of gender and adult-child relations. Our data show that more innovative ideas about parenting and its enhancement are absent from child protection practices.

El Enfrentamiento Entre Guerrillas: Nuevos Aportes Para El Entendimiento De La Lucha Por El Territorio En Contextos De Guerra Civil

La confrontación entre rebeldes con ideologías semejantes es un conflicto particular que pocas veces ha sido analizado. En el caso colombiano, las guerrillas de las FARC-EP y del ELN han tenido una contienda intermitente primero desde el plano ideológico, y después desde el plano militar cuando sus territorios se han visto trastocados entre sí. Una de las regiones que más fuertemente ha sentido el flagelo de este enfrentamiento ha sido Arauca de 2005 a 2010 con la aparición de una guerra abierta que se expandió a la población civil.

Los movimientos sociales de izquierda en Arauca de 2005 a 2010 se vieron fuertemente atacados por cada una de las guerrillas, ya que estas extendían el conflicto que tenían entre sí hasta las "bases sociales" del contrario. La lucha por el territorio está íntimamente ligada con el apoyo civil que los actores armados encuentran y ganan en cada zona. Cuando estos recursos políticos se ven amenazados se entra en una competición directa por conseguirlos pues estos pueden significar la supervivencia de la organización armada.

El anterior fenómeno ayuda a evidenciar una de las muchas particularidades que se pueden llegar a producir un conflicto civil. El estudio de este ayuda a entender mejor las diferentes escalas de confrontación que pueden llegar a producirse, y cómo estas interactúan entre sí con otras; cómo el territorio es visto por cada actor armado; y cómo se construyen las dinámicas de guerra dentro de la población civil. El objetivo de la ponencia es mostrar por medio de un estudio de 2005 a 2010 localizado en la región de Arauca-Colombia, como los conflictos inter-rebeldes se configuran y cuáles son las incidencias que este tiene dentro de los movimientos sociales con los que interactúa.

How the Paradigm Shift in Germany's Family Policy Affects Mothers' Labour Force Participation

Parental leave policies and child care programs are two means by which gender equality can be promoted. Designed properly they can reduce women's burden of child care and facilitate female labour force participation (FLP). In most OECD countries, FLP has increased considerably over the last decades. However, in Germany this was accompanied by a continuous decrease of average working hours of mothers. Since 2005, both FLP and average working hours are increasing. In Germany, around this time a paradigm shift in family policy took place: two ambitious child care programs and an income-related parental leave benefit were introduced. This makes Germany especially interesting to study policy effects on FLP. Hence, we investigate if and how these new family policies have affected FLP in Germany – particularly in the group of mothers with toddlers.

Two data sets and different analytical techniques are applied to assess the effects of both policy reforms. Based on the Socio-economic Panel (SOEP) we apply event history techniques to analyse the effect of the parental leave reform of 2006 on the labour force participation of mothers on individual level. Regional data for the years 1996 to 2012 were used to analyse the determinants of the FLP of mothers with toddlers on district level by applying changing rate regressions for

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the years of child-care facilities expansion. Results of the SOEP analysis show, that the parental leave reform caused an increase of FLP after the 12th month of a child. However, this effect only exists for the first but not for the second child. The regional analyses show that the different tempo of expanding child-care facilities affects recent changes in FLP. However, the results show that policies which are supposed to stimulate gender equality strongly depend on the cultural background and the economic structure of the regions.

Working Mechanisms of Empowerment Programs on the Agency of Roma Women in Montenegro

In this paper I focus on the interplay of gender, culture and empowerment in the case of Roma women in Montenegro who choose to break with certain aspects of tradition and patriarchy in order to realize either their work or education goals or to gain autonomy in other fields of their life. More precisely, I explore the working mechanisms of empowerment programs that contribute to the change in terms of agency and gender equality of Roma woman, in mainly Roma and non-Roma communities in Montenegro. Therefore, the concepts that are central to my research topic are at the intersection of gender, culture and empowerment.

I will shortly elaborate on their interconnectedness further on. If we choose to analyze Roma culture through an essentialist perspective, assuming that time, place and context have negligible effect on it, we could conclude that Roma will act the same way regardless of whether they are owners of a property, artisans, refugees, artists, well-educated or not. Moreover, we would neglect the importance of their migration path, their place of residence and their civil and political rights in a respective society. We may even go further and say that all Roma worldwide have preserved the same cultural traits over centuries. The vision of their group as homogeneous would imply that individuals, man or woman, young, adult or old neither could nor would choose their developmental path and thus deviate from the mainstream norm. This approach leaves little space for support mechanisms for those who choose not to conform to the majority norms as it is presumed that the Culture and group rules matter more than the individual choice.

Fighting for Food Safety in Post-Fukushima Japan: How Consumers Are Challenging the Governance and Regulation of Radionuclides in the Food System

The ongoing disaster at Tokyo Electric Power Company's (TEPCO's) Fukushima Daiichi Nuclear Power Plant has renewed conversations about the links between nuclear technology and food safety in Japan and around the globe. As the Japanese government works to ease public worries and establish a regulatory framework to control and legitimize the spread of escaped nuclear matter into the food system, not all consumers feel comfortable welcoming TEPCO's radionuclides into their everyday diets and bodies. For concerned consumers, the food system has become a contentious space where they are forced to encounter new, invisible risks at markets, restaurants and their own dinner tables. This PhD project plans to use Ulrich Beck's theory of Risk Society and Michel Foucault's concept of governmentality to explore the contentious spaces that many concerned consumers find themselves in as actors within Japan's food system, focusing particularly on the experience of people living in the Kansai region of Japan—600 kilometers southwest of the disaster. Though these concerned consumers live far from the disaster, they are intimately connected to the risk of radionuclide exposure via the food system. As fieldwork will begin in early 2016, this presentation will include a discussion of the conceptual framework guiding the research project and preliminary findings.

The Governance of Food Safety in Post-Fukushima Japan: Is There Space for the Public's Rationalities and Experiences to be Included in the Governance and Regulation of Risky Technologies?

The ongoing disaster at Tokyo Electric Power Company's (TEPCO's) Fukushima Daiichi Nuclear Power Plant has signaled the need for more reflexive governance of modern technologies that takes into consideration the diverse rationalities and experiences of the public. While scientific experts and politicians currently have the authority to make decisions on the use and diffusion of modern technologies, it is the lay public who must deal with the consequences of accidents and disasters. Following TEPCO's nuclear disaster, it is not only the nuclear power plants that have been destroyed, homes, forests, oceans, rivers, lakes, farmlands and

fishing waters are also being contaminated with invisible radionuclides—detectable only by sophisticated scientific instruments—that will remain in the environment for hundreds to thousands of years. In this presentation, post-Fukushima food safety will be used as a case to explore the far-reaching impacts of the disaster and how both experts and the public have responded to the dispersion of TEPCO's escaped nuclear matter into the food system.   Focusing on the experience of people living in the Kansai region of Japan—600 kilometers southwest of the disaster—this presentation plans to use Ulrich Beck's theory of Risk Society and Michel Foucault's concept of governmentality to illustrate how current systems of governance in Japan are dealing with the complex consequences of the nuclear disaster, identify how the public navigates new risks, and recognize spaces where rationalities and experiences of the public can be recognized by those in power and included in the decision making process on the use of risky technologies.

Invoking Heritage: The Catholic Church and the Politics of Religious Diversity in Spain

Processes of ethno-religious diversification in a variety of new immigrant societies have intensified state efforts to 'manage' religious structures and practices through legal and bureaucratic regulations. In some cases, these regulations have been framed as important for the safety, support, and protection of religious minorities. In others, they have been framed as necessary for protecting the civic or secular character of public spaces and institutions. This deepening of governmentality in the religious sphere has generated challenges not only for religious minorities, but also for majoritarian communities that previously enjoyed a high degree of autonomy from the state and its regulatory apparatuses. In an effort to remain shielded from governmental regulation and control, majoritarian religious leaders have increasingly invoked discourses of "heritage". Such discourses have proven critical for defending the differential treatment of distinct religious confessions against critiques rooted in the liberal principles of equality and neutrality. Understood in this way, heritage discourses constitute a cultural resource that majoritarian communities have mobilized strategically in response to the deepening of governmentality within the religious sphere. In advancing this argument, we draw on data and fieldwork from Spain, a historically mono-confessional society that has experienced a tremendously rapid wave of immigration and religious diversification over the past several decades. We focus on recent debates surrounding the laws and regulations around places of worship, devoting particular attention to how the Catholic leadership has responded to regulatory changes developed in response to the proliferation of mosques and Protestant churches.

How Educational Policies Affect Social Gradients in Student Achievement: A Comparative Study of 31 European Countries

Research has demonstrated social gradients in student achievement in any country for which data exist. Socially privileged students tend to outperform their peers from lower social classes. Recent evidence suggests that these social gradients in student achievement cannot be explained satisfactorily by differences in genetics or educational aspirations. This raises the question of the causes of these gradients. By now we know that social gradients in educational achievement can be associated with characteristics of the individual, the family, and broader environmental contexts. This study seeks to determine how country-specific educational policies affect social gradients in student achievement in European countries. It focuses on four policy dimensions: pre-primary enrollment rates, public/private education sectors, educational tracking (selection of students into hierarchically structured types of schools), and amount of schooling. The study uses data from the Program for International Student Assessment as well as from several data repositories (e.g., Eurostat, UNESCO). The sample comprises around 200,000 students. Hierarchical linear models are performed which take into account the nested structure of the data (students in schools in countries). Cross-level interaction effects are calculated to establish whether country-specific educational policies moderate the social gradients in student achievement. Preliminary results indicate that social gradients in student achievement change as the policies change. For instance, the longer the annual schooling time, the weaker are the social gradients in achievement. By contrast, the greater the amount of tracking in an education system, the stronger are these gradients. In sum, the study contributes to debates about the effects of educational policies on educational stratification and mobility.

Student Perceptions of the Fairness of Grading Procedures: The Role of the Academic Environment

This study investigates the extent to which student perceptions of procedural justice and informational justice are not only affected by individual-level characteristics, but also by the *academic environment* of university departments. The focus is on two aspects of the academic environment: the *method of assessing student performance* and the *organization of classes*. Both are subject to department-specific variation: While essays are more common in the humanities and social sciences, STEM fields use exams such as multiple choice tests as the preferred method of student assessment. Likewise, while some programs are geared towards lectures as the primary type of classes, others are more seminar-based. Building upon theories on *justice climate*, it is expected that the department-specific configuration of the academic environment leads to department-specific justice perceptions.

Multilevel analysis is used to estimate effects of individual- and institutional-level variables on individual justice perceptions. Further, cross-level interactions are fitted to check whether effects of the academic environment vary with student SES. The analysis sample is comprised of n=1.629 students nested in n=48 departments of a German university. The dependent variables are procedural justice (PJ) and informational justice (IJ), adapted from Colquitt's (2001) instrument. For PJ, perceptions of the amount of control students can exert on the grading process (PJ-C) are treated separately from aspects regarding the perceived validity of grading procedures (PJ-V).

Regression results show that PJ-C and PJ-V are significantly affected by the method of performance assessment. Higher proportions of essays relative to exams lead to higher ratings of PJ-C, while they decrease ratings of PJ-V. Ratings of IJ are higher as well if assessment is more essay-based, although this only affects low-SES students. As for the organization of classes, higher proportions of seminars were found to significantly increase perceived PJ-C and IJ. Again, effects on IJ are moderated by parental SES.

Towards a (Modern) Historical Risk Perspective

The long term historical distinction between the pre-modern and modern is an important backdrop to the sociology of risk, understanding risk as a distinctively modern perspective, institutionalised through mechanisms such as insurance. Little has been done to enrich and contemporize this perspective, however, through more finely tuned analysis where risk perspectives and mechanisms have unevenly progressed within particular societies. Some recent work has begun to examine the consolidation of risk within the United States and this paper will draw out and integrate these new insights. I will further set out a project focusing on key moments and events that have combined to consolidate another significant 'risk society', the United Kingdom. Such a perspective allows us to highlight the role of particular actors and contingencies in what should be understood as an ongoing process of risk consolidation

Contributions of the Communicative Methodology to Gender Violence Prevention in Educational Research

The present paper analyzes how the Communicative Methodology (CM) in research with teen girls and following the international ethical standards thoroughly, can contribute to overcoming a central problem such as gender violence among teens. The Free-Teen-Desire Marie Curie project funded by the EC analyzes new methodological approaches under the communicative paradigm for that purpose. The project focuses on the potential of dialogue using language of desire to question the change in desire towards violent hegemonic masculinities that some girls present (CREA, 2010-2012; Gómez, 2015). One of the premises of the CM is to include all voices, especially traditionally excluded voices, in egalitarian dialogue. In this dialogue the research participants contribute with context-specific knowledge and the researcher with the scientific knowledge related to the issue. Therewith the standpoint of teen girls from diverse social backgrounds and their interpretation of gender violence can be obtained tackling the mistaken perception that this phenomenon is linked to social class, ethnic or religious backgrounds.

The joint reflection on the evidences and the social reality of the participants in relation to gender violence and the trend of attraction towards violence among the participant and the researcher opens up a possibility for changing the reality. Therefore the research seeks to analyze the influence of using language of desire to facilitate this change in attraction towards violent hegemonic masculinities. The communicative methodology and the egalitarian dialogue with teen girls provides a space in which language of desire comes up to discuss gender violence and attraction towards violent men and facilitate a change in their desire. The paper concludes with main contributions of the CM to responsible social and educational research on gender violence prevention among adolescents preventing any negative outcomes for research participants or vulnerable groups.

Anthropocentric Versus Bio-Centric Views of Parks and Protected Areas: A Comparison of Perspectives from Austria—Germany, Brazil and United States.

One can view peoples' perspectives of parks and protected areas along a continuum ranging from anthropocentric to bio-centric. Those who fall toward the anthropocentric end tend to view parks and protected areas as places in which to recreate, while those on the bio-centric end of the scale often see the same settings as places to be preserved; where human recreation activities should not be allowed. Understanding this can be related to how a person feels a setting should be managed; where we often use zoning techniques in an attempt to meet the desired leisure experiences of various users and user groups. What are the drivers of this anthropocentric or bio-centric paradigm? This discussion will focus on the perceptions of people from three distinctly different geographic regions; Austria-Germany, Brazil and the United States. Von Ruschkowski et al. (2013) Burns, Arnberger, and von Ruschkowski (2010) and Burns and Moreira (2013) suggested several reasons for these varying viewpoints, which will be discussed during the session. A typology of underlying sociological reasons will be discussed, based on empirical research conducted by the presenters. Arnberger et al (2012) suggested that peoples' affinity toward parks and protected areas may be a predictor of support for positive attitudes toward parks. The role of national legislation and its impact on how people perceive parks should be used will also be discussed. The overall discussion will be a synthesis of a body of work that seeks to explain behavior from a social and political perspective.

The Sociology of Complex Social Systems: Applications of Moderns Systems Theory to Practical Problems

This article outlines a sociological systems theory, drawing on the work of Walter Buckley, Margaret Archer, Thomas Baumgartner, Tom R. Burns, Philippe DeVille, Felix Geyer, and others.. The work has shown how key social science concepts are readily incorporated and applied in system description and analysis: institutional, cultural, and normative conceptualizations; concepts of human agency and social movements; diverse types of roles and social relationships; social systems in relation to one another and in relation to the natural environment and material systems; and processes of transformation and sustainability.

A key feature of the theory is its consideration of social systems as open to, and interacting with, their social and physical environments. Through interaction with their environment—as well as through internal processes—such systems acquire new properties and are transformed, resulting in evolutionary developments. The theory incorporates in its framework human agents as creative (destructive) transforming forces. They may choose to deviate, oppose, or act in inno-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

vative and even perverse ways relative to the norms, values, and social structures of the particular social systems within which they act and interact.

The theoretical approach has entailed several key applications, each of which will be briefly illustrated/exemplified in the paper: (1) the conceptualization of human agents as creative (also destructive), and drivers of innovation and creative development within particular social system contexts; (2) the conceptualization of collective consciousness in terms of self-representation and self-reflectivity and applied in analyses of the gaps and dilemmas of international law regarding gender equality; (3) a theory identifying the universal features of groups and organizations and their dynamics; (4) a theory of paradigm shifts in policy regimes and regulative institutions (selected case studies of major EU policy shifts); (5) transition and transformation of social systems: selected historical cases as well as the ongoing "sustainability revolution."

Organizational Cultural Competency and Leisure Delivery

Leisure contributes to the development of strong communities, but what happens when the cultural insensitivity of agency employees creates a barrier to participation in those leisure opportunities? How do we ensure that all cultures are represented in our leisure programming, and that our leisure delivery staff are culturally competent? Cultural competence recognizes, affirms, fosters, and values the strengths of individuals, families, and communities and protects and preserves the worth and dignity of each. Operationally defined, cultural competence is the integration and transformation of knowledge about individuals and groups of people into specific standards, policies, practices, and attitudes used in appropriate cultural settings to increase the quality of services, thereby producing better outcomes pp. 11-12. National Association of Social Workers. (2001).

Municipal leisure service agencies are charged with the formal and institutional delivery of leisure opportunities. However, these agencies and the participants in their programs are very often not represented by the sociodemographics of the publics they serve. The delivery of leisure to these varied cultures is often negatively impacted by cultural incompetence of the municipal employees of leisure services. Data was obtained from a series of 6 focus group meetings which gathered information regarding what agencies were doing to ensure that they are culturally competent, and what resources they felt were needed to aid in the delivery of culturally competent leisure services. Further, 453 employees of municipal agencies were surveyed regarding what agencies are doing to address this issue, and what challenges the employees see as paramount to delivering leisure opportunities to all groups. Results highlight the impact on the development of community through leisure opportunities explored and discussed in the context of cultural competency. The results of this study may enable other agencies to gain insight to the delivery of culturally competent programs and leisure services.

Chance or Challenge? How the European Union Fosters or Interferes with Young People`s Opportunities for Developing a Common Identity

Recent developments such as the EURO crisis or the refugees` rush are challenging the European Union as a common and joining construct. This does not only refer to the political or economic level, but also to a civic and cultural one. On the one hand, values like tolerance, peace and democracy serve as driving factors for people feeling as a part of a unified European population and thus, developing a European identity. On the other hand, differing political and economic interests in the EU member states interfere with this. Considering these prerequisites, we ask to which extent the next generation considers itself as European citizens instead of perceiving their respective national affiliation only. We point out how young people evaluate the European Union today and which expectations they formulate. Thereby, we analyse which aspects and mechanisms of the European Union as it exists today lead to an alienation from or, on the contrary, to a more solid identification with the European Union.

We use data drawn from a large scale EU project (MYPLACE), which focused on young people between 16 and 25 years. This age group is particularly important for analysing the future of the European Union as they have been growing up in its expanding structures. In order to give more detailed insights into young people`s thoughts, we use quantitative data that was gathered in 30 European locations (14 countries). For giving some explanatory insights we refer to in-depth interviews conducted with a sub sample of the survey participants.

BUSSE, ERIKA* (Universidad del Pacifico, Peru, busse.erika@gmail.com)

Performing Identity: A Comparative Study of Two Peruvian Immigrant Communities and the Practice of Peruvian Dances

This paper focuses on Peruvian ethnic identity construction in two cities in the U.S., namely Paterson, New Jersey and the Twin Cities, Minnesota. Theoretically, I argue that in order to understand the ethnic identity of a group, we need to pay equal attention to the notions of ethnicity (intertwined with race, gender, and class) that immigrants bring from their home country as well as to the racial and ethnic context in the country of reception. Considering these two sides is more relevant in these times given the technological development of communications that allow immigrants to be in permanent contact with their family members back home. Which in turn, will reinvigorate the notions of ethnicity from home.

In order to illustrate this case, I study the practice of a traditional Peruvian dance that is very popular among Peruvian immigrants in a well-established Peruvian community in the U.S. (Paterson, NJ), and in a less prominent destination for Peruvian migrants (Twin Cities, MN). Empirically, what are the notions of ethnicity do Peruvian immigrants bring to the States? What does their engagement (or not) with the Marinera tell us about the Peruvian ethnic identity construction? To what extent does the context of reception shape how immigrants construct their ethnic identity? I argue that by choosing the Marinera among other cultural practices to assert Peruvian ethnic identity, Peruvian immigrants reinvent their ethnic identity in a racialized country by highlighting their mestizo identity. This speaks to the U.S. context but can only be fully understood by bringing in the notions of ethnicity that operate in Peru. In so doing, dancing is a window to study how Peruvians construct their ethnic identity vis-à-vis the ethnic communities, the larger community, and their families back home.

BUTLER, NINA* (Rhodes University, nina.btlr@gmail.com)

Becoming in the Open Space of History: Imagining Alternative Possible Futures in Palestine/Israel through the Words and Images of Mahmoud Darwish, Mustafa Hallaj and Edward Said.

It is international consensus that the most favourable outcome of the Middle East Peace Process is a 'two-state solution'. It is not obvious or certain that a perpetuation of the entrenched binary in national identification – Palestine/Israel – is at all a favourable, just, and peace-enabling solution. What is most remarkable about this is not just how unsuccessful attempts at this solution have been, but that there are no viable alternative solutions imagined and tabled other than that of 'binationalism', which also perpetuates instantiated nationalism in the region. This presentation attempts to contemplate alternative futures through Edward Said's writings in *After the Last Sky,* Mahmoud Darwish's poetry in *Unfortunately it Was Paradise,* and Palestinian artist Mustafa Hallaj's endeavour to 'rewrite' a history of the region based upon synthesis, multiple perspectives and cyclical time. Focus is placed on historiographical temporality, and the role 'ways of seeing' the past have in conceptualising and enabling an alternative future. What these Palestinian voices reveal is potential for the construction of a sense of self and one's community in terms of open incompleteness, and a disposition to the past and future as integrative and fluid. This view is exilic and not tied to dogmatic ideas of a homeland, but rather finds a homeland within the expression of self. Furthermore, this view is the foundation for a postnational identification that frees up the weighted and reflexive histories for Palestinians and Israelis.

It is postulated that this view of temporality is in keeping with Martin Heidegger's notion of time as 'ecstatic' in Being and Time. Heidegger offers a refutation of teleology, and along with it historicism. This paper thus argues that a decontextualisation of the prosaic 'historical separateness' of Zionist and Palestinian national narratives could palpably assist in the imagination of alternative futures that are more equitable.

What about the Workers? the Latest Industrial Revolution and Its Shop Floor Effects

The effects of digital rationalisation on employee's working conditions, specifically on workplace health and safety and worker participation have been largely ignored in the German discourse on the digital economy. We criticize the current debate for its technocentric orientation, its frequently narrow and national perspective, its focus on manufacturing and on the single company organisation. Current, rather futuristic, debates about a fourth industrial revolution in Germany or the coming of the 2nd machine age in the US tend to discuss economic transformation without paying sufficient attention to the manifold aspects of capitalist

crisis, e.g. increasing social inequality, weak economic growth and escalating ecological problems.

This contribution is structured as follows: we will introduce the German discussion on the latest industrial transformation, for which the term "Industrie 4.0" has been coined. The dominant strand within this debate predicts positive economic effects: According to BITKOM`s (an association of IT businesses) calculations, there is a potential to create a relevant increase of GDP and efficiency effects supporting a break-through for green economic growth. When it comes to expected results of "Industrie 4.0" on work and employment, projections of fully automated production and deserted factories are widely rejected. Quite to the contrary, workers will take increasingly coordinating functions in production and will be able to develop and broaden their skills.

We will then present case studies from an interdisciplinary research project. Using original qualitative data we will offer an account of the discernible effects of digital rationalisation on working conditions, health and safety and worker participation in the workplace. For this purpose, we have identified organisations that are quite advanced when it comes to the application of cyber-physical technologies. These empirical insights help us identify problematic forms of work organizations caused by digitalised, networked processes, new software and machine-to-machine communication.

Race Science and Surveillance

This paper aims to use a global perspective to address the relationship between race and the urban through an examination of the role of surveillance—a growing global phenomena—in contemporary western cities and its uses in creating and maintaining boundaries of race, particularly because surveillance of racial and ethnic minority groups tend to be grounded in specific and bounded geographic locations. Using data from the New York Police Department (NYPD) Stop and Frisk program during the 2003-2013 period, this paper asks whether or not, strategies of state surveillance of racial and ethnic minority groups, should be interpreted as a "new" type of scientific racism given the state's desire to deploy and its hyper-reliance on technologies to fulfill its surveillance role.

Legitimación De La Desigualdad y Naturalización De La Pobreza En Los Programas Sociales Neoliberales. De "Oportunidades" a "Prospera" En México: Conceptos, Asunciones y Efectos.

En este trabajo se reflexiona sobre los resultados de la política social neoliberal aplicada en México para "combatir" la pobreza, dando cuenta de que han sido insuficientes frente a la magnitud del problema. Se considera que no inciden en las causas histórico-estructurales que la generan ya que se identifican las fallas en los procesos de aplicación, las mediciones, los métodos de focalización, el destino de los recursos y la articulación de las fases y actores que intervienen, para proponer modificaciones y/o ajustes a los programas. Sin embargo, en el tránsito de un programa a otro, de "Oportunidades" a "Prospera", no se cuestionan los fundamentos y concepciones que históricamente han legitimado la desigualdad, asumiendo que la acción individual se rige por la competencia, el afán de lucro, la acumulación y la ganancia, parámetros utilizados para jerarquizar y darle sentido a la organización social.

Asimismo, asumen que el incremento de la pobreza deriva de la falta de competencias y habilidades de cada individuo para insertarse en la dinámica del "desarrollo". Así, la pobreza se plantea como una condición natural propia de la dinámica social, por ello, se da continuidad a los programas para fortalecer el llamado "capital humano", en el entendido de que éste facilitará a los individuos contar con "capacidades" para aprovechar las "oportunidades" que brinda el mercado. En consecuencia, el mercado se encarga de los "exitosos", y la intervención del Estado se dirige a "aliviar" la situación de quienes no logran serlo.

Tampoco toman en cuenta el "divorcio" entre política social y política económica, misma que impulsa la desregulación del mercado de trabajo, la eliminación de los derechos laborales y el deterioro del salario real, en un periodo histórico en el que el predominio del capital financiero ha profundizado los procesos de marginalidad social y desempleo estructural.

Unwrapping the Children's Gift Box. a Sociological Perspective on the Role of Offering Toys, Clothes and Money in the Construction of Desirable Futures.

Offering and receiving presents is ubiquitous in family life, particularly in the context of children's birthday's parties and other special events such as Christmas. In their narratives about gift giving, present-day parents tend to emphasize the importance of granting what the child wants and what makes him/her happy. However, when asked about what children actually receive, parents end up referring to multiple gifts, including toys, clothes and money. Although gift giving is a classical topic in anthropology studies, some questions remain unsolved as far as a sociological perspective is concerned. Why does this happen? What is behind these decisions and why are gifts perceived differently by the parties involved, namely the parents and children? To answer this question, this paper brings together contributions from two sociological studies carried out in Portugal based upon semi-structured interviews. Through qualitative content analysis procedures, data was examined and analyzed in the context of how parents reflect on the gifts they offer to children, and how young adults retrospectively realize the importance of the gifts their parents offered them during childhood and adolescence. By the end, we expect that crossed gazes over the seemingly ordinary act of gift giving to children might shed new light on the issue, especially regarding their role in the construction of the futures familes both want and do not want.

Dialogue on Democracy and the Environment from the Approaches Procedural and Substantial Democracy

The article exposes the debate that involves two types of democracy - the substantial or social and the formal or political- *and the debates on deliberative democracy*, in order to seek solutions to the problem of how - to confront the environmental crisis - including the subject of sovereignty future generations and the

biotic community without action and word. To do so, Habermas proposed of popular sovereignty and guidance to the procedure, provides important information so that it can assume the presence of such diffuse subjects rights and interests. The debate allows to realize the enormous difficulties that this task involves considering obstacles to democracy represented *by the current environmental crises.* The obstacle arises from the contrast between the citizen's incompetence of citizen facing ever more complex problems and teaching technical solutions accessible only to specialists. Given that environmental problems involve the difficult balance between maintaining a healthy environment and economic / industrial development made possible by advances in science and technology, the compatibility between democratic participation and a tendency to the solution of environmental problems precisely because of its complexity, it is increasingly decided by a technocracy, is a debate that needs to be faced.

Swiss Retirees As "Active Agers": A Critical Look at This New Social Role

Nationalized retirement began in Switzerland as a response to economic crisis and unemployment in the 1930s, and the content of this role reflected this context. Over time, changes in this role have occurred in relation to economic and demographic shifts, especially since the late 1970s. Similar to other countries in the European Union, contemporary Switzerland faces concerns about an ageing population, and the policy framework of active ageing is one response. Today's retirees are asked to actively participate in society in ways that are recognized as social contributions. We argue, however, that the redefinition of the role of retiree to be an "active ager" rests upon age and gender inequalities, among others. We argue that if these inequalities are not challenged, this well-intentioned framework can reinforce both the construction of dependence in later life and the exploitation of elders, especially old women. To illustrate our argument, we draw both on national data on gender, age, and unpaid work and on interviews conducted among Swiss retirees to demonstrate the ways that active aging can reinforce both ageism and gender inequalities in late life.

CALDERON COCKBURN, JULIO* (Consultor independiente, cockburnjulio@gmail.com)

Democracia, Individualismo y Clientelismo. Un Contra Ejemplo En Peru

La experiencia peruana difiere de la de otros países de la región. El proceso de democratización (1980-1992) fue interrumpido por un gobierno neoliberal -autocrático (1990-2000), una guerra interna y la destrucción del tejido social configurado en las década de 1970 y de 1980. El modelo neoliberal (1990-2015), a través de políticas y leyes promovió el individualismo, la propiedad privada y la privatización de la función pública.

Entre sus consecuencias un proceso de crecimiento económico, diferenciación social, surgimiento de una nueva clase media (ex pobre) y permanencia de un núcleo poblacional pauperizado. En el mundo urbano popular se ha constituido un desinterés por la cosa pública, un desvanecimiento de la conducta ciudadana y mercantilización de la vivienda. Se han constituido subalternos autónomos, sujetos que tienen autonomía de decidir en qué espacio moverse mientras construyen redes y se encuentran atrapados en una lógica de vida a la que le han dado sentido. El individualismo ha socavado las bases de solidaridad y de la acción colectiva, removiendo las demandas de ciudadanía. Este proceso no podría funcionar sin, a la vez, haber constituido un "sistema" de prácticas clientelares fomentadas por autoridades políticas y partidos políticos.

Un estudio histórico comparativo, a partir de las demandas de gestión del territorio entre las décadas de 1970 – 1980 y el siglo XXI, mostrará los mecanismos que han llevado a un desprestigio de la acción colectiva y la ciudadanía (social), el clientelismo político y un mayor individualismo. Los ejes del acceso al suelo y la ciudad y los perfiles biográficos de los dirigentes serán considerados.

CALLEGARI, JOSE* (Programa de Pos-graduacao em Sociologia e Direito, calegantonio@yahoo.com.br)
BASTOS, DAVID FERREIRA (Univsersidade Federal Fluminense)

Brazilian CIVIL Procedure: Democratizing the Procedure Relationship.

We investigated the narrative structure in the Code of Civil Procedure. We observed in each one deontic marks that delimitates the argumentative strategy of the procedures subjects

The data show an important new procedure: mediation. This is a discursive space in the process less formal and more dialogical than jurisdiction. In jurisdiction, we have a complex discursive network. In mediation, the procedure constraints are mitigated. The judicial discourse is more technical end hermetic with lexical expressions that require certain epistemic domain or cultural fluency (MELLO, 2014). The reduction of formalities as in mediation and the simplification of proceedings could facilitate the transit of communication between litigants, judges and lawyers

Besides, we noticed a linguistic turn of participation of the parts involved in the management of the process. For the Brazilian procedure doctrine, the new procedure civil code have a vision of shared management of proceeding, putting the parts in active position in the relationship of the process. If a systemic view of the process make you believe in a procedural relationship of the process developed with the concerned (LUHMAN, 2009); a dialogic vision of the process tend to create a new procedural relationship of the process managed by the concerned (HABERMAS, 2003). We would be against of an inclusive proposal and democratizing of the Brazilian procedure, or we will be witnessing only a rhetoric participation without the Brazilian judicial structure break with the old institutional paradigms of operational closing? Issues like that indicate the relevancy of the research in course and the opportunity to communicate some observations to the scientific community.

With this research, we tried to contribute for a less dogmatic view and more discursive practices of the process.

Protected Natural Areas in Indigenous Lands: The Lacandon Community of Mexico

This paper researchs six Protected Natural Areas (PNAs) located in Indigenous lands in Mexico´s Lacandon rainforest. Based on information on land use changes and census data for the period 1990-2015, the paper assesses how environmental public policy has shaped the rainforest as a priority region for conservation in Mexico. The paper then examines the extent to which the indigenous population has utilised the local natural resources, and highlights the problems in the operation of protected areas. The PNAs under study, located within the lands of the Indigenous Community called *Comunidad Zona Lacandona* (Lacandon Community), have different categories: three are Biosphere Reserves (Montes Azules, Lacan-Tún, Nahá-Metzabok), two are Natural Monuments (Yaxchilán, Bonampak), and one is a Protected Area for Flora and Fauna (Chan-Kin.)

Womenxs Empowerment and Political Extremism

While female empowerment appears to be a solution to the universal problem of oppression of women by men, the paper highlights the existence of different methods and goals of empowerment. For instance, while the Millenium Development Goal has sought to promote gender equality and the empowerment of women by means of increasing female representation in national legislatures, some other women have chosen political violence as a tool of empowerment. By looking at cases of women active in guerrillas (El Salvador, United States), terrorism (Rusia, United Kingdom), and civil guards (Pakistan, Siria and Iraq), the paper examines three issues: 1) the historical and contemporary nature of militant women. 2) Stereotypes associated with female participation in armed political movements. 3) Female roles within radical organisations (sympathizers, spies, fighters, leaders/generals, suicide bombers). The paper concludes by stressing the need to continue studying women´s political participation beyond Democratic institutions. Qualitative data for this paper comes from digital and printed versions of internaitonal newspapers, and biographies.

Ayotzinapa in the Mexican Press: Between a State Crime and a Mafia's Grudge Match

On September 26, 2014 a group of indigenous students from Ayotzinapa (Guerrero, Mexico) were victims of an armed attack that left a death toll of six students, two civilians and the dissapearance of other 43 students. This attack turned to be one of the most shocking events of the administration of the President Enrique Peña. As news broke, national and international public opinion were shaken up

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

by facts that have let think the students had been massacred. Two versions of the attack had been spread by traditional media and social networks that have dominated the political milieu: some see the attack as a state crime while others as a mafia's grudge match. Based on a theoretical argument built on Jeffrey Alexander's cultural sociology, Ann Swidler's sociology of culture, Peter Berger and Thomas Luckmann's sociology of knowledge, Anthony Giddens' theory of structuration and Sthepen Reese, Nadia Koziner, Dennis Chong and James N. Druckman, Claes H. de Vreese, Dietram A. Scheufele and María Teresa Sádara contributions to the media framing theory, I will analyze the construction of the event using two of the most important national newspapers, *Excélsior* and *La Jornada*. The former is a paper that have been focused on national security issues and is close to the official version of the attack while the latter is a left-wing paper identified with the left parties that are opposed to the government of Peña Nieto. I will identify events that were watersheds in the investigation of the attack and analyze the news coverage, the graphic visual representation of the events and the debate developed in the op-ed pages in order to disclose the discursive patterns of constructions of the phenomenon and the resources the papers used to biuld meanings and representations of the event. My methodological approach will be discourse analysis.

The Growing 'Blurred Lines' of Health Care Provision in the English NHS

With the advent of the 2012 Health and Social Care Act, marketization policies with an emphasis on both competition and choice have been pushed into the NHS limelight and there has been intense debate about whether or not the English NHS will be subjected to privatisation as a result of restrictions being lifted on commissioners. Under the reforms, commissioning of services has moved from managers to clinicians operating in Clinical Commissioning Groups (CCGs), who have the power and freedom to pursue provision from a large array of different providers, public, private and third-sector. This has lead to public debate about the use of non-public sector provision in the NHS and how the commissioners will choose to utilize the opportunities that they have in their new roles.

This paper will provide analysis and findings from a comparative ethnography, which follows the commissioning processes in two CCGs. This ethnography involves interviews with key informants and observation of committee meetings. Throughout two different services, mental health and elective surgery, with different histories of private provider involvement, have been traced and examined. The analysis looks at the commissioning process and how important the type of provider is to commissioners in their decision-making. Preliminary findings suggest that commissioners' decisions are shaped by other influences that are more important than the type of provider, with commissioners pursuing a stance that can be described as being essentially pragmatic.

Reproductive Trajectories of Indigenous Mexican Women

Reproductive Trajectories of Indigenous Mexican Women
Fertility levels in Mexico had a sharp drop in the last forty years, from an average of 6 children per woman in 1975 to 2.2 children in 2014. However, results from several research have shown this decline occurred differently among women from various socio-economic and cultural backgrounds. In particular, they have consistently shown a delay in fertility decline and persistent higher levels of fertility among indigenous women compared to non-indigenous ones, as well as a tendency among the former to suffer more underserved complications during pregnancy.

This paper analyzes and compare the reproductive behavior dynamics of Mexican indigenous and non-indigenous women throughout their reproductive lives. From a life course perspective the focus is not only on the total fertility levels reached by women at the end of their fertile period, but mainly on the ways those levels are reached.

Based on reproductive histories of women and by using event history analysis and sequence analysis techniques, reproductive trajectories of women are built and analyzed. Trajectories are built taking into account the occurrence of reproductive events such as pregnancies, abortions, stillbirths and childbirths, whose frequency, timing and sequencing are analyzed. The aim is to provide an overview of the reproductive dynamics of indigenous and no-indigenous women, to identify and understand the similarities and differences between them.

Data used come from the National Survey of Demographic Dynamics (ENADID) conducted in 2014, which collected longitudinal and retrospective reproductive information for a sample of 98,711 women of reproductive age. The analysis is performed for women whose fertility is considered complete (45-49 years old at the survey time), as well as for those aged 30-34 as a way to analyze recent changes among younger women.

Construction and Results of a Weighted Incidence Index (WIIPA) to Measure Frequency and Severity of Personal Accidents: Europe 2009

Accidents constitute a serious public health problem. To effectively and efficiently address this public health problem, it is necessary to launch adequate intervention programmes. To design such programmes, as well as to evaluate them, it is necessary to establish a thorough and complex apparatus for the statistical measurement of daily accidents.

The study that we present consists in the design, construction and calculation of a synthetic index to measure the annual incidence, weighted by the seriousness of their consequences, of personal accidents in the 28 member countries of the European Union. The index is calculated based on data from several sources: Statistics on causes of death, the different administrative registries that provide data on "hospital discharges" in each country, and micro-data from the first wave and, when available, the second wave, of the European Health Interview Survey(E-HIS).

It is necessary to combine statistical sources because none of those currently available provides a complete count of accidents. Thus, fatal accidents are gathered in an annual registry, Statistics on causes of death; data on severe accidents - those that require hospitalisation - come from hospital registries, although they do not provide information on the place of accident, and lastly, the number and location of accidents, although not including fatalities, are from a representative survey carried out every five years, the European Health Interview Survey.

The index of the incidence of accidents is calculated as the sum of the frequency of incidents - deaths, hospitalization, injuries, accidents without victims and/or minor accidents and total accidents - weighted according to their severity. The index results in "death equivalent units" per 100.000 population.

A Cosmopolitan Youth? New Directions in Research on Contemporary Youth

Contemporary youth is a challenging field of research. The effects of contemporary globalisation processes and social uncertainty on young people's biographies and their *Weltanschauungen* require new scientific tools. Cosmopolitanism is a fertile category to investigate the consequences of the individualisation and de-standardisation processes that are affecting young people's transition to adulthood, and their life-styles in terms of consumption practices, values and future projects. Moreover, it helps to analyse young people's identitarian configurations and their sense of belonging.

The paper is based on a qualitative research conducted in Milan (Italy) on young cosmopolitans who were temporarily residing in the city for a dual purpose: that of enriching their education in the arts, scientific research or design, and first and foremost that of having new life experiences.

The biographical profile of these young people – aged between 24 and 33, both with Western and non-Western origins, in possession of high levels of cultural and social capitals, with middle-class origin and a high level of mobility– gives us an image of 'distinctive subjects'. They differ from 'traditional' migrants in terms of educational credentials and highly specific career paths, constant mobility and the planning involved in that. Moreover they consider themselves different from 'traditional' migrants showing a cosmopolitan Weltanschauung. Indeed, since they consider themselves 'citizens of the world', they assume international mobility as a key element of their identity.

The paper will underline the epistemological need to overstep the dichotomy migration/mobility, suggesting the concept of cosmopolitanism; a concept stemming from political philosophy and recently embraced by anthropology. This new perspective allows sociology to focus on the very characters of contemporary youth, that traditional sociological categories are not able to grasp.

Robots and Unemployment: A Scenario Analysis

The aim of my presentation is to explore the possible futures generated by the development of artificial intelligence. Our focus will be on the social consequences of automation and robotisation, with special attention being paid to the problem of unemployment. In spite of the fact that this investigation is mainly speculative in character, we will try to develop our analysis in a methodologically sound way. To start, we will make clear that the relation between technology and structural

unemployment is still controversial. Therefore, the hypothetical character of this relation must be fully recognized. Secondly, as proper scenario analysis requires, we will not limit ourselves to predict a unique future, but we will extrapolate from present data at least four different possible developments: 1) unplanned end of work scenario; 2) planned end of robots scenario; 3) unplanned end of robots scenario, and 4) planned end of work scenario. Finally, we will relate the possible developments not just to observed trends but also to social and industrial policies presently at work in our society which may change the course of these trends.

"Slaving Away": Temporary Migrant Workers in Australia's Farm Workforce

The farm workforce in Australia has been transformed over the past ten years, as employers in the sector have come to rely more heavily on temporary migrant workers. Farm employers are able to draw on a rich and growing variety of types of temporary migrant, spurred on by a new globalisation of labour supply. They include undocumented workers – generally on tourist visas without work rights – and participants in the small Seasonal Worker Programme, which draws on workers from eight Pacific island nations together with Timor-Leste and Papua New Guinea. Perhaps the major source of seasonal labour is the Working Holiday Maker (WHM) scheme (417 and 462 visas), which since 2005 has deliberately supported farmer employers by offering a second year on the 417 visa if the WHM can demonstrate that they have completed 88 days of specified work in a regional area. The number of WHMs engaging in farmwork has boomed, with labour hire agencies, either in the home country or in Australia, stepping in to organise the traffic into regional areas and the accommodation in 'working hostels'. This paper describes the growing significance of the 417 visa scheme as a source of farm labour. It draws on extensive interviews conducted in 2015, primarily with WHMs, to describe the impact of low wages and poor working conditions and to analyse the experiences of precariousness. It argues that the growing significance of the scheme illustrates and reinforces the dilemmas of labour regulation in the sector. Increased supply of a vulnerable group of workers to service employers' needs has led to several unfortunate consequences, including cases of worker abuse, the spread of unfair competition amongst employers, diffusion of precarious and informal work, and displacement of competing sources of labour from groups such as participants in the Seasonal Worker Programme.

Institutional Ethnography and the Practice of International Development: Exploring Ruling Relations

The International Development literature is awash with critical analyses offering various explanations for a development program's poor performance, or for a project achieving less than its promised outcomes. Bringing Dorothy E. Smith's (1990) social organization of knowledge approach to such puzzles is, as Adele Mueller (1995) suggested, rather like examining the inside seams of a garment to find out how it is shaped and held together and, eventually, discovering how or if "what happens" can be read as institutionally acceptable achievements. Using this approach, an institutional ethnographer looks analytically at the language used in the framing of such projects learning from those involved in the work itself how they (become engaged in) enacting and materializing an institutional design. Instead of applying the concepts of a social theory, or an institution's accountability framework, or a policy discourse, the analyst must therefore attend to what actually happens, including who does what and how they know what to do. A social organization of knowledge analyst assumes that each actor stands in a particular and socially organized relation to the project, and while these relations may not be apparent even to participants, the analytic purpose is to discover and describe the relations of ruling and how they work. In international development work, ostensibly characterized by "the will to improve" (Li, 2007) there is much to be learned about ruling practices. This paper offers the opportunity to consider some of the critical writing by practitioners and researchers in the field of international development, drawing on some of our own analyses of development work in which we employed a social organization of knowledge analytic framework.

Freedom and Morality in Indebted Societies

This paper argues that morality, specifically sentiments of guilt and fault, is deployed through the mechanism of debt to subjugate humans at a pre-subjective. Debt is fundamentally linked to time, wrestling the unknowable future of free human activity into a present set of financial and moral constraints upon that free action, rendering freedom knowable, calculable and therefore governable. The debtor is in this sense disciplining themselves, rather than being coerced by a disciplining society. It is our thesis, that in the post-crisis era entire nations and their populations have been forcefully 're-born with original sin' – an economic sin, that we propose constrains free human action through moral constraint and the production of particular temporal experiences for the debtor. We shall deploy the reflections on original sin of Charles Baudelaire, and one his key influences Joseph de Maistre, along with Benjamin's analysis of 'capitalism as religion', to analyse how the experience of sinful debtors (both nations and individuals) experience time without the possibility of redemption, without the promise of salvation. We present an analysis of the erosion of our freedom through the creation of a particular moral and temporal experience for indebted men and women.

CAO, SIYANG* (University of York, sc1568@york.ac.uk)

Egalitarian Husbands and Engaged Fathers? Negotiating 'New' Familial Masculinity in Contemporary Chinese Families

Rapid social transformations have brought great changes to domestic practices and familial masculinity in contemporary China. While an increasing amount of scholarly research acknowledge the home as a key site of constructing masculinities in both historical periods (Davidoff & Hall, 2002) and contemporary world (Robinson & Hockey, 2011; Song & Hird, 2013), relatively few empirical investigations have been conducted in the non-Western context. This paper is going to present some initial findings from in-depth interviews with 30 young men during my fieldwork in two urban Chinese cities. Despite proliferating media discourse and globalizing influence on transforming gender roles and domestic labour divisions, my participants demonstrated little departure from conventional perception of gender roles. However, as I shall explore, the construction of familial masculinity is not a smooth and stable process, but rather subject to consistent negotiation, adaptation, resistance and reinforcement. Inspired by Jamieson's (1999) work on how couples may employ diverse and creative strategies in disguising inequalities, I intend to unpack young men's narratives through which they constructed themselves as the 'new' family men, especially represented by the egalitarian husbands and engaged fathers. Beyond this, I will further look into the intentional tactics and unconscious negotiations that are frequently used to deal with the gendered domestic agenda, including housework division, fathering practices and the perpetuating obsession with being the breadwinner. Grounding my research within Jenkins's (2004: 5) theorization of identity as 'never a final or settled matter', I see familial masculinity, as a form of gendered identity, as fluid, negotiable and an in-process work, which is meanwhile significantly located within broader social contexts. In this sense, I also try to contextualise young men's construction of familial masculinities within the transforming social realities that speak to the tension and negotiation between tradition and modernity in contemporary China.

CAPOBIANCO, PAUL* (University of Iowa, paul-capobianco@uiowa.edu)

The Impact of Second Language Acquisition on Foreign and Japanese Identities

Scholarship from communication studies and applied linguistics have shown that engaging in second language study often alters one's perception of the world and can induce changes in the way learners conceptualize their self-identity. The context of Japan provides an intriguing opportunity to examine the material effects of these identity changes. Japan has experienced intensified diversification in recent decades and foreigners are rapidly comprising larger portions of Japan's population. These foreigners come from diverse ethno-national and socioeconomic backgrounds and many embark on efforts to learn or improve their Japanese language skills. Concomitantly, English education remains popular amongst the Japanese population and the EFL industry has experienced considerable diversification in recent years. These linguistic pursuits are occurring in the context of a rapidly changing Japan where status quo constructions of identity are becoming difficult to uphold. Previously Japanese collectivity had been established upon characteristics that emphasized ethnic homogeneity, linguistic and cultural uniqueness, and psychological exceptionality. The presence of increasing numbers of foreigners in Japan destabilizes such notions and raises questions concerning the future of Japanese identity and the relationships that develop between foreigners and Japanese citizens.

Drawing on ethnographic data, this presentation shows how intercultural communication and relationships that develop between foreigners and Japanese induce identity reconstructions in both parties. These interactions provide a means through which formerly exclusivist ideas about Japanese identity can be tangibly renegotiated. Mutual linguistic and cultural interests within this particular context provide a platform for these changes to occur. Situated within a changing Japan, these reconstructions have considerable implications for the nature of foreigner-Japanese relations in ways that may permit greater recognition of foreigners

within Japanese society. However, this paper also explicates how these identity reconstructions are not always utopian in nature and in addition to embracing diversity can also engender new forms of marginalization.

CAPPELLINA, BARTOLOMEO* (Sciences Po Bordeaux, bartolomeo.cappellina@gmail.com)

From European Standard(s) to a European Space of Justice? Judicial Networks, Quality of Justice, and the EU.

The concept of quality of justice appears nowadays a mandatory reference in every policy discussion over justice and its organizational dimension. However, its significance is far from being uniform depending on the context and the actors employing it. In the international sphere, a broad spectrum of activities and documents focuses on this issue. These standard-setting activities take place in various transnational arenas, promoted either by international organisations as the Council of Europe and the European Union or by the professionals of the justice sector themselves. This paper looks in depth at the transnational standard-setting activity on "quality of justice", considering if and how this characterisation effort participates to the construction and definition of a proper European space of justice. A comparative study of the activities and instruments developed by three European judicial networks (CEPEJ, CCJE, ENCJ) particularly active on this topic is at the core of the analysis. Building on a theoretical framework inspired by political sociology and sociology of public policy instrumentation, I combine an analysis of the social fabric(s) of these policy instruments with an analysis of their circulation at the European level, considering in particular their reception and adaptation by the European Commission. Therefore, this paper provides, in first place, a theoretical reflection over the role of actors, of their professional backgrounds, and of their cognitive arguments in framing the connotation of "quality of justice" at the European level. Additionally, focusing on the process of reception-adaptation of these instruments, this paper draws attention to both the dynamics of learning through which the European Commission constructs its own expertise in matters of judicial organization, and the role played by the latter in sanctioning a certain view of the quality of judicial systems as an integrant part of the constituting European space of justice.

RC12-147.3

CAPPELLINA, BARTOLOMEO* (Sciences Po Bordeaux, bartolomeo.cappellina@gmail.com)

From Evaluation to Evidence-Based Policy. the Council of Europe, the EU, and the Construction of European Indicators on Judicial Systems.

Since the end of the last century, a new focus has been put on the measurement of judicial activity, expanding it far beyond the national borders and the previous limited areas of measurement (crimes, prisoners...). The transnational sphere played an important role on this expansion, with the development of policy instruments by a number of international organisations trying to assess the performance of judicial systems in aspects as varied as the human rights' enforcement or the capacity to ease economic activity. Out of this heterogeneous array of international indicators, this paper focuses on two specific projects of quantification of the judicial organisation and activity, both developed with the goal of enhancing knowledge and comparability of European judicial administrations. In particular, the analysis looks in depth at the origin and evolution of the "Evaluation Report on European judicial systems", developed by the CEPEJ (Council of Europe), and of the "EU Justice Scoreboard", developed by the DG Justice of the EU Commission. While giving an insight on the historical and institutional premises to the creation of these two respective projects of judicial performance measurement, this contribution analyses in detail the methodology of both the initial design and the successive modifications intervened on the indicators composing the two reports. This analysis shows that the goals associated with a certain instrument are fundamental in determining the type of knowledge that is to be produced through the instrument, or in other words, that "what we plan to do influences the way in which we measure". Moreover, focusing on the use of these instruments in the decision-making sphere, this paper points out that instruments are never neutral and that their effects can go far beyond initial expectations. Finally, "what we measure influences what we do", even besides initial intentions.

CAPPELLO, GIANNA* (Department of Cultures and Society - University of Palermo, gianna.cappello@unipa.it)

Digital Labour and the "Social" of Social Media. a Marxist Critique

The Web 2.0 has certainly made it easier for amateur/grassroot/DIY culture to reach unprecedented levels of visibility and creativity. What was once a "piece of work" shared within the restricted face-to-face circles of amateurs and circulated only via traditional forms of mailing, is now boosted into the virtually unlimited digital communities of social media. Not only that. Also the creativity process is changing as its social/collaborative dimension grows in unprecedented ways too. Of course, acts of creativity (however you define them) have always involved a connection with other people, either directly (in the actual "crafting" of the piece of work) or indirectly as a form of cultural influence. With the emergence of social media this connection is further developed into ever-new forms, means and modes of collaboration, both offline and online.

While the positive aspects of this process are undeniable (access to and use of social media are typically free or little expensive; interfaces are typically "friendly" and intuitive; the commenting and sharing they allow is crucial to build people's self-esteem and expertise, etc.), this contribution intends to offer a critique of it by arguing that the various forms of cultural production being created and circulated in/by social media are in fact a form of digital labour and that Marxist theory may offer some interesting insights to counteract the hyper-enthusiastic an populist myths that often accompany discussions (both at academic and popular culture level) about the "social" of social media.

CAPPELLO, GIANNA* (Department of Cultures and Society - University of Palermo, gianna.cappello@unipa.it)

The Augmented Experience of Television "Watching" in the Web 2.0. a Marxist Critique

Watching television has been typically one of the most important leisure activities in people's everyday life. In the convergence culture, where old media and new media collide (Jenkins 2006), this activity is being reshaped in quite new and unprecedented ways. Connected to and "watched" through mobile devices and social media, television screens are today sophisticated means of entertainment bringing to a radical change both at the level of consumption and production. Broadcasters are rapidly changing their productive and marketing strategies to tune in with the multiples places and practices "networked publics" (boyd, 2010) inhabit and share. While the augmented experience of television watching in times of Web 2.0 is undeniably symptomatic of an "active" audience, a Marxist critique of it, as developed in this contribution, may give quite interesting insights in arguing that in fact it may also be seen as a form of exploitation by a capitalist industry in search of ever-new markets and low-cost (digital) labour.

CARBAJO PADILLA, DIEGO* (Universidad del Pais Vasco // Euskal Herriko Unibertsitatea, diego.carbajo@ehu.eus)

Becoming Self-Entrepreneurs through the Debt. the Processes of Residential Emancipation of the Young People in the Basque Country (Spain).

The presentation focuses on some results obtained from a recently finished thesis about the residential trajectories of young people in the Basque Country.

In Spain and in the Basque Country a generalized precarization process intertwines with a residential culture that fosters the home ownership. The subjections and strategies that simultaneously are producing the job insecurity and the indebtedness —due to "the goal of the property"— requires to rethink not only terms like young, adult or emancipation, but also what kind of representation of the individual is working behind them. From this framework the self-entrepreneur emerges as a useful concept to understand the logics of action of an actor that, in order to develop his/her life project, is obliged to manage entrepreneurially not only a debt, but also a wide range of resources, bonds, affects and dependencies. So two are the main ideas to be exposed: The extension of youth can be better understood focusing the attention in the precarization of the adult identity or the "arrival position". And, the responses to that de-stabilization can be better grasped through the logics of action and self-management strategies that sets the self-entrepreneur. In short, the emancipation processes of youth have become reversible and they don´t result in definitive subject-positions. Rather, they have become an uninterrupted work of self-maintenance —mediated with others.

Corporate Elite Networks and Social Inequalities Around the World

The number of billionaires and the wealth concentration on the 0.1 % of the population has increased in the last years. At the same time, the number of poor people and inequalities has augmented in most of the developed and emerging economies. Wealth concentration is one of the causal conditions of the augment of poverty and inequalities. However, I introduce another possible causal condition: corporate elite networks. Previous research has indicated that cohesiveness of corporate elite networks increase social closure and facilitate collective action for policy lobbying, and consequently corporate networks might reduce opportunities of mobility and elite circulation. The present research study: 1) cohesiveness

of corporate elite networks in 17 economies on basis of network analysis of inter-locking directorates among the largest corporations, and 2) measures the impact of business elite networks on social inequalities using qualitative comparative analysis (QCA). Results show that, under certain conditions, the cohesiveness of corporate elite networks has influence on the reduction of social inequalities. Fi-nally, I evaluate the relationship between corporate elites and social inequalities.

The Technological and the Human in Contemporary Society: Artifacts, Devices and Representations

My research project is located at the convergence of Social Studies of Technol-ogy, Anthropology and Social Systems Theory, mainly focused at emerging and potential relations of humans and technological artifacts through the organizing processes of social formations. Relying on Luhmann's distinction between social structure and semantics, on the medium/form distinction, and on the concept of structural coupling, the questions guiding this paper are: ¿How social structures that couple the human and the technological are formed? ¿How a device emerges, which is both social form and material support? ¿How does contemporary soci-ety includes and excludes the technological in its representations of the human? ¿Which social movements appear, searching to uncouple or to couple in alterna-tive ways the human and the technological?

In this study I observe how some communications of contemporary society react to an increasing interdependence between humans and technology and re-flect on how technological proliferation modifies the human condition. To achieve my aims, I analyze certain outcomes creating public opinion (newspapers, radio, television and social media), artworks, literature, and technological metaphors and metonymies in contemporary philosophical thought.

By thinking the human as a bio-psycho-social event from a social systems the-ory approach, my aim is to observe not only the structural couplings between psychical (consciousness) and social systems (communication), but also how bi-ological (corporality) and technological systems (devices, artifacts) are implicated in the formation of social structures of interaction. This means complementing Luhmann's theory, like Jorge Galindo proposes, by recognizing an embodied so-cial form (as in Bourdieu's notion of habitus) and the presence of social forms surrounding 'non-human' technological artifacts (as in Latour's actor–network theory).

Immigrant Integration Programs and Job Quality in Denmark

The paper builds on dualisation/segmentation of labour markets and on inte-gration theories to investigate the effects of the integration program implement-ed from 1999 on in Denmark in terms of preparing immigrants for the labour market. Taking advantage of a quasi-experimental situation, generated by the fact that such programs were absent in Denmark before 1999, the paper will com-pare the labour market outcomes of immigrants who have followed this integra-tion program and those who have not. Through interviews with immigrants, the paper will examine whether a job was obtained, and will pay close attention to the quality of the jobs. Our study has implications on understanding the effectiveness of integration program in terms of providing migrants with the ability to earn their own living.

CARON, CECILE* (EDF R&D, cecile.caron@edf.fr)

Ambivalences Experimental Devices on the Appropriation and Diffusion of Eco-Innovations in the Field of Energy

In the area of managing electricity demand, eco-innovations in the residential sector oriented dynamic pricing, piloting or uses information devices (Darby, 2006; Faruqui, 2010) borrow heavily to the experimental method. They seek primarily to measure in real and controlled situation with a set of household effects and their maintenance over time, of such devices on the load curve. The robustness of the results is related to the representativeness of panels and control groups (Fisher, 2008). Nevertheless, since the surveys (1927-1939) conducted at the West-ern Company, we measure the participants' commitment is partly shaped by the monitoring and observation devices produced by the experimental setting (Ro-ethlisberger & Dickson, 1939). A structural tension therefore passes through the conduct of experiments looking at the same time to neutralize the effect of "haw-thorne" and forms of reflexivity induced by the experimental method to evaluate the effectiveness of proposed devices (Teil, Muniesa, 2006) and rely on the own stylistic devices in experimental mode that encourage participants to be stake-holders of results (Lanham, 2006) to accompany incentives "behavior change". We intend, through a qualitative survey conducted among experimentalists working households (30 households) in the residential sector and holders of the "Smart Electric Lyon" (15 participants), to see how this tension and un-certainty it generates shape the ownership of various devices experienced. It appears that the experimental device is a true "trajectory" that binds the events that punctuate the course of any work organization deployed to follow the (Strauss, 1985, trans. Fr. 1991). Here, the key steps of the experimental pro-cess going through the devices and professional or collectives involved in porting their help shape the direction and manner of appropriation experienced devices. These focus moments wondering, in terms of participants, the devices, whose use eventually stabilizes in practical and specific logical losing the original incentive dynamics.

Quest of Information on Health Issues through Social Networking on-Line and Off-Line, Among 18-34 Years Old.

This paper discusses the findings of an exploratory qualitative research con-ducted among 18-34 years old. It focuses on their use of social networks, off-line and on-line, in their research on health issues. It examines whether *digital natives* still prioritize traditional research paradigm including face-to-face inter-actions with family, friends and health professionals. The analysis of in-depth in-terviews conducted with 21 subjects (the majority of whom consider themselves healthy) from the greater Montreal region (Canada) identifies factors influencing their approach to seeking information on health issues, as well as their use, their perception and their search trajectory on social networks. This paper examines the following questions: What place is granted to interpersonal skills and to trans-actional communication between the patient and health professionals? Do the connectivity and the interactivity of individuals constitute vectors of use? This pa-per shows the importance of offering a diversity of sources for finding health in-formation. It also argues that interpersonal participation regarding health issues occurs both in off-line and on-line social networks.

Long-Term Effects of Job Strain and Mental Health in Midlife on Early Labour Market Exit

Higher life expectancy and persistently low birth rates has resulted in popula-tion ageing across European countries. The consequent increase in old-age de-pendency ratios (persons aged 65+ as a proportion of persons aged 20-64) pres-ents a serious challenge to the fiscal sustainability of old age pension systems. In response, many governments have sought to delay statutory retirement ages and extend working life (beyond age 50). Several studies have shown stressful or demanding working conditions in midlife (around age 45) to predict early re-tirement. Similarly, poor mental health has consistently been linked with early labour market exit. However, few studies have considered the interaction of job characteristics and mental health, and none from a cross-national perspective.

This study draws upon three longitudinal occupational cohorts from England, Finland and France (with follow-up between 1985 and 2013). The psycho-social work environment (measured with the Karasek job content questionnaire) and mental health (measured using GHQ and CES-D) are measured repeatedly during midlife. We then estimate the additive and interactive associations with timing of labour market exit at ages 50+.

In the Whitehall II cohort, both job control and poor mental health were in-dependent predictors of labour market exit. However, the effect of poor mental health on labour market exit was similar for people with low and high job control, supporting only the additive – but not interactive – relationships between men-tal health and work characteristics. Initiatives that enhance mental health among older workers and improve the psychosocial work environment (e.g. reduced de-mand, increased control) may contribute towards European policy goals of ex-tended working life.

Reading with Infants in a Mexican Day Care Center

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Reading with and to babies (0 to 3 years) is an emerging theme in research and practice (cfr. Maas, et al., 2013) and is highlighted by UNICEF (2001). This research focusses on literacy practices and communities of practice and recognizes babies as social participants and cultural apprentices.

This presentation reports findings from a 10 month reading intervention in child care centers with infants aged 45 days to 24 months. Thirty minutes of reading per week were enough to familiarize babies with reading as an activity and as a way of handing books. We designed a shared context for communication and language interaction around reading events of fiction and non-fiction books for children.

Babies learned to use the books as linguistic participants (cfr. Barton y Hamilton, 2004) in interactions with adults (cfr. Schaffe, 1989). Our results show that they express themselves through babbling and gesticulations of joy. They also learned to look at books as objects and to point out specific aspects of reading materials. As they participated in these literacy events, they recognized and appropriated their environment, books as technologies and different roles. Each infant seems to decide how to intervene and assume passive or active stances toward reading. Commitment by infants to reading practice does occur but only in carefully structured environments for this purpose. This is important for promoting reading in a highly inequitable society such as Mexico.

Individual Determinants That Trigger Protest Participation: The Case of Mexico City

During the decades of 1960-1970, big Protest Events (PE) have taken place in Europe and in the USA, those mobilizations have drawn the attention of social scientists and among all the approaches that were explored to study this phenomenon two were used and developed the most. On one hand, the resource mobilization theory was emphasized in the USA, whereas the new social movement was privileged in Europe

Both theories were developed in two societies that are not different – socio-economically speaking – from each other. Hence, PE participants will share some characteristics. But what happens in societies that don't share the same characteristics found in those countries? Who are the people who take part in PE? To what extent the social movements theories can explain this phenomenon in a country like Mexico where it's a fact that the society differs from countries where the mainstream theories were written?

At the micro level, Mexican demonstrators should be studied taking into consideration the variability of the traditional determinants that trigger social protest. In this regard, based on a questionnaire applied to 569 people (including protest participants and non-participants) during and after street demonstrations in Mexico City in 2014, this research aims at analyzing if variables related to demographics, emotions, satisfaction with the political context, political/civic membership and participation of the social circles that surround an individual could predict the probability of taking part in PE according to the relevant theory.

For the study of these determinants, the data collected will focus on three subjects aiming the individual level: contextual dissatisfaction, characteristics and socio-structural conditions. The first findings suggest that some characteristics diverge from what was expected, for example, the traditional role of the family, the active participation even under conditions of danger or the potential that personal invitations still have over social-media.

Counter-Hegemonic Projects and Cognitive Praxis in Transnational Alternative Policy Groups

Since the mid-1970s, and particularly since the 1990s, *alternative policy groups* have generated ideas, both visionary and strategic, for a 'globalization from below' in which transnational social movements have been leading protagonists. This paper presents a comparative analysis of eight *transnational* alternative policy groups (TAPGs) along with a basic conceptual framework for understanding them as sites of *cognitive praxis*: producers and mobilizers of knowledge for social transformation. We explore how, in contrast to neoliberal think tanks (NTTs), TAPGs endeavour to expose private interests' problematic role in the global political economy. Their remit is not to centralize knowledge within elite policy networks but diffuse it, and promote dialogues that strengthen processes of democratization by building the capacity of counter-hegemonic publics. And although both TAPGs and NTTs mix, in different degrees, research, analysis, advising, lobbying, persuasion, deliberation and advocacy, there is a key difference: NTTs are vehicles for dominant class interests; TAPGs align with subaltern classes and groups. Taken together, the TAPGs introduced here represent an important source of alternative knowledge production and an illuminating contrast to hegemonic think tanks. They matter because they create new critical sources of knowledge and mobilize that knowledge within projects aimed at social justice, human thriving and ecolog-

ical well-being. TAPGs remind us that enlarging such spaces is a practical matter. It means critically analysing, but always doing so in close cooperation with actual on-the-ground struggles towards a different and better world.

Modalities of Corporate Power in Carboniferous Capitalism: An Overview

Based on a six-year interdisciplinary research partnership that brings together academics and activists in a program of critical knowledge production and mobilization, this paper presents a conceptual framework for understanding the structures and practices of corporate power within contemporary fossil capitalism. Our focus is on the carbon-extractive resource sector of Canada, but from that vantage point we map relations of power and influence, nationally and transnationally, while also attending to relations of struggle that interrupt flows of power and commodities at key flashpoints. The project examines a variety of modalities through which corporate power is expressed, including elite networks, networks of capital ownership, policy-planning groups, mass media influence and corporate social responsibility advertising, and commodity chains. Preliminary findings are offered, along with reflections on the implications of our work for democratic movements and progressive political alternatives.

Does Retirement Improve Health Outcomes of Older Individuals? Comparison Between Retiring and Remaining Employed.

Does retirement improve health outcomes of older individuals? Comparison between retiring and remaining employed.
The impact of health status on retirement decisions has been widely studied, there has been less attention focussed on researching the effect of retirement on health . Variation in the relationship between retirement and health outcomes and socio-economic group in particular has been under researched and remains a key gap in evidence.

Three international harmonised longitudinal data sets, the English Longitudinal Study of Ageing (ELSA), the Survey of Health, Ageing and Retirement (SHARE) and the Health and Retirement Study (HRS) are used to compare health and wellbeing outcomes of individuals following retirement compared to 'matched' individuals who remain employed. Propensity Score Matching (PSM) techniques are used together with the Difference-in-Difference methodology to control for unobservable characteristics of individuals and time fixed effects.

Results are presented by age group (those up to and those over the State Pension age) and by socio-economic status and type of occupation. In addition, differences between countries are included, understanding not only individual characteristics but also country-level factors, as national pension system or working practices, likely have a simultaneous effect on health and retirement decisions. The findings have implications for policy – the impetus toward extending working lives and delayed retirement evident across the EU, US and beyond, may be associated with quite distinct consequences for different socio-economic groups.

CARTER, JULIA* (Canterbury Christ Church University, julia.carter@canterbury.ac.uk)

The Wedding: Constructing Family Meaning through Ritual

According to Durkheim, rituals are acts of collective celebration around shared symbols and practices. Rituals comprise a set of shared symbols which confer shared meanings for shared practices in which individuals participate. These shared symbols and practices are annexed from everyday social life and become sacred entities; those which represent the group's significance to itself and the relationships to one another. In order for a ritual to succeed, a shared definition and understanding of the situation and ritual itself is paramount. It is the purpose of this paper to demonstrate how in an age when marriage and weddings are no longer social or political necessities in Britain, contemporary couples still engage in wedding practices to achieve a sense of sacred significance to their relationship and family life. The wedding provides a means, as a ritual, to separate their relationship from profane everyday concerns to another plane of sacredness. This paper draws on three ways in which participants in a study on weddings in the UK narrated this separateness. The first is through the notion of performance before a gathering of family and friends, the second through the fantasy of extreme commodity consumption, and the third through the appropriation and reassertion of various wedding 'traditions' and ritualistic practices. Due to the shared nature of

the practices and processes involved, a common understanding of the 'wedding' emerges, not only in the talk and description of weddings but also in popular culture, media and discourse where weddings appear remarkably similar. The ritualistic nature of weddings enables anyone to create one and yet, the impact of consumer narratives pushes the opposite agenda- to create a unique, one-off event. The result of the clash of these hegemonic discourses is what I call 'individualised conformity': narratively unique events with ritually similar construction and meaning.

DUNCAN, SIMON (University of Bradford)

Troubling Relationships: Towards a New Language of Personal Life

Despite recent moves in family sociology in the UK towards alternative and more inclusive notions of family and family relationships (intimacy, personal life, relationality and so on), there remains a pervasive appeal to the notion of 'family' in British public, political and policy discourse. What Gilding (2010) has noted is that the writing out of 'family' has also resulted in a writing out of convention as a central part of relationships and family life. What we hope to demonstrate in this paper is both that family is still an important notion for individuals in varying circumstances, and that notions of convention and tradition are pivotal in the constructions of family life. We demonstrate the pervasiveness of 'family', 'families' and 'tradition' through two examples: LAT (living apart together- a potentially 'troubling' concept in itself) and marriage. While LAT relationships have been heralded by some as a mark of transformed, individualised lives where individuals can live in relationships free from the conventions that previously restricted them, what we found instead is that LAT is often used as a precursor to more traditional cohabitation or marriage or that LAT is used as a protection or defensive relationship state after bad previous experiences. Neither state suggests individualised lives free from constraints and convention. Similar findings were revealed when talking to young women about marriage who were, on the whole, extremely keen to conform to the traditional norms and conventions of gendered marital roles. What we conclude is that a new discourse is required to talk about the nature of family and personal relationships and we suggest that family relationships and personal life are constructed and reconstructed and invented and re-invented through choice, agency, convention and tradition- of which the appeal to 'family' is clearly a part.

CARTER, NEIL* (University of York, Neil.Carter@york.ac.uk)
CHILDS, MIKE (Friends of the Earth)

The Big Ask: An Exercise in Effective Policy Entrepreneurship

Friends of the Earth's 'Big Ask' campaign is widely regarded as one of the most successful UK ENGO campaigns of recent years. It was launched in May 2005 as a response to the perceived failure of voluntary emissions reduction targets. FoE chose a simple but radical policy demand: a Climate Change Bill with statutory targets for annual emissions reductions. Remarkably, by October 2006 the Labour Government announced it would be introducing a Climate Change Bill. The path-breaking legislation, the *Climate Change Act* (CCA), was eventually passed in 2008. Since then FoE Europe has campaigned to get similar legislation passed across Europe.

Although the Big Ask has been examined in the wider context of UK climate and energy policy there has been no detailed analysis of the campaign itself. Drawing on the inside knowledge of one of the authors (who was Head of Climate at FoE during the Big Ask campaign), interviews with key ENGO actors and politicians, and documentary evidence, this paper analyses how the campaign strategy evolved and its efforts to mobilise the wider public, so that FoE was able to exploit the window of opportunity that opened in climate politics during 2006-08, first to get cross-party support for the Bill and then to strengthen its content. The paper examines the attempts by FoE Europe to roll out the CCA to other countries. The paper applies an analytical framework based on Kingdon's multiple streams approach, focusing on the role of FoE as a policy entrepreneur in shaping the agenda-setting process. It argues that FoE exerted a major influence on the UK Government's decision to introduce the CCA, but the conditions that FoE exploited domestically were not replicated in the later phases of the campaign.

Participation, Involvement and Engagement – More Than a Question of Semantics

Internationally, the distinctions between the state, the market and civil society are becoming increasingly blurred. Governance theories show the complexity and interdependency of relationships between actors and institutions working across these fields. We are currently conducting a qualitative case study incorporating ethnographic methods to research the process and effects of patient and public involvement in one region of the English NHS. To date we have conducted in-depth interviews with a sample of members of the public / patients who get involved, Healthwatch Chief Executive Officers and Chairs of Health and Wellbeing Boards. In the next few months we will be interviewing NHS staff and observing involvement processes.

Our focus of inquiry is on a relatively new body Healthwatch, described as a 'consumer champion'. Healthwatch is mandated to involve volunteers in its work of amplifying the voice of local people who use statutory health and social care services. Commissioned by local authorities, Healthwatch organisations are entitled to a seat on the local Health and Wellbeing Board. They have powers to 'enter and view' NHS and social care establishments and report their findings to these providers and to commissioners.

Preliminary findings suggest that statutory bodies are actively engaging local public(s) as they plan for service transformation. Recognisable tensions surface around how public(s) are constituted, how deliberative or not methods of engagement are, as well as the usual problematic issue of representation. Unexpected and novel findings are emerging around legal definitions and requirements for statutory consultation in the context of major service changes. It appears that patient and public engagement is being carried out in an attempt to pre-empt objection to proposed service changes when these are formally presented for legal consultation. This raises interesting theoretical questions about governance and governmentality and empirical questions concerning agenda setting and manipulation versus empowerment and co-production.

Does the "Developing Countries Girl" Exist?

The notion of a homogenous "girl from developing countries" underlies as an implicit assumption in many academic papers in the field of education and development. Such girl is supposed to be uneducated, oppressed by traditional gender patterns, family oriented, victimized and object of processes on which she has no influence. She is understood as having no access to school or to a safety childhood, burdened with domestic or paid work and having no agency to build better conditions, either in the present or in the future. As a result, the diversity of experiences of young women within the developing countries, the range of possible femininities, and their own negotiations and resistances are likely to go unrecognized. This paper aims to criticize this notion, putting together tools offered by post-colonial theories, feminist studies and the sociology of childhood. This means using a concept of a socially constructed gender, which emphasizes its contradictory, non-linear aspects, and also taking children as active subjects in the process. Therefore gender relations are defined – in the global North as much as in the global South - as a complex dynamics of power, resistance, oppression, and freedom, inside a specific context. Empirical finds on girls from urban low-income families from São Paulo, Brazil, are used to exemplify how that monolithic notion of a "girl from developing countries" is useless to understand their diverse life experiences, their high performance at school and their active position in feeding new life perspectives for their future.

CARVALHO, PRISCILA* (Universidade Federal de Minas Gerais/ Federal University of Minas Gerais, prisciladcarvalho@gmail.com)

When Social Movements and States Ally: The Associations That Led to the Creation of Reaf/Mercosur

The paper discusses complex interactions among rural labor unions, rural social movements, the Mercosur and its member-countries by presenting a detailed account of the process that led to the creation of an institutional space for family farming issues in Mercosur, namely the REAF- Special Meeting on Family Farming, subordinated to the Common Market Group, the executive body of the block.

REAF includes representatives of national governments, trade unions and social movements form each of the Mercosur countries. It meets at least twice a year, discusses common public policies for family famers and is known as one of the most relevant experiences of social participation in Mercosur.

The interactions among these actors are an example of the often tortuous paths for building dialogue among international organizations, states and civil society at the transnational level, since each of them is highly heterogeneous. The research stresses the common political projects that allowed these different actors to establish connections and the relevance of previous articulations among social movements and labor unions. Some of the main actors present through this process are COPROFAM - Coordinator of Family Farmer Organizations of Mer-

cosur, and the Brazilian CONTAG - National Confederation of Agricultural Workers and MDA – Ministry of Agrarian Development.

The analysis is based on the actor-network theory. It follows the associations established by the actors by the time they were struggling to create REAF. This approach has specific theoretical-epistemological assumptions (such as understanding the social as a collective of on-going associations and including objects as actants in its assemblages). Therefore, the paper discusses opportunities and pitfalls of employing this theory for studying transnational social movements and how it differs from other well established theoretical framework in the area, especially network approaches.

CARVALHO, TERESA* (University of Aveiro and CIPES, teresa.carvalho@ua.pt)

Who Is in Charge? Internal Differences on Perceived Organisational Power of Portuguese Academics

Portuguese higher education reforms, inspired by New Public Management, promoted changes at the system and institutional level with a reconfiguration of the collegial regime towards a more corporate and entrepreneurial-like system. The decline of the importance of collegial and democratic bodies in the decision-making is said to decrease professionals' power within Higher Education Institutions. Several studies on governance and professionals' power have been developed to attest this. However, these studies tend to look at academics as a single and homogeneous profession neglecting important variables as the type of institution, the generation and gender. The purpose of this paper is to overcome this gap by analysing the internal differences of Portuguese academics' perceptions of organisational power. The study is empirically based on data deriving from an on-line survey administrated to all Portuguese academics (with 1320 valid responses). Survey's results were analysed according to the type of institution (new and old universities); generation (based in three age groups: the youngest generation- from 22 to 35 years; the middle generation- from 36 to 49 years; and the oldest generation - from 50 to 70 years), and gender (women and men).

Data analysis reveals that the type of institution does not affect the perceptions of organizational power but there are relevant differences based on generation and gender. Youngest generations and women tend to consider having less influence in shaping institutional policies at the department, faculty and top management levels and tend to perceive more frequently institutional top managers and units' managers as the more powerful actors. These findings reveal that to understand how professional power change in the organizational context it is important to look at the internal differences in professional groups.

Democratic Legacy, Education and Support for Democracy: Direct and Interactive Effects.

Education is a key variable to explain support for democracy. The vast majority of research shows that the higher the education, the greater the support for the democratic regime. However, does this relationship is the same in all contexts? This paper studies how the democratic legacy of a country determines the effect of education on support for democracy. Our hypothesis is that in countries where the democratic legacy is more consolidated the education has a stronger and more significant effect. Using the latest wave of the WVS, preliminary results confirm this hypothesis. We will discuss the mechanisms that explain this relationship and also its implications for democratic legitimacy.

CASALEIRO, PAULA* (Centre for Social Studies of the University of Coimbra, pcasaleiro@ces.uc.pt)

Child Custody Disputes: The Role of Social Workers

The relationship between law and other knowledge is not new and arises as a concern of the socio-legal studies, since the twentieth century. These studies have used the concepts of "trading zone" and "boundary work" to describe the conditions and modalities of dialogue and negotiation between law and other knowledge, in which they are mutually transformed.

The recent changes to the Portuguese regulatory regime of parental responsibilities narrowed the relation of law and justice with other knowledge, such as social work or psychology. In the current legal regime, in the absence of agreement between parents, it is mandatory to carry out a social, moral and economic survey (social report), that's done by the Court Support Multidisciplinary Teams (EMAT, composed mainly by social workers). According to Bolieiro and Guerra (2009) the use of these surveys is increasingly common and often the judge decides based

only on these social reports. Simultaneously, there has been a gradual increase of family disruption and the (consequent) demand of courts regarding the judicial regulation of parental responsibilities (Pedroso et al., 2012), which has given social, media and academic visibility to interdisciplinary nature of this judicial cases.

This communication aims to analyze how judges, public prosecutors and social workers act and interact in the judicial regulation of parental responsibilities, contributing or not to the (re)production of gender inequalities. Through the analysis of child custody proceedings, we intend to examine how non-legal reports and opinions of social workers are integrated and interpreted in court decisions and examine to what extent the conformation or not to the traditional gender roles and parenting is present in technical and scientific advice and in judicial decisions.

SANTOS, ANDREIA (Centre for Social Studies of the University of Coimbra)

Family Disputes in Times of Austerity: The Growth of Family and Children Legal Disputes in Portugal

In the beginning of the 21st century, in Portugal, there is the deepening of family transformations and, simultaneously, an economic and financial crisis, followed by austerity measures. On the one hand, there is an increasing fragility of family relationships, with the increase in divorces and separations and subsequent regulation (extrajudicial and judicial) of parental responsibilities. The family of the second modernity translates, in general terms, a deepening of individualization process, which have begun in the late nineteenth century, and the transformation of family ties with a growing valorization of love in family relationships, as well as privacy and independence family life (Beck, 2005; Singly, 2011).

On the other hand, the economic and financial crisis and austerity policies in Portugal contributed to the increase of unemployment, particularly unprotected unemployment, and underemployment situations. The "society of austerity" (Ferreira, 2012) is perceived as a generator of income inequalities through the exclusion of the labor market and of the social protection system (Carmo and Cantante, 2014). This implies a sharp impoverishment of the material and subjective conditions of individuals and families (idem).

In this communication we argue that this context of crisis and austerity contributes directly and indirectly to the increase of family disputes in the Portuguese family and children courts: namely it increases the judicial mobilization to solve child support payments disputes (reduction of the value and failure to pay) and to regulate parental responsibilities, in order to access social protection mechanisms. We will also analyze the responses of the Portuguese family and children courts to this family disputes, seeking to realize to what extent the judicial decisions may contribute or not to deepen the consequences of the crisis on families and to the feminization of poverty.

Artistic-professional strategies in music art scene in Barcelona. The case of modern music and jazz

The main objective pursued in this investigation, which is being developed as part of the doctoral studies in PhD program in Sociology (UB), is to analyse the creative and professional dynamic and the artistic-professional strategies and formulas undertaken by musicians of modern music and jazz living in Barcelona, as an exponent of the situation faced by musicians in developed societies, with working conditions often characterized by growing fragility and a digital transition that challenges the traditional creative practices. The study case is focused on musicians specialised in modern music and jazz that are professionals in the current art scene in Barcelona. Through this case, we will try to observe and discuss the existing professionalization processes and ways of transition between different stages of professionalism.

We would conceive strategies as those formulas of combined activities that will allow musicians to develop processes of managing creation and simultaneously managing processes related to more professional practice in the music sector. We are going to present different major areas in which musicians pass and develop them as professional strategies to sustain their career. For example, the role of teaching as a parallel activity to the music practice; all training and studies of technique that will determine the different valuation criteria established as a mean of recognition inside the group of professionals, and the multiactivity or multiple job, and therefore versatility and flexibility, considered as a form of optimization to reach the professionalism and stay active in it.

Key Drivers and Barriers of Social Innovation in Long Term Care: Lessons from the Italian Case.

Background: In the last decades the debate on policies to address the challenges posed by population aging has led to a change in the approach used to to tackle this issue. More attention is being paid to the impact this phenomenon might have on society and on lifestyles along the life course (Leichsenring et al., 2013; Walker & Foster, 2013). The widespread use of keywords such as "active ageing" and "social innovation" in formulating policies underline the emergence of innovative strategies to face the new challenges deriving from changes in socio-demographics and societal needs (European Commission 2012).

In Long Term Care (LTC), social innovation has been focussing on attempts to improve the quality of life of frail older people and their informal caregivers. In recent years, many good practices have been activated in this respect, but no systematic review of these experiences has yet been carried out. This would be helpful to better understand what are the main barriers and drivers of social innovation in this field, and what can facilitate the mainstreaming of prototypal actions into systematic change.

Focus of this presentation: Starting from the research carried out by the MO-PACT project (*http://mopact.group.shef.ac.uk/*) in the field of LTC, this presentation aims to illustrate which social innovations have been implemented in the Italian context, and the areas in which further steps are more urgently needed for the future. This will take place by highlighting first the linkage between social innovation and LTC, as well as the strategies and actions undertaken so far. In a second step, the key factors that can facilitate or hinder the process of implementation of these initiatives in this country will be identified, on the background of recent developments across Europe. Finally, suggestions for a realistic strategy to implement social innovation in LTC will be formulated.

CASES, RIZZA KAYE* (University of Trento, rizzakayecases@gmail.com)

Filipina Domestic Workers and Caregivers in London and New York: Networks, Networking, and the Limits of Organising

One major trend in international migration of Filipinos is that women generally outnumber men and that most of these Filipinas are employed in caregiving and domestic work. While hailed as unsung heroes of their country of origin and whether they have the legal authorisation to work or not, they remain disadvantaged and vulnerable to exploitation in their countries of destination.

However, alongside the focus on the difficulties that migrant workers face, it is also equally important to explore the strategies they employ in order to survive and realise their aspirations in a foreign place. Using quantitative and qualitative techniques, this paper focuses on one form of such strategies – forming and maintaining networks. It is recognised that potential material and non-material resources can be accessed through one's connections. Going beyond the individual ties that constitute migrant networks, the study also examines Filipino communities and organisations as key players in improving the conditions of Filipino workers as a particular group. By tracing the development and possible transformations of migrant networks from initial migration phase (pre-London/New York) to the process of settlement and subsequent integration, the paper examines the transition from forming informal ties to engagement with formal organisations, particularly in identifying the conditions in which such engagements become possible.

On the other hand, it also argues that the reciprocal exchange of support from migrants' informal connections can also be seen as a way of self-organising such that each member of the network can expect help and assistance in times of need without needing the ties with formal organisations.

Finally, the study resonates the idea that networks are not static sets of connections but are also subjected to the changing needs and experiences of migrants. The paper concludes with exploring the practices of engagement and disengagement vis-à-vis the evolving nature of migrant networks.

Lessons from Utilising Retrospective Network Mapping and Visualisation: Comparing the Networks of Filipino Nurses, Domestics, and Careworkers in London and New York

Past studies have recognized the crucial role network connections play not only in facilitating the movement of potential migrants but also in serving as a resource

both for the migrants settling in a new place (e.g. finding a job) and for those they left behind (through remittances that migrants provide).

However, it has also been noted by previous researchers that collecting personal network data entails a heavy burden to the respondent as it not only requires to list relevant people and their characteristics but also to evaluate the ties between those people they listed. Another issue to consider is the tendency to inaccurately recall all relevant connections. For instance, respondents mostly remember those they have recently in contact with but tend to forget the relationships that are distant in time.

In this study of the networks of Filipino nurses, domestics, and careworkers in London and New York, I employed several strategies to minimise the issues mentioned. In order to reduce respondent burden and to aid respondents' memory, I utilised network mapping and visualization both in paper-based and electronic formats depending on the respondent's preference and the given interview situation. The software package VennMaker was used for the digitized version. The diagram is comprised of four concentric circles corresponding to the level of importance of each actor named and divided into geographical locations of the relevant actors.

Though not technically a longitudinal study, I attempted to reconstruct changes in migrant networks through retrospection by asking for a particular network in each migration phase (before coming to London/New York, initial settlement, and further integration). While eliciting these networks by embedding them within migrants' narratives does not entirely eliminate the problem of forgetting, I argue that doing so enhance the ease of recall of relevant ties thereby providing a better understanding of migrant networks.

CASSILDE, STEPHANIE* (Centre d'Études en Habitat Durable, stephanie.cassilde@cehd.be)

Occupied, Unoccupied, Inhabited, Inhabitable: Sociological Dimensions of Housing Categorization

This communication deals with the lability of categorizations and its articulation with the research question. The research context is related to the future designed by a public policy aiming at being able to identify unoccupied housing to offer solutions regarding the lack of housing. The primary objective is creating, testing and validating a methodology to do so, and understanding why these housing are unoccupied. The data were collected in Charleroi, Belgium, between June 2014 and February 2015.

At the first sight, language is primary both researched and unresearched as the identification of given, labeled, situation (unoccupied housing) is implemented without researching the (unexpected) diversity that might be related to it. The landlords are contacted on the basis of low water or electricity consumption for the concerned housing. During the research, several landlords refused categorizing the concerned housing as unoccupied, but agree for instance in categorizing this housing as uninhabited. Also, several landlords, immediately after having underlined that the concerned housing was in fact occupied, were asking what would be the consequences in the case the concerned housing would have been unoccupied. The objective of this communication is to shed light on what is as stake through this, including a critical analysis of the consequence of having missed to include from the beginning the issue of language in the research. Thus, a secondary analysis of the data was implemented and focused on the sociological dimension of language to understand when, who, and why landlords shifted from a label to another. The results help to reframe the research question and give more insight regarding the results of the primary research.

Forms of Representation As Socio-Discursive Formations: The Case of Mexican Democracy Deficits

A form of representation is a socio-discursive formation, like a national myth, a social problem or a civilization trauma: its being what it is depends on its being recognized as such, which in turn is the result of narrations and argumentations sanctioned by civil society. Its emergence and maintenance are functions of communicative activities by pluralities of groups, that produce action models, participant typologies and approval rituals, as well as identity symbols and compact designations, which allow for its roles in both the aggregation of individuals and in the emergence of non-aggregative properties of collective beings.

As a consequence, observing representation from the perspectives of political science or political sociology, and hence focusing on variables such as number of parties or mean party age, is not sufficient to identify a democracy's strengths and weaknesses. In particular, to understand the quality deficits of Mexico's democracy, the standpoints of cultural sociology are necessary, for represented and representatives are arrived-at configurations: they are semiological and pragmatic attributions.

From a conjunction of the said standpoints and perspectives, ideal and actual forms of representation in Mexico are characterized as sets of commitments and

options in language games of negotiation, alignment, deliberation and contest. Furthermore, hypotheses are formulated for future research on the potential of initiatives to reduce the gap between those forms.

Civic Agriculture in Calabria: What Next ?

Calabria, a region in the south of Italy, is the least developed region in Italy in terms of per capita GDP. In 2014, its rate of unemployment (22,2%) is still higher than in Italy (12,2%) and Europe (10,1%), especially for women (21,1%) and young people (59,7%).

The importance of agricultural sector in the regional economy (4%) is still higher than in Italy (2,1%) and Europe (1,7%). Demografich trends are negative across the region especially in the most remote areas where essential services are lacking. Overall the quality of services in Calabria is lower than North and Central Italy. Another key element is the criminal organisation. Its control of territory is pervasive.

As such, without commited efforts by local, regional and national institutions and civil society long-term sustainable development efforts will continue to yield below minimum results.

This paper presents experiences of civic agriculture in Calabria and illustrates different aspects of this experiences: processes of re-territorialisation, social inclusion, the reuse of land that has been confiscated from the mafia.

The paper illustrates the learning curve of these experiences; their relative strengths and weaknesses are assessed on the basis of the principles of civil economy (Bruni, Zamagni, 2004); specifically, the aspects that are analysed are the relationships between reciprocity, freedom and individual creativity. These experiences demonstrate that:

1) giving and reciprocity may be ways into the market;

2) social cooperative companies can be a model for territorial development in Calabria;

3) it is a complex development model: social cooperatives are multi-stakeholder organisations that require the involvement of different participants and complexity in the network of relationships.

This paper is a moment of reflection for the proposition of public policies.

World Cup 2014: Brazilian Football Gentrification

In 2007, FIFA has named Brazil as the host nation of the Wold Cup 2014. In addition to the celebration of the population, as well as the Brazilian government, this choice led to several structure changes in the country's football. Until then, the stadiums were democratic places and represented on of the most frequented leisure facilities by the disadvantaged socioeconomic classes. However, in post-modern times – named liquid-modern (Bauman, 2008) – uniformity and standardization are inevitable. Thus, Brazilian soccer clubs implemented the system of "associated fan" that had already been done in Europe and, associated with the construction of new arenas standardized by FIFA, they provoked a gentrification of the national sport. This research aims to discuss this phenomenon in the context of the 2014 WC through the following questions: organizing a mega sports event can influence the leisure practices of the host country population? In the liquid modernity, the commercialization of football necessarily leads to fan's gentrification? Through a qualitative approach, the theme will be analysed taking into consideration the testimonies of the main actors (organizers, fans, club directors, politicians) in the context of the WC 2014. The fieldwork took place between the years 2013 and 2015 and included two host cities - Belo Horizonte and Rio de Janeiro - of the event. Data collection combined the analysis of official documents – and those published in the press – with participant observation in their spatial and interactive dimensions. Moreover, semi structural interviews were conducted with stakeholders. The temporal aspect - before, during and after the event - contributes considerable data, enabling a comparative analysis in the long term. Indeed, the results show a significant change in supporter's profile in the stadium after the 2014 WC and a greater commercialization of the sport in the country.

CASTILLO, JUAN CARLOS* (Pontificia Universidad Catolica de Chile, jcastillov@uc.cl)

Distributive Preferences and Types of Participation in Latin America

High levels of economic inequality have characterized Latin America over the past 40 years. As economic resources have been typically associated to higher rates of electoral participation, this means for unequal contexts a high concentration of income and the transmission of economic inequality into political inequality, threatening ideals of equality and even the legitimacy of the political system. Social protests and movements have demanded more equality and redistribution in different parts of the world in the last years, raising the question of to what extent distributive demands translate into different forms of participation. Using data from the Latin American Public Opinion Project 2012 - 2014 (N app 28,000 per wave - countries=18), this paper aims at identifying different typologies of participation through latent class analysis, and then to assess to what extent distributive preferences are related to the belonging to different classes. Preliminary results from multilevel estimation show that status variables such as the educational level are positively related to classes characterized by higher participation levels. Furthermore, those with a strongest preferences for redistribution depict a higher probability to participate mostly in protest activities.

Derechos Sociales Ayer y Hoy: Breves Notas Sobre La Nueva Ofensiva Neoliberal En El Brasil Contemporáneo

Este artículo tiene como objetivo discutir la actual ofensiva neoliberal en los derechos sociales en el contexto brasileño. Así que al principio, vamos a presentar el modelo de ciudadanía implantado en Brasil, a partir de 1930, a través del acceso a los derechos sociales. La investigación tiene como objetivo realizar un análisis crítico de la acumulación de las manifestaciones de la vieja y la nueva cuestión social en nuestro contexto.

Con respecto a la antigua "cuestión social" discutirán temas relacionados con las contradicciones resultantes de proceso de acumulación capitalista (especialmente la informalidad, el subempleo y los bajos salarios), que son concomitantes a su desarrollo y por lo tanto se remontan a la emergencia de la sociedad capitalista.

En cuanto a la nueva cuestión social, cuestionamos las transformaciones contemporáneas que ocurren en el lugar de trabajo, que han surgido "nuevos" problemas derivados del proceso de acumulación (que se manifiestan en forma de desempleo estructural, trabajo atípico y ocupaciones precarias).

En el tercer y último tema del artículo, se presenta la configuración de ajuste actual y el desmantelamiento de los derechos sociales ganados en los últimos veinte años, a partir de las medidas económicas y sociales impuestas recientemente, durante el segundo mandato de la presidenta Dilma Roussef. La hipótesis es analizar si este proceso puede llegar a estar en marcha en Brasil, una nueva ofensiva neoliberal, marcada por una profunda austeridad económica y social.

Vamos a utilizar como métodos de investigación revisión de la literatura y la encuesta de datos empíricos y las noticias sobre los principales indicadores económicos y sociales de Brasil.

Por lo tanto, esperamos profundizar en el debate sobre el delicado solapamiento existente entre el neoliberalismo, los derechos sociales, la ciudadanía y la cuestión social que ha contribuido sólo a la intensificación de nuestra histórica exclusión social.

CASTRO, MARIA PIA* (University of Catania, Italy, mpcastro@unict.it)

Social Workers, Higher Education and Managerial Practices in Welfare Organizations: An Italian Case

In Italy the professionalization of social worker has been closely linked to the development of social work education. It has been a "professionalisation from above", also favoured by state intervention. Laws on the establishment of welfare organizations (in the 1970s) had assigned important roles to social workers, contributing to their professionalization. In the 1980s the higher education programmes were unified and then education to social work became an academic training.

The university's reform carried out in 1999 with the Bologna process set up bachelor and master courses also for the social work: the bachelor (a three-years

denotes a presenting author. Abstracts are organized by first presenting author's last name.

course) corresponds to the traditional training and qualification level for social workers, while the master (a two-years course) concerns a new managerial and organizational training, with learning goals and contents still heterogeneous in the several universities and addressed to professional with various bachelor' degrees.

So the social workers' community asks for a greater recognition through an unique five-years training course and laws that give managerial roles in welfare organizations only to their profession. But the current rescaling processes in public administrations are producing as results that managerial roles traditionally played by social workers are also carried out by other professionals, mainly due to the spending review. Furthermore, in no-profit organizations managerial roles are played by professionals with heterogeneous academic backgrounds and skills mainly learned by doing, during their working life.

The paper offers a comparison among the goals and the contents of Italian higher education in social work, the laws that set requirements for performing managerial practices in Italian welfare services and the results of a recent analysis carried out with qualitative methods about skills, managerial practices in Italian welfare organizations (both public and no-profit) and the ways of their learning.

CASUSO, GIANFRANCO* (Pontificia Universidad Catolica del Peru, gcasuso@pucp.edu.pe)

Power, Exclusion, and Critique: Between Cognitive Dissonance and the Social Constitution of the Space of Reasons

Exclusion is usually understood as the situation of those who are outside of the recognized social order and who struggle to be incorporated into it. However, this dualistic understanding of exclusion as the simple "outer" side of society is a problematic way to critically analyze social orders and to account for the way in which exclusion within those orders is produced. Against the dualistic conception, I will provide an alternative, immanent conception of exclusion, defined not as a peripheral condition, but rather as the counterpart of the exercise of constitutive social power. This reconceptualization of exclusion takes the analysis from a purely phenomenal or ontic level and brings it to a noumenal or ontological one. In connection with this, I will distinguish the latter concept of exclusion from a more limited approach related to the exercise of power over an agent, which has been often used to explain social relations of domination and subordination. By doing so, I try to show that it is possible to speak of exclusion in an immanent way without understanding the excluded as the result or the object of an intentional act of an agent with whom an easily identifiable (and eventually criticizable) dyadic relationship is established. Rather, the immanence of exclusion has to do with the position that agents occupy in a shared social space of reasons which they implicitly make use of, but in whose constitution they have not explicitly participated. In that sense, I intend to explain why the possibility of social criticism is related to some form of cognitive dissonance, that is, to a perceived inconsistency in reference to the agent's own set of valid beliefs and reasons. Thus, rather than being the object of criticism, this form of exclusion represents an instance which enables immanent social critique.

La Fragmentación Del Derecho y El Deber De Reparar (o no) Daños Vinculados a La Concesión De Crédito a Sobreendeudados

La investigación científica aquí desarrollada está **ambientada** en la Sociedad de Consumo esbozada por Jean Baudrillard, Guy Debord y Benjamin Barber. El **problema** que inspira ese artículo puede ser delineado en la fusión (a) de la percepción de que la concesión de crédito es uno potencial factor de estímulo al sobreendeudamiento de una infinidad de consumidores en Brasil – y, por supuesto, no solamente en Brasil – (b) a la indagación sobre la posibilidad de identificación (o no) de una conducta contraria al Derecho en la concesión *abusiva* del crédito y, en ese caso, a la consecuente posibilidad de reparación de los daños atados a la violación de derechos de la personalidad de titularidad de seres demasiado humanos. La **hipótesis** a ser comprobada (o no) está basada en el presupuesto de que la concesión de crédito, sin el *previo, cuidadoso* y *minucioso* análisis concreto de la situación socioeconómica de cada mutuario, ha de ser comprendida como un ejercicio inadmisible de posición jurídica capaz de disparar el deber de reparar daños – eventual y comprobadamente – ocurridos en tal contexto. Entre los **objetivos** aquí proyectados – más allá de la pretensión de esbozar una pequeña parte de la realidad en la cual todos estamos inmersos – elíjese la necesidad de analizar las categorías jurídicas: (a) sobreendeudamiento, (b) ejercicio inadmisible de posiciones jurídicas, (c) daños extrapatrimoniales y (d) los presupuestos del deber de reparar, saberes que permitirán comprobar (o no) la hipótesis que motiva esta investigación, vinculada **metodológicamente** a las corrientes jurídicas postpositivistas de comprensión del fenómeno jurídico, y también, a la Sociología del Riesgo de Niklas Luhmann. Finalmente, se anticipa que la contraprueba de las afirmaciones teóricas construidas a lo largo del texto será buscada en juzgados del Superior Tribunal de Justicia tupiniquim.

Partial Least Squares Path Modelling Approach for Social Composite Indicators Using Different Sources of Data

Many social phenomena are complex and therefore difficult to measure and to evaluate. Complexity implies also multidimensionality and high level of abstraction.

Several social concepts represent multidimensional concepts that are difficult and complex to define. For this reason, researchers in many fields of social sciences, have been focusing on the development and use of a "composite indicators" in order to obtain a global description of the various faces of a complex phenomenon, and to convey a suitable synthesis of information.

The existing literature offers different alternative methods in order to obtain a composite indicator.

Structural Equation Modeling (SEM), and specifically the Partial Least Squares approach to SEM (PLS Path Modeling, PLS-PM) can be used to compute a system of Composite Indicators.

Empirical case on Italian Social Cohesion was analyzed with the aim to research alternative sources to compute the Italian Social Cohesion, using PLS-PM approach.

We apply a theoretical model firstly on data using European Value Study - Italy database (2008), and secondly on mixed data (official data, administrative data an networking data), using some indicators extracted from different sources (I.Stat and SocialCohesion.Stat warehouse). These warehouses have, as reference periods, different years (from 2011 to 2013).

Moreover, for the Latent Variable "Italian Sentiment", social media data were used, specifically Twitter data.

Finally results are compared. The first important result is the confirmation of the unidimensionality property, in both models, for each latent block. This result shows that the outer model is well specified and that the LVs are well measured by the Manifest Variables, being a good their synthesis.

This result suggests that it is possible to measure the social cohesion using heterogeneous sources of data.

CAVAGHAN, ROSALIND* (Radboud University, R.Cavaghan@fm.ru.nl)

The Democratic Impacts of EU Macro-Economic Surveillance: Reconfiguring the Eu's Gendered Normative Base

This paper explores how EU integration has progressed after the financial crisis, focusing specifically on the increased role of macro-economic surveillance and the resulting re-location of democratic control over budgetary policy. Focusing on feminist activists working at the EU level it maps shifts in civil society participation mechanisms to examine 1) how the EUs core economic policies have proved impervious to gendered critique emanating from: the EU parliament; the gender unit in the Commission; and feminist civil society and 2) feminist civil societies efforts mobilise and contest the re-newed dominance of a macro economic model which regards gendered social impacts as irrelevant or necessary.

Premised on this empirical material the paper examines 'the crisis' as a critical juncture enabling a reconfiguration of the EU's normative priorities where economic standardization takes re-newed prescience over the EU's flagship normative commitments such as democracy, solidarity and gender equality. In doing so, the paper deepens our understanding of the role this crisis has played in steering EU integration and its normative values.

Permanence Strategies in High Selective Undergraduate Courses and Professional Expectations: The Case of Quota System Beneficiaries in Brazilian Public Universities

The aim of this paper is to present the results of a research about the strategies of permanence and professional expectations from high selective undergraduate students who entered through quota system in Brazilian public universities. Quota system, which is an affirmative action and a demand from minorities, was implemented in public universities in 2003 in Brazil and became compulsory for federal universities in 2012 with the approval of a law. This affirmative action has been a strategy for people in disadvantage as well as a way of breaking the social reproduction cycle. It has benefited blacks, indigenous, disabled and public schools students to have access, not only in prestigious universities, but also in very competitive courses. With the quota system, access problems for these groups have been partially resolved although merit and gift ideology are still the main legitimated filters in universities. In highly competitive courses and universities, students are classified and declassified according to the structure and the volume of cultural and informational capitals and because of their social and racial background. The outcomes of the research show that the students developed a sense of the game creating material and symbolic permanence strategies in order to increase their chances to become successful in the academic field and to be recognized as legitimated students among a very selective group of students. Their professional expectations are ambiguous and based on the material existence in the university. Time is a very important capital for these beneficiaries as they urge to be engaged in work as soon as they graduate.

OF QUALITY FOOD AND LABOR IN THE GLOBAL SOUTH. CASES FROM THE NORTHEASTERN OF BRAZIL

Agriculture and food are some of the most globalized economic sectors. The corporate search for convenient factors and conditions of production illustrate new and, often more exploitative, labor relations. The growing demand for quality products has materialized in recent decades from processes such as certification of local products, geographical indications and quality labels that emphasize aspects such as good agricultural practices, tradition, identity and territoriality of food. Local food is part of global value chains in which farmers are subordinate to the power of large multinational companies. These companies control the production and ways of producing food by imposing strict quality standards that directly affect the structuring of production, labor relations and local regional dynamics. Fruit production in the São Francisco Valley, Brazil, is a case in point. In this region of Northeast Brazil, multinational companies, supermarket chains, third part certification bodies and large retailers interfere with new regulations on fruit production. However, these new forms of control over local production are involved in a bulk of relations enmeshed in socio-economic contradictions. For example, increasing forms of labor exploitation: Laborers work longer for less pay, perform tasks that are more sophisticated, mostly under temporary contracts, and experience new and more advanced forms of control; and a large number of small family farms, excluded from the global markets, become simple providers for large producers. The purpose of this article is to discuss and analyze the contradictions and processes found in quality production system in the São Francisco Valley to understand how the controls exercised by the hegemonic organizations of the global food system affects the structuring of production and social relations, but does not immediately translate into better labor relations in the global South.

Volunteering in Spanish Older People: A Life Course and Multicontextual Perspective

This study explores older people's involvement in volunteer activities through non-governmental organizations in Spain. The objective was to describe trajectories of this kind of participation across older people's life and how it is balanced or confronted with other traditional roles as grandparenthood. Thirty-nine older adults that volunteering in 3 different organizations (management, cultural actions, and social care) participated in the study. A semi-structured interview was used in order to elicit narratives of how important is to older adults to have an impact in their society either in their families or through their volunteer activities. Data was verbatim transcribed and results were analyzed by Atlas.ti program. Three main issues were highlighted: the confrontation with a stereotyped image of older adults as passive, the on-going duty/responsibility towards family and society, and the rewards older adults obtained doing volunteer activities. Those

results will be analyzed taking into account macrovariables (such as the economic crisis) and microvariables, such as identity, generativity and activism in older population.

TEAM Ethnography: A Comparison Between Perspectives of Different Researchers

Starting from an ethnographic research carried out for one year in two neighbourhoods of public housing in the city of Livorno in Italy, the paper aims to contribute to methodological reflection on team ethnography.

Although ethnography is conceived in the collective imagination as a solitary activity, a good deal of sociological and anthropological research is often the result of teamwork (Douglas, 1976; Salzman, 1989). The methodological reflection on team ethnography was launched (Erikson and Stull 1998; Mitteness and Barker 2004; Fortune and Mair, 2011), but still needs to be developed.

The research experience in two neighbourhoods of public housing involved a group of researchers and it was therefore distinct from that of classic studies in which the ethnographer alone immerses him/herself in the field. Being a team meant that researchers were engaged in an exercise in which they had to deal not only with the social actors in the field, but also with each other. Through their 'ethnographic performance' they were almost always able to arrive at shared, inter-subjective interpretations.

Ethnographic research has been used in order to compare two different neighbourhoods. Team ethnography aimed to the comparison of different perspectives.

The paper proposes a reflection in particular on the various activities relative to access to the field, immersion in it, note-taking, and interpreting the information gathered. Through the analysis of different aspects of ethnographic research in the two neighbourhoods – managing the entry into the various situations, gaining trust, coping with emotional problems, dealing with polysemy in interpretations – advantages and drawbacks of team work in ethnography will be highlighted.

Reductionism and Short-Termism in EU Knowledge Policies: How Are We Conceiving EU Future?

European Union declared in the 2000 Lisbon European Council the will to turn itself in "the most competitive and dynamic knowledge-based economy in the world". The core idea of *knowledge-society* as a theory of contemporary society is that during the second half of the XXth century knowledge has come to the real centre of it. Due to its capacity to re-valuate the traditional economic factors (*land, capital* and *work*) it has progressively been taking the scene, relegating them on the backstage. We shall try to give an insight into how Europe is structuring knowledge policies, which have become increasingly relevant for the socio-economical functioning of developed countries: which are their shaping criteria? What are the declared aims of research and what are the structures and instruments of policy? Who is deciding over policies and how? Is there a particular, if not openly declared, sociological imagination underling such orientations? Knowledge production, access and use, indeed, have not only acquired importance as key economic factors, but also a matter of lively public dispute in Western countries about daily-life-relevant matters. The request underlying citizens' protests is strongly related to legitimacy and breath of the scientific decision-making process. European Institutions especially are perceived as opaque and far from citizens' concerns, and many inquiries have already been made on the public attitude towards techno-scientific decisions. Our research, conversely, will focus on the European policy-makers' implicit theory, their policy-shaping guiding values and the actors they consider legitimate to participate in decision-making. We will then convey evidences from official publications to two main theoretical topics within contemporary *sociological imagination*: *reductionism* as epistemological tool and *short-termism* as scope of both societal challenges and social science. Along these two tracks runs the *sociological imagination* with which we are conceiving the future.

Gay Ethos and Countercultural in Argentina's Artistic Field during the Transition to Democracy

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

This paper analyzes the cultural changes in Argentina during its transition to democracy (1983-1993) cross referenced with the history of homosexuality. The international level provides a background (e.g., Stonewall), but the shift from totalitarianism to democracy 'shaped these changes in a distinct way. This research is based on different sources: deep interviews, análisis de obras del período y publicaciones del activismo. I examine how the prior homosexual experience and their subsequent collective coming out in the 90s (called gay experience) promoted the construction of spaces of autonomy and artists how took over esthetic ruptures.

I propose exploring relationships and transferences between homosexuality and the counterculture from a sociological perspective, beyond aspects related to LGBT politics, like: 1. A type of sociability derived from the homosexual "insular cosmos" which existed until approximately the mid-90s; 2. A selective homoerotic tradition, encouraged by national and international cultural models, in the face of the prevailing intellectual canon; 3. A morality constituted around the authority of the group itself. These dimensions favored a non-instrumental relationship with the lettered culture which was interwoven emotionally with personal life and which allowed actors with no significant cultural inheritance to become involved with the high culture practices of heterodox social actors.

Visual Sociology and Experiential Learning

With the proliferation of digital photography, more and more students are taking pictures of their everyday life and share it with their family and friends. In this paper, the use of photographs as a learning tool is analyzed. The author modifies the Photovoice approach and makes it a part of course assignments. In the assignment, students are required to carefully take photographs that they think can be related to sociological concepts they learn class. Students will then interpret the photographs, in the form of a "Sense Poem", or according to the SHOWeD approach (Wang, 1999), and make connections to sociological concepts they learn. Students will also incorporate personal meanings to their analysis of the photographs. This process of relating sociological concepts to the photographs often elicits personal emotion and meanings from students. In the process, students achieve personal transformation intellectually and emotionally, and visual sociology is made a form of experiential learning.

Mobilizing Representations: The Condition Sine Qua Non for a Social Movement

In this paper we will suggest a cognitive approach in order to reach a better understanding of the emergence and maintenance of a social movement. It is in the context of the most lasting and persevering antigovernment protests in the recent Bulgarian history that we will proceed to an analysis inspired from the theories of frame alignment processes that focus on the interpretive frameworks emerging within a protest movement. According to David Snow, frame alignment processes are "the linkage of individual and social movement organization (SMO) interpretive orientations, such that some set of individual interests, values and beliefs and SMO activities, goals, and ideology are congruent and complementary. »[1] Therefore, this conception implies the pre-existence of organization structures. How should we study the cases when organizations emerge post factum? Put in other words, how could we explain unsolicited and spontaneous social movements? How does an individual become a challenger? Our main thesis consists in the apprehension that the condition sine qua non of a social movement is a set of mobilizing representations. How do they crystallize? How are they constructed and diffused? Therefore, we will strive not only to make a point about the reasons for participation in the movement but we will try to elicit the motives of challengers.

The development of the notion of mobilizing representations will lead us to discuss the theories of both sociology of knowledge as sociology of social movements, based on empirical data. Understanding the emergence, development, dissemination and incorporation of a representation is a theoretical, methodological and empirical challenge that could solve Olson's Paradox - the aporia of social movements.

Is Rehabilitation Essential in Probation Service? : A Socio-LEGAL Approach to Developing a Theory of Self-Correction?:

The policy of inclusion of offenders to the mainstream through the process of self-correction in probation is a less traversed path of research. All the Probation Service Agencies adopt a rehabilitation programme to help the probationers for their ultimate return to normal life. The study raises the question: "Is rehabilitation essential in Probation Service ?" The study is based on (1) official data, (2) house-to-house survey, and (3) field observations. The research question in the study is that how without any rehabilitation programme or proper supervision, majority of the ex-probationers are able to lead a normal life by engaging themselves mostly in unskilled lawful occupation? To get answer to this question the author analyzed (a) psychological, (b) criminological, and (c) sociological variables. An analysis of the data reveals that majority of the probationers came from families with poor financial condition (66%), unskilled agricultural or industrial laborers (82.89%), illiterate(59.43%) rural background (65.71%) and their monthly income was unsatisfactory ($13) (Source: Office of the Chief Probation Officer, India, West Bengal, Calcutta). From the study it is also revealed that (1) there is no voluntary or governmental programme of rehabilitation for the probationers in the state; (2) and sample survey of 100 ex-probationers clearly reveals that about 70% of them are able to lead a settled life with lawful activities and returned to normal life process; and (3) the state of affairs of probation supervision in the state is very poor and not up to the standards followed by many countries. Thus it can be concluded that the probation system has an inherent efficiency of "self-correction" by which the system has survived for the last 175 years and will survive for a long time to come. Hence 'Theory of 'Self-correction' should be considered as a process of rehabilitation in probation system.

Life Strategies in the Context of Societal Inequalities and Asymmetrical Migration and Gender Relations – Intergenerational Transmissions

In our paper we explore how women, who are faced with ascriptions to be the ‚migration other', develop ways of dealing with social inequalities, asymmetrical gender relations and hegemonic racialised and gendered power structures. Our focus lies on how these ways of dealing are transmitted and/or transformed intergenerationally and within a family and how continuities, as well as modifications and disruptions in transmissions between mothers and daughters can be reconstructed.

The qualitative data for our paper – collected via group discussions with families and biographical interviews – is from a European research project focusing on life strategies of families with a migration background in marginalized urban neighbourhoods in Germany, Austria and Switzerland. In our theoretical approach, family members are seen as actively dealing and negotiating with societal circumstances and social meanings (Wacquant 2006). Their strategies are analysed, with regard to enabling and hindering contexts, which shape each person's scope of possibilities (Holzkamp 1983). Our research project aims to transcend beyond the deficit-oriented perspective without neglecting the social and societal challenges families have to deal with (Riegel/Yildiz 2011).

We would like to show how under conditions of migration, and societal inclusion and exclusion processes connected with it, certain ways of dealing are transmitted and or transformed. We ask in which ways life strategies (with a focus on education and care work) of mothers and daughters are connected and in which way, implicitly or explicitly, connections to the other generation are made and how gender and generation contexts are made relevant.

The transmissions, transformations and disruptions in intergenerational mother- daughter-relationships and strategies connected to dealing with gender and generation will be analysed in their societal intersections and interplay with racialised and gendered power and inequality conditions.

The Vulnerability of Prudential Professions. How the Concept of Practical Wisdom Explains Increasing Pressure and Allows Revisiting the Practical Question of Professional Control

This presentation first aims at showing how a general lack of awareness of the prudential nature of the work of some professions has caused increasing pressure on them. Their high level of expertise was a key argument to give them special autonomy. As objectivity is a very positive value, professionals have put this theme at the core of their discourse. First this strategy worked well. Then it became a trap. Over the past 50 years, doubts about professionals' ability to provide high quality services, namely objective services, have been a key argument to put their power under attack. Yet some subjectivity is unescapable in prudential activities : practical wisdom (or prudentiality) aims at facing situations in which singularity and complexity bring a high level of uncertainty. This uncertainty makes bets necessary, for instance about diagnosis, prognosis, and the efficiency of different cures in the case of medical practice. The demand for objectivity thus is impossible to fully satisfy and the gap between discourse and practice justifies control. Second the presentation will show how the idea of practical wisdom allows revisiting the theme of professional control on a practical point of view. Given the prudential dimension of professional work, the level of control is not the main question : actually the link between control (or autonomy) and practical wisdom is equivocal. A more appropriate question is : how do contexts of work and controls impact the ability of professionals to practice prudentially ? We will present research conducted to answer this question.

Lasting Struggle: Ideology, Frame Transformation, and Collective Action of the Chinese Falun Gong Movement

As one of the most popular *qigong* groups in China, the *Falun Gong* captured the world's attention and inspired voluminous scholarly research during its tumultuous times in the 1990s. However, it has lost public support and drawn less attention from the media and academia in recent years, despite having undergone a striking transformation. The FLG of the 1990s emphasized their peaceful nature especially in demonstrations before and during the crackdown from the Chinese state in 1999. In contrast, FLG followers in the 2010s are unashamed of their "radical" image and publicly display their mission of overthrowing the Chinese Communist Party. Based on a social movement framework, this project seeks to understand changes in the FLG by examining the interplay of micro and macro factors in the process. Using the FLG as a case, this research is aimed at unpacking and theorizing the evolution of a quasi-religious movement in relation to the movement's ideological content, the role of its charismatic leader, the actions of the state authorities, and the immediate socio-political forces. In particular, this project traces the transformation of FLG's collective actions and the ways they framed their actions over two decades from the mid-1990s to the mid -2010s. It identifies changes in their collection action frames over three periods of time: prior to the crackdown (1996-1999), during the crackdown (1999-2000), and after the crackdown (2000 – present). I examine how the FLG mobilized different ideological ideas to construct different action frames under different political contexts, and why their collective actions have turned radical after the crackdown period.

Co-Creating Movement Symbols: The Umbrella Movement of Hong Kong

The Umbrella Movement of Hong Kong taken place in 2014 was to fight for universal suffrage. Besides democracy, ideas such as non-violence and autonomy were celebrated in the movement. Since the movement was triggered by student strikes instead of the occupation advocated by Occupy Central with Love and Peace since 2013, framing of the movement was not planned and executed by movement organizers. They were spontaneously co-created by protestors. Among many symbols representing the spirit of the movement, umbrella, Lennon Wall and a study room in the occupation site were selected in this study to demonstrate how framing task in "crowd-enabled connective action" was carried out without central authority.

The use of umbrella as major symbol of the movement was purely accidental. Since many ladies in Hong Kong always bring along umbrellas to block sunshine, they were immediately used by protestors as shields to protect themselves from police's pepper spray and later became a symbol of non-violence. The Lennon Wall was named after John Lennon probably due to a banner hanged in a nearby footbridge with the verse from his song Imagine. Protestors wrote down their wishes such as "I want universal suffrage" on colorful post-it stick to the wall. It was a wall of dreams and a symbol of good will. The temporary study room was built by volunteers to cater the needs of student young protestors. Human power station was installed for protestors to help generate energy for the study. Photos of student studying in this room became a symbol of diligence, environmental protection and mutual support.   With these symbols, the occupation space was seen as a utopian community celebrating a set of civil virtues. This study illus-

trates how public space could be configured and symbols be created to frame a radical action such as occupation.

The Protestant Community and the Umbrella Movement in Hong Kong

This paper examines Protestants' participation in the Umbrella Movement in Hong Kong through Richard Wood's theory of faith-based community organizing. Protestants were an integral part of the protesters in the movement. Despite many church leaders expressing reservations and opposition, the Protestant community displayed a high degree of participation in the Umbrella Movement, far exceeding any previous collective action. The author argues that the Protestant's participation can be explained by the theory of faith-based community organizing, in which organizers of action groups used biblical stories, ideas, images, and symbols to create meaning and to build an internal political culture, leading to the Protestants' spectacular involvement in and commitment to the Umbrella Movement.

Economic Risks, Shocks and Responses: Family Dynamics in a Comparative Perspective

In this paper we study family response to economic risks and shocks in China, Germany, the Netherlands and the UK. We use data from recent and large scale household panel surveys from these four countries. We focus on cases where the household head is of prime working age (roughly 30 to 55). Because these countries face very different macro-economic and labour market conditions in the past few years, and also because their labour market institutions and social welfare systems are very different, families and households in these countries face very different risks. We seek to determine the commonality and difference in the risks that they face, and explore how families respond to the vulnerabilities and shocks that they might experience as a result of changes in the labour market and/or the family.

Revisiting Sadomasochism in Everyday Life

This paper returns to a book I wrote in 1992 entitled *Sadomasochism in Everyday Life: The Dynamics of Power and Powerlessness* and tries to update the arguments presented there so as to take into account mediating factors that can either encourage or mitigate against the dynamics discussed in the earlier volume.

In particular, the paper looks at the overlap between my arguments and that of Erich Fromm, and attempts to look at whether developments in the public sphere (especially the emergence of Donald Trump in the United States as a viable political candidate) and in the private sphere (discourse about the private sphere, and efforts to protect reproductive freedom currently being made by feminists) suggest an ongoing relevance of Frankfurt School perspectives. However, in an updated context, the paper also reflects from a social movement perspective on what might help to offset contemporary sadomasochistic dynamics -- i.e., it analyzes 'mediating' factors that were not given adequate attention in the book when previously published.

Building the Knowledge Society through Digital India Programme

Modern nations develop their society as 'knowledge society' through promotion of various uses of science and technology. Information and communication technologies play an important role on expanding the horizon of knowledge society. India is one of the major countries in BRICS nations where the government has focused on the digitalization programme at various levels of governance. The industry, education, health and service sectors in India are using digital technologies to enhance its reach to masses and through these new technologies a knowledge society has been created. The present paper is examining the strength and weakness of Government of India's "Digital India" programme and will try to

sketch out the role of digital India programme in creation of knowledge society in modern India.

Young People's Experience and Understanding of Climate Change and Natural Disasters in India

Climate change is a global challenge of modern times. Recent events have emphatically demonstrated India's growing vulnerability to climate change and various natural disasters such as earthquakes and landslide in mountain region. The consequences of climate change on ecosystems, weather conditions and socio-eco-political realities is experienced by all sections of the society including youth which consists more than fifty percent of Indian population. Young people not only experience the consequences of climate change and natural disasters, but also study these issues in their classes. Topics like global warming, climate change, earthquakes, tsunami, and other ecological disturbances are subjects for discussions, debates and academic assignment in school-college curriculum in India. Young people have to play a crucial role in combating climate change and natural disasters as they are real contributors in nation building. Given to this, an empirical study was planned to study the experience and understanding of climate change and natural disasters of 300 youth of age group between 12-17 years from two senior secondary schools in Lucknow city. The data has been collected through a well designed and focused interview schedule. The four major research questions are probed in the present research. 1) How young people take the current changes in weather conditions? 2) Are young people aware about the possible threats of natural disasters and climate change? 3) To what extent young people are prepared to face the challenges of natural disasters? 4) What is young people's experience of recent April-May 2015 earthquake in North India? The main argument in this research paper is that youth in Indian Cities are well aware of the phenomenon of climate change and various consequences of natural disasters. They also see their role in combating it. They relate themselves to future of ecosystems in which they live.

CHANDRIKA, K.B.* (Number and Name of RC: 41 Sociology of Population, chandrikakb@rediffmail.com)

Healthy Ageing:Interventions to Improve the Quality of Life

In recent years, due to significant changes in the demographic characteristics of the older population, researches on Sociology of Aging has provided new insight concerning the problems and challenges associated with aging. Age related Biological, Psychological and Sociological changes that occur with the aging influence the extent to which an individual is able to cope up with the changes. The so far evidences point out to the importance of various interventions to enable old persons to improve the quality of their later life.

The main objectives of the study are-: 1) to identify older people's perceptions and attitude on quality of life and healthy ageing, 2) to identify dietary and lifestyle factors, that contribute to healthy ageing, 3) to study the ethical dimensions of quality of life in aging, and 4) to know about the morbidity profile and interventions to maintain the health status of old persons. This is an empirical study conducted in Belgaum city, of Karnataka State, India. 160 respondents in the age group 60-70 were selected on random basis and data were collected using structured interview schedule. A simple descriptive statistical method is applied to analyze the data.

The findings of the study suggest strategies in improving the quality of life of elderly. It is concluded that, the social, personal and philosophical interventions on their own habits and activities help elderly in improving the longevity and quality of life. Interventions to slow the aging process could be regarded either as an enhancement of health spans or as preventative therapeutic interventions that reduces risk of illness and disability.

CHANG, BENJAMIN* (The Hong Kong Institute of Education, benjichang@gmail.com)

"What's the Point When We Can't Even Afford a Home?" Competition, Competence, and Agency Among Hong Kong and Mainland Chinese Tertiary Students

For over 15 years, the Hong Kong Education Bureau (EDB) has attempted to address paradigm shifts related to the emergence of the globalized economy and knowledge society. Through reform policies like *Learning To Learn* and the *New Senior Secondary* curriculum (implemented in stages beginning in the early 2000s), the EDB has rapidly revamped its educational system to boost mastery of the core competencies that are supposedly essential to competing in the global marketplace. Indeed, Hong Kong's continued success as one of the top achievers in

TIMSS and PISA scores can be a testament to the effectiveness of its reforms. Yet there remain strong contentions in scholarship and public discourse concerning the state of Hong Kong's educational system and its impact towards an unequal social order. Despite high rankings, Hong Kong is critiqued as being too focused on exams, competition, and test preparation. Critiques hold that such a focus does not lead to real-world competence or greater social-economic development, but instead reifies existing stratification and elitism within a society that already has the highest income gap between rich and poor of any developed economy.

This paper examines these issues of competition, competence, and agency (socioeconomic, political) from the perspective of tertiary students from Hong Kong or mainland China, in the aftermath of the 2014 Umbrella Movement struggles. Utilizing a critical sociocultural framework, this paper reports on a study that conducted individual and focus group interviews with students across different campuses, with an emphasis on how they articulated their views on pedagogy, empowerment, and futures. Drawing from the author's previous research on similar issues with Chinese students in North America, this paper nuances notions of the Chinese learner, Confucian values and ethics, and student agency across the Chinese diaspora. Ultimately, this paper generates implications for teacher education, Chinese studies, and educational equity.

CHANG, CHENG-HENG* (National Taiwan University, cchang23@illinois.edu)

The Emergence of Rhizomatous Community: Toward an Ontological Turn in Community Studies

This paper aims to propose a new theoretical concept of community based on an empirical study. By applying the idea of social ontology to community studies, I argue that it is necessary to discard the conventional concepts of community formed in the dualist understanding of the social. On the one hand, contemporary politics of locality production under global capitalism urges new formations of social relationship and connectedness in the local context. On the other hand, a community is not only about a group of persons who live together or share the same believes. Rather, community is also about the social co-evolution of human and nature, or *terroir* and *fûdo*.

I collected the empirical data of this paper through a long-term fieldwork on a community-making project called the BVP in a rural town of Japan. This project aims to recruit retired urbanites to settle in their depopulated town to practice pesticide-free farming. Through the research, I found that the implementation of the BVP has created a new form of communal life, which I term, a "rhizomatous community." At the end, the BVP grows into a discursive community that does not physically exist but that is substantially constituted by face-to-face contact, seasonal events, gift exchange, and various interactions with nature. In this respect, the BVP can be imagined as an assembled network that is composed of heterogeneous actors and things.

The social ontological view contributes to community studies by challenging the understandings of community in classical and contemporary theories. A rhizomatous community is neither an interpersonal network existing in a socio-geographic vacuum, nor a traditional neighborhood situated in a spatially bounded place. Rather, it is a heterogeneous assemblage discursively constituted through the process of producing locality. It is liberated from while remaining associated with traditional bonds such as family, kinship, and neighborhood.

Does Confucian Culture Make Difference on Student Achievement?Cmchang@Mail.Ndhu.Edu.Tw

The purpose of this study is to use Taiwan Assessment of Student Achievement database 2006, in which sixth grade student test scores as the dependent variable to explore the relationships between the achievements and student common background variables and individual disciplines learning variables by using data mining, the decision tree method.

In TASA database, common background of sixth-grade students are 28 variables, and the result shows the common background variables for all subjects have discriminating effects. Two phenomena are interesting :(a) on Chinese, mathematics, natural, and social science, fewer and more concentrate common background variables make differences. On the other hand, for English subject the impact variables are distributed more widely; (b) the impact of variables to each subjects can be divided into three main aggregation scope: The first part is the student›s native family backgrounds, including students' ethnic groups, their parents› education level and occupation, and whether to accept free lunch program; the second part is the time for students to use at home, including the completion of homework, reading, watching TV, and use the amount of computer time; the third part is the habit of reading, including reading like essays, novels, adventure, or detective books.

In addition to background variables, this study also analyzed students' achievement with disciplines learning variables. It is interesting to find, except to English

subject, background variables have no discrimination effect on learning outcomes to the remaining four subjects, when disciplines learning variables were added to the analysis.

Transnational Social Movement Network and the Implementation of Crpd and in Taiwan

The United Nation Convention on the Rights of Persons with Disabilities (CRPD) in 2006 triggered the disability rights revolution globally. Taiwan is not a member of United Nations and has been excluded from the international human rights framework. However, the government continuously seeks to engage in international affairs through non-official UN channels. This paper explores the role of the transnational disability rights social movement networks in promoting a rights framework for Taiwan and a unique way of ratification of CRPD in Taiwan. The data include interviews with activists from major Taiwanese disability rights non-governmental organizations (NGOs), newsletters from disability rights organizations, documents of workshops and conferences with transnational social movement networks, legal documents related to disability policies, and participation observation of workshops and rights campaign related to CRPD. This paper shows that transnational networks bring rights framing to local disability rights NGOs. The rights frame not only transforms the disability policies, but also triggers new wave of political participation by disabled people and led to the establishment of new advocacy networks by disabled people. Finally, this paper discusses the politics of cooperation among a non-UN regime, local social movement organization and transnational civil society organizations in transnational human rights campaign.

Attitudes Toward Labor Migrants, Live-in Care Workers, and Skilled Migrants in a New Immigrant Destination: Does Social Contact Matter?

Ever since Taiwan first opened its door to labor migrants in the early 1990s and later to more types of foreign workers, the Taiwanese government has only considered marriage migrants (who married with Taiwanese citizens) as legitimate citizens and all others as temporary. As a new immigrant destination and an aging society, Taiwan is in need of more human capital from its neighboring countries to support care work and industries such as construction, fishery, and agriculture. However, unlike western immigrant societies, these migrants have to leave Taiwan whenever their contract ends, without any possibility to apply for citizenship, unless they marry with Taiwanese. The 2015 Taiwan Social Trends Survey is the first-ever large-scale representative survey covering questions on attitudes toward the citizenship rights among labor migrants, live-in care workers, and skilled migrants. Would the Taiwanese welcome non-marriage migrants to apply for citizenship if these "temporary" migrants wish to migrate permanently? Using a representative sample in Taiwan (n=1,203), we found that male, the younger generations, and the highly-educated, tend to be more open to the idea that these temporary migrants becoming permanent residents or citizens in Taiwan. Further, more social contacts with live-in care workers and skilled migrants have statistically significant and positive effects on Taiwanese's attitudes, but not the case for labor migrant workers. Last but not least, we include some analysis on Taiwanese' attitudes toward runaway (undocumented) migrant workers, who are constrained by the very restrictive migration policies that they do not have the rights to change employers even under unreasonable work conditions. Using the most updated data in Taiwan, we aim to explore Taiwanese' attitudes toward migrants of different gender, education levels, and countries of origin. We also wish to call for more tolerant migration policies in Taiwan and other new immigrant destinations.

CHANG, HSIN-CHIEH* (National Taiwan University, hcchang@ntu.edu.tw)

Social Integration and Post-Divorce Wellbeing Among Marriage Migrants: Evidence and Policy Implications

The social phenomenon of intra-Asia marriage migration has received considerable attention from marriage and family scholars. One common observation across several new immigrant destinations, including Taiwan, Hong Kong, and South Korea, are the relative high prevalence of divorce among these transnational marriages. What happens to marriage migrants who choose to remain in the host societies after getting a divorce? In this article, I use a unique social survey in South Korea to investigate the associations between social integration and post-divorce wellbeing among 2435 female marriage migrants who come from China, Vietnam, the Philippines, and several other Asian societies. Descriptive results show that the self-rated health and life satisfaction of migrant divorcees are significantly worse than the average of all marriage migrants. Compared with all marriage migrants in the sample, migrant divorcees maintain less social relationships with Koreans and more of them perceived discrimination in daily lives. Logistic regressions indicate that social relationships with Koreans play a crucial role in migrant divorcees' better wellbeing. Those who have Korean friends to turn to when in trouble and to spend leisure time with reported significantly better health (OR=1.48) and life satisfaction (OR=1.55) than those who do not have social relationships with Koreans. However, perceived discrimination is significantly associated with worse health and life satisfaction. Such results indicate both the positive and negative consequences of social interactions with the native population, which is especially important for migrant divorcees who lack of social support from natal families in the host societies. Furthermore, I examine the effects of other aspects of social integration-related factors and the influence of marital family's socioeconomic status on migrant divorcees' wellbeing. Using the case of migrant divorcees in South Korea, this article ends with policy implications on social integration that may inform other marriage migrant receiving societies within and beyond Asia.

Is Gender Division of Labor Unequal? Children's Experiences in the Puyuma Tribe

The Gender Equality Committee in Taiwan is in charge of bringing gender perspectives into the government's policies. In 2013, the committee suggested the Council of Indigenous Peoples should have examined indigenous peoples' traditional customs and ceremonies which limited women's social participation, such as the Puyuma tribe's ceremonies. The above suggestion made Puyuma indigenes angry, because traditionally, the Puyuma is close to a matriarchal society, the eldest daughter inherits the property, but the title of chieftain is passed on from father to son. Women suffer from no gender oppression, and they have superior power over men in their familyhood. Women and men have different roles and tasks in the traditional ceremonies, but it is not unequal. They thought the suggestion showed the arrogance of feminists and the incompatibility of multiculturalism and gender equality.

However, there were some researchers found that the Puyuma's matriarchal society changed gradually influenced by the mainstream patriarchy. This study employed semi-structured interviews and participation observations to explore Puyuma children's experiences about gender division of labor in their customs and ceremonies. The research found that merely classifying the indigenous society in terms of the patrilineal or matrilineal character would limit our understanding. Properly speaking, the Puyuma is bilateral descent. However, from children's experiences, the researchers found boys from elementary schools had the opportunities to learn and practice their culture, gender roles and masculinity in the ceremonies and the Men's House according to the age system, but there were no ceremonies belonged to girls at the same age. In many ceremonies nowadays, these girls felt like tourists, and they thought women were "prohibited" participating in men's activities, and women's jobs in the ceremonies were only serving and waiting according to the tradition. Therefore, the gender division of labor in the ceremonies would affect women's cultural learning and social participation.

The Reflexivity of Modern Communication As a Factor of Socio-Cultural Changes

It is known that modern IT tools lead to a reduction of the regulatory functions of social institutions in society. It is important to understand the underlying causes and social consequences of this trend.

Nowadays communications are concentrated in network structures. These structures often provide people an opportunity to position themselves using convenient notations, such as fictitious names and icons, without fixing social status. Since the presentation of the social status is the most important condition to realize of institutional relations, then definitely this fact destroys the industrial tradition of creating relationships based on social norms. Networks and communities are defining a new trend of communication based on a different approach, where social status isn't taken into account and socio-cultural norms are not necessarily used.

This different approach of communication is created at the moment of interaction between communicants considering the specific situation of commu-

nication and the individual conception of participants› life-world. That is, it takes the ability to co-create agreements in area without ready-made rules. This ability requires reflexive relation for the institutional norm that still exist in culture, but no longer relevant to online communities. Thus personal creativity and innovation are becoming essential.

Today, the innovative potential, tolerance, willingness to take risks, mobility, the dominance of horizontal business relations are more pronounced in online communities. As a result, the demand for these kind of personal characteristics at the system level leads to a change in social and cultural environment in the society.

De L'ecriture Comme Souffrance Au Travail à Une Reformulation De La Performativité.

Les pratiques professionnelles des secteurs sociaux, éducatifs, sanitaires et judiciaires sont affectées depuis un demi-siècle par d'importantes mutations éthiques, pragmatiques et épistémologiques. On propose ici de s'intéresser à celles des pratiques d'écriture, production et fourniture d'écrits, dans le contexte professionnel complexe de « l'éducation judiciaire ».

Une recherche multidisciplinaire dans une grande région française a permis de renouveler l'approche de cette pratique, souvent rattachée à l'idée de souffrance au travail, d'échec et de normalisation abusive ou de management communicationnel paradoxal. On peut ainsi montrer que des approches psychologistes, sociologicistes, pédagogistes ou historicistes de l'écriture au travail ont participé de la construction de cet objet en objet partiellement dénié dans ses réalités pratiques, pour le plier à des approches s'intéressant systématiquement à « autre chose » que la dynamique essentielle du travail et de la pratique. On proposera qu'une approche radicalement performative de l'écriture au travail peut participer d'une restitution aux acteurs professionnels de leur autorité et du sens de leur activité.

CHANTRAINE, OLIVIER* (Universite de Lille 3, ochantraine@dbmail.com)

French "Chrononym" "Spirit of January Eleven", State Propaganda and Society

The idiom « War on terror », acronym "WOT", can be considered as the title of a widely spread epic tale, which succeeded where the clumsy slogan "crusade" primarily hammered by president G.W. Bush failed. It is the banner and label of a variety of episodes and series which can be designated by "chrononyms" , like "Nine Eleven"

In the recent French history, the president Hollande himself promoted the chrononym "Esprit du 11 janvier" ("Spirit of January 11th"), after he took the head of a gigantic street demonstration with his guest leaders of the "free world" (Omar Bongo et alii) on January 11 2015, in an attempt to inaugurate a new era of political correctness and unanimity for "War On Terror" in a French version. The non-adhesion to that "spirit", its slogan – "Je suis Charlie", its ceremony – "minute of silence" enforced in all schools - , created a stigmatization of numerous youth, mainly designated by their supposed religious or "origin" identities, as well as located as living in specific areas or being educated in the second-rate school system. The mass reaction to violence against freedom and non-racist society was deeply divided by this state propaganda, resulting in widely spread defiance towards official tales of public action.

We will focus on academic and educational actors who worked in this context to rehabilitate youth of discriminated schools and areas in their democratic and human feelings and opinions. And on attempts by scholars and writers to promote an alternative representation of youth, suburbs and cultural diversity.

Human Security in New Frontier of Environmental Sociology: EIA, Community Participation and Community Right in Petroleum Exploration and Production Project in Thailand

This study is seeks to highlight the community participation and community right in Environmental Impact Assessment (EIA) and the petroleum exploration and production project impacts human security. The qualitative methods were used in four rural agriculture communities, Ban Komyai, Ban Kompai, Ban Nalao and Ban Namon in Northeastern of Thailand. This paper provides a brief background to community participation and community right versus EIA in Thailand and reports on the human insecurity in health, economic and environment from petroleum project. EIA is a tool for integrated environmental management of complex and potentially high impact activities such as health and environment

impact. Although, public participation is being considered as an integral part of the assessment procedure, but EIA process is extremely limited in community level, knowledge, right, access and appeal. In petroleum project not only lack of community participation but also transgress community right. Understanding and accepting in multi-right concept, claim right, legal right, and culture right, in development process can relieve the hostility between petroleum stakeholders. While petroleum project is running, health risk, low income and biodiversity reducing rise in community as human insecurity. This paper argues that standard EIA is a tool of community participation to extricate human insecurity situations and the application of complexity of right concept will stabilize the human security.

Transforming Rural and Indigenous Farming Communities in Thailand: Household Food Security and Globalization in the Twenty-First Century

Food security policies planned nationally and globally challenge the farming lives of rural and indigenous communities. This paper presents five qualitative case studies: two rural and three indigenous villages in the forests of Thailand. National policies affected by globalization not only restrict the rural and indigenous villagers from managing their own lands and natural resources, but also challenge them to secure their own living. Limited access to farm lands and forest reservations results in insecure and unstable food availabilities in those villages. Transforming their lifestyles today depends highly on the market economy. How can they have stable access to food in the market system? How can we make the system as fair as possible in a rapidly changing society? Studies show how lack of social capital, along with the loss of local culture and shift to a modern consumption-oriented lifestyle, could affect the living conditions of local villagers. They suffer from insufficient household food productions and limited food availabilities from the forests. My findings suggest that community food sovereignty is important to sustain household food security. Moreover, I argue that the supports from both local and national governments are crucial for the villagers to successfully secure food, particularly at a developmental stage of such village transformations. This study provides a critical perspective toward the global trend which drives the governments to implement policies with few concerns for negative impacts on everyday food productions in local farming communities.

Investees' Voices

Building on our prospective approach on investees' capitalism (Charron, 2015) and Michel Feher's work on investees' activism, we will try to understand how investees are making their voices heard *as such*.

Valuation happens to be a topic that draws attention in social sciences, as shown for example by the recent creation of the Valuation Studies journal. However, studying what valuation actors and valuation formulas actually do on financial markets leaves a specific feature of these markets unnoticed: what is valued here are people, not things.

Consequently, valuation can be envisioned as a relationship between the valuers and the valued or, as we now say, the investors and the investees. We used the term investee (first in Charron, 2010) to designate, in a broad sense, any kind of actor, organization, state, etc. that is financed and valued by a financial market. Investees can be firms, states or households, in any case human communities that can be considered as actors. Therefore, in the case of financial markets seen as valuation relationships, what is valued may want to have a say about how it is valued.

This is what happened on several occasions in the recent years. We will try to show through several examples how investees chose, in hirschmanian terms, to voice instead of just exiting (defaulting) or being loyal (abiding by investor's demands). The "Strike debt" movement, the "Escrache" movement in Spain, the Greek debt crisis can provide material showing notably how valuation criteria, but also the behavior or reforms demanded by investors are discussed, questioned, acted upon.

The project being at an early stage, we are just beginning to collect it. The general idea is to show in which ways finance may be made more symmetrical by making valuation political.

How an Organic Certification System Transforms Farmers' Work: The Case of a Transnational Cotton Production Chain Between France and Brazil

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In this presentation, I analyze the effects of a certification system on the work of North-Eastern Brazilian farmers (from the region of « Sertao ») in an agroecological cotton production chain that is built by French social entrepreneurs advocating criteria of fair-trade. I will present observations and interviews for my doctoral thesis in sociology conducted during several months with a plurality of actors of the chain (social entrepreneurs, farmers producers of cotton, local NGOs linked to regional social movements). An apparent tension lies in how social entrepreneurs justify organic certification as a market and consumers requirement while simultaneously establishing it as a strategy and firm policy which aims at improving local organizational performance. Entrepreneurs' imposition of organic certification of cotton as a new purchasing criterion becomes a control system on local farmers' work-norms who subsequently start thinking and acting differently in relation to their work and start imposing new requirements upon themselves. I notice the important transformations of farmers work, such as additional working hours and differentiated attention to the cotton production process. Such differentiated attention alters value and quality perceptions that small-scale Brazilian farmers have of their cotton and their own work. As a result, some farmers demand a higher price for their work, claiming that the higher quality of their cotton and extra time spent to produce it justifies a higher compensation than initially paid by French entrepreneurs. The relationship between French entrepreneurs and Brazilian farmers is based on a contract signed by both parties and reinforced by meetings and direct exchanges, there by seemingly creating a new kind of transnational wage system based on hybrid social techniques of control and exchange.

Unsettled Transitions to 'Adulthood': Young Migrants' Experiences of Future, Self, and Wellbeing in the UK

Previous work has shown that young people subject to immigration control frequently draw a link between their own subjective wellbeing and whether or not they have a projected sense of self within a clear future trajectory (Allsopp, et al. 2014; Chase 2013). Drawing on in-depth narrative interviews, this paper examines the meanings and associations of wellbeing linked to futures for unaccompanied minors, as they transition to 'adulthood' within the UK asylum and welfare systems. The paper further explores the relationships young people draw between intentions for their future, notions of imagined self, and their subjective wellbeing in transition. By demonstrating the multiple, complex and dynamic transitions that young people encounter and respond to as they become 'adult' within the migratory project, the paper unsettles the dominant theories of youth transitions linked to human capital development and critically engages with the methodological and ethical challenges of conceptualizing wellbeing in 'transition.'

Size Upswings of Cities and Polities: Comparisons of World-Systems Since the Bronze Age

This study examines growth and decline phases of cities and polities (states and empires) since 1500 BCE in order to test explanations of the evolution of complexity and hierarchy in world-systems. World history has long recognized that the population sizes of largest cities as well as the territorial sizes of largest polities go through cyclical growth and decline phases. It has been found that urban and polity upsweeps (large changes in scale) are correlated in time. But the number of these instances of large-scale change (upsweeps) is limited to about 40. Far more numerous are the smaller **upswings** in which the sizes of the largest city or polity increases but is not significantly larger than earlier increases. This study will examine these upswings and will compare them with upsweeps in ten world regions (Europe, Southwest Asia, Africa, Central Asia and Siberia, East Asia, South Asia, Southeast Asia, Oceania, North and Central America, and South America and Caribbean) since the Bronze Age. We will also use political/military interaction networks as units of comparison and analysis. And we will examine the temporal relationships between urban and polity upswings and such potential causes of upswings and upsweeps as warfare and trade and the hierarchical or decentralized structure of interaction networks.

Gentrification in the Textile Mill Areas of Mumbai: Changing Spatial Relations and the Role of State

This paper attempts to portray the transforming textile mill land areas of Mumbai, its changing spatial relations from the past and the negotiation with the State in the post industrial city. The process of deindustrialisation followed by the prolonged textile mill strike that lasted for two years (1982-83) led to an eventual but gradual closure of the textile mills. This culminated into city space transformation where redevelopment regeneration of the built environment and city branding process became the main mantra. The emergence of the new landscape with service sectors firms, IT industries, creative sectors, cheek by jowl shopping malls, high- end restaurants, pubs, nightclubs, fashion houses and gated communities juxtaposed with long rows of chawls (houses for the working class) in the old neighbourhood of working class community led to an exorbitant land values and reproduced itself as a landscape of contrast, contestation and rising aspirations. The mill lands in the central part of the city turned into a gold mine for the real estate developers and also a space of negotiation for the ex mill workers and state.The arrival of the upwardly mobile middle class and the effect of bourgeoisie culture deeply disturb the older urban rhythms related to space, place, work and life in these localities and also changes their everyday life practices. The lack of employment, the ghettoisation of working class chawls surrounded by gated communities and low affordability, displaced many workers to far off places. Those who sustained to stay here became informal workers. This creates not only a sense of discontent but ignites a process of negotiation and bargaining with the state. This ethnographic paper through observations and semistructured interviews take into account of the transformation, role of state and its policy formations and the process of practice, negotiation attached to it.

Spirituality and Faith through Leisure: A Study of Two Cities in India

For a standard living leisure is essential for the human beings today. Social development requires both work and leisure in a balanced manner. Leisure is cultural in nature hence; different societies have different concepts and types of leisure. In this manner leisure has been structural to every society. Spirituality is an integral part of many societies. Spirituality comes under essentials of living conditions for human beings. In this paper I would like to analyze on how spirituality is a type of leisure activity, particularly among the city dwellers in India.

People in the cities have both a traditional conservative mind set as well as some have a rational modern mind sets. Most of the people have integrated these two types of mind sets for life style in general and leisure activity in particular. For the purpose of analysis for this paper two cities have been chosen: Lucknow in Uttar Pradesh, India and Berhampur in Odisha, India. It is really interesting to know that there is a great similarity between the cities: both are relatively traditional cities, in both the cities people are mostly ritually oriented. It means they get pleasure out of the rituals and for them going to temples is a leisure activity. In these manner temples, pilgrimages and rituals are linked with leisure.

Sociology of Leisure and Climate Change: Some Observations

Leisure and its creative utilization have been crucial to Social Development. In the development scenario despite criticisms social development holds the key towards the human development**.** However, in today's era of Global Warming such kinds of development become very difficult in the whole world. Climate change has been a crucial issue not only in India but for the whole world. It has affected the basic living standards in the world irrespective caste, class, creed, religion and race. Leisure activities contribute immensely towards Global Warming: for example transportation involving carbon emission, use of hotel, use of plastic bag, wrappers, wastage of food products and may be washing of hair daily. Undoubted the advance countries have undertaken major steps to control carbon emission.

If you consider cities the pollution index has been alarming in thickly populated countries like China and India. Both have five cities each in the first twenty five most polluted cities in the world. In light of the above this paper will make an attempt to analyze various causes of climate change in India particularly in the cities. Under this backdrop this paper would try to analyze the factors of Warming through leisure activities and the measures of control for such warming.

Food Culture, Identity and Globalization: The Dogra Weddings of Jammu in Northwest India

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Food shapes our identity as people and gives meaning to our culture. The surrounding society and ecology influence the development of individual taste, explaining why and how food cultures are identified and associated with groups and nations such as Italy with *pizza* and *pasta*, *kimchi* with Korea or potatoes with Ireland and *wazwan* with Kashmir. Among the Dogras of Jammu in the northwest state of Jammu and Kashmir (J&K) in India food at weddings reflects the identity of its people as well as the social transformation to which the Dogra food culture is adapting. No wedding can be complete without food being served in an appropriate manner and style, and with required taste and flavour with typical essential Dogra dishes like *Rajmash, Ambal, Kalaari* or *Mitha Madra*. However, in the recent years it is seen that other cuisines like Punjabi, Kashmiri, South Indian or even international ones like Chinese or Italian have been added to the food served at Dogra weddings. This shows on the one hand, the impact of globalizing consumer world, and on the other, the urgency on the part of the people to maintain their identity through food culture. The paper explores the dimensions of food culture of the Dogras of Jammu region, best expressed in their weddings, in the context of their transforming identity as a result of the process of globalization facilitated by new developments in the field of information and communicative technology.

Honor Killings and Gender-Based Violence in India: Women's Activism and People's Initiatives

'Gender-based violence' refers to violence that targets individuals or groups on the basis of their gender, most of them being inflicted by men on women and girls transgressing their fundamental right to life, freedom, security and dignity. Gender-based violence cannot be understood outside the social structures, norms and roles that support and justify it as normal or tolerable. In many cases it is tacitly supported by different people, groups and institutions. 'Honor Killing' is one such type of violence that occurs as an act of revenge or vengeance usually resulting in a murder or death of a member of a family or social group due to the belief of the perpetrators that the victim (usually women) has brought dishonor and shame to them. In the year 2000, the United Nations estimated that 5000 people were victims of honor killings including 1000 from India. Most of these cases reported from the states of north India occurred when the age-old rules of marriage related to religion, caste, community, clan or village were violated, i.e. when people married outside prescribed social rules and norms of their choice. No specific law against honor killings exist in India today, though other legal provisions include various forms of crime against women. Efforts are being made by women activists, lawyers and several people and organizations against these acts. This paper aims to understand the role of women's activism and people's initiatives and the difference they are making towards generating discourse that looks at women and their issues more favorably from gender-sensitive and human rights perspective. The analysis is based mainly on the studies on Hindus, and the cases are drawn largely from the state of Haryana in north India.

Communicating through Internet in India: Some Formulations on Understanding Change

The paper is divided into following five parts: (i) introduction; (ii) the use of internet and transformation of relationships in India; (iii) inequality and challenges posed by digital divide in India; (iv) communication through internet: some conceptualizations in sociology, and (v) conclusion. Following questions have been raised and discussed in the paper: (i) how has internet communication transformed the nature and types of relationships in India?; (ii) what has been the social background of internet users in India?; (iii) what has been the notion of 'consumerism' and its association with 'gratification' in Indian society and how is it different from the western countries; and (v) how have the internet users participated in various political discussions and processes and strengthened democracy in India? Finally, some of the conclusions arrived at are discussed like: (i) communication through internet has helped in the formation of new types of relationships in the virtual world at the expense of primordial ones like kinship relations in India; (ii) older people prefer to use communication through internet at their homes, while the people of younger generation prefer to use it at internet café; (iii) the class-divide suggests that the communication through internet is out of reach for very large population in India; (iv) social inequalities have further increased and strengthened as a consequence of digital divide in India; (v) 'consumerism' led 'gratification' exists in India also, but it is different from the one found in the west; (vi) different political parties and 'caste like-groups' have been using internet for communication to further their political interests like addressing and convincing their respective constituencies.

Significance of Complementary and Alternative Medicine Systems in India: Some Issues of Its Continuity and Re-Emergence

This paper attempts to examine the significance of 'Complementary and Alternative Medicine' (hereafter CAM) systems in India. Following questions have been raised and discussed in the paper: (i) as the very idea of CAM systems came from west, it's significance in the context of Indian Society needs re-examination; (ii) how the CAM systems with it's strong tradition in the history of India responding to the challenges of other systems in the era of Globalization?; (iii) which sociological theories and concepts are useful to understand this emerging phenomenon?; (iv) what has been the response of the patients to the claims of CAM systems?; (v) how does sociology of professions get strengthened with the studies of CAM systems? Following are the main conclusions of the paper: (i) the CAM systems need to be seen and analysed in the wider context encompassing other competing systems as well; (ii) Talcott Parsons' theoretical and conceptual formulations particulary 'belief-system' are relevant to understand CAM systems; (iii) the process of globalization has strengthened the continuity and re-emergence of CAM systems; (iv) in the era of globalization the CAM systems have attracted patients from upper classes along with middle and lower classes; and (v) the patients have been using both the CAM systems and allopathic medicines for the treatment of the same diseases.

Between Welfare State Retrenchments, Globalization, and Declining Returns to Credentials: The French Middle Classes Under Stress

In a critical approach of Bourdieu (1979) and Schmoller (1897) before him, and within a Piketty (2013) debate, I rework here the multipolarity of middle classes between higher and lower, and between cultural and economic capitals. This theoretical reconstruction helps understand the "middle classes adrift" in France and Continental Europe. After the golden age of the "new wage earner middle class" and the Welfare state expansion, the European social structure faces a trend of "repatrimonialization" (or re-wealth-isation), a U-turn towards expansion of wealth and a relative decline in the value of middle level skills. Assets, housing, inheritance, savings, and wealth accumulation, more than consumption in broad definition, are again key issues. First, a new description of repatrimonialization is useful in the specific European context of middle class societies. We need a re-definition of the system of middle classes (plural) in the context of the construction and decline of strong welfare states. Second, we have to analyze three ruptures in the social trends of the 'wage earner society'. In this period, economic growth, social homogenization, and social protection were major contextual elements of the expansion of a 'new middle class,' based on educational meritocracy, the valorization of credentialed skills, and 'depatrimonialization'. After the 1980s, the post-affluent society generated a backlash in the system of middle classes. Third, I analyze the demographic and social consequences of the new trends in terms of the shrinking and quartering of the middle classes in a context where the inheritance of assets and resources changed the previous equilibrium. Finally, I highlight the importance of addressing the problem of social stability when large strata of the middle class have less interest in the maintenance of the social order.

More Necessary and Less Sufficient: An Age-Period-Cohort Approach to over Education in a Comparative Perspective.

During the last 5 decades, tertiary educational attendance rates increased dramatically, both for men and women. In most countries, the demand for academic skills did not expanded at the same rate tertiary educational did, even during the information revolution. The U.S. debate between Richard Freeman (Overeducated American 1975) and Herbert Smith (Overeducation and Underemployment: An Agnostic Review 1986) was one of the first in a much contrasted international comparison of social trajectories: in many countries, some birth cohorts have been exposed to risks of over-education, or a decrease in returns to education.

In our paper we analyze LIS data on five contrasted western countries (US, Germany, France, Spain, Denmark) for cohorts born between the Second World War to more recent generations of young adults today. This dataset built on harmonized cross-sectional surveys, is combined with secondary data on skilled biased technological to study whether educational expansion reduced both relative

and absolute returns to education. Using newly developed age-period-cohort gap models (taking into account the most recent debates on APC models), we are able to study whether the younger cohorts enjoy higher or lower returns to education than older cohorts. Our results suggest that generally, the increase of skill based sector was not enough to provide demand for the supply of tertiary education graduates, leading to a decrease in educational returns relative to older cohorts. However, the expansion of skill based sectors increased within-cohort inequality, especially increasing the gap between tertiary and secondary education graduates.

Positions and Perception of Social Mobility in Young People and Their Families from Popular Sectors in La Plata, Argentina.

Ubicados en una ciudad media de la provincia de Buenos Aires (Argentina), a partir de diferentes situaciones y referentes empíricos de experiencias juveniles en la ciudad, nos propondremos analizar, por un lado las posiciones ocupadas en el espacio social en términos de tres trayectorias contextualizadas históricamente: sector de clase, familia e individo. Y por otro, la percepción de la posición y de las movilidades sociales, sean descendentes o ascendentes en perspectiva de las trayectorias antes enunciadas. La construcción de los datos se funda en investigaciones etnográficas propias y en revisión de investigaciones de otros colegas en la región, tanto de modalidad cuantitativa como cualitativa. Siguiendo a Tilly (2000) entendemos la desigualdad como una característica de las relaciones, y no solo como la existencia de dos posiciones asimétricas. Desde ese lugar interesa el punto de vista del actor juvenil en el análisis de la desigualdad, así como el conocimiento del contexto que lo hace posible, tanto en términos de espacio social general como del escenario de las interacciones donde se funda y pone en acto las representaciones de las posiciones percibidas y ocupadas. Interesa además dar cuenta de los argumentos con los que los sujetos explican las movilidades, cómo éstos se legitiman o no en matrices valorativas y culturales más generales de la gramática social, y cómo operan en la persistencia de las desigualdades.

CHAVEZ, LAZARO* (Sistema de Universidad Virtual de la Universidad de Guadalajara, chlazaro@gmail.com)

La Modernidad y Su Eterno Retorno Moral, o La Voluntad Por Lo Correcto

Esta ponencia reconoce las inquietudes político-morales en ciernes como principios rectores que determinan la agenda política de los diversos movimientos sociales contestatarios, inmersos en el actual contexto de modernidad -para algunos posmodernidad- y diversidad. Ante lo cual, es sustancial que nos preguntemos cómo el camino de la tradición permea a los individuos para que éstos continúen reproduciendo las formas simbólicas, revestidas de alegorías modernas que sustentan los triunfos sociales por la recomposición de un estado moral y político que se sabe expropiado, a través de los distintos mecanismos de configuración discursiva que ponen en operación el Estado e instituciones al servicio de la tradición, de la clasificación, del estigma y del aislamiento posmoderno.

Hay que considerar a la tradición como ese conjunto de dispositivos y tecnologías morales, de la vida cotidiana y del sentido común, a partir de las cuales el individuo organiza su vida, le da sentido, se diseña como sujeto moral en la práctica y en la auto concepción de su mismidad clasificada como gay, lesbiana, bisexual, intersexual, indígena, mujer, obrero, migrante, joven... Estos principios morales tienen su fundamento en la tradición. Por ende, es desde la tradición que el sujeto se autodiseña en un ejercicio hermenéutico, de la "inquietud de sí" o lo que Foucault nombró como "tecnología del sí" (Foucault, 2001), para dinamizar la auto-concepción del individuo y de sus relaciones totales con los otros, cuyo consecuente es la posibilidad de modificar, no cambiar ni sustituir, las configuraciones sociales imperantes de una época. De esta manera, la tradición es el punto de partida bajo el que se expresa los actuales principios político-morales, en ciernes, a la que nombramos como "voluntad por lo correcto", ese eterno retornar de las formas simbólicas, el camino que recorren los movimientos sociales a la modernidad, o si se prefiere, a la posmodernidad.

La Excelencia Del Profesorado Universitario. La Visión De Los Estudiantes.

Este trabajo es producto de una investigación que se vincula con el campo de la ética y la educación, que busca en lo general analizar las valoraciones sobre la docencia y el trabajo académico en una universidad pública del noreste de México, particularmente sobre los rasgos y características profesionales y éticas que

deben cumplir como formadores, siguiendo algunos planteamientos del proyecto Excelencia del profesor universitario de Hirsch Adler. La labor de los profesores es relevante en la formación de nuevos profesionistas, en la generación y divulgación del conocimiento y en la gestión institucional, lo que justifica observar, analizar y comprender su actividad desde diversas perspectivas, considerando sus propias percepciones, las de los estudiantes y las de otros actores universitarios. El proyecto de investigación particular tiene como propósitos, fundamentar teóricamente el tema de la excelencia académica en nuestro contexto, contrastar los supuestos bajo los cuales se valora a los docentes universitarios con los datos resultantes de diversas fuentes de información, analizar dichos datos en el marco de los criterios o indicadores que la Universidad toma en cuenta para ubicarlos en un cierto sistema de categorías académicas o apoyos de diversa índole, a efecto de realizar un diagnóstico del perfil real del profesorado universitario. El enfoque metodológico es de tipo mixto: se revisan datos cualitativos y cualitativos procedentes de profesores, estudiantes y otros actores universitarios, así como también los indicadores que promueven los rankings nacionales e internacionales. Las categorías de análisis que se analizaron son: excelencia, ética, calidad, liderazgo, institución, formación, valoración, profesionalismo y crítica. Lo que esta comunicación ofrece en particular, es un análisis de los datos procedentes del cuestionario aplicado a estudiantes que muestra la satisfacción con el trabajo de sus profesores, en tanto que es un indicador que habla de la calidad educativa.

Enabling Institutional Innovations: A Critical Examination of Initiatives in Public Service Delivery in India

Public service delivery systems are the most critical components of good governance. However, their efficiency and effectiveness are contested, by the beneficiaries who utilize them and the bureaucracy or bureaucratic structure implementing it. Sociological perspectives on bureaucratic form of organisation, especially the classical notion by Max Weber conceives of it as a rigid structure. However, there has been some transformation as the State, with its bureaucratic machinery and the society in which it exists are in constant interaction. This interaction is mediated by technology and other socio-political and cultural factors, while bringing about innovations in the public delivery systems. In this context, innovations in the public delivery systems in India are now being institutionally promoted by the State in India. Factors that contribute to these innovations are technology and the human and organisational processes which are oriented towards innovation, in spite of the stringent institutional framework. This paper discusses two innovative initiatives in the health sector, focusing on the complex social, cultural and institutional milieu which contributed towards their continuous and sustainable implementation and replication. Based on primary and secondary data collected, this paper tries to decipher the processes and practices which have evolved successfully despite some limitations of the regulated bureaucratic environment, as well as the social and cultural complexities.

A Time-Series Cross-Sectional Analysis of Exposure to Competition and Sense of Fairness in Urban China

Situated in transitional China with a rapid market expansion and rising inequality, this study discusses the relationship between an exposure to competition and sense of fairness. A puzzle rises as whether exposure to severe competition encourages individuals to averse risks and desire for fairness, or it contributes to a belief in the law of jungle and a tolerance on inequality. Labor market incentive hypothesis has already supported the validity of college (or high school) premium as an indicator of competition. Therefore, I apply a time-series cross-sectional calculation of competition index based on Chinese Household Income Projects (CHIP) and Urban Household Survey (UHS), represented by college/high school premium at the time of entering senior/junior high school. This measurement fully reflects the heterogeneity of macro condition on individuals by time-series cross-sectional consideration.

The data on sense of fairness are drawn from urban sample of Chinese General Social Survey (CGSS) 2010, 2011, 2012 and 2013, nationally representative social surveys. Sense of fairness is measured as to what extent one agrees that the society is fair. By coding competition index to the pooled datasets, I obtain three main findings. 1) The severity of competition one experiences in school is likely to exert an undermining effect on sense of fairness, which is still effective when one leaves school. 2) This undermining effect is contingent on economic development, with a more explicit effect in less developed areas while insignificantly in developed areas. 3) Self-rated class ratings is positively related to sense of fairness due to self-interest explanation, yet competition has little effect on this relationship. This study emphasizes the role of competition as a determinant of social mentality in transitional China that should be explored in future research.

Do the reasons professors choose academic work influence their work interest, time devotion and achievements? A study of academics in Taiwan's higher education

The purposes of the study are to explore the relationships among the reasons professors choose academic work and their devotion to and achievements in their work. To achieve the purposes, the study used questionnaire investigation and interview as methods to collect the data needed. One hundred and seventeen questionnaire samples and fifty interview samples were collected, which included different professional areas, ranks, gender, educational types, and university types. The data collected were analyzed statistically. The results show that the reasons people choose academia for their careers influences the time they devote to different work areas (research, teaching, and service) and the achievements they produce related to these three duties. The study offers suggestions for academic human resources management based on the findings.

Childhood Poverty, Cumulative Risk Exposure, and Adjustment in Emerging Adults: A Prospective Latent Profile with Contextual Factors

Families in poverty are more likely to suffer from financial stress, to live in disorganized neighborhood and to experience more negative life events compared to average families. Consequently, the cumulative risks are more likely to increase depression and substance use of children who grow up in these families. Nevertheless, variations among families in poverty have been identified; resilience has also been proposed. Therefore, factors that contribute to their resilience should be identified, too. The present study was designed to (a) identify, using confirmatory latent profile analysis, groups of poor Taiwanese youths who show distinct groups in exposure to cumulative risks and adjustments; (b) identify, using multinomial logistic regression model, contextual factors that distinguish the identified groups. The study used data from an ongoing survey on economic disadvantaged families with child who have received welfare services over 4 years (N=1,622, mean age=16.07).

We proposed that poverty-related risks and adjustment assessment would reveal 5 patterns including (1) experiencing high levels of risks with high levels of behavioral maladjustment, a externalizing problem group; (2) experiencing high levels of risks with high levels of emotional maladjustment, a internalizing problem group; (3) experiencing high levels of risks with high levels of emotional and behavioral maladjustment, a comorbidity group; (4) experiencing high levels of adversity with a low level of adjustment problems, a resilience group; (5) experiencing low levels of risks with a high level of functioning, a low risk group.

A latent profile analysis identified 5 profiles in the data that confirm the hypothesis. Academic engagement, involvement in prosocial behavior, and parental monitoring are key protective factors to distinguish the resilience group from the externalizing problem and commodity groups. The results suggest youths in poor families benefit from these factors facing the effects of poverty stress across childhood to early adulthood.

Out of Rural Community While in the Family: The New Form of Work-and-Family Linkage of Migrant Women Workers in the Construction Site

Sui Gong Fu Nv is used to define migrant peasant women workers who accompany their husbands to metropolitans to work and live in the same space. SGFNs left rural places to construction sites so they have broken free from complicated family relationship and the supervision from relatives and acquaintances in rural communities. The one-to-one link in each pair of couple may bring some certain changes to SGFNs' status and power in the core-family.

I respectively conducted the first time fieldwork in Chang Ping district in Beijing suburb from October to December in 2012 and the second time from July to August in 2015. Under the sub-contracting system, there was a hierarchy within workers in the construction site, including labor contractors(Bao Gong Tou),vice labor contractors, skilled and unskilled workers. Compared with two years ago, there are more and more SGFNs in the construction sites and their age tends to be younger. It is common for spousal workers to do some specific types of work like kitchen work and elevator work.

The research studies the group in three theoretical perspectives. Production regime: The share of work and the access to salaries under the fixed production regime can reveal the employment's influence on family relationship; Dormitory system: The daily activities and social network in the dormitory is equally important when viewing the employment's effects on women's lives; Allocation of housework between every husband and wife: It is helpful to see the couple's coordination in the special construction site.

Based on cases study in Beijing, the article breaks through the traditional conception on the controversy between the Patriarchy and women's autonomy. It proposes that these women respond to their own roles in the family in a more positive and initiative way in the working site. The work and family are interactive for SGFNs.

The Elephant in the Room: Living and Dying with Hazardous Chemicals in Urban Settings in the Disasters of 2014 Kaohsiung Gas Explosions and 2015 Tianjin Chemical Explosions

Within a little more than one year's time span, two major explosions in the East Asia have drawn the worldwide attention. On July 31, 2014, a series of gas explosions rocked Kaohsiung, a big industrial city in southern Taiwan, a country with vibrant electoral democracy. It was discovered that the explosions were caused by the gas leaked from the labyrinth of underground pipelines that deliver hazardous gas from the port to the petrochemical plants in the city's heavy industrial suburb. One year later, on August 12, 2015, another chemical explosion of even greater scale stroke China's major industry-port city of Tianjin, a metropolis designated as the growth pole by an authoritarian regime. This time the culprit was a company specialized in the logistics of hazardous chemicals whose licensed warehouse located less than one kilometer from the middle-class housing complex. Similar to two urban disasters is the proximity or even the overlap of residential area and industry facilities has caused the heavy civilian casualties. This seemly deviant urban design is rather normal in most of the developing countries. This paper first analyzes the normalization of deviance in the daily operation of petrochemical industries in late industrializing settings. It then explores the political economy of the spatial production that has led to the urban disasters beyond the differences of governance regimes. This paper attempts to shed lit on the urban development pattern common in the newly industrializing countries and its potentials for disastrous consequences.

Does the Age of Career Decision-Making Matter? Accounting for Teacher's Job Commitment in Taiwan

Accounting for teacher's job commitment, does the age of career decision-making matter? Before 1994, teacher education in Taiwan has been largely controlled and monopolized by the government. Through institutional arrangements such as tuition-free teacher education, future job guarantee and stability, teacher's colleges attract many teenages at the age of 15 or 18. However, examination-oriented educational environment in Taiwan did not provide much chance for youths to explore one's aptitude. It also commonly seen that decisions on fields of study have been influenced or even determined by the parents. In this case, the decision on attending teacher's college almost determines lifelong careers.

Using data from Taiwan Education Panel Survey, this study investigates whether the age of career decision-making among middle school teachers has any impact on their job commitment. It is hypothesized that career decision-making at a younger age in the job-guarantee system in Taiwan before the 1994 reform is unfavorable to job commitment among these prospective teachers, which in turn affects students' performance. It is possible that the rigidity of institutional arrangements prevents youths from a self-determination process. When extrinsic motivation outweighs intrinsic motivation, lack of intrinsic motivation is detrimental to job commitment as well as teaching efficiency.

Criminogenic Knowledge Structure and Youth Violent Behavior: The Role of Co-Evolution of Friendship Network

Recent advances in criminological theories have focuses on structured individual variation (or propensity) in violent behavior. Simons and Burt (2011) have pro-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

posed their knowledge structure theory. The theory proposes that environmental adversities (conflicted family relationship, disorganized community, and victimization) influence criminogenic knowledge structure (CKS), including immediate gratification, hostile view of relationship, and disengagement from conventional norms. This CKS, in turn, influences youth involvement in violent behavior. The theory of CKS focuses on individual framing on personal understanding of social scripts, interpersonal relationships, and social rules and norms. The social adversities structured the CKS and push the person into involvement of violence.

Although past studies have provided supportive evidence of the theory, two components of the theory remain untested. First, tests of the theory were based on African American samples. Whether or not the theoretical model can be applied to other populations remains in question. Second, although current literature on violent behavior emphasizes on the role of peers, CKS theory has not incorporated this important component in their theoretical and empirical work. The present study sets to fill this literature gap.

The present study adopts data from an on-going longitudinal study in Taiwan. There are around 1,600 adolescents, aged from 13 to 17 within 56 classes. Data on the components of CKS and friendship nomination within a class were collected to answer the proposed research questions: 1) Structural equation modeling will be used to test the construct validity of CKS in an East-Asian sample; 2) The dynamic influence of peers and their CKS will be assessed via friendship nomination across two time points. Network analysis will be used to present the impact of co-evolution of friendship network in both the network characteristics and attributes of the target adolescent's friends.

The Rise of Solo Living in Taiwan: Age, Gender, and Educational Differences

Family sociologists have been engaged in a heated debate about dramatic transitions in the structure and functions of families over the twentieth century. What is new is the option of forming a one-person household within a traditionally family-oriented society like Taiwan. According to the latest population census, there are more than 1.6 million Taiwanese or 7.2 percent of the population living alone in 2010. The one-person households have constituted 22 percent of the total households. Such a rise is attributed to the increasing number of young Taiwanese in their twenties and thirties who leave their parents' homes to live independently as well as people who delay marriage or choose not to get married. There are also those who live alone after getting divorced and some widowed seniors who live by themselves. However, people living alone can be split into two types, *elective* one-person households who have chosen living alone as well as *forced* one-person households who have been constrained to this lifestyle by circumstances. Why are more people living in one-person households in Taiwan? How much is by choice and how much is by necessity? What demographic and socioeconomic factors underlie the growth and how are these likely to change in the future? To answer these questions, this research examines the factors that affect the formation of one-person households among Taiwanese and their housing characteristics by using four decennial censuses of 1980, 1990, 2000, and 2010.

A Review of the Common Core State Standards Initiative in the United States and Its Relevance in Taiwan

The Common Core State Standards (CCSS) initiative has been regarded as one of the most influential educational movements in the United States since *Brown vs. Board of Education* in 1954. While its origins can be traced back to a much earlier date, the CCSS were officially launched by the National Governors' Association Center for Best Practices and the Council of Chief State School Officers in June 2010. As of December 2014, 43 states, the District of Columbia, and four U.S. territories have adopted the CCSS. Standardized testing at the K-12 level is a topic that has received growing attention for decades across the world. And with comparison data from the Programme for International Student Assessment (PISA) and the Trends in International Mathematics and Science Study (TIMSS), many U.S. policy makers and practitioners felt it was time to help provide a common standard in key subjects at the national level as well. Advocates argue that the CCSS focus on fewer, clearer, and higher educational standards in English language arts and literacy and mathematics. In this article the authors analyze the historical background and rise of the CCSS within the United States, and then compare the CCSS with other U.S. education laws and initiatives, including the Head Start Program and the *Elementary Secondary Education Act* in 1965, the Standards and Accountability Movements in the 1990s, the *No Child Left Behind Act* of 2001, and the Race to the Top Fund in 2009. The concluding section offers recom-

mendations and practical suggestions for policy makers and educators in K-12 settings in Taiwan and other international contexts.

Transnational Views on/from Arab Mediterranean Youths: Challenges and Potentialities

Recent debates in the sub-field of youth studies have been engaged in methodological and epistemological discussions about what instrument of analysis need to be deployed for the examination of youth in the Global South. This paper aims to contribute to such debate by analysing the views on the Arab uprisings and the current events unfolding in North Africa of young migrants of North African origins in Italy.

The paper will draw from the research experience accumulated thanks to an international research project on Arab Mediterranean youth, and will tackle the issues of transnational and youth activism.

In particular, the paper will focus on a qualitative study on young people of Arab Mediterranean origins living in Italy, exploring their views on the Arab uprisings and their aftermaths, their transnational practices of participation to these key events and their views on the current affairs unfolding in Arab Mediterranean countries.

The paper is part of the EU FP7 research project "Empowering the new generation: towards a new social contract in South and East Mediterranean countries (SAHWA)".

Educational Expansion and the Persistence of Social Inequality Related to Parental Education in Australia

Since the 1990s, the Australian higher education sector has undergone a series of changes that have resulted in the doubling of the number of universities, a tripling of the number of undergraduate university students and the creation of alternative pathways into university. Access to university is no longer restricted to high performing secondary school graduates and the majority of undergraduate students now enter via alternative pathways. Despite these changes, inequalities continue to exist due to differentiation within the university sector with entry into elite professional degrees and elite universities still highly selective. Effectively Maintained Inequality theory posits that highly-educated parents are able to identify opportunities to secure qualitatively better educational outcomes for their children regardless of the structure of the education system. Using data from the Household Income and Labour Dynamics in Australia (HILDA) project, I examine trends in university graduation for four cohorts of Australians born between 1948 and 1987. Preliminary findings indicate that the association between having university-educated parents and graduating from university has persisted over time. Furthermore, individuals with at least one university-educated parent were more likely than those with low-educated parents to graduate from an elite university and/or with a higher status degree.

The Societal Effects of Secondary School Curriculum Reforms on Gender Participation in Higher Education: A Comparative and Longitudinal Study of Asia, 1950 - 2010

The paper investigates how changes in secondary school curricular emphases reallocate education opportunities for women and men in higher education with a regional focus on Asia. This paper argues that any reorganization of curricular emphases in secondary schooling enacts a societal effect on gender partitioning in higher education. Empirical findings present a worldwide picture of gender equality with an almost equal rate of gender participation in higher education since 1990s. At the same time, a "new" form of gender inequality is emerging with women's increasing prevalence in higher education after the time point of equal participation. Recent literature draws a close attention to social consequences of quantitative rise in higher education, such as stratification of gender enrolment in disciplinary areas (Barone 2011; Ramirez and Wotipka 2001). As a world region, Asia is highly responsive to such redrawing of gender partitioning. The study explicates how a world-integration model of educational culture rearranges social

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

partitions of gender in regional higher education. But still, the paper examines to what extent a colloquial-differentiation model of cultural attributes purports gender reorganization in a region with varying levels of economic modernization, differing types of political regime, and diversified groups of religious beliefs and cultural values. The study takes two aspects of cultural attributes into investigation, first, religious traditions and cultural beliefs, such as Confucianism, Islamism, and Buddhism; second, colonial hegemonies and legacies. To evaluate which model provides viable explanations to higher education expansion in Asia, the study employs, first, multiple regression analyses to assess factors relating to higher education expansion in two time panels: 1950-1989, 1990-2010; second, textual analyses to compare formal statements of higher education goals and secondary school curricula across seven polities in Asia (China, Hong Kong, Japan, Singapore, South Korea, Taiwan, and Vietnam) over two time periods in 1980s and 2000s.

Cultural Dynamics and Educational Expansions of Secondary Schools in Japan and Hong Kong: Equality for Individuals or Citizens?

While New Instituionalism now becomes one of the standard intepretations of the expansion of mass and elite education by means of comparative and statistical methods, the strength of this line of thought cannot be fully appreciated if one ignores the cultural dynamics of how institutional legitimacy and isomoprhism could also be achived in different contexts. This paper argues the importance of introducing the historical dimensions and qualitative methods to examine how legitimacy towards educational expansion could be achieved in very different contexts. The case of Japan higlhy relies on the logics of the nation-states which emphasizes equality among citizens, while the case of Hong Kong defines equality in terms of the competativeness of individuals. This paper argues why both cases could both use the same concept of "equality" and seems to be coupled to the world-society, thus examining in what sense the concept of "decopuling" is useful for institutional analysis.

Taming the Rape Scourge in Nigeria: Issues and Actions

Gender-based violence, including rape, domestic violence and other sexual abuses, has assumed serious dimensions globally. In Nigeria, incidences of rape are fast assuming a threatening dimension that requires urgent intervention. Rape, like other forms of violence against women, is an infringement on women's rights, privacy, self-preservation and dignity. Available data in the print and electronic media reveal that rape issue has become a serious social problem of epidemic proportion and no longer an isolated criminal act affecting just a few women in the society. Thus, sexual assaults and their debilitating consequences for the victim, particularly under aged children, adolescents, young women and the elderly, have become serious societal issues in recent times. This paper interrogates the dynamics, institutional, socioeconomic and cultural factors accentuating cases of rape on both the victims and the perpetrators of this heinous criminal act. The paper concludes with recommendations on ways and means of tackling this social menace.

Labelling Social Innovations: A Solidarity Label in France and a Participatory Guarantee Scheme in Namibia

A number of alternative socio-economic approaches to how food is produced, distributed and consumed 'sustainably' are presented as innovations. At times connected with social and solidarity economies or with social movements that seek to reclaim control over how one can produce, trade and consume differently, these initiatives are relatively new. Nonetheless, they are increasingly being recognized by the public as important means to stimulate transitions to sustainable agrifood systems. Indeed, the literature on social innovations focuses on those innovations whose main driver is the desire to address a social problem. Using Polanyian theories of embeddedness, we examine two social innovations that have emerged from groups who have been working to de-marginalize women in the processes of production, trade and consumption of food. The first experience comes from France and is focused on a short food value chain (*circuit court*) that uses a solidarity economy label to join economically marginalized female farmers and consumers. The second case focuses on a participatory guarantee system (PGS) in Namibia that has been the core innovation in the emergence of a small organic movement that is made up of wives and mothers as producers and consumers. Through these two cases we focus on a number of key analytical elements that constitute these experiences as social innovations: such as the identification of the social problem, the innovative techniques and knowledge mobilized to create group identity and the work of intermediaries in the innovation trajectory. The authors reflect on these two cases so to understand how these innovations might contribute to transitions to sustainable agifood systems.

Young Australian's Education and Employment Transitions: Comparing Young Immigrants' Wellbeing to Their Native Australian Peers.

Previous research indicates that, in Australia, educational achievement among immigrants at age 15 is, on average, equivalent to or slightly higher than that of students of long standing Australian heritage. However, these averages hide wide variation in achievement within the immigrant student population. Even with this variation, post-school study rates are higher for young immigrants compared to native Australians. Although Human Capital Theory suggests that increased education should lead to improved likelihood of employment, rates of unemployment are higher among immigrants. Given that improving lifetime wellbeing is a core aim of the Australian Government's settlement policy, examining levels of well-being of young immigrants as they transition between education and employment and/ or tertiary study has important policy implications. In this paper, I present findings from analysis of data collected by the Longitudinal Surveys of Australian Youth project. My research questions examine whether young immigrants differ from their native Australian peers in terms of their education, employment and engagement outcomes as well as their levels of well-being. I also examine differences between migrant groupings based on country of origin. Using a cross-disciplinary approach, I construct a comprehensive model to identify various factors in education to employment transitions for young immigrants to Australia. Additional variables based on social capital, cultural capital and psychological approaches are tested to determine if they provide additional explanatory power across comparison groups.

Local Practice of Solidarity Economy: A Case Study on Pgs Project for the "Tribal E-Shop" in Taiwan

Solidarity economy is a community-based economic model to resist the exploitation of capitalism and neoliberalism. In the case study on PGS project for the "Tribal E-shop" in Taiwan, solidarity economy not only provides a solution for promoting organic agriculture in indigenous tribes, but also can be beneficial to human rights, health, food sovereignty, fair share of land of indigenous peoples and avoid the domination of food chain as well as preserving biodiversity from big corporations or financial institutions.

The Association of Taiwanese Indigenous Peoples' Development (a local NGO) had established a platform named "Tribal E-shop" for cooperative production and marketing since 2005. It has a retail shop for marketing agricultural product of indigenous farmers. The project of participatory guarantee system (PGS) provides an alternative path for whom in a difficult position to conform to the official standards of certification. One of the authors in this study is the manager of this "Tribal E-shop". Through years of management and participatory observation, we found PGS established a high autonomous guarantee system and paves a way for the development of organic agriculture in indigenous tribes. Taken as a whole, PGS offers two important mechanisms: First, the PGS fosters social networks, increasing farmers' participation. Second, in order to empower farmers' ability to surmount the difficulties of the prevailing system, the PGS integrates the habitus of local contexts into a relatively autonomous field, which is called 'indigenous farmers' cooperative'.

For sustainable development of indigenous peoples, this study suggests that the stakeholders (including consumers, producers, retails etc.) should cooperate and have the opportunity for coexisting in the context of capitalist society.

Environmental Conflicts and Risk Governance after 2014 Kaohsiung Gas Explosion

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In the midnight of 31 July 2014, a deadly gas pipeline explosion killed 32 people and injured over 300 people in Taiwan's second largest city, Kaohsiung. Due to the lack of precise information about the pipelines of toxic gases and the operators, the municipal government and fire brigades have failed to prevent the disaster. Kaohsiung people suddenly found that they have been actually living in a mega petro-chemical industrial zone for decades. How to deal with the complex net of underground petrochemical pipelines connecting several industrial zones, gas storages and the harbor becomes a big challenge to Kaohsiung. This paper examines the responses to the risk of petrochemical pipelines from the environmental organizations and the communities, the municipal government and the companies involved after the Kaohsiung Gas Explosion. It finds that, while the leading environmental group and the general public request for environmental justice, information transparency and community right to know, and the establishment of risk control platform with public participation, the local government and the industry are rather reluctant to engage the issues raised by the public. Moreover, although the local government has released a rough map of 89 pipelines and the Petrochemical Pipeline Self-governance Articles one year after the disaster, the government has shown little interests in industrial transition. Both central and local governments and the industry have advocated a proposal of a new mega petrochemical industrial zone off-shore or on the coastal area of Southern Kaohsiung. The attitude of the government disappoints the environmental and community groups who want to get rid of petrochemical dependency and advocate of industrial and energy transition. The tension and conflict between the government, the industry and the environmental groups are in continue. How different players can work together to reach a consensus on disaster prevention and risk management remained a challenge.

CHIU, TUEN YI* (Harvard-Yenching Institute, jtychiu@gmail.com)

Postmarital Residence Patterns and Wellbeing of Female Marriage Migrants in South China

Typically studied in the literature of cross-border marriages is the gendered marriage migration led by the female partners who physically migrated to reunite with their male partners, few look at those who do not spatially move as a result of cross-border marriage. In light of this, this paper attempts to contest this monotonous prototype by comparing three types of cross-border families with different residence patterns – (1) *wife-to-husband, (2) husband-to-wife,* and (3) *dispersed residence* (one or both partners commuting between two places). Using ethnographic data from Mainland China-Hong Kong cross-border families in South Chin, results revealed that diverse residence contexts did bring differential gendered power dynamics to couples, which significantly affected the wellbeing of female marriage migrants. Mainland migrant wives in the mainstream *wife-to-husband residence* group appears to be the most vulnerable group due to their disrupted social network, lack of childcare support from extended family, discrimination and assimilation difficulties in the immigration context. Whereas Mainland wives in the *husband-to-wife residence* group could maintain their social network, obtain childcare support from their natal families, and receive less discrimination and assimilation problems than those in the former group did. Interestingly, the *dispersed residence* context enabled Mainland wives to gain autonomy in household management and parenting and provided a context for Mainland wives to avoid conflicts with their husband and in-laws, but they had to shoulder the childcare burden alone and find ways to maintain their intimacy with their husband and to help their children to build bonding with the father. Nevertheless, prejudice and discrimination against female marriage migrants appears to be universal across various residence contexts, which may well suggest that the hypergamous nature of marriage migration appear to be a quintessential cause of gender inequalities in cross-border marriages, irrespective of residence localities.

Votes and Visibility on Social Media. the Case of Poland's 2015 Surprising Presidential Elections

The paper aims to explore the influence of visibility on social media in Poland's public sphere today, in this particular case: the unexpected 2015 presidential election results. The sure-to-win candidate Bronisław Komorowski, then president in office, lost to a newcomer from the main opposition party, Andrzej Duda, with the help of another unusual presidential candidate, Paweł Kukiz, an outsider punk-rock star. Both their powerful internet campaigns significantly focused on social media—e.g. memes on Facebook and news bites in tweets—successfully swayed the voters by using the power of viral information. The virals (i.e. information which spreads in a viral-like manner) included campaigning for single-member districts (Kukiz) as well as negative campaigning filled with quotes out of context (Duda). At the same time Komorowski put little effort in his own campaign, his use of social media was barely noticeable, and often unsuccessful in gaining attention of social-media users.

While it is difficult to claim that social media determined the outcome of the recent elections, they undeniably played an instrumental role in engaging people in the campaign on the internet: they shared memes, tweets, and news articles, and they often engaged in discussions concerning the candidates' programs. Furthermore, social media platforms, e.g. Facebook and Twitter, are perfect examples of contemporary everyday tools which influence what information users see, how they interact with it, and how they organize it by sharing information with others. It is particularly visible in situations when information posted on social media is intended to achieve a particular goal in "real" life (i.e. outside the internet), such as national politics. Thus, I believe a close analysis of virals focused on the candidates during the 2015 presidential campaign may show interesting insights concerning the visibility of different types of information used on social media to influence citizens' choices.

CHOI, SUSANNE* (The Chinese University of Hong Kong, choiyp@cuhk.edu.hk)

Gender and Anti-Immigration Politics in Post Colonial Hong Kong

Since the late 1970s, Hong Kong has witnessed gradual intensification of anti-immigration sentiments directed mainly at immigrants from Mainland China. After the handover to China in 1997, rather than subsiding, these anti-Chinese immigration sentiments have reached a new high and crystallized in the implementation of restrictive migration policies, tightening of welfare access for immigrants; overt discrimination against immigrants in the media and internet fora, at community and family levels and the emergence of independence movements openly advocating the 'Hong Kong for Hong Kongers' manifesto. Since the mid-1980s, the majority of immigrants from Mainland China have been women, in cross-border marriages, who came to join their Hong Kong husbands. In 2011, 34.6 per cent of all marriages registered in Hong Kong involved a local male resident and a Mainland Chinese woman. As a result of the concentration of Mainland foreign brides in the recent immigrant population, anti-immigration sentiments have assumed a distinctly gendered dynamic, with Mainland women seen as the epitome of the uncivilized, ruthless, and dangerous aliens; posing an imminent danger to society and positioned to wreck marriages and break families. By means of a mixed method approach combining textual analysis of newspaper reports, internet discussion fora, immigration and related policies, interviews with politicians and government officials, this study asks the following questions: 1) How have anti-immigration politics in Hong Kong stigmatized Mainland women in cross-border marriages? 2) How do antiimmigration discourses reflect particular concepts of manhood and contribute to the formation of specific types of masculinity? The research is significant because it sheds lights on how anti-immigration discourses and policies, nationalism, and gender join forces to structure the process of settlement of a rapidly growing group of female immigrants, thus producing and reproducing gender inequalities in a local and regional scale.

Forgotten Fever. How Municipalities (do not) Adapt to Heat Waves.

Heat waves, are assessed as one of these effects of climate change that are to be more frequent (Della-Marta 2007). Moreover, their duration and intensity increases as well (Graczyk et al. 2015). This extreme weather event impacts societies by bringing economic consequences as well as threat for human health. Since the year 2000 Europe was hit by two large heat waves that brought thousands of fatalities: in 2003 Western Europe up to 70 thousands (Robine et al. 2008), in 2010, Eastern Europe about 56 thousands (Munich Re 2011).

Poland, although during the mentioned heat waves was not experienced so severe, also faces problems related to this type of event. Within the years 1989 – 2012, four years with significant heat waves were observed: 1992, 1994, 2006 and 2010. Large cities are at the disposal of different resources (starting with financial, human, infrastructural) to cope with the issue of heat waves. Nevertheless, they are also vulnerable, especially because of the urban heat island effect that mostly strikes large agglomerations due to large population density and concentration of buildings and concrete covered areas.

With these research authors are analysing the problem of municipal preparedness to the risk of heat waves. The focus is on smaller towns in the Wielkopolska region in Poland, with reduced resources when comparing with large agglomerations. It is stated that hardly any efforts are undertaken by municipalities in this respect, even though ageing population of smaller towns increases the risk of dramatic consequences.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

The selection of analysed municipalities bases on statistics (from Central Statistical Office of Poland) covering the number of mortality due to cardiovascular disease during heat waves (1992, 1994, 2006, 2010). The communes with the highest number of fatalities, as those mostly experienced, are under investigation. The research is conducted through in-depth interviews.

TG04-680.5

CHORYNSKI, ADAM* (Institute for Agricultural and Forest Environment, Polish Academy of Sciences, adam.chorynski@gmail.com)

Money Isn't Everything. Adaptation of Municipalities to Extreme Rainfall.

Heavy precipitation is seen as risk that will become more frequent and more intense in the future (IPCC 2007). This extreme weather event is a threat for human health as well as for infrastructure. It is predicted that due to changes in heavy precipitation patterns larger financial losses will occur.

Large agglomerations are more exposed to the problem of heavy precipitation mostly because of high density of population and accumulation of infrastructure. Smaller municipalities are less vulnerable, but they are also in the disposal of different resources. The scale of risk is smaller (less inhabited, still urbanised), but their potential to react is different (financial resources, infrastructure, knowledge and social resources). Studies point out that in smaller communes in case of reaction to natural hazards there is a large role of local authorities (Biernacki 2009). The most important issue making local authorities the successful actor is the awareness of local community needs and knowledge of local specifics (Michałowski 2006).

In this research authors are suggesting that financial resources are not a barrier for increasing resilience. Studies indicates that the main issue that needs to be solved regarding low resilience is the case of hazards perception and resulting from the behaviours (Collins et al., 2014). Municipal budgets for dealing with hazards are significant (but that does not mean that mitigating activities are sufficiently funded (Nemayer et al., 2014)). The problem is the direction of resources, so the consequences of hazards in the future will be not as severe. The process of learning, crucial for resilience, is the main issue regarding decreasing losses in the future and developing natural hazards preparedness.

The analysis bases on in-depth interviews with municipal representatives from the Wielkopolska region, Poland. Communes with a high number of fire department interventions related to extreme rainfall (2010-2014) are investigated.

A Permanent State of Crisis? Lessons from Organizing Migrant and Immigrant Workers in Quebec

Montreal's Immigrant Workers Centre (IWC) arises from community organizing and non-traditional labour organization traditions. Its activities include casework, the building of worker leadership, organizing against precarity and immigration injustice, build grassroots solidarity between temporary agency workers, migrant workers in several programs, undocumented workers, and other coalition work. This paper explores the successes, challenges, and limitations of the IWC considering increasingly restrictive immigration/labour policies, an unresolved crisis of organized labour (Camfield, 2011), and a climate of 'austerity'.

Drawing from interviews with workers, organizers, and allies, and literature about organizing migrant/other precarious workers outside of traditional trade union forms (e.g. Choudry and Hlatshwayo, 2015; Fine, 2006, 2011; Ness, 2014, Suzuki, 2012), we discuss the IWC model as developed over 15 years. Considering the 2008 crisis, we contend that there is continuity and change in the conditions for migrant and immigrant worker organizing.

First, we give a brief history of the IWC's development, contextualized in relation to the state of Quebec/Canadian trade unions as precarity increasingly becomes the norm for many workers. We argue that the IWC has helped advance an analysis relevant to confronting labour precarity and exploitation, strategy and organizing in the context of the crises of capitalist globalization, the attendant neoliberalization of the Canadian immigration regime, and the transformation of work. We also consider challenges surrounding the IWC's sustainability, scale and impact, and the dynamics of its relationships with unions.

Second, we examine IWC's work to build and develop worker leadership, maintain political autonomy, and responses to austerity measures, including building worker associations of agency workers, and temporary foreign workers. We explore a) challenges from women im/migrant workers; b) knowledge produced with/by workers in building resistance; and c) the dynamics of coalition work. (eg. on the minimum wage). We conclude with some broader lessons about labour organizing models.

Children's Marginalization in Sports in India: A TALE of Multidimensional Experience

The present study explores various forms of intersectional discrimination experienced by children in India within the institution of sports. Intersectionality during the last three decades emerged as a primary analytical tool in sociological discourses which questions the ideology that construe inequality as an inevitable consequence of one's social position, taking into account not gender alone, but also other sources of identity like race, class, sexuality, religion, age, ability, nationality. Though a deficient amount of literature exists examining varied factors that promote or inhibit children's participation in sporting activities, Annette Lareau (2003) noted that children's access to and participation in structured sports are highly influenced by the union of their class location, family environment, school curriculum, gender, and parenting style. In fact, burgeoning researches in North American and European societies espousing intersectional approach within sociology of childhood has brought to the fore the diverse lived experiences of children belonging to different strata of the society. Conversely in India, research on the interrelationship of childhood and sports, more specifically the intersectional complexities influencing children's participation in sporting activities has not been sufficiently examined. This paper hence illustrates by drawing real life examples from Indian context like, the case of Purulia football team, Deeksha boys football team, Para Athletic team, and many more how the communion of diverse social identities like class location, religion, gender and disability situate children in multiple hierarchies i.e. expose them to structural intersectional discrimination, which controls and manipulate their opportunities to participate in organized sporting events. Secondly, this paper also focuses on how the complex alliance of social characteristics along with the legal and political institutions facilitates discriminatory practices by reproducing their subordinate status and fabricates unequal prospects for these children.

MEDIA Representation and Gendering of Technology: Assessing Social Transformation in 21ST Century India

This paper utilizes feminist intersectional approach to assess social transformation through media representation of gendering of technology in 21st century India. Feminist critiques have acknowledged gender along with other social variables like class, race, religion, and sexuality as a decisive amalgam of constructing gender power relations that shape the everyday life experiences for women. In addition feminist researches further advocate that along with these sources of identities other institutions such as science, technology and media symbolize and reconstitute the existing ideologies of gendered practice prevailing in the society. Dwight E. Brooks and Lisa P. Herbert (2006) posit that the commodified texts produced by media construct notions of self identity i.e. what it means to be a male or female, heterosexual or homosexual, elite or poor in the larger social context, i.e. it ultimately represents social realities. Similarly Judy Wajcman (1994) advocates that technology is not a neutral scientific product, rather it bears the imprint of dominant patriarchal knowledge and practices that encroach every aspect of public and private lives. Therefore technology along with media plays an integral role in crafting the knowledge about one's class position, sexuality, masculinity and femininity, based on the notion of biological differences, technical expertise – dictating who can access to technology, what kind of technology one can use, and what kind of technology usage will make one more acceptable within the patriarchal arrangement of social order. However, Indian sociological discourse has been mostly oblivious to the relationship between gender and technology and more specifically to the distorted media depiction of the gendered nature of technology. This paper hence explicates how the present Indian visual media culture expresses and consolidates power relationships between technology and women; secondly this paper also elucidates how the intersection of gender, class and sexuality accentuate such stereotypical representation.

Researching the Female Reproductive Body: Theoretical Approaches

The expanding academic interest in the body during the last three decades has resulted in remarkable work concerning the construction, representation, and experiencing of the body across diverse geographical, socio-cultural, and historical contexts. However, much of the work produced tends to rely on distinct theoretical approaches, utilizing either approaches that focus on the social regulation of

the body or phenomenological approaches that emphasize the lived experience. In this paper I discuss the use of multiple conceptual tools for the empirical study of Greek Cypriot women's experiences of menstruation and menopause. Specifically, I discuss how I approach the body both as a subject and as an object, by examining the women's experiences and practices on the one hand, and by examining the construction of the female body and its representations within discourses and institutions on the other, and how these affect the women's experiences in the context of everyday. Combining phenomenological approaches with the theories of Douglas, Elias and Goffman, enables me to pay particular emphasis to the notions of embodiment and agency, that is, to view women as embodied social actors who reflexively construct meaning and interpret their experiences. Additionally, such a framework allows me to take into consideration the materiality/ corporeality of the body, which is inextricably linked with women's reproductive experiences. I argue that researching the female reproductive body provides an excellent opportunity to connect the lived body and the body as a site of social control and regulation. This paper illustrates that adopting an open, flexible theoretical approach that engages with diverse theoretical concepts according to their usefulness can provide significant insight into what it means to be a woman and to 'have a woman's body' in the context under investigation.

CHRISTOU, MIRANDA* (University of Cyprus, miranda.christou@ucy.ac.cy)

The Gender of Accountability

In this paper I use feminist theories of the ethics of care (Tronto 1989) in order to analyze the gendered implications of educational accountability policies. Accountability is a term shaped both by moral reasoning and the methods of financial accounting (Strathern, 2000). Although educational accountability is a desirable quality, it has become problematic through the equation of good practice with high test scores and financial efficiency. This focus on teachers' performativity at a global level has redefined teachers' time through the lens of test results and ignores the fact that teaching is not simply instruction but also the labor of care that cannot always be measured. Feminist perspectives on teaching and the ethics of care have discussed the invisibility of teachers' and especially women's labor in the classroom (Acker, 1995; Vogt, 2002). I point out that, in this process, the political dimension of care (care as necessary for survival, care as a commodity, care as work) is replaced with a notion of care as a 'natural' psychological state of women. Within accountability policies, care practices are rendered un-measurable, neglectable and even punishable. I argue that, although the concept of educational accountability implies good practice, it has moved away from a relational definition of responsibility which involves active agents (whose responsibility? to whom?), towards a mechanical process of auditing. This new globalized version of educational accountability has ritualized an abstracted notion of responsibility that is not only unrelated to learning but it also fosters indifference towards learning.

Labor Integration and Job Embeddedness and the Role of Social Factors on the Transitional Phases of Greek Youth in the Time of Economic Crisis

For Greek youth, the transition from education to employment has become hard and often impossible in a labor market characterized by low demand for young graduates. In an age of austerity, large numbers of young people shift their prospects towards an internationalized European job market, particularly if their professional abilities are in demand in countries that have under-invested in professions such as nurses, engineers, etc. In this paper, trends and behavior profiles of young people in today's labor market are analyzed. The study is based on primary data collected via a survey conducted in Greece from 2012-2015 (sample of 1952, ages 15-34). The statistical analysis included Multiple Correspondence Analysis. We found that unemployment and situations of unwillingness to pursue work embeddedness are often related with strong dependencies on family and a high degree of support reception, while stable employment status is associated with strong social capital but moderate family support. The flexibility of contemporary labor activity continues to call into question work position, security and predictability. Our findings suggest that the Greek labor market appears to present a particular triadic segmentation not common in more dual market segmented developed capitalist economies, as those proposed by Doeringer and Piore (1971). Our proposal for a triadic structure of the labor market also differs

as to the perceptions of the second and third generation models, regarding the segmentation of labor markets (Rubery 1992) where the new form of flexible production and the variable product markets play an important role. In Greece, social regulation plays an important role for the transitional phases from education to employment for Greek youth. Most often, youth social networks, accumulated social capital, and family encouragement, play an important role as main factors of economic integration for young people. Finally, these findings are discussed in relation to their policy implications.

CHUAQUI, JORGE* (UNIVERSITY OF VALPARAISO, jorge.chuaqui@gmail.com)

The Meaning of Social Inclusion

THE MEANING OF SOCIAL INCLUSION

What is it social inclusión? In a way some authors state that to be integrated means the fulfillement of social norms. Or in another sense means to be socially adapted. This leaves the subject in a pasive and subordinated position, moreover if there are exerted coercitive means to achive this adaptation. According to this look the system is first and then the subject.

But there are other alternatives. If we consider social structure of contemporary societies in a historical way, a "normal" adult person that has a "good life", usually have a qualified work that allows a suitable earning that facilitate to make up a new own familiy, and a social and political active life. To achive this, he has to use all his creative resources and initiative. A "normal" person is not subsumed in the system but has an important personal component.

Social inclusión has to be conceptualized and measured with three criteria:
1. The degree in which the person achives valuable social goals.
2. The degree in which is allowed to practice his most beloved values.
3. The degree in which he can use all his creative potential and initiative.

Among the valuable social goals are to have a good job, to have a good partner,to live in a suitable home. We know that for mentally ill persons frequently lacks some of this achivements, but is a question of degree: it is better lo live in a suitable home than to live in a hospital, better to have a good partner than the opposite, and so on, and these goals according to some or all his beloved values and using his creativity in the highest posible degree; they are no replaced by a dubios "social adaptation" that ussually conducts to a compulsory conformism.

CHUDNOVSKAYA, IRINA* (Lomonosov Moscow State University, inchud@bk.ru)

"Otherness" in Traditional Russian Media in the Modern Social Context

The oppositions "we - they (the others)", "my – alien" constitute any society and set up the basic framework for its functioning. According to Hegel, Husserl, any "something" needs "other" in order to determine their identity. Currently, scientific category "other" can be interpreted from the standpoint of the phenomenological, hermeneutical, poststructuralist leading directions. The problem of detection the "other" is actual both in theoretical terms (e.g., to diagnose the state of a particular society at a particular time of its development), and in practical terms (e.g., for a just solution of social conflicts). Despite the fact that a society aims to maintain its cultural and moral core, the list of social groups perceived as "other" is not a constant. Changes in the socio-economic context cause the changes in the nomenclature of "others" and in intensity of attitudes to them. The purpose of our research is to characterize the media category of "others" in its dynamics in modern Russian society. The empirical object includes texts of traditional media (television and newspapers) of the capital region. Particular emphasis is placed on the period of preparation for the state elections due to higher attention to issues of social identity in communicative space. Media, on the one hand, reflect the actual societal assessments and opinions, on the other hand, introduced into society certain social stereotypes that support the interests of specific social actors. As a result of a content analysis and discourse analysis a number of conclusions was made regarding the typology of the "other", the transformation of the image of the "other", the public reaction to the "other" and his media image, the linguistic representation of the "other" in the contemporary geopolitical context.

Organizing Care and Construction Workers in South Korea: The Complex Entanglements of Gender, Ethnicity, Migration and Nationalism

Care and construction workers in South Korea – workers in two contrasting sectors of gendered informal employment – are creating new organizations and experimenting with new representational strategies. Founded in 2004 under the

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Korean Women Workers Association, the National Home Managers' Association is a membership-based social cooperative with 14 branches across the country that represents women who provide housecleaning, cooking, personal care, childcare, and eldercare to private households, forms of domestic work that have been historically excluded from the national labour standards law and social insurance schemes. Established in 2007 as an affiliate of the Korean Federation of Construction Industry Trade Unions under the Korean Confederation of Trade Unions, the Korean Construction Workers Union is a regionally-organized labour union that represents men who work as day labourers on residential building construction sites and as own-account workers in industrial plants under a multi-layered subcontracting system that is unlawful and perpetually violates minimum employment standards. Interestingly, both organizations utilize collective contracts, either in the form of collective bargaining agreements or domestic service contracts, to secure job placements for their members: Korean nationals who face age and social status discrimination as older workers in their 50s and 60s and who confront labour market competition from a younger cohort of Korean Chinese migrant workers, commonly referred to as Joseonjok. Such agreements provide important institutional vehicles for reducing job instability and improving working conditions for specific groups of socially marginalized workers, but they also reflect the complex social terrain upon which informal worker organizations are building collective voice and representation. In this paper, I draw upon preliminary field research conducted with a team of graduate students for a global comparative study to explore how gender, ethnicity, migration, and nationalism shape the priorities and strategies of newly created organizations in the informal care and construction sectors.

Flexible Working and Consequences for Working Patterns Post Childbirth for Mothers in the UK

One of the commonly used strategies for mothers to combine work with family life is to reduce their working hours, and move to a part-time job (Visser, 2002). Although part-time work could increase perceived work-life balance of workers, it also entails career sacrifices that (can) have consequences for the rest of the career (Yerkes, 2009). Another strategy that is frequently adopted by companies is to allow workers to combine work with family demands by working flexibly (Eurofound, 2015) – e.g., flexi-time that allow flexibility in starting and ending time of one's work, and tele-working that allows workers to work from home. Studies have shown that flexible working can allow a better work-life balance (Allen et al., 2013) and can potentially increase parent's time spent with children (Craig and Powell, 2012). However, it is still unclear whether flexible working patterns can be used as substitutes for part-time work, i.e., whether mothers are likely to retain their working hours if they are allowed to work flexibly. If this would be the case, allowing mothers to work flexibly can help reduce gender inequalities in labour market outcomes after childbirth. We examine the UK case, where the right to request flexible working has been expanded quickly over the past decade and where flexible working is being promoted as a major way to address work-life balance issues. The data used is Understanding Society (2009-2013), a large Household Panel survey with data on various types of flexible work arrangements including flexitime, working a compressed week, and regularly working from home. The analysis proposed is a competing risk event history model where we examine the effect of having a first child on the likelihood of remaining working full-time (versus part-time or not working) and compare the risks between mothers with and without various flexible working arrangements.

Transition to Sustainable Agri-Food System through CSA Initiatives: The Social Innovation Attempts of the University and Local Communities

Social responsibility has been recently included by universities in their strategic goals, which represents a commitment to promoting the well-being of local communities and wider regions through teaching and research. In the face of widespread deprivation and deactivation of agriculture and rural life, how universities can bring positive impacts on rural transformation to more sustainable development? This paper explores the potential for such transformation to sustainability by bridging the university and rural communities. We examine this potential by reflecting on projects undertaken by a university research team in Taiwan to implement Community-Supported Agriculture initiatives. CSA is designed to directly connect growers and consumers and to foster reciprocal and caring relationship between them. The projects in question were developed and practiced by appealing to CSA principles. It was found that not only can access to safe and healthy food be created through CSA initiatives, but these initiatives, in which

student groups participated with the assistance of the research team, can also have positive effects on campus, by raising students' consciousness of agri-food production and their consumption habits, and by calling their attention to issues over "ethical" consumption. Moreover, participation of students in agricultural activities, such as harvesting, selling farm produce, and helping to arrange experiential tours, can provide significant support for transformation to sustainable agriculture in rural communities, where farmers are typically elderly people.

El IEA (Índice de Envejecimiento Activo), Su Aplicabilidad En América Latina y Su Valoración Conceptual Desde Los Ejecutores De Políticas Públicas. El Caso De Uruguay.

En 2012, la UNECE (United Nations Economic Commission for Europe) desarrolla el IEA (Indice de Envejecimiento Activo), en el marco del Año Europeo para el Envejecimiento Activo y la Solidaridad Intergeneracional.

Su objetivo es proveer de información pertinente, actualizada y comparable entre países, a los ejecutores de políticas públicas, de cara al fortalecimiento de este grupo poblacional, en términos de identificar sus necesidades y potenciar sus capacidades de participación social, desarrollo personal y aporte a la comunidad.

Las particularidades de su diseño lo hacen compatible con su aplicación fuera de la Unión Europea, ampliando su margen de utilidad y fortaleciendo la discusión sobre las políticas de envejecimiento en todos los países que se encuentran en un estadio avanzado de su transición demográfica.

Trabaja sobre cuatro dimensiones: 1) empleo, 2) participación social, 3) independencia física, salud y calidad de vida, y 4) capacidad para el ejercicio de un envejecimiento activo.

Estas dimensiones se desagregan en indicadores específicos que contemplan otros aspectos como la perspectiva de género, el acceso a las TICs, los servicios de cuidado, etc.; permitiendo permite distintas combinaciones y ponderaciones de cada dimensión e indicador, lo que habilita a contemplar la idiosincrasia cultural de cada país.

Su versatilidad metodológica permite adaptar los indicadores previstos a las fuentes de datos disponibles, respetando las dimensiones conceptuales propuestas.

Para los ejecutores de políticas, la valoración del IEA estará relacionada con el grado de compromiso con la problemática del envejecimiento y las líneas orientativas en materia de política pública más actuales (Plan de Acción de Madrid-2002, Convención Interamericana sobre la protección de los derechos humanos de las personas mayores de la OEA-2015); y por lo tanto las necesidades que se definen desde los órganos de ejecución política constituyen un insumo para adaptar el IEA a la realidad específica de cada país.

CIESLIK, MARK* (Northumbria University, mark.cieslik@northumbria.ac.uk)

'the Best of Times, the Worst of Times': Making Sense of Young People's Wellbeing?

This paper draws on recent empirical research that explored the different ways that individuals experience wellbeing across the life course (Cieslik, 2016). I focus here on the lives of young people and contradictory research findings that suggest that many western youth are experiencing a wellbeing crisis whereas others suggest they are resilient and have mostly positive experiences of growing up. The former position suggests that structural changes to youth transitions (such as precarious routes through work and welfare) have eroded the wellbeing of young people. Whilst the latter shows that the majority of young people in western societies are usually happy most of the time. I argue that one way to make sense of these contradictory positions is to employ a more nuanced, process based conception of wellbeing (Eudaimonia) acknowledging that wellbeing is an ongoing collaborative process as well as a measurable, subjective experience (Cieslik, 2015).

I examine the different networks and practices implicated in young people's leisure showing how their wellbeing can oscillate from good to bad events framing their (un)happiness. Often their educational and employment experiences were problematic, threatening their wellbeing but many were also connected to supportive networks and activities that allowed them to flourish. Their accounts of happiness therefore involved disappointments as well as stories of overcoming these challenges and developing creative, nourishing pursuits. This processual approach to wellbeing is one way of offering a more insightful analysis of young people's lives that avoids the traditional divisions between cultural and transitions approaches in youth research.

New Frontiers of Precariousness. Internships and the Training to a Precarious Life

Over the past few years, the European young workers have experienced increasing job insecurity and growing unemployment. Policy makers, employers and educational institutions have promoted internships as a fundamental training experience for the integration of educational pathways with practical experience and the insertion in the labour market. However, the recourse to internships is increasingly related to unpaid/low-paid work and exploitative work experiences.

Referring to the research "Internstage: internships, work placements, volunteering: stages on the road to decent work or to insecurity?" and focusing on the Italian case, this paper explores the impact of the growing diffusion of internships on the labour market and on the working life of youth.

In Italy internships have spread since the last decade, after the implementation of the Bologna Accords and the labour market de-regulation. They have been promoted as an active labour market policy, however, currently only a small part of half a million of young people that every year has one or more internships is hired, usually with precarious employment contracts.

The intern may be given low-profile tasks – which devaluate the internship's training and "train" the intern to accept her/his own devaluation. Alternatively, after a brief training, the intern is required to meet the standards of a regular employee in terms of working hours, productivity, and discipline, but with no other rights but those of an intern. Moreover employers are using internships to substitute paid work with unpaid work and work with rights with work without rights, thus resulting in a general downgrading of labour conditions. For these reasons, the internships' "training to work" socializes among youth the idea that the precariousness is the rule and that obedience, competition and individualism are the only relationships that can exist in the workplace – thus resulting in a veritable disciplining to the neoliberal values.

CILLO, ROSSANA* (Ca' Foscari University of Venice, rossana.cillo@unive.it)

The Struggles of Immigrant Workers in the Logistics Sector in Italy

Since 2008 the logistics sector in Italy has been affected by an increasing number of strikes, that have been successful thanks to the organisation activities by the independent trade union Si-Cobas, the support of far left organisations and, last but not least, the self-activation of precarious immigrant workers employed in the co-operative enterprises of the subcontracting system. These strikes had a strong impact on the most important logistics hubs of Northern Italy (such as Bologna, Padua and Piacenza) and have temporary blocked the "just-in-time" commodities' circulation of the most important multinational corporations in the logistics (TNT, DHL, GLS, SDA, Bartolini...), in the e-commerce industry (Yoox), in the large-scale distribution (Coop, Esselunga, Ikea) and in food industry (Granarolo).

Even if state and employers have reacted with a severe repression, these strikes represent by far the most important struggles that have developed in Italy as a result of the crisis and the very first attempt to organize a workers' struggle outside the social-democratic unions, which are more and more accepting compromises with capital at the national level.

Quick and Dirty: Speeding up Criminal Procedures at the Cost of Defendants' Rights

Since the late eighteenths, following the transition to democracy, there has been a process of reforms in criminal courts all over Latin America. They were carried on by governments applying programs designed and supported by local and international experts and sponsored in most cases by international financial organizations. Those reforms were aimed at democratizing Latin American criminal courts by introducing adversarial-based procedural systems. However, in the new century, the focus of the reforms has changed from expanding defendants' rights to improving the efficacy of the system, especially to speed up procedures. After more than three decades of reforms, the results show that changes have deeply affected the way criminal courts work. By drawing from the example of reforms made in Argentina, particularly in the Province of Buenos Aires, this article argues that those reforms introduced a managerial rationality in criminal justice. However, the historical, cultural and material local context has limited and shaped that rationality. The undesired results are criminal courts that promote the resolution of cases through plea-bargaining, probation or penal mediation instead of public trials. The final consequence is that most sentences are passed without a comprehensive debate on the grounds of the cases, which in the vast majority of the cases is sustained by police reports. Therefore, criminal courts end up legitimising police action without properly reviewing it.

Advertising and Consumerism Versus Social and Environmental Activism in Myanmar, Malaysia and Indonesia through the Lens of Visual Communication

This paper explores the expansion of advertising in three emerging economies in South East Asia: Myanmar, Malaysia and Indonesia. While activism on climate change and sustainability is increasing in western industrialized societies, in emerging economies priorities are quite different and are felt more immediately. In these countries (making up 80% of the world population), those who have recently reached the middle classes aspire to achieve some approximation of the western affluent lifestyles they see portrayed in the media. Their interest in consumerism is stimulated by advertising and media programming and they are less concerned about issues of social justice and environmental sustainability. In comparison the majority of the population in emerging economies are still struggling to meet their basic needs for food, housing, education and healthcare. The poor are more likely to be immediately affected by environmental issues such as poor health provision, deforestation of land for agribusiness and social injustice. The poor are more likely to be involved in activism and social movements to protect the rights they have that are under threat or to regain what they have previously lost. This paper compares and contrasts advertising versus activism in the three countries through examples of visual media.

CIPRIANI, ROBERTO* (University Roma Tre, rciprian@uniroma3.it)

World Diffused Religions

Having theorized that "new modern topics" like individual autonomy, the *ethos* of mobility, self-expression, self-achievement, sexuality, familism and the private sphere were destined to replace historically institutionalized religions (Luckmann 1963), giving rise to a kind of "invisible religion" (defined as such by the publisher, not by the author, but only for commercial reasons), Luckmann has addressed the issue once more. He has acknowledged the fact that religion has not disappeared from the modern world and that various minor, intermediate and major degrees of transcendent experiences, seen as existential components, are to be found and that they cause differentiation at social-structural level and an institutional specialization of religion. This tends towards privatization, thus becoming a matter for single social actors who pass from major extra-terrain transcendence to one of an intermediate socio-political kind and, finally, to minimal individual realization, subjective autonomy and personal expression (Luckmann 2014: 40-44). Along this pathway one finds an increasingly marked gap between religious institutions and individual actors. Empirical investigations, however, even the most recent (Campiche 2010; Abbruzzese 2014), seem to reveal a tendency for traditional religious institutions to remain firm and maintain a certain link with individuals despite formal estrangement and radical criticism. Rather than as a breach or a separation, it appears more opportune to interpret the dynamics at work at present from the point of view of a substantial *continuum*.

Playing with Catastrophe: Law, Urban Regenerations and Contestations in Turkey

In the aftermath of the 2011 Van Earthquakes that occurred in the Eastern part of Turkey and killed approximately 600 people, the ruling Justice and Development Party (AKP), which imposed profound urban regeneration projects all over Turkey in the last fifteen years, has developed a new rhetoric around the alleged forthcoming fatal earthquakes and vulnerability of towns and cities for the future outcomes of disasters. The AKP, therefore, has been able to instumentalize the past disasters to further urban regenerations and, despite large oppositions, passed a new law, Law No: 6306 "Regeneration of Zones under Risk of Disasters" which opened a direct way to regenerate public and private lands once they are approved to carry "risk". The new fashionable discourses around "victims" of catastrophes and "salvation" of "vulnerable" settlements have spread to local governments to push opportunities for urban regenerations. My paper will present three case studies from Eskişehir which have been initiated by two different municipalities ruled by AKP and Republican People's Party (CHP). Although, CHP

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

was one of the oppositional body which criticized the Law No: 6306, we see cases where the same party utilizes the same law in the municipal level. In my presentation, I will show how centrally produced discourses have been penetrated into municipalities of different political views and what kind of contestations started to take place among the inhabitants of the three neighborhoods about whether the zones carry real risk of disasters, how they can manage to pay monthly payments to the regenerated housing units, or whether they would be displaced out from their neighborhoods.

Same-Sex Marriage, General Health, and Health-Risk Behaviors in the U.S.

Marriage is associated with numerous benefits for husband/wife couples in the U.S., including better physical health. Using results from a web-based survey of members of same-sex couples and same-sex-attracted singles in the U.S. (N=429), I tested whether these "marriage benefits" extend to same-sex marriages, civil unions, domestic partnerships, and cohabiting couples with regard to general health, cigarette smoking, and alcohol consumption. Although there was no difference among cohabitors in self-rated general health, legal recognition (marriages and civil unions) did provide some benefits in terms of health-related behaviors. Specifically, same-sex spouses and legal partners were 68% less likely to smoke than singles/daters, but cohabitors were no more or less likely to smoke than singles/daters. Among those who drank alcohol, spouses and legal partners drank less than couples who were only cohabiting, consuming about 6 fewer alcoholic beverages per month.

In the U.S., there are diverse views on marriage equality, and the question of whether legal status matters beyond legal rights is a legitimate one. Does marriage need to be a structurally integrated institution (i.e., a legal status with all rights and benefits) to provide intangible benefits, or can marriage as an ideological institution (i.e., an emotional state) provide the same experience? To broach this subject, I re-tested the models above using "self-defined marriage" – viewing one's own relationship as a marriage, regardless of legal recognition. This measure grouped cohabitors who viewed their relationship as a marriage with legal marriages and partnerships. Self-defined marriage was also strongly associated with a marriage benefit; self-defined spouses were 47% less likely to be smokers than those who were single or just dating. I conclude that, although self-definition as a married person did reduce the likelihood of smoking, having a legally recognized relationship proved more beneficial in reducing health-risk behaviors.

Housing As a Social Determinant of Health: Its Impact on Health Inequalities Across Europe

Housing has long been considered a key determinant of health, however research has tended to focus on the physical qualities of housing, such as the presence of damp or overcrowding. Yet the role of housing in people's lives is such that this approach does not adequately demonstrate the full importance of housing to health and the role it plays in health inequalities. This presentation brings together a portfolio of research investigating the broader influences, such as affordability and stability, of housing on health. Results of secondary analysis of large-scale data, including the EU Statistics on Income and Living Conditions survey, are presented. Results of multilevel modelling and fixed-effects regression analysis show that falling into housing arrears has a significant detrimental impact on health equivalent to that caused by job loss. However, this impact varies across tenures, levels of wealth, gender, as well as across countries. Generally it is renters rather than owners, the less wealthy and women that are affected most severely, but this varies across countries. Indeed in some countries no negative impact on health is found for those that fall into housing arrears, suggesting some countries are better able to protect the health of those in housing difficulty than others. The causes of these variations and consequences for health inequalities are discussed with particular reference to the development of scales of housing precariousness and precarity. These scales have been developed using cross-national secondary data from a range of sources and are used to investigate the stability and security of housing across countries, their association with different approaches to housing policy, and which policies are most successful at mitigating health inequalities.

Social Organization, Classificatory Analogies and Logics: Institutional Theory Revisits Mary Douglas

As a social theory of organization, it is unsurprising that institutional theory draws upon the profound and ambitious work of the late anthropologist Mary Douglas. One of the foundational concepts of organisational institutionalism, institutional logics, directly draws upon her work. Yet, in recent times this foundational role has faded from view as institutional theory itself becomes increasingly institutionalized as a vibrant branch of organization studies. This is unfortunate for there is much continuity in current work with that of Douglas, it now being 50 years and 30 years, respectively, since the publication of some of her formative works. The deep analogies that underpin classificatory systems and the processes by which they are sustained remain significant areas under continued investigation by institutional theorists. Thus, in this paper we revisit Douglas' core arguments and their connections to institutional theorizing. We specifically explore her contribution of 'naturalizing analogies' as a way of accounting for the unfolding of change across levels of analysis, extending, modifying and enriching explanations of how institutional change is reified, naturalised and made meaningful. We do this by providing empirical descriptions of meta-organizing analogies and also field-level applications. Douglas' major theoretical works are of considerable relevance for current institutional theorizing, particularly in informing accounts of the movement between individual cognition and collective signification.

Ce Que Fait La Musique : Espaces D'écoutes En Foyer De Travailleurs Migrants

« La musique ne parle pas aux travailleurs migrants », me dit un résident syndicaliste, dans un *foyer* du 19ème arrondissement de Paris. Pourtant, « la musique », et plus précisément un CD rarissime de l'Orchestre National de Mauritanie, fera parler cet homme, quelques minutes plus tard.

L'État français a construit des foyers dits de travailleurs migrants (FTM) à partir des années 1960 pour accueillir les « travailleurs » d'Afrique du Nord et de l'Ouest. Ces constructions ont peut-être amélioré leurs conditions de vie, mais leurs vies elles-mêmes ont été concentrées pour pouvoir être mieux gérées. Aujourd'hui encore, les espaces de vie sont standardisés et leurs usages sont contrôlés. Dans ma communication, j'analyserai la place que la musique s'y fait.

Je le ferai à partir d'ethnographies de situations d'écoute. Si certains résidents étiquettent leur musique de « musique du village », on s'aperçoit que leurs bibliothèques musicales sont hétéroclites. Certaines musiques sont liées au lieu d'émigration, d'autres ont été découvertes en chemin ou sur leur lieu de résidence, et toutes peuvent leur permettre d'agir sur leur environnement actuel. Ils les convoquent pour créer des espaces de recueillement ou de partage, pour fédérer la communauté émigrée au delà des foyers, pour appuyer leur parole lors de revendications politiques...« La » musique est elle-même un instrument.

De là, il ne nous reste qu'un pas à franchir pour la considérer comme un outil de politiques culturelles. En collaboration avec des résidents, des associations et des festivals choisissent dailleurs les foyers comme lieu d'action et de programmation. Les événements transforment la salle polyvalente en salle de concert, les résidents en musiciens ou en public, le bâtiment en lieu public. Nous verrons comment la musique reconfigure les espaces et les dénominations qu'on leur attribue, comment elle altère leur « identité dominante ».

Indigenous Women and the Struggle for Food Sovereignty: Engaging with State Policy in Bolivia

Indigenous women's organizations in Bolivia are employing the concept of Food Sovereignty (FS) in their struggle for an equitable future. The logic underpinning FS involves the right to decide what to produce, and how to distribute and consume nutritious, culturally appropriate foods in ecologically sustainable ways. A key issue at the World Conference on Indigenous Women held in 2013, indigenous women are examining FS and their role in local and global food justice. They have constituted transnational networks to put forward the agenda at the global level including G-77, Indigenous summits, and the creation of international spaces like the *Comité Internacional de Planificación por la Soberanía Alimentaria*. In Bolivia, women's organizations, like Bartolina Sisa, were among those instrumental in the inclusion of FS in the new Constitution in 2009. Yet state-mobilized FS is transforming the concept in contradictory ways, creating tensions as well as spaces for continued engagement. These spaces have the potential for further incorporating gender into the priorities of FS at the state level. However, contradictions suggest that the direction the government may take in further gendering FS will continue to be informed by preconceived notions of gender roles that limit the ways in which women are included. Furthermore, the tension between policy and practice in gender equality exposes a persistent struggle for women's secure access to

COCKBURN, JENNY* (Carleton University, jennyc.cockburn@gmail.com)

Realizing Food Sovereignty in Bolivia: Collaborations and Contradictions

This paper examines tensions between the MAS government's recent implementation of Food Sovereignty (FS) policies and the pressure to increase development based on an agro-industrial model. The Bolivian state's incorporation of the FS concept with Food Security policies has implications for small farmers that raise questions regarding the concept's limitations once it is adapted to serve state purposes. Contradictions between FS as it is envisioned by the global peasant social movement, La Vía Campesina, and the way it is utilized by the Bolivian government present challenges to collaboration efforts between local social movement actors, small farmers and state actors. Importantly, related contradictions emerge between certain ideals of a plurinational state and (neoliberal) economic policy. This paper scrutinizes FS policy implementations through a gendered lens, shedding light on the extent to which patriarchal structures of the state have been overcome or remain entrenched. The tension between policy and practice in gender equality exposes a persistent struggle for women's secure access to farmable land and food security. As indigenous women's organizations take up FS as a tenet, they work toward reshaping gender relations at the grassroots and state levels, with implications for food security and sovereignty policies within Latin America more broadly.

Idéologies Politiques, Recrutement Politique Et Sécurité Publique : Une étude Des Agents De La Sécurité Publique Au Brésil

Au Brésil, la sphère de chaque état est le niveau où se concentre la plupart des activités de la sécurité publique. Ainsi, le Secrétaire de Sécurité Publique occupe une position importante dans la structure publique de sécurité. Hiérarchiquement il est au-dessous seulement du gouverneur par qui il est nommé, de sorte qu'il y a une dépendance politique dans leur recrutement. Historiquement, il a été représenté par différents types sociaux. Pendant la dictature militaire (1964-1985), le poste du Secrétaire de la Sécurité Publique a été occupé par des hauts officiers de l´armée ; après cette période, pendant la démocratisation, le poste a été progressivement lié à des commandants de la police militaire, hommes politiques, procureurs et chefs de la police judiciaire, etc. La présente recherche se propose de faire une cartographie des profils des secrétaires de sécurité publique et de vérifier à quelles familles idéologiques ils sont liés. Pour résoudre cette question, nous réaliserons une analyse des origines professionnelles des secrétaires de sécurité publique entre 2003 et 2015, en les confrontant avec les idéologies politiques des gouverneurs respectifs des états fédérés. Les résultats montrent qu'il y a une orientation cohérente dans le recrutement des secrétaires par l'idéologie politique depuis ces treize dernières années. Tandis que le centre et, principalement la gauche concentrent des policiers nationaux, la droite préfère les hommes de carrières juridiques, comme les procureurs. Ces résultats rendent compte de la croissance de la politisation du thème de la sécurité publique au Brésil pendant les gouvernements de gauche.

"If We Get New Generations to Enter the Feminist Movement... It Will be Different, It Will be Fantastic": Youth Gender Justice Activism in Peru and Ecuador.

This paper focuses on youth feminist political action in Ecuador and Peru and its relationship to professionalized adult feminism. In Latin America, social movements are crucial democratizing forces not only due to their influence on civic and

political society but also because they constitute sites of struggle over meanings and practices of inclusion, participation and citizenship. Feminist movements are no exception. Social divides based on class, "race" and ethnicity have generated important debates within Latin American feminisms, yet age and generational divides remain less visible.

In Peru and Ecuador, a new generation of feminism has emerged among youth initially mobilized by professional adult feminism. However, whereas professionalized adult feminism seeks changes to government policies, youth gender justice activism seeks changes to cultural discourses and practices, especially in the family, intimate partnerships and household. In this sense, young feminists have more in common with youth in general in Latin America than professionalized adult feminists. Our paper aims to clarify why this is the case by drawing upon a grounded theory study among 21 youth gender justice activists.

We found that youth activists developed new ways of perceiving political action in response to exclusionary processes within professionalized adult feminism and contradictory processes within gender equality policies. Exclusionary processes consisted of professionalized adult feminists defining "the movement" on the basis of their own organizational structures, thereby preventing young women from joining the movement on equal terms and hindering young men from being included. These exclusionary processes were exacerbated by professionalized adult feminism's strategic emphasis on government policies. Youth activists perceived three contradictory processes within government gender equality policies: inconsistent policy approaches and implementation, institutional practices upholding gender hierarchies, and demobilization/de-politicization of civil society. We discuss these findings in relation to current theorizing of feminist and youth movements in Latin America.

COHEN, BRUCE* (University of Auckland, b.cohen@auckland.ac.nz)

Diagnosing Neoliberal Subjects: A Textual Analysis of the DSM

The American Psychiatric Association's (APA) Diagnostic and Statistical Manual of Mental Disorders (DSM) has become the most authoritative text on defining the nature of mental illness in western society. The psychiatric profession claim that this document reflects the advancement of scientific knowledge in the area and is unaffected by subjective and politically-motivated value judgements. In this paper I aim to question this assumption through presenting a textual analysis of mental illness classifications and symptomologies presented in each edition of the DSM (I-V). It will be demonstrated that, over time, the language employed by the APA has increasingly conformed to the development of neoliberal values and the closer surveillance of the self – this is an expert discourse where words and phrases such as 'productivity', 'employment', 'school', 'leisure', 'play' and the 'home' have taken on greater meaning and been enshrined in typologies of mental disorder.

The presentation will take time to consider the theoretical implications from this case study for understanding the structural forces which may aid or hinder the construction of psychiatric classifications. For example, following the neo-Focauldian argument of Nikolas Rose (1999), psychiatric discourse can be understood as a necessary technology for the management of neoliberal selves. Such a view suggests that the recent DSM additions of Social Anxiety Disorder, Pre-Menstrual Dysphoric Disorder and Hoarding Disorder reflect contemporary social problems and popular anxieties surrounding patterns of work, consumption, the family, and leisure. Utilizing a more traditional Marxist analysis, however, it could be argued that the reinforcement of neoliberal ideology identified within the DSM may instead suggest the increasing hegemonic role played by the institution of psychiatry in medicalizing social and economic problems within capitalist society.

The Meaning of Illness: Narrative Approaches

Narrative scholars of health argue that we give meaning to our behaviour through the stories we tell about ourselves (Gergen 1994; Kleinman 1988). When we experience serious illness such as cancer or schizophrenia, for example, we attempt to make sense of it in personal terms rather than through grand theories offered by medicine. Likewise, our road to recovery from illness will involve a compromise or resolution of such understandings at the personal level. This approach is in stark contrast to the dominant biomedical view of mental disorder where illness is considered as pathology; that is, an irrationality or deviation from the 'normal' state of the body and mind, one in which the individual is isolated and alienated from the process of medical intervention and recovery.

This presentation draws on the emerging academic literature that has given primacy and validity to biographies of mental illness and recovery (Brown 2008; Carless and Douglas 2008; Foster 2007; Ridge 2009) including my own research with mental health users in the UK (Cohen 2008). These studies demonstrate that the illness process is fundamentally 'storied'; it is understood in terms of a wider biography that includes social, economic and cultural frames of reference. For

***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

example, it will be highlighted that user narratives typically involve points of perceived failure and crisis (such as the loss of the job, a divorce, or a breakdown in social relations due to alcohol use) as well as positive life events and successes (such as the birth of a child, completion of a college qualification, or taking leadership of a prayer group). With the recent release of the revised edition of Mental Health User Narratives (Cohen 2015), time will be given to consider the advantageous position of sociologists in undertaking narrative research in this area.

COHN, SAMUEL* (Texas A and M University, s-cohn@tamu.edu)

Changing Economic History and Unchanging Development Theories: Can World Systems Theory Survive a Past That Is Continually Being Re-Written?

There is a tendency in development sociology to view all theoretical advancement as coming from recent economic and sociological changes. Such discourse carries the implicit assumption: *"We Understood the Past Perfectly Well – So Our Theories of the Past Are Practically Perfect. The Only Challenge Out Theories May Face Come From Late Breaking Recent Empirical Developments."* Unfortunately, the historical profession does not stand still – and new data continuously emerge about older realities that suggest that our former theoretical constructions do not even fit the old data terribly well.

This paper addresses the adequacy of world systems theory as an explanation of global disparities in development. The paper addresses the following "inconvenient" changes in the historical narrative:

1) Jeffrey Williamson's discovery of a positive correlation between low commodity prices and SUCCESSFUL rather than failed industrialization.
2) Dieter Senghaas's discovery of the economic advantages of core nations stemming from agricultural rather than manufacturing exports
3) Jonathan DiJohn's discovery of the positive relationship between latifundism and national capacity to confront international capital and create nationalist development
4) Wallerstein's own treatment of the failure of Hapsburg Spain – which undercuts most traditional of the developmentalist arguments made by world system theorists

World systems theory can actually survive all of these inconvenient empirical formulations – but it requires a new series of propositions about the relationship of global economic relations of domination to national economic growth. I conclude by presenting an initial version of what such a revisionist world systems theory might look like.

COLEMAN, REBECCA* (Goldsmiths, University of London, rebecca.coleman@gold.ac.uk)

Developing a Sensory Sociology of the Future: Affect, Participation and Politics

This paper explores the difficulty of researching the future because of its intangibility. It proposes that one way to research a not-yet temporality is through the development of a sensory sociology of the future, and more specifically of sensory methodologies. Drawing on recent work in visual and sensory sociology, on affect, and on time and futurity, I suggest that sensory methodologies provide some ways of grasping, understanding, attuning to and relating to the future. To develop this argument, I pay close attention to the *Children of Unquiet* (2013-14) project by artist Mikhail Karikis, and especially the film of the same name. This project involved Karikis working with local children to probe the possible futures of a site that was invested with hope and progress in the twentieth century, but has since been depopulated. In turning to an art project to consider the developments of a sensory sociology of the future, my intention is to examine the resonances between the project and some of the concerns of a sensory sociology of the future. In particular, I discuss the following issues which are apparent both in the film and in some sensory sociology: participation, and especially the participation of children; the entanglement of space and time, and of nature and culture; the evocation of an affective atmosphere through sound, images and techniques of filming and editing, and; outputs, dissemination and exhibition or screening. The paper therefore seeks to contribute to a sensory sociology of the future not by providing a blueprint for further work, but rather by mapping out some indicative points that may offer some coordinates for this emerging field of research.

COLEMAN, REBECCA* (Goldsmiths, University of London, rebecca.coleman@gold.ac.uk)

Temporalities and the Ontological Turn: Futurity and Potentiality in Amazon's System of Speculative Shipping

This paper suggests that one of the implications of the ontological turn in social theory is an increased interest in temporality, and particularly futurity. It has been suggested, for example, that the erosion of distinctions between subject/object, nature/culture, ontology/epistemology indicate that the social is alive, becoming and transformative (for example Adkins and Lury 2009) and that the speed of contemporary technologies require an understanding of that which exceeds the human (for example Clough 2009, Clough et al 2014). This paper considers some of these arguments through a focus on a patent granted to Amazon in 2013 for a system of 'speculative shipping', which aims to ship products near to potential customers in advance of orders. I concentrate on the temporalities of speculative shipping – and more specifically on the significance of potentiality and possibility to it – and argue that speculative shipping is a good example of a contemporary logistics system (and, more generally, a contemporary business practice) that attempts to harness and/or engage the future. I suggest the concepts of lines and the diagram are a means to understand speculative shipping as a surface that is arranged and co-ordinated in terms of both the actual and potential, planning and adaption. To conclude, I consider how these lines and diagrams are not simply illustrative but performative; that is, lines and diagrams co-ordinate the surface in ways that enact worlds. In so doing, I pose a number of questions about the kinds of worlds that are brought to life and about the capacity of potentiality to be put to use in and by speculative business activities.

Dis/Placements and Dis/Ruptures in Cosmopolitan Conviviality: 'Writing' Multi-Cultural London

Cosmopolitan conviviality is located within the 'maelstrom of affectivity' (Thrift 2004) that makes up everyday life in a city. Within this context, consumption, specifically that of food, becomes a primary means through which everyday cultural identities are negotiated. Focusing on notions of affinity and commensality these perspectives highlight food consumption's capacity to mediate multiculturalism by signaling the seemingly uncanny ability of food to bring diverse arrays of people together. Additionally, signaling social-sensuality they identify the radical potential of particular consumptive arenas, such as markets, corner shops or 'ethnic'/multi-'ethnic' neighborhoods and the social-sensual experiences that they engender to overcome and transform otherwise fixed social, cultural and political relations. Current debate about transnational migration and global gentrification, however, indicate the concurrent re/emergence of a visceral nationalism that demarcates social and cultural, as well as, political spaces. Alongside 'together-in-difference', these spaces suggest that projects of convivial cosmopolitanism come laden with displacements, fractures and ruptures.

Drawing from interconnected case studies of London's Kingsland Road and Borough Market, this paper seeks to examine the multiple, mutually construed relations that lead to affinity and displacements within spaces that define both convivial cosmopolitanism and visceral nationalism. We interrogate the ways in which material, social and discursive relations surrounding food and its consumption assemble to re/produce, re/construct, but also contest, the muti-cultural urban landscape. This is explored via the [creative] spatial practices of geo/graphy and topography ('earth-writing' and 'place-writing respectively'), that enable the emergence of place through its writing, telling and re/presentation. Utilising both form and content to construct affective re/presentations of multi-cultural places, these approaches move beyond the conventions of academic publishing to embrace the disruptive nature of place in proactive and provocative ways that engage the multi-sensorium that surrounds consumption,

COLLIN, JOHANNE* (University of Montreal, johanne.collin@umontreal.ca)

Social Plasticity and Pharmaceuticalisation

This paper discuss, through a series of specific examples (hypertension, suppression of menstruations, smart drugs), the manner in which medications play a significant role in three central processes of contemporary social dynamics: medicalisation, molecularisation and biosocialisation. It highlights the ways in which they operate to transform the social and medical gaze toward what is normal and pathological, natural and artificial, and the processes of inclusion and exclusion. The first transformation concerns medicalisation, as a shift in the boundaries between the normal and the pathological. Through molecularisation, the blurring of boundaries occurs between living and non-living organisms, and by extension, between what is considered as *natural* from what is perceived as *artificial*. Through biosocialisation, pharmaceuticals would play a significant role in the constitution of a techno-scientific identity fashioned by drug-taking as something to either embrace or reject. Hence, central to this conceptualization is the assumption that, through medicalisation, molecularisation, and biosocialisation, the same basic mechanism is at work: that of an evolving polarity between two antinomic categories, the positions of which are constantly being redefined by the various

uses of drugs, among other social forces. By examining the question from this angle, I seek to understand how these polarities evolve and the role pharmaceutical drugs play in the process. I will end by proposing three core characteristics of pharmaceuticals that distinguish them from other medical technologies, and that help explain their relative omnipresence in contemporary western societies.

Aspirations and Outcomes for Temporary Migrants to Australia: Korean Working Holiday Makers and Pacific Island Seasonal Workers

Australia is a traditional settler immigration nation that has been transformed in recent decades into a predominantly temporary migration nation. In 2014 Australia received 700,000 temporary migrants compared to 200,000 permanent migrants. Temporary migrants enter Australia under three main programs: international students, skilled migrants and working holiday makers. The advantages to Australia are obvious: temporary workers or students who will leave when their labour is no longer demanded or their education is completed. But what are the advantages to the temporary migrants themselves? Are their expectations fulfilled or do they face considerable disillusionment? This paper draws on primary research with Korean Working Holiday Makers and Pacific Island Seasonal Workers as well as secondary research to argue that experiences vary considerably even within the one national and visa group of temporary migrants. Some temporary immigrants face discriminatory work practices and severe exploitation in Australia. Co-ethnic entrepreneurs are often the source of this discrimination. Others have more positive experiences and are able to transfer to permanent visas, often the main motivation for temporary migration. The paper explores their aspirations, their experiences at work and their social relations in Australian neighbourhoods.

Missing in Action? Sociological Analysis and the Provision of Public/Private Healthcare

The sociology of medicine arguably began as a specialty of sociology with a structural functionalist, systems approach to the field, propagated by Carr-Saunders and Wilson, and even more notably by Parsons, between the 1930s and 1950s. Critiques of this approach from Illich and Zola during the 1970s and 1980s made it evident that the very structures and organisation of medicine are crucial determinants of medical practice and medical knowledge. Subsequent studies of the political economy of healthcare in the 1980s and 1990s, particularly the studies of the American healthcare system, pressed home these ideas. Recent decades, in contrast, have seen relatively little theoretically-informed debate in sociology about the healthcare system as a structured field of practices, organisations and institutions. In this paper we report on a context-content analysis of publications from the major journals in the sociology of health, illness and medicine, combined with an analysis from the Thomson-Reuter Web of Science. We find evidence of trends towards the experience of illness; but little theoretically informed debate about the healthcare system as a whole. Our discussion centres on the reasons for this disciplinary lacuna and its implications for the making of sociological knowledge. We argue that such analyses are vital in order to inform public and policy discussions about future directions in healthcare.

How the Economic Crisis Is Affecting Young People. a Research in the Milan Area

This paper investigates how present economic crisis is affecting the daily life and social position of young people in Italy. The data presented are based on 65 narrative interviews with young adults (aged 20-30) living in the urban area of Milan, North Italy. Adopting an intersectional perspective, interested in analyzing the effects of different social locations derived by the intertwining of gender, class, education, and ethnicity, we focused on the perceptions of crisis and the strategies and tactics young adult in everyday life.

The narrations collected show that precariousness and reduced job opportunities, with their consequences on social mobility, constitute only the more explicit and raw evidence of the lived experience of the crisis among young people. The research shows that these consequences are diversified according to the economic, cultural and social capital of families, to gender and generation position, and to subjective and contextualized perceptions. The central hypothesis of our work is that 'the crisis' is not just a temporary economic conjuncture; it is also a social phenomenon reshaping the social positions of individuals in both structural and subjective terms. Showing how the crisis is affecting different young people in very different ways, the paper investigates both structural evidence and subjective interpretations of the crisis. It highlights how the current economic crisis might represent both a potential danger and a new opportunity, stressing the relevant role of structural intersection of gender/education/ethnicity in shaping the factual space for youth's agency.

SARUIS, TATIANA* (University of Urbino Carlo Bo, tatiana.saruis@gmail.com)

Housing First: From Local Social Innovation to a New Policy Strategy?

Housing First is a model of intervention on homelessness, created in New York City in 1992. It is growing and spreading in US and Europe and it is strongly challenging the traditional staircase approach, whose underpinning logic is that homeless people are expected to qualify for housing after having proved to be ready for it. For this reason, they are placed in different forms of shelters and other collective, temporary and supervised accommodations. The Housing First approach overturns this logic and considers housing stability as the pre-requisite to promote health and mental well-being, support social inclusion, participation and activation.

We compare seven qualitative case-studies (conducted within the European research project ImPRovE: Poverty, Social Policy and Innovation) on local initiatives inspired to the Housing First model realised in Europe (Austria, Belgium, Hungary, Italy, Sweden, UK) and US, with the aim to highlight:

- Which are the trajectories of this process of innovation? How is the new approach influencing and how can it be influenced by the different context conditions and welfare models?

- Which policy-making strategies and processes are being successful in promoting innovation? Which are the governance challenges to be faced to transform new ideas into mainstream policies?

- Which actors and coalitions are influencing the innovative/conservative processes? To what extent Housing First has introduced new decision-making processes, promoting (or not) participation and including (or not) new actors or social groups?

The local practices inspired to the original model present some common features, but also relevant differences depending on the local needs, actors and institutional conditions, as regards different aspects: governance coalitions, strategies and styles, funding, target groups, aims and activities.

Late Selection, More Equality of Opportunity? an Experimental Analysis

A longstanding hypothesis of educational sociology is that the timing of tracking affects track choice differently for students of low and high social background. The earlier tracking occurs, the less inclined are parents from lower classes to choose longer educational tracks. One explanation is that upper class parents react less to the timing of tracking, since their aim is to reproduce their social position (Breen/Goldthorpe 1997). In order to test this hypothesis, we conducted a laboratory experiment in which participants had to solve a certain numbers of anagrams in a time period over several rounds with increasing time pressure. Not solving enough anagrams would lead to a lower payoff in the end. We manipulated two factors: The first factor is timing of decision. Participants had to decide after a short time period (early decision) or a long time period (late decision) whether they wanted to continue solving anagrams. A second experimental factor was status maintenance. Half of the subjects could win money if they completed enough anagrams (no motive for status maintenance), while the other half could lose all of the money (motive for status maintenance). We hypothesize that the risk of continuing with the anagrams was greater in the system with early tracking because it is harder to estimate one's future performance (i.e. one's ability to solve enough anagrams under increasing time pressure). However, in accordance with the status maintenance motive, this should concern individuals without a motive for status maintenance more. Therefore, the difference in the rates of subjects who decide to continue between individuals with and without motive for status maintenance should be greater when decisions are made early. Indeed, we found that an early decision point reduced the overall willingness to continue but more so for subjects without a motive for status maintenance.

Mediators with Italian Characteristics. Styles, Conflict Attitudes and Settlement Rates

We analyzed a questionnaire sent to 200 mediators registered with the mediation providersof the Italian Chambers of Commerce. We sought to investigate three areas relevant to the professionalism and attitudes of the mediators: the style of mediation; the personal attitude towards the conflict; effectiveness in leading the parties to a negotiated agreement in mediation. To determine the stylistic orientation of the mediator, we tried to find out what types of behavior by respondents corresponded to his/her own style as a mediator, and the style that ideally they believed the most correct. The distribution of the styles of conflict management is homogenous even compared the experience of mediation and the number of mediation agreements.

We then probed the relationship between the variables related to characteristics of respondents through correlation analysis. There were no significant correlations between the style of mediation and the attitude of the respondents to the conflict. A second significant result is that individuals with economic education have a higher rate of agreements with respect to the lawyers. Although not by a significant difference due to the relatively small sample, respondents with a post-graduate training in economics or accounting, report rates of agreement significantly higher than those who reported a background in law, in ADR, in psychology or who do not report a post-graduate training. Finally, the anova test on the rate of mediation agreements shows a significant difference between men and women. The Italian model is legalistic, but its practical results seems not so distant from the results obtained in voluntary models. It seems that the style of the mediator might be of some use as a paradigm of orientation with respect to each phase of the process, but has no sufficient predictive value to be confirmed as a key to the functioning of the mediation

The Epigenetic Hypothesis and the Social Sciences: Socio-Legal Implications

The epigenetic hypothesis is currently the most interesting attempt to overcome the eternal dilemma between biological determinism and sociological idealism in the explanation of social behavior. Based on some empirical studies that have considered the permanent effects of poverty, war or social deprivation, it is hypothesized that environmental factors retroact on the genome and that therefore the environmental influences have an impact on an equal basis with the biological individual factors. The epigenetic hypothesis argues that genes are turned on or off, and exert their influence on social behavior, depending on the surrounding environment. This hypothesis, which began with the experiments on rodents and is still in a rather early stage, argues that human nature is not formed niether by the genes themselves, nor by cultural universals, but by "rules of inherited mental development". Behaviors acquired in response to the environment become hereditary, being transmitted to subsequent generations. This perspective is particularly interesting for the social sciences, and poses serious questions in terms of law-oriented decisions and policies.

The Production of Material Goods As Resilience Adaptation By Impelled Migrants in Malawi

Framing impelled displacement resulting from ecotourism promotion and development as a form of sociocultural and economic disaster, this study investigates the challenges faced by this new class of environmental refugees. Interviews conducted in Malawi with 153 local craftspeople and vendors show that the portability of human capital helps to ease the rural to urban transition and reduce the impact of anomie. Through the production of material goods, impelled migrants forge connections with their past while reinventing their sense of self. This contributes to disaster literature that focuses on transition processes in the aftermath of disasters and provides suggestions to improve resilience amongst displaced populations.

Negotiating Care Responsibilities for Older Parents: Intersection of Gender and Socioeconomic Status in the Case of Turkish Siblings

Negotiating Care Responsibilities for Older Parents: Intersection of Gender and Socioeconomic Status in the case of Turkish Siblings
Gulcin Con
PhD. student, Sociology, Purdue University, U.S.A
The gendered nature of care work is a topic widely studied; however, there have not been many studies focusing on gendered caregiving dynamics among siblings in a non-Western context. In this paper, I utilize within-family data collected from adult siblings participating in their parents' care in Turkey to explore gendered practices in the dynamics of caregiving when parents are in need of assistance. Analyzing qualitative data collected from two siblings in 15 Turkish families, I identify themes explaining why some adult siblings assume caregiving responsibilities to older parents whereas their siblings do not. Gendered expectations and practices are found to play an essential role in reports of within-family differences in sibling relations during not only division but also negotiation of care responsibilities for older parents. Findings reveal that in Turkish culture, the pathways to caregiving are shaped by both the gender of the adult child and the gender composition of sibling groups in regard to gender norms around caregiving and family responsibilities. In addition, these pathways are observed to be affected by the socioeconomic status of the siblings. As a result of this qualitative study, it is noted that intersections of gender and socioeconomic status create great impact on both negotiation and division of parent care responsibilities among Turkish siblings.

Paiter-Surui on Google Earth: Interative Mapping for Local-Global Sociabilities and Sensibilies on Environment Conservation

Within a research project scope which aims to investigate the online mobilization with regard to the *Convention on Biological Diversity* (CBD) in Brazil, with the systematic tracking of the Brazilian environmental public sphere vehicles and themes, a video circulated by the Paiter-Surui of the Brazilian Amazon, during the *United Nations Conference on Sustainable Development*, Rio + 20, which took place in June of 2012, called our attention. The message aimed to divulge the multimedia content on this people in the Google Earth platform, an interactive 3D modeling georeferenced cultural map, which has been elaborated to represent the Surui territory.

On the one hand, the Surui Map confronts us with a digital representation of the nature in a new sociability experience, in this case, the territory representation is expressed and propagated through abstractions, a symbolic and interactive leisure experience, which is build through informatics applied to cartographic tools, so as to "turn tangible" the articulation and the expression of reciprocal relations between nature and culture both at local and global level. This takes place with the potential to "inform" and update on the relations between the natural world and the social in the process that engenders, here and now, this territory form and composition of nature, culture, and politic transformations.

However, the map transcends such analysis revealing an "enchanted forest", shared in the Internet, which envisages the entertainment – the ludic – that incentivizes the feedback and collaborative construction, and what is constructed with representation layers that include myths, oral narratives, and images on the Paiter-Surui ways to relate with the forest. This includes expressing that their culture depends directly on their existence and vice-versa, and with this message, an invitation for reflection and dialogue. Could this be an attempt to "educate the foreign eye" favoring different symbolic perspectives toward nature?

Contested Spaces, Diverse Places: Socio-Cultural Diversity and Weather-Related Hazard Mitigation Policy in Contemporary Rural Scotland

While scholars working within the fields of climate change mitigation have moved beyond referring indistinctively to different socio-cultural groups, it can be argued that recent UK government hazard mitigation initiatives, like many other centrally-controlled hazard response developments, continues to lag behind in terms of consideration of the socio-cultural diversity embedded within contemporary rural communities that shapes local residents' responses to extreme weather hazard events and hazard mitigation policy strategies. With extreme weather-related hazard events becoming more severe, the Scottish Government has focused on increasing the adaptive capacity of rural communities through initiatives aimed at establishing local resilience committees with responsibility for

    *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

devising practical strategies to protect local citizens in the event of weather related incidents. However, the appropriateness of these initiatives for mitigating the effects of extreme weather events in contemporary communities can be questioned because they are can be argued to be underpinned by outdated assumptions about the demographic and cultural character of rural Scottish communities. In effect, this not only disempowers certain groups of local residents in their abilities to shape storm response policy development, but detracts from the practical effectiveness of local 'informal' coping strategies already embedded within local contexts. Yet, at the same time, the increasingly diverse character of rural Scotland demonstrates some need for a more formal response procedure than what can be afforded by sole reliance upon 'informal' local strategies and 'traditional' adaptation measures. Using empirical evidence derived from ethnographic research examining experiences of storm responses and policy-driven initiatives from three Scottish rural communities, this paper reveals how rural experiences of weather-related hazards and mitigation policy developments are both ground upon and affected by wider cultural, socio-economic and political factors, which are not evenly distributed within each individual locality, but which are not fully incorporated into the frameworks of existing mitigation policy.

Unpacking Sustainable Intensification: Discourses from Agribusiness

In response to the growing legitimation crisis of the conventional agrifood system, competing discourses have emerged around the general and opposing positions which can be typed as "agro-ecology" and "sustainable intensification." The agro-ecology discourse centers on honoring indigenous cultures and appropriate technologies that support a sovereign and decentralized agrifood system aligned with concepts of fair trade, while the sustainable intensification discourse continues the Green Revolution focus on high-technology solutions to growing more food on less land with more efficient use of resources to feed the world aligned with a comparative advantage framework and free trade. Using secondary data gleaned from agribusiness and trade association documents, this research investigates the particular discourses employed by advocates and practitioners of sustainable intensification, in particular the major agribusiness TNCs and their allied organizations.

Pouvoirs Contemporains, Mises En Scène, Symbolismes Et Récits : Introduction

La relation entre médias et vie politique constitue de nos jours un facteur important pour la compréhension des enjeux liés aux pouvoirs en place. Il est particulièrement intéressant de se pencher de plus près sur certains aspects du politique contemporain, qui se rapprochent intimement du processus communicationnel et des médias.

La « médiatisation de la vie politique » est liée indissociablement à la transformation du cadre politique des sociétés modernes situant progressivement la question des rapports entre médias et pouvoirs au cœur des débats. La relation entre médias et vie politique constitue de nos jours, un facteur important de la compréhension des enjeux liés aux pouvoirs en vigueur. Il s'avère particulièrement intéressant de voir de plus près certains aspects du politique contemporain, qui se rapprochent intimement du processus communicationnel et des médias et pour chacun des points suivants nous allons donner un exemple de la vie politique contemporaine :

Les mises en scènes des pouvoirs.

Les nouvelles stratifications sociales et les nouveaux pouvoirs (la gestion économique et sa médiatisation).

Les relations du pouvoir avec le sacré (rites, liturgies, symbolismes) dans les sociétés mondialisées.

Les propagandes et les récits (narrations sociales autour du pouvoir).

Le « marketing électoral » et les effets des médias sur les citoyens.

Les inégalités et les stratifications : questions de genre et d'appartenance.

Comment ces points définissent-t-ils la culture politique en train de se former ?

Giro Decolonial y análisis Interseccional: Una Aproximación Epistemológica/Metodológica Para El Estudio De Las Mujeres Latinoamericanas En España

Al momento de investigar la realidad de las mujeres latinoamericanas que han asumido el reto de emigrar a España, es posible observar situaciones que complejizan su devenir migratorio; este es el caso de factores relacionados con el racismo, la racialización e inferiorización socio-cultural hacia éstas; los cuales fortalecen los paradigmas que las sitúan desde la subalternidad. Es en este contexto, que surge la necesidad de buscar nuevos enfoques y metodologías que nos permitan aproximar a sus trayectorias migratorias consideren estos aspectos, ya que éstos cruzan de manera transversal sus historias, experiencias y subjetividades. De ahí que, para comprender estos escenarios localizamos la migración de este colectivo de mujeres desde el giro epistemológico decolonial, pues éste nos nutre de un marco teórico que permite desmontar los procesos históricos que han delineado una jerarquía de dominación sobre lo humano, y cuya base es el racismo; entendido éste no solamente como estereotipos y prejuicios, sino también como prácticas institucionales. Entonces, desde este enfoque entender el racismo nos aproxima a una mayor comprensión sobre la interseccionalidad de opresiones que se ejecutan como poder racial en el contexto moderno-colonial.

Por ello, esta comunicación presenta una propuesta epistemológica/metodológica desde el giro decolonial y análisis interseccional para desarrollar investigaciones sobre las migraciones; poniendo especial énfasis en los resultados de la investigación doctoral en curso, la cual ha profundizado en las mujeres latinoamericanas que han emigrado hacia España; y que refleja, por un lado, las múltiples discriminaciones que éstas enfrenta a raíz del racismo imperante en la estructura social y en los discursos políticos-normativos; y por otro lado, evidencia la capacidad agencial como mecanismo de sobrevivencia en contextos adversos.

Asimismo, esta propuesta podrá ser extrapolada a la realidad migratoria que vive América Latina en la actualidad.

Palabras Claves: Racismo/racialización; Decolonailismo; interseccionalidad; Propuesta epistemológica/metodológica

The Ideology of Modernity? the Study of Nationalism Between Historical Sociology and Political History

As a discipline born to tackle and make sense of the social problems brought by modernity, sociology would seem well placed to elaborate on the concept's ideological underpinnings. However, the outcomes have rarely been satisfying and most developments in this area of research have emerged from other disciplines.

The paper defends the need to incorporate contributions from kindred social sciences in order to integrate sociology's capacity to fully grasp and comprehend the broader implications of the ideological components of modernity. Building on Charles Tilly's study of 'war and state formation' and James Scott's notion of 'high modernism', it explores the ideological kernel of the concept of modernity by associating it to the spread of nationalism as the triumphant form of political legitimacy. It does so by bringing in contributions from political history, comparative history and the history of political ideologies --besides historical sociology.

The temporal focus is on the formation of the modern nation-state articulated through the ideology of nationalism, but is also accompanied by a critical attention to the rise and fall of the 'developmental state' characterized by high modernism.

This is needed, I argue, to advance our understanding of the current predicament facing the sociology of modernity in a world dominated by neoliberal impulses framed by their own ideological matrix.

Les Firmes Et Leur Management à Travers La Science Fiction / Science Fiction Stories of the Firm and Its Management

Les mondes créés par la science-fiction (romans, comics) proposent des représentations de la firme, de l'entreprise, du management. On montrera, en travaillant sur plusieurs récits, la forte politisation des récits proposés, qui vont de la défense libertarienne de l'entrepreneur et de l'entreprise (dans la lignée de

Ayn Rand) à la méfiance à l'égard d'un pouvoir exorbitant des grandes organisations (Dick, Ballard). Enfin la SF propose des images pour évoquer les dérives possibles des techniques managériales et de leur emprise sur les subjectivités et les sociétés. La SF a parfois nourri la politique (Reagan lisait assidument Rand), mais on pourra montrer aussi la forte politisation des récits qu'elle propose, et, globalement, la forte politisation de ce sous-champ littéraire.

The worlds created in science fiction stories (novels, comics) provide descriptions of firm, company and management. A variety of books reveals a high political signification of the tales displayed, ranging from libertarian defense of entrepreneurs and free enterprise (in the tradition of Ayn Rand) to defiance towards excessive power of global organizations (Dick, Ballard). Science fiction proposes images evoking the possible vicious trends of management techniques taking hold of subjectivities and societies. Sci-Fi happened to inspire politics (Reagan read Rand assiduously). The paper will focus on the high level of political convictions and expressions in that literary domain.

Feminist Struggles over Social Reproduction: In the Squares and Beyond

A new wave of democratic movements has emerged globally to challenge both authoritarianism and austerity, and the connections between them. Women and feminist issues have been central to these struggles (Moghadam, 2013; Potuoğlu-Cook, 2015). Social reproduction has formed a particular strand of feminist activism within these movements. Social reproduction refers to the unpaid activities associated with family and societal maintenance – procreation, socialization, and nurturance – as well as paid work in social sectors such as health care, education, childcare, and social services (Bezanson and Luxton, 2006; Ferguson, 2008; Federici, 2012). Socially reproductive work was visible in the squares movements in their focus on daily maintenance of life through food provisions, shelter, security, and childcare (Brown, et al. 2013; Feigenbaum, 2014).

Feminist contestations over social reproduction recognize that socializing reproductive work is an essential starting point for women's participation in the public sphere. However, it is also central to the more egalitarian gender orders and democratic social orders. Politicising social reproduction forces a larger conceptualization of both the political and the economic, and can provoke a rethinking of the core democratic demands of anti-austerity movements. Social reproduction is central to women's participation, to their democratic voice, but is also central to the content of democracy.

Since the squares movements of 2011 feminist initiatives in Spain centring social reproduction have proliferated, all with historical lineages to earlier feminist struggles. Through an empirical study of these initiatives, we seek to understand to what extent socially reproductive practices in the squares were sites of feminist contestation and have precedents in women's movements prior to the square, how they persist beyond the square in time and space, and how such practices impact feminist struggles over citizenship and political subjectivity.

The Quantified-Self Movement and Basketball: From Cagers to Cyborgs

This paper seeks to describe and survey the sociological perspectives on the emerging quantified-self movement as applied to basketball. Modern society has long adhered to self-management techniques found in cultural artifacts such as wristwatches and alarm clocks. Much of the movement is targeted specifically in the sectors of health care and bodily wellness programs. With this ever-increasing integration between material technologies and the corporeal body, this offers an opportunity to assess these trends both descriptively and from critically sociological perspectives. The paper will review the research literature regarding the quantified-self movement, while locating the movement in time and space, as applied to basketball. A review of past, present, and emerging forms of the quantification of the body playing basketball will be addressed. Further, this paper is informed by Michel Foucault's work on the body, yet it specifies bio-power techniques as exerted on the corporeal body from the corporate body. Namely, how corporations today, exert a constantly measuring surveillance system over professional basketball athletes. What sociological perspectives can best inform our understanding and use of these emerging technologies?

Social and Environmental Policies As Context for Systemic Social Innovation: Comparing Networks of Re-Use Work Integration Social Enterprises in Belgium and the UK.

This paper analyses how the historically grown institutional arrangements of welfare regimes and more recent evolutions in local, national and European policies shape the form and trajectory of social innovations. We do this by comparing the evolution and current governance challenges of two large networks of work integration social enterprises (WISE) in the reuse sector in Belgium (Flemish region) and the UK: namely De Kringwinkel (KW) and Furniture Reuse Network (FRN). Both pursue a more sustainable and circular economy, combining the aims and policy instruments of waste reduction, of provision of jobs and work experience for the long-term unemployed and the sale of low price quality second hand goods. We observe that differences between the networks such as heterogeneity in organisations and involvement in poverty reduction reflect differences in the respective countries' welfare mixes. The Flemish KW combines government supported job creation and regional waste reduction policies (setting re-use targets and incentives for local authorities), which explains the rather successful mainstreaming and professionalization of the sector. In the UK, FRN is more rooted in the charity model, makes use of short-term 'workfarist' programs and engages more systematically with the private sector while the government does little to promote re-use social enterprises and cuts funding for schemes that could enable local cooperation. This helps to explain more heterogeneity within the network in terms of professionalization and relations with local authorities. Still, due to EU legislation and directives (for instance on waste reduction) and EU level lobbying (on reuse, social enterprise and public procurement) both networks pursue similar strategies in terms of setting up new activities and raising public awareness. As for current governance challenges, we highlight the differing impact of tendencies towards more strict activation policies, austerity policies and relatedly, internal and external pressure to become self-supporting social enterprises.

COOPER, CHARLIE* (University of Hull, c.e.cooper@hull.ac.uk)

Imagining Different Ways of Working with Young People – the Utility of Utopian Dreams

A long-standing limitation in youth policy debates is the inability to conceptualise and dream differently possibilities for human wellbeing beyond what 'should be'. Mainstream social policy thinking is largely limited to 'tinkering' with the system, influenced by normative thinking dictated by a particular morality. This inability to imagine a reconstituted society ('utopia') encapsulating human flourishing is addressed by Levitas (2013) who urges sociologists to take utopia studies seriously and as offering 'a critical tool for exposing the limitations of current policy discourses ... [promoting] genuinely holistic thinking about possible futures ... The core of utopia is the desire for being otherwise, individually and collectively' (Levitas 2013: xi). Levitas' call informs the substance of this paper. It utilises William Morris' *News from Nowhere*, written in 1890, to illustrate the potential of utopia as a social science method that offers a heuristic device to encourage us to desire something better. '[W]e should understand it as the catalyst of a process, in which the reader is an active agent, of disrupting the normative and conceptual frameworks of mundane experience' (Levitas 2013: 113).

The diverse experience of an ISA audience offers an opportunity to facilitate dialogue to explore the possibilities of dreaming different ways of working with young people – beyond the current neoliberal system to what 'could be'. It is clear from the current literature, and today's difficult economic and social context, that this is an area both ripe and vital for exploration.

Stewardship: An Ethico-Aesthetic Approach to Uncertain Futures in the Valley of the Wild

In January 2010 I deployed an ethico-aesthetic technique to address urgent issues in the area where I live. Issues that are common the world over, such as climate change and environmental degradation are also issues affecting our valley, but there it is also the question of community, of community's human and non-human relations, and the ways these unfold at local and micro levels. The ethico-aesthetic technique I began to deploy is similar to Felix Guattari's notion of "ecosophy" that operates across the three registers of the environment, social relations and human subjectivity. Within our valley, processual ethico-aesthetic techniques and modes of expression demand a rethinking of relations between humans and the environment, without preference to either. Instead, they are thought and enacted ecologically, or what Guattari terms "ecosophically".

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Aesthetic machines of the type emerging in our valley are generating heterogenous events toward the resingularization of subjectivity and the aestheticization of the everyday. This project addresses processes that occur in the everyday but that can become resingularised: listening, noticing and waiting. Through this resingularisation such processes create the conditions for events to emerge collectively.

The techniques, processes, conditions and events that have occurred over the last four years will continue to become. It is from such becoming that more sustained evental conditions emerge that provide a sense of collectivity across the community, our environment and our subjectivations. Via such evental conditions, systems of durational stewardship become possible.

In other eco-art projects, the question of stewardship is present. But I suggest, through this process-based art research, that what is needed is durational stewardship, referring to ecologies of care that operate over long time scales. Durational stewardship challenges notions of relations between artists and community as it may well require artists to situate themselves within the project indefinitely.

CORMAN, MICHAEL* (Queen's University of Belfast, M.Corman@qub.ac.uk)

The Social Organization of Dispatch Operations – the "Brains" of Emergency Medical Services

Most sociological research that investigates the work of those in Dispatch Centres uses ethnomethodology's conversational analysis (CA) to explore the "joint interactional work" (Cromdal, Persson-Thunqvist, & Osvaldsson, 2012, p. 200) or "talk-in-interaction" between call-takers and callers and how this interactional work is coordinated vis-à-vis talk for the purposes of dispatching or not dispatching emergency services (e.g. police and ambulance services) (Whalen & Zimmerman, 1990, p. 467). Understanding how talk is coordinated between callers and call-takers at Dispatch Centres and describing how technologies shape the work of callers is important because there is much at stake during this interactional event, such as the appropriate coordination of emergency services. However, Smith (2005) explains, "Ethnomethodology's conversational analysis can be understood as investigating how people's ordinary talk is coordinated" (p. 60). As such, conversational analysis "cuts out pieces" of social relations for scrutiny, without a focus on the social organization that coordinates such interactional events. By focusing on isolated units of talk for analysis, "ethnomethodology and, more specifically conversational analysis, differentiates talk from what becomes its context, relegating the latter to a region that its methods do not embrace" (p. 67).

This presentation draws on an institutional ethnographic inquiry into the work of paramedics and the institutional setting that organizes and coordinates their work processes. Drawing on over 200 hours of observations and over 100 interviews with paramedics and other emergency medical personnel, I explore the work of people at the Dispatch Centre and the highly organized and coordinated environment in which they work. In doing so, I explore "what people are doing or what they can tell us about what they and others do . . . to find out how the forms of coordinating of their activities 'produce' institutional processes, as they actually work" (Smith, 2005, p. 60).

Employment Experiences in Later Life in England and the US: A Gendered Life Course Perspective

Policy responses to recent concerns over population ageing and the sustainability of public pensions tend to gloss over the considerable heterogeneity in older adults' labour market trajectories and the social and biographical factors that shape them. Indeed, decisions about work in later life are linked to gender, social position, employment and family histories, as well as being shaped by the national context in which they occur. While England and the US are both classified as 'liberal' welfare states, important differences exist with respect to family, employment and pension policies that have implications for understanding patterns of later-life labour market involvement and its relationship to health. In this paper we adopt a gendered life course perspective to understand the association between later-life employment biographies (ages 50-69), gender and health among older adults in England and the US using data from the English Longitudinal Study on Ageing and the US Health and Retirement Survey. Our approach uses sequence analysis to model labour market biographies, and regression techniques to assess their gender-specific relationships to family and work experiences earlier in the life course and to health and well-being in later life. While later life employment is gendered in both countries, stronger gender gradients are evident in England relative to the US. Between-country differences in the gendered nature of labour market involvement and its association with health are discussed in light of country specific policies across the life course.

Rethinking Youth Mentoring: Limitations and Possibilities for Youth Work

Rethinking Youth Mentoring: Limitations and Possibilities for Youth Work Abstract:

Youth mentoring is being promoted as an intervention strategy for those at-risk. Young people are vulnerable to physical and mental health concerns during adolescence and their transition from school to work; higher mortality rates; higher rates of death from drug and alcohol use; higher suicide rates; increased likelihood of premature death from disease; and greater susceptibility to the effect of worsening socioeconomic status. However, young people are less inclined than other demographic groups to seek help.

Mentoring has appealed as a means of achieving positive youth development; school-based mentoring programs have proliferated as a way of improving retention, academic performance and behavioural issues. Many countries have active peak bodies promoting mentoring and mentoring programs are being delivered by various non government organisations. However, the evaluative evidence of efficacy is mixed. While there are reports of positive effects the size across programs is modest and there appears little consensus on how to engage the highly disadvantaged. Access to mentoring programs for high needs young people is an issue where mentors are voluntary. The modest efficacy effects may suggest that taking mentoring to scale may involve inherent practical limitations. This paper suggests that current youth mentoring iterations may be being 'oversold' as a simple cost effective community strategy for dealing with complex social problems.

The paper discusses whether the broader concept of 'significant others' is a more promising reference point when recognising the limitations of current conceptualizations of mentoring. Help-seeking behaviour in young people is more likely when there are supportive social relationships, including from non-related individuals acting as mentors or concerned family and friends. The paper questions whether current strategies directed to at-risk youth should focus more on the ecology of supportive social relationships rather than traditional mentoring.

Women's Voices in Europe: Alternative, Indigenous and Dominant Intellectual Traditions

In this paper I use my own research and lived experience and the work of others I have edited to examine the impact of commonly employed western feminist frames of reference on the ways in which the production of knowledge is gendered and the ways in which gendered knowledge influences the outcomes of attempts to create gender-affirming social change. I will consider the implications of terms such as East/West and First/Third World used to designate populations and geographic locations and the consequences of applying and teaching our concepts and protocols for social change out of context. I will call attention to the ways in which concepts are modified as they travel and the difficulties we encounter in framing subject matter such as gender-based violence for study or application in ways that are context-specific yet allow for comparison and generalization. I will show that despite advances in our understanding, the creation of knowledge is gendered and its transmission occurs within gendered institutions including the academy, publishing, governmental agencies and NGOs. While acknowledging that that we are well beyond essentially all women or seeing women outside the west as radically different from ourselves, I will also show that preconceived notions as well as our own feminist values and goals can sometimes be barriers to understanding what we observe.

Refinements to the Study of the Day-to-Day Life in Organizations: Exploring a Neo-Institutionalist Approach to Doctors' Behaviour in Hospital Organizations

The evidence gathered has not yet produced a clear picture of how the institutional (i.e. macro) and behavioural (i.e. micro) relationship/link works for doctors in hospital organizations, in particular with regard to their reasons for being for or against organizational change driven by managerial values.

This article seeks to address this issue by looking at what structures the actions of doctors, in order to see possible reasons for the conflict and alliances among them and between them and? managers.

Drawing on qualitative, in-depth research conducted in a hospital organization, with the focus on doctors from two wards (one surgery and one internal medicine), differences in their actions and discourses challenge the coherence associated, as a rule, with professional values and organizational culture. Rather than denying these influences/differences, we relate them to the way the medical professionals reflexively make use of their roles in situated circumstances. In sum, this presentation discusses not only the fact that the doctors' medical rationale is crisscrossed by a diversity of influences – ethics, management itself and the organizational culture and subcultures – but also that they make reflexive deliberations about themselves and that their personal interest(s) are defined in relation to specific contexts. Theoretically, the analysis is aligned with other work on critical realism, which is expected to refine the study of organizations as inhabited spaces by adding empirical accuracy to theoretical arguments in social theory on reflexivity.

The Medical Profession Between New Limits and Values: Lessons from the Portuguese Case

The challenges of the growing exposure to the market and the neo-liberal policies generally adopted in the European countries to the governance of public services and the professions has been widely debated. One of the conclusions often referred to is the variety of outcomes across countries, particularly in the health sector, which therefore calls for comprehensive analyses focusing on such processes in different contexts.

This presentation seeks to address the situation of Portugal specifically referring the healthcare system. One the one hand, the place of health professions and their relationship with the State is still poorly understood in comparison with countries sharing the Beveridge model (e.g. UK, Sweden, Norway, Finland). On the other hand, Portugal was one of the European countries subjected to the conditions imposed by financial assistance programs with the institutions also known as the Troika, which resulted in tighter mechanisms to control both clinical and managerial procedures while public investment retracted considerably. These are usually considered as factors responsible for changing professional values and autonomy in healthcare organizations.

Based on a national scale survey to doctors (n=3442) collected in 2014, the aim of the analysis is to describe how doctors think their work has been affected by the policies applied during the bailout and to discuss possible implications to their autonomy. The doctors' response is consistent regarding greater administrative controls to their practice of medicine. However, we argue that this is not enough evidence to conclude as to new limits to medical autonomy and that medical professionalism actually can be reinforced in this context. In sum, theoretical conclusions are drawn in order to help framing this evidence as indicative of the interdependence between the State and medicine rather than simply assuming new limits to medical autonomy and deep changes in professionalism.

Cash Transfer and Social Assistance Policies Devised As Means to Improve the Consume of the Poorest in Brics Countries

The institutional history, macro politics and the ideas supported by decision-makers of particular policy areas can promote shifts in policies that go beyond incremental changes. Ideas supported by sectorial policy communities, with enough political power to promote their proposals, usually generate only marginal adjustment in policies, since institutional legacy and macro politics tend to exert decisive influence over policies. However, occasionally ideas can create fundamental change (Baumgartner, 2012).

The paper analyses the convergences and contrasts in policies promoted by governments of Brazil, Russia, India, China, and South Africa – the Brics countries – aiming to integrate the poorest in a consumer society and to reduce socioeconomic inequalities, during the last 15 years. It highlights the role of cash transfer policies – that played a major role in Brazil, India and South Africa – and social assistance policies – more relevant in Brazil, Russia, China and South Africa – to make a comparison of the ideas – values, justifications, intended objectives – sustaining these policies in the five countries. It also examines major changes and tendencies in such policies in the period. The analysis places such policies in the broader framework; since each of these countries' governments has implemented distinct macro policies (in which cash transfer and social assistance played different role) aiming to fully integrate the poorest in a consumer society. The analysis is based in a systematic review of the literature and governments' documents on these themes.

Social Assistance Policies in Brazil: The Role of a Policy Community Defending the Rights of the Citizens

The institutional history of a policy area, the macro politics and the actions of sectorial policy communities can promote shifts in policies that go beyond incremental changes. Communities refer to a limited and relatively stable number of members who share beliefs, values and a view about what should be the outcomes of policy (Baumgartner, 2013). The paper focuses on strategies of a policy community defending social assistance as a right of the citizen. Such strategies have led to structuring the Social Assistance Unified System (Sistema Único de Assistência Social - SUAS), set up in 2005, and to an impressive expansion of the social protection offered to Brazilian citizens. The research analyses: (1) interviews with decision makers in this policy area and members of the community, (2) documents and (3) the literature. It concludes that by 2005, social assistance ceased to aggregate a set of relatively disorganised actions promoted by 'charitable' individuals or organisations to become one of the most important areas of public policy in the country. It was the social area that expanded the most between 1995 and 2010 when one takes as an indicator federal government spending as a percentage of GDP. The growing importance of the area is partly due to strategic actions developed by a policy community that took advantage of windows of opportunity to advance institutional and policy changes that created a national system of social assistance and ensure the right to assistance for those in need.

La Sociología De Alain Touraine y El Movimiento De Pobladores Chileno

La trayectoria de Alain Touraine ha estado estrechamente ligada a Chile. Su influencia intelectual fue decisiva para la conformación del campo de la sociología local, sea mediante la dirección de tesis de algunos de los más importantes investigadores chilenos o a través de la circulación de su teoría y método. Precisamente esa doble influencia se plasmó en la Intervención Sociológica, el método touraniano de análisis de los movimientos sociales, realizada al movimiento de pobladores chileno entre 1985 y 1987 por un acuerdo entre CADIS (Francia) y SUR (Chile) y que concluyó que éstos no correspondían a un movimiento social, siendo incluso asimilables a la idea de un "anti-movimiento". En un contexto político en el cual se debatía si la salida a la Dictadura de Pinochet sería por una vía institucional o por una de movilización social, con protagonismo de los pobladores; algunos autores recientemente han afirmado que esta intervención sociológica contribuyó a consolidar la opción por una salida pactada al régimen, prescindiendo de los actores sociales. A partir del análisis crítico de este caso, esta comunicación pretende mostrar las tensiones existentes entre la teoría touraniana centrada en los movimientos sociales y la investigación sobre los mismos, que terminaron por mostrar la distancia entre la construcción analítica y su expresión empírica.

The Boom in Latin American Literature and the Beginnings of Globalization

The most visible of globalization has been the technological development which has generated what Castells has called "the culture of virtual reality". However, this wide and rapid technological penetration it was only possible due to the social changes they preceded him. The paper seeks to detect such social change in Latin America, on the periphery of the world system, at a time as early as the decades of 1960 and 1970 through the great cultural movement known as the "Latin American literature boom". The importance of this movement was that with some own issues had a global reach, with which several writers won the Nobel Prize, but, above all, began to be read en masse not only on the continent but in much of the world. Its success is explained by making visible processes that were hidden behind a narrative of modernity that exalted exclusively the civilizing role of an imperial European culture. Since the beginning of the conquest, Latin America began a comprehensive process transculturador as the "war of images", studied by Gruzinski, currently produced by phenomena such as the "Televisa" in Mexico and "O Globo" in Brazil, or processes management rationalist in the cities, according to Romero and Rama, that they have been phenomena such as Buenos Aires and Mexico city at one end, or as Bogota and its urban network, on the other.

The Debate on the Post-2015 Global Agenda. Civic Participation from the Local to the Global.

During the last years an International debate ocurred around the Millenium Development Goals (MDG) and to define the Agenda Post -2015, now called the Sustainable Development Goals (SDG). Very different actors both from governments and from civil society were part of this discussion and participated in this debate, seeking to influence the orientation. The level of participation gotten, became this in one of the global debates around the "common worries" about poverty and sustainable development. As part of this process, the initiative "Participate" had an active role in this debate, like a space through which numerous organisations of Civil Society and academic institutions working in 29 countries, were able to be involved in this global debate from their work at local and national areas.

For this purpose, the Initiative developed some methodologies oriented to do participative research that present the perspective of the Citizenship participation and of the accountability for sustainable development, seeking to take the perspective of people living in poverty and exclusion in very different societies around the World.

In the paper it is presented a reflection on the experience of this initiative, their origins and development, considering what this initiative mean, and what are some of the lesson that we have learned, and that could be considered in similar initiatives for the future. The work is based in the participation that the author have had in this initiative as one of the participants of the Participatory research Group and as a member of the Steering Comite of this Initiative.

The Colour of the Resistance; Is It Red, Purple or Green? the Grassroots of the Eco-Feminism in Gezi Resistance

We are in the war with black. Biased creatives are manipulating the colours. They are putting on the screen a black ninja and an orange victim. This manipulation and by the control of the perception, small children are running out with the knifes and behead their brown teddy-bears. We are in the post-communication era. The colours are so saturated, lively and garish. The image is powerful in HD; high-definated times.

If we have the definite screen as a member of "society of spectacle", we are looking and seeing the plastic colours but if we were the initator resisters from the beginning; for example read Bookchin and practice ecology and be aware of the global environmental crisis, what if the colours look like?

Gezi resistance in 2013 in İstanbul, it was an unique uprising in Taksim square and for 15 days a commune experienced in the center of the city. There were different social resistant groups, even the feminists which represented by purple or the socialists with red, LGBTI with the rainbow…

Gezi protesters were talented and avant-garde in art. They drawed and coloured the stairs, the walls, the city in every colour. The state colored back in grey. The police was like against to the all colours of the world. What is the war of the colours? What are their symbolism? The purple's, the red's, the green's in the park… Which contains the other? And if the words come into the social movement, can be told any organisation for a political participation which contains the true colours? What is the junction point of the green movement and purple representation of feminists in Gezi resistance? We have to examine the grassroots of eco-feminism in Turkey and their methods for activism in the light of the road to the Gezi experience.

Beyond Network Structuralism: Weaving Webs of Publis in ART-Activism.

Within the research field who investigates social networks' role in mobilization, we can identify an emerging research strand that is moving beyond the understanding of networks as organisational and communication structures (Kaun, 2014; Barassi, 2013; Gerbaudo, 2015). While each of these contributions develops its counter-narrative to network-structuralism, they converge in stressing the cultural dimension of networks as spaces of negotiation of meanings and identities. This proposal tries to understand networks of protest as webs of "addressed" publics, applying notions developed in media research (Dayan, 2005; Barnett, 2003) to the study of social movements. The paper focuses on Macao who is part of the Italian network of occupied cultural spaces and an active participant in the informal and international network of art-activists since May 2012. In Macao's first phase, strategies of mobilization were inspired by what it has been previously defined as "eventful logic" (Cossu e Murru, 2016), within which a wider and inclusive public was addressed through big and resounding cultural events around the city. Through such events, Macao publicly offered itself as the liminal space where the insurgence of the unexpected into society was possible. Our contribution here focuses on Macao's stabilization phase during which wider summons of general public are replaced by targeted strategies aimed at creating webs of identified and circumscribed publics. Our research aims at identifying and classifying the heterogeneous publics addressed by Macao in its last year through a multi-method approach that combines critical discourse analysis applied to their digital production (blog and social media) with interviews to key activists that define their communication strategies. Such methods will be triangulated with research techniques inspired by the "digital methods" approach (Rogers, 2013). It is argued that understanding networks as webs of "addressed" publics allows to rescue both the collective and the symbolic dimensions of digitally-enabled contentious action.

Norbert Elias and Psychoanalysis: The Concept of Figuration in the Clinical Practice.

The influence of Sigmund Freud's psychoanalysis in the work of Norbert Elias is notorious and recognized by the sociologist himself. The Freudian thought grounds the thesis about the civilizing process, according to which social norms are internalized by individuals, leading them toward a differentiation with others at the expense of the repression of drive and affections. According to the idea of the civilizing process, we should not think on social structures as static, but always consider them as subject to a long-term development. We also should not think on acts as due just to individuals, because individuals are part of a network of relationships. For psychoanalysis, the individual cannot be thought out of social ties, as well as social discourses should be understood through subjective processes. In turn, the concept of figuration shows that individuals are in relationships of interdependence with each other, allowing the dissolution of the antithesis between individual and society. Figuration is a concept that Elias applies in sociology, but can be extended to every discipline that works in the perspective of understanding the human being within a network of relationships and interdependencies, beyond a structure closed in itself. In this paper, we propose to consider how the concept of figuration can contribute as an operator for the field of psychoanalytic practice. So, we will seek to articulate psychoanalysis and Norbert Elias's sociology through the concept of figuration as a methodological operator that helps us understand the subjective processes in psychoanalytic practice. Jacques Lacan's psychoanalytic theory will contribute to our research through concepts such as discourses and social ties. For Lacan, the unconscious is the politics and his theory of discourses show different forms of production of subjectivity.

Can Austerity Also Aggregate? Discourses and Responses of Trade Unions and Socio-Occupational Actors

As a result of the Eurozone crisis, "austerity" became the overwhelming issue of Portuguese industrial relations system. Particularly since the end of 2010, labour relations were affected by measures of employment liberalization, with implications for working time, contractual arrangements, rules for dismissal, etc. Consequently – and also because of a resurgence of old "materialist" values centered on employment issues and protection of labour rights (Estanque, Costa and Soeiro 2013: 33) –, new synergies between trade unions and other socio-occupational actors/movements were stimulated.

In order to discuss last years' struggles against austerity, we have a double goal. Firstly, we want to characterize the old trade union actors that historically defended labour rights (CGTP and UGT, the main trade union confederations) in order to highlight their discourses on the crisis. The same exercise in proposed with the new socio-occupational actors like FERVE (Fartos Destes Recibos Verdes, Fed up of these green receipts); MayDay network; Precários Inflexíveis (Precarious Inflexible Workers). Secondly, we compare the episodes of "traditional" social conflict (strikes) with the "innovative" social conflicts and broader social protests.

In our analysis of the strikes, we focus on: a) five general strikes (between 2010 and 2013) organized by CGTP and UGT and also on b) the 2014 workers' strike in a specific precarious sector (employees at the "Saúde 24" medical helpline), which provides scope for an assessment of the challenges facing trade union activity and reflections on new ways of organising social conflict. On the other hand, our analysis of broader social protests if focused on demonstrations (12th March 2011, 15th Sept 2012; 2nd March 2013) directly oriented to the denunciation of austerity and to the defense of Social state. By doing this, we identify both the basis for alliances between trade unions and social movements, and the old cleavages between them.

CARNEIRO, BIA (University of Coimbra)

Changes in Labour Law and Devaluation of Labour in Portugal: Critical Perspectives and Prospects for a New Labour Regulation

Especially since 2008, public authorities and lawmakers across Europe have taken steps to make labour markets more flexible. According to Clauwaert and Schömann (2012), two types of measures were adopted: a) transitional measures, mainly related to working time (increase in working hours or reduction in overtime payment) and atypical employment contracts (fixed-term; part-time; temporary agency work); b) permanent measures, related to redundancy rules (e.g. reviewed definitions for collective redundancies; flexibilisation of existing regulations) or the trends to decentralize collective bargaining and the progressive weakening of trade union representation.

Portugal was not immune to such changes. Accordingly, and based on the research carried out within the Observatory on Crises and Alternatives, our goal is threefold:

i) first, we intend to systematize the main changes in labour law in order to propose a measurement of the income transfers from labour to capital (on this purpose, and among others, some figures concerning overtime work are presented);

ii) we then identify and classify the main forms of precarious employment in Portugal (which the debt crisis helped to exacerbate), as these enhance the weakness of regulatory mechanisms oriented to the world of work. Our analysis will be focused on fixed-term contracts, "green [self-employment] receipts", involuntary part-time work, temporary work, and state-induced precariousness;

iii) finally, we list a set of priorities for the world of work that should involve political, economic and social actors. In this sense, a prospective exercise necessarily involves the contribution of the main actors of the Portuguese industrial relations system: government, employers and trade unions.

Social Responsibility and Police Forces an Investigation about Values and Practices Developed in Brazil and Portugal

The theme of social responsibility in security forces yet is little explored. In our view, this fact occurs because some academicians and politicians believe that introduction of the management models typical of private sector in the public organizations would conduce to the destruction of social state model implemented in Europe.

Many studies developed in the security area associates defend the social responsibility as being the obligation of police forces to prevent the crimes and the extreme violence situations.

The extreme use of violence by the policemen in the United States, especially against African and Latin American communities in 70th decade, conducted the security organizations to reinforce the human rights (Valente, 2011) in its doctrine as well as in its graduation plans.

As consequence, the polices were going to privilege pedagogical initiatives (Balestreri, 1998) that contribute to the prevention of crimes (Avina, 2011) to ostensive interventions that use violence and fire guns to combat the crime and the violence (Serrano,?:112).

After 2003, different police forces in Europe and South America reinforced the ethical principles (Gregori, 1998) in (Balestreri, 1998:2) in its strategic and operational choices (Stephens and Millen, 2012:1).

Until now, there aren´t any normative orientation on social responsibility to police forces in Brazil and Portugal. Despite, they are creating departments and internal agendas to support initiatives developed in areas as social, environment and prevention of crimes.

We propose in this study discuss how the concept and the practices of social responsibility are being implemented in police forces of Brazil and Portugal. The outcomes would contribute for the developing of new scientific knowledge and for the clarification of potentialities, difficulties, opportunities and threats of this practice.

Understanding Families Beyond Ruler and Square. Advances in the Use of the Genogram in Family Sociology Research

As many people enjoy telling the story of their family, to design genograms has never been easier than today. Nonetheless, genograms seem to be used mostly in the anthropology of kinship, psychology, nursing, family therapy and counselling, with a restricted use in the sociological practice. This paper aims to present the familial genogram to a wide audience of family sociologists and to illustrate and explore its possibilities within the framework of qualitative strategies adapted for the sociological inquiry. A genogram is a graphic representation of a particular family, desirably involving more than one generation. Using symbols and standard rules, it synthesizes multiple data ranging from the genetic aspects, medical, social, behavioural, relational and cultural while providing an account of the family structure, its functioning and dynamics. Used either as a data collection technique, usually together with a semi-structured interview, or as a data analysis procedure, it allows the researcher to review at any time relevant information about the interviewee (ego), in particular, demographic data, pathways of conjugal and parental life, both for the ascendants and descendants. Despite being a static representation of the family, whose understanding requires the knowledge about certain rules and symbols, its analysis is very fast and extremely intuitive. Additionally, designing family genograms nowadays does not have to be a difficult task of using pencil, ruler, square or graph paper. Specific software (e.g. GenoPro®) exists to turn the task easier and more professional while allowing for a rapid and friendly incorporation of results in research reports. Using empirical illustrations from previous work, this paper ultimately seeks to (re)discover genograms within the field of Sociology of Families and, thereby, contribute to broaden the array of commonly employed qualitative research methods within the field.

Downsizing Exclusion, Bringing Inequality Research Back in

Due to its empirical self-evidence and political appeal, the concept exclusion has been vastly applied in social research as well as in public policies. The paper makes an argument against this elastic use of the concept in two steps. Initially, building on knowledge accumulated within inequality studies (C. Tilly, G. Therborn, R. Kreckel), it defines exclusion as one of at least six mechanisms of reproduction of inequalities, also including hoarding of opportunities, distanciation, hierarchisation, exploitation, imposition of environmental risks. In order to empirically illustrate this argument, the paper examines, in its second part, the national programs to promote racial and gender equality in Brazil. Focusing only on discrimination/exclusion, both programs have been unable to mitigate socio-economic and power asymmetries between blacks and whites and women and men.

COSTA DE OLIVEIRA, RICARDO* (Universidade Federal do Paraná, ricardocostade.oliveira@gmail.com)

Political Families in Brazil and India. Social Structure and Hereditary Power

Brazil and India are BRIC countries and they share some common features. They are big countries with large and complex societies. Brazil and India are democracies with relatively competitive political party systems and "free" regular elections. We can observe different forms of political background of Brazilian Congressmen and Indian Members of Parliament. Family is a very important factor in the politics of both countries. We can find political families in Brazil (Na Teia do Nepotismo, Ricardo Costa de Oliveira: 2012) and in India (India: A Portrait, Patrick French: 2011). Nepotism and strong social inequalities have been historical processes in both societies. "Longue Durée" structural inequalities like Colonial Slavery in Brazil and Castes in India were long-term historical structures with pre-modern forms of socio-political stratification. The quest for modernization and citizenship. How political dynasties or political families are interacting with the political and judicial systems in both democracies. The different conceptions and elites building the Nation-State in both countries. How the social classes or social groups are affected by the power families and forms of nepotism present in almost all political and social institutions of Brazil and India. Trends and challenges. Age, gender, ethnic and regional features are also related to some politically hereditary conditions of access to the Legislative Power in many empirical cases to be investigated, analyzed and described.

Toward a Critical Interactionist Approach to Emotion-As-Practice

Over 35 years after Hochschild (1979) and Shott (1979) each published ground-breaking work theorizing a sociology of emotion, the field has blossomed in unexpected ways with new theories and empirical applications. Of course, critique has also been a healthy part of this development. As part of that critique, Emirbayer and Goldberg (2005) call for an "emotional sociology" rather than a sociology of emotion, which attends to how "matrices of emotional ties or transactions are ordered, how they are put together from within, and how they operate" (497). While they primarily focus on the study of social movements and the role of emotion as a *catalyst*, their synthesis of pragmatist philosophy with Bourdieu's theory of social practice make for a compelling critique of the dualisms inherent in current theorizing of emotion and society.

Following their call, this article aims to develop an emotion-as-practice perspective that transcends underlying dichotomies within social theory, synthesizes previous theoretical approaches within the sociology of emotion, and makes the study of emotion more applicable to various facets of the sociological endeavor, including the role of emotion in perpetuating social inequalities. We draw on the work of Pierre Bourdieu to theorize emotion as the non-conscious (potentially conscious or unconscious) modes of engagement/being that infuse and emerge from structural conditions, social interactions, and internalized dispositions. Feelings exist in tandem with information. As the line between reason and emotion is blurred, both infuse each other. Applying this conceptualization to healthcare—an area of general sociological concern, we flesh out a critical interactionist approach to emotion-as-practice using data drawn from 48 nurse diaries. Our findings push for a new conception of emotion as structured, as well as fluidly absorbed, channeled, and transformed into other emotions, cognitions, and actions within every day social practice.

Building Alternative Infrastructures for Digital Communications: Technoscientific Activism in the Italian Wireless Community Network

Wireless Community Networks (WCNs) are grassroots emerging infrastructures of communication, build up at local level by activists as political and material alternatives to the hierarchical global governance of the Internet (Chenou, 2014)**.** WCNs are raised by groups of people rooted in media-activism (Carroll and Hackett, 2006) and engaged in the implementation of a non-profit infrastructure, which is developed through the cooperation of activists, including scientists, hackers, and lay-people. Technically, a WCN is a decentralized infrastructure for digital communication, alternative to commercial Internet Service Providers, that allows interconnecting a community of people sharing a set of goals, beliefs, and political identities, and resulting in radical criticism of the contemporary governance of Internet.

In this paper we present the outcome of an on-going qualitative research (articulated through in-depth interviews, ethnographic observation and document analysis) focussing on the multi-dimensional processes of democratic involvement and technoscientific activism of the Italian WCN named Ninux.org, started in 2001 and composed by more than 320 interconnected nodes.

In the presentation we will particularly unfold the cultural, political, and technological issues raised by the Ninux.org project, highlighting how these different aspects are strictly interwoven each other, and can hardly be understood as separate dimensions. Thus, we will pay attention to the relationship between the various actors involved in the project, highlighting how the WCN is the emerging outcome by the cooperation of members involved in a process of mutual-learning and of sharing of scientific expertise and political outlooks.

In this sense, we ends up describing the WCN as an "heterogeneous" (Law, 1987) innovation process, in which technical, political, material and cultural aspects interact recursively each other, and where the democratic involvement of media-activists and scientists is crucial to materialize a political project into an innovative model of the digital infrastructure.

Health Workforce Evidence Informed Policies? Portuguese and Brazilian National Policy-Makers' Perspectives

In most policy areas, there is significant evidence about research that is not used or not used in a sufficiently timely manner to inform policies. There has been a surge in the production of knowledge on health workforce (HW) issues since 2000, with the creation of Human Resources for Health Observatories, initially in South America, and gradually in other regions of the world. However, integrating the results of research in the policy-making process remains a challenge. For instance, how can research on making the HW more effective/efficient contribute to the objectives of strengthening the health systems and reducing health inequalities? We analyzed what explains how and why research knowledge was or was not used to inform policy decisions/interventions affecting the HW.

We analyzed education and management policies/interventions in two different health care systems with distinct political and institutional environments (Portugal and Brazil), but which have cultural affinities and similar commitments to providing universal access to health services to their population.

We conducted semi-structured interviews with present and past national policy and decision-makers directly or indirectly involved in HW policy and management, as well as "producers" of evidence; the only selection criterion is to be available to participate. The key issues explored include conditions of access to evidence; strategies of communication and dissemination of evidence; influence of political, social and economic context on demand for and utilization of evidence; measures to overcome the gap between research and policy-decision. We will focus on what utilization is made of sociological knowledge on professionalism in the design of policies/management practices in relation to physicians and nurses. The comparative analysis will allow us to understand the influence of the social, political and economic factors in the process of research utilization in decision making process through the perspectives of political actors involved.

Age, Sex, and Happiness Among Men

We use pooled General Social Survey data (1989-2014) to study the effect of frequency of sexual activity on subjective wellbeing (happiness) in the U.S. Prior research has found a general positive effect. However, we do not know yet how the effect differs by gender and age group. We hypothesize that frequency of sexual activity has a larger impact on happiness for younger persons and for males. Hence, younger males should see the largest happiness increase. Furthermore, we hypothesize, that sex still remains a significant predictor of happiness among older males. In our analysis we aim to discover at what age, on average, sex ceases to be a significant predictor of happiness—we hypothesize that at some point sex is not important for happiness. Furthermore, we expect a nonlinear effect, specifically, diminishing marginal returns—having some sex rather than none is more important for happiness than having a lot of sex. Controls include race, marital status, children, perceived health, socioeconomic status, region, and place of residence. We examine whether age also conditions the effects of these variables.

Exploring the Affective Dimensions of Videogame Play with Deleuze and Guattari: An Analysis of the Player's Investments in Hegemonic Narratives

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Videogames are a unique media form, and require an equally unique language to understand and interpret them. In this paper I turn to Deleuze and Guattari's non-representational philosophy to develop a conceptual toolkit for thinking anew about videogames and our relationship to them. Rather than approach videogames through a language suited to other media forms, the paper invites us to think in terms of a videogame plane and the compositions of developers and players who bring them to life. Accordingly, we are not simply playing videogames we are creating them. We exceed our own bodily limitations by assembling forces with the elements comprising them. Beginning with the question 'What is a videogame?' the paper, drawing on my book *Exploring Videogames with Deleuze and Guattari*, develops a critical methodology for interpreting the form and also the player's affective investments in games that reinforce hegemonic myths and gendered and racial stereotypes. Of sociological importance, here I discern between those in which the player is active in advancing hegemonic narratives and those in which only the non-playable segments are framed in such ways.

Going Back to the Future of the Culture Industry

The concept of the culture industry, introduced by Theodor Adorno and Max Horkheimer in their 1944 book *Dialectic of Enlightenment*, explains why under conditions of servitude people identify with interests to whom they ought logically to oppose. Their focus is not culture industries as such but rather the adaptation of factory-style techniques to aesthetic production for the purposes of exchange. This leads to the standardisation of culture and the reification of easily reproducible, interchangeable and marketable artefacts, be they films, music, paintings, celebrities and so on. Familiarity is key to popularity. By seeking out and consuming the ever same, the aesthetic sensibilities and intellectual capacities of the individual are stunted and they regress into a childlike state. To engender novelty minor variations are factored into cultural production. By identifying with and recognising his or herself in these novelties, the person becomes a pseudo-individual with anything substantive liquidated.

Rather than consign the culture industry thesis to history, the paper will claim that it was ahead of its time and is indeed relevant now. Taking into account new technological developments, the sphere of Internet communication in particular, it will be argued that the thesis is also useful when speculating on the future. Gilles Deleuze will be enrolled into this task.

"Bottom-up" Europeanization and Transnational Civil Society Collaboration: Examples from the Refugee Crisis

The ongoing refugee crisis has been characterized by an overwhelming amount of tragedy, and the EU's inability and partially also lack of political will to find a fitting solution for the problem. As attempts to reach an agreement on a quota system fail, and as more and more people make their way through different EU member states, civil society has become an active player in the public reception and evaluation of the issue, especially through the use of social media. While the lack of a European public sphere is often criticized, activists are creating and using this sphere for their projects. People willing to engage are able to connect in a low-threshold, local, and interactive way, while also keeping connected to similar movements in other EU countries. This process of connection and collaboration can be regarded as an instance of "bottom-up" Europeanization processes, in which national and subnational actors work together transnationally to reach a common goal. Social media as fora for exchange allow efficient communication, present a possibility to directly lobby the decision makers (e.g. local politicians), and provide an apt tool for the planning of collective actions. The present paper aims to look at how "bottom-up" Europeanization and new possibilities for collaboration through the internet as a transnational, open forum for discussion have influenced public debate over the recent months, as well as if and how a transnationally connected civil society may also be able to lobby the European level for a common approach to the issue.

"Otherness" As a Prerequisite for Self-Identification? Europeanization and Identity Change Regarding National Minorities

My paper aims to address the paradox of identity continuity and identity change regarding different national minorities in 'old' and 'new' (post-2004) EU member states, and to shed light on how Europeanization processes may influence these developments. For national minority groups, an identification as being "different" from the majority population is essential, as its different characteristics (e.g. in language and culture) provide the basis for the demanding of group rights and safeguarding measures. Keeping a distinct minority identity is therefore important for its long-term goals of preserving its identifying, differentiating features. On the other hand, minority identity does not exist in a vacuum, and is heavily influenced by socio-political processes of change, such as European Integration. I therefore argue that identity continuity and identity change are not mutually exclusive concepts, but rather that they precede, overlap and complement each other. I aim to look at the conditions under which identity becomes permeable, and on how shifts in emphasis on minority identity take place. The German-speaking minority in South Tyrol (Italy), the Italian minority in Istria (Croatia) and the German minority in Silesia (Poland) will serve as case studies to illustrate these developments.

'Londongrad': A New 'Home' for 'Migrants' from the Post-Soviet Space?

This paper seeks to uncover whether and how London turns into 'home' for post-1991 'migrants'. It draws on a qualitative research investigating migration trajectories of professional women originating from the post-Soviet space. Therefore, firstly, a regional perspective in understanding migration will be conceptualised as the alternative to methodological nationalism and ethnicity-centred approaches in migration studies. Its strengths and weaknesses will be discussed. Secondly, gradual and smooth moving to London will be explained through previous experiences of mobility, 'urbanity' factor, re-migration and living 'in-between-cities' phenomenon. Thirdly, women's pre-migration expectations and initial impressions about life in the UK/London will be compared with 'stabilizing' feelings and thoughts about new 'home'. Finally, their preferences for living in London as well as plausible future mobility scenarios will be analysed. Overall, this paper should reveal whether these women feel themselves as 'migrants' in so called 'Londongrad'.

The Quest for a Violence-Free Future: Drawing Visual Connections to End Men's Violence Against Women.

The past four decades have seen building momentum in global and local initiatives to address the 'wicked problem' of men's violence against women (MVAW). In 1979 the United Nations General Assembly adopted the *Convention on the Elimination of all Forms of Discrimination Against Women*, now ratified globally by all but seven states. In 1996 the World Health Organisation (WHO) declared intimate partner and sexual violence as a global public health issue. Amnesty International launched a campaign to stop violence against women in 2005, and in 2011 Australia implemented the *National Plan to Reduce Violence Against Women and their Children (2010-2022)*. Current statistics indicate an average of one in four women has experienced male violence; in some countries the rate is 70% (WHO, 2010). As yet, there is little evidence suggesting this issue is retracting. Even so, feminist activists retain hope for a future free of MVAW. Prevention campaigns have made widespread use of visual imagery to convey messages through popular media, such as print and television, and social media has now become a key platform. This presentation draws on the case study of a social media initiative led by a regional women's health organisation in southeastern Australia, known as 'Make the Link'. The campaign involved the development of a set of posters for display in workplaces, which are designed to challenge beliefs about the origins and nature of MVAW; image-based messages are also conveyed through Twitter, Instagram, and Facebook. In this presentation I will critically reflect on the various, multi-dimensional visual devices employed in 'Make the Link'. A key line of inquiry will be exploring how a positive 'future vision', ie. a violence-free future for women and children, is founded on faith in the power of the visual to shift deeply entrenched gendered attitudes and practices.

Integrating Complexity into Research on Rape Culture on University Campuses

　　*** denotes a presenting author.*　Abstracts are organized by first presenting author's last name.

Recent incidents in Canadian universities have highlighted the problem of "rape culture" on university campuses. We are seeing renewed interest in improving the institutional response and efforts to prevent future events and improve campus safety. This paper argues that our efforts will continue to have little effect unless we integrate lessons of complexity theory into our work.

Those who write about complexity compare simple, complicated and complex problems. Simple problems are characterized by repeating patterns and linear, cause and effect relationships. These problems may be addressed based on facts and "best practices." Complicated problems require expertise to uncover the less obvious cause-effect relationships and underlying patterns. While there may be more than one solution to a complicated problem, the resolution is still driven by facts. Complex problems present as "fluid and unpredictable" (Snowden and Boone 2007:7). They require innovative responses and creative methods to uncover patterns. Fixing a Ferrari is a complicated problem but fixing a rainforest is complex (Snowden and Boon 2007).

Given the context described above, "rape culture" is complex. Despite the proliferation on programs and policies, reports of sexual violence and manifestations of "rape culture" continue to take place on campuses across North America. In my view, the research underpinning the responses to has not approached "rape culture" as a complex phenomenon.

This paper describes the findings of a project that involved university students in a participatory research project to explore how they how they understand, negotiate or make meaning of rape culture. This project has adopted innovative research tools specifically developed to capture and analyze large amounts of narrative date in complex contexts. The preliminary results of the project suggest new ways to tackle the problem of rape culture on university campuses.

The Rise and Decline of the Business Roundtable: Large Corporations and Congressional Lobbying

The US Business Roundtable provides an interesting extension of the legitimising claim that think tanks act above particular interests as expressions of a common or national interest. While explicitly advocating the interests of the largest US corporations, the Roundtable simultaneously embodies Charles Wilson's popularly interpreted dictat "What's good for General Motors is good for the country". Where more broad-based business-based associations such as the Chambers of Commerce were unrelenting in opposing government restrictions in virtually any form, the Business Roundtable was much more selective, pragmatic and ultimately effective through the 1970s, 80s and early 90s.

Mark Mizruchi argues that the success of the Roundtable and other business-based interest groups and think tanks during this period actually generated the hysteresis apparent in contemporary US government, ultimately undermining the ability of such lobbies to act collectively. But in this chapter I challenge this proposition through an examination of the dual strategies used by large corporations in the US to represent their interests.

Previous research on corporate engagement with think tanks and lobbying has concentrated on interlocking directorships, membership of collective groups and contributions to political action committees as indicators of corporate unity and proxies for government influence. But lobbying disclosure returns, mandated over the last decade, provide a large untapped source of data on the efforts of corporate representations to Congress in considerable detail. I employ social network analysis to identify the distinct channels of representation used by large corporations individually and complementarily to pursue a variety of issues with Congress.

I find that participation in think tanks such as the Business Roundtable is one mechanism of representation that complements rather than contradicts more direct political representation by individual corporations themselves and that collective action is still evident with respect to congressional lobbying by large corporations.

CROTHERS, CHARLES* (AUT University, charles.crothers@aut.ac.nz)

Theorists Views on Variations in Futures & Their Confrontation with Evidence

To the considerable empirically-orientated sociologies of the varieties of capitalism and of welfare states there can be added an emergent – more theoretically intense - sociology of the varieties (or multiplicities) of modernity and likely trajectories into the future. This literature encompasses an array of social theorists' attempts to depict the essential features of the contemporary and its futures and to conceptually isolate possible trajectories. Not only does this array of views require more attention than available summaries seem to provide, but reaching

out towards more systematic empirical research would be helpful in advancing this highly important face of sociology.

Theoretically-charged conceptualisations of the contemporary often exaggerate its emergent future features in order to state their thinking more dramatically. Examples include discussions of late/liquid modernity, pure intimacy, 'risk society', mobilities etc. and more generally various views of the processes of globalisation, Westernisation, Americanisation and Europeanisation.

Relating these theories to contemporary social reality through marshalling available evidence is useful in:
- helping pin down the meanings of the theories
- estimating the actual extent to which the phenomena pointed up pertain contemporaneously
- establishing what people want to see in their future societies.

In this paper the work of relevant theories is combed to reveal the evidence they produce and recourse is then made to data concerning contemporary realities and future preferences from surveys including the Pew Global Attitudes and trends surveys, the World Values Survey and the UN's Sustainable Development Goal (My World) Survey.

The result is a theoretically-based, but empirically-informed set of views about the cotemporary social world and its possible trajectories into the future.

SANZ-MENENDEZ, LUIS (CSIC- Institute of Public Goods and Policies)

The Changing Role of Research Councils in Public Research Systems: Argentina and Spain in Comparative Perspective

The aim of this paper is to compare the evolution of Public Research Systems (PRS) of Argentina and Spain, focusing on the changing role of their main Public Research Centers (PRC) –the National Research Councils (CONICET and CSIC)- as well as their relationships with the universities within each PRS. A radical transformation of the Governance of PSR has occurred in the two countries, but the outcomes appear quite different.

After the transitions to democracy the general socio-economic features and the PRS in both countries were relatively similar. Government owned research centers had a bigger role in research than universities.

Both countries and their PSR have evolved in similar ways and have been affected by similar economic cycles, ups and downs in the available resources for research, expansion of the university roles in the PRS, separation of the competitive project funding from the mission of the Research Councils (kept as research performing organizations), etc.

However, there are also significant differences. In Spain, there has been a process of federalization, with an increasing role of the Regional Governments in promoting independent S&T policies, increasing the funding plurality in the system, and promoting their own Higher education policies, while in Argentina, the higher education policy is still a national competence and the promotion of new universities has not resulted in more competition among the elites.

While the Spanish PRS has become more pluralistic and competitive, with loss of centrality of the CSIC, in Argentina the CONICET has been able to remain as a quasi-monopolistic player in the PSR. We argue that understanding governance and research career structures is essential to understand the changes roles of both PRC in their own PSR.

Protestant Ethic, Religiosity and Migration in Hungary at the Reformation 500th Anniversary

The church sociology research group of the Károli Gáspár University of the Reformed Church in Hungary has conducted a large-sample survey research during the summer of 2014 in eight locations in Hungary, reaching out to 1456 adult respondents and during the summer of 2015 in five locations in Hungary, reaching out to 887 adult respondents. Though in the study we applied a random sampling of households only on the level of the pre-selected settlements, the findings plausibly reflected the social and cultural characteristics of Hungarian townships below 25.000 with a partly secularized population of a multi-confessional background. The survey questionnaire included variables inquiring about social-demographical background (gender, age, school attainment, labour status, subjective perception of social status and income), religious identity and behaviour, denominational affiliation, as well as several indicators of faith and belief. Furthermore, the study put a special focus on subjective well-being, life satisfaction, physiological and mental health, too.

We aim to scrutinize faith values and belief as well as the mental and psychological well-being of those asserting an uncertain religious identity, either through

*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

self-identification (i.e. classifying themselves as „religious in their own way") or showing loose ties to traditional institutionalized religiosity through their religious behaviour. We will examine whether an internal structure of faith and belief is related to religious behaviour, religious identity and self-classification. Our focus is on what is behind religious identifications and how it interacts with subjective well-being and mental health, a key function of religious affiliation according to previous research. Thus, our findings will contribute to the research into understanding the meaning of the category „religious in their own way" and also the changing role of religion in contemporary Hungarian society.

Self-Legitimacy and the Military Police in the State of Sao Paulo – Brazil

International researchers show that the interactions among police and citizens are expected to affect the legitimacy of police institution. In this process, procedural justice judgments regarding officer's authority play a central role: if officers interact with public in a procedurally fair way, citizens become more likely to accept police decisions and cooperate with the police. Recently, the debate over the legitimacy of the police has broadened the perspective of citizens and have been focused on the perspectives of 'self-legitimacy' or 'internal legitimacy', defined as the level of confidence that an officer has about his or her own legitimacy—feeling worthy or not worthy of his or her authority. It is an ongoing process of dialogue between police and the population as well as within the police organization itself. This approach may help to identify the reasons why authorities mobilize their political power, as well as their internal beliefs in their moral right to exercise such authority. In Brazil, great expectations for the development of democracy have not been fulfilled mainly in the public security field. The democratic Constitution of 1988 established the policing model during the return to democracy, but little changed polices of the dictatorship, it maintained two police forces which divide the activities, one of them being militarized. The Military Police is responsible for patrolling the streets, organized as a military-based rank structure, with a very strict hierarchy divided in two ranks, each one with different process of selection and training. Based on complaints registered by military police officers in Police Ombudsman of the state of São Paulo, the current paper discusses practices and procedures that expose internal models of authority, and problems and weaknesses of the institution which lead to questions about democratic policing and self-legitimacy in a militarized structure.

CUERVO, HERNAN* (The University of Melbourne, hicuervo@unimelb.edu.au)

Using Iris Marion Young to Discover the Meaning of Justice for Rural Students and Teachers

While social justice is a contested term but usually invoked as an explicit concept, research studies looking at how rural school participants make meaning of it is rare in the educational literature. This seems surprising given the different well-documented inequalities endured over time by rural schools (e.g. lack of breadth of curriculum; staffing shortage; deficient infrastructure and cost of services; and students' educational performance). This paper examines what social justice means for teachers and students in public schools in rural Australia. It draws on data from a qualitative study using focus groups and semi-structured interviews with 40 secondary school students and 24 teachers in rural places in the state of Victoria. I draw on the prolific work of Iris Marion Young (1990, 1997, 2000, 2001, 2006) to construct a plural model of social justice that overcomes the shortfalls of the liberal-egalitarian model -which usually equates social justice solely with distribution of resources- to include the dimensions of recognition and participation. Drawing on the data and on Young's theory of justice, the paper answers the following questions: What does social justice mean to rural school participants? Can we learn what is happening in rural schools through the concept of social justice? Which dimension of social justice is dominant in rural school practices? What are the possibilities for enacting a more plural social justice in rural schools? How can socially unjust discourses and practices be interrupted in rural schools? Answers to these questions are a first step to discovering what social justice means in rural settings and how socially just rural schooling is. Without this understanding, policy makers, educators and researchers alike risk continuing to adopt an insufficient or limited model of social justice, a one-size fits all approach to issues of social inequality.

CUNNINGHAM SEGOVIA, JESSICA* (Arizona State University, jsegovia184@gmail.com)

Measuring Average: A Study of the Educational Barriers for Children with Moderate Disabilities within the US School System.

In 2004 the U.S. Congress reestablished the Individuals with Disabilities Education Act (IDEA) which guaranteed children with disabilities the right to free and appropriate education within the state's education system. As part of this act the federal government mandated the use of an Individual Education Plan (IEP) to coordinate and implement an appropriate accommodation plan for individual children with disabilities. Using Institutional Ethnography as my mode of inquiry I uncover the relations that organize my experience of navigating my son's school to seek accommodation for his moderate hearing loss. Based on personal accounts, second stage informant interviews and the textual discourse used in the IDEA, by the school and state officials, I explicate how this same text meant to promote a child's education clouds the underlying issue of a child's disability as well as impedes their academic potential.

My study focuses on how the IDEA phrase that accommodation is required for a child's disability only if it "adversely affects a child's educational performance" is translated by schools and states to mean "average". Children with mild to moderate disabilities who are considered "average" students will not be granted services or accommodations through an IEP, regardless of the possibility of the child's educational potential. Moreover, if a child who is currently receiving services effectively meets all academic requirements and the child is considered to be "consistent with the standards and achievements" of other children of their age then they will be at risk of losing the same services which helped them reach those goals.

Practices of Exclusion: Mass Incarceration of M?ori and the Impact of State Violence on the Indigenous Community in Aotearoa/New Zealand

This paper explores the connection between the mass incarceration of Māori and its impact on the well-being of Māori communities. With the colonisation of Aotearoa/New Zealand and development of a white settler society based on the imposition of European social institutions, the capitalist political economy and the appropriation of Indigenous land, Māori became subject to British understandings of law and order. To justify mass colonial settlement colonisers used both ideological and repressive strategies of exclusion. A colonial ideology was embodied through symbolic violence based on the systematic ignorance of tikanga Māori (customs and practices) and forced identities that embedded racism into the white settler's society; meanwhile repressive strategies were instilled through law and order policies and military/police enforcement. Consequently, Māori became a focus, and a subject of, the criminal justice system. Since then they have been over-represented in prisons, juvenile detention centres, mental hospitals and other forms of confinement.

Today, Māori make up around 15 per cent of the New Zealand population but over 50 per cent of the prison population. When the data is disaggregated for gender the rate is even more sobering: Māori women represent over two thirds of women prisoners. This paper is based on ongoing research, including interviews with ex-prisoners (and gang members), their families and with the Indigenous scholars to illuminate the connection between mass incarceration and its impact on the well-being of Māori communities. The presentation will also critically analyse mainstream society's symbolic representation of Māori as criminals, and the symbolic violence that continues with the ignorance of tikanga Māori, the obliteration of New Zealand is colonial history, and ultimately forms of white privilege that sustain 'racism without racists'.

CURRAN, MEGAN* (University College Dublin, megan.curran@ucdconnect.ie)

Large Family, Poor Family?: A Comparative Examination of Changing Patterns in Children's Family Circumstances and Inequality

The average woman's family size across developed countries is 2 children, yet 27% of American children and 35% of Irish children grow up in households with 4 or more children. Large families – and their high risk of poverty and poor child outcomes – were a historic point of concern for policymakers until the recent rise in lone parent households shifted attention. Yet large families are clearly still a reality in the developed world and child poverty in these same countries remains high, at a high cost to both child well-being and the economy. The fortunes of children in large families, however, diverge across countries in unexpected ways. In the US, for example, the largest families are among the poorest, but in Ireland, the largest families are often middle-class (producing a relatively flat social gradient among family sizes that resembles Denmark and the more egalitarian Nordic

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

countries, despite significant social policy differences). The objective of this paper is to examine changes in children's family circumstances in two large-family industrialised societies, the United States and Ireland, over the last generation, when the most determinative demographic shifts in women's fertility, marriage, and childbearing took place. Using census microdata from 1971 and 2011, it employs a distinctive approach that examines the data from the perspective of both women's cohort fertility and of children themselves, to look at changing patterns of socio-economic differences in children's family size as measured by differences in maternal education, occupation, and age and overall family structure. In doing so, it revives interest in family size as a potential source of disparities (or not) among children and discusses social policy implications on both a country-specific and international level.

Law and Collective Memories after the Communism – Why the Post-Communist States Decided to Create Institutes of National Remembrance?

End of communism and beginning of the transitions in Central and Eastern Europe was not only connected with reconstruction of states and its economies. New democratic regimes from that part of Europe had also to deal with their past. Apart from different ways of transition – from agreements to military uprising – all of them decided to create a beings which we can name as a group – institutes of national remembrance. All of them are unusual institutions, unknown in the other parts of the world. They were created, they are supervised and financed by the states. The critiques in media discourse are usually presenting them as a "ministries of the historical truth". Followers are emphasizing that they are playing outstanding role for putting straight the history of former communist Central and Eastern European States.

The main paper task will be presentation and analyze the legal institutions related to the institute's creation and functioning. Especially to answer of question what is the relation between state legislation on collective memory and what is its impact on their societies. How the post – communists states are trying to influence on history through the law on "Institutes".

CZERANOWSKA, OLGA* (University of Warsaw, o.czeranowska@gmail.com)

Occupational Prestige As Element of the 'Decent Work'

Apart from it's purely economic meaning, work is one of the key factors that influence individual biography and identity as well as individual's position in the community. Self-development and feeling of personal fulfillment connected with occupational prestige are therefore important components of 'decent work' as defined by International Labour Organization. Moreover, occupational prestige shapes social structure and has a bearing on interpersonal relationships and psychological well-being of the worker.

Traditional model of stable employment enhanced the process of shaping occupational identity as well as emotional bonds inside occupational group or organizations. In the modern, flexible labour market however, this model of career is no longer dominant. In its place new career models are emerging – their shared characteristic being lack of stability and consequently - need of individual construction of identity. This social and economic changes on the macro level have a bearing on the personal meaning of work and occupational life. Nevertheless work and prestige connected with it are still important components of social and individual life.

In the research for my PhD thesis I was aiming at creating social definition of occupational prestige and examining its implications for the individual biographies. My research project was based on triangulation of sources and methods, it included both qualitative and quantitative elements. Media discourse analysis and quantitative research (PAPI questionnaire) as well as secondary data enabled me to identify categories of interviewees for qualitative interviews. My research

problems involved meaning of prestige (also in terms of private sphere and work-life balance) and process of shaping occupational identity of high prestige groups and individuals. Having in mind problems of discrimination on the labour market I also taken into account gender perspective.

Globalising Commodification: Outsourcing Legal Work to India

The outsourcing of legal work from geographic areas where it is costly to perform, such as the United States or Europe, to geographic areas such as India where it can be performed at a significantly decreased cost, has been made possible by the disaggregation of the legal processes into discrete units. Anecdotal evidence suggests a variety of benefits such as financial gains, opportunities to perform "global" work in a corporate atmosphere, interaction with foreign law firms and clients and acquisition of important skills and training enhancing the prestige of the host country lawyers. In addition, Indian legal process outsourcing (LPO) firms are viewed as important catalysts in the transformation of the country's legal profession, offering the possibility of destabilizing the long-standing and highly stratified professional hierarchies based on social identities and social networks that typify the legal sector. Our study concludes that given that even well trained lawyers had little chance of succeeding at the bar without the help of a practising fellow professional family member or relative, the corporate culture pursued through the espousal of Western industrialism privileging rationality, objectivity, transparency, performance, merit, equality and inclusivity in LPO firms seemed to be an attractive proposition for lawyers from non-elite backgrounds. However, the simplified, standardized and routinized nature of offshore work led to the deprofessionalization of lawyers, reducing them to 'glorified clerks' engaged only a narrow set of their legal skills. In fact, since outsourcing lawyers did not interact with clients and colleagues abroad, they could not gradually build up their expertise to gain legal insights rendering them untouchable even in the Indian legal labour market. Implications of this were that LPO firms only provided parallel avenues for career mobility but did not destabilize the local legal market which at its core remains socially networked.

Moral Silence of the Fighter or Traumatic Silence of the Survivor? Different Cultural Construction of Selfhood Among Former Revolutionists in Turkey

This paper is based on an ethnographic research about Turkish leftist revolutionaries and their families. It analyses different memory frames regarding the 1980-1983 military coup, a watershed that changed the political, cultural and economic features of Turkey. Former revolutionaries continue to denounce the violencethey suffered, contrasting an official history where they are represented as enemy of the country. Nevertheless, the Turkish memory field is far from being a hegemonic-resistance opposition, because counterhegemonic memories are characterized by a plurality of configurations. Also in Turkey Transitional Justice, talk therapy and the paradigm of trauma and PTSD spread, in the wake of contemporary global trends and in addition to the martyrdom and fighter pattern characterizing the Turkish left and defining a specific interplay between memory and politics. By presenting themselves as neutral and technical, these categories establish supposed appropriate ways of remembering, in public and in private space, and often classify memories that are not expressed through psychological language as "abuses of memory". Collective self-narratives, emotions like suffering, and daily practices like silence are common behaviour among former revolutionaries and make sense within the moral economy of the "fighter". The latter underlies ideas of personhood and selfhood that are quite different from the model of the "silence of survivor" suggested by the increasingly diffused paradigm of trauma. The idiom of trauma is a poietic language that changes the reality it aims to describe fostering a model of westernized and individualized selfhood and influences the familial dynamics and intergenerational memory transmission.

Socio-Environmental Vulnerability, Resilience and Disasters in Modern Urban Contexts: The Case of Vila Velha (ES, Brazil)

This text presents for discussion the research project "Understanding socio-environmental vulnerability construction in modern urban contexts: The case of Vila Velha (ES)" The project considers the perspective of complexity and an interdisciplinary approach, observing the importance of considering existing interconnectivities between the various environments involved in the development and urbanization process in peripheral areas, and its relationship with the construction of socio-environmental vulnerabilities and with tackling disaster situations. In this context, it is presumed that the modern city is located within a physical base, not considering its biogeophysical characteristics. As the oldest site in Espírito Santo state, Vila Velha is the object of a study which, based on the perspective of human occupation of the biogeophysical basis of its land area, seeks to gain an understanding of the reasons for which socio-environmental disasters, such as mass movements and floods, are recurrent - having an impact on vulnerabilized populations in risk areas - and what resilience strategies are in place in the communities studied. In 2013, the city twice found itself in a state of emergency during periods of heavy rainfall causing, in December of that year, significant disruption to life in the city – populations made homeless and streets flooded for several days. Since February 2015, this project has been under development with the employment of different methodological procedures to meet the objectives of research teams in the fields of geology; architecture and urbanism; biology; sociology; geography; anthropology and photography.

Re-Signifying Feminism: The Neo-Liberalization of Gender Equality in Post-Recession Britain.

With the rise of more extreme forms of austerity measures and cuts to social welfare in the UK, democratization (especially in reference to women's equality) seems to be 'rolling back'. Women are bearing the brunt of the deficit reduction strategy, specifically women from lower social classes and from particular regions in the North of England (Women's Resource Centre, 2012). Within this context, there has been a reported resurgence of feminist activism, which has been affirmed within mainstream media and other social and political spheres (Dean, 2010). However, drawing on interviews and focus groups with 55 young women (18-35) in three cities in the UK (Leeds, London and Brighton), I argue that this certain kind of 'new feminism' helps to re-direct such a trend of democratization, rather than increase democracy and equality (see Walby, 2009/2011).

Using the term 'neoliberal feminism' (Rottenberg, 2014), this paper explores how feminism is currently being re-signified within post-recession Britain. I argue that the feminism young women now 'speak', can be seen to adopt a 'neoliberal' form, consisting of free choice, individualism, opportunity and success, in which the female subject accepts full responsibility for her own well-being and self-care (Rottenberg, 2014). Despite living in a time of rising uncertainty, precarity and deepening social inequality in the UK, such a 'neoliberal feminism' helps to disavow the current social, cultural and economic forces producing inequality. Young women acknowledge the impact austerity is having on their lives, however individual creative solutions are used to appease such structural problems and are presented as the way out of such a situation. Such findings will contribute to understand how feminism is both spoken and 'allowed' to be spoken within the current economic and political context of the UK and how this new form of feminism is aiding the re-direction of democratization.

Adaptation to Flooding and Resilience Building in Pasig-Marikina Basin: Intersections of Social, Political-Economic and Place-Based Vulnerabilities

Previous studies on vulnerability and adaptation to climate change-related effects like flooding have focused largely on the social and economic drivers of vulnerability, adaptation and resilience. This paper argues that to understand better these drivers, the intertwining effects of socio-economic/livelihood vulnerability and placed-based vulnerability must be examined through the intersections of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

place/space and social structures/institutions and their interconnected processes and impacts. Thus, the study examines the adaptive capacities, flood responses and resilience-building initiatives of both urban poor communities and upper-income residents in gated communities along the Pasig-Marikina riverline on the east, Magallanes and Alabang Hills on the south, Katipunan Avenue on the North. Preliminary analyses shows that socially differentiated patterns of adaptation and resilience building follow along the lines of income class and place-based vulnerabilities; while those at the intersections suffer more but they are able to recover and construct resilience through mobilization of their bridging social capital and trust networks with civil society organizations, private sector and local governments.

Exploring Memories, Understanding Legacies. the Biographical Approach in the Study of Social Movements' Unanticipated Consequences

In the long range, social movements collective action could generate, and/or combine to effect, crucial modifications in society and human relationships, that are considerably different from the intended and foreseen purposes of leaders and activists of social movements. Often results overlap with the stated intentions of the activists of the movement, producing unanticipated consequences both in the life dimensions they were addressed to or in other areas.

Moreover, social movements are only one of several collective actors involved in the process of creation of social change, hence it is difficult to give an unequivocal interpretation of "goals-strategies-outcomes" dynamics and to attribute the outcomes (social changes) of collective actions to only one actor, in particular as far as cultural modifications are concerned.

The paper proposes the biographical approach as useful for rebuilding temporal processes. Making use of a narrative method that does not claim to represent a close and detailed model of the above change processes, seem to be particularly suitable because of its implicit power to give an analytical frame of the past, the present, and the future as constitutive and inseparable parts of the temporal flow. These research methods, data, and relative interpretations are in fact characterized by a dynamic relationship between temporal registers where it is possible to distinguish the above dimensions.

Starting from the result and process of a concrete research design, the paper aims at analysing strengths and weaknesses in the using the above methodological model. In particular, it aims at evaluating the advantages of the approach in exploring the link between the past and present, as useful to better understand long-term and unanticipated consequences of social movements.

The Social Context of Patient Safety Risks for People Living with Multiple Health Conditions

Contemporary research in patient safety has tended to focus on clinical systems and processes. However, an increasing body of research from ambulatory (as opposed to inpatient) medicine has underlined the relationships and human factors involved in keeping patients safe. One contemporary strand of sociological interest has pointed to the ways in which patient safety is a subjective or co-produced 'feeling' maintained and negotiated in interactions with health workers who are judged on their approachability, knowledge and behaviour.

Against this background we report the results of a qualitative interview study of 37 people living with multiple health conditions in England and Wales. The study set out to broadly capture patients' experiences of 'multimorbidity' and the health service response. Even though the interviews were not focused on patient safety, a range of harms were spontaneously mentioned by some participants alongside judgements of the inappropriate behaviour of health workers.

Ethical approval was obtained prior to the study. Transcripts from semi-structured video and audio interviews were transcribed using a framework based on known issues in primary care patient safety from existing studies (communication, access, relationships and technical issues). Transcripts were also examined for interviewees' subjective perceptions of risk and safety. The Quirkos software package was used to manage the coding process.

The findings underline the social context of risk for patients with multimorbidity. Patients with multiple health problems need multiple inputs, which exposes them to increased risks of harm or (perceived) assault or incompetence. Increasing involvement with medicine can also bring risks of increasing uncertainty with

attendant worries and anxieties. However, more tangible risks—such as falling down the stairs or dealing with drug side-effects—lie in the domestic sphere. In this paper, we use patients' articulations of risk to partly deconstruct a biomedical conception of "safety" for patients living with multiple long-term conditions.

"from Smart Cities to Smart Villages: New Sustainable Futures for Disrupting Rural Migration in Myanmar and India"

Smart cities represent the new engines of growth in the global development of knowledge capitalism. Europe and the United States generally celebrate this rapidly emerging mode of urban development for its capacity to enhance more sustainable environmental practices, extend the institutional reach of democratic governance, and improve the efficiency of urban management. Increasingly, smart city development has been encouraged by international development agencies like USAID and DFID as the paradigm of choice for addressing the social problems they anticipate in the emerging "megacities" of the world. Large corporations are also finding profitable niches in the global business of smart city development. Qatar-based Ooredoo, for example, now controls a growing portfolio of ten Asian megacities which represent its significant investment in smart city development. Dubai-based Smart City, which focuses on developing high-tech, full service urban campus-fortresses for clustering the R&D offices of the worlds largest ICT companies, controls more than 90 percent of Smart City Malta and Smart City Kochi. One of its tenants, Google, has now also leaped into the fray of smart city development with the launch of "Sidewalk Labs." This paper focuses on smart city development in Myanmar (Dale and Kyle, 2015) and India and an emerging progressive counter-movement within their rural hinterlands that seeks an alternative to both smart cities and traditional village models. This movement articulates a new vision for the "smart village" that blends ICT-based knowledge production and community problem-solving to improve the sustainability of its agricultural production, rural institutions, and social mobility. It seeks specifically to institutionalize a different future for rural villages that reverses the new patterns of rural to urban migration, particularly among young adults, that smart city development has amplified in this region.

On the Theatrical Dimension of Political Representation: Beyond the Usual Approaches

Throughout my comparative work on political representation, my insistent aim has been to link three aspects, namely: cultural representations, the representation of interests and theatrical representations. It is worth dwelling on the third aspect which remains under-invested by social scientists. To the extent that the literature on political representation takes account of the theatrical dimension at all, it is generally to point out symbolic manipulations (as is very clear in many anthropological or historical works and within studies on political communication). Here, I would like to depart a little bit from such conventional approaches and suggest some new directions for study.

Effects of Economic and Cultural Contexts on Formal Volunteering: Evidence from 33 European Countries, 1981-2008

Past research on the sources underlying volunteering indicates that besides peoples' individual characteristics such as economic resources or motivations, the social contexts people live in exerts a significant effect on engaging in voluntary activities. The type of religious denomination, religiosity, or economic situation of the country are some of the main contextual factors found to explain differences in volunteering across. However, prior studies focused only on cross-sectional data and, therefore, did not take into consideration how dynamic predictors (e.g. economic development) affect volunteering across time. This study seeks to improve on previous work by considering not just differences between countries in a certain year but also variation within countries across time. Using data from the four waves of European Values Study (1981-2008), merged with country level information from World Bank, it simultaneously tests the longitudinal and cross-sectional effects of economic and cultural country characteristics on formal volunteering. The findings show that the cultural characteristics (religiosity and the type of religious denomination that prevails in the society) and income

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

inequality have a negative between and within country effect, while the economic situation (GDP per capita) has a positive effect on formal volunteering across time.

Effects of Host Country Social Inequality on Immigrant Civic Participation Across Europe

The aim of this study is to examine to what extent the social inequality level in host countries affect immigrant civic participation. It has been shown, repeatedly, that individual economic, social and cultural resources are strongly related to civic participation among both native and immigrant groups. Furthermore, the economic and cultural context in which one lives matters as well (for a review see Musick & Wilson, 2012). However, there is still little evidence regarding the effects of social inequality on participation among the immigrant group. We know that in countries with high levels of inequality, those who have already fewer resources will be less likely to engage civically. But there is no concrete evidence for the immigrant group. We believe that this is one of the main explanations of why immigrants participate to a lesser extent than natives. Therefore, the present study seeks to explain differences in civic participation among immigrants across Europe, by looking at the effect of host countries' social inequality. To this end, we employ multilevel modeling techniques to individual-survey data from European Social Survey (2002-2003) and Eurobarometer (2004), enriched with several contextual-level characteristics.

Unions in Post-Communist Albania: Problems of Organization and Solidarity in the Times Crisis

The change of the regime in the early 1990s led to the creation and the division of trade unions in Albania along the two major parties' lines: the Socialist Party and the Democratic Party with which they shared similar ideologies. Both confederations serve as umbrella organizations for a number of federations. The main issues they have been struggling with during the transition are informal employment, an antagonizing state, and the lack of employer organizations. Scepticism towards most forms of solidary organizations at the early stages of pluralism strongly affected union membership rates, which in the long-term held unions in a relatively weak position exacerbated by the competitive attitude between them.

As Albania is preparing for EU membership, issues such as informality and the social partners have recently received considerable attention. These processes have developed in parallel with the global economic crisis and the current government's project of economic development. The questions we ask in this paper are: What is the current state of trade unionism in Albania? How do the formalization of employment relations and the tripartite system affect their position? What is the impact of the economic crisis on the unions' position and strategies?

In our analysis we find two contradictory trends. Formalization of employment relations and the establishment of the tripartite system create the grounds for stronger union activity. Meanwhile the government appeals to international investors from countries affected by the crisis such as Italy are based on the argument that 'there are no trade unions here'. Meanwhile, the Albanian workforce reaction to the crisis has gone in both directions: exit through emigration as a reaction to increased poverty, and return from migration (especially in the case of Greece and partially Italy) as a reaction to increased unemployment.

DANIEL, ANNA* (Institute of Sociology, FernUniversitat Hagen, anna.daniel@fernuni-hagen.de)

The History of DIY – from Punk to Everyday Culture

The slogan *Do it Yourself* currently keeps flourishing in many countries all over the world. It comprises many different ideas and practices of a so called self-made-culture: Whether in the context of home-improvement, or in the music-scene, by software-engineers or in the creative scene the *DIY*-culture spreads everywhere. While in the home-improvement-movement or the punk-scene the *DIY*-culture has a very long tradition, it became popular in other fields of everyday culture not until the last few years. Today many people like to make their clothing, assessors or furniture by themselves and often those self-made products are as well offered for sale at appropriate *DIY*-websites like etsy or dawanda. While in the youth culture of punk *DIY* was interpreted as a kind of counterculture and a critique of consumerism, you can ask if the new *DIY*-trend is based on the same motivation. Although current *DIY* trends are often labeled as an acquirement of

manufacturing processes, we should keep in mind what Boltanski and Chiapello said about the ability of capitalism to absorb its critique.

Following Foucault's program of the history of the present I am going to trace the changes of the practices and ideas which are linked to the DIY-culture across the years. In doing so, we can learn more about the causes and preconditions of this transformation which exerted influence not only on the relation of the globalization and localization of youth cultures but as well on the relationship between youth culture and everyday culture.

DANIEL, ANTJE* (University of Bayreuth, antje.daniel@uni-bayreuth.de)

Being in-Between – the Women's Movements in Kenya

Since independence from British colonialism female activists have been coopted by government. First women's movements, independent from government, emerged in the 1980s. For those, the UN World Women Conference, held 1985 in Nairobi, provided impulses for creating movements working in the field of women's human rights. Insofar, the transnational event legitimized the movement in a closed political society. In the 1980s, women's activists also became part of the democratic movement, which fought against the autocratic regime. Since this time the Kenyan women's movement is an important opponent, holding the government accountable for its actions.

Against the backdrop of definitions about new social movements the paper illustrates that western concepts cannot be applied to southern movements without restrictions. At the same time context related features of the women's movement in Kenya become obvious. Especially the concepts of in-betweenness of the women's movement relates to the specific social and political context in which the movement is engaged: First, the in-betweenness reflects the social structure: While mostly middle class activists deciding about the strategy of the movement, women from lower classes often do not feel represented. Second, the in-betweenness refers to the sense of collective identity within the movement. Activists are navigating between ethnic-political loyalties and their female identity, while the former hampers a collective belonging at times. This point relates to the third aspect of in-betweenness: The movement acts as broker between the political system and the society and thereby takes over party functions. Therefore, the in-betweenness of the women's movement refers the challenges the movement face in the movement building process and the role of the movement as mediator between the society and the state. At the same time the in-betweenness illustrates the particular context in which the movement operates and shows restrictions of definitions about social movements.

DANIEL, ANTJE* (University of Bayreuth, antje.daniel@uni-bayreuth.de)

Navigating within the Development Nexus: The Women's Movement in Kenya

Persisting images of African women are controversial and depict women both as victims of their environment and/or as powerful agents of change. For instance, the 1970s development nexus postulated that development without the empowerment of women is impossible, while at the same time designing an image of African women as "poor and powerless" and in need of assistance to access gender justice. Almost simultaneously women from the South opposed the allegedly exclusive white feminism that dominated the UN Conferences on Women and thereby the UN Convention on the Elimination of all Forms of Discrimination (CEDAW), conceiving it as upper-class and ethnocentric. African female scholars thus reacted by condemning feminism as western, imperialist and not suitable to local realities. In this contradicting field women's movements oppose, adopt, appropriate and reinterpret gender roles and relations circulated within the development nexus.

Based on an empirical research on the Kenyan women's movement I will illustrate one the one hand to what extent activists refer to CEDAW as international norm. The convention is an important source for defining gender inequalities and relations in order to legitimize the claims of the movement in opposition to the state. On the other hand CEDAW exacerbates solidarity between women's activists because some deny the Convention as western concept. Likewise contradicting are donor resources, because the women's movement is highly depending on donor funding. In order to get access to donor funding activists navigate between gender policies of donor agencies and their local realities. This becomes particular obvious in the debates about the role of women within the welfare state, contents such as polygamy or abortion. Thus, the paper draws attention to contradicting edges of norms and development policies circulated within the development nexus and shows how female activists navigate in-between different visions about gender roles and relations.

DANIEL-WRABETZ, JOANA* (STOP Trafficking and Oppression of Children & Women, danielwrabetz@gmail.com)

Born to Serve: The Singular Case of Domestic Work in the Context of Trafficking in Human Beings for Labour Exploitation

Domestic servitude is a form of extreme abuse of domestic workers, and domestic workers are amongst the most vulnerable to exploitation because of their invisibility and lack of control mechanisms (social and institutional), particularly in terms of legal protections and restrictions on movement. In societies marked by social inequalities, studies such as Cock (Cock 2001), indicate that domestic workers are situated "in the convergence of three generating lines of inequality: class, race and sex."

Several studies conducted by ILO in several countries aimed to determine the extent of child labor, concluded that there are more girls under 16 as domestic workers than any other category of child labor. So far, despite the growing interest and a number of studies, not only in Sociology but also in Economics and Law, a deeper sociological analysis on the association of domestic work to new forms of slavery or trafficking in human beings for labor exploitation is still missing.

Are all forms of slavery understood as such by contemporary societies? Or are there "islands" socially acceptable in some contexts, either for religious reasons, cultural (castes), or simply for its invisibility, were slavery forms are surviving over the years? It is domestic servitude of these "islands"? This is already an indication of anomie, or just the acceptance of a certain degree of illegality?

This paper discusses to which extent the theories of Marx and Durkheim apply to the phenomenon of trafficking in human beings for labour exploitation, in particular domestic servitude, and focuses on empirical research in India where several domestic workers come from lower castes or migrate from neighboring countries such as Bangladesh and Nepal.

Trafficking in Human Beings in Time and Space: A Socio-Ecological Perspective

<align="center">Trafficking in Human Beings in Time and Space: A Socio-ecological Perspective

What makes a person, whether man, woman or child (more) vulnerable to human trafficking or any other crime? What makes some places more propitious to the occurrence of certain criminal phenomena ?

This paper argues that these questions can be considered within a socio-ecological model of vulnerability where the Geographical Information Systems are used as relevant tools to put crimes and its actors in a temporal and spatial context.

Applying a geographic-determined knowledge to the study of THB vulnerability will allow the detection of profiles based on socio-ecological indicators, that is to say, profiles arise from the nexus between the individual social and symbolic interactions (perpetrators, victims, and witnesses) and their ecological environment.

Vulnerability to crime and to THB in particular (criminogenic conditions) is hard to observe and although crime statistics can be viewed as an attempt to measure it (Brunsdon et al. 1995), it is necessary to build it by integrating/crossing other types of data and levels of observation. The Socio-ecological approach as well as Geographic Information System is multi-level in its nature, allowing a broad conceptual and methodological pathway to explore the modelling of vulnerabilities.

Identifying THB patterns will help to develop models of vulnerable areas and groups, either at origin, where recruitment occurs, or at destination, where exploitation is already taking place. This information is essential to assist all relevant actors in the planning of intervention measures based on knowledge at different but interconnected levels: operational, tactical, investigative and strategic policing, crime reduction and victims support.

Unrecognised Crisis Management – Normalizing Everyday Life

Crisis management is often understood as the role of emergency managers or security managers at governments. This picture is reinforced in institutional structures, crisis plans and also in media, were pictures from a crisis often show emergency responders in action. What other professionals do during or after the crisis is less recognised. The aim of this study is to investigate the role and work of professionals within elderly care and schools during a crisis. Interviews was conducted with rescue personnel, school and elderly care personnel involved in handling a crisis. The result show that the exciting picture of the crisis manager is reinforced by involved actors. Even though parallelism between emergency personnel and schools and elderly care personnel was the dominant pattern during the crisis, it was also the case that the direct crisis management of the emergency personnel took precedence over the indirect crisis management of school and elderly care personnel, e.g., when the school and elderly care personnel left the incident scene to the rescue workers, but the school and elderly care personnel dominated when re-establishing everyday life for their dependant – this kind of crisis management is today unrecognised.

Remembering the 'Long 1960s': How Contemporary Left and Right-Wing Movements in Germany Relate to a Contentious Past

Often referred to simply as the '68 movement', the long 1960s mark nearly two decades of unrest, violence, and civil disobedience in East and West Germany. While more than 40 years ago, this period remains an emotive issue in the German public discourse till today. Retrospect interpretations of this period range from idealization to demonization. While the protests of the long 60s have received much scholarly attention (particularly the protests in West Germany), analyses of memory work related to this period are largely missing – in contrast to research about its counterparts in other Western European countries such as France and Italy.

The project explores how contemporary movements in Germany remember this period of protests – left movements such as the German Global Justice and Occupy movements as well as right-wing populist movements such as PEGIDA (Patriotic Europeans Against the Islamisation of the Occident). How do these contemporary movements relate to this contentious past? In how far does their memory work differ from the public memory of the long 60s? The analysis will provide insights into present day notions of citizenship as well as into contemporary dynamics of political activism in East and West Germany.

Women Empowerment and Its Impact on Social Development in India

Empowerment was defined as a process of transformation of power relation by which oppressed persons gain some control over their lives and involved in the matters, which affects them directly The role of women in development is most intimately related to the goal of comprehensive socio-economic development. Empowerment is the re-distribution of power that challenges ideology and male dominance. It is the greater transformation of the structure or institutions that reinforces and perpetuates gender discrimination. Self Help groups have been playing a vital role in employment generation and employment of women. Many self Help groups are using the financial resources availed to fund investments in assets creation and help financially and socially for the downtrodden women in India. Micro -finance is directly helping poor to empower the conditions of women in India. Women from gross roots investing in self help groups and engaging the women in social, economic, and political fields. Women will be able to plan for their livelihood through the self help groups. Marginalized women finds self help groups are rejuvenating sparks in their lives. This paper looks into the impact of Self Help groups in the upliftment of women status through their contribution to the empowered society. Self Help groups helped them to overcome majority of their personal as professional life. This is a new venture in the women empowerment and social development angle. If not full at least this micro-financing is a hope for many women who are downtrodden sections of the society. This will be programme of mass enlightenment and empowerment .This study carried out in Karnataka of India

Textile Capitalism in Africa: Competition, Innovation and the African Challenge

The clothing and textile industry is an important economic sector; it heralded the industrialisation process in most African countries in the 20th Century. While the sector has since its inception has been characterised by periods of growth and decline, recent global economic trends and the level of interaction with and integration into the global value chain system have had a tremendous influence on its development. Even so, for a major sector that is crucial for Africa's industrial growth as well as economic and socio-cultural development, its changing fortunes have both local and global relevance. Using empirical literature this paper traces the trajectory of textile capitalism in Africa from the 20th century to the present day. With examples from Ghana and South Africa the paper outlines the challenges facing the textile industry internationally and continentally, the various ways the industry has responded to global competition, and the contradictions embedded in some of the responses. In the particular case of Ghana and South Africa, the paper examines the ways in which the textile and clothing sector has innovated and transformed in the face of global competition. In the main, the paper argues that textile and clothing industry in Africa has reacted differently in different periods, and that responses and innovation strategies have broadly reflected the resources available in a given economic era as well as the socio-cultural relevance of the sector in a given time and place.

Southern Feminist Youths' Contributions to Knowledge Production

Although Southern voices have made inroads into feminist knowledge production over the last three decades, feminist knowledge production is largely dominated by Northern voices and Southern voices located in Northern spaces. Much of this knowledge production takes place in academic spaces. Academic spaces also serve as sites for reframing students' knowledge and meaning making of their worlds. In the last decade and a half, social media has emerged as yet another site for knowledge production and meaning making of one's existence as fe/male. Social media sites offer more spaces for Southern youth voices than the academic spaces of the North for contributing to feminist knowledge production. In this paper, I analyse both the blogs of a number of Ghanaian youths who describe themselves as feminists as well as responses to these blogs to understand what contributions Southern youth voices are making to feminist knowledge production.

Privatising Asylum: Neoliberal Bordering and the Urban Governance of Forced Migration

This paper critically examines the political geography of asylum accommodation in the UK, arguing that in the regulation of urban housing and support services for asylum seekers, we witness the entrenchment of practical and discursive borders designed to manage those on the thresholds of the state. In 2010, the UK Home Office announced that it would be passing contracts to provide accommodation and reception services for asylum seekers to a series of private providers. This meant the end of asylum housing through urban authorities. This paper explores the impact of this shift for those seeking asylum. The paper draws on fieldwork in four cities, including interviews with local authorities, politicians, asylum support services and asylum seekers themselves. In considering this evidence base, the paper argues that as the realities of 'austerity urbanism' have interacted with the privatisation of support, so we are witnessing the emergence

of new assemblages of authority, policy and governance at the urban level. These new assemblages are marked by the production of new forms of social, symbolic and discursive bordering for those seeking asylum – as the welfare of an already liminal population is further removed from public view and accountability in line with a neoliberal framing of asylum as an emergent 'market'. A limited concern with the social needs of asylum seekers, has been replaced with an increasingly revanchist and experimental policy agenda that seeks to maximise the economic gains to be made from accommodation. In this context, the framing of asylum seekers as a 'burden' emerges as a central discursive and symbolic achievement of the neoliberal politics of accommodation. Framing asylum seekers as a 'burden' represents both a move to position asylum as a managerial issue, and at the same time reiterates an economic account of asylum as a question of resource allocation, cost and productivity.

Adoption of Improved Wheat Production Practices in District Agra of Uttar Pradesh,India

Sumit Bhadoria & Dr.E.P.K.Das

Agriculture is the livelihood of Indian economy and economic growth is substantially influenced by growth of agriculture sector. The present study was conducted with following objectives (1) To ascertain the Socio- economic profile of respondents. (2) To determine the level of Knowledge of respondents about improved practices of wheat production (3) To determine the extent of adoption of Improved practices of wheat production.

The present study was conducted in Bah block of Agra district, U.P, India. There are 15 blocks in Agra district, out of these Bah block was selected purposively for the present study, as maximum number of farmers have adopted improved wheat production practices. There are 157 villages in Bah block, out of these 6 villages were selected randomly. 20 respondents were selected randomly from each off the selected villages. Thus total number of respondents were 120.

It ca be conducted that 24. 16 per cent respondents come under young age group and 49.17 percent come under middle age group. 33.33 percent respondents were literate. 11.67 percent high school and only 7.50 percent were intermediate. Monthly income of most of the respondents 55.83 percent was between Rs. 5,000 - Rs. 10,000. Most of the respondents 55.00 per cent had medium extension contact. Same way 60.00 per cent respondents had medium mass media exposure.

54.17 percent respondents had medium knowledge about improved wheat production practices. Only 16.66 per cent had high knowledge.

56.60 per cent respondents had partial adoption of improved wheat production practices. Only 28.40 per cent had full adoption . Age, education and income were found to be positively associated with knowledge of respondents about improved wheat production practices. Same way age, education and income were found to be positively associated with level of adoption of respondents about improved wheat production practices.

Indigenous Knowledge and Sustainable Development: A Case Study of Zabo.

A detailed interaction between environment and society; culture and development demand sharp attention in contemporary sociology. This research intends to explore and evaluate the scope of indigenous knowledge in forming a revised understanding of sustainable development. In recent years indigeneity has found voice in two directions- one regarding the struggle for rights of indigenous people across the globe, and the other is a growing awareness of the relevance of indigenous knowledge for a greener development practice. One prime limitation often put forward against the concretization of indigenous theory for sustainable development is the limitation of cultural relativism. 'Zabo' is an indigenous integrated farming system known for its excellent water harvesting method, said to have originated in the Chakhesang community of Phek district, Nagaland in North-East India. Can such a practice serve as a non-arbitrary symbol of development in general and that of sustainable development in particular? This study identifies the characteristics of environmental sustainability embedded in Zabo on the backdrop of power-knowledge complex. An ethnographic case study of Zabo seeks to move beyond mere incorporation of indigenous practices as elements of technical knowledge judged on the parameters of science and modernity. Accordingly, this study maps out the relation between such practices, community life and worldview. It also traces the spread of such practices to other areas. Methods of primary data collection used are sample household survey, non-participant observation and interview apart from the secondary sources. This study relies on data triangulation to analyze the research problem. The research finally attempts

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

to highlight the dynamics between indigenous and modern scientific knowledge systems in a globalizing world vis-à-vis sustainable development.

Environment Protection : Role of National Service Scheme in Belgaum, India.

Since many years environmental degradation that has occurred is marked by a large extraction of natural sources, Loss of forests, extinction of animal and plant species, depletion of the ozone layer, air, water and soil pollution, loss of marine life, and bio-diversity and so on. These have posed serious threat to the very survival of life on earth. Protecting the natural environment for the benefit of humans is the need of the hour. Environmental protection has gained momentum in recent times. In this direction the Government and NGO'S have initiated many programmes to protect the environment. One of the significant initiatives is the National Service Scheme implemented by the Government of India, under the Ministry of Youth Affairs & Sports popularly known as NSS was launched in Gandhiji's Birth Centenary Year 1969.

The role of NSS in protection and conservation of environment is examined by conducting an empirical study. The data from 150 respondents are collected by questionnaire method. NSS organize activities of Environment Enrichment and Conservation, such as plantation of trees, Construction of sanitary latrines etc. Cleaning of village ponds and wells, construction of Gobar Gas Plants, use of non-conventional energy, Environmental sanitation, and disposal of garbage & composting, Watershed management and wasteland development. The study concludes that, NSS has provided a platform for the students to support the best environmental practices. Involvement of student volunteers in environmental activities through NSS can contribute to the overall development of positive qualities in young people and develops among them a sense of social and civic responsibility.

The Relational Sociology of Shaping Eco-Innovations

The relational sociology of shaping eco-innovations
Martin David, Dr. Alena Bleicher, Magdalena Wallkamm
Helmholtz Center for Environmental Research (UFZ)

Until today the concept of eco-innovation lacks societal contextualization and most eco-innovation concepts lopsidedly focus on technological aspects and market integration. This means that important process-categories of societal imbedding of eco-innovation like innovation prologues and changing stakeholder perspectives over time are mostly kept out of the focus. The meaning of such changing societal interdependencies has been discussed in sociology,[1]however, so far it remains unclear how changing societal bonds relate into establishing eco-innovations. Questions arise in this regard which can be rooted to relational sociology, focusing on collective, societal interdependent trajectories of the development of eco-innovations and their translation into stakeholder positions.

Within this presentation we will take the example of the development of a sustainable resource strategy in the German federal state of Baden-Württemberg and examine patterns of societal interdependencies and controversies. This resource strategy can be understood as an eco-innovation, since it focusses on new environmental friendly practices such as green industrial growth and recycling.

Controversies arose over the efficiency-oriented green growth strategy from a degrowth-perspective, but also over questions of participation of civil society representatives within the process of strategy development. In regard to interdependencies and evolving controversies the lens of relational sociology helps because it depicts on social bonds of actors to each other and to society. Since the aim of the process was not to focus on consensus, but to highlight facets and positions of participating actor groups, this case study provides meaningful insights on how eco-innovation is societally conceptualized and how social interdependencies of participating parties translate into innovation-processes.

The Future of the Past in Myanmar: Experimental Evidence

Most countries undertaking transitions from authoritarian rules to democracy seek to overcome historical divisions and build a more inclusive society based on reconciliation and trust. They adopt some of transitional justice measures, such as prosecution, amnesty, and truth-telling, to deal with the past. In Myanmar, currently in the early stages of democratic reforms, issues of transitional justice would soon also arise. Given that the military retains considerable political power, the key questions are whether and how the country would deal with an abusive past without compromising prospects for political change. At this moment, however, the general public has not been influenced by imported discourses of international justice. This provides us with a unique opportunity to examine the potential of transitional justice to influence the prospect for social reconciliation at the onset of political transition.

The paper examines the prospect for transitional justice in Myanmar. It is based on the experimental design, which manipulated four transitional justice interventions against their absence in a 2x2x2x2 factorial design. The experiment was embedded in a representative survey of 1600 members of the general public in two major provinces and three ethnic states in Myanmar. The paper will provide us with the analysis of results about one of the most important topics of transitional justice in general and in the Myanmar's democratization in particular.

Social and Demographic Factors with Influence on the Educational Status of Romanian Youth

In Romania the high education has undergone a spectacular expansion after the fall of the communist system. The relative easy access to high education combined with a high rate of unemployment among youth (24.3%, Sandu et al, 2014), lead young people to increase their chances on the job market by aspiring to tertiary education (Hatos, 2006). These aspirations often are unrealistic: 80% of high school students in their final school year from a nationally representative sample surveyed in 2012 declared that they want to continue education, when the graduation rate from high-school was about 60-70% or even lower in the last 3 years. In addition, the recent PISA results had shown that the Romanian high school students were among the most unmotivated in the sample, the rate of truancy being very high, all this reflecting the gap between aspirations and attitude to school, called "no penalty beliefs" by Rosenbaum and Jones (2006).

In this context the objective of this study is twofold : (1) to see if the school related variables (GPA in the final school year, the school deviancy and the school engagement) are related to the actual educational status of the the youth, and (2) what factors influence the young people's decisions to continue education and what specialization to choose. The study will consider the type of high school – theoretical, vocational or technical - graduated by youth, as well as the effect of demographic factors (socioeconomic background, residential area and gender).

The data were collected in the frame of the project "Outcomes of Adolescence. A longitudinal perspective", being realized two waves of survey (the first in 2012, the second in 2014), from a nationally representative sample of 3508 youth in the first wave obtaining a data base of 1509 respondents in the second wave.

The Descent from the Ivory Tower: On Higher Education's Contribution to Reducing Social Disparities. the Case of Israel.

Access to undergraduate degrees has become a major issue on the agendas of the systems that have been concerned with higher education in recent years. The end of WWII marked the beginning of a shift to higher education institutions of a more democratic and open nature compared to the institutions of the previous centuries. This development expanded in most Western countries in the second half of the twentieth century and has led to a glut in undergraduate degrees. In less than 50 years, the statistics in this field have doubled and even tripled. This global trend has also affected Israel, one of the many countries that have joined the international higher education revolution. In Israel, the proportion of students among the young adult population has more than doubled in two decades, from 23% in the 1990s to more than 50% in 2013. Undergraduate studies have arguably become a degree for the masses. This paper discusses the price of this social policy and explores its academic implications.

DAVIDSON, DEBRA* (University of Alberta, debra.davidson@ualberta.ca)

What the Frack?! Observations on the Rapid Development of, and Growing Resistance to, Hydraulic Fracturing.

Hydraulic fracturing, a technological process used to extract oil and gas from shale, has been expanding rapidly around the world. Called "fracking" for short, this intensive extractive process consumes a large amount of land and water compared to conventional oil and gas extraction methods, and has been associated with a number of negative impacts regionally, including contamination of groundwater and earthquakes. Fracking, moreover, is associated with higher intensities of greenhouse gas emissions than is conventional production. Considering the geological extent of shale reserves, there is potential for fracking and its effects to become quite widespread.

This rapid development has been met with intense resistance; resistance that is not necessarily being led by the usual green players, but rather local communities themselves. Despite in many cases depressed economic conditions, and a conservative rural culture, local mobilizations against fracking have been widespread, and a large number of these efforts have been successful, resulting in moratoria on fracking activities.

Social reactions to fracking can be seen more broadly as a disruptive response to a complex energy-society system that is increasingly fraught with crises. Shale reserves constitute a low-quality fossil fuel that until recently had not been considered attractive to investors. As energy theorists have projected, however, a decline in conventional supplies has led to exploitation of these lower quality reserves. Through personal conversations with members of communities at the forefront of the fracking enterprise in rural Alberta, I employ a reflexivity lens to explore how residents exposed to fracking conceive of this industry, and how have they responded to their personal conceptions. In other words, what does their reflexive processing look like? Do personal experiences with fracking open up avenues of deeper reflexive processing about energy and climate change? Finally, do these responses suggest the potential for structural transitions in society's relationship with energy?

The Pleasure of Protest: Piety, Performance and Pretty Policewomen in Indonesia

This paper explores a move within Indonesia's police to deploy its prettiest policewomen to engage protestors. When asked why he deploys pretty policewomen (*polwan cantik*) to protest sites, Indonesia's Police Commissioner responded that people angry at increasing fuel prices, for instance, will be easily calmed by a cadre of beautiful women performing a Gangnam Style dance and handing out sweets. Such deployment reinforces the importance of the selection criteria women recruits must meet, namely walking on a catwalk and being deemed literally 'pleasing to the eye' (*enak dilihat*).

The fact that people attending protests in Indonesia now expect performances by pretty policewomen opens a site to explore the dynamics of pleasure. Protestors speak of how such events have become enjoyable given performances by pretty policewomen. Policewomen also talk about how they derive pleasure from subsequently becoming social media stars – policewoman Eka Frestya, for example, has 18 000 Twitter followers. There is also a new dynamic to pleasure seen since 2014 when Muslim policewomen were for the first time in Indonesia's history allowed to wear a veil on duty.

Juxtaposed to these sites of pleasure, however, are sites of extreme displeasure. The beauty of policewomen is determined not just by outward appearance but by embodied morality; women police recruits are forced to undergo a two-finger virginity test. Drawing on the work of Saba Mahmood (*2005*) and Arjun Alvi (*2013*) the paper explores ways in which sites of pleasure and displeasure entwine in the creation of an ethical self.

An Emerging Profession: The Development of Mechatronic Engineering in South Africa

The professions have perpetually arisen as a topic of contention within the sociology of professions (Hughes, 1963; Freidson, 1973; Child and Fulk, 1982; Brante, 1988; Evetts, 2003; Saks, 2012, Faulconbridge and Muzio, 2013). However, only a few have concerned themselves with the question of how new professions emerge and become established (Nelsen and Barley, 1997; Sherman, 2010, Gorman and Sandefur, 2011). This predicament gives impetus to this study, which explores how new professions emerge in South Africa, paying particular attention to mechatronic engineering. While this profession is relatively young across the globe, it is only just being introduced in South Africa. Based on 50 interviews around the country and documentary data, this study explores how a new profession, such mechatronics, emerges in South Africa.

While literature suggests homogenous linear models (Wilensky, 1964 and Montgomery and Oliver, 2007) of professional development, I will argue, through the findings of the study that emergence or legitimisation of a profession is dependent on factors which 'push' it towards legitimisation (qualification, industry demand and social media) and those which 'pull' it away from establishment (such as cultural mandates, non-accreditation by regulatory bodies and the pressure to specialise in one of the more familiar traditional professions). These factors, and their context, result in a 'struggle' for legitimacy, rather than a smooth transition as previous work on professions suggest. Furthermore, I argue that a new profession does not simply move from a state of non-existence towards establishment. Rather, various streams of it may exist simultaneously in the same context. This paper will demonstrate the haphazard and pluralistic nature of an emerging profession in its struggle for legitimacy, with a focus on mechatronic engineering in South Africa. It aims to provides a basis for contexually sensitive and poignant questions into the emergence of new, necessary professions.

Sustainable Agricultural Management, Productivity Growth and Impact of Climate Change in India's North-East

Sustainable agricultural practices to a large extent determine development prospect of an agricultural economy in terms of food security, employment, income in various agro-climatic conditions of the developing world. During the 2nd half of the last century, significant changes in agricultural productivity, crop diversity and agricultural technology have been observed along with the changes in climatic conditions. This paper examines the growth of agricultural productivity, crop diversity and their regional convergence pattern in India's North-East. Impacts of changing climatic factors on crop diversity and agricultural productivity have also been examined through a longitudinal data analysis. Finally, farmers' adaptation towards extreme climatic effects are examined by constructing an adaptation index and analysing a set of primary data on farmers' various adaptation measures collected from the state of Assam.

Despite the growth of productivity and changes in cropping pattern, a certain level of regional convergence is observed except for some sub-periods. Also, temperature, and level of precipitation are found to positively affect the crop diversity along with the use of chemical fertiliser. However, in case of composite productivity index; rainfall and temperature in the Khariff season have positive impact on diversity along with chemical fertiliser. But the temperature in the Rabi season is found to have negative impact on productivity in the region. It is also revealed that education of the respondent farmers, farm size, area of holdings and share of family income from agricultural activities have significantly positive impacts on the crop diversification as well as adaptation to moderate the adverse climate impact or avoid climate related disaster. Education helps to improve the knowledge and raise technology adoption capacity and thus helps farmers adapt better to the changing climatic conditions.

DE CASTRO, MARCUS* (University of Brasilia, mfarounb@gmail.com)

From Numbers to Post-Logocentric Normative Craft : On the Use of Indicators and Comparable Constructs in Contemporary Legal Analysis

The use of indicators for several purposes, including policy design and diffusion, has drawn attention from international organizations and legal scholars in recent years. Indicators are often seen as elements that make up "technical" (as opposed to "legal") norms, and also as devices that link "scientific laws" to legal rules. One strand of argument explores the idea that law in some contexts has become subject to the influence of a "mathematical turn" coming from within "neoclassical" economics. The paper articulates some ideas about how legal criticism can be worked into the use indicators in contemporary legal analysis. The paper thus discusses, in stylized form, relevant relationships between law, taken as a social practice, and specialized means by which legal craft has sought to move "beyond" commonplace moralities of received worldviews. The paper suggests that, while rhetoric remained more linked to the development of political (not jural) ideas, the direct use by jurists of dialectics, philology, history and the "emulated" use of mathematics (law *more geometrico*) have offered pathways for legal craft to attempt overcoming established moralities. The rise of statistics and accounting techniques has tended to occur within the bounds of the rationalist idea of a *mathesis universalis*. Yet, despite all these transitions, the question must be asked how far legal craft has remained a means to actuate the exercise power (thus keeping its role as logocentric craft, to use the language of Derrida). The paper finally suggests that the modernist transformation of mathematics -- which paralleled the rise of modernist trends in art and aesthetics -- and the emergence of computer technology and the internet have the potential of unleashing a process by which social coordination can be made to move beyond markets (as characterized by neoclassical economics) and become embedded into law revamped as a post-logocentric normative craft.

DE JONG, SARA* (Open University, sara.de.jong@univie.ac.at)

Finding Pocahontas in Contemporary Europe: Migration Research Meets Historical Studies on Cultural Brokerage

Historical anthropology and ethnohistory have complicated the narration of encounters between on the one hand settler and colonial communities and on the other hand indigenous societies, by discussing the complex role of so-called 'cultural brokers' or go-betweens, who interpreted and negotiated between the two 'camps'. Most famously these include Pocahontas in the US and Malinche in Mexico, but cultural brokers have been documented in various geographical areas across different colonies and settler communities. Some historical scholars have attributed the surging interest in the study of colonial cultural mediators that started in the 1990s, to the increasing pluralisation of contemporary societies through migration. Migration sociologists have so far, however, failed to draw on these rich historical case studies and conceptualisations in developing contemporary research agendas.

In this paper, I will draw on an empirical study about the positionalities of ethnic minority and migrant staff of mainstream non-governmental organisations, which provide services to migrant clients in the UK, the Netherlands and Austria, to illustrate the relevance of the insights of historical research for the sociology of migration. I will argue that the discipline of history disrupts the supposed newness of diversity programmes in organisations, by demonstrating that 'difference' has already been used as a 'resource', for example in terms of language skills and intercultural competences, in the colonial era and that an understanding of these continuities is constructive in challenging the celebratory language of diversity politics as it uncovers the power dynamics at play. Moreover, I will propose that contestations in historiography, which critically consider how to write about cultural brokers without reproducing gender and 'racial' stereotypes and how to go beyond the traitor/translator logic, should inform the ethics and presentation of findings of contemporary sociological empirical research.

DE JONG, SARA* (Open University, sara.de.jong@univie.ac.at)

Unanticipated Routes and Windows of Opportunity: Biographical Narratives of Migrant NGO Staff

This paper is based on research in Austria, the UK and the Netherlands into the trajectories and positionalities of staff of NGOs supporting migrants, who share their migration background with their 'clients'. Many of these staff members have experienced a shift from being a client of these NGOs themselves, to becoming a provider of services and advice. Based on their biographical narratives which demonstrate a break between their previous work experience and qualifications, I suggest that their recruitment should be understood both in the context of a diversity management discourse that values their 'difference' as a skill, and in relation to labour market discrimination that closes off other avenues of employment.

I argue that their biographies reveal that their social mobility should be conceptualised as contextual and relational, since different points of reference, such as their status in their country of origin, their initial position upon arrival, and the different communities in which they are embedded, could render them simultaneously as socially mobile and immobile. Furthermore, this paper proposes to read their social mobility with an intersectional approach that complicates trans-

nationality with an analysis of situated class as well as gender positions and relations. Finally, I will draw on their biographical narratives to address the paradoxical ways in which a diversity management logic that recognises their 'difference' as a resource is both a stimulus for their social mobility, and simultaneously a barrier for continued upward mobility, locking them into their position as 'migrant Other'.

Understandings of Human-Animal Relations and Animal Welfare in 'Precision Livestock Farming' Research and Development

Due to scale enlargement in animal agriculture, farmers face difficulties to adequately attend to the well-being of each of their individual animals. To address these difficulties, much recent animal science research focusses on developing and assessing so-called 'smart farming' or 'Precision Livestock Farming' (PLF) technologies. These technologies, which principally involve on-farm sensors and data-processing software, are promised to extend farmers' eyes and ears, and thereby allow farmers to re-connect with individual animals and to improve their animals' welfare and productivity. Starting from the recognition that technologies are never simply facilitating but rather remaking and remade in human-animal relations, this paper critically examines how interactions between animals, humans and technology are understood and constituted in PLF research and developments. The paper offers a qualitative content analysis of systematically collected scientific papers on PLF technology and promotional materials of PLF manufacturers. In this analysis, the paper builds on the sociology of science and technology and the sociology of human-animal relations to reveal and criticise different reductionist assumptions that underlie PLF research and developments. The paper concludes by underlining and specifying the need for more social scientific attention to if and how PLF technologies may improve on-farm animal-human relations and animal welfare.

"Mass Society": A Simultaneous Approach of David Riesman and Gino Germani

The paper has two interrelated goals. First, from an epistemological and methodological viewpoint, we explore the possibilities of a "simultaneous approach" of perspectives from different regions. Second, as application case of this approach, we analyze the problem of "mass society" in the 50s in two sociologists: Gino Germani, from Argentina, and David Riesman, from the United States.

The "simultaneous approach" allows the comparative study of sociological theories framed by unequal relations of intellectual "production and circulation". However, this approach postulates that the relationship between "South" and "North" should not be understood only from an alleged "temporal delay", tied to a logic of "reception" of theories, nor from a supposed "temporal incommensurability", linked to a "cultural relativism" of theories. Thus, a simultaneous analysis of a theoretical problem enables a comparison between perspectives, specially about their differences and shared views on concepts, ways of developing theory and certain "epochal crossroads".

These more general reflections are brought into play in the analysis of two perspectives on "mass society". On the one hand, Germani deployed a complex analysis of the emergence of mass society in Argentina and Latin America. Obsessed by European totalitarian experiences, and seeking to identify the singular characteristics of the first Peronism and the "modernizing" governments which followed it, Germani conducted studies which elaborated original conceptualizations about psychosocial, historic, economic and political aspects of mass society. On the other hand, David Riesman criticized the "American character", due to the emergence of a "lonely crowd". This crowd was configured by the "other-direction", for example, by the neighbors in the suburbs or by the media, rather than by an "inner-direction", typical of the values of modernity. With this comparison between Germani and Riesman, we "test" the proposed methodology through analyzing a central sociological problem of the twentieth century: "mass society".

Community Policing Programs in Brazil

In recent years, the Brazilian public security sector has faced an alarming rise of crime rates, especially homicide, robbery, smuggling and drug trafficking, resulting in a generalized sense of insecurity in most of the country's great cities. The ineffectiveness of police efforts in order to prevent, repress and reduce violent crime rates have inflated the debate over the capacity of public security forces, mainly the civilian (judiciary) and military (patrol) police, to establish social control. In addition to this scenario, continuing violation of human rights by police officers in action have put the nation's police forces among the top most lethal corporations in the world. Corruption, power abuse a repression towards civilians have pressed authorities to rethink current policing models and traditional forms of action, stimulating the search for alternatives. Community policing is considered an efficient mean to overcome many problems in traditional policing practices, such as the limitations of standard ostensive car patrolling in preventing crime, the widely known lack of confidence of citizens towards police officers that work on the streets, and the never-ending insufficiency of human resources to manage post-crime occurrences.

Over the past two decades, police divisions from all states in Brazil have adopted community-policing programs as part of the effort to change the public image and the relationship of police forces with citizens. Focusing on training and practices, in nine different states, this research aimed to understand how community-policing programs have been introduced, assimilated and adapted in Brazil. Although the philosophy of community police is now widely disseminated, it is still considered a public policy best suited for regaining social control in socially vulnerable urban areas most exposed to violent crime rates. Moreover, several obstacles in the way police forces are organized and managed in Brazil make it extremely difficult to produce successful results.

Young Offenders in Brazil: Analyzing the Interplay of Family, Peer Group and Social Context As Risk Factors for Youth Involvement with Crime and Violence

Recently, data on criminality and violence produced in Brazil have indicated an ever-growing number of death rates by homicide among young people, especially those between 15 and 24 years old, male, and afro descendants. The increase in criminality rates, mainly related to drug and firearms trafficking, have led to a public debate over the legal age for criminal responsibility. Support for the reduction from 18 to 16 years old has grown in all social sectors. However, researchers and experts from social sciences, education and public policy sectors have come forward against such measures, arguing for a better understanding of the involvement of Brazilian young black men with lethal violence, both as victims and as perpetrators. Factors commonly related to explain victimization, such as social and economic inequalities, associated with race and gender, usually indicate a higher probability of young black men from impoverished backgrounds of being victims of homicide, police harassment and participation in gangs and drug trafficking, but are not enough to understand the complex social dynamics that lead young people to deviant trajectories. Based on recent qualitative data collected among youngsters who live in violent neighborhoods, we aim to analyze the interplay of family, peer group and social context influence in the involvement of youth with crime and violence, from the perspective of risk, masculinity representations and sociability practices. We hope to contribute to a further understanding of key factors that either enable, either restrict social actors' decision making and choices regarding engagement in illicit and violent acts.

Globalization, Law and Social Change in Latin America

Latin America legal system faced substantial reforms and transformations in this last 15 years. However, the administration of justice continuous to be inefficient affecting drasticallly the society. Globalizaton forces and new domestic actors until now were enable to promote social justice to the countries.The political and social challenges of democratization and globalization have affected al of them, but these economic and social processes have no doubt affected political and legal culture in different ways. Even though there were significant reforms, democratization and liberalization were not sufficient to overcome difficulties against the implementation of social justice. Many Latin American countries have failed to improve in a more forceful way the distribution of resources and break the strong hierarchical tissue that prevented the law from fulfilling its role in so-

ciety. In the present context of Latin America, the type of justification of the rule of law one prefers is likely to make a significant difference in terms of the policies that might be advocated. In particular, there is the danger derived from the fact that nowadays legal and judicial reforms are strongly oriented toward the perceived interests of the dominant sector basically domestic and international commercial law, some aspects of civil law, and the more purely repressive aspects of criminal law. At the heart of the problem may be the inability of the reconfigured state to tackle the growing social and political inequality that is central to the vulnerability problem. As long as inequality persists, it is unlikely that the picture of increased vulnerability and low adaptive capacity among the poor in Latin America will change. This study analyzes in the past 15 years the major challenges for Latin American society to achive a more democratic legal system.

Demanding Policy Change, Taking Direct Action, or Promoting Alternatives: Explaining Differences and Overlaps in Strategic Preferences within the Climate Change Movement

Over the last decade, the climate change movement has known a strong diversification of its strategies for mobilizing around UN climate summits (COPs). Especially since the failed Copenhagen summit a central point of debate within the movement has become how actions should relate to the international policy process. While parts of the movement continue to believe that making claims towards government leaders at the COP can bring about sufficient solutions to the climate crisis, others have lost faith in the process and believe that any strategy that relies on the outcome of the COP is doomed to lead to disappointment. The latter still aim to use the momentum created by the COP, but propose two main alternative strategies: direct action against the perceived 'culprits' of climate change, and the promotion of concrete solutions to the climate crisis. Although these different strategies do not necessarily contradict, different segments of the movement still compete for resources, and through that competition, differences in strategic preferences become salient. In some cases, these differences even lead to conflict.

This paper aims to explain how such strategic differences ultimately drive the internationally coordinated mobilization of the climate movement for COP21 (Paris, 2015). It combines 14 months of observations from meetings and actions with more than 40 qualitative interviews. As a theoretical framework, the paper starts from a political opportunity structure approach, assuming that variations in these strategic preferences can to an important extent be explained by variations in organizers' perception of contextual opportunities. Nevertheless, other factors, like activist traditions, resources and decision making processes are taken into account as well. The paper aims to make a strong contribution to our understanding of strategic variations within the climate change movement, the development of transnational mobilizations, and the role of POSs in these processes.

DE MOOR, JOOST* (University of Antwerp, joost.demoor@uantwerpen.be)

Demanding Policy Change, Taking Direct Action, or Promoting Alternatives: Explaining Differential Participation in the International Climate Change Movement

Over the past ten years, the climate change movement has known a strong diversification of its strategies for mobilizing around UN climate summits (COPs). Especially since the failed Copenhagen summit a central point of debate within the movement has become how actions should relate to the international policy process. Organizers now plan a wide range of actions that potential participants can take part in. While some organizers continue to stage demonstrations that aim to put pressure on negotiators, others have lost faith in the ability of the COP-process to solve the climate crisis and therefore propose alternative strategies, like direct actions against the 'culprits' of climate change, and the promotion of concrete alternatives.

This paper asks why those people mobilized by the organizers join some of these actions rather than others, or, abstain. Building on the political opportunity structure (POS) approach, it hypothesizes that the type of action activists choose to join depends on their perception of the availability of particular opportunities. Those joining actions that demand policy change should have a more positive outlook of the COP's POS than those who abstain or who join the alternative actions.

The paper describes the different strategies that are organized around COP21 and uses survey data to analyze why activists participate. Data is gathered from among the members of the key organizations involved in this international mobilization using a pre- and post-survey method (Klandermans and Oegema, 1987) to include both participants and non-participants and to assure that causality can be assessed. The goal of the paper ultimately is to increase our understanding of what drives participation in international climate change activism, and what can explain the diversification the movement's repertoire. As such, it also increases

our understanding of the emergence of transnational activism, and the effect of political globalization on political participation.

Citizenship Rights for Young Offenders: The Impacts of the 1990's Reforms on the Youth Justice System in Brazil

The youth justice system in Brazil has been through many reforms of the last two decades. This system was created in 1927 in order to separate young offenders from adults and prevent adult criminality by means of early intervention. Throughout the 20th century, early intervention meant custody on juvenile correction centers and the youth justice system adopted a tutelary model that denied citizenship status to young offenders. It was only in the 1990's that significant reforms were taken. Brazil ratified many of the UN documents on the rights of the child and on youth justice, resulting in the implementation of the doctrine of integrated protection in the national legislation. Henceforth, the tutelary model was supposed to be replaced by a new model that would focus on non-custodian intervention and that would recognize and guarantee the citizenship rights of young offenders. This paper will analyse the impacts of these reforms in the state of São Paulo, which has the major number of juvenile offenders in the country, in order to identify in which extent the reforms can be considered effective in the guarantee of citizenship rights and status for young offenders. The tension between the guarantee of civil and social rights and the persistence of physical violence in juvenile centers will be discussed as a key factor to understand the possible outcomes and limits of the reforms.

Unequal Exchange in the World Language System

The World Language System consists of a 4-tiered constellation of plm 6000 language groups, held together by multilingual speakers in a hierarchical structure of peripheral, central, supercentral and hypercentral languages, resembling the moons planets, suns in the galaxy: the hub of the system is English. How could such a system with English as the one hypercentral language emerge? Is it because of the unique characteristics of the language, the historical ascent of Britain and then the US, or was it just a matter of sheer luck? Since English now offers so many advantages, people the world over are eager to learn it and thus accelerate the 'slow stampede' towards English. These asymmetric language relations certainly have profited English speakers who have much less need to learn a second language than others do. It also has made for an 'uneven exchange of texts': books and other cultural products travel far more easily from the English speaking core outward than the other way round. The near hegemony of English also helps to spread English, especially American, notions and practices across the globe. In this presentation the position of the supercentral languages, the state languages and the peripheral languages in unequal power relations with one another and with global english will be examined from the perspective of the world system approach to languages.

Corruption and Cheating As the Tragedy of Modern Culture

Increased political corruption and cheating in a wide diversity of practices such as sports and academic examinations are becoming two of the most important problems affecting contemporary societies. Political corruption, especially in the developing world, has reached such a colossal scale that many scholars have identified it - and not lack of economic resources *per se* - as the most important problem confronting the prospects of economic and social development. In the developed world corruption is also growing. In the U.S. and Europe many serving officials have been indicted on numerous counts.

Different from corruption but closely related to it, cheating represents another serious challenge. Dishonesty in taking examinations has become common in many parts of the world. Cheating, it is claimed, is anathema to sport, yet the use steroids in competitive sports is too common to be ignored.

The scholarly literature agrees in that these forms of deviance occur within the framework of particular sub-cultures that work to normalize such practices. Some forms of corruption are accepted among political circles. Studies on cheating at exams show that many students justify helping friends they are close to. In professional sports many athletes see "fair play" like an expression of amateurism.

Normative frameworks have been put in place to curb dishonesty such as the U.N. Convention Against Corruption. Severe punishment now awaits exam cheaters, and new testing techniques are used to detect doping in sports. However, be-

yond such disciplinary responses lies the need to acquire a deeper understanding of the general cultural forces driving these harmful trends. It is my contention that the work of George Simmel on the Tragedy of Culture, which duels on the massive growth of objective cultural products, and their overwhelming impact over the subjective culture of individuals, can shed light upon the problem at stake.

The New Work Order in Corporate South Africa from the Perspective of Black African Managers

This paper seeks to lay out the ways in which one of the largest multi-national companies in South Africa is a working example of the New Work Order in this time of New Capitalism. The paper does this by examining some of the main characteristics of the New Work Order - such as the dispersal of centralised authority and the use of sociotechnical engineering - and discusses these using evidence from company documentation and staff interviews. The main objective here is to consider the dominant discourses of the New Work Order that potentially impact both the identities of black African managers who work for this multi-national company and their cross cultural workplace experiences.

Accountability, the War on Terror, and U.S. Police Criminal Intelligence Units

Criminal intelligence units have become a common, though somewhat controversial, feature of U.S. policing over the last several decades. Recently, a growing body of criminal justice research has focused on the policy and technical considerations involved with implementing intelligence-led policing initiatives. Far less research, however, has explored the social and cultural conflicts that have accompanied the emergence of this type of policing activity. Criminal intelligence units have long been criticized by rights activists as being unnecessarily secretive, unaccountable, and prone to abuse and corruption. Moreover, US activists have been particularly critical of the post-911 expansion in the use of multijurisdictional "fusion centers," which bring together U.S. federal, state, and local policing agencies to collect and analyze information relating to individual suspects, groups, or patterns in suspected criminal activity. Partly in response to this criticism, US law enforcement agencies have sought to legitimate the use of intelligence-led policing through public information campaigns, the creation of credentialing programs for intelligence analysts, and the formation of professional associations. Taking the debate over intelligence-led policing as background, this paper reports the results of a qualitative thematic analysis of policy and procedure documents drawn from U.S. criminal intelligence units and professional organizations. More specifically, this paper adopts a contextual constructivist framework and examines how police departments and criminal intelligence units have sought to reduce external pressure for reform by appropriating, re-packaging and re-deploying a series of discursive frames initially offered by skeptical community rights activists. By exploring these discursive processes, this paper will allow us to better understand how criminal justice actors seek to defuse and deflect the claims making activities of external reform groups.

Integrating CAM in General Practice: A Case-Study on Homeopath Physicians

Few studies in social sciences are concerned with primary care doctors who integrate CAM in their daily practice, a model that Philip Tovey and Jon Adams describe as «direct integration practice». Thus, I did my PhD thesis on homeopath physicians, a category particularly emblematic of this model.

My study is based on a corpus of twenty-six semi-structured interviews conducted between 2010 and 2013 with homeopath physicians who worked in private offices, in the french speaking part of Switzerland and who, mostly, graduated in the 1980s-1990s. Twenty interviews with non-homeopath general practitioners complete this corpus.

In this presentation, I will give the results of the comparative analysis, which has been carried out following the methodological principles of career narratives and content analysis. This work brings to light a continuum of professionnal identities, ranging from «specialists» to «eclectics». I interpret these internal differences in the category of homeopath physicians by the following aspects: careers,

therapeutic values and beliefs, nature of work and configuration of workplace, type of clientele, professional networks and political commitments.

Professions in the (semi)Periphery. The Multipositioning Strategy of Lawyers in Poland.

The paper shows the multipositioning strategy that is characteristic trait for lawyers in (semi)peripheral country as Poland. The core theoretical framework of the analysis is Pierre Bourdieu's field theory, applied in particular to semi-peripheral conditions (as understood in the world-system theory). Authors claims that in (semi)peripheries, under the conditions of general weakness of states as „ordering" meta-institutions, particular social fields (i.e. scientific, legal, political, administrative) are poorly differentiated and overlapping – contrary to states of the world core. Because of this, agents are realising their practices, especially professional ones, in various contexts, combining resources from different fields. It is particularly visible in professional legal practices, where combining a purely scientific capital (professor of law) and professional capital (solicitor, barrister) is very common. These practices were already visible in social realism, but became most prominent process under the conditions of (semi)peripheral capitalism, when the status of being an academic, together with the cultural and social capital connected to this position facilitated (and still does) the occupation of dominant positions in the local field of legal counsel, especially local law firms and the lucrative advisory services rendered to global corporations. Thus, paper shows transitions of legal professions regarding a globalisation process and relations between the local and transnational field of law – the autonomy and heteronomy of the local field. The high status of cultural capital (and intellectualists) is in turn caused by an absence of local bourgeois, characteristic for the (semi)periphery. Thus, the (semi) peripheral conditions cause a constant game of multiple inter-strengthening capitals. This behaviour seems to be modelled for the majority of occupations realised in various versions in the (semi)peripheral areas.

DEBSKA, HANNA* (Pedagogical University of Cracow, hannadebska86@gmail.com)

The Social Construction of Femininity in the Discourse of the Polish Constitutional Court

The paper outlines discursive strategies employed by the Polish Constitutional Court in its judgments in cases involving the concept of femininity. Application of Pierre Bourdieu's perspective and Critical Discourse Analysis (CDA) allows for a reconstruction of the Constitutional Court's ideological patterns, and, consequently, hidden political contents. It also reveals an area of symbolic power and the role of legal institutions such as Constitutional Court in shaping gender relations.

Both concepts (Bourdieu's and CDA) seem to be compatible with each other. Bourdieusian perspective provides an explanation of how a legal institution, hidden behind universal and impartial structures, can use its structural position to impose several ideological visions of the world on society. Critical Discourse Analysis, in the perspective of Norman Fairclough, offers a general systematic framework which can be used to conduct innovative qualitative research of the Constitutional Court judgements.

The article argues that the Constitutional Court, being a legitimised interpreter in the legal field, is also one of the key institutions of power. By using neutralising language procedures it often contributes (occasionally in a way imperceptible to itself), to preserving social order, differences, and inequalities, particularly in cases regarding femininity. By identifying several argumentative strategies, the research shows how one vision of "femininity" and "female" (as well as other implied terms, such as "motherhood", "family" etc.), is constructed, and consequently supported in selected judgements. This aspect goes unnoticed by the traditional legal theory which does not allow for reaching the subsurface structures of argumentation. The effectiveness of symbolic power stems directly from these surreptitiously imposed mental schemata. Resulting from these argumentative strategies is a naturalised social order, arbitrariness of which is misrecognised, and particularisms universalised. They are taken for granted and because of this, there can be no social discussion regarding them.

DECIEUX, JEAN PHILIPPE* (University of Luxembourg, jeanphilippe.decieux@uni.lu)

Bargaining for Evidence in a Hybrid Forum. the Case of an Indicator Expert Group Chaired By the European Commission.

In the area of policymaking, we observe that decisions increasingly base on knowledge/evidence debated in hybrid think thanks by external experts. This knowledge is used to ideally fade uncertainties by calculating the risks involved in the final decision and by this to legitimize political decisions by delivering hard-facts in the argumentation (e.g. as "evidence-based-policy-making"). A consequence of this decision-making processes is the authoritative implementation of knowledge and direct application into the context of everyday-life. Such a political-decision-context often is a very specific situation, in which traditional mono-disciplinary scientific knowledge commonly is not precise enough, because usually it is produced to be universally valid and bases on certain assumptions. What is needed in such a context of real life application is *socially robust knowledge.*

As a response to that demand, the mode of knowledge production is changing. Instead of linear-ordered knowledge-production, hybrid forums of heterogeneous actors are becoming important. These actors are debating and bargaining solutions to a problem and are co-constructing a contextualized knowledge as decision-making-base for the specific context of application. This discursive process of knowledge production is not only affected by the different forms of knowledge from the heterogeneous actors, it is also influenced by the heterogeneous world of relevancies (interests, targets, practices, experiences...).

This study assesses and analyses by a multiple triangulation how an Indicator Expert Group of the European Commission develops social indicators (as an example for political evidence) within a transdisciplinary- and transnational expert-discourse. Based on multiple data sources my study is offering information on how evidence is produced in decision-making within such hybrid forums, e.g. important factors, processes and structures influencing indicator-systems.

DEFORGE, QUENTIN* (IRISSO - Paris-Dauphine University / CNRS, quentin.deforge@gmail.com)

When after the Struggles the Experts Come: Sociology of a "Worldwide Parliamentary Development Community of Practice"

In "The Democracy makers", N. Guilhot (2005) shows how during the cold war, the US foreign policy gave birth to a large number of NGOs working at "democratization": supporting political parties, training activists for struggles, and promoting human rights all over the world. Since the 90's, new perspectives have emerged, such as a focus on parliaments: strengthening secretariats, supporting oversight mechanisms, training members of parliaments, etc. A "worldwide parliamentary development community of practice" now gathers experts from NGOs and international organizations (such as the United Nations Development Program and the World Bank), as well as scientists. Contrary to Guilhot's "democracy makers", who were seen by governments mainly as political activists, "Parliamentary development" seems to follow different institutionalization and legitimization processes.

This presentation will explore how these experts embody the "community of practice", with a focus on division of labor. We will see how these "knowledge workers", coming frequently from parliaments of "developed" countries (both members and staff), build their expertise mainly from the understanding of informal mechanisms inside parliaments. With the UNDP example, we will show how the transformations of funding, as well as the practices for managing human resources and expertise in the UN system (rosters, contracts, etc.) lead to an international market of expertise and provides both constraints and support to the institutionalization of a professional group, who is trying to globalize knowledge on political systems.

This work is part of an ongoing PhD research in political science, undertaken as a "global investigation in social sciences" (Siméant, 2015), and is based on field researches (interviews, observations, archives) among international actors in Egypt and Tunisia, at UNDP headquarters, and currently in the UNDP team for Parliamentary development in Tunisia. The main case study of this research is the parliamentary strengthening policy implemented in Tunisia after the "revolution" in 2011.

Re-Thinking Defamilialization in the Light of Global Care Chains and the Transnational Circulation of Care

The defamilialization concept has been abundantly mobilized for the study of the gendered character of welfare States and, in particular, their action to diminish the burden of child and elder care that heavily rests on women's shoulders. But this theory needs to be revisited in the light of the growing importance of transnational mobilities of care, including the migration of care workers and the transnational « circulation of care » (Baldassar & Merla 2014) between these migrants and their geographically distant relatives. This paper aims at revisiting the defamilialization theory in order to better acknowledge the profound transformations within contemporary welfare states in relation with these transnational

　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

mobilities of care. This is done through the identification of the points of intersection between the circulation of care and the defamilialization theory. Based on two case studies of domestic migrant workers in Belgium, the paper highlights the importance of migration within European care regimes and questions the defamilialization of migrant care workers themselves. These women are indeed considered by policy makers and employers as 'defamilialized' through the migration process, an illusion that partly justifies their exclusion from defamilialization schemes. This is particularly problematic in particular for migrant women who continue to care and provide for relatives living in highly familialistic states. These women are indeed located at the intersection between the care and social protection regimes of their home and host societies. This leads us to interrogate the conditions of exercice of their participation in the transnational circulation of care with their distant relatives, and ask in particular if transnational family solidarity necessarily involves the hyper-familialization of female migrants. We conclude with an exploration of possible directions for the transformation of care and social protection regimes and migratory policies.

Gender, Race, and Nationality Differences in Low Wage Workers' Access to Sick Leave

Focusing on access to paid sick leave, we examine the multiple marginalization of low-wage, racial minority and especially immigrant women by labor market divisions, employer practices, and public policies. Workers in low-wage sectors are less likely than others to have paid sick leave to care for their health or the health of a child. Given women's family responsibilities as caregivers, this becomes a gender and work-family policy issue. Racial/ethnic minority and immigrant workers are more likely than others to hold jobs that do not allow sick days, making an analysis of the intersection of gender, class, race, and immigration especially relevant. The U.S. does not have any mandated national paid sick leave policy, but in recent years several states and localities have passed sick and safe leave (covering safe time for domestic violence survivors). Research on other countries shows that even with national paid leave policies, marginalized workers have less access to the benefit.

We analyze data collected from over 6,000 low income workers who sought legal assistance, for various complaints, from a local worker advocacy NGO in Washington DC in 2008-2015. Of these, 97% were racial/ethnic minority, 47% were also immigrants; overall 46% were women. To assess implementation of local paid sick and safe leave law, all clients were asked about access to, and use of, paid sick days. Initial findings show, for example, women were twice as likely as men to report being denied a requested sick day, with immigrants of both genders denied more than non-immigrants, and immigrant women denied the most. Open-ended questions reveal incidents where women lost their jobs when they took time off to take a sick child to the doctor or hospital. Our paper provides a multivariate and intersectional analysis of the data, and the larger workplace and policy issue.

DEKKER, MISCHA* (EHESS, m.dekker@ehess.fr)

Feminism or Security? the Transnational Campaign Against Street Harassment

My analysis focuses on tensions in the transnational campaign against « street harassment » and specifically on differences in the construction of a public problem between France and the Netherlands.

In a fashion similar to #Occupy movements, local activist groups associated with US-originated Hollaback and Stop Street Harassment have over the last three years emerged in many cities in over thirty countries, campaigning against what they argue is a daily violence against women in public space.

Policies and legal frameworks are created in alliance with governments and public transport operators. Enterprises are urged to train personnel, as #WelcomeBar/Festival labels allow user evaluation that impact businesses' clientèle. A more active kind of citizenship is promoted through pamphlet guidelines and trainings on how to intervene as a bystander.

Although the campaign seems transnational, actors are confronted with tensions arising from efforts to apply the same concept in countries with different ideas about (non-)acceptable behavior and differing policy and legal frameworks to address allegedly harassing behavior. Street harassment campaigns' root both in feminist and security justifications, the latter seemingly more dominant in the Netherlands and the former in France. French activists' frequently reference « Northern European » public spaces as more gender-equal. Yet in the Netherlands anti-street harassment propositions frequently come from the political right, leading Amsterdam's left-wing mayor to argue a local ordinance is not a priority as street harassment does not seem a major local problem and legislation could stigmatize ethnic minorities.

My main corpus consists of ethnography and interviews with anti-street harassment activists, policy-makers and legal actors in the Netherlands and France,

and interviews with important US actors as to grasp how strategies and ideas diffuse.

Is street harassment a transnational campaign? How to explain differences in coalitions between activists and states, and the legal and policy measures that evolve from them?

DEL ROSARIO, TERESITA* (Asia Research Institute, delrosatess@gmail.com)

Love on the Run: Transmigration, Emotions, and Governmentality Among Filipino Domestic Workers in Singapore and Thailand

Migration studies almost always tend to emphasize economic factors as the overriding motivation for leaving, and are always couched in terms of searching for better sources of livelihood. Where studies have shifted to the emotional sphere, these usually focus on the destruction of the intimate relations particularly among those who have been left behind by the migrating worker. Among Filipino workers, particularly female Filipino domestic workers who service households in foreign countries, their departure often results in an "emotional deficit" back home. Parents, spouses and children are bereft of emotional care while the new employers benefit from the service of Filipino domestic workers and care givers. Rarely has attention been given to the re-construction of intimacies in a context of migration, especially among women who have had to contend with regulatory migration regimes that prohibit them from entering into emotional liaisons with the locals. In other less regulated situations, the reconstruction of an intimate life is more possible, and there are various options that are open to women to experience a relatively more enriched emotional life that is mainly of their own choosing. These two contrasting situations are the subject of this paper.This study discusses the contrasts between Filipino domestic workers in Singapore and Thailand. A highly regulated regime in Singapore prohibits Filipino (and other) temporary domestic workers from entering into emotional relationships with Singaporeans. In contrast, a highly unregulated labor market in Thailand offers far more emotional options for Filipino domestic workers. Through continuous two-week visa reissuance by immigration authorities, Filipino workers can stay indefinitely and build their intimate lives around situations of entry and exits across Thailand's borders. In both countries however, marriage as a migration strategy is a closed option.

Child Marriage in Nigeria: From Global Social Policy and International Law to National and Local Legislation and Policy

This paper addresses two questions related to global social policy, international human rights, social welfare, and gender discrimination. First, how do international conventions and covenants (embodying social policy frameworks and normative prescriptions) influence legislation and policy at the country level? Second, what are the pathways of diffusion, contestation, and translation from global social policy to national and local legislation and policy? These questions are answered by analysing the case of Child Marriage in Nigeria in three substantive sections.

First, the interaction between international and national law is examined. A comparison of the CEDAW, CRC, and African- and Islamic-specific conventions on the issue of Child Marriage is presented. The role and values of supra-national institutions (African Union, Committee of the Rights of the Child, etc) in shaping national legislation and policy is explored. Furthermore, given these influences, the evolution of legislation and jurisprudence in Nigeria at the national level is assessed.

Secondly, Nigeria being a federal country, the issue of Domestication, i.e. translating federal legislation into state laws, is explored. This process is similar to the reception and translation from international to national law and policy. This governance topic is complemented with a review of the agency and interaction of transnational actors (International NGOS, UN agencies, donors, etc.) and local counterparts in the domestication process.

Finally, Nigeria has allowed customary and religious law to exist. Consequently, changes through time in the interaction among these different types of legal traditions are investigated. These traditions are supra-national too and provide a normative framework (e.g. regarding social welfare and gender) to the production of national and state-level legislation and policy. Thus, national and local legislation, through a process of contestation and adaptation, reflect competing global social policy prescriptions regarding Child Marriage in Nigeria.

A concluding section summaries the arguments and suggestions for future research.

Between Secret and Public Exposure through Patients' Organisations: The Double Moral Injunction of Infertile Couples Using Medically Assisted Procreation with a Third-Party Donor

Public debate and the involvement of patient organisations are important dynamics that must be taken into account to understand the definition and regulation of standards and guidelines on some of the most controversial technical and medical issues. In this paper, I seek to analyze the major role of infertile couples, especially the engagement of women through the Portuguese Fertility Association, for the promotion of access to Medically Assisted Procreation (MAP) with a third-party donor. Although the right to privacy on intimacy, for fear of stigma and social discrimination by the family and work colleagues, the association members also assert their right to participate actively in the fight against the lack of both information and donor gametes. By associative engagement, as a political requirement, the women interviewed mobilize their private world to claim their health and citizenship rights (struggle for recognition). Their critical participation in public causes is based on the proximity created by attachments and crossed by similar care pathways: the discovery of being infertile and the need for a third-party donor to become a parent. Searching for information and sharing personal experiences via online forums of infertility associations, as well as the public visibility in the media, are transforming the relationship between, on the one hand, "experts" (politicians, ethics committees and doctors) who design and implement infertility treatments and, on the other hand, "laypeople" (beneficiaries). The civic potential of Internet and media for a collective mobilization in the public sphere, according to a new archetype of participatory democracy, contributes to a different form of relationship between politics, media and civil society. Building upon my post-doctoral research on controversies, tensions and discomfort around MAP with a third-party donor, I will approach this problem theoretically and empirically, based on the analysis of online discussion forums and in-depth interviews with infertility patients.

Communication Problems within Medically Assisted Procreation and Palliative Care: The Power of Words

In this paper, I seek to analyse communication problems between health caregivers and patients within Medically Assisted Procreation (MAP) and Palliative Care. These discursive and relational difficulties are revealed through social interactions in health frameworks, which are defined by transparency (to give all the clinical information to the patient and his family) and objective measures (the results of medical examinations or treatments and the application of standardized therapeutic protocols). For example, MPA protocols are standardization instruments, based on the success rate, which neutralize patients' singularity and make it difficult to keep the communication between health caregivers and patients. Moreover, sometimes terminally ill patients and their families are unable to grasp the meaning of the medical discourse, i.e. the scope, depth and implications of what is transmitted on the diagnosis and prognosis. Communication is troubled by technical language poorly controlled or disease basic knowledge and beliefs. Communication issues that cross over institutional frameworks are a complex relational dimension because of communication problems, constraints of narrative exchanges in the medical context and understanding or empathy deficits between health caregivers and patients. Regarding ordinary situations encountered in health institutions, the difficult dimension of living together requires interpersonal and communication skills to transmit a diagnosis, prognosis or therapeutic that are not always possessed by caregivers by the lack of rules thus producing unintended drift of communication that result in disorders, misunderstandings and disagreements. I will try to demonstrate that communication is fundamental in complex and delicate situations, such as an infertility diagnosis or the stop of traditional cancer treatments (chemotherapy, radiotherapy, surgery) and referral to palliative care. Building upon my post-doctoral research on MAP techniques and a research project on palliative care, I will approach this problem theoretically and empirically through the analysis of field notes and in-depth interviews with health caregivers and patients.

The Symbolic Dispute over the "Peace-Building" Between the Government and the Catholic Church in Morelos, Mexico

The Mexican government has implemented a series of public policies for "violence prevention" and "peace-building" to face the violence associated with drug trafficking and organized crime in Mexico; while the Mexican Catholic Bishops' Conference promotes initiatives in the same direction.

In the state of Morelos, which corresponds to the Roman Catholic Diocese of Cuernavaca, high rates of violence put the problem on the public agenda as one of the central issues; turning the "peace-building" in a scenario of symbolic dispute in which various visions of peace, and of the world, are expressed and dispute.

This paper makes an analysis of the "peace marches" convened by the Catholic Church in the state of Morelos (Mexico) during the years 2014 and 2015 from the perspective of the link between religion and territory. We analyze the use of space in these marches and the processes of desemantization and resemantization that happen in the geography of religious practices during such events; assuming that performed territorial markings generate spaces of transactions between the faith community and the civil society.

We seek to show that analyzing the use of space and territorial markings in this particular process, allows us to analyze the convergence between the political and the religious fields that happen there, as the physical space operates according to certain social logics and allows us to observe worldviews clashes in a social microcosm.

Incorporating Children's Perspectives in the Management of Urban Risks

Addressing risk has long ceased to be the sole prevail of experts and policy makers. Public engagement and governance of risk approaches rely on integrating the perspectives of different stakeholders, as well as contextual factors (legal, political, social, values) in decision-making.

Children and young people make up a substantial proposition of urban population. However, they are usually relegated to the role of vulnerable population or potential victims in urban risk management. Although schools and school aged children are the main targets of disasters risk reduction education programs, these programs tend to see children in terms of their role as future adults, often ignoring their lives as children. Their specific perspectives could provide valuable insights in responding to risk.

This paper aims to assess the roles assigned to children in urban strategies of coping with risk and identify ways of increasing their engagement and participation in Portugal. It addresses this subject at both the national level (legislative and institutional framework, national programmes and initiatives, implementation of international policies, such as the Hyogo framework for action) and at the local level, with case studies of four cities susceptible to different kinds of risk (earthquakes, floods, industrial accidents) and with diverse urban and sociodemographic profiles (the capital city, a suburban city, a medium-sized agrarian city and a medium-sized industrial city). Empirical data for this paper stems from document analysis and interviews with key informants.

This paper is based on the Horizon 2020 funded project CUIDAR Cultures of Disaster Resilience Amongst Children and Young People, coordinated by the University of Lancaster.

Why I Do Not Trust the "Realities" of Underdevelopment

The process that leads us, in the field of "development", to make decision is unfortunately too often unquestioned. But more often, decisions are based on a combination of emotions, numbers, rational argumentation and beliefs coming from figures of intellectual or moral authority. These data and opinions originate from various sources that contribute to our understanding of the social world. Here, we are calling "reality" this rather complex comprehension of social dynamics that is believed to be independent from the observer's own experience. That is to say that "reality" is thought to be accessible to all and identical to all who have the same information. "Reality" is thought to be universal and often, its nature is taken from granted. Other ideas of what is real are said to be of less value or ridiculed.

We are building our sense of "reality" from first hand experiences, from popular culture, the media, documentaries, scientific literature, administrative data and official statistics. We are too often adamant that we have an intimate understanding of the "reality" of social dynamics in the so-called "developing world". We also believe that our "reality" is better than others' because it has stronger foundations. But "reality" is not a given, it is not available to us. "Realities" are multiple and competing. Our reception of "realities" depends on who we are, on how we grew up, on how we were educated and on why we are acting.

This paper questions the validity of the various "realities" of "underdevelopment". I contend that they are shaped by ideologies, design shortcomings and severe technical limitations. In this paper, among elements used to build "realities" I will look at media representations and statistics. Ultimately, this papers attempts to force us to question the grounds on which we are making decisions.

Crisis Neoliberalism and the Social Welfare State: Comparing Structural Challenges and Policy Responses in the US and Scandinavia

Emblematic of a global system in crisis, the social safety net of the most advanced capitalist countries have experienced significant new challenges in recent years. Social services have become targeted for sharp reductions, consolidation or elimination under shifting political conditions and a highly disorganized popular resistance. Comprehensive social service approaches have become politically defined as a "problem" frequently blamed for undermining global competitiveness. In a world turned upside down, the social welfare policy shift to "human capital approaches" has been redesigned to transform the poor and the disenfranchised into "more attractive" commodities for capital exploitation. This paper draws contrasts between the embattled Nordic Welfare State model and the permanently underfunded, minimalist US version with an emphasis on challenges posed by migratory upheavals and a substantive political shift to the right. An attempt is made to identify and anticipate some key areas of neoliberal restructuration of social services delivery where successful political resistance may emerge.

Changing Patterns of Professional Regulation : The Case of the Notaries in France. a Profession Between Self-Regulation, State-Regulation and Market Rules.

L'organisation et les règles professionnelles des notaires font l'objet de critiques récurrentes relatives aux situations d'opacité et de monopole contraires à la libre entreprise et à l'égalité des chances. Ces griefs se sont exacerbés depuis plusieurs années, en particulier depuis l'apparition du Livre blanc de la Commission européenne sur les professions libérales. Dans le même temps, nous assistons au développement de sociétés de notaires, à un souci croissant de spécialisation et de rationalisation des études et à l'émergence contrastée de grandes structures d'exercice. Cette logique d'entreprise a été renforcée par plusieurs réformes dont, en France, la loi « Macron » du 6 août 2015 tendant à libéraliser la profession.

Dans un premier temps, la communication présentera les spécificités du notariat français, comparativement aux autres notariats, notamment européens. Elle évoquera ensuite les dynamiques professionnelles à l'œuvre. Parmi celles-ci, on évoquera cette emprise croissante d'une logique d'entreprise et son articulation avec une patrimonialité encore très prégnante chez des professionnels libéraux, officiers publics titulaires d'une charge ministérielle, fortement ancrés au niveau local. L'élargissement de la focale permettra en conclusion d'interroger les évolutions contemporaines du « marché du droit » et de tester plusieurs hypothèses concernant la structuration de ce marché spécifique et la mise en question d'une logique professionnelle qui serait aujourd'hui prise en étau entre celles du marché et de l'organisation.

L'analyse de l'identité notariale, du rapport contrasté au métier, de sa régulation et des recompositions professionnelles actuellement à l'œuvre s'appuiera sur les premiers résultats d'une enquête documentaire, quantitative (exploitation statistique de données biographiques et sur les offices), par observation (de diverses manifestations) et entretiens (dont 60 approfondis retranscrits). L'étude de l'origine sociale des notaires en exercice, des modes de pérennisation et d'accumulation du capital (transmission, liens entre patrimoine et entreprise...) permettra de mieux comprendre cette articulation et les évolutions en cours.

Think Tanks and the French Political Game.

This paper examines the increasing weight of think tanks in the French political game and its acceleration from the Medef's Project of a "Refondation sociale" at the end of the 1990s. The comparative analysis of their recruitment, their policy advice, their networks and their influence during the last French presidential election campaign will highlight the conditions and the effects of this expansion. What are the factors that account for the higher incidence and variations of this type of institutions, and how they affect politics and the presidential election campaign? What are the specificities of these think tanks in comparison with intellectual circles of the past? How do they work? Who finance them? How independent are they? Today, there are about two-hundred think tanks in France. The paper presents them. After an historical presentation and a statistical study, it highlights the action of some of these institutions, on the basis of several criteria: influence, contrasted policy advices, proximity to the political parties and to the candidates of the election. Some policy research institutions close to political parties (specially "Fondapol" and "Terra Nova") and some topics (like participative democracy, health, sport, labor and education) will be selected. How do these think tanks spread their messages and contribute to train decisions of vote? How their political advices are taken by the candidates? How they can exercise an influence on the messages emitted by these candidates and on the main themes of campaign? The paper analyzes in particular the links between these think tanks and the communication agencies, the media, internet and the social networks. In order to take into account their specificities in comparison with think tanks in the United States of America and in the United Kingdom, the analysis will be further refined by comparing them with some European and foreign examples.

The Function of Liminal Spaces of Protest in Imagining the Future, Here and Now: The Case of Gezi Park Occupation

The occupation of Gezi Park allowed the heterogeneous social actors to build a liminal and ephemeral space of utopia. It was not only the spot of a mere defensive protest. Rather, it was a space where the utopia was lived and bodily experienced. I argue that the specificity of progressive social actors today is to produce collective practices performing and experimenting the future they want, instead of producing discourses about future emancipation. Prefiguration of the utopia revealed itself as a public performance. The possible future is enacted in the present as a modality of creative protest. How do the social actors implement alternative sociability ties inside and after the occupation? Inside Gezi Park, it is illustrated by the organization of the camping with autonomous security tactics and medical aid volunteering, the collective kitchen, library and garden, as well as by the means of music and dance. Each of the performances shows how to transform everyday activities into a possible future's description. The modalities of a utopic social life based on equality, direct participation, freedom, solidarity, artfulness have been performed in the Park. Along with the ritualization of ordinary activities, the pluralism desired by those social actors was expressed through being together with people different from oneself (political views, gender orientation, religion, social class) in the name of a common (i.e. the park and by extension, the city, even more generally the Nature). After the occupation ended, we observed the emergence of citizen networks such as neighborhood forums, consumer cooperatives, shared spaces for freelance workers etc. My analysis examines the function of the liminal space in order to shape an alternative future's representation, its resonance with global movements and the difficulties that social actors met trying to implement the future they want, outside and after the liminal space of the protest.

From South Korea to Turkey: Interactions of Youth Culture through South Korean TV Serials and Korean Music in Turkey

This paper aims to discuss young people's interpretation of different cultures around the world, giving way to social changes in their own culture in the case of the impact of South Korean TV serials and Korean Pop (K-pop) music in Turkey. The discussion is grounded on how youth cultures, styles and consumption patterns from different part of the world affect each other with the help of digital technology. This paper addresses emerging youth cultural patterns in the case of the penetration of South Korean soap operas and Korean pop (K-pop) music into Turkish youth culture. The main research questions of this paper are as follows: Why Turkish youth is interested in South Korean culture? What kind of commonalities and differences do they observe between the culture they were born into and the culture they are interacted most? Although Turkey and South Korea are far from each other geographically, digital technology makes the introduction and increased popularity of South Korean culture through TV serials and music among Turkish young people. According to newspaper articles, many Turkish young people learn Korean language and their main 'dream' is to live in South Korea one day. There are more than ten South Korean TV serials adapted into Turkish TV serials. According to newspaper articles, Korea-Fans website in Turkey has 67 thousand members and there are 12 associations related to Korean culture in different cities. Turkish youth's interest in South Korean culture through TV serials and music is growing day by day. In order to understand this intertwinement between two

To be Connected Family or Not to be? ICTs and Transnational Families in the Case of Turkish Transnational Families in Japan

Based on my ethnographic fieldwork, among Turkish immigrants in Japan and their left behind families in Turkey, this paper aims to discuss how the use of Information and Communication Technologies (ICTs) affect family relations in transnational families. The discussion is grounded on how changing ICTs, especially Internet, are influential in the construction of transnational family relations, how ICTs are powerful on the transformation of family dynamics, specifically of transnational families, and what kind of challenges emerge in the use of everyday developing digital technologies in physically separated families. Studying family as an institution is a challenging experience for researcher in Turkey because it is regarded as a sensitive and private structure for individuals (e.g. in terms of emotional or financial relations between wife and husband or hierarchy between wife/husband/children). Therefore, specifically, it is peculiar to understand family relations, dynamics and changes in transnational families; and the construction of 'family' through ICTs. Although improvements in communication technology is very crucial in the construction of transnational families; I argue that it creates an illusion of being family, creates kind of 'virtual families'. Therefore, how ICTs connect and transform transnational families; and why being connected is important for them in the case of Turkish transnational families in Japan will be discussed in this paper.

DENG, DELIN* (EHESS, delin.deng@gmail.com)

Analysis of Two Discourse Markers, Oui and Voilà, Used By Chinese-L1 Speakers of French in France

Despite many fruitful researches on discourse markers used by native speakers of French (Chanet, 2001, 2004, Beeching, 2001, 2002, 2007, etc.), few studies have documented the usage of French discourse markers by non-English-L1 speakers. The current study aims to show how social factors influence the discourse of French-L2 speakers.

This case study explores the French vernacular of a group of Chinese-L1 speakers in France by analyzing their usage of two functionally interchangeable discourse markers, "oui" and "voilà". For example,

Example 1 :

...tu fais le soir français y a rien y a rien y a rien soit le restaurant soit le bar c'est tout oui (Lai-H-N-2014)

Example 2 :

... après j'ai fait l'année 2012 et 2013 à Clermont Ferrand pour améliorer la partie de français voilà (Wei-H-P-2014)

The statistics show that females are more associated to "oui", and males to "voilà". Men use both forms, while women avoid largely "voilà". Students prefer "oui", while professionals "voilà". Also, only the latter alternate between these two forms. However, the duration of stay is proved to be statistically insignificant to their usage of these two discourse markers. In contrast, social network and extracurricular contact with native speakers seem to be strongly influential. The more diverse the social network is, the more one uses "voilà" and is able to alternate between the two forms. The same has been proved to be true to extracurricular contact.

In conclusion, the social factors influence largely the usage of certain discourse markers by non-English-L1 speakers of French. However, the insignificant influence of the duration of stay contradicts the results from previous studies with French-L2 speakers from other L1 language backgrounds. The current datas shows that it is not how long we stay in the target language community that matters, but the kind of interaction with native speakers.

Privileged Migrants Transformation: Young Taiwanese Skilled Migrants in China

During the last few decades, working abroad became a common phenomenon in the daily lives of Taiwanese people. It is estimated that around 850,000 Taiwanese business people, Taiwanese expatriates and their relocated family members are currently residing in China. For a long time, Taiwanese expatriates were seen as privileged migrants in China in terms of high-income earners and for being hired in a higher position in the Taiwanese companies than their Chinese coworkers. Yet this might gradually begin to change as many other Asian

countries' economy continue to rise while the recent economy in Taiwan remains relatively stagnant, pushing many young people to search for overseas jobs. Empirical research on younger professionals working abroad so far tended to focus on those from less-developed regions moving to well-developed countries. Little attention was given to young professionals from developed countries migrating to less-developed areas. With empirical studies on various cities in China, this paper explores how the ambiguous position of young Taiwanese skilled migrants were shaped under work "transnationalization" and under the emergence of a new regional mobility/migration regime. By doing so, this paper will examine the process of "becoming an expatriate" for young Taiwanese skilled migrants in China. It will then illustrate the privilege status they enjoyed as expatriates in the host society, and it will analyze the changes between the social status of the "new" and "old" Taiwanese expatriates in China during the last two decades. Finally, it will also show the kind of disadvantages young Taiwanese skilled migrants face in terms of family arrangement and career building.

Professional Power and the New Governance

Professional Power and the New Governance
Mike Dent

This paper will consider the implications of developments in governance arrangements with health care on the professional autonomy and power of the medical profession in relation to other professionals and management within the English NHS. In particular it will focus on the growing interest and implementation of health care pathways and related governance arrangements. These involve the 'knitting together' of clinical pathways from a range of health professionals and in principle the patient too.

We will revisit the literature on professional power and its cognate concepts in order to assess the relevance and utility of these and drawing on a largely foucauldian informed approach will evaluate the current situation within the English health service. In particular the fluid and changing boundaries and relations between medicine and nursing, but will include consideration of IT specialists too. The latter's inclusion is not as a competing jurisdiction but rather in their role of developing and implementing e-health systems of care pathways which programme in rules of professional autonomy and control.

The paper will draw on a research project on the implications of e-health systems for various health pathways and inter-professional power (Eason et al 2011; Dent and Tutt 2013).

TG04-682.2

DENT, MIKE* (Staffordshire University, mike.dent@staffs.ac.uk) PAVOLINI, EMMANUELE (Macerata University)

Risk, Trust and Uncertainty within Two Health Care Systems: Italy and England.

The proposed paper reviews literature and data in Italy and England comparing the relative trust patients and citizens express and experience in their health professionals and systems. This will be discussed in relation to the changing context of risk and uncertainty for patients and their families within two national health systems in the broader context of Europe.

The paper will discuss the implications for trust in the health care systems and actors in light of the shift in emphasis to governance as and away, apparently, from governmentality. In short, rather than trusting health professionals and especially doctors, to autonomously deliver good quality and affordable care under the new governance regimes the work of these professionals now have to be quality assured, increasingly it seems by the implementation of clinical and health care pathways.

The authors will explore the implications of recent developments in the two countries drawing on the recent work of Zinn (2006) and in light of previous theories of Luhman, Möllering and others. The paper will attempt to unravel the complex relation between growing user involvement in health care and patient confidence and trust in its public sector provision.

DEPELI, GULSUM* (Hacettepe University, gdepeli@gmail.com)

New Images: A New Language?

The individualized and democratized forms of individual creativity and political activism in social media opened a new ground for visual communication. Recently, in the social media of Turkey, we witness the circulation of some new types of photographic images, which are comprised by integrating two different (in)relevant news photographs into one frame.

In comparison to the conventional photographs which "do show but not narrate", these photomontage images construct a narration, a political argumentation within one frame. Despite of the theoretical approaches which emphasize the power of photography as evidence, far beyond this, the social media users utilize the photographs for constructing a critical political discourse, and circulate it in public space. In other words, they instrumentalize the photographic content for the benefit of generating a counter-discourse against state violence, rather than using the photography as evidence of truth. They make use of the images, as if they are just a simple component of the visual language/grammar to build an image-text. This activist intervention makes the photography get rid of its authentic roots more than ever before: Rather than anchoring to the past and claiming to be the evidence of truth, the photographs travel and function among different discourses in public space. Henceforth, in these kind of images, not the photographs themselves, but the discourse they circulate is the most important one.

In this paper, I will attempt to discuss photographic images, which produce and circulate discourses against the state discourse in social media in Turkish context. For that purpose, I chose four images roaming in social media, which are related to significant incidents occurred in the recent past of Turkey: Roboski Massacre; Reyhanlı Massacre; Gezi Resistance, and the very precarious time period after the General Elections (June 2015) in Turkey.

RC34-397.7

DERADO, AUGUSTIN* (Ivo Pilar Institute of social sciences, augustin.derado@gmail.com)

Career and Education Strategies of Young Adults in Croatia: The Role of Capitals and Habitus in Transition to Employment

Stable employment has become hard to attain for many young people in contemporary Western societies as they cope with transitions to work marked by longer periods of job-seeking, unpaid internships and underemployment (Woodman & Wyn, 2015; ILO, 2014; Standing, 2011). As a country with one of the highest youth and young adult unemployment rates in the European Union (Eurostat, 2014), Croatia is no exception to those kind of labor market entry insecurities (Matković, 2011) young people have to navigate through.

Along with the influences from macro social factors, the transition from education to employment is an outcome of the young peoples' long term education and career strategies as well as the specific strategies in the process of seeking employment. Following Bourdieu (1997) we take strategies as part conscious, part pre-conscious and generated from the habitus. And as the social world is 'accumulated history' (Bourdieu, 1979; 1990) and not everything is equally possible within, the young peoples' strategies are not randomly distributed amongst the individuals.

In this paper we aim to explore the education and career strategies of young people in Croatia from different social backgrounds and how their habitus and unequal access to economic, social and cultural capital differentiate their transitions. To do so, we have reconstructed the field of social classes in Croatia with the Bourdieu-inspired Multiple Correspondence Analysis (Le Roux et al., 2008) using the data from a nationally representative survey. Typical households for every social fraction have been chosen and in-depth interviews with 20 young people who had finished education conducted, along with the separate interviews with their parents. That enables us to explore the role of social inequalities in the transitions from education to employment as well as the forming of the strategies as interplay of structure and agency, and family and young peoples' habitus and capitals.

DERMAN, OZGE* (EHESS Paris (CRAL), ozgezderman@gmail.com)

The "Standing Man" As a Performative Creation of Immediate Collectivities and Counter-Public Spaces

Since 2010 an unexpected phenomenon emerged within numerous rallies in public spaces of big cities around the globe, during which people demand freedom and dignity for all. These new social movements have certain physicality due to the presence of people claiming their rights but also the right to a space in which they exist. Through gatherings and occupations, those public places transform into spaces of interaction and experience upon which a truly democratic realization of "acting together" come into existence. A new experience of "living together" of heterogeneous identities generated a collective energy by creating multiple ties and changed the nature of social and political movements. These new social movements of public places represent thus a different way of doing politics by their existence out of political parties and unions, as well as by not seeking any power conquest and not being represented by a leader. As a consequence, they bring about idea of occupation and civil disobedience by considering the equality of all individuals involved. Those people construct their own unique temporality and spatiality along with their creation of plural "counter-public spaces".

As everyday life becomes a theatrical scene resulting from a performative social creativity, art also takes a democratic form by which artists create alternative spaces of liberation and resistance. Considering the intense presence of artistic interventions throughout all occupy movements, in this study one of the most iconic performative actions of Gezi Movement in Istanbul will be examined, the "Standing Man". The stand-in of one man who stayed still and silent for 8 hours in Taksim Square represents a performance or/and a protest that has been followed around the world through social media. A simple and small gesture of everyday life engenders immediate collectivities of bodies as counter-spaces that finally break up the sense of powerlessness.

Theorizing Precarity in a Global Era

Increasingly social theorists and analysts are using the concept of precarity, in particular self-precarization and governmental precarization (Isabel Lorey), to discuss the impact of the neoliberal policies on workers in Europe and the US. Theorists like Judith Butler and Lauren Berlant, also theorize precarity as a relational concept, an ontological condition of human vulnerability. Yet, most of these theorizations trace the genology of the term to its Western European and US context. In this paper I first present an alternative geneaology that links precarity to feminist theorizations of informal work that enable us to see precarity both as an ontological condition of human vulberance but also as leading to creative strategies that include individual and collective challenges to precarity and alternative possibilities in and beyond neoliberal globalizations.

Do Chinese Mothers in the United States Have More Male Births Than White Mothers?

In China, the deeply-rooted Confucian cultural influences have stressed for thousands of years the importance for Chinese families of having one or more sons. Confucius is attributed to have stated that "Happiness is a hall full of sons," and that "Having daughters is like weeding another man's field." When the birth rate is high, as it was in China for thousands of years up to the early 1970s, this was not a problem. When Chinese women were having six children on average, the probability was less than 2 percent that none of the six children would be male. But when the birth rate is low, as it is these days in China, it became more problematic to guarantee having a son. Hence many Chinese have relied on ultra-sound technologies and sex-specific abortions to guarantee they will have a son.

Our paper addresses the following question: do Chinese women and their families bring their Confucian culture regarding son preference with them when they immigrate to the United States? We use birth certificate data for the years 2003-2013 to test whether foreign-born Chinese mothers have a greater likelihood of having a male birth compared to U.S.-born Chinese mothers, and even more so compared to U.S.-born non-Hispanic white mothers. We expect to find that foreign-born Chinese mothers living in the U.S. do indeed have a statistically greater likelihood of having a male birth than do U.S.-born Chinese mothers, and that both groups of Chinese mothers have statistically greater likelihoods of having a male birth than do U.S.-born non-Hispanic white mothers.

Strategy and Resistance Against Marginalization in the Barber Profession : The Case of "Arabs" or "Blacks" Female Professional Hairstylists.

Cette communication qui prend pour référence la sociologie des professions et la sociologie du travail portera sur les pratiques discriminantes que subissent certaines professionnelles de la coiffure ou professionnelles en devenir (apprenties

coiffeuses) en fonction de leurs origines ethniques (supposées ou réelles) et de leur classe sociale. Plus précisément, nous nous attacherons, dans une approche intersectionnelle, à décrire les différentes barrières et discriminations que rencontrent les coiffeuses dites « issues de l'immigration » d'origine « magrébine » ou « africaine » tout au long de leur carrière (de l'embauche à la stabilisation dans l'emploi) et les tentatives qu'elles essayent de mettre en place pour infléchir cette situation. Par exemple, tout un travail sur leur corps et leurs manières de s'exprimer est réalisé afin de dissimuler les « stigmates » liés à leur origine sociale et ethnique et ainsi se rapprocher de l'idéal caucasien recherché par la profession et par les clients. Certaines y parviennent mais ces « stratégies » s'avèrent précaires et se doivent d'être constamment renforcées. Pour autant, ces tentatives de conformisme à un idéal caucasien ne signifient toutefois pas acceptation des rapports de domination de la part des coiffeuses. Nous verrons, en effet que loin d'être démunies, des formes de résistance discrètes et ténues se donnent à voir vis-à-vis des clients et de la direction et permettent aux professionnelles de « tenir ».

Ce travail s'inscrit dans le cadre d'une thèse et est basé sur soixante-quinze entretiens semi-directifs avec des patron.ne.s, des coiffeur.se.s et des apprenti.e.s ainsi que sur des observations participantes en tant que stagiaire dans sept salons de coiffure (franchisés ou indépendants) et dans deux établissements chargés de la formation des futurs coiffeurs (école privé et centre de formation d'apprentis).

DEUSDAD, BLANCA* (Dep. Anthropology, Philosophy and Social Work. Rovira i Virgili University, blanca.deusdad@urv.cat)

Challenges of Ageing-in-Place in Urban Places: The Case of the City of Tarragona (Spain)

Residential care was historically widespread as an important alternative in Spain to address the increase of ageing population, while Nordic countries and Central and Eastern European countries have introduced important social policy reforms focused on deinstitutionalization processes, and as such, fostering ageing-in-place (Deusdad & Pace, 2016, in press). Furthermore, some gerontological studies have highlighted the importance of following a *Person Centred Practice* approach for older adults (Martínez Rodríguez, 2011; Casado, and Fantova 2007). In doing so, professionals are trying to preserve, as much as possible, older adults' social life while not excluding them from their communities' daily life.

In the case of Tarragona, even though an Integral Urban Plan had been implemented, most buildings still have accessibility difficulties for older people (no lifts, barriers outside and inside the dwellings and steep stairs, as well as impediments in urban areas), which has dramatic consequences for older people to maintain an active social life and reinforces an attitude of ageism. In other words, it is also having a consequence of situations of isolation and loneliness. Moreover, the city does not provide for different types of housing as in care-adapted to the older adults' needs. Besides, there are long waiting lists so as to have access to public residential. The only alternative is care homes, which can be more expensive than their income. In addition to this, a false deinstitutionalization based on family care and support is taking place with far more severe consequences on older people's ageing-in-place.

This study was part of a European project (COST Action IS1102 "Social Services, Welfare State and Services"), where more than 22 countries were involved. Using a qualitative methodology (interviews with social and care workers, politicians and older adults), adding statistical data from Eurostat and Spanish National Statistics Institute.

LONG-TERM Care in Spain: The IMPACT of the Economic Crisis on Social Policies and Its Effects on Older Adults with Care NEEDS

The ageing population is increasing in Southern European countries and is becoming an important social issue for the coming decades. The OECD percentage of people over 65 years old—14.4%—is surpassing in countries such as Italy (20.3%), Greece (19.3%), Portugal (19.1%) and Spain (17.1%). This demographic change is bringing about the need of long-term care policies and specific services and benefits for older people. Nevertheless, austerity measures resulting from the economic crisis have deeply affected these social policies and retrenchments in Southern European countries such Spain. Additionally, high unemployment rates have affected indirectly the quality of life of older adults and the amount of caring services and caring support received. The economic crisis has affected indirectly older adults increasing intergenerational transfers and solidarity to the extent of changing their way of life and independence. Therefore, caring support

has changed for older people as a consequence of the economic crisis, fewer public services and a *false deinstitutionalization* based on family care and support. The context of deep economic crisis has brought about processes of re-familiarization, where older adults are handing up their pensions to their relatives, offsetting high unemployment rates and homeowner evictions, which also opens the door to situations of economic abuse. Furthermore, there are processes of marketization through co-payment of care services, which forces a dependence on family care by women. This study was part of a European project on social services (COST Action IS1102) and is been published in the Journal of Social Service Research in January, 2016. The study was based mainly on a qualitative methodology, although some statistical data from Eurostat and Spanish National Statistics Institute were included. In particular, we drew on discussion groups and interviews with social workers and care workers, politicians and older adults.

DEUTSCHMANN, ANNA* (Universität Wien, anna.deutschmann@univie.ac.at)

Mobilization – Organization – Instituionalization Students As Political Actors in Kenya

Students in various African countries have been provoking political transformations since the beginning of the struggle for independence. The political influence of students is often mentioned as an important factor but seldom systematically investigated in detail (Zeilig/Ansell 2008). Sometimes student activism leads to the formation of student movements and influences political change. This change induces a transformation of the actors themselves and is reflected by the modification of protest, different modes of organization and activism respectively.

Rammstedt (1978) classified this process of transformation of social movements in phases. The institutionalization and integration into the social structure are results of this process. Establishment or integration is discussed by several social movement researchers (cf. Snow/Soule/Kriesi 2004:8). Following McAdam there are relevant dimensions for the rise and success of social movements, such as openness of political institutions, consensus of elites, existence of allies, and the degree of repression of the state (cf. Meyer 2004). Especially the tension between students and state influences the formation of activism. For instance, student unrest in the 1960s is described by Balsvik (1998) as being rooted in the relation between universities and the state, which was characterized by mistrust and disappointment. Student's expectations that the state would facilitate living and education conditions, as well as their future employment opportunities remained unfulfilled. This discontent is still an influential factor in present waves of protest.

Students present one civil society actor among other components of a differentiated and complex civil society structure. On the basis of interviews with (former) student activists I analyze the internal and external development, modes of organization as well as personal and professional opportunities for student activists. The paper analyses the political mobilization, the organization and institutionalization of student's political activism in Kenya.

DEUTSCHMANN, EMANUEL* (Bremen International Graduate School of Social Sciences, emanuel.deutschmann@ovgu.de)

Regionalization and Globalization in Networks of Transnational Human Mobility, 2000-2010

The dramatic increases in transnational mobility and communication over the last decades give rise to the question whether the world is globally integrating or whether regions are emerging as a new layer of societal integration beyond the nation-state. Yet, our knowledge in this regard is still rather limited, as researchers have thus far modeled regionalization and globalization as *either* independent from *or* dependent on each other and their conclusions are heavily contingent upon this decision. Furthermore, most past empirical studies on this issue have focused on economic and institutional ties, disregarding people's cross-border activity. This article aims to (a) clarify the relation between regionalization and globalization via a novel conceptualization that allows to model the two processes as *both* complementary *and* competitive and thus to compare resulting outcomes, and (b) empirically trace regionalization and globalization in five types of transnational human mobility (asylum-seeking, migration, refuge-seeking, studying abroad and tourism) between 2000 and 2010. Network analyses of flows between 38,220 country dyads reveal that while in absolute terms both regionalization and globalization occur, regional integration exceeds global integration. While this effect is found for all regions, it is strongest in Latin America and the Caribbean. Consequentially, world regions do constitute an increasingly salient layer of societal integration beyond the nation-state. This finding contradicts basic assumptions of world systems theory's core-periphery model, demanding for rethinking the structure of the transnational world, paying increased attention to the role of regions as a relevant layer of societal integration between the nation-state and world society.

Single Women- Choice or Chance?

The Singleton has emerged as a distinct social category in the rapidly changing Kerala society. The present study attempts to show the change from Spinster to Singleton and the generation differentials of single women in Kerala, India. The study also made an attempt to find out the factors that led women of Kerala to singlehood they have in their unique life style.

The focus of the study is single women of two generations, 225 spinsters and 225 singletons. Single women from three districts- Thiruvanathapuram, Ernakulam and Kozhikode constituted the sample for the study. The different aspects of the singlehood were collected with the help of Interview schedule and the scale developed was used for measuring adjustment of the single women. The economic theory of Marx, Women's economic empowerment theory of Blumberg, Dramaturgical model of role theorists, Becker's labelling theory of deviance, Michalo's Multiple-discrepancy theory are the theoretical framework of the study.

The analysis of the study reveals that there is difference between spinsters and singletons in all background variables and dependent variables. The findings of the study shows that the motivational factors-chance and choice of single women in two generations. Single women, who selected singlehood by their own choice and singletons with high expectations, have low level of life satisfaction, even though they have high adjustability in their life.

News Channels and Democracy: A View from India

Post 1991, India has witnessed a proliferation of television news channels. Shifting gears from 'news' to 'news and views', these news channels have traversed a long path. Located within the framework of news channels as the *new* opinion makers, this paper attempts to understand, how talk shows contribute to the understanding of deliberative and participatory democracy.Talk shows in news channels are a post satellite television creation. Talk shows have become an important constituent of news programming. Scholarships abound on the impact of talk shows on audiences. While some scholars have lauded talk shows by equating them with deepening democracy, others dismiss them as mere carriers of neoliberal ideas that further widens the existing social divides. In order to further our understanding of the nuances of the 'talk' genre in television news, an attempt will be made in this paper to do a content analysis of a few episodes of the popular talk show *We The People* aired on the English news channel NDTV 24x7 every Saturday from 8 to 9 pm. The data generated, will be analysed along broad themes, like the type of issues debated, the presentation of the episodes, the nature of the debate/discussion, the representation of diverse voices in panel, the promotion of viewpoints and henceforth. This analysis will be used in building up an argument of how news channels are creating space for public discourse.

DEVLIN, MAURICE* (Maynooth University, Ireland, maurice.devlin@nuim.ie)

"Youth Work" and "Youth Justice Work": What a Difference a Word Makes?

The field of youth justice in Ireland, as in many other countries, has moved towards an increasing emphasis on restorative rather than punitive practices and on preventative or "diversionary" measures aimed at lessening the chances of young people coming into contact with the justice system. Ireland's *Youth Justice Action Plan 2014-18* assigns an important role to Garda [Police] Youth Diversion Projects (GYDPs) in meeting its overall mission of "creating a safer society by working in partnership to reduce youth offending through appropriate interventions and linkages to services". However, while funded by the Department of Justice, the GYDPs are almost entirely operated (and their staff employed) by *youth work* organisations whose mission is usually stated in terms that emphasise young people's personal and social development, their participation and empowerment, rather than the imperative of crime prevention. These organisations now frequently house *both* youth justice projects and youth work projects, funded at different levels (the former more generously than the latter) and by different government departments or statutory agencies. They may also differ significantly in the extent to which young people attend and participate *voluntarily*. It is an aim of the Youth Justice Action Plan to "engage with other youth service providers to promote the use of crime prevention supports and a *standardised working ethos* in delivery of youth services". Based on empirical research involving young people and adult workers in both types of project within the same organisations, this paper explores some of the tensions and difficulties, but also some of the opportunities and synergies that arise in these contexts. In doing so it interrogates the

assumptions underpinning some of the central concepts at play, including the "work" in "youth work" and the "justice" in "youth justice".

TIERNEY, HILARY* (CYRD, MAYNOOTH UNIVERSITY, hilary.tierney@nuim.ie)

Youth Work and Inequality: Discourse and Practice

Recent years have seen a greatly enhanced focus on youth work in the political and social policy agendas of many European states, including Ireland. Much of the "official" interest in youth work stems from a concern with social order and stability and an expectation that it can help to alleviate pressing social problems such as, in recent times, youth unemployment. On the other hand, the youth work sector also includes social movements with a strong focus on social change and on combating social inequality. There is, however, little empirical research on how these contrasting impulses are reflected in the activities and programmes of youth organisations or the discourse and practice of youth workers. This paper draws on two sources. One is a national study of volunteer-led youth work in Ireland. Based on a documentary analysis of reports and application forms prepared by youth groups (n=1111) seeking state funding for their work, the paper explores the range of terms in which such groups describe their aims and objectives as well as their activities and programmes. In particular it focuses on the extent to which, and the ways in which, various dimensions of inequality (e.g. gender, class, ethnicity, sexuality, disability) feature in this discourse, and whether they do so in terms compatible with, or in tension with, "official policy". The other source is a qualitative case study designed to explore the tacit and explicit "explanatory frameworks" that inform the professional practice of youth workers. This paper presents an integrated analysis of both sources that highlights some key opportunities and challenges for youth work in addressing social inequalities.

DEY, DEBLINA* (O.P.JINDAL UNIVERSITY, deblina_dey67@yahoo.co.in)

New Roles and Old Bodies: Role Transformation Among Ageing Women in Kolkata

The landscape of care for the elderly in India has been undergoing a change since the last decade of the 20th century where care practices around elderly family members in India, are increasingly relegated to various care organizations that are predominantly non-governmental and/or private. This study aims to explicate changing modalities of care forging newer social roles and identities among ageing women. Through an ethnographic study of two contexts of care in Kolkata, the processes of role-transformation among ageing women is explained. Analyzing the lived experiences of women in old age homes and those who are cared for in one's houses by 'companions' from private agencies, highlights not only emergent social roles among the elderly women in contemporary times, but also delineate the continuities and ruptures in the roles when individuals relocate outside their own homes. The study operationalizes nostalgia as an analytical tool to understand the importance of home and kinship ties in consolidating role and identities in old age.

Women are considered to fulfill the role of the primary care-giver all throughout their lives. The study unpacks the idea of caregiving in these two contexts and finds that an intersectionality of class, marital biographies and kind of relationships, past and present play a significant role in determining their roles, either as 'active citizen' or consumers respectively in the two cases. It also exposes the fallacy of assuming that a woman's life in later years is defined only by her familial roles. For instance, not having to undertake traditional roles of grand parenting or performing duties of the wife can be quite liberating for women. The study concludes that the kind of mediation of care, by caregivers other than relatives, to a great extent determines the kind of attitudes, role and identities ageing women acquire.

Russian-Speaking Researchers Abroad: Do They Want to Cooperate with Russia?

A survey has been conducted among the hundred and fifty Russian-speaking researchers that reside and work abroad to evaluate their motivations and previous experiences in interactions/collaborations with Russian universities, research institutes, and government agencies.   Another goal of this survey was to identify the mechanisms that might further stimulate and promote links and cooperation

with the Russian-speaking research diaspora for better knowledge transfer in the areas of science and technology.

The results demonstrated that the respondents are actively involved in both government-supported and independent collaborative research activities with Russia; for example, 62 % of them have joint publications with Russian colleagues. The respondents are eager to expand their cooperation with Russia even on an unpaid basis, especially in education and training of graduate students. At the same time, many of the surveyed researchers voiced criticism of not only the organization of scientific research in Russia but also of Russia's broader economic and foreign policies; these issues appear to be among the key factors that hamper development of a more extensive cooperation with the diaspora.

The logic of the presentation is as follows. First, lessons of global experience towards cooperation with scientists from diaspora are examined. Second, major results of government activity in Russia aimed at establishment of closer links with Russian-speaking research diaspora for better knowledge transfer are evaluated. Third, a survey results that has been conducted among the hundred and fifty Russian-speaking researchers that reside and work abroad are presented and interpreted in a broader context of the current situation in Russian science. Finally, suggestions are made on improving cooperation with the Russian-speaking research diaspora by addressing the interests of both parties.

Historical Sociology of the Nation State: A Critique from the Italian Case

According to Andrew Abbott, the "globalization of disciplines" clearly reveals the normatively and historically situated dimension of social sciences. It is also the case of the historical and political sociology. When focused on the construction of the State, it invites us to find out if it does not convey de facto a particular vision of society, the values produced at a specific time and in a defined territory, that of Western Europe. The work of historians and sociologists has been marked for centuries by specific ideologies of the State, for instance contractarian liberalism or the various forms of nationalism.

For their part, the authors of nation-building - whether coming from Durkheimian, Weberian, Marxian or Gramscian traditions - dedicate a prominent place to political centralization. Besides, an author like Peter Sahlins has shown the importance of taking into account the periphery, the various time frames, the conflicts and the diversity of trajectories.

This contribution aims to provide a critical reflection on the historical sociology of the Nation State. In particular, it targets Italian trajectorie(s). It refers to authors such as Antonio Gramsci and Umberto Cerroni, which show the importance of historical contingency. Also, it refers to Emilio Gentile for a critique (of authors) of Italian fascism.

DI GIUSEPPE, SILVIA* (University of Lisbon, silvia.giuseppe@ics.ulisboa.pt)

"Women, Work and Family in the Digital Society: Italy and Portugal, 1960-2015"

The PhD project "*Between work and private life: biographies of Italian and Portuguese women in the digital society*" aims to describe and comprehend how Italian and Portuguese women run their daily activities between work and private life, considering we live in societies characterized by a massive diffusion of new information and communication technologies (ICT). The research aims to explore the construction of mobile pathways of autonomy, individualization and reflexivity between work and private lives of women, going beyond the traditional idea of "conciliation" and against the backdrop of intense diffusion of ICTs and weakening of the boundaries between the public and private spheres. Specifically, the study will be based on the *representations* and *practices* of employed women aged 25 to 49 of different professional groups and levels of education, who live as a couple and have children. It will be conducted through the production of *semi-structured interviews* and *ethnographic method*, in Rome and Lisbon. In order to contextualize the phenomenon, a first stage of the study will be dedicated to the collection and analysis of official statistics about Italian and Portuguese women in relation to work, family and ICT access and use. My presentation at the Third ISA Forum of Sociology will consist in a systematic comparison between Italy and Portugal, through a repertoire of indicators capturing behaviours and values about women and work, family, wellbeing, public policies, care, new media and ICT (sources: EUROSTAT, EVS, INE and ISTAT, 1960-2015). The decision to make a comparison between Italy and Portugal is built on a major assumption: Southern European countries, often portrayed as a whole, do not fit into a single model.

DI MARCO, ALESSIO* (Piccolo Opificio Sociologico, alessio.dimarco@hotmail.it)

VENTURELLA, MARIO* (Piccolo Opificio Sociologico, m.venturella@piccolopificiosociologico.it)

Space, Time and Faces behind the Bars.

This research is a prison ethnography that started while the two authors were working inside the two detention facilities of Firenze and Prato. During the year of work/field activity, we closely observed the building of a *prison frame* that works in the construction of everyday life. The time spent inside an Italian prison is a suspended time that influences how space, relations and time itself are perceived by inmates. The relationship between prison and capitalism is old, deep and, for many reasons, problematic. The prison in Italy, as total institutions do, is very dominating, especially regarding the partition of time. At the same time, the prison system is characterized by his incapacity to organize everyday time down to the smallest detail. The paradox is that of a total institution which leaves wide space of action to his subordinates, without offering a real space for agency. Expelling some person from society, and relegating them in an alternative space-time, may lead to the creation of awkward subjects. No longer able to experience their bodies into community and, at the same time, unprepared for addressing the complexity of an increasingly less face-to-face society, those who leave prison meet serious re-integration problems. As an example, inmates know as well the existence of modern smartphones, but they hardly conceive the social and relational conventions behind its use. The *prison frame* works as a filter in the relationship between body and space-time, and acts like a habitus outside the prison, not allowing a good re-entry in society.

Organizing, Participation and Democracy in the Work Fragmentation: Precarious Workers' Collective Actions in Italy

Work fragmentation and flexibility are major trends in the contemporary working processes and in the labour market, in Italy and in the Western Countries, with deep impacts on the individual and the collective life. Work fragmentation and flexibility are spread across different levels: in the relations between company and individuals (by an increase in the use of temporary jobs, bogus freelancers, involuntary part-time, mini-jobs, downsizing, facilitation for dismissals, risk of unemployment); in the relations among companies (subcontracting, outsourcing, segmentation of the value chain); in the relations among the companies and the territorial institutions, under the pressure of the global capital mobility and the power of the market forces. These processes led to a crisis of democracy considering the crisis of the individuals' fundamental rights (as workers and citizens) and the reductions of the participative opportunities at company and social level.

During the recent years, several strategies have been adopted by unions in cooperation with association and self-organized groups to cope with these problems. This paper presents the findings of a long-term research (2009-2015) on the workers' collective actions in the contexts of work fragmentation and precarity in Italy (in particular supported by CGIL). Analysis concerns different sectors, professions and working conditions: temporary workers, unemployed people, freelancers, knowledge and cultural workers, migrants in agriculture, subcontracting units and franchising, struggles against outsourcing and broad campaigns against precarity. Several methodological approaches have adopted in-depth interviews, focus groups, workshops, participative observation, and questionnaires.

Analysis is focused on the organizing models of these actions to present the new ways of the workers mobilizations; limits and drivers for the change of the union organizations; their orientations towards the affirmation of democracy in broad sense, considering both the fundamental rights and the forms of deliberation, participation and representation in the fragmentation of working and social life.

Precarious Workers' Collective Actions in Italy: Between Silos and Synergies in the Fragmentation of the Working and Social Life

Unstable employment, casualization, work discontinuity, insecurity, lack of social protections, risk of unemployment, low wage and poverty, have become major problems for an increasing number of individuals in Italy and in the Western Countries. Precarious workers have many difficulties to organize collective actions because they have to cope with the work fragmentation, the low bargaining power, the lack of union representation. At general level, labour movements and oth-

** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

er social movements have to cope with a crisis of the social dialogue institutions and of democracy, with a reduction of the individuals' opportunities to participate in the definition of the working and social life in front of the market forces.

In Italy there is an emergence of several micro-struggles organized by precarious workers but, on the other hand, there are difficulties to organize large-scale workers movements and to strengthen a wider cooperation between the labour movements and other social movements. This paper presents the findings of a long-term research (2009-2015) on the workers' collective actions in Italy in the contexts of work fragmentation and precarity organized by unions, associations, self-organized networks, considering the conflict and the cooperation among these actors. Analysis concerns different sectors, professions and working conditions: temporary workers, unemployed people, freelancers, knowledge workers, cultural workers, migrants in agriculture, subcontracting units, franchising companies, and broad campaigns against precarity. Research methodology adopted several approaches: in-depth interviews, focus groups, workshops, participative observation, questionnaires.

What are limits and opportunities of the precarious workers' collective actions? What are their organizing models? What is the meaning of action? What are goals and orientations they want to affirm? What are impacts and trends for the union organizations? In conclusion, what factors are in favor of silos or synergies for the collective actions in the fragmentation of the working and social life?

DI PADOVA, PASQUALE* (Sapienza University of Rome, dipadova86@gmail.com)

The Explanation of Inequalities through Generative Models. a Contribution to the Understanding of Social Mobility from the Analytical Sociology's Point of View

The aim of this work is to represent social mobility as a macro-phenomenon generated from a lower level of analysis. Despite Boudon has put a great deal of effort into persuading sociologists of the importance of this explanatory strategy, research on social mobility found however rather difficult formalizing and testing this kind of "bottom-up" theories.

It's with this in mind that the present work intends to address the following purposes:

giving a pivotal role to a micro-founded rational theory of social action in the explanation of the phenomenon;

gathering various partial mechanisms found in previous research in a more general theory;

trying to reconnect two different levels of analysis into the same theoretical framework (the macro-level of social mobility, seen as an emergent phenomenon, and the micro-level of intentional, interdependent, competitive actors);

representing social mobility as a dynamic process continuously unfolding through time.

To do this, I implement my model by means of agent-based simulation. This technique is indeed well-suited to translate a "bottom-up" theory of social mobility into a non-equivocal algorithmic language, in order to study more closely how a system dynamically emerges from complex interaction between intentional agents.

I sequentially introduce the hypotheses into the model to provide, although deductively, better evaluations of the explanatory power of each mechanism. Then, I compare the outcomes generated by the model with the empirical ones (data from a large national survey carried out during 2003 by the Italian national bureau of statistics).

Finally, I assess the model on the basis of its ability to reproduce the empirical mobility table, the bootstrapped distribution of its samples, and trying to account for a variety of features of the phenomenon.

What Is "Traditional Islam"?: Defining the Borders of Islam in Russia

The paper will examine the dilemmas faced by Russian Muslims in contemporary Russia and the question of how they relate at the same time to secular authorities and a secular society and to the broader Muslim world. It will use the analytical framework of "domestication of Islam" (Bowen 2004, Humphrey 2009, Sunier 2012, Braginskaia 2012) to study how Russian Muslims answer state efforts to define the borders of a national form of Islam. In contrast to Muslim populations in Western European countries, Russian Muslims have lived in Russia for centuries. The term "traditional Islam" has been used since the 1990s to designate forms of Islam that are inscribed in Russian history; are seen as moderate as well as loyal to secular authorities. The term is widely used, but difficult to define as it has several connotations. The paper will analyze how Muslim religious figures or representatives of Muslim institutions make use of the term, what connotations of the notion of "traditional Islam" they do embrace or reject. For example, Tatar religious figures often refer to the term in relation to a particular historical heri-

tage, while Muslims in the North Caucasus associate "traditional Islam" to Sufism. The paper will study definitions, perceptions and uses of the term by asking the following questions. How do Russian Muslims react to state interference in the religious sphere and the setting of particular boundaries for religious practice? When do they welcome this interference and when are they more cautious in their support? To what extent do they perceive the official state support for an institutionalization of Muslim practices as potentially hindering their efforts to connect to the Islamic world and strengthen their Muslim religious identity? The paper will be based on field research conducted in Moscow and Kazan in 2015-2016.

DIANI, MARIO* (University of Trento, mario.diani@gmail.com)
ERNSTSON, HENRIK (African Center for Cities, UCT)
JASNY, LORIEN (University of Exeter)

The Structure of Urban Struggles: Insights from South Africa and Britain

Recent waves of collective action challenging neoliberal globalization have paid systematic attention to the urban dimension. Cities have represented one of the most important arenas for attempts to integrate in broader political platforms concerns about growing inequalities and worries about environmental degradation. These collective efforts have seen the involvement of highly heterogeneous organizations, including community groups, labor organizations, and environmental groups. This paper maps the structure of alliances and cooperation between organizations mobilizing on a broad range of urban issues in Cape Town. Covering a section of the city that ranges from the extremely dispossessed to the extremely affluent, it explores some of the factors that facilitate as well as discourage alliances and joint campaigns between actors that differ substantially in terms of resources and/or political legitimacy. Particular attention is paid to the relations between community organizations, unions, and political parties. In this regard, the paper contributes to overcome conventional distinctions between unions, parties, and movement organizations by looking at them all as part of broader collective action fields. The concept of "modes of coordination" (Diani 2015) enables us in particular to identify different relational patterns, and to differentiate between social movements and other forms of organizing. A comparison with the structure of relations between organizations active on similar issues in Glasgow and Bristol (Diani 2015) illustrates the differences running between action fields located in polities in which traditional cleavages have been largely pacified, and fields located in settings, such as South Arica, in which such cleavages – in particular, the one given by the overlap of race and class – are still largely salient. The comparison also calls for a refinement of mainstream social movement theory, particularly in its organizational version. DIANI, MARIO* (University of Trento, mario.diani@gmail.com)

Union Activists in Collective Action Fields: A Comparative Exploration

This paper explores alliances between unions and other social and political organizations from a particular angle, the embeddedness of union members in broader associational milieus. Over a decade ago, Cornwell and Harrison (2004) suggested that the decline of labor organizations in the USA corresponded, and was in many ways facilitated by, the declining involvement of their members in other types of associations. Consistently with findings from social movement research (see e.g. Diani and McAdam 2003), the embeddedness of unions in broader collective action fields was assumed to facilitate broad alliances. I expand on this work in two ways. First, I add a comparative dimension to the analysis, by looking at data from four waves of the European Values Survey in at least three countries (Germany, Italy, and the UK) and hopefully more. Second, I take into account not only data on participation in associations, but also in different types of protest activities. This information, which is usually missing from large scale surveys, comes from data gathered on the occasion of the 2003 anti-war demonstrations in several European countries as well as in the US (Diani 2009). As no single explanatory factor can be expected to account for complex processes, the comparative analysis explores in particular differences in network configurations in countries with inclusive or exclusive elite strategies, and variable salience of traditional cleavages. Dekasseguês: Una Identidad Lingüística En Construcción

Los brasileños, como comunidad extranjera, ocupan actualmente en Japón el cuarto lugar. Son más de 170.000 los brasileños que viven en el archipiélago. Algunas localidades tienen grandes comunidades brasileñas. En ellas se observa un gran esfuerzo por preservar la cultura brasileña y mantener los lazos con Brasil, y para eso, mantener la lengua portuguesa es muy importante. Sin embargo, el contacto con la lengua japonesa está dando lugar al **dekasseguês**, variante del portugués caracterizada por el uso de palabras y expresiones japonesas en las conversaciones cotidianas.

En las ciudades de Oizumi y Ōta independientemente de saber o no hablar japonés, el uso del portugués es una actitud natural y cotidiana de los brasileños. Por eso, el dekasseguês se está desarrollando en un ambiente donde el portugués es el idioma más utilizado, pero el japonés es la lengua que se impone por su valor socioeconómico.

El dekasseguês todavía es una variante lingüística poco investigada, pero no menos importante que las demás. Nuestro objetivo es presentar ejemplos y consideraciones acerca del dekasseguês y profundizar en la necesidad de aprender a respetar y valorar a los demás, considerando también sus diferencias lingüísticas.

Managing Multiple Marginalization: Russian-Speaking Women Doing Sex Work in Finland

When migration and commercial sex come together in academic writing or popular imagination they often morph into trafficking discourse, leaving little room for a more nuanced exploration of experience and attitudes of migrant women engaged in commercial sex. This study of Russian-speaking women working in different fields of erotic and adult industry in Finland analyses how they conceptualise and make sense of sexualisation of Russianness, the association of Russians with commercial sex and assumptions made about their migration history based on their perceived Russianness. The study shows how the women, when discussing their work experience and migration, challenge and negotiate the assumptions made about their ethnic and cultural identity as well as their sexuality.

The study is based on interviews conducted with Russian-speaking women engaged in different forms of erotic and sexual labour including escorts, exotic dancers, adult film actresses and models, etc. The study also draws on data derived from ethnographic research in private shows, exotic dance clubs and sex restaurants in two large cities in Finland.

A World Society Perspective for Women's Rights and Women's Empowerment: Thirty Years of the CEDAW in Spain (1984-2015)

This paper tries to offer a global perspective of the process of expansion of women's rights in Europe since the end of World War II to the present. We'll assess the effectiveness of the UN human rights system nowadays, as well. For this purpose, we will analyse the case of Spain in the CEDAW monitoring process as the first step of a broader research involving more countries.

Spain ratified the CEDAW in 1984 and was first examined by the Committee on the CEDAW in 1987. This procedure took place in the early building of a gender equality architecture in Spain and it has been repeated in four occasions during the following two decades. Both, gender equality policies and feminist organizations in Spain have experienced complex changes during this period that will be studied.

We'll pay special attention to the most recent examination experienced by Spain which is one of the 16 nation-states that has been examined in 2015 by the Committee on the CEDAW in a context of economic crisis, adjustment policies and gender equality setbacks. Both governmental and feminist movement' strategies have already been displayed in Geneva at the 61 session of the Committee on the CEDAW.

This paper will address three issues through a chronological history of the CEDAW examination of Spain: 1) the way followed by the Spanish Governments towards the incorporation of CEDAW recommendations in their search for international recognition; 2) up to what point CEDAW has promoted legal and institutional changes towards gender equality in Spain; 3) feminist political strategies displayed by Spanish women's organizations to get their goals in terms of national/transnational networks, dissemination and mobilization.

DICKINSON, JAMES* (Rider University, dickinson@rider.edu)

Assembly Line Art; Modes of Making Art in the Era of Capitalist Production

This paper investigates the contradiction between large-scale industrial production prevailing in the general economy and persistence within the art system of small-scale handicraft production. I consider how machine technology, factory organization, and proletarian labor play a role in the aesthetic realm, hence how the art system interfaces with the dominant economy.

In the first part of the paper I compare industrial production to handicraft art production, pointing out the different ways these systems typically organize and divide labor, utilize machine technology, maximize or restrict output, and interface with the market. Next, I review previous meditations on the relation between industrial production and art including Constructivist, Futurist, and other manifestos of 20th century art

In the main part of the paper I describe five strategies of art making which adapt aspects of industrial organization. (1) Direct appropriation of the products or methods of industrial production as art objects, as with Marcel Duchamp's invention of the Readymade; (2) Mobilization of a factory-like labor process to mass produce conventional works of art for distribution via 'starving artists' sales; (3) Increasing the productivity of handmade art through a speeding up and intensification of the traditional craft labor process; (4) Increasing the overall social production of art through a democratization of art production techniques including 'paint by numbers' kits or TV art instruction programs; (5) Using automatic creative generators of art such as self-acting machines or computer programs to replace human creativity in art-making.

My concern is to describe how artists have modified or adapted industrial production techniques to mass produce 'conventional' unique artworks. As such, I am interested in ways the art world has sought to simplify, democratize, and popularize art production, thus overcome the contradiction between industrial mass production and art.

The Relationships Between the Executive and Legislative Powers in Brazil and the National Policy of Decent Work: An Analysis of the Law of Outsourcing.

In 2003, Brazil established a deal with the International Labour Organization to develop a Decent Work Program. The Decent Work definition supposes access to productive jobs, with good earnings and social protection, permeated by gender, race and age equality, and the stimulus to social dialogue. Since then, the Brazilian Executive, supported by employers and workers, pull out efforts to convert the definition in to policies, instituting an Agenda and a National Plan of Decent Work, with the intention to progress to a National Policy of Decent Work.

In contrast, a few actions in the Legislative indicate opposite positions. In 2004, the congressman Sandro Mabel (PMDB) submitted the law project in order to regulate the outsourcing in Brazil, in all labor activities, including the central activities in a company. Currently, in Brazil, the outsourcing is allowed only in non-central activities, such as security and cleaning. The law project, was removed from the Legislative agenda in 2014, coming back to the Legislative agenda in 2015, now being debated in the Federal Senate.

The law project is supported by employers, with the main argument that outsourcing will allow job rises. In the other hand, the workers are against the law project, considering that outsourcing reduces labor rights and rises the labor insecurity.

This paper aims to analyze the relationship between the Executive and Legislative powers in the regulation process of outsourcing and their consequences to maintain the Decent Work in Brazil. It will seek to show, based on the analysis of the law project of outsourcing and of the congressmen discourses and the Executive representatives discourses, the relationship between outsourcing regulation and the precarious labour relations and how this relation affects the National Policy of Decent Work, conducted by the federal Executive since 2003.

DIEHL, PAULA* (Humboldt University of Berlin, paulaDiehl@gmx.com)

The Representative's Body and the Logics of Representation

The physical bodies of representatives are involved in multiple symbolic processes that contribute to the way we conceive, think about, and imagine democracy. I will focus on two of these processes: the neutral representation of political institutions and the representation of particular groups (descriptive representation).

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In democracy, the power does not belong to the representatives but to the people. In this sense, the representation of political institutions is embedded in a neutral frame, symbolizing the people as a whole. For this reason, the symbolic representation of political institutions requires neutrality to be performed by the representatives and by their bodies. But, at the same time, the body always performs identity even if the actor does not want to. This process is closely linked to the concept of descriptive representation, in which the representative mirrors the identity of represented. If in the first case the body is required to symbolize neutrality, for descriptive representation the crucial element to legitimate the role of the representative is the particularity of the body.

Yet there is an intrinsic contradiction between the neutralization of the physical body in the representation of institutions and the identification with representatives' physical appearance connected to their race, gender, class, etc. that occurs with descriptive representation. Representatives have to take both forms of representation into account, particularly when they are recognized as belonging to a minority or to subaltern groups. In this case, representatives have to carefully balance their body performances in order to avoid being perceived as representing only one minority. Barack Obama and Angela Merkel provide two examples of the strategic negotiation between these two levels of symbolism and serve as the empirical material that I scrutinize in this paper.

The Explanatory Approach to Social Science. a Common Perspective

Rational Choice Theory (RCT), Analytical Sociology (AS), most theories and models in Mathematical Sociology (MS) and Computational Social Science (CSS) have the following three common features:

(1) Explanations are based on assumptions of individual behavior, interactions and social context (Gintis' BPC or Hedström's DBO plus assumptions on social interaction/context)

(2) Researchers use precise models from network analysis, decision and game theory, agent based simulation models and others (mainly to aggregate micro interactions to macro outcomes).

(3) Assumptions and implications of models and theory are, in principle, testable by empirical methods (often sophisticated statistical models of causal analysis for non-experimental data).

In my presentation, I will outline a unifying framework. Based on this framework I distinguish sub-groups of theoretical approaches such as RCT, bounded rationality, and evolutionary approaches. There is no approach that is superior in all situations. Instead, there is a rich toolbox with a great variety of instruments to construct competing middle range theories.

"Take One for the Team!" Individual Heterogeneity and the Emergence of Latent Norms in a Volunteer's Dilemma

The tension between individual and collective interests and the provision of sanctioning mechanisms have been identified as important building blocks of a theory of norm emergence. Correspondingly, most investigations focus on how social norms emerge through explicit bargaining and social exchange to overcome this tension, and how sanctions enforce norm compliance. However, sanctioning presupposes the existence of the behavior at which it is directed, and the question how behavior worth sanctioning can emerge tacitly if communication is not possible has hitherto received little attention. Here we argue that game theory offers an ideal framework for theorizing about emergent behavioral regularities and show how latent norms can emerge from actors' recurring encounters in similar social dilemmas. We conduct two experiments in which small groups of subjects interact repeatedly in a volunteer's dilemma. We vary the heterogeneity of group members in terms of their costs of cooperation and the way they encounter each other in subsequent interactions. Our results show that subjects in homogenous groups take turns at cooperating whereas in heterogeneous groups mostly the subjects with the lowest costs cooperate. The emergence of solitary cooperation is mediated by the way subjects encounter each other again and their other-regarding preferences.

DIETRICH, HANS* (Institute for Employment Research, hans.dietrich@iab.de)

Mental Health and Unemployment in the Youth Age and Labor Market Outcomes

The paper addresses the mutual reaction between unemployment and mental health and its effects on the labor market outcome of young people. Survey data covering 1.918 individuals, collected by the IAB project "Transitions from unemployment – A empirical study on unemployed youth in Germany" over three panel waves between 2000 and 2004 are combined with the "Integrated Labour Market Biographies" (IEB), covering individuals life course from school time up to the labor market activities in 2013, to analyze the employment career of young people under control of mental health and unemployment experience in the youth age in Germany.

The analytical data combine both data gained by retrospective and prospective survey techniques and register data. The data contain daily precise information on unemployment, employment and wages from the register data and a rich set of information on mental health (subjective health, HSCL 10 mental health indicators and HSCL 5 somatic health indicators) work commitment (Warr et al 1979), social background (EGP class scheme and parental education), migration background, household composition etc. from the individuals.

All individuals included in the data experienced a minimum of 92 days of continuous unemployment, however both the total duration of aggregated unemployment duration and the mental health status measured at three points of time is varying over individuals.

That allows addressing both the effects of mental health and unemployment experience and their interaction on individuals' later labor market outcome up to 15 years after the observed unemployment event.

As depending variables both the social class position and individuals income in 2013 are addressed. In line with the Blau-Duncan Model (1967) and the Boudon Model (1974) the effect of social background will be controlled.

Linear and categorical regression models will be employed to address the scarring effect hypothesis of mental health and unemployment experience.

A Food Environment Photovoice Project in Madrid: A Tool to Gain Empowerment and Reconstruct Neighborhood Biographies

Photovoice is a novel participatory-action research technique by which the taking of photographs– usually by people who are disadvantaged or ignored – becomes a means of critical reflection and personal empowerment. Participants capture and reflect the strength and concerns of their community through real life experiences.

Our aims were (1) To enable residents of a low-income urban area to record and reflect their community´s food environment, (2) to promote critical dialogue and knowledge about the local food environment through small group discussions of photography, and (3) to evaluate how this experience transforms the collective neighborhood biography.

Therefore, we carried out 4 photovoice discussion groups (men and women, within 40-75) in two contiguous low-socioeconomic neighborhoods by 8 public health practitioners and 4 researchers. Participants took images on their local food environment, serving as prompts to elicit residents' health concerns and beliefs regarding urban environmental determinants of eating patterns. Discussions were transcribed and interpreted using thematic analysis with the aid of Atlas.ti software.

47 pictures (out of 134) were selected by the participants, to be included in a photobook and an exhibition to share their experiences with other community members. "Economic crisis/poverty", "cultural diversity", "healthy&cheap" and "social relationships" are collective and cultural food values building the neighborhood identity. Throughout these groups, residents became aware of the relevance of their food environment, demanded a nutrition-workshop and strengthened their social networks. New bridges were built between the community and

public health practitioners, who gained new and deeper knowledge about the residents' concerns and new ways to connect with them.

Photovoice is improving the Heart-Healthy-Hoods project (hhhproject.eu), by helping residents rebuild their identity together, gain knowledge of their environment and engage in a process of individual and collective empowerment. Photovoice is a powerful tool to change residents´ self-concepts about themselves and reconstruct collective biographies.

The 'indignados' in Space & Time: Transnational Networks & Historical Roots

This paper analyses one of the most interesting movements that arose in Spain since the end of oppositional movements to Franco's dictatorship in the late seventies. My approach to this social movement in Spain, the May 15th Movement, focuses on frame analysis and its collective identity, and emphasizes its social reflexivity, its transversal character and its internationalization (Laraña & Díez, 2012).

The first aim of the paper is to tackle the internationalization of the Spanish 15M, focusing my interests on the role played by transnational networks of 'indignados' (or 'occupiers') in the spread and resonance of their calls and messages. With the aim of contributing to a wider understanding of this phenomenon I emphasize the usefulness of considering democracy as an open and dynamic process constantly threatened by oligarchical tendencies.

Secondly, I emphasize the relationship of continuity between the 15M and the American New Left of the 1960s, with whom the 'indignados' share some goals and common traits, such as its non-violent character and its demand of a 'participatory democracy' (ibid.).

The international scope and global resonance of this movement also illustrates its transversal character, given that its calls, messages, demands and forms of action went beyond the four cardinal points, as expressed one of the most chanted slogans in the Spanish mobilizations: "From the North to the South / from the East to the West / the struggle continues / whatever it takes". But its transversal character, not only cuts across different territories, cultures and socioeconomics contexts, but across different ideologies, activists traditions and NSM.

The Contemporary Development Sector in Kenya: The Emergence of a Development Assemblage

Globalization has transformed the development sector. As people have become increasingly connected across larger distances and interdependent in different ways, the organizations that constitute the development sector have become ever more diverse and interconnected as they work to advance a range of global agendas. The development sector now consists of various actors, including the organizations that constitute the state apparatus, development banks, bilateral development agencies, international nongovernmental organizations (INGOs), private equity companies, and multinational corporations. This diversity is particularly evident in efforts to ensure universal energy access. Whereas the postcolonial African state used to be the sole owner, operator, and organizer of national power sectors in the pursuit of national development objectives, it is now one actor in a development assemblage that seeks to expand access to electricity in the service of overlapping national, regional, and global goals. This paper documents and explains the transformation of the Kenyan power sector as it has shifted from a national concern to a broader development assemblage. By assemblage I mean a novel and dynamic set of relationships among a wide range of actors that conforms to a specific pattern. I argue that an analysis of this assemblage advances our understanding of how the development sector is being transformed with respect to the actors involved, their relationships to one another, and their subsequent capacities to effect change.

Exploring Poetry as Visual, Arts-Based, and Participatory Research Practice in the City of Gold: Experiences from Johannesburg, South Africa

Visual, arts-based, and participatory research recognizes different forms of knowledge, audiences, "products," and ARTifacts, not just those emerging from and for academia. The visual and performing arts can enhance representation, generate new insights, and serve as a catalyst for dialogue and collaboration. Poetry is a particular type of art that is also seen as a tool of research that can be used to investigate human phenomena (Poindexter, 2002; Thomas, 2004; Furman, 2006). Although poetry is personal, the forms of a poem—visual, oral, and auditory—are patterns that are well-known to both storytellers, readers, and listeners, and allow the audience to make sense of the story being told (Finley, 2003). In consideration of "exquisite mutuality" (Cahnmann, 2011; Boyle, 2013), the authors are conscious of the ethical issues of power and privilege in artist engagement, while also attempting to identify qualities of arts-based research methods practice that areresponsible, humble, and reflexive. This paper details the authors' engagement with nine migrant LGBTQI "co-researchers" and previous participants in the *MoVE method:visual:explore* visual bodymapping project (Vearey & Oliveira) in a week-long poetry workshop in Johannesburg, South Africa. The poetry workshop aimed at delving deeper into the participants' internal and external forms of displacement and place-making, as the co-researchers engaged in "participatory narrative analysis" (Dill, 2015) of these themes. This paper explores the visual and performance aspects of the participants' critical analysis of extant poetry in order to generate new forms of visual (written, printed, and published) and performance (oral) art. Finally, we will discuss the utility of such visual and performance arts-based methods, particularly for social justice-oriented researchers interested in engaging with marginalized populations.

Beyond the Camera: Women Screenwriters in Turkish Cinema

May 1968 brought a lot of changes to the so-called "Occident". What often people forget though, is the fact that 1968 was most probably the first global and generational movement that managed to make boundaries such as "West" and "the Rest" fuzzy.

In Turkey, 1968 marks not only the entrance of margins into political debates. It also introduces new genres to cinema, in parallel with the emergences of social movements as the ones of women.

This article proposes to study the links between women screenwriting and feminism in Turkey starting the 60's, from both historical and aesthetic angle:

- How has screenwriting been used as a means to support and popularize feminist movements?

- What was the impact of feminism in the field of film and video?

Following the work of women screenwriters from Turkey, I argue that one can show how film industry as one of the most powerful popular cultural artefacts, can be a counter-hegemonic and/or a provocative tool for women to express and create their quest for individual and collective identity.

In order to do so, the first part starts with the emergence of the "woman question" within the "realist cinema" reconfigured after May 1968 in Turkey: a gender specific field in the cinema opens thanks to movies focusing on class struggle. The second part examines the emergence of an autonomous women's feminist screenwriting practice, which is closely related to a political process of self-representation. Grabbing the tool of scenario writing responds, in a way, to a political strategy of speaking and reclaiming their bodies and their sexuality through the screen. Beyond the movies, the third part examines in how far scenarios have been used as feminist and/or a political tool. I particularly focus on " women cinema" to confront feminism, its theories and practices.

Reconfiguring Protests in the Media Milieu: Iconic Productions from Gezi Park Movements

This paper is part of the international project *Protests as Active Audience Voices: Global, Glocal or National Phenomena* focusing on the wave of social protests raised all over the world since 2011, leading to different political processes and social movements like the Arab spring in Northern Africa, Occupy Wall Street in the United States and other Western democracies, May 15th Movement in Spain, Gezi Park in Istanbul…

Our general purpose is to achieve a better understanding of the role played by iconic productions in this global attempt of fostering a revolution or, at least, to achieve some degree of social change. Both online and offline media played a certain role in the proliferation of oppositional political aesthethics which still requires a deeper clarification, placing its users and consumers as the main instances for achieving grounded explanations.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

For the Turkish Case Study, iconic productions from Gezi Park Movements show that street art artists were actively involved in the protests both onsite and online, so their own negotiation between material and virtual worlds and their self-interpretation about how and why they are using and perceiving media turns into an appealing mileu for oppositional political aesthethics.

After a descriptive introduction presenting the key features, in-depth interviews with some of the artists whom images distributed though social media gained an 'iconic status' will be carried out in order to explore, among others, the following questions:

- How was the image distributed? And how did it evolve at the short, medium and long term into an 'icon'?
- Which ICT resources were used during the protests and which functions were they attributed by the artists?
- What kinds of connections were established in terms of political aesthethics with other social protests co-occurring in different places of the world? How was this dialogue performed?

How to Integrate the Newly Arrived Refugees into the Labour Market? an Evaluation of the Three Year Danish Integration Programme

Abstract

The European countries experience the largest migration flow since World War II with least a million refugees expected to arrive in 2015. Consequently, policy makers face the challenge of how to integrate these newcomers into the labour market. The scientific literature provides limited knowledge about the effect of policies and integration programmes (UNHCR, 2013). Most previous studies focus on how general institutional features (e.g. immigration policy, welfare and labour market institutions) influence the labour market outcomes of immigrants, while few evaluate the effect of specific policies (for an overview see Diop-Christensen, 2014). To the best of our knowledge, of the latter type of studies, only Rosholm and Vejlin (2010) focus specifically on the group of refugees (see also UNHCR, 2013).

This paper contributes to filling this knowledge gap by investigating the effect of different integration measures for newly arrived refugees in Denmark. More specially, refugees in Denmark participate in a three year integration programme, which should aid their labour market transition. However, the programme varies widely in content because the implementation is decentralised to 98 municipalities. In a first step, we identify the specific nature of this variation by conducting a survey in all Danish municipalities. This information will be used for constructing variables (e.g. the use of internship in firms, focus on transferring educational qualification). Secondly, we analyse the effect of these variables on the duration until the refugees make a transition to the first job using Danish administrative data.

DIXON, A.L. SINIKKA* (Burman University, dixosin@bellaliant.net)

Age Life Cycle

Of all life cycles, age is the most fundamental; we enter into it at birth and exit at death. We start aging from the moment we are born, but our quality of aging varies. Weaving is a useful metaphor for engagements in and disengagements from the life cycles of family, education, work and leisure. The warp as the length of our life span varies by historic time period and social location which limit our life opportunities, further complicated by biological inheritance.

Age, or time, is a talent all of us have. We can squander it, treasure it, or maximize its usefulness and meaning to us and those to whom we are functionally and emotionally linked. The young and healthy often ignore the existence of this factor in life, busy growing up and acquiring an education and fitting into the work cycle.

We age with cohorts. Earlier societies had maturation rites, but even today's society prescribes certain rights and obligations based on chronological age. We also limit ourselves by our self-perceptions.

There is even a shift in our evaluation of the concept time. In fact, it is over the past decade, in the fields of aging and health, that researchers have shown a growing interest in a concept called "Future Time Perspective" (FTP), referring to "an individual's perception of his or her remaining time to live" (Coudin & Lima, 2011:220).

I would like to take it a step further and illustrate by my own life history and personal observations (I am now 78), that the society would benefit from a total life cycle perspective. It involves an interaction effect of age, family, education, work and leisure, the role of life values, health, voluntary and involuntary relocation and self-esteem (Dixon, 2013). Case studies based on these are cross-culturally comparative.

The Views of Adults with Dementia Towards Managing Future Health Care Risks.

Dementia is a degenerative disease which affects an individual's thoughts, memories and behaviours. Survival times differ with those diagnosed in their 60s in the UK living 6.7 years on average. During this time individuals are likely to require substantial amounts of care. It is well established within adult care policy that individuals should be able to choose the type of care that they receive. Whilst this principle extends to dementia care, there is the added complication about what should happen should an individual lose mental capacity. The government has implemented a range of policies to enable individuals to make decisions about their future care whilst they retain mental capacity. These policies are being promoted on the basis that they allow greater choice. This reflects an emphasis on choice within adult care more generally, which has recently been extended to end of life decisions. Whilst choice is presented as a positive outcome in policy, such policies require individuals to take responsibility for managing future welfare risks. It is therefore important to establish how people with dementia believe their condition may affect them in the future and how they manage risk and uncertainty. Drawing on published research, the paper argues that people with dementia do not necessarily respond to appeals to manage risks in rational ways. The paper argues that people with dementia adopt a number of strategies. A substantial group take steps to avoid confronting risk decisions altogether. Other people with dementia adopt formal or informal approaches to risk taking. Those adopting formal approaches make use of legal and policy networks, whilst those acting informally rely on social contracts with friends and family members. The paper considers implications for future policy research.

DOANE, ASHLEY* (University of Hartford, doane@hartford.edu)

What Is Utopia? the Science Fiction of Arthur C. Clarke and the Road Ahead

Historically, sociologists have devoted attention to unraveling the nature of human society, most typically in the present, but also routinely turning our gaze to the past. We have probed the "patterns," "structures," and "systems" of social groups and societies. When we study social change, we examine the tensions and other social forces that effect change, as well as the dynamics that shape how society evolves.

In other words, sociologists generally seek to understand what was and what is, as opposed to what will be. We are better at social criticism than social planning. When we have turned our attention to the future, it has been to make relatively short-term predictions based upon our assessment of current trends and conflicts. What sociologists have not done, to any substantial degree, is to describe what could be, or even what "ought" to be. And those sociologists who do focus on more humanistic or emancipatory alternatives—e.g., Erik Olin Wright's "real utopias"—use the present as a point of departure in moving towards a better future.

Writers of fiction, on the other hand, are not constrained by sociological realities. In this presentation, I propose to use the utopian vision of Arthur C. Clarke (one of the most prolific and scientifically grounded authors of science fiction), as outlined in his four volume "space odyssey" series, to explore questions related to visions of a "non-alienated" utopia. How does Clarke's vision, which extends out over a millennium, inform our understanding of the road ahead? Can this shape our analysis of more short-term "utopias" such as those envisioned by Wright? And—going forward—what does this mean for sociologists? Beyond our normal calls for greater equality and social justice, are there more ways in which we can help humanity on the path to a less alienating and more "utopian" future?

The Greek Social and Political Crisis As Shown in Street Art in Athens 2015

Based on graffiti text and visuals and interview data collected in Athens in July 2015 as well as a review of current literature, we examine the Greek crisis that has particularly been generated by the implementation of austerity measures associated with the troika (European Commission, International Monetary Fund, and European Central Bank), the membership in the European Union, and the corruption of the Greek politicians and police. Leventis (2013:7) has pointed out that Athens especially has been affected stating "quantity and scale of street art parallels the ever increasing intensity of the unfolding state of emergency grappling and crippling the socio-urban heart of Athens." We focus on the portrayal of social injustices in a historical frame but especially examine graffiti after the "No" vote to the continuation of austerity measures (the second of three national votes thus far in 2015). The search for alternatives as well as anger, fear, frustration, and hopelessness are some of the images seen in Athenian graffiti. For example WD's (Wild Drawing's) mural of a homeless person sleeping on the streets of Athens illustrates the extreme poverty that many encounter given the high unemployment rates especially for youth. In a mural Dimitris Taxis questions if anything useful has been learned from Greek historical contributions related to democracy, the ideas of Socrates, etc. Texts and sketches reveal the frustration with the police that led to riots in 2008 and in Exacheia the creation of a memorial to Alexandros Grigorapoulos, a 15 year old Greek youth. The concerns about the austerity measures can be seen in graffiti critical of the Euro and of Angela Merkel, the Chancellor of Germany. The walls tell a complex story of Greece's past, present, and future.

Sociological Relevance of the Diversity Concept(s)? for a More Careful Debate

Scholars who take critical positions towards the concept(s) of diversity and its related practices can be divided into two groups: First, those who assess the ubiquitous 'diversity turn' as fundamentally flawed. In this context, the term of diversity is perceived as deeply immersed by principles of marketability and economization (e.g. Noon 2007; Prügl 2011) and thus inappropriate for analyzing social inequalities and questions of inclusion. Some scholars go even so far as to identify the 'diversity turn' as one of the causes of the increasing inequalities in contemporary societies. They assume that the "buzz of diversity" (Ahmed 2012: 61) might distract from the fight against racism or represents "at best a distraction and at worst an essentially reactionary position" (Michaels 2006: 16) because it leaves questions of economic inequalities "absolutely untouched" (ibid.: 75). In contrast, the second group of scholars, who also keep a critical distance, approach the 'diversity phenomenon' rather as "socially (re)produced in on-going, context-specific processes" (Zanoni et al. 2010: 10) and thus neither solely driven by business rationales nor predetermined regarding its empirical ramifications.

Against this background, I suggest that it is not diversity concepts, but rather the respective sociological debate in continental Europe, which needs re-adjustment (see also Krell 2014). This debate mostly neglects decades of critical diversity (management) studies in the Anglo-Saxon area, and maintains the assumption that the concepts of diversity are intrinsically insensitive to inequalities and power relations. Further, ongoing empirical research about the multi-faceted and ambivalent effects of diversity related practices attracts little to no attention because the debate often remains on an abstract level. Consequently, instead of (re-)shaping and advancing differentiated, power-sensitive concepts of diversity, the issue plays a marginal role in the sociological mainstream despite its increasing social relevance.

A Better WORLD from Learnings of the African Diaspora

This paper engages findings from a field investigation of Cuban African descendants' religious practices that were adjusted, sustained, and/or recreated from ancestors who retained and transformed their continental customs for new situations of Spanish colonial society. The intent is to comprehend contributions these colonial and contemporary practitioners can offer toward visioning a "better world."

Despite the enslaved status of ancestors to contemporary AfroCuban descendants, research findings demonstrate that several Africa-inspired religious traditions are linked to colonial customs. This reaffirms that humans, including African descendants have used religious rituals and practices to incorporate survival techniques to help sustain their sense of humanity no matter social, political, and economic circumstances. This reality can assist our visioning a "better world," one not dependent on singular assimilation model(s) but inclusive of the healthy continuation of our global communities' cultural practices.

The paper reviews how, through four hundred years of the Americas' repressive intentions, colonial and contemporary African descendants have adjusted, created, and sustained religious practices that kept alive their Africa-inspired epistemological and cosmological core to help construct rituals, customs, and traditions that undergird distinct behavioral understanding of an "African way of life." This reality is exemplary of how those in the Americas portion of the African Diaspora have demonstrated on-going capacity to sustain their sense of humanity by employing Africa-inspired principles to build social spaces, express self-identity, and transfer religious understandings to new generations. However, sociological literature rarely acknowledges or conveys full comprehension that descendants' African-inspired patterns under gird much of these human groups' social practices. The paper proposes that we must comprehend how these patterned understandings do or do not represent humans' ability to vision their world and a future.

Market Structure and the Unintended Consequences of Quality-Related Innovations: The Use of Screwcaps on German Wines

More than 400 million bottles of wine of all qualities and prices are adversely affected by faulty cork closures each year; a problem that is especially dramatic when it afflicts expensive wines of high quality. The screwcap long offers a solution. Used on table wines since the 1930s, it eliminates cork-related defects and is also substantially cheaper than cork of high quality. A recent innovation, the long-skirted screwcap for premium wines, has been gaining market shares in Germany. In light of evident advantages over the fault-prone and expensive cork, it does not surprise that many makers of premium wines have embraced its use. But while each winemaker *individually* stands to benefit, widespread screwcap adoption on wines of high quality has the unintended consequence of legitimizing their use on wines of *all* qualities. And while makers of premium wines primarily stand to realize cost savings, makers of basic wines - who must currently resort to cheap closures of inferior quality - stand to substantially improve the organoleptic quality of their product. The adoption of the screwcap by makers of premium wines thus has as its unintended consequence that the overall quality of wines brought to market will increase - and with it, the competition that makers of premium wines experience.

In this paper, I present an empirically tractable model that captures this mechanism in terms of market competition on price and on quality. This model allows for explorations of how quality-related innovations such as the screwcap affect market structures and, as an unintended consequence, the economic incentives that markets offer their participants. Drawing on data on 35,000 wines made by 790 winemakers in Germany, I find empirical support of my hypothesis that while an innovation seems beneficial for the individual winemaker, its unintended consequences may negate this effect.

Inter-Organizational Coordination As a Professional Project: Nursing, Field-Level Change and Informal Coordination Mechanisms

Fragmentation in public service organizations is a salient problem, which is exacerbated by increasing functional and structural differentiation together with the highly complex problems many users experience. The literature on inter-organizational coordination focuses on integration based on administrative coordination and associated formal coordination mechanisms. Informal coordination mechanisms are described as frequent and substantial mechanisms, but there is little knowledge of how they work in practice. The same applies to the role of professions in inter-organizational coordination at the operative level of the public sector.

In contrast, recent organizational studies of professionals emphasize the close connection between organizational and professional development and describe how institutional field-level change occurs in tandem with professional projects. The nature of professional projects is dynamic and adaptive, driven by professionals as institutional entrepreneurs. Building on this, this paper analyses inter-organizational coordination as a professional project.

The specific aim of the paper is to examine how professionals use informal coordination mechanisms and what the interplay is with more formal forms of coordination. The analysis is based on a qualitative case study of nursing and cross-sectorial care coordination of multi-morbidity in Denmark. Nursing offers a particularly interesting case; although the profession does not have a formal mandate, it de facto assumes a key role in care coordination. The analysis draws on observation, focus-group interviews and written documents.

DOMARADZKA, ANNA* (University of Warsaw, anna.domaradzka@uw.edu.pl)

Urban Tinkers – Between City Planning and Grassroots Insurgent Urbanism

Recent emergence of „right to the city" movement in Poland indicates a shift in a way people perceive their urban environment, expecting greater participation in local planning, but also taking matters into their own hands, to counteract the money-not-people-driven city investments. That's why grassroots insurgent urbanism often coincides with top-down revitalisations projects, focused on the recovery of degraded urban areas, through renovation that often leads to gentrification.

The focus of the paper is to analyse the impact of different types of urban revitalization initiatives on the wellbeing of people living within the affected areas. Paper investigates how, through planning or collective re-imagining of public space, both local governments and neighbourhood groups can create potential for the city social revival. The analysis is supported by the works of Hall (1966), Whyte (1980, 1988), Jacobs (1961) and Gehl (1987, 2010), describing the links between the urban space and forms of interactions happening within it. The classical measures of Convoy Model of Social Relations (Kahn, Antonucci, 1980) were used to identify the characteristics of urban interventions that lead to their success in terms of raising social cohesion and the residents' wellbeing.

Paper presents results from quantitative study (N=1000) conducted in 10 Warsaw neighbourhoods that underwent revitalisation projects in recent years, supplemented with qualitative data from 20 in-depth interviews with leaders of grassroots initiatives involved in social revitalisation and "reclaiming the city" projects.

The study attempts to explain how urban revival initiatives stimulate self-organization of the residents, and in result leads to higher social cohesion and wellbeing. As research shows, crafting new city spaces often leads to non-intended democratic mobilization, that transforms passive residents into active agents of urban change. Embracing the potential of "angry citizens" in re-shaping of public space lead to more sustainable improvement of quality of life in studied neighbourhoods.

Who Should Maintain Unused Public Lands? : To Foster Citizens' Behaviours Based on Private and Local Needs in Order to Overcome Public Issues on Japanese Context

This research focuses on who should maintain unused public lands. It is well known that the unused public lands have caused the around people undesirable impacts, and it has been necessity to overcome this problem as a serious public issue all over the world. In Japan, some reports express that a small number of unused public lands have been changed to neighbourhood parks or community gardens which are temporarily available, based on the contracts between local people and municipal offices. On the other hand, Saitama City Office in Japan established an ordinance to use unused public lands as the multi-purpose square in 2010. Moreover, the Office suggested the condition which it is needed by citizen groups to offer the maintenance and management of the lands before the Office introduces the squares in each land. And then, there are 13 multi-purpose squares at present. We had promoted interview with the member of the citizen groups from 2014 to 2015.

It seems that the citizen groups have the shared value with Saitama City Office which wants to enhance the function of the multi-purpose square. However, most citizen groups have reasons, which do not correspond to the Office's demand, based on each private and local need such as to avoid negative impact caused by the construction of tall buildings even after they will be sold. Therefore, citizen groups hope to establish the multi-purpose squares and to keep a moderate function of them with minimal costs for the maintenance and management, and the Office does actively not require paying a large amount of their cost. Consequently, there are a lot of citizen groups which are able to take part in the maintenance and management of the lands, and then the number of multi-purpose squares has increased there.

Realism and Trend-Concepts, the Political System and Modernity

This paper resumes the discussion of modernity relating it closely to debates in the philosophy of science, proposing a specific way of relating empirical perspectives and theoretical construction. It draws upon Bhaskar's work, critically departing however from some key elements in his conceptions, towards a more process-oriented and anti-reification demarche as well as with the intention of developing a systematic analytical strategy. Marx and Parsons are mobilized to achieve this reorientation. The paper aims at showing that *trend-concepts* should not be contemplated according to empiricist standpoints, with the notion of mechanism receiving pride of place in its strategy. It then applies its resulting perspective to a substantive issue, namely, the development of the modern state, whose contradictory dynamic is brought out.

Analyzing the Theoretical and Practical Implications of Resilience Transferences Among Social Groups in Merida City, Mexico

Although the recent introduction of resilience notion in the study of urban systems has expanded the existing knowledge about their socio-ecological processes and structures, it has also tended to generate simplifications about the complex relationship between resilience and vulnerability. As Chelleri et al (2015) mentioned these simplifications include among others, denial of the evolutionary and multi-scale dimensions of resilience. In this regard, Holling et al (2002) reminds us that resilience in a specific scale or period could being achieved at the expense of other scales, time periods or other systems, therefore is important to pay attention to resilience transfers between scales, periods and systems. Recently Chelleri et al (2015) deepened in the study of resilience transfers in urban socio-ecological systems from three perspectives.

Although Chelleri's work clearly presents the basic approach to the study of resilience transfers in and between urban socio-ecological systems, this only point the way from which this line of research should developed. Questions such as, is there resilience transfers among the different urban social groups, and what are they characteristics? and how effective are the social and economic development, and climate change governmental programs in the transfer of resilience among the different urban social groups, particularly the most vulnerable? remain for answers. This paper aims to explore the theoretical and practical implications of these and other questions thus making a contribution to the current debate on the complex adaptive systems, particularly in what refers to the resilience of urban socio-ecological systems in developing countries. The work focuses in the case of the city of Merida, Mexico and methodologically develops on the statistical analysis of a recent database whose development was in charge of the author, as well as the addition of in-depth interviews to key actors.

Hacia Un Sistema De Indicadores De Bienestar En La Infancia: Una Propuesta Desde Los Enfoques De La Sostenibilidad De La Vida y Las Capacidades

En las dos últimas décadas han proliferado mucho los estudios sobre medición de bienestar en la infancia, ligados fundamentalmente a las necesidades de abordar una temática desde una perspectiva multidimensional y capaz de integrar enfoques con una visión más completa de la realidad. En este sentido, se han abordado cuestiones clave y existen debates aún abiertos como la inclusión de los niños y las niñas como agentes activos en la definición de sus necesidades, o la consideración en el bienestar de aspectos que afecten tanto a las necesidades presentes como a las futuras. La teoría de las capacidades ofrece un marco teórico muy interesante en este sentido, por lo que en este trabajo se tratará en primer lugar de hacer una aproximación a la temática del bienestar infantil desde este enfoque.

Por otra parte, sin embargo, no existe una traslación en paralelo de estas aportaciones teóricas al desarrollo de indicadores, si bien se reconoce su necesidad por las implicaciones políticas y de acción social que tiene llevar al terreno de lo tangible estos avances. Esto es así, en gran medida, por dos cuestiones, por un lado por la escasez de datos relacionados directamente con la infancia que permitan el desarrollo empírico de medidas fiables y válidas en el terreno que nos movemos, pero también por la dificultad metodológica que entraña definir de forma apropiada para su cuantificación, este tipo de factores que van muchas veces ligado a lo subjetivo y/o intangible. Sin obviar esta circunstancia, en la segunda parte de este trabajo se pretende avanzar en este sentido y proponer un sistema de indicadores que apoye lo previamente analizado desde un punto de vista conceptual.

The Paradox of Transition. Environmental Vs. Economic Development: The Eternal Dilemma.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Even if crises attack the roots of the ideal of modernization and the same basic principles of development that justify the exploitation and domination of nature for the benefit of unlimited growth and consumption of goods (Alemany, Sevilla Guzmán, 2007), we assist to a relevant discrepancy in the understanding of what sustainable "transition" means and has been proposed in the different levels of governance.

The Island of Sardinia (Italy) is facing old and new challenges linked to a deep economic, ecological and social crisis. These challenges today represent a clash between two models.

On one side the idea of an economical approach based on the "extractive" model persists and it is attempting to dismantle the protection of natural resources at the expense of a non-rational use of the environment (actions taken forward at private and public level). This economic model has left Sardinia in a deindustrialization context and presented relevant environmental externalities. In fact, according to the last publication of SENTIERI research (project Funded by the Italian Ministry of Health on National Territories and settlements exposed to risk from pollution,) Sardinia is the most polluted region in Italy with 445.000 hectares of contaminated soil still to be reclaimed.

On the other side, we detect a number of committees and collective actions that involve citizens, local administrators, experts and different associations, who are trying to redirect public policies and struggle to defend environment from impacting projects (e.g. renewable energy plants in agricultural land, green chemistry, fracking, privatization of common land…).

The aim of this paper is to introduce the context of a network of social regional movements and local actors that are facing the challenge of a sustainable transition in a context of low participatory political processes. Can transition have a shared meaning and represent a common objective?

DONG, WEIZHEN* (University of Waterloo, weizhen@uwaterloo.ca)

Social Determinants of Health in Rural Anhui

This paper is based on a study exploring the social determinants of health of rural residents in Anhui, China; which is sponsored by the Lupina Foundation. The study looks into the main health determinants such as living condition, social security, healthcare access, and rural-urban migration's impact on Anhui villagers' health and overall wellbeing. It attempts to identify the problem areas in order to develop strategies for the improvement of the reality.

Compared with urban residents, villagers in rural areas tend to be vulnerable in terms of social programs' entitlement and access various resources, including healthcare. In an age of rapid urbanization (of populations), the left-behind family members tend to be lack of childcare, eldercare and family support. Both questionnaire survey and qualitative data from the project reveal that rural Anhui has developed into a stage, which requires new social infrastructure and social policies.

Generating Antagonistic Nationalist Collective Identities and Lynching Regimes through Social MEDIA in Turkey

This study analyses the power of social media in generating antagonistic nationalist identities leading to political violence and lynching regimes in Turkey. By addressing the Turkish case, our study tries to understand the symbiotic relationship between social media and lynching regimes emerging from two antagonistic nationalistic collective identities -namely Kurdish and Turkish nationalisms-. The study evaluates nationalism strategies both in terms of symbols and discourses, and in terms of mobilisation practices through social media.

As a field of study, we take lynching incidents which happened in the South of the country from the 8th September 2015 till the 15th September 2015, the aftermath of Turkish Security Force and PKK's (Kurdistan Worker's Party) arm struggle which costed the lost of many security forces' lives. After this arm struggle, a crowd attacks most of the pubs and discos run by Kurdish business people. Most of them are ruined. People blame ordinary Kurdish citizens and Kurdish businesses. Some of them denounce to the newspapers that they were aggressed by the victims' Facebook accounts.

This case makes essential to analyse the role of social media in generating competing identities and lynching attempts.

We follow two routes to reach this rationale: The first one is to carry out observations in the southern part of Turkey where the incidents occur -namely Manavgat, Fethiye, Alanya, Alanya towns- and to collect oral history about these lynching incidents, both from the victims and perpetrators in order to understand the role of social media in these actions. The second is to perform discourse analysis of the nationalist messages -both Kurdish and Turkish websites- on Facebook and Twitter, in order to understand how these competing identities nurture each other.

DONZA, EDUARDO* (UBA-UCA, edonza@yahoo.com)

Imputación De La No Respuesta En Las Variables De Ingreso. Encuesta Permanente De Hogares. Gran Buenos Aires, Argentina / 1990-2010.

La no respuesta a las preguntas de ingreso constituye uno de los principales problemas de los estudios referidos a la temática y de los que utilizan sus datos para estratificar o clasificar a la población. La ausencia de respuestas depende de factores que exceden la instancia de relevamiento, tales como procedimientos y estrategias en el proceso de investigación, cambios de cuestionarios y factores socioeconómicos.

Utilizando los datos relevados por la Encuesta Permanente de Hogares del Instituto Nacional de Estadísticas y Censo para el aglomerado Gran Buenos Aires de la Argentina, retomando y ampliando estudios anteriores, en esta ponencia se determina la evolución y el impacto de la no respuesta a las preguntas de ingresos entre 1990 y 2010. Se demuestra que la no respuesta es elevada en parte del período, fluctuó por cuestiones técnicas y efectos procedentes de la población, y su distribución no es completamente aleatoria.

Debido a esto se plantea la necesidad de realizar una imputación de los ingresos no declarados y se aplica el procedimiento de máxima verosimilitud para enmendar la no respuesta. Se realiza la estimación de los ingresos no declarados, a partir de los cuales se recalculan los principales estadísticos sociales. Se verifican importantes diferencias entre los estadísticos calculados al considerar solo los valores de ingresos declarados y los obtenidos al considerar también los ingresos imputados. Se comparan las imputaciones con las realizadas por el organismo oficial de estadísticas en parte del período.

Se concluye la necesidad de que los organismos productores de información refuercen sus actividades para generar información de mayor calidad y se recomienda que para el uso de la información sobre ingresos se imputen los valores a las preguntas no respondidas.

Las Estrategias PARA La Prolongaci"N De La Vida Zactiva? Zlaboral? Como Respuesta Polĺtica a Las Consecuencias DEL Envejecimiento De La Poblaci"N

El envejecimiento, y más concretamente, su secular identificación con la inactividad, ha originado uno de los debates más controvertidos en la actualidad dada sus implicaciones económicas, laborales, sociales y políticas que, a priori, no tiene un final a corto y medio plazo, pues, a medida que avanzamos desde un punto de vista cronológico, éste se hace más patente. En esta línea y dada la importancia que han adquirido las medidas puestas en marcha en torno al envejecimiento de la población y, dentro de éstas, las relacionadas con la actividad laboral (*prolongación de la vida activa)*, se requieren mecanismos y criterios que aseguren que los esfuerzos invertidos en su elaboración e implementación, sirven a las necesidades e intereses de la sociedad en general, y a la población a las que van destinadas en particular, y reviertan en ella no sólo desde la eficacia y la eficiencia, sino desde la idoneidad. Por ello, el estudio que se presenta en esta comunicación analiza, desde un enfoque sociológico y desde la lógica de la evaluación de políticas públicas, el diagnóstico elaborado para el diseño de las estrategias destinadas a fomentar la prolongación de la vida activa de los trabajadores en la Unión Europea en el marco de la política del envejecimiento activo. Estas medidas nacen en un contexto en el que el sistema de protección social dominante en Europa, el denominado Estado del bienestar, se encuentra en pleno cuestionamiento. En este sentido, los resultados de esta investigación podrán, entre cosas, corroborar si el diagnóstico elaborado para el diseño de las estrategias para la prolongación de la vida laboral refleja la situación problemática real de partida y, por tanto, legitima el diseño de dichas estrategias de cara a solventar los problemas y necesidades existentes.

Retail Shift Workers: The Times and Rhythms of Emotional Labour. a Qualitative Case Study in Milan, Italy

Post-Fordism and the expansion of the service sector in the labour market have led to a substantial increase in young people employed in this sector, often in multinational companies of famous brands and in a condition of flexibility of contract terms. Shift work, in holiday, on Sundays, sometimes at night, up until only a few years ago was synonymous of factory work and blue collar workers.

Today this is intertwined with the retail work, characterized by an empathic interaction between workers and customers in a condition of immediacy. Retail workers must identify with the customers and must empathize with them everyday with timing and pace of work fast and tight. Working with customers, they could perceive a condition of estrangement from themselves. This kind of alienation could be linked to the demand of instant satisfaction and the contraction of times and rhythms, the immediacy of relationships, in the shopping areas of the western metropolis. The topic of this empirical research is the retail shift work, in particular the signals of this specific kind of alienation in the perceptions and feelings of retail shift workers in Corso Buenos Aires, Milan, Italy. The methods used are qualitative methods: interviews, focus groups and ethnographic fieldwork. I worked three years as retail shift worker in a phone store in this shopping street in Milan. This research will carry on within another case study, Oxford Street in London. In Italy the legislation regarding shop opening hours has become total in 2012, while in England the opening hours are more regulated. This topic is actual and important in the public debate in Europe: both in Italy and in England there are campaigns against the deregulation and against working on Sunday supported by religious and secular groups and organizations, Keep Sunday Special and Libera la Domenica.

DORNELES, EDSON* (Dorneles, edsonbertin28@uol.com.br)

Raising Children: The Strategy of Accusations in Establishing Age Boundaries and Moral Duty.

Raising children: the strategy of accusations in establishing age boundaries and moral duty.

This work aims to discuss the conflicts and negotiations on intergenerational relationships, specifically between adults and young children. It is based on studies of childhood, family, morality and emotions in the fields of Sociology and Anthropology. The research highlights the emic notions of "lack of attitude" regarding parenting and "lack of limits" related to the children's behavior. These notions are related to complaints from adults which point out flaws in demarcation boundaries, between what cannot be exceeded or what has to be done as a moral duty. In spite of the fact that this discussion has been made in the field of Psychology and Education, this work develops reflections on education and care in childhood, according to a logic of a social category of accusation, which is a conscious strategy to manipulate power and morals, and to organize emotions. (Gilberto Velho, 1987). This research is based on a triangular relationship between parents, teachers, and children considering the form of raising and education. The data comes from field research in an early childhood institution in a neighborhood with a low-income population in Porto Alegre, Brazil. The results demonstrate social representations that present disputes and negotiations on what is acceptable and tolerable. There is also a tension between stiffness and flexibility on the regulation of behavior, according to moral standards and the administration of moral emotions, in an intergenerational dynamic in the daily life of an early childhood institution.

DOS ANJOS, GABRIELE* (Fundacao de Economia e Estatistica, gabrieleanjos@gmail.com)

Social Sciences and the Making of Brazil's Intangible Cultural Heritage

Since the 2000´s the Brazilian state includes in its policies for cultural heritage the notion of "intangible cultural heritage", defined by UNESCO´s Convention for the Safeguarding of the Intangible Cultural Heritage (2003) as "the practices, representations, expressions, knowledge, skills" and "the instruments, objects, artefacts and cultural spaces" recognized by communities, groups and individuals "as part of their cultural heritage". This intangible cultural heritage is "transmitted from generation to generation" and provides "a sense of identity and continuity" for such groups. That definition opposes a traditional culture to mass and elite cultures, and the Brazilian policies emphasizes the "popular or native" character of intangible heritage, following the creation and sponsorship of a "national culture" by the Brazilian state.

These policies carry the creation of the National Program for Intangible Heritage (Programa Nacional de Patrimônio Imaterial) and procedures for intangible heritage´s identification, register and enrollment. The description and labeling of social practices as "intangible cultural heritage" demand the knowledge of culture experts, like architects, historians and mainly anthropologists. This work presents the analysis on the making of the intangible cultural heritages by the uses of social sciences' concepts and methodologies. Those uses imply the intermediation between social sciences and state requirements, and the enrollment of social scientists in cultural heritage´s advocacy. Simultaneously, it could imply in a lack of perception on power relations and conflicts entrenched in social practices, promoted and even celebrated as "heritage". Moreover, these social scientists contribute to establish otherness, defining the "people" and his "traditions" to be safeguarded, so distant in relation to elite patterns, resources and practices.

WG03-654.4

DOUCET, ANDREA* (Brock University, andreadoucet@mac.com)

Family Photographs and Ontological Narrativity: A Relational, Performative, and Ecological Approach

The study of family photographs and family photographic practices occupy a small corner of both visual sociology and family sociologies (see Chalfen, 1987, 2002; Kuhn, 2002, 2007; Langford, 2001; McAllister, 2006; Pauwels, 2002, 2008; Rose, 2004, 2010). As Gillian Rose notes, there are very few studies on family photographs and even fewer studies that pay attention "to the many things that are done with family snaps, particularly how they are made, stored and displayed" and to the "social practices in which they are embedded" (Rose, 2010, p. 12; see also Chalfen, 1987, 2002; Hof, 2006; Larsen, 2005). Building closely on the work of Rose and Chalfen, I argue in this paper that family photography is not simply a collection of images or a textual archive, but is "something that people do ... as a social practice" (Rose, 2010, p. 1) as well as a methodological resource for the making and re-making of family narratives and practices across time. While family photographs are often viewed as representations of families, I argue for a non-representational approach to family photographs. Working with non-representational theories and methods (see Mauthner, 2015; Thrift, 2008; Vannini, 2015; Verran, 2011), and informed by a wide set of epistemological and ontological resources that are performative, ecological (Code, 2006, 2008; Ingold, 2011, 2015) and relational, I develop an argument that frames family photographs as moments of "ontological narrativity" (Somers, 1994, 1995), as sites of ongoing affective relationships, and as "both compositional and lived" (Stewart, 2010).

DOUGLAS, KAREN* (Sam Houston State University, kmd007@shsu.edu)

SJOBERG, GIDEON (University of Texas at Austin)

Corporations, the Managerial Elite and Social Stratification

Our objective is to highlight the role of large-scale organizations in the stratification process in advanced industrial societies like the United States. We build on Sjoberg's essay about the rise of world bureaucratic capitalism in Abu-Lughod's Sociology for the 21st Century. While corporations are the legal creations of the state, their activities transcend national boundaries. Further, the managerial sector typically has limited liability that protects their personal fortunes when say a corporation files for bankruptcy.

The impact of corporations on the stratification system comes into stark relief in light of the 2007-2009 Great Recession. In this Recession the federal government bailed out Wall Street overlooking the plight of the people on Main Street. No doubt the banking system is a critical feature of the modern economy and must somehow be sustained. The government might have opted to take over the big banks or capped their growth, but such was hardly feasible in the existing political climate.

This climate took root in the l970s and l980s when a number of forces converged to grow the financial sector. After Reagan's election in l980 market ideology including deregulation came to the fore. Financial markets expanded at a major pace with investment banking encroaching on commercial banking, and vice versa. Technological revolutions including the development of the Internet and enhancements in transportation greatly facilitated this growth.

We also give attention to financial arrangements outside of banking: hedge funds, corporate tax havens, offshore banking. The latter two make it possible for corporations to escape regulation and taxation, allowing the managerial elite to make even more money. These patterns have been underwritten by the U.S. Supreme Court's decision Citizens United. Now the managerial/financial elite can more or less make unlimited contributions to political candidates who will protect and advance their economic and social power.

Complete Loss of Individuality – Phenomenological Reflections on Mass Action

Even though it is not any more in the center of current social theoretical discussions, the concept of "mass" possesses the potential to describe a specific expression of collectivity formation and collective action, highly relevant for the description of modernity. Mass action as linked to the "dark side" of modern society is often related to irrational behavior of the crowd, which cannot be controlled. The paper presents phenomenological reflections on mass action, arguing the concept of "mass" must be understood parting from the dialectical relationship of individual and collectivity. In comparison to the concept of mass, individuality can be considered as counter concept, since mass describes a form of collectivity, which includes the least involvement of the subjectivity of the individual actor.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The particular mass we-relationship fugaciously and temporarily gets established, e.g. when a crowd of soccer fans climbs the fences to the area of the supporters of the opposing team to use violence against them. This kind of mass action takes place when the moral individual who can promise, feel guilty or regret *gets suspended* in mass collectivity. Collective mass action may appear independently of the possibility for the individual to interfere, leading to its potential dangerous, irrational and chaotic progression. When the individual still has the possibility to reflect on his or her collective crowd action, we cannot speak of "mass." Only when individuality gets completely suspended, mass action will appear.

Cultural Distances and Immigrants' Labour Market Integration

This paper investigates the role of the social and cultural background of immigrants for their successful labour market integration in the host society. Cultural patterns such as religion and language are important factors in explaining discriminatory behaviour against social groups. While religion shapes many aspects of culture, e.g. values or collective rituals, language relates to learning the host country's language and is particularly relevant when applying for jobs. Both aspects of culture are very visible in social interactions and often used in the formation of prejudices. Thus, the host society may perceive immigrants, who "carry" the culture of the sending country with them, as more or less deviating cultural outsiders. Resulting disadvantages during the job search process are documented, for example, for immigrants who have a family name very different from host society's language patterns.

This study focusses on cultural distances between immigrants' religion and language and those of the host country. Referring to balance theory it is hypothesized that a greater cultural distance increases negative attitudes towards immigrants and impedes their labour market integration. We ask: To what extent can differences in the labour market integration of immigrants be attributed to their cultural distances? To answer this question we analyse data from the Children of Immigrants Longitudinal Survey in Four European Countries (Germany, the Netherlands, Sweden, and the United Kingdom). Using structural equation modelling we estimate the effects of language and religion distance as well as important socio-demographic variables such as education and religiousness on employment and compare differences between the four countries. We expect that people with a greater cultural distance are less likely to be employed than people with a smaller distance. The results will help to better understand the causes of immigrants' employment disadvantages and particularly shed light on the interplay between cultural and social factors.

DRIESSENS, OLIVIER* (University of Cambridge, od252@cam.ac.uk)

Digital Media and the Reshaping of Power Structures, Public/ Private Boundaries and Intimacy in Celebrity Culture

This paper examines the impact of digital media on celebrity culture. The combined use of mobile technologies and the internet with social media such as Instagram and Twitter enables not simply the increased exposure of celebrities' everyday (private) lives and practices, but has more far-reaching consequences. Three consequences will be highlighted in this paper.

The first point is the question of power and control. We can note some ambiguity here: on the one hand, it could be said that the celebrity gains more (relative) control over self-promotion and –representation, but on the other hand the increased visibility also leads to a further commodification of the celebrity, his/her body and representation. Moreover, celebrities clearly offer added free labour in the benefit of the industries in which they are still embedded.

Second, the intense use of digital media by a large group of celebrities to promote and present themselves leads to a redefinition of the very categories public and private. The traditional distinction between the celebrity's public, constructed private and 'real' private personas is under increased pressure which leads to the collapse of the constructed private persona into the public persona. Through the continuous exposure of one's constructed private persona, or those aspects of private life that are made visible to the audiences in a self-controlled way, these representations become deeply associated with the public persona and even encoded into it.

Finally, digital media affect the nature and degree of intimacy between celebrity and audiences. Yet this is also rather ambiguous since on the one hand there are indeed more possibilities for social rather than mere parasocial interaction, but on the other hand this change might be not much more than an illusion of intimacy since we are witnessing indeed a mere expansion of the public persona.

DROVE, TAMARA* (UN Women, United Nations., tamara.drove@gmail.com)

Reclaiming Safe Access to Public Space: Youth Resistance to Street Harassment in Chile.

In Chile, 9 out of 10 women experience street sexual harassment, 85% of them young women. Article 373 of the Criminal Code, enacted in 1874, is the only existing legislation that addresses this matter in Chile, aiming to "punishing offenses injurious to public morality and decency". But under what parameters is morality offended in a public space? Far from classifying street sexual harassment as a criminal offense, this law has been arbitrarily employed, for example, to sanction women's clothing considered to be "provocative". This illustrates the hierarchic interaction between gender and space, which articulates forms of spatial exclusion of women's bodies from male-centric public domains through violence, perpetrated in the form of street harassment.

In response, and in an attempt to denaturalize patriarchal conventionalities of space and gender, a group of young Chilean sociologists created the "Observatory against Street Harassment" (Observatorio Contra el Acoso Callejero) in 2013. Among its activities, it drew up and presented the project: "Street Respect Law" to the Chilean Congress in 2015, in order to engage the Government in reflecting on public safety policies and to criminalize and punish street sexual harassment as a form of violence. Due to its success in Chile, youth-led movements have created their own Observatories in Uruguay, Nicaragua, Colombia and Bolivia, contributing to youth advocacy on gender equality in Latin America.

Hence, this paper employs Critical Discourse Analysis (CDA) as a theoretical-methodological tool for shedding light on street harassment in Chile, as a means of control based on restrictive discursive construction of gendered public spaces. This document also seeks to underscore how the possibilities of youth empowerment and resistance to unequal power relationships can influence policy and contribute to the process of reclaiming safe access to public spaces, ultimately achieving a real impact for gender equality.

Cleaning up: The Growth of Outsourced Domestic Housecleaning Services in Johannesburg, South Africa

This paper considers the reasons beyond people's use of outsourced domestic housecleaning services from a sociological perspective in a South African context. Outsourced domestic housecleaning services provoke a revolution in domestic work as it transforms the personal, often exploitative employment relationship between domestic worker and employer into an impersonal triangular employment relationship between manager, domestic worker and client (former employer). However, it is unclear as to why people prefer using these domestic housecleaning services in South Africa. Some international studies have shown that a reduction in employment costs, an increase of flexibility by allowing more leisure time for clients, the growing number of middle-age and "empty-nest" households, an increase in dual income households, the growth of disposable personal incomes of households and an aging population, influence the use of housecleaning services. However, South Africa has different dynamics and the nature of domestic work differs by race, class and gender. It is unclear, whether it is mainly the White middle-class population who are using these domestic housecleaning services, or is the rising Black African middle-class using it too? Are only married couples using these services or do single men and women acquiring these services too? This research paper aims to address this gap by analysing interviews and survey questionnaires of clients of three major outsourced domestic housecleaning services in Johannesburg, South Africa.

Children of Romanian Transnational Families Confronting „Difference"

Moving within the field of transnational families, in this paper we primarily focus on the way in which transnational families manage the inconveniences they confront through being „different" from the classical family: both on the family or micro level – which means being born or becoming the member of a transnational family; as well as on the extra-family or mezzo and macro level – how they are perceived by their social milieu, comprising anything from the community they live in to the nation-state.

„Difference" within TFs in the Romanian context can be perceived in multiple senses, but in our study we wish to approach it with a priority on the specific situations that children from TFs face: children gliding between two or more countries;

　　*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

children with double citizenship; children in transnationally mixed families – and the practices employed by families in these cases.

The paper will include the following aspects:

1. Children born and raised partly in Romania confront integration problems within the education systems abroad; in turn, if they come back home, they encounter adaptation difficulties within to the Romanian educational system too;

2. Many children are born outside the country and already have a double citizenship and hence are to be considered special family members for whom alternative life projects can be drawn.

3. The case of children born and raised in bi-national or ethnically mixed couples constituted through marriage with a „foreigner" (either in the target country or with an immigrant in Romania) raise new challenges in parenting style and educational choices.

The research will be based on the qualitative analysis of data obtained through (both live and online) audio and video interviews with transnational family members and key persons from 4 communities (in Romania and abroad).

RC11-133.11

Online Caregiving in Romanian Transnational Families

Identifying transnational family practices is among the most frequent aims of most transnational family studies carried out until the present. The transfer of care among transnational family members is another issue often addressed by research in this field: either the transfer of care of the elderly among adult migrants; of children at home among adult migrants; of migrant children by grandparents at home or of sick family members either at home or abroad.

This paper aims at the specific goal of analyzing the way in which online technology provided through the Internet (Facebook, Skype, Yahoo Messenger etc.) is used by TFs to provide support for family members in need. From the way in which grandparents' survey online children abroad until parents get back from work, to the way in which the adult child watches online her sick parent while the direct caregiver is away, this research proves how online technology changes from a simple means of communication to an active tool of care in the practices of transnational families.

We also use this research as an occasion for the analysis and perfecting of Skype/Facebook or other forms of online video communication as a medium of gathering dates; we obtained a number of 20 online interviews with transnational family members, some at home, and some abroad.

The use of this method of data collection in the study of TFs seems more than adequate, since in the life of TFs online communication is extremely frequent. Data are analyzed both thematically and narratively with an emphasis on the surplus of information that video recording brings over audio

DUDEL, CHRISTIAN* (Max Plack Institute for Demographic Research, dudel@demogr.mpg.de)

Recent Trends in US Working Life Expectancy By Sex, Education, and Race and the Impact of the Great Recession

We use data from the US Health and Retirement Study to analyze differences in working life expectancy by sex, race, and education. Moreover, we report findings on the impact of the Great Recession on working life expectancy and on trends in the timing of retirement. Analyses are based on period working life tables. We find strong differentials along all three studied dimensions. Working life expectancy is highest among white males and males with a college degree, while it is lowest for Hispanic females and females with no degree. The impact of the Great Recession generally was strong, although results show some heterogeneity. It had a strong negative effect on working life expectancy of males with college education, whereas working life expectancy of female Hispanics increased. The recession had no impact on the gap between first and final retirement, which shows an upward trend for all groups.

DUDINA, VICTORIA* (St. Petersburg State University, viktoria_dudina@mail.ru)

Subjective Inequality, Social Cohesion and Political Reforms: An Example of Russia

The sharp increase in mortality of the population of Russia in the 1990s, called "mortality crisis", attracted attention of researchers and led to a whole range of explanations. In spite of different explanations of mortality crisis, substantial and short-term increase in life expectancy in 1985 - 1987 years in the Soviet Union by 2.8 years for men and 1.3 years for women is explained solely by the positive impact of anti-alcohol campaign. Such explanations cannot reveal the other important factors contributed to mortality reduction during this period. The reduction

of mortality was influenced not only by anti-alcohol campaign, but by short-term reduction of subjective inequality and recovery of social cohesion in the beginning of Perestroika.

The hypothesis of influence of subjective inequality on life expectancy in the early years of Perestroika is supported by the fact that life expectancy changed simultaneously not only with the level of alcohol consumption, but also with the changes in public attitudes. Three stages of Perestroika corresponding to well-marked differences in some demographics are considered.

It is concluded that changes of the political climate could help to reduce subjective inequality and have a positive impact on social well-being, the level of social stress and, ultimately, on the health and life expectancy. But if the reduction of subjective inequality is not supported by decrease in objective measures of inequality, it could have only a short-term impact on health.

DUDINA, VICTORIA* (St. Petersburg State University, viktoria_dudina@mail.ru)

Transformations of Sociological Methodology in the Context of Digital Data

Development of new information technologies and digital tools requires reconsideration of basic aspects of social methodology and epistemology. Digital tools influence social life, transform social reality, and generate social events. Digital world could be considered as a model of social reality what makes it possible to use digital data as a substitute for traditional social data. The distinguishing feature of digital data is their naturalness and spontaneity, what does not require creating artificial experimental situation. The other feature is a lack of standardization, which always more or less accompanies collection of social data.

Principal developments in sociological methodology and epistemology are identified. The significance of social theory is questioned by the development of big data: when researchers have excessive amount of data, functions of theory shift from structuring data collection to identifying patterns in available data. Possibility to collect data representing not only opinions and meanings, but transactions, networks, flows of people, images and objects stimulates heterogeneity turn in social methodology. Development of digital tools and methods of data analysis transforms explanations of social behavior and gives sociologists possibilities to focus not only on static characteristics but on dynamics. Transition from "social as society" towards "social as mobility" implicates transition from theory of systems and structures to more dynamic social theory of networks and flows. Post-demographic reconsideration of sampling and representativeness in social research is connected with the lack of demographical information in social media which could be replaced by such characteristics as tastes, preferences, choices connected with the users' profiles. Representativeness implies representation not demographics but behavioral patterns. Item-to-item explanations of social behavior could be predominant form of explanation, when behavior is explained not by static demographic characteristics or by institutional context but by previous actions and choices.

Factorial Surveys in Social Psychology: Comparing (Dis-)Trust in Outgroups in Germany and Spain

The objective of the paper is to deepen the understanding of what determines social trust and distrust in outgroups using an experimental design in two european cities, Bilbao (Spain) and Cologne (Germany). The concept of social trust is very relevant for social ciences and is very important connector with the concept of democracy and "good governanace", as it's the "glue of social life". The rapidness, with which the changes are produced in the composition of our population, in the migratory activity, religious and interethnic diversity etc. immediately generate growing heterogeneity in our environment regarding the variety of groups that compose nowadays our society. This plurality of origins, religions and cultures that increasingly form part of our society has consequences for the nature and implications of social trust, and more specifically, for the social distrust.

Our main objectives are:

1. To measure social trust and distrust, focusing in characteristics of those people who tend to trust and distrust others.

2. To analyze and depict the characteristics of those individuals and groups who are subject of trust and distrust in our society.

3. To compare the levels of trust and the effect of the different correlates in two different cities which present clear differences in terms of exposure to outgroups and lenght of the contact with outgroups in recent history. In order to measure this a factorial survey was carried out. The method is ideal to measure and decompose the effects of specific characteristics of those who trust and those to be trusted.

Discriminatory Expressions, the Young and Social Networks: The Effect of Gender

In the framework of the «Project I: CUD» (Internet: Creatively Unveiling Discrimination), carried out in the United Kingdom, Italy, Belgium, Romania and Spain, we have studied the expressions of discrimination used by young people when surfing social network sites (SNS). We designed a methodological strategy for detecting discriminatory content in 493 Facebook profiles and we collected 363 examples for further analysis. Our goal was to compile information about types of discriminatory content and how they work online, and to create tools and strategies so that trainers, teachers and families can fight against discrimination on the Net. As a result, we detected different patterns between young men and women, which reveal that they behave differently on Internet and express discrimination in different ways on SNS. Men tend to be more direct: they post and share messages that are clearly more discriminatory and which focus on ethnic groups and cultural minorities. Women, on the other hand, tend to be indirect: they are less obviously discriminatory (reactive) and focus on sociocultural status and physical appearance.

DUMITRICA, DELIA* (Erasmus University, dumitrica@eshcc.eur.nl)

Facebook's Global Imaginary: The Symbolic Production of the World through Social Media

This paper discusses the symbolic production of the 'global' through Facebook. Methodologically, the paper rests upon autoethnography and platform analysis. The critical examination of my own experience of Facebook (the autoethnographic dimension) seeks to "connect the autobiographical and personal to the cultural, social and political" (Ellis, 2004, p. xix). This examination is supplemented by a reading of the platform's visual interface in terms of the categories, options and services offered through Facebook (e.g. Gillespie, 2010). Both methods are driven by the larger goal of understanding how the notion of the 'global world' comes to be produced through our use of the platform.

The analysis is structred along three lines: the intersection between the user's socioeconomic position and her Facebook customization choices and use practices; the role of the Facebook NewsFeed algorithm; and the wider discourses through which Facebook as a company has positioned itself as a global medium. The global imaginary produced through Facebook appears to us a celebration of our technologically-enabled individual cosmopolitanism. Yet, this imaginary masks the centrality of socioeconomic class and of commercial interests in structuring choices and creating not a cosmopolitan self, but rather a cosmopolitan privilege. The production of the global imaginary through Facebook valorizes personal choice as the condition for the development of a cosmopolitan subject position, while simultaneously veiling the structural constraints shaping these choices in the first place.

Alegria for a Future Life - Photointerviews with the Women of Huizachera, Mexico

The paper presents photos and narratives illustrating future life by women of the initiative "W*omen of Huizachera*", (Community Salto, Province Jalisco), supported by IMDEC Guadalajara (Instituto Mexicano para el Desarrollo Comunitario). This CSO supports women in developing their own „*Jardin de la Esperanza comunitario*", a cooperative garden for alternative agriculture. They acquired a "terrain" where they will build ecotechnologies and plan for a future school of Huizachera.

Based on a qualitative photo interview approach, we created future scenarios. Photo interviews generate photos and narrations about the present and future. They proved to be an empirical basis for an active future concept, where par-

ticipants unfold a trail toward a full good life, thereby realizing their potential. Whereas many studies are problem-oriented, photo interviews encourage a forward-looking approach and open spaces of possibilities.

The interviews show that the women see themselves not as victims, but as empowered actors. They have a high awareness of existing problems, including ecological, gender and societal issues. We identified a cultural and philosophical realm of a fulfilling life. Future is seen in a highly complex way; it includes material elements, like specific vegetables, up to broader concepts of social change and happiness.

This paper is a result of the EU-funded nopoor project, an innovative research effort consisting of over 100 topics in 21 countries. The goal of nopoor is research for change, based on the identification of forces that perpetuate poverty, taking into consideration the varying dynamics existing in each country, The research is ground-breaking in its intent to produce tangible outcomes, such as policy recommendations and capacity-building for poverty alleviation. The presentation will include visual material to present the many aspects of future visions.

Mapping Care in the Era of Post Welfarism: An Interrogation of the Contemporary 'Market' for Care Work in India

Care work, often defined by scholars as work that involves social reproduction has been the focus of much academic research in recent years. Healthcare, child care, care for the elderly and scores of other work that directly or indirectly contribute towards the development of human capital have led to the emergence of considerable scholarship in the social sciences. Some have focussed on gender, others on the welfare state, yet others on labour. Academic debates on care have impact, whether mediated or directly onto policy formulation. The labour market for care workers globally is dominated by women. The prevalence of women in paid care work is shaped by both historical and cultural factors. In more recent times, with new economic measures, care services have been particularly susceptible to market pressures such as low wages and poor social protection. One of the primary objectives of this paper is to map out the different trajectories in the conceptualisation of care as work. It shall attempt to historically situate the debates with a special focus on the current trend towards a retreat of the welfare state and the growing significance of the private sector. This entails analysing the different models of welfare states and adoption of different notions of care by them with a special emphasis on India. The following paper shall attempt to make a historical study of the genesis of welfare/caring state in India and its implications on gender equality. The study would critically assess the role of the Indian state in 1) guaranteeing institutional care to its citizens 2) regulating women's role as care providers. Further, the paper would discuss the conditions that characterise the contemporary market for care work in India and its linkages to the global relations of care giving.

DUNMORE, STUART* (University of Edinburgh, s.dunmore@ed.ac.uk)

Linguistic Ideologies and Cultural Identities in Gaelic Scotland: Scots, Gaels, and New Speakers

Researchers in the sociology of language have theorised that language ideologies can have an important influence on the ways in which bilingual speakers in minority language settings identify and engage with the linguistic varieties that are available to them (Fishman 1991, 2001; Boudreau & Dubois 2007; Makihara 2010; Cavanaugh 2013). My recent PhD research examined language use and ideologies among a purposive sample of adults who started in Gaelic-medium education (GME) during the first decade of its availability in Scotland, between 1985 and 1995. Semi-structured interviews were conducted with 46 informants located throughout Scotland as well as further afield, whether in England or overseas. Four of these 46 informants may be described as 'new speakers' of Gaelic, having been raised without Gaelic at home and acquiring the language in school, and who actively make frequent use of it in the present day. Additionally, my postdoctoral research has examined linguistic practices and social profiles among the wider community of new Gaelic speakers in Scotland. I draw attention in this paper to some of the language ideologies that these and other informants convey when describing their current engagements with Gaelic, in order to shed light on the cultural identities that Gaelic speakers profess in modern Scotland. I argue that whilst the language clearly plays an important role in the daily professional lives of new speakers, the language ideologies that they express seem to militate both against their greater use of the language socially, or an ethnolinguistic association with the Gaelic community. In particular, I will draw attention to new speakers' negative perceptions of the traditionally defined Gaelic community and lack of identification as 'Gaels' - overtly indexed by some speakers as a category of social 'otherness' - in their expression of language ideologies.

Fracturing the Nation: Muslim Youth Accounts of Belonging in Nigeria, Pakistan, and Senegal

Drawing on recent empirical data, this paper explores how youth construct their identities in three contrasting post-colonial, predominantly Muslim nation-states. Our focus on Nigeria, Pakistan and Senegal recognises their different colonial histories, their struggles for independence and their contemporary geopolitical positioning. In a global context of heightened concern about youth, the youth bulge and religion, we analyse the heterogeneous ways that national and local cultures, societies and their education systems represent and produce forms of local and global citizenship. We focus on how youth appropriate multiple discourses of nation, religion, gender and ethnicity as significant axes of differentiation recruited in the construction of their own identities and those of 'others'. This analysis is informed by post-colonial, post-structural and feminist theorisations that recognise the discursive construction of identities and the constitutive force of difference in these productions.

The research processes involved female and male focus groups conducted with Muslim youth in higher education in each country case, with the support of local youth researchers. The focus groups aimed to provoke discussion of youth's affiliations with respect to nation, religion, gender and ethnicity. In this paper we discuss how youth's discursive constructions of identity and national belonging in all three contexts were interwoven with religion in ways that were consistently gender inflected. The analysis further traces how these discourses of belonging constructed both socio-cultural allies and 'others' within and beyond regional and national boundaries in ways that worked to fracture rather than to produce a shared national imaginary.

Trucking in Tastes and Smells: Adelaide's Street Food and the Politics of Urban "Vibrancy"

This paper analyses the use of food trucks in spaces of an Australian city, as one of Adelaide City Council's strategies for creating "a more vibrant public realm" and for "bringing … streets and laneways to life". Such calls for the revitalisation of city streets bring to mind Edensor's comparison of the western (British) street – as over-regulated, soulless and sanitised of sounds, smells, tastes and visual spectacle – with the richly-textured sensory landscapes of the Asian (Indian) street. To unravel the politics of "vibrancy", linked with movement within and beyond built landscapes, this paper follows the food truck, la Chiva, a council-sponsored initiative of a group of young Colombian migrants, to a number of urban locations. Here, our project is to capture, particularly through the senses of taste and smell, the ghosts of transnational belonging. However, this is not simply a story of diaspora, or of brightening up the city (for whom?) with novel tastes and smells. Instead, Law's conceptualisation of sense-based imaginaries of cosmopolitan identity, and Low and Kalekin-Fishman's "sensorial interface" suggest other scripts. Meanings of mobility, multiculturalism and inter-ethnic encounter; meanings of health and sustainability; meanings of community-building and activism; meanings of fusion cuisine and cultures – these are all part of La Chiva's "mixed" sensescapes, together with lingering sense memories of "home". Unravelling such meanings will indicate the messy, yet potentially productive, politics at the intersection of nostalgia and cosmopolitanism, of commodification and entrepreneurialism, and, perhaps, provide a challenge to Tonkiss' claim that "the gentrification of contemporary cities" tends to "aestheticize rather than represent urban 'diversity '". The question remains: to what extent do transnational identities and spaces inscribe performances of "vibrancy" for others, or are these identities sensorily "grounded" in meanings of hospitality, reciprocity, community-building and remembering?

"Home" for Now or "Home" for Life: Migration Memories of Kosovar Albanian Migrants in West European Countries

Through a biographical approach this article explores the live experiences of Kosovar Albanian migrants in West European countries. Germany and Switzerland have been the main destinations for Kosovar Albanian migrants, starting from the early 196 and representing one of the first migration flows toward West

Europe. Initially they enter destination countries as guest workers via bilateral agreements between origin and destination countries with expectations of temporary stay and return. However, this group of migrants did stay permanently despite their primary intention to return once the employment contract came to an end or after improvement of the situation in their home country. This group of migrants served as the basis for constructing the Kosovar diaspora building social networks and triggering chain migration for three other following migration flows; the asylum-seekers of second flow during 1980s and 1990s, the asylum-seekers and refugees of third flow during war years and since 2000, and the actual flows since 2013 but also flows of economic migrants and family reunification.

The migrant's biographies tell us that their integration process has been challenging. They recognise as reasons, the low paid jobs, and difficulties to upward mobility, difficulties to learn the host country language, lowliness and many more. Despite the struggels and difficulties many of them did decide to stay and bring their families along managing to be an active part of the host country societies. Based on migrant's memories this paper builds the paths and explores the strategies of inclusion and integration in the host societies. We also found that they have preserved a strong national identity, developed robust home country ties and networks via social and financial remittances reflecting their dilemmas of where their real "home" is and where they really feel at home.

DUSI, DAVIDE* (Ghent University, davide.dusi@ugent.be)

Social Innovation Driven By Digital Innovation: Conditions of Citizens' Participation in Technology-Driven Innovation Processes

Recent technological advancements fostered the change of users' role from passive to active participants in the development of Information and Communication Technologies (ICTs). This shift harbors promises for social progress through technological development and power reconfiguration through participation. Nevertheless, the interpretation of emerging socio-technical arrangements as capable of generating social innovation raised contrasting opinions. Some scholars celebrate people's involvement in ICTs development for social purposes, whereas others emphasize the downsides of their participation.

Adverting to this scenario, and making use of ethnographic research methods, I am analyzing the development of a project called We for Work Flanders. It is a trajectory where citizens gathered to create digital solutions to face social issues supported by social and digital experts, entrepreneurs and creatives. Participants were asked to engage in idea-generation activities, to transform the generated ideas into digital prototypes, and finally to develop the prototypes into functioning digital tools. The goal of this contribution is twofold: to describe the socio-technical arrangements characterizing processes of bottom-up ICTs development for social innovation; and to clarify the role of citizens in these practices.

Preliminary findings show inconsistency between the way in which the project was launched, as a socio-technical process, and how it eventually evolved, as a mainly technical activity. The asymmetric power relationship between the organization responsible for the initiative and its partners and funders crucially affected the outcome of the project, the role assigned to participants as well as the way in which their participation was rewarded and acknowledged. Thus far, the criticism emerged from this project invite us to question the conditions of citizens' involvement in processes of digital innovation to foster social innovation. Finally, greater attention to the design of these initiatives to favor the alignment of the involved heterogeneous actors and its maintenance throughout the process seems desirable.

A Simple Algorithm to Predict Post Traumatic Stress (PTS) Symptom Prevalence and Local Distribution

Managing the psychological impacts in the aftermath of a disaster is a critical public health task. One of the biggest challenges faced by researchers and practitioners is identifying as precisely as possible the at-risk population. Post-traumatic stress (PTS) disorder should be one of the main targets of post disaster emergency mental health interventions.

The Post-Terremoto survey (EPT for its Spanish acronym) contains unusual longitudinal data about the same persons before and after a major disaster. It comprehends nationally representative data of a household survey that was gathered a few months before the 2010 Chilean earthquake and tsunami streaked. This was complemented by post-disaster follow up information, from a representative subsample of the original households. In the follow up, persons were requested to respond the Davidson's trauma battery to evaluate PTS symptoms, leading to 25600 valid PTS scores available for the analyses. We complemented EPT data with information about the strength of the earthquake and the tsunami, the history of replicas, and the death rate.

 The objective of the project is to derive an algorithm to predict PTS symptom prevalence and its local distribution, using the database described above. Several

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

model specifications for the mean and centiles of the distribution of PTS symptoms (at the municipal level), together with PTS disorder prevalence are estimated via linear and quantile regressions. Models vary in the set of covariates included.

Preliminary results show that it is possible to devise simple algorithms to predict PTS prevalence and distribution, even in a setting where data is scarce. Such settings are highly probable at the immediate aftermath of a large-scale disaster. This rough but quick estimate could be of use for emergency managers that must decide where to assign the scarce mental health personnel that is available at the aftermath of a major natural disaster.

Post Traumatic Stress Disorder and Social Context

Post traumatic stress (PTS) symptoms may arise when a person is subject to trauma. One of the multiple sources of trauma is the experience of a major natural disaster. We study the development of PTS sympthomathology after the earthquake and tsunami that struck Chile in 2010. Our goal is to understand how pre-disaster social context variables are associated to symptom prevalence after the disaster has striken, when disaster intensity and the extent of destruction have been taken into account. We also study how the different response and coping mechanisms (individualistic versus communitary) are associated to PTS symphomatology.

For this purpose, we use several data sources. The Post-Terremoto survey was gathered as a followup of the nationally representative household survey that was collected a few months before the 2010 Chilean earthquake and tsunami streaked. Therefore, we have several pre-disaster contextual information such as poverty, income, ocupational status, health, family size and organization, among others. In the follow up persons were requested to respond the Davidson's trauma battery to evaluate PTS symptoms, leading to 25600 valid PTS scores. Information about degree of household and other community goods destruction was also gathered, together with information about coping strategies (whether the affected individuals relied on recently organized neighborhood networks or acted individually/relying on close family networks). We complemented this data with information from other sources, such as the strength of the earthquake and the tsunami, the history of replicas, and the death rate (at the municipal level). We also added other social context variables such as local criminality and domestic violence.

Several models were estimated with PTS symphomatology as the dependent variable. Individual level and hierarchical regression models were complemented with further studies of the mean and centile distribution symptoms at the municipal level, through linear and quantile regression methods.

Non-Promotional School Mobility of Immigrant and Refugee Language Minority Children in Texas: Unintended Consequences of the Educational Accountability System

Language minority children in U.S. public schools are overwhelmingly low-income immigrants and refugees or children of immigrants or refugees. U.S. federal and state policies specify that such children, referred to as English Language Learners (ELLs), are eligible to receive instruction in their home language or in English, generally based upon their level of English fluency. The U.S. Supreme Court has ruled that free public education is to be made available to all children, regardless of their legal status in the United States.

School mobility is common among Immigrant/refugee families, moving frequently to seek employment, avoid deportation, or attempt to secure cheaper housing. Consequently, language minority children are likely to experience substantial non-promotional mobility (moving from school to school for reasons other than promotion to higher grades), which is often associated with diminished academic achievement (Dworkin & Lorence, 2007). Under the aegis of the No Child Left Behind Act of 2002 and Race to the Top Act of 2009, parents are offered school choice if the school their children attends is low-performing and fails to meet test passing standards two years in a row. However, only high-achieving schools can off-set the cost of non-promotional mobility. Such schools are often white schools where the immigrant/refugee children become tokens (< 10%) and their test scores are not subject to disaggregated accountability results. The children may be ignored by their teachers, thereby negating the advantages of mobility to a higher-achieving school.

Using student-level data on three cohorts of Texas students (n = 210,000) we examine the academic cost to immigrant and refugee children of moving from a failing to a passing school if they become tokens whose test scores are not disaggregated for school accountability. The academic cost of non-promotional

mobility is higher for immigrant/refugee children than for native-born children from low-income families.

Conditional Benefits and Barriers: Migrants' Experiences of Sanction and Support within the UK

International evidence exists to suggest that migrants face particular issues and barriers in relation to their interactions with social security benefit systems and work activation programs. This paper initially highlights the common barriers faced by many migrants in the UK when accessing out of work benefits and meeting job search requirements. For example, misunderstandings due to a lack of available interpretation and translation services and/or discriminatory practices from Work Programme and Jobcentre plus advisers. The paper then considers the extent to which the support available to migrants mitigates such barriers when accessing benefit rights and meeting the behavioural conditionality associated with unemployment benefits. Finally the paper explores how issues of social-legal status may interact with these concerns to differentially disadvantage individual migrants' opportunities to access support and / or enter the paid labour market. The paper draws directly on an analysis of new data generated in two waves of qualitative longitudinal interviews with 47 migrants (i.e. 30 European Economic Area migrants and 17 Third Country Nationals with various humanitarian protection statuses) in six cities in Scotland and England. These migrant respondents are one cohort within a larger, repeat qualitative longitudinal panel study being conducted as part of a the five year ESRC funded 'Welfare Conditionality: Sanctions Support and Behaviour Change' project (see www.welfarecondtionality.ac.uk)

Confidence, Social Linkages, Power, Inequalities and Fear in a World in Rapid Transformation – a Brazil-China Dialogue

The historical forces surrounding economic development in both China and Brazil are placed in context especially with reference to the theorizations of Sun Liping. We conducted a large survey of university students in both countries, the data revealed that the family is the most trusted institution in both countries. However, the literature teaches us that in spite of apparent similarities (DaMata) the family fulfills quite different roles in the West and in China (Fei Xiaotong). The operation of the political system is surrounded by a certain degree of skepticism in both countries, yet far higher levels of political participation are found in China than in Brazil, and far less confidence in political institutions exists in Brazil than in China. While definitions of corruption are difficult to apply in a cross-cultural context, there seems to be agreement that overly-close relations between the State and certain sectors of the market produce particular types of elites and high inequalities (Lazzarini, McGregor, Yasheng Huang). Our survey data shows that inequalities are condemned more severely by Chinese than by Brazilian students, and that corruption is seen as a greater problem among Brazilian students. Some political science literature suggests that youth has an important role to play in relation to political stability, and evidence drawn from these two countries suggests that educated youth, when faced with adversity, may not remain quiet for long. Since the beginning of the 1990s the rise of a post-industrial society has been associated with the rapid expansion of the higher education systems in both countries. While expansion of opportunities has accompanied strong economic growth in these two countries over recent years – our data showed unexpected commonly-held fears of the future among Chinese and Brazilians. Consequences for theory in the sociology of youth are then drawn.

Perspectives from South America, Reflecting on Key Messages from Chinese and Brazilian Undergraduate Students

This paper brings South American perspectives to bear on reflecting on developments in global youth studies, key ideas and thinkers, and the futures we want. It draws on analyis from a recent survey that was conducted in 2012 among over 4000 Chinese and Brazilian undergraduate students. The family is the most trusted institution in both societies. Students obtain their views of their country and the world by referring to both old and new media, which are sources they only trust moderately, and news is reinterpreted during discussions with friends and family. This is compatible with the theory of the receiver in communication

studies. Overall, students had generally neutral views of the other country when asked about its contribution to: environment, world peace and cooperation between peoples. Such a result is good news for those who wish to avoid a civilizational conflict (Huntington) between the two countries. Student exchange is a visible facet of cultural globalisation, the Brazilian government envisaged sending thousands of students to China, this has not taken place. The survey showed that neither Chinese nor Brazilian students were interested in studying in the other's country, nor in other large developing countries such as Russia, India and South Africa (BRICS). We seek to explain this and to drqw implications for the future, and for a reflection on the significance of youth studies more generally.

Legal Education in the Russian Federation

In the past two decades, we observed an enormous increase of law students in the Russian Federation. Together with the radical change of country legislations, it creates an enormous pressure on Russian system of legal education. However only tiny part of graduates of law faculties starts their career as practicing lawyers, court clerks, prosecutors and other traditional legal professionals while many of the law school graduates start working for governmental and business organization, law enforcement agencies. Such situation poses a dilemma before university professorate: how to teach law, whether to focus on doctrinal and theoretical studies or on providing students with practical skills.

This research aims at explaining the role of legal education in formation of legal professional in modern Russia. How university teachers describe their role in building a legal professional. What techniques do they use to fulfill their goal. What is the general role of law faculty: a mere teaching of doctrines and codes or becoming a hub where practice meets theory.

The discussion will be based on the empirical data collected as a part of "Legal profession in Russia" project. The data includes a number of focus group with university lecturers and a survey of teachers of law.

Exploring Vietnamese Sensescapes of Home: Neolocality, Kinship, Cosmopolitanism

This paper explores the sensescapes of home experienced by second generation urban migrants in Ho Chi Minh City, Vietnam, a location which has been a magnet for migrants seeking opportunities for better education and employment for decades. While many migrants arrive and leave in seasonal flows, others settle permanently in the developing mega-urban region where they can attain higher education and pursue a profession that enables their upward social mobility. This first generation experience a transformation from a village way of life to a metropolitan mode of living as they establish a home in the city and learn new ways to live and experience the sensorium of home. The second generation, their children, are city born and raised so the metropolitan smells, tastes and touch-textures are the familiar sensory qualities of their neolocal home. However, as part of extended family networks, they also experience the alien smells, tastes and touch-textures of their parents' village-homes where their extended kin reside. This paper draws on anthropological fieldwork carried out in Vietnam since 2000 to explore the sensoria of homes experienced by three young sisters, aged under 8 years old. They are being raised in a small middle-class dwelling in a residential laneway in the city's congested northern suburbs to a father, a middle manager, originally from a central coast village, where daily life centres on the beach and the orchard, and a mother, an office administrator, originally from a central Mekong Delta village, where daily life revolves around rice farming and lay Buddhism. Through examples of the contrasting sensescapes of these three homes (neolocal, *nội*, and *ngòai*), the paper demonstrates the production and consumption of actual and imagined materialities of home shape a grounded cosmopolitanism that characterizes second generation urban migrant experience.

Laws, Regulations, and Standards: An Agenda for Researching the Mechanisms of Compliance

We begin from our different projects—one on health care for Deaf patients and one on environmental regulations and decision making in fossil fuel extraction. In each case, we see activists working to enforce and sustain accomplishments of their social movements—gains that have been textualized in laws, regulations, and standards. Such accomplishments represent significant progress but we suggest that the "technologies of compliance" associated with them may be designed in ways that do not work for constituencies in the ways that were intended. We see that "compliance" is sometimes operationalized in "ticking the box" procedures that may not change on-the-ground realities, or accomplished through reporting that transfers responsibility from the organization to constituents. Standards designed for businesses (such as those introduced by the ISO) produce compliance as a marketing tool. And in all cases, new laws, regulations, and standards seem to produce "industries of compliance," that is, new consulting professions whose interests and practices deserve further attention. We have begun to explore the practices of compliance with an eye toward their use by social activists and we hope to open this productive field of inquiry to further institutional ethnographic investigation.

Informal Workers Organizing and Negotiating: Lessons from Nine Case Studies Around the World

This paper summarizes commonalities observed in a five year study of successful organizing and negotiating campaigns to improve the conditions of informal workers in nine different occupations and countries. The cases include the two major types of informal workers – those who have been "distanced" from the primary employer though the various mechanisms of dismantling formal employment and those involved in traditional self-employed/own account work. In addition to the variation in type of work and national context, the campaigns also vary

in terms of whether they were initiated by traditional trade unions or by workers' self-organization either into unions or alternative types of organizations. Several cases included some combination of the two. The cases were conducted by various scholars and activists under a grant from the Solidarity Center and in collaboration with the Solidarity Center, Rutgers University and the WIEGO network.

Findings include the following common characteristics: Successful campaigns are based on the power of moral claims that resonate with international norms of justice; they require a lengthy time period to position themselves to take advantage of changes in the political opportunity structure;[1] they include forms of direct action; they exploit sources of leverage from workers' structural power in the labor process; they build solidarity between formal and informal workers through education. In addition, solidarity support from global labor organizations was important in most of these campaigns. In sum, these campaigns suggest a need to broaden the definition of collective bargaining as the principal "method of trade unionism"[2] to include new forms of workers' organizations and new forms of "collective negotiations."

How Do Occupational Characteristics Contribute to the Explanation of Occupational Sex Segregation? Results from a Dynamic Fixed-Effects Panel Analysis for the German Labour Market

This paper aims to investigate how occupational characteristics can contribute to the explanation of occupational sex segregation by using dynamic fixed-effects panel analysis. Occupational segregation is a distinct feature of the German labour market and has a wide impact on labour market outcomes. Although prior research has shown that occupational segregation leads to social inequality, there is still a research gap concerning the causes of this labour market feature.

This paper focuses on the influence of structural conditions represented by occupational characteristics, such as working conditions or qualification requirements, on the share of women in occupations. So far, only few studies exist which analyse the interplay between occupational characteristics and the share of women in occupations on the occupational level. These studies are, however, based on cross-sectional data and are, hence, limited in interpreting their effects as causal. Building on this, we aim to improve causal statements with the help of panel data analysis.

First, we build a dataset on the occupational level by aggregating individual data of the 1996 to 2010 waves of the German micro census. For this reason, we merge the information of all respondents that work in the same occupation. Relying on causal interpretations of parameters obtained by dynamic fixed effects panel models we then test whether occupational characteristics influence the share of women in occupations. Our key findings show that rising working-hours and fixed-term contracts lead to a decrease in the share of women in occupations. We trace this back to the influence of structural conditions on the probability of female occupational choices. Furthermore, higher mean incomes and the representation of academics in occupations reduce the respective percentage of women. These effects are in line with the assumption of men being preferred employees due to attributions of higher productivity and less labour turnover.

EBERT, NORBERT* (Macquarie University, norbert.ebert@mq.edu.au)

Global Financialization: Class and Precarity

The purpose of this paper is to look at the financialisation of capitalist economies not only as the main dynamic behind the emergence of a global financial class, but also as a simultaneously destabilising factor for social structures on a global scale resulting in precarity. Rather than matching the emergence of 'global financial class' with the formation of another class, namely the precariat, I argue that the consequences of a capital accumulation built on more volatile financial processes results in global structures of inequality and precarity defining what I call 'precarious work societies'. The globalisation of financial markets potentially intensifies the locally destabilising effects of the shift of capital accumulation towards the global financial sector. It is in particular the combination of globalisation and financialisation that might result in a 'global financial class' on the one hand, and locally quite different precarious social structures on the other, that do not automatically lead to the emergence of a precarious class. Global financial markets become less dependent on social and political conditions in particular places, while local employment conditions become more competitive and as a

consequence more precarious. Global financialisation intensifies local precarities and as two sides of the same coin find their expression in various tensions between, for example, increased job opportunities in global finance as job security in the real local economy declines; the erosion of localised mass solidarities and the emergence of a global financial class; more vulnerable and competitive local employment conditions and global employers who take advantage of this vulnerability. These tensions can be described as tension between economic differentiation and social integration. My goal is to develop the concept of a 'precarious work society' in order to capture those processes more specifically.

ECHEVERRIA CUBELLO, GABRIEL* (Università degli Studi di Trento, gabrielecheverria@gmail.com)

"Ni Es Lo Mismo, Ni Es Igual". Ecuadorian Irregular Migrants in Amsterdam and Madrid.

A great number of different theories have been proposed to explain the causes of irregular migration. Broadly speaking, two opposite arguments have been proposed. On the one hand, the idea of a "decadent state", which, overwhelmed by the forces of globalization, would not be able to control migration fluxes anymore. On the other hand, the idea of an "almighty state", which, in order to fulfil its own or other social interests, would "produce" or "favour" the existence of irregularity. While certainly illuminating of important aspects, all these theories appear to be affected by three important limitations: they offer mono-causal explanations; tend to overstate the role of the state; are unable to explain the emergence of irregular migration within very different contexts. These theoretical limitations can be linked to the general lack of comparative empirical research on irregular migration.

The proposed paper will present the results of one of the first attempts to comparatively study irregular migration within two different contexts. The study, combining multisited ethnography and case study methodologies, compared the trajectories and lived experiences of Ecuadorian irregular migrants in the cities of Amsterdam and Madrid. The aim was to discover which kind of "irregular migration realities" are conformed within different societies and how. Three aspects will be discussed: the legal trajectories of migrants and experience of controls; the labour trajectories; the access to crucial necessities such as housing and healthcare. On the basis of such analysis, which clearly shows the existence of very different irregular migration realities, it will be advanced a proposal for a systemic, differential understanding of irregular migration, which is able to put in relation such realities with the structural characteristics of each context.

RC51-576.3

ECHEVERRIA CUBELLO, GABRIEL* (Università degli Studi di Trento, gabrielecheverria@gmail.com)

Towards a Sistemic Theory of Irregular Migration

A great number of different theories have been proposed to explain the causes of irregular migration. Broadly speaking, two opposite arguments have been proposed. On the one hand, the idea of a "decadent state", which, overwhelmed by the forces of globalization, would not be able to control migration fluxes anymore. On the other hand, the idea of an "almighty state", which, in order to fulfil its own or other social interests, would "produce" or "favour" the existence of irregularity. While certainly illuminating of important aspects, all these theories appear to be affected by three important limitations: they offer mono-causal explanations; tend to overstate the role of the state (even when they diagnose its current or upcoming decline); are unable to explain the emergence of irregular migration within different contexts. All these theoretical limitations can be linked to an inadequate, largely influenced by the modern state semantics, conceptualization of modern society. The proposed paper will present the results a theoretical study, which, building on the critiques to the principal theoretical explanations of irregular migration, focused on the theoretical work of Niklas Luhmann in search for a more convincing theoretical framework. This approach helped to overcome most of the theoretical difficulties and paradoxes that have characterized the field of research. It allowed to go beyond a dichotomist understanding of the relation between agency/structure and to retrieve a social perspective where a statist one had been clearly dominant. Irregular migration emerged as a complex, differentiated, structural phenomenon of modern world society. Its development was related to the existing structural mismatch between the dominant form of social differentiation (functional) and the specific form of internal differentiation (segmentary) into territorial states of the political system.

ECKERT, JUDITH* (Institute of Sociology, University of Freiburg, judith.eckert@soziologie.uni-freiburg.de)

Social Constructionism in the Sociology of Risk and Uncertainty: From Theory to Methodology and Methods

As a lesson of her research on fear of crime, Wendy Hollway noted that the common assumption of the interview – "you ask, they answer and then you know" – should be overcome. While she argued on a psychoanalytic basis, social constructionist methodologies also refuse such a conception of the interview as unproblematically transparent. When social reality is continually under construction, interviews cannot be regarded as a neutral technology to collect data, but have to be considered as a particular form of social interaction in which the participants co-construct meaning. However, while social constructionism has found its way (more and less) into central theories of the sociology of risk and uncertainty, its implications and potentials for methodologies and methods are far from being exhausted.

Based on Kathryn Roulston's writing about different interview epistemologies, Karen Henwood et al.'s reflective risk research, Jan Kruse's integrative hermeneutical analysis and my own research on contemporary fear, this paper will demonstrate the consequences of such a social constructionist epistemology for the conceptualization and analysis of interviews as well as the usefulness of such an approach. It will be argued that methods for analyzing interviews should not only focus on what has been said as a product of the interview, but they should also include how the process of interactive meaning-making has evolved. As some examples from my own research illustrate, the usefulness of taking the interaction into account applies even for projects that are more interested in the "what", for instance when it comes to possible effects of researchers' risk framings and wordings on the results respectively on what interviewees think they should and may talk about (or not).

ECKHARD, JAN* (Heidelberg University, Jan.Eckhard@soziologie.uni-heidelberg.de)

Comparing Measurements of Social Isolation Using Population Surveys from Germany

The presentation will be based on findings from a research project on the causes of social isolation. The project is funded by the German Research Foundation (Deutsche Forschungsgemeinschaft, DFG) and hold by the University of Heidelberg (Germany).

The term of social isolation hereby refers to the absence of close relationships like – for instance – friends, partners, close relatives or befriended colleagues. Thus, social isolation is seen as a matter of strong and reliable ties that are likely to offer support and provide identity and affiliation. It is also understood as an objective ascription rather than a subjective state of mind. Furthermore, it is seen as an attribute of individual persons rather than one of collectives like families or classes.

Meeting the aims of the session "Measurement of Social Isolation", the presentation focuses on the differences between several indicators of social isolation with regard to the measured prevalence of social isolation and to the respectively observed correlation between social isolation and both physical and mental health. Therefore, it examines diverse indicators of social isolation that can be created by using information given in large population surveys from Germany, particularly the German Socio-economic Panel (GSOEP). The indicators for social isolation are based on information on social support, ego-centered networks, personal relationships, family ties, and leisure time. The measurements of health include self-assessed health, grip strength as well as international established measures on physical health and depression. The comparison of the various indicators shows pros and cons of different measurement of social isolation and identifies possible sources of over- and underestimations of both the prevalence of social isolation and the link between social isolation and health.

EDDINS, CRYSTAL* (Michigan State University, eddinscr@gmail.com)

African Diaspora Memory Communities: Rituals, Rebels, and the Haitian Revolution

This paper investigates the influence of Africa-inspired sacred rituals on late 18th century diasporic Africans' collective consciousness and struggles for liberation before the Haitian Revolution. In addition to being the modern era's most successful rebellion of enslaved people and most radical political event during the Age of Revolutions, the Haitian Revolution and its causes were, and largely remain, an enigma of historic proportions. By investigating understudied micro-level actions that occurred from 1750-1791 in the French colony Saint Domingue, I enhance scholarly understanding of the factors that explain the shared consciousness for liberation that led to Haitian Revolution. The African Diaspora process was initiated by the European trade of captive Africans, which resulted an enslaved population of nearly 500,000 in Saint Domingue. Diaspora and/or transnational populations can contribute to the decline of hegemonic regimes in host societies due to their experiences with oppression and ability to sustain political resistance cultures. Despite the collective trauma of the Middle Passage, Africans in diaspora did not lose their systems of understanding and ways of life that were largely, though not entirely, rooted in and shaped by social, cultural,

political, economic and religious forces in their African homelands. Therefore, this paper argues that Africa-inspired systems of understanding and cultural memory had a considerable influence on African Saint Dominguans' self-perceptions, views about their social conditions, and approaches to collective action and mobilization. Reporting on findings from archival and secondary sources, I hypothesize that, in addition to being sacred events, Africa-inspired ritual gatherings were simultaneously free spaces wherein rebels invoked cultural practices, campaigned for liberation, and sought new mobilization recruits. The most well-known case of a ritual leader operating as a campaigner for rebellion is "Zamba" Boukman Dutty, who, in August 1791, steered both the Bwa Kayman ceremony and the mass uprisings in northern Saint Domingue.

Navigating Motherhood and Social Relationships: A Comparison of Movers and Stayers in the U.S. and Mexico

International migration changes relationship dynamics both for those who move to a new country and for the loved ones who stay in migrant-sending communities. The implications of these shifting dynamics on family functioning depend on a person's place in the life course and their social location. This study compares the role of kinship ties and institutional contexts in shaping processes of family formation and growth using in-depth interviews with Mexican immigrant women in the U.S. (n=16) and non-migrant women in Guanajuato, Mexico with immigrant spouses (n=25). In particular, this study focuses on the degree to which kinship ties can serve as a source of support or stress during and after women's first and subsequent pregnancies. By examining the role of social relationships across women's childbearing trajectories, this research highlights the shifting role of transnational family dynamics that come with time and family growth. Specific attention is paid to the ways in which both transnational and local kinship ties serve as an informal safety net as well as a link to accessing formal health care and social services in the U.S. At the same time, this study draws attention to how shifting institutional contexts in both Mexico and the U.S. alter the role of social ties for women across their childbearing trajectories. Finally, this study illustrates the gendered dimensions through which undocumented status shapes social relationships and family processes both for the women who migrate and the non-migrant spouses of immigrants in Mexico. When taken together, the findings from this study contribute to our understanding of how gender, social context, and citizenship structure the social reproductive worlds of women impacted by international migration in diverse ways.

RC49-570.5

EDELBLUTE, HEATHER* (University of Texas at San Antonio, edelblut@gmail.com)

Social Relationships, Gender, and Mental Health: A Perspective from a Migrant-Sending Community in Mexico

Although the role of social integration on mental health is well established, the need to understand the complex ways through which social relationships may influence mental health remains. An extensive literature has demonstrated that the provision of social support represents a key function through which social relationships can promote well-being. However, this research has tended to focus solely on the positive role of social relationships on adverse mental health outcomes. This focus limits the spectrum through which social relationships may affect mental health, while also neglecting to consider how relationships are embedded in larger social contexts that structure these dynamics. In this study, I examine the ways in which the composition of social networks according to gender, kinship, and migration are connected to indicators of both positive well-being and depression. I use egocentric network data from the Social Networks and Health Information Survey (SNHIS) (n=343), a random household survey of mothers in a migratory sending community in Mexico, to examine these relationships. Findings from this study highlight the complex ways in which social ties are connected to mental health. Extended kin ties, for example, are positively linked to both positive well-being and depression. Other results highlight the robust influence of family migration and gender on mental health. This study emphasizes the need to focus on multiple facets of mental health and to consider the social context in which relationships operate in sociological studies of mental health.

EDER, ANJA* (University of Graz, anja.eder@uni-graz.at)

Title: Public Support for State Redistribution in Times of Increasing Inequalities Subtitle: A Cross-National Comparative Trend Analysis of Fifteen Countries

The distribution of incomes has become more unequal within many OECD-countries since the 1970s and 1980s and today reached "it's highest since

records began" (OECD 2015). Whereas in the 1980s the highest 10% of the population earned 7-times as much than the lowest 10%, it was nearly 10-times as much in the early 2000s. From this trend scholars conclude that inequality follows a *u-curve*, ending the historical phase of equalization.

To what extent do people in different countries and welfare states think that their governments are responsible to reduce these income differences? Is there any evidence that citizens throughout the 1990s and 2000s have legitimated the rising levels of inequality? In democratic societies public support plays an important role in political decisions and may directly and indirectly impact social structural changes. Since welfare states incorporate distributive norms and standards of social justice, countries were selected along the line of ideal-typical welfare-state regimes (WFS): Norway and Sweden as representatives of the social democratic WFS, West-Germany and Austria as conservative WFS, the United States, United Kingdom, New Zealand and Australia as liberal WFS. In addition Russia, Poland, Bulgaria, the Czech Republic, East Germany, Hungary, Slovakia, and Slovenia were included as contrasting post-state-socialist countries.

Using data from the ISSP, distinct cross-country variation, largely inconsistent with the classical regime-typologies, and rather constant attitudes towards state redistribution get obvious. There is no clear evidence that people normatively accommodate to growing income gaps. Regarding the still highest preference for state redistribution in the wealthier and less wealthy post-socialist countries it seems that indeed „the identities and interests of social actors are (...) created in a process where the institutional frame work within which people act, and the historical traditions through which events and processes are interpreted, have a decisive impact" (Svallfors 1997: 291).

Debates on Contemporary Anti-Semitism and Anti-Muslim Racism in a Post-Nazi and Post-Colonial Research Setting

In my presentation I illustrate theoretical omissions of academic debates on the current relation of anti-Semitism and anti-Muslim racism in the German-speaking context and show how they intermingle with conflicting political stances regarding the Middle East conflict.

Approaches focusing current anti-Semitism predominantly follow Adorno´s and Horkheimer´s analysis of the resentment as "negative leitmotif" of modernity, while perspectives on anti-Muslim racism mostly take a Saidian post-colonial stance. Thereby, academic debates reflect competitions of victimization: one side focuses the rise of anti-Semitism within European Muslim communities but dismisses anti-Muslim resentment; the other side emphasizes the rise of anti-Muslim racism and does not grasp the specify of anti-Semitism but rather frames Jewish communities as "white" and part of post-colonial European dominant societies. Both omissions culminate when the Middle East conflict and/or Israel turn into a "signifier" in the debates: while post-colonial perspectives frame Israel as oppressive settler colony and falsely explain current anti-Semitism by its mere existence, the other side frames the Israeli state solely as historical consequence of the Holocaust and dismisses anti-Muslim implications of a criticism of "new, islamized anti-Semitism".

Concluding, I thus propose to correlate the criticism of anti-Muslim racism and anti-Semitism. Theoretically, overlaps and differences of the resentments should be discussed and one starting point could be Hannah Arendt´s historical-analytical work on the interrelation of imperialism, colonial racism(s) and the rise of European anti-Semitism. Regarding academic-political debates, a reflection of the *discursive function* of the Middle East conflict as "projection surface" is needed. In line with these conclusions, I suggest to relate anti-Semitism theory to post-colonial perspectives and post-colonial analyses of anti-Muslim racism to the research of anti-Semitism in order to grasp the specify of the two resentments as well as pitfalls of the analysis.

Gently Prodding the Cultural Evolution of Attitudes on Female Genital Cutting

Female genital cutting puts millions at risk of serious health problems throughout life. It is an ancient practice based on deeply embedded cultural attitudes that are difficult to change. In many countries female genital cutting continues to be widespread even though governments and development agencies have been promoting its abandonment for decades. An estimated 3,000,000 girls continue to be at risk of cutting each year. We developed a new approach to changing attitudes about female genital cutting in a population in Sudan where cutting is widespread. To do so, we produced a number of different movies that show an open discussion about whether to continue or abandon the practice. This approach respects the cultural traditions of practicing societies. To enable causal inferences about changes in attitudes, we randomly assigned participants to the different movies and then measured their attitudes. In my presentation, I will document the impact of the various treatment movies on attitudes towards cutting based on an implicit attitude test that we developed to circumvent social desirability bias.

"a Prole with Class": Fashion, Pop Culture and Social Inequalities Among Young Men in Berlin

Colloquial talk of 'being a prole' shows how everyday comments on dress styles, postures and hair-styles are also a means of negotiating the mutual disrespect between social groups. How is the self-stylisation as a 'prole' connected with hostile or sneering acts of labelling by others? What does it mean if someone refers to himself as a 'just a prole, but a prole with class'. Based on ethnographic research, Moritz Ege offers insights into 'classification struggles' und into the reality of life of young men whose stylistic practices as 'proles' is conceived by others as a threat and a provocation. In his book, young adults have a say for the first time who are usually the objects of debates on social issues.

Moving Towards Participatory Senior Care. Explaining Cross-National Differences in the Participatory Rights of Senior Care Recipients

In recent years the demographic change and rising number of senior citizens put the health and care sector of many mature welfare states under pressure. New welfare state policies were introduced to shift the responsibility back to the individual and community, emphasizing citizen participation. Regarding senior citizens, stronger participation refers to the enhancement of choice and autonomy as well as to the overcoming of dependency. Even for seniors in need of care participatory measures like re-ablement or user involvement in decision making processes were increasingly supported. Nevertheless, there are considerable differences between the countries concerning several dimensions of participatory measures.

Therefore, this paper poses two questions: in how far do European welfare states differ regarding the participatory rights of senior care recipients? How can the differences between the countries be explained? The main aim is to build a typology to identify different participation regimes based on a multi-dimensional analysis. The dimensions include the generosity of social rights towards care provision, different forms of co-production and rights to activating measures (e.g. re-ablement) as well as the basic principles concerning the responsibility of care provision (state, market, community). To explain the differences between the countries the role of the relevant political actors and cultural ideas concerning the role of the welfare state as well as the cultural ideas about citizen participation of care recipients are analyzed.

The empirical study is based on a document analysis of the legal framework and a structured content analysis of government papers and party documents concerning care policies of Denmark, England and Germany. Those countries are chosen because they all represent different types of welfare and care regimes. The analysis shows that all countries represent different types of participation of care recipients due to their welfare regime type and cultural ideas towards care.

Appraising LEGAL Enforcement Promotion and Gender Violence Control in Nigeria

The question of indentifying and defining the impact of gender inequalities on human development has remained a critical sociological discourse that has engaged the attention of scholars, development practitioners, policy makers and civil society organization over the years. Even more worrisome is the growing in-

　　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cidence of gender violence against women in Nigeria which have refused to abate in spite of laws enacted to address this menace. While the continued existence of disparities between women and men in access and control over resources, human rights and the overt discrimination against women throughout history are not only seen as a clog in the wheel of national and international development agendas, importantly, the achievement of gender equality is bound up with all other goals of sustainable development such as governance, poverty reduction and inclusiveness in development planning and practice. Using secondary sources of data and radical feminist theory, this paper seeks to interrogate those factors responsible for the lack of capacity to fully enforce legislation enacted against gender violence in order to fully nip in the bud its continued prevalence in our society. The paper further stressed that sustainable development may be hard to achieve when women are not fully engaged and involved in the process of formulating, implementing and evaluating legislation that tend to solve the prevailing problem of gender equality particularly as it relate to their economic well-being and social equity which most time is exploited through gender-based violence. The paper concludes with the proposition that partnerships and equality between women and men are critical building blocks in the establishment of strong families and viable societies in this rapidly changing world. For if development is not engendered, it becomes endangered.

Sociology in Foreign Scientific Fields: An Analysis of the Portuguese Higher Education System

In the last four decades, sociology has gained a lot of importance in the higher education and research level, in Portugal. This growth, along with a gain in reputation, is found not only within the social sciences, but also in other areas of knowledge, fostering multidisciplinary scientific production. At the education level - not the teaching of sociology as a major scientific field, but its mobilization by graduations of other scientific areas in higher education - the intervention is often performed through 'specialized sociologies' with greater approach to the formative area in question.

This proposal is the result of research done within a doctoral project, entitled 'The role of Sociology in multidisciplinary educational and research contexts" (Ref FCT:. SFRH/BD/84515/2012). First, a list of the Portuguese higher education undergraduate programs that provide one or more curricular units in the area of Sociology (concerning the 2013/2014 academic year) was collected, along with a few additional variables, and organized by scientific fields. For instance, a total of 656 undergraduate programs in 95 institutions were found, 22.7% of which in the Health and Welfare field, contrasting with only 0.6% of graduations in the Agriculture, Forestry, Fisheries and Veterinary field. The next aim was to understand how the discipline stands within the general scope of the undergraduate program and what its usefulness is - both planned, and perceived -, so pairs of coordinators / sociology teachers' were interviewed (in a total of seventeen institutions nationwide) regarding the characterization of the institution, program and discipline; personal characterization; sociology's presence and assessment in the program; constraints in teaching the discipline; students' acquired skills expectations and contribution of the discipline to their future employability and job functions; and perspectives on the most and least valued aspects by students. The main conclusions will be presented.

Doing Science in the South: Negotiating Centrality and Marginality in the Process of Knowledge Production on a Global Scale.

Much has been said about the globalization of knowledge and the increasing flow of ideas, academics and even institutions between North and South. Although postcolonialism has drawn attention to new forms of inequalities and domination that have emerged from this process, there is a lack of empirically-informed research on such problems. This paper addresses these issues by discussing North/South relations in three domains of knowledge: HIV, climate change and gender studies. Each domain is interdisciplinary, crossing natural science, social science and the humanities; each is recently constructed or expanded; each is significant for public policy. Moreover, each is a domain where knowledge from the global South (broadly conceived) has played a significant role. Our 4-year research program focuses on three countries in the global South (Australia, Brazil and South Africa) and examines knowledge workers and their labour processes (including gender relations and its effects on knowledge practices), knowledge institutions (including workplaces and communication systems), economic strategies and the resourcing of knowledge work and workforces. The project is multi-method, including life-history interviews, citation-context analysis, organizational ethnography and documentary research. The paper outlines the main following findings of the research: the different patterns of centrality and marginality within and between domains; the space for negotiation and autonomy in the process of knowledge production on a global scale; and 'extraversion' as a key feature of intellectual work in the South even though it is found in various forms.

Factorial Surveys in Social Psychology: Using Different Modes of Presentation in a Factorial Survey on Fear of Crime

Factorial surveys are based on vignettes in which a detailed description of the situation of interest is presented to the subjects. It is assumed that vignettes evoke less socially desirable responses as they provide a general frame of reference and leave less room for individual interpretation. While several studies compared the results of non-reactive methods and factorial surveys, there are only few studies that refer to different modes of vignette presentation.

The present study introduces verbal and visual presentations of vignettes within the framework of a factorial survey on fear of crime. The factorial survey is administered to a simple random sample of students from a German university (n=xxx). Influences of individual features, effects of features of the situation and interactions between these features are systematically compared by means of hierarchical linear models (HLM).

The analysis suggests that influences of individual features as well as effects of the features of the situation differ with regard to the mode of presentation. The results are discussed with regard to theories of social cognition, i.e. theories concerning assumptions about how subjects process and apply the information which is presented in the factorial survey.

English Studies for the Arab Minority in Israel: Social Tracking or a Key to Mobility?

In Israel, secondary education is provided in two systems: one for Jewish students and the other for students from the Arab minority. Among other things, the systems differ in variety of curricula, levels, and scope of English studies. The Jewish education system offers a relatively wide choice of subjects and levels within English studies, compared with the Arab system, where the English programs differ mainly in scope and level.

Research has shown that the social background of students is a crucial explanatory factor in inequality of educational opportunities. However, some disadvantaged students seem to overcome the socioeconomic barriers and perform better than others. Against this background, we asked whether placement in the high-status advanced English study track in an education system with limited choice (the Arab school system) correlated with academic achievement alone, or

with social background variables, as well. This question is salient in light of the correlation of high-school English studies with access to higher education and future social mobility.

Questionnaires were distributed to 316 students in Arab schools in central Israel. The analysis was based on two logistic regressions, one measuring the impact of social background variables on the chances of learning English at an advanced level, and the other, the impact of academic achievement beyond social background.

The findings revealed that selection for the advanced study track was associated with both social tracking and meritocratic considerations. Children of educated parents had better chances, compared with children whose parents were not educated, of attaining high achievements in middle school, which in turn correlated with advantages in high school, such as acceptance to advanced English programs. However, the children of uneducated parents who attained high scholastic achievements were also able to improve their chances of admission to the high-status study track, despite their social background.

Blurred Boundaries - Challenges for the Analysis of Hybridized, Mediated and Glocalized Communities of Interest

The field of youth cultures is a highly dynamic reseach field confronting the social scientist with manifold theoretical and methodological challenges. These challanges arise from societal tendencies of modern society - especially the mediatization of social phenomena, the pluralization of cultural affiliations and the glocalization of knowledge.Due to this youth cultures become more dynamic, fluid and harder to grasp. It is not just that due to the history of youth cultures (e.g. Punk is now over 40 years old) adults and teens share the same affiliations, but that cultural knowledge and innovations spread through the internet with such speed that what catches the attention of the researcher may be already obsolete at the time. The methodological questions are centered around the problem to follow these highly dynamic social networks. One question is how the toolbox of social sciences is suited to these changed research fields (e.g. what modes of data collection are 'good' to register and follow emerging youth cultures).

The theoretical question is what concepts are fitting to describe these communities of shared interest we call subculture, youth culture or (youth) scene. Each concept represents a different scientific perspective and each concept has different deficits regarding the current developments. The mediatization of youth cultures leads to the hybridization of former exclusive communities (e.g. 'metalcore' as a hybrid of hardcore and metal or 'indietronic' as a hybrid of guitar-oriented indie and electronic music) - this leads to the question how we as researchers reconstruct the - now more and more blurred - boundaries of these cultural networks.

The main focus of my presentation is the question if our theoretical and methodological tools became blunt for analysing glocalized, hybridized and mediatized social groups with a shared interest. And if so what ways there are to answer these problems.

Social Innovation As a Challenge for Urban Governance Policies. Analysing Local Administrations' Approaches and Their Inclusive Policies.

Abstract: To look at cities as local systems is a useful way to understand the localised nature of social innovation dynamics. As previous research has shown, social innovation is featured by the particularities of multilevel governance dynamics in each particular context. The role of public and private actors in the provision of policies and the historical role of social movements and civil society is key to understand the emergence of socially innovative initiatives to tackle social exclusion. In this paper we analyse how the interplay between urban governance, economic development and welfare policies influence the production of social innovation. Specifically we analyse institutional arrangements on employment and citizenship participation policies as contexts for social innovation in four different spanish cities: Barcelona, Zaragoza, Bilbao and Madrid. The comparison wants to shed light on the emergence of different repertoires of socially innovative practices and its relation with local administration. Based on insights derived from fieldwork developed in the framework of INOSOGO research project, this paper shows how local models of governance define and influence the development and shaping of socially innovative initiatives and how these initiatives engage with local administration.

Theoretical and Methodological Challenges and Advantages When Combining Methods and Using Cross-Scientific Perspectives in the Study of Senior Camps.

Since the beginning of 2000 senior camps have been established on several places in Sweden, with the purpose to decrease social exclusion and improve health amongst elderly people. These senior camps build on notions of what it means to age and to "be old" in relation to activity, health, functional abilities and participation in society. In a cross-scientific and holistic study at CASE, Lund University these senior camps have been studied from three perspectives 1) History of ideas: What is the cultural meaning of senior camps? 2) Ethnology: How is age made visible and important at senior camps? 3) Occupational Science: What are the individual social and health aspects of the senior camp?

In this presentation we will discuss the theoretical and methodological challenges and advantages of combining different perspectives when studying the phenomena of senior camps. What happens in the cross-scientific meeting of ethnology, occupational science and history of ideas in the view of notions such as activity, subject and power? Further, experiences of applying a user perspective through a user conference following the methodological principles of the world café will be shared. The world café method enabled the researchers and responsible persons for the 11 different senior camps in Sweden to jointly reflect upon the findings and deepen the analysis. Experiences of combining different scientific perspectives as well as researcher-users perspectives will be elaborated upon in this presentation.

El Estudio De La Segregación Residencial y Escolar Frente a Las Limitaciones De Las Estadísticas Oficiales. El Caso De La Zona Norte De La Ciudad De Alicante (España).

La crisis financiera internacional ha generado en España, como en otros países desarrollados, un incremento de los niveles de desigualdad social, acompañado por una agravación de los fenómenos de segregación residencial y escolar. El ámbito geográfico de este artículo se sitúa en la Zona Norte de la ciudad de Alicante, área de mayor concentración de población inmigrada y gitana de todo el municipio, con centros escolares públicos reflejo de la importante diversidad étnica de sus habitantes, a la vez que de sus altas semejanzas en términos de estatus social. El objetivo de esta investigación es proporcionar una perspectiva particular de la segregación urbana y educativa en la zona, poniendo en evidencia algunas limitaciones de las estadísticas oficiales que obstaculizan el análisis exhaustivo de ambos fenómenos. Ello se produce, en primer lugar, al confundir categorías poblacionales diferentes bajo la misma etiqueta estadística: 'nacionalidad española'. Este es el caso de las poblaciones 'extranjera naturalizada', 'de segunda generación', 'gitana' y 'española no minoritaria'. Y en segundo lugar, al carecer de una definición estadística única y estandarizada respecto de la categoría 'población extranjera'. Asimismo, los resultados del trabajo de campo realizado en centros educativos de la zona, revelan, de hecho, que las estadísticas oficiales pueden distorsionar -hacia una imagen mejor, pero ficticia- el conocimiento de la composición real del alumnado por origen y etnia. Esto es, en definitiva, como la Administración Pública española, fuente registral exclusiva, puede contribuir a que la información divulgada sobre las minorías sea limitada y, en ocasiones, inexacta.

Negotiating Private to Public Transitions: The Case of Italian/French Muslim Sufi Convert Community

As the presence of religion in the public sphere becomes more prominent, there has been a rise in tension within each religious community, between occupying itself with religious belief and practice and representing its faith in the public sphere. This tension can especially be seen in European Muslim communities, following the emergence of negative narratives of Islam. Religious communities that have sought to remain insular are being pulled into the public sphere as representatives of European Islam.

This paper looks at the scope and preliminary results of my research on this private to public transition in the Ahmadiyya Idrisiyyah Shadhiliyyah Italian/French Sufi Muslim convert community. Specifically, I raise the question of how this transition is negotiated and what its potential impact is on the Muslim and European

communities at large. The community was established in the 1960s in Italy by its current leader, Shaykh Abd al-Wahid Pallavicini. In its first years the community remained strictly private but its members have now moved from the privacy of their order to public engagement with the French and Italian states. Pallavicini has given Sufi Islam an unexpected visibility, marked by his participation in the 1986 ecumenical conference of Assisi with Pope John Paul II. Since then, the state has solicited him and his son, Yahya, to make official statements in the media and so, the community established the Communita Religiosa Islamica Italiana (COREIS) and the Institut des Hautes Etudes Islamiques (IHEI). Recognized by the French and Italian states, these public organizations participate in debates on citizenship by interacting with the public administration, media, academia and civil society through conferences, courses and exhibitions. This paper will show the impact of this religious community, with its representatives in fields like banking, food, inter-faith and inter-cultural dialogue, on the understanding of Islam within the European context.

The Religious Dimensions of Popular Culture: Experiencing the Sacred in the World of Comic-Con

One of the most enduring and controversial legacies of Emile Durkheim's *The Elementary Forms of Religious Life* (1912) is how he conceptualized religion, which revolved around "beliefs and practices about the sacred." The sacred, as he explained, is set apart by the group as something powerful, transcendent, and deeply meaningful, and is clearly distinguished from the mundane world of everyday affairs. The primary means of distinguishing and experiencing the sacred is through collective rituals, which are central to Durkheim's theory. To be sure, this conception of religion includes beliefs and practices involving the "gods" or the "supernatural," which is the typical focus of sociologists of religion. But it is not exclusive to them – a variety of beliefs and practices can be sacred. While Durkheim's original conception challenges us to expand our understanding of what is traditionally considered religious or spiritual, few have applied it to the increasing variety of leisure activities in modern life.

This paper builds on The Elementary Forms, and other scholars, to explore how particular leisure activities can involve ritualistic behavior that evokes the sacred and, therefore, shares important similarities (or elementary forms) with traditional religion. Specifically, I propose a study to investigate how, and to what degree, fans of popular culture can experience variations of the sacred. While contending explanations may view fan devotion as a deviant obsession, the result of intensive commodification, or simply a form of mindless entertainment, I hypothesize that the more dedicated or devoted a fan is to a particular pop cultural form, the more their expressions and activities are endowed with sacred meaning. Ideally, data gathering will involve systematic surveys of various types of fans at prominent pop-culture conventions in the United States, such as ComicCon.

Which Types of Non-Kin Networks Relate to Survival in Late Adulthood?

Background: Integration into social networks is an important determinant of health and survival in late adulthood. Non-kin relations are particularly believed to make a unique contribution, as they provide access to support resources beyond the family network. We investigate the association between older adults' survival rates and integration into different types of non-kin networks.

Methods: Official register information on mortality is combined with data from the Longitudinal Aging Study Amsterdam (LASA). The sample includes 2,440 Dutch respondents aged 54—85 at baseline in 1992 and six follow-ups covering a time span of twenty years. Using latent class analysis, respondents are classified into distinct types of non-kin networks, based on differences in network size, social support and contact frequency. Membership in network types is next related to mortality in a Cox proportional hazard regression model. The model controls for socio-demographic characteristics and several health confounders at all follow-ups.

Results: There are four latent types of non-kin networks, which differ in their associations with mortality, net of all control variables. Older adults integrated into large networks of varied support live longer than those embedded in concise and relatively unvaried non-kin networks.

Conclusions: Neither contact with many non-kin relations, nor receipt of much support alone facilitates higher changes of survival, but a combination of both. This should be taken into account when developing intervention programs aiming at increasing social integration outside the family network.

Games without Borders: An International Look at Game Culture

The area of video games study is robust after extensive research has been conducted within the past years. However, comparative video game studies are still lacking compared to other areas of research. Studies comparing game cultures are especially rare and game cultures are usually studied singularly in an explorative method.

When analyzing videogames (and their cultures particularly) it is important to consider the international/global aspects, especially with the growing rate of online play, where national boundaries are becoming less relevant. Our talk will present the theoretical framework for studying digital game cultures transnationally, in an attempt to find commonalities and differences between exclusive cultures.

Similar to Hepp' work on media cultures (2011, 2015), we base our framework on Paul du Gay's et al. (1997) work on the production of culture. It suggests five different contexts important in the creation of game culture. The contexts of (re)production, identification, appropriation, representation and regulation deal with different aspects; from how games and their players are presented in the media or public discourse, to how gamers identify with certain games, and even how non-producing bodies control game releases and production. Using these different contexts, we propose a comparison of separate game cultures.

Finding commonalities and differences within digital game cultures from different countries (or even games) helps explore the idea that digital game cultures are not bound by national borders, but instead exist as a global, united subculture, or even a cultural cross section, similar to folk, high and urban cultures. The presentation of the theoretical framework will be accompanied by insights from a pilot study on European and Arabic game cultures, which is qualitative and explorative in nature, using mixed methods for data collection. The selection of these methods is due to the lack of qualitative (and quantitative) research comparing game cultures internationally.

From Lesbos to Budapest and Beyond the Construction of the Refugee Problem in the Greek and Hungarian Dailies.

The present study intends to test empirically how the mass media contribute to the construction of the refugee crises. Our analysis is based on the theory of complexity reduction and reality construction as developed by Niklas Luhmann. As a result of this reduction and construction process mass media construct a reality that is a reduced image of the world.

In order to investigate empirically this theoretical approach we collated all the articles in the online editions of Greek and Hungarian dailies – both EU member states significantly affected by the refugee problem – that related to the refugee crises. Based on the analysis of these articles we try to explore the interpretation framework of crises as well as how mass media present these crises as a humanitarian problem, as invasion problems, or cultural and religious opposition problems.

The networks of concept have been drawn up on the basis of the appearances of words related to the crises in the articles. Thus the nodes of networks represent words appeared simultaneously in a given article. In this way we try to empirically reconstruct the conceptual network of refugee crises shaped by the mass media.

Trans Bodies on the Route: Transgender and the Claim for Identities in Iran

Setting off from the acknowledgement that the subjective recognition of gender along with the understanding about the body are relationally placed within the cultural influences and values of a given society, our intent with this debate will be to map the possible constructions of individual identities in the Iranian context in which the practice of transgenitalization is being carried out for decades. Thus, the main objective of this paper will be [a] to clarify how policies implemented by Iranian government encouraging sex reassignment surgery gives sense on way people live (or should live) their own subjective experience of being,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and [b] to understand how (if) medical professionals involved at the diagnosis of transexuality undertake to a gender bias that can both undermine expressions of the self and allows strengthening and rise of personal identity. We also intend to reflect on the extension of citizenship and on the granting of humanity to trans-formed bodily configurations, highlighting existing attempts to associate psycho-logical and behavioural disorders with sexual orientation and ways of life of the transsexual population.

If we were to summarise the thrust of this reflexion, we could say that its main reason is to understand the destiny of trans bodies and identities given the ar-duous path of the transsexualising process. In addition, we intend to investigate the relevance of the discussion around the act of recognising the condition of humanity and dignity of the "human person" throught the process that disciplines body transformations, mostly attempting to the ways through which religion en-gages with politics in the context of individual demands of identity and right to subjectification.

The Irula Tribes of Nilgris: Anthropology of Development

Irulas are one among the thirty six communities from the state of Tam-il Nadu scheduled under the ninth schedule of the Constitution of India (Basu, 2012). These tribes are still cut off from the main stream society and they are more vulnerable among all those scheduled communities in the state of Tamil Nadu despite various efforts being taken by the state government for the better-ment of their life. According to the census of India 2011 Irulas constitutes 1,74,224 in the total population of 1.21 billion. Report of the United Nations Development Programme India (2011) revealed that Human Development Index (HDI) of the Scheduled Tribes at all India level was estimated at 0.27, which is lower than then HDI of scheduled castes and non- Scheduled castes/Scheduled Tribes. In Nilgris district of Tamil Nadu where irulas are mostly concentrated in the places includes Udagamandalam, Coonoor, Kotagri, Gudalur taluks. Earlier they were engaged in hunting of wild life animals and gathering; presently most of them are engaged in agricultural and plantation labourers. The Government of India had a unique five year programme aimed at the overall development of the country in general and tribe population in particular named as Tribal Sub-Plan for the wellbeing of tribal people. Despite these efforts owing to the problem in implementation it was not fully achieved and they still remain in poverty, unemployment, indebtness, alienation, lack of basic amenities, healthcare and education. In light of this an attempt will be taken to understand the above mentioned life hazards of irulas in anthropological perspective since, they are contemporary to us. To realise the objective of the proposed study various anthropological techniques will be em-ployed such as, participant observation, unstructured interview, and case study. The results of the study would substantiate the available literatures in the field of development anthropology.

Applications of Group Processes Theory to Understand How Early Polities Solve Collective Action Problems

This paper explores how chiefdom and early state social structures resolve collective action problems. In particular, the paper applies advances in social psy-chological theory to understand practical solutions to collective action problems in prehistory. The theory includes actor and structure level assumptions. Solu-tions to problems of collective action are two-fold; incentive systems discourage free-riding and encourage individuals to act and organization combines individu-als' acts. Broadly stated, we argue that influence and power, once organized into the hands of one or a small sub-group of individuals, can be used to administer incentive systems that motivate others in the community to act. Those incentive systems, in turn, can shape collective activities such as warfare and defense. Drawing on experimentally grounded theory in sociology, we model forms of so-cial organization and discuss the relation of each to collective action. In particular, we argue that simple chiefdoms solve problems of collective action through the well-ordered influence relations in their status lineage structures, while coercive chiefdoms, to the same purpose, exercise power through threat of force. As in coercive chiefdoms, early states solve collective action problems through coer-cive relations but, where chiefs coerce only directly, heads of territorial states use bureaucratic systems of administration to exercise coercive power over vast geo-graphic and social distances.

Social Exclusions: Leisure, Play, Power, and Race in 21st Century Online Experiences

Defining leisure and play has been contentious if not unremarkably invisible. Writers in the Critical Theory tradition such as Ernst Bloch, Herbert Marcuse, and the Frankfurt School have all attempted to locate play (and leisure) as just an-other version of exploitative activity under the conditions of modern capitalism. The role of daydreaming, fantasy, non-instrumental behavior is consigned to a lower order of activity (leisure) as compared to work and productivity under cap-italist social relationships. With the rise of the Internet and virtual environments are new questions that go beyond grappling with the distinction of play as an exploitative activity or a new way to think about liberation (i.e., that which does not depend on the commodity fetish for realization of work/production of capi-tal accumulation). It also begs new questions about understanding how existing forms of inequality beyond class, such as racism, fit into our understanding of play, leisure, work, and fantasy. This paper seeks to tease out how the growing use of the Internet in everyday life maintains (or alleviates) racial exclusion similar to that of the "real" world.

In the Eye of the Beholder: Students' Attitudes on Inequality in the European Economic Crisis

The European economic crisis has triggered widespread public debates about social justice and solidarity in the EU. This includes supranational controversies on financial aids and debt reliefs for member states as well as national discus-sions on the fairness and adequacy of distributional policy measures. For the main part, these debates have been initiated and framed by political elites.

On the contrary, laypersons' perceptions and beliefs have largely remained uncovered, even though their perspective determines future policy decisions based on their vote choice in national and European parliamentary elections. In this context, the attitudes of young voters in the EU are particularly crucial since these individuals will experience the social, political, and economic repercussions of the European crisis most directly in their own lives. The European economic crisis thus provides an instructive setting to empirically investigate the intricate interplay between perceptions of economic inequality, distributive preferences, and political outcomes.

In detail, this study presents findings from a large-scale survey of social science and economics students (n > 1,500) enrolled at two major German universities. The analysis controls for a wide range of educational, political, and socioeconomic variables and examines students' perceptions and evaluations of the European economic crisis in terms of its antecedents, effects, and political responses. In particular, the analysis applies latent concept measurements in combination with predefined sets of statements on diverse aspects of the crisis. In this way, the sur-vey allows to capture those attitudinal components which determine (a) students' awareness of inequality, (b) the accuracy and coherence of their perceptions, and (c) the political impact of their predispositions. The results will shed light on the conditional nature of politically efficacious representations of social and econom-ic justice.

Natural Increase/Decrease in Turkey: Is Turkey Starting to Follow the European Pattern?

In Europe today there is virtually no population growth from natural increase because the crude birth and death rates are equal. Seventeen European countries have more deaths than births (i.e. natural decrease), including three of Europe's four most populous nations (Russia, Germany and Italy). Of Europe's four largest countries, only Turkey has more births than deaths.

Demographic research on the rate of natural increase (RNI = crude birth rate minus crude death rate, divided by 10) for European countries has mainly been conducted at the national level. But research on natural increase and decrease has indicated that it is at the subnational level where the phenomenon of natural decrease (more deaths than births) first begins to appear.

In our paper, we analyze the RNIs among the 81 subnational units, i.e., provinces, of Turkey for each year from 2000 to 2014. We first describe the RNIs for Turkey's provinces for each year. These descriptive analyses will inform us if some of Turkey's provinces are moving toward having more deaths than births. Turkey presently has the highest RNI of all of Europe, at 1.2 %. But it may well be that some of its provinces are moving toward negative RNIs, or, perhaps may already have negative RNIs. Then we will estimate two multivariate regression equations, one for the provinces of Turkey for the year of 2000, the other for the year of 2014. The dependent variable will be the RNI and our independent variables will focus on age structure and fertility. We hypothesize that as the proportion of elderly in a province increases, the RNI will decrease. And we expect to find that as the fertility rate of the province increases, the RNI will increase.

ENGUIX, BEGONYA* (Universitat Oberta de Catalunya, benguix@uoc.edu)

Business, Politics and Activism: LGTB Activism in Spain and Its 'unintended' Outcomes

This proposal aims to analyse two 'unintended' outcomes of Spanish contemporary LGTB Activism. On the first hand, the conversion of Madrid State Pride Demonstration in a mass spectacle that brings more than two million tourists to Madrid and leaves a benefit of at least 110m euros for the city, has fed the debates about the relationship between business and politics. But probably without this 'alliance' Spain would not have been one of the first countries in the world to legallize egalitarian marriage.

In the last two years, and particularly in 2015, another 'unintended outcome' of LGTB activism has become evident. In a context of 'new politics' in Spain, with some emergent political parties (Podemos, Ciudadanos) and many elections being held during 2015, the connections between the LGTB 'officialist' movement and mainstream politics have been intensified. Many members of the LGTB associations have left their associations to be included as candidates for different parties; also the presence of the political parties in the LGTB demonstrations is visibly increasing. The reactions of grassroots activists towards this 'political colonization' is not unanimous.

This process of hybridation between mainstream politics and grassroots activism draws our attention to the status and roles of LGTB associations. One of the most important LGTB activists (and a politician) in Spain, Pedro Zerolo, shortly before dying remembered associations that they were not just NGOs, but political instruments.

This proposal aims to analyse the relationship between these two 'unintended' outcomes and enable a reflection about the contemporary nature of the connection between grassroots activism and 'mainstream' politics. It is based in intensive ethnographic research of Pride celebrations in Spain, in-depth interviews with LGTB activists and leaders and participant observation of the Marches: in 2015 I was invited to the VIP zone of Madrid March.

Being "Good" and "Smart" Consumers: Communication about Food Risks

In sociology, we have rich studies about food and risk. However, we face new phenomena day by day. When we discuss food related to risk or the risk society, we have to think about at least two aspects at the same time.

One involves functional or so-called techno-foods. There are many functional foods that protect our body from health risks. It is recommended that we aim for zero risk by eating functional foods.

The other aspect is an important issue in Japan, because after the Great East Japan Earthquake, laypeople have been facing a big problem with the radioactive contamination of food, and boycotting or product delivery refusals still continue. It is recommended in the name of reconstruction aid that we support producers in disaster-affected areas by eating the food from these areas. The criticism against people wishing to have zero risk from their food increases. It brings about division regarding what one eats or does not eat. Here, the focus is on "risk communication" as a form of politics and a new type of communication skill.

I use data from group interviews, government discourses and other sources to discuss these issues. I consider that there are these two aspects to any case: laypeople as "good" and "smart" consumers are made much of rather than acknowledging that as the nation we have rights of the health. It is recommended, on the one hand, that we aim for zero risk (to future health) by eating functional food based on its scientific name, while on the other hand, it is forbidden that we find zero risk in food (for example by not eating something) by saying that this is not correct scientifically. I clarify how risks over food and eating are related to stirring up our greed as "good" consumers.

Assessment of Justice in the Institutions of Learning

Education is often regarded as an institute that contributes to the equalization of life chances in society. The critical tradition in sociology represented by P.Bourdieu and J-P.Passeron focused on the inequalities of the system of education itself. The inequalities tend to stem from differences in cultural capital, level of integration of the students to the system of institutional rules and ambition. The All-Russian representative survey based on the sample of 2003 respondents focused on the different perceptions by students of the educational institutions and the process ongoing inside it. The respondents evaluated the justice of grading and the justice of education outcomes. It turned out that variance in the assessment of justice inside the institution is closely related to the achievement level of the respondent and later mobility outcomes. The more successful the respondent was, the more justice he attributed to the system of education, the more positive was his or her assessment of education. The survey revealed an obvious dependence of the perception of justice in education on perceived outcomes of the educational attainments and the larger context of social mobility. The survey also revealed that the years of learning and the level of skills had a significant impact on the way the education process if perceived. Most of these factors depend on the family background of the respondent and point to an influence of family cultural capital on the evaluation of justice in education system.

Vertical and Horizontal Accountability Among Stakeholders in Disaster Mitigation and Response in the Philippines

The Philippines is regarded as one of the most disaster prone countries not only in Asia but globally. The Philippine Government at the national and local levels have claimed availability of effective and efficient disaster mitigation and response mechanism. Common to hear from government officials, "everything is taken cared of". Politicians would even say we will be better off next time as we already experience the worst. But despite this claim and apparently lessons learned, damage to properties and human lives continue to occur.

This paper focuses on the delivery of disaster response and mitigation at the communities as guided by the central government development planning and strategies. The paper focuses on the selected communities in the Philippines and how uncoordinated efforts from the national to the local levels affect the quality of disaster response and mitigation. This justifies the need for a more careful study on the issue of accountability and responsibility among the key actors, how accountability is being exercised horizontally and vertically, who is accountable to whom, how can accountability facilitates or hinders a more effective disaster mitigation and response. This paper utilizes actual field works to the communities. The study makes use of key informants interview and focus group discussion among key stakeholders and review of the existing laws and relevant policies.

There is a limited studies conducted on the roles responsibilities and accountabilities of the local government as mandated by two national laws, the Local Government Code of 1991 (RA 7160) and the (RA 10121) National Disaster management Law. The paper hopes to provide fresh insights and recommendations on how to improve delivery of disaster response and mitigation particularly at the community level in the context of accountability.

Culture and Capital: New Religionist Middle Classes and Their Changing Cultural Forms within the Context of Class Transformation of Islamic Groups in Turkey

Conceptual tools like culture and capital is two of concepts that are used to study any social fact or event. In Turkey, one of these groups, often discussed and analyzed as a social fact, is Islamic-inclined groups or/and communities. To begin with, by concept of capital we should state that what we mean is forms of economic-based capital if we consider Bourdieu mentions from forms of a few capitals. These Islamist groups have had increasingly a the growing accumulation of capital and religionist new middle classes, who try to increase and form these economic-based capital within many distinct sectorial areas like textile, clothing or food industry, and construction in Turkey. Such form of capital is pointed out to have formed new cultural forms, emerging more in consumption and fashion, except for ones of cultural capitals like education, academy, and media in Bourdieuian sense. However, what we imply by new cultural forms is mostly consumption and fashion-focused cultural forms. These groups are conservative in values

but avant-garde in consumption practice. For instance, having been created style of clothing known as Tessettür, the fashion of veiling is one of first practices of consumption produced in rich Islamic groups. There would be unavoidably some magazines such Âlâ Dergisi, which advance and created the fashion of clothing in accordance with Islamic principles. Apart from clothing, new spheres of consumption are constituted by islamicising a great deal of areas of urban life like hotel, restaurant, and café and so on. Wealthy classes within these groups have luxury hotels to have their holiday. Caprice hotel is one of them, which is designed for these classes to go. In sum, we will study these Islamist groups' consumption-focused new cultural forms by taking emergence of new religionist middle classes and capital accumulation in these Islamist groups into account.

European and International Labour Movements: Two Sides of the Same Coin.Labour Mobility and Migration in a Context of Austerity in Europe

Austerity and the labour market restructuring in Europe have intensified inequalities and injustices in society. The deterioration of working conditions, the rise in income inequality and the weakening of trade unions in Europe have also caused a rise of inequalities among workers on international level. The measures to protect the value of labour and the established trade union rights in Europe has created the image that the interests of European workers are different than the interests of non-European workers, especially migrant workers. Flexibilization and precarization of labour are touching severely on migrant workers in Europe having both residential, legal and work-related, social problems. This paper studies broader alliances between trade unions and social movements in Europe engaged mainly on the violation of trade union and social rights and work-related issues but also about non-work related issues concerning migrant workers in Europe. Theories on international aspects of collective action and the construction of relations between transnational actors will present the framework of this analysis. Throughout a research based on the analysis of the press, official declarations and publications of trade unions, it will examine common platforms, campaigns and actions of trade unions in different countries and the campaigns of the ETUC on labour mobility and migration. It will point our two main aspects. Firstly, it will explain briefly the consequences of austerity on the working conditions, income equality, labour mobility and migration in Europe. Secondly, it will analyse trade union activities and alliances in different national contexts and on European level. Thus, this aims to point out the importance of discussing together the questions of austerity, migration and broader alliances in labour protests. It aims to introduce an international aspect to the study of the consequences of austerity on the European labour market, European labour movements and trade union rights.

Multilayered Intersectional Citizenship: The Kurdish Women's Movement in North Kurdistan/ Turkey

The image of the Kurdish woman fighter has become iconic in the recent conflict of extremist Islamist groups in the Middle East, symbolising a secular, self-confident Middle Eastern femininity, opposed to Islamization. Yet, few beyond the Kurdish community and area studies specialists, are aware of the long history of Kurdish women's activism, without which these recent interventions of Kurdish women as fighters and organizers against Islamist violence would not have been possible.

Mobilizing intersectional analysis, this paper explores the Kurdish women's movement in Turkey/ North Kurdistan through the theoretical framing of multi-layered citizenship. While Kurdish women have been politically active for a long time, in the mobilizations for democratic and ethnic rights since the 1990s they came to form a mass movement. This mass movement is particularly interesting because it became vocal in challenging not only ethnic, but also gender oppression. The paper highlights the role of the Kurdish women's movement within the Kurdish national movement, disrupting ideas that women's movements within national liberation movements are bound to be co-opted and confined to the role of handmaidens of nationalism. The Kurdish experience instead, shows how Kurdish women's movement has established its own institutions, processes of successfully increasing women's participation and representation in formal politics, such as quotas and the co-chair system, taken up by wider political parties and civil society organizations in Turkey. This activism in combination with campaigns for gender equality, such as that against sexual violence, has established a social consciousness that gender equality is a key aspects of democratization, a cornerstone of the Kurdish national movement's demands from the Turkish state.

The paper argues that the Kurdish women's movement has co-created the Kurdish national movement since the 1990s, thereby changing the meaning of

politics and sparking debates on representation of women in politics in Turkey more widely.

Competing with 'Others': Economic Globalization Framing Professional Identities of EU Civil Servants and Lobbyists

The paper explores the identities of EU civil servants and lobbyists based in Brussels. We aim at opening the constituents of the transnational "European identity" of the civil servants and lobbyists. We ask, whether their national identity has been complemented by something new when entering Brussels and if so, by what? Analyzing survey and interview data, we conclude that among our respondents in the EU civil service and organisations of interest representation a European identification pattern has become stronger at the cost of national and local identification. However, assessing the respondents' views on "Europe and what it means to be a European", we identify new signifiers related to global competition that do not stem from any particular European or national semantic field and are constructed as 'us' competing with 'others'. As it seems, EU civil servants' and lobbyists perceptions of Europe and "European interest" seemed to be related to factors of economic globalization and the frame of competition it imposes; furthermore, they represented their nationalism much stronger in relation to a frame of competition as well. Therefore we conclude that economic globalization has a crucial influence on both European and national aspects of professional identities of civil servants and lobbyists in Brussels.

Issues and Aspects of Comparative Long-Term Studies in Youth Unemployment in Europe: Biographical Constructions of "Generation Y"

Are we - in view of the 'brutal' challenge posed to the significance of human labour and its digitalization in the fourth stage of an anthropological history of wage labour? On the one hand we suffer from skills shortage; low-performance persons with a minimal amount of cultural capital are increasingly isolated from participation in the job market, on the other. Esp. youth unemployment is still a persistent conflict and unemployment rates in European countries always used to be higher than average unemployment rates. Youth unemployment can not only be defined as an individual but also as a structural phenomenon: generational conflicts, increasing radicalization of young people without a professional perspective, a long lasting dependency of young people on family resources and homes, the threat of little pension claim as well as uncertain living conditions for these young people in the future. Accordingly, these young people show little respect for social and political institutions at the European level, due to the lack of their integration. Since socialization via work is still highly relevant and these young people are supposed to refine the future European integration, youth unemployment occurs to be a very crucial issue for sociological research; esp. a research that reflects the mutual constitution or interplay of individual and collective processes as well as the drag effects of institutional and individual behavior.

With regard to these developments, could one speak of a "forgotten generation" or even of a "generation without future" in Europe? How can we cope with methodological problems of long-term and comparative research throughout Europe (various quotas, work-ethics etc. and key figures of youth unemployment)? How can we compare European youth unemployment, employment poli-

cies, the long-term effects and its biographical impacts (i.e. physical, material and psychological effects, self-images in relation to dominant work-ethics)?

International Information War: Reality or Irreality?

The mediation of political life in contemporary societies creates a new reality that exists by its own laws. It is extremely noticeable in situations of war or armed conflicts.

After the Persian Gulf Crisis (1990-1991) all the world scientific society was discussing the appearance of a new era of information technologies and a new era of international conflicts. These "online bombing" broadcasted by CNN were shocking but effective. What is going on now? Mass communication through the Internet play an every-second increasing role in the contemporary world. It seems that Samuel P. Huntington was right saying that "world is thus a well-developed international system but at best only a very primitive international society" (1996:54).

Is it true or not? Could we just talk about the truth in this context? What the reality (or irreality) of the events we've got? How to understand news? In this paper we would like to discuss modern communications theories through the contemporary system of international relations, especially in situations of war and armed conflict.

Inheritance Laws, Wills and Women: A Study of Esan People of Edo State, South-South Nigeria.

Devolution of property in Nigeria is either through intestate succession, that is when a deceased dies without leaving a Will or through the testate succession which have to do with the application of the relevant statue. The intestate succession has to do with the customary laws and rules which dictate how property of a deceased who died intestate is to be shared while the testate succession comes in the form of a Will which is a creation of relevant statue having the force of law. Wills are means through which women and girls alike are considered in the inheritance of their husbands and/or fathers properties. Studies have shown that a good way to ensure women and girls inheritance rights is through the application of Wills, as against customary laws, in the sharing of a deceased property. But in Nigeria the devolution of property of a deceased is mostly governed by the customary laws of the land. Customary laws of Esan people do not favour the women group, especially when it comes to inheritance of property. In the light of this development, this study attempts to answer the following questions: What is the level of awareness of devolution of property by Wills among the study population? Have the devolution of property by Wills gained wide acceptance among the study population? Have the application of Wills being able to improve the status of women in the study population? The data for this study shall be collected through the application of questionnaire and in-depth interview of key respondents. Multi-

stage sampling methods shall also be employed in selecting relevant respondents for the study. It is expected that the findings from this study shall help us to suggest some useful recommendations.

La Responsabilidad Social Universitaria En Tres Universidades De América Latina. Comparación De Planes De Desarrollo

La responsabilidad social universitaria es un paradigma que emergió en Latinoamérica a principios del siglo XXI, por lo que su incorporación en las agendas educativas de la región es reciente y se encuentra todavía en discusión. Este concepto tiene indudablemente su origen en el ámbito empresarial desde hace más de cincuenta años. En el ámbito universitario muestra una transformación para coincidir con las funciones de la universidad, las cuales, para el caso de las universidades públicas en América Latina, toma tintes que se relacionan con el compromiso, la responsabilidad social o constituirse como una institución socialmente responsable.

El objetivo de este trabajo es mostrar, desde un análisis comparativo, el uso y evolución del concepto de responsabilidad social universitaria (RSU) de tres universidades de diferentes países de Latinoamérica, en las cuales se desarrollan actividades de docencia, investigación y extensión.

La investigación es de carácter documental, en la cual a través del análisis de contenido se revisan aquellos rasgos que son la base del ideario que guía la conceptualización que una determinada institución de educación superior imprime al concepto de RSU. En los documentos analizados de cada universidad se encuentran las misiones y visiones así como los planes institucionales de desarrollo y los programas estratégicos que atienden los temas transversales.

En este recorrido se pudo observar que el concepto de RSU es diverso en apreciación y significado, sigue evolucionando y alcanza distintos niveles de abstracción que van desde los comportamientos hasta los fines institucionales. El concepto descansa en diferentes instancias: en algunas instituciones alude a las organizaciones, en otras el énfasis está puesto en los actores de la educación superior y en otros más lo que importa es el tipo de relación que establece la institución educativa con su entorno.

ESCHE, FREDERIKE* (Free University Berlin, frederike.esche@fu-berlin.de)

Job Loss and Its Consequences on the Individual's Subjective Well-Being: How Important Is Leisure?

The resources and benefits linked to employment are manifold. Employed persons do not only profit from income, but also from important non-material benefits like a structured life and level of activity, a sense of belonging, creating identity, providing social contacts, prestige and social approval. On the contrary, unemployed individuals especially suffer from the absence of these non-material benefits and, hence, are less satisfied than the employed. Although numerous previous studies already have investigated the link between job loss and the individual's subjective well-being, the consequences of unemployment for specific life domains, such as leisure, are far from settled.

This paper aims to dig deeper into the relationship between unemployment and the individual's subjective well-being by specifically investigating the impact of unemployment onto the individual's free time activities. Using the longitudinal data of the German Socio-Economic Panel (SOEP; 1984-2013) and applying fixed-effects regression models, this paper investigate firstly, if time use for free time activities and the engagement in different specific forms of social participation, such as voluntary, political and cultural activities as well as sports, changes when people become unemployed. Secondly, the paper asks whether those changes mediate the negative impact of unemployment onto the individual's life satisfaction.

Results show that people spend on average more time on free time activities and, therefore, are more satisfied with their leisure when becoming unemployed. However, this does not seem to affect the life satisfaction of the unemployed. Looking at specific activities, and hence, specific forms of social integration, results highlight that if unemployment causes less participation life satisfaction decreased even more.

Proposals for Social Network Analysis of Big Data

Given the emergence of big data generated by massive digitization, as well as the growing access to information from the so-called second digital revolution, sociologists face a number of methodological challenges to better understand social life: data collection, new ways of sampling, automatic coding and statistical analysis of information.

This presentation proposes the analysis of information based on data binarization. The idea is to build three-dimensional binary matrices formed by 1) temporal or spatial sets, 2) scenarios and 3) events or characteristics, supported by matrices with their attributes. The treatment of this structure is based on the methodology of two-mode networks, combined with statistical tools for selection and location of nodes, and representation of edges.

The proposed analysis, which runs in the cloud, will be explained using a variety of examples that range from the analysis of photo collections, content analysis of text, representation of concerts and exhibitions, surveys of personal correspondence, ... to the analysis of multiple response questions in questionnaires.

Las Libertades Se Expanden Desde La Niñez: Una Lectura Sinérgica Del Enfoque De Derechos, La Sociología De La Infancia y El Enfoque De Las Capacidades Para La Participación y Agencia En La Infancia.

La niñez ha sido históricamente vulnerada y relegada de la toma de decisiones frente al mundo adulto. Desde una visión tradicional, los niños son aún considerados como "menores de edad" o "en proceso a la adultez", lo que supone un escenario de relaciones de dominación y tutela a la infancia. Sin embargo, desde el Enfoque de Derechos, a través de la Convención de los Derechos del Niño, se articula un marco normativo con carácter de exigibilidad para garantizar el derecho de la infancia a una voz y protagonismo. Sin embargo, esta participación no se plasma de manera automática en la práctica si no existe un compromiso de los diferentes actores a nivel político y social. Para ello, resulta importante incorporar los aportes del Enfoque de las Capacidades, en tanto, además de colocar al niño como centro y fin del desarrollo, postula un esquema de análisis que recupera sus necesidades y demandas en función de las oportunidades o límites de la estructura social. De este modo, la visión gira hacia un niño como actor social, quien tendrá un conjunto de derechos protegidos de acuerdo al marco jurídico y los ejercerá de manera práctica en los distintos espacios sociales, políticos y culturales. Es decir, será un niño que escogerá modos de vida que valore y tenga razones para valorar: un niño agente. Así, el presente estudio presentará una lectura analítica del Enfoque de Derechos, la Sociología de la Infancia y el Enfoque de las Capacidades, con el propósito de consolidar una propuesta final de análisis sinérgico e interdisciplinario para la participación y agencia en la niñez. De este modo, se espera contribuir al enriquecimiento de marcos teóricos que generen conocimiento y discusión para mejores políticas públicas en favor de nuestras infancias.

Multiple Struggles in Fighting Violence Against Women: Implications Among Roma Women Leaders in Spain

Violence against women is a central issue in global feminism and one that has united feminist activists from around the world. But this does not mean that the struggle is a single one: indeed, one can say that there are many, diverse and sometimes even contradictory struggles occurring throughout the world. In this presentation, we aim to highlight the struggle among Roma women leaders in Spain. We will present the results of a qualitative study with twelve women leaders of Roma associations. Semi-structured interviews were conducted and then analyzed using thematic analysis. The resulting themes included: strategies used to address gender-based violence, perceptions of gender relations and violence against women in the general population and in particular the Roma population, discourses regarding the role their organizations play/can play in preventing violence against women, and differences in discourses between diverse groups of (Roma) women, especially between those who are involved in mixed-gender organizations and those involved in women-only organizations.

The analysis allows us a closer approximation of how Roma women leaders perceive gender identities, gender relations and violence against women as well as the relationship between these elements and their collective action. Thus, our ultimate goal is to demonstrate how Roma women activists in Spain negotiate around different, and sometimes contradictory, ethnic and gender identities, from a position that involves, to varying degrees, sharing, knowing, understanding and assessing the social norms dominant in their contexts. These processes

of negotiation also imply some of the components of the global feminism imaginary, with a conflictual relationship that will be analyzed through the activists' discourse.

Christian Churches, Social Capital and Civic Involvement in Chile

In the last decade scholars have stressed the positive effect of religious commitment on the civic involvement of their beievers. In this presentation I will analyze original survey data from Chile including several Christian denominations as well as the Catholic, on the formation of social capital, religious practices, religious beliefs, and political leanings. Although a body of literature exists on religion and political involvement at a general level, this presentation analyses the differences between denominations. The relevance of this approach stems from the social transformation of Chilean society and the emergence of a myriad of new Christian movements, conveying innovative practices about participation in public life. The presentation treats two aspects: on the one side, it considers the characteristics of civic involvement of members from different Christian denominations. On the other side it considers whether social capital characteristics respond to "bonding" or "bridging" dynamics. I hypothesize that younger people as well as recently upwardly mobile believe will belong to denominations akin to their civic involvement and will also present higher levels of bridging social capital.

The Core of Personal Networks. an International Perspective on Social Isolation

Who do we speak with about the things we care? No matter what's the issue, knowing who people talk to shows the social shape of isolation in its quantitative (number of partners) and qualitative (subjective value attibuted to the relationship) dimensions. The presentation compares survey results about personal networks in Chile 2014 (N=2025), the US (2004 and 1985), and Toronto (1968, 1979 and 2004) taking issue on social isolation in three social contexts. In spite of obvious difference of size, economic development, political culture and religious beliefs, the comparison has interest in terms of the generality of outcomes associated with social isolation. Preliminary results show that the levels of isolation in Chile are not as large as those detected in the US in 2004. I will compare results about social cleavages detected in social relationships and their impact on the levels of interpersonal trust, exposure and tolerance to religious and ideological diverstity. I consider close as well as extended social relationships.The main hypothesis is that the more diverse the social network, the higher the levels of trust and tolerance to diversity. Aditionally I consider the geographic location of social networks establishing a difference between ghettos and enclaves.

ESPINOZA RIVERA, JERRY* (University of Costa Rica, jerryespinozar@yahoo.com)

Desecularization of Public Space in Costa Rica

Modernization and secularization of society has never been completely achieved in Latin America, a traditionally conservative region.

Costa Rica, in spite of its institutional stability, has not been an exception. At the moment this Central American country is the only one in the region that officially declares that Roman Catholicism is the religion of the state (article 75 of the Constitution of the Republic of Costa Rica). Notwithstanding that many politicians have recognized the necessity of reforming this article, all the attempts to establish a secular state have failed. Even more concerning is the fact that the political interference of religious conservatism in public policies have increased during the last decades.

This paper analyzes the religious appropiation of public space in Costa Rica since 2000, especially of policies related with reproductive rights. Since that year, Costa Rica is the only country in the world that prohibits IVF. It relates this phenomenom with the lack of a clearly defined border between religious and public space in Costa Rica since the Colonial period and the strong influence that historically has been exerted by Catholicism on public education.

Precarious Work and "Middle Class" Struggles

The aim of this presentation is to analyze recent trends in the labor field, namely the phenomenon of precarious work, and its impact on professional categories considered as "middle class". Empirical examples will be mentioned from

    *** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Portuguese and Brazilian social movements (between 2011-2013). The process of "flexible" working conditions as well as the retreat of social welfare in Southern European countries, especially in the period of austerity, have been increasing vulnerability and impoverishing of the middle classes. This have been distorting and frustrating its consumer patterns and upward expectations.

So, the argument considere the process of insecurity and instability in the employment field and try to show the possible interconnections between: (i) discontent among the middle class strata resisting to their decline; (ii) a traditional working class / trade unionism on decommissioning; and (iii) a youth generation who is facing the blockade of their future. I will try to present some examples of social movements in Portugal / Spain on the one hand, and Brazil on the other. In the first case, the so called "Desperate Generation" (Geração à Rasca) specially the great demonstrations between 2011 and 2013, but also the impact of the changes imposed by austerity measures in the labor field until the end of the financial rescue. In the second case, the 2013 rebellions in Brazil carried the marks of an educated youth and very familiar with the cyberspace, and that, according to the criteria of income and education, belongs to the intermediate categories of social stratification, that is: middle class strata. Are the interconnections between "insecurity", expectations and the middle-class status structuring new subjectivities and forms of collective action to confront the austerity policies? Does middle class lifestyles still require the consistency of the welfare state or do they prefer to rebuilt a meritocratic society?

Womenxs Working Role in Double Earner Mexican Families: Communication, Marital Satisfaction and Intimacy

One of the assumptions that for long time have been assumed in Mexican culture is that couples, usually under the form of the nuclear family, are supported by love and companionship. Although this has been sharply questioned by feminist and empowering views towards women, there isn´t enough data about how couples hold together or not by such model and how relationships are build and endure through a long period, especially in a rapid changing society such as the Mexican one. The aim of the paper is to analyze - through 30 in depth interviews to low-middle class working women, in double earner families - women´s experiences about their working role within their relationships, and if this can be related to other domains such as the quality of their communication within the couple, marital satisfaction, and intimacy.

Social Technologies for Trust, Transparency and Conflict Resolution and the Imagining of Peaceful Futures: The Engagement of Tamera Ecovillage with Peace Activism in Israel/Palestine

This paper is an ethnographic case study of how the use of social technologies, aimed at promoting transparency and trust in group processes, support pedagogical initiatives for peace activists that aim to promote the imagining and implementation of strategies for peaceful coexistence. The case study is Tamera, an ecovillage and peace research center founded in 1995 in Alentejo, southwestern Portugal.

Tamera is developing a replicable model for sustainable human settlements, based on a post-capitalist economic system and a peaceful coexistence among humans, as well as with other species and elements in nature. Since the early '00s, Tamera has been supporting activist groups in conflict regions through educational initiatives aimed at transferring the experiential knowledge it has accumulated, during the last decades, on social and environmental sustainability. At the core of such knowledge is know-how on the implementation of environmentally sustainable technologies, as well as social technologies aimed at promoting trust, transparency and conflict resolution in group processes. At the time of fieldwork (April-December 2015), the educational initiatives for peace activists revolved around three core projects of Tamera: "Global Campus", "Terra Nova School" and the "Community Course".

This paper looks at the collaboration between Tamera and peace activists in Israel/Palestine. It makes an ethnographic analysis of how the experiential learning, gained by activists that were present in Tamera for the "Global Campus", "Terra Nova School" and "Community Course" of 2015, contributes to the imagining and implementing of strategies for peaceful coexistence between Israelis and Palestinians. It pays special attention to how the use of the social technologies promoted by Tamera contribute to the dismantling of propaganda-induced images of "the enemy" and the "us-versus-them" attitude that feeds conflict. The fieldwork on which this paper is based took place in Tamera, as well as in various locations in Israel and the West Bank.

Una Nueva Historia De Las Mujeres: Un análisis En El Marco Del Proyecto "Mujeres De La Paz" En Brazil

Desde el concepto de género, que legitima y construye relaciones sociales, las mujeres y los hombres comienzan a comprender la naturaleza recíproca de género, la sociedad y las formas individuales y contextualmente específicas en que la política construye el género y el género construye la política. Por lo tanto, se propone analizar el Proyecto de Mujeres de la Paz (Ministerio de Justicia /Brazil) cuando las mujeres trabajan en el espacio público y en el tratamiento de la violencia a producir nuevos significados para sus propias trayectorias y de las otras mujeres. La propuesta consiste en incorporar una nueva dimensión a los estudios de género, poniendo la dimensión cotidiana de la práctica política como la mujer con su propia práctica dinámica. Sé una mujer como sujeto de políticas públicas que conducen a posiciones de las mujeres frente a situaciones de dominación. Tales políticas proponen que, a nivel de la sociedad civil, la mujer ya no es un particular y comienza a tener una identidad pública. La investigación, por lo tanto, la instrumentalización de las comunidades en el conocimiento de sus derechos para promover condiciones para el desarrollo social local, con el estímulo de diálogo con la comunidad, lo que permite acciones de prevención de los conflictos, mayor rendimiento y la promoción de la seguridad colectiva.

International Collaboration in a Department of Applied Physics in Mexico: Scope and Character Analysis from a Gender Perspective

In the global science scene that includes stratified logics characteristic of the international division of scientific labor, some academic and scientific communities from peripheral or developing countries have accomplished competent world-class work. Studies done in Latin America demonstrate the presence of research groups acknowledged and legitimized by the quality of their work, which have managed to become national models and hold prominent positions among international communities within their fields of study (Schwartzman, 2008, Altbach, 2004).

In this paper we analyze the characteristics and roles of international collaborations established by male and female researchers from the Department of Applied Physics at the National Polytechnic Institute´s Center for Research and Advanced Studies (Cinvestav-IPN, for its acronym in Spanish). We will discuss the results from work carried out together with the researchers from the department that included the construction of their co-authorship networks of scientific production during the period from 2000 to 2013 as well as their reflection on their insertion and enrollment mechanisms in international projects. We will reflect on a gender perspective that focuses on the differences between the types of international collaboration, access methods, and the roles of male and female researchers from this department. This attention, centers on scientific fields still characterized by low female participation. Additionally, the paper looks at the implications encountered by these men and women as a result of their enrollment in international collaboration projects responding to global demands as compared to those of national or local character which seek to address issues from the region where they carry out on their scientific activity. This work forms part of an on-going doctoral research project for Cinvestav-IPN´s Department of Educational Research.

Scientific Production Re-Configurations Under a Global/Local Perspective: The Case of Applied Physics in Southeast Mexico

This paper presents a preview of an on-going doctoral research project with the aim of studying the conditions that sustain knowledge production and reproduction processes within research groups which notably stand-out in the development of scientific activity and research-training in Mexico. Our interest is focused on studying foundational processes and subsequent developments undergone

by the first Department of Applied Physics in southeastern part of the country, established by the National Polytechnic Institute´s Center for Research and Advanced Studies (Cinvestav-IPN, for its acronym in Spanish) in the eighties under a national climate that favored the decentralization of scientific institutions and researchers.

It is the goal of this work to discuss that this group´s type of choices and the alignment of its research themes and threads can be understood from the interrelationships between the department members´ careers, the institutional development and the research demand forces at international, national and regional levels. Drawing on qualitative methodology that includes the use of multiple primary (in-depth interviews) and secondary information sources (analysis of scientific production and co-authorship networks, hemerography, documentary analysis) we propose an analysis of three configuration moment of the scientific production at the department during the period from 1980 to 2013. We will shed light on permanence, elimination, addition and reorientation of research lines and the ways in which researchers organize and structure their scientific activity. We will analyze the tensions and implications that these movements have generated over time in regards to the group´s role at participating and responding to knowledge production demands emerging from its own region before those derived from global science trends.

A Critique of Positionality in Critical Ethnography

In this study we focus on positionality of ethnographers. We know that some have discussed the meaning of 'the critical' in critical ethnography, and criticized for its focus on social change but lack of focus on researchers own positionality. According to Noblit at all. (2004) "[c]ritical ethnographers must explicitly consider how their acts of studying and representing people and situations are acts of domination even critical ethnographers reveal the same in what they study" (cf. Madison, 2005:7) This urges us the tense nature of positionality including double critics of the notion of objectivity and the notion of subjectivity. Although positionality must not be confused with subjectivity, our presentation mainly comprise a discussion on subjectivity reflecting upon researchers own power position. We already aim at discussing the tension about positionality in terms of our participant observation conducted in a bar where mostly gays go, but also which lgbti and a few heterosexuals take part. Our experiences were challenging because some guys touched us up a few times, After then we quite discussed whether it was called a harassment or not in sheltering our strategies coping with patriarchal structure as feminist women. Above all our discussion evolved to positionality of researcher in critical ethnography, that is, our positionality as 'self-reflexivity'. This is a "turning back" on ourselves, which creates the occasion for us to change ourselves thanks to examination our own position of authority: a transformation of the relationship we have with our own knowledge, a knowledge of others. In this respect it is important to ask if there is a limit to elude power position and make desubjectivation possible. Is not a *re*-contextualization' necessary? Otherwise do not we keep even our power position in questioning it as well?

EULE, TOBIAS* (University of Bern, tobias.eule@oefre.unibe.ch)

Law As Professional Field(s): Legal Education Between Narrow-Mindedness and Arbitrariness

"Law" as subject of tertiary education is increasingly a stepping stone for multiple types of careers beyond legal practice. In Switzerland, two thirds of law graduates find work outside chambers and judiciary. However, most law faculties still treat their students as attourneys-in-training, and do not offer insights into the more common forms of working in, with, or after law. This paper is based on focus group interviews with employers, practitioners, academics and students on diverging perspectives on legal professions and the challenge this poses to law as university subject. It argues that while there is an urgent need to provide students with a more realistic perspective of their possible futures, "legal education" works as stepping stone exactly because graduates are seen to have "classical" legalistic competences. While they might not ever work as solicitors, a key hiring quality seems to be their qualification as "as-if-lawyers". Legal education, then, must find a way to incorporate both classical professional training and a realistic preparation for the multiple fields of "law work".

EULE, TOBIAS* (University of Bern, tobias.eule@oefre.unibe.ch)

Unlikely Partners? Collaboration and Shared Interests Among Immigration Bureaucracy and NGO in Germany

Immigration management and local migration-related NGO are often seen as conflicting partners within the field of immigration control. While the former are usually described as focussing on restrictive law enforcement and having a criminalising attitude towards migration, the latter are seen as advocates of immigrants and partly implicit in irregular arrangements that seek to skirt state control. However, in Germany, immigration control agents and NGO representatives increasingly find themselves on similar sides of arguments, and can even be seen collaborating against other parts of state bureaucracy. This is true even for cases around irregular migration and asylum claims. Based on extensive ethnographic fieldwork with both immigration officials and NGO employees, the paper shows that migration control is not a simple encounter between static actors with opposing political views, but rather a complex contested field in which different actors can bridge political divides to build relatively stable political alliances. This is often of advantage for everyone involved: NGO actors are able to access bureaucrats more easily and, perhaps crucially, to increase their credibility to attain state funding. Similarly, immigration officials are able to avoid open political confrontations and "bad press", and can even instrumentalise NGO for critiques of federal policies. However, these alliences should not be seen as everlasting, but rather momentary and relatively instable, depending on case and political context. In this sense, immigration officials and NGO representatives should be seen as convivial sparring partners rather than classic antagonists.

EVANS, PETER* (University of California, Berkeley, Dept of Sociology, pevans@berkeley.edu)

National Political Trajectories and the Changing Power of Labor in the Global South

A Polanyian strategy can help us build on recent theorizing of labor's comparative political success at the national level. Cheol-sung Lee's focus on the construction of political networks connecting labor militants with both communities and political parties seems on target. But, the effects of political networks are unstable, as Lee documents in detail in the Korean case and as recent decades in South Africa and Brazil confirm. How can we build on Lee's network-based model to get a more satisfying theory of differences and changes overtime in labor's clout among a range of similarly situated middle-income countries in the global South?

The construction of networks and the robustness of their effects depend on the extent to which the labor movement is seen as serving a "breadth and variety of the interests" in addition to its own (Polanyi, 2001[1944]:163), that is, on the extent to which other sectors and classes see labor's struggles as furthering their own aspirations. When middle class aspirations for political voice are blocked by authoritarian regimes, labor may be perceived as a champion of general interests. But, the parameters that allow labor rather than some other group to take this role have not been explicated. Nor do we understand what prevents a simple escalation of repression from undercutting labor's success. Finally, the perils of success itself must be considered. Michels and the Thermidor still lurk.

We may still lack satisfying theories of labor's successful engagement in national political trajectories, but this does not excuse us from exploring the possible lessons of labor's comparative fortunes in recent years. Complementing CS Lee's analysis of network effects with a Polanyian analysis of perceived service to the commonweal is one way to move forward.

When and Why Do Synergies Work? Comparing Synergistic Movements to Stop "Free Trade" to Synergies Between Transnational Labor and Feminist Movements

Two contrasting cases in which synergistic strategies joining transnational labor movements and other transnational social movements appear to have benefitted labor and its partner movements create fruitful foundations for debating the theoretical underpinnings of cross movement synergies.

At the beginning of the millennium, a set of diverse social movements known as the Hemispheric Social Alliance (HAS/ASC), in which labor played a leading role, stopped the Free Trade Area of the Americas (FTAA), a regional trade and investment regime strongly supported by both capital and globally hegemonic political actors. Today, no similarly powerful counter-alliance of social movements to counter the Trans-pacific Partnership (TPP) and the Transatlantic Trade and Investment Partnership (TTIP) is to be seen. Why cross-movement success in the FTAA case and not (yet) in the fight against the TPP/TTIP?

Synergies between transnational labor networks and transnational networks focusing on rights and gender equity have a different trajectory. Silvia Walby (2011) asserts that there has been a "re-gendering of unions" and that "Trade unions are the largest feminist organizations." Possible explanations include the shifting composition of trade union membership, the increased salience of issues with a strong gendered component, such as fights against austerity and cutbacks of public services, and the increasing importance of women workers' organiza-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tions in transnational efforts to organize informal workers, as in the fight for ILO Convention 189.

The contrasting historical dynamics of the two cases is provocative. In the first synergistic victory, historically conjunctural factors that apparently will not be repeated appear to have been crucial. In the second, robust long-term structural changes reinforce the logic of cross-movement synergies. Is the contrast between the two cases serendipitous? Or does it offer a start toward a more general argument about when synergies are likely to work?

Successful Aging: History and State of the Art

Robert Havighurst advanced his concept of successful aging, understood as life satisfaction continuing into later maturity, in the early 1960s. The two theories he drew inspiration from were those of activity (maintaining the level of social activity typical of middle age) and disengagement (individuals gradually leaving society). Both theories were later criticized for their allegedly one-sided nature; nevertheless, they formed the basis of contemporary views on "aging well". Various researchers saw this as healthy / active / positive / productive aging. Today, successful aging is regarded by gerontologists and sociologists as a broad framework not limited to one particular theory and aiming to encompass the whole older population. Both relatively healthy individuals and those with a disability, working and retired, (grand)parents and childless can be said to be aging successfully if their view of themselves and their lives is positive rather than negative. Meredith Flood defines successful aging as an ability to adapt to emerging changes while preserving one's own identity and a sense of life. A promising trend consists in connecting successful aging with the concept of gerotranscendence which was put forward by Lars Tornstam in the late 1990s and implies transcending, in old age, the limits of everyday material existence, thus reaching a new personality level (characterized by selectivity in connections and activities, increasing independence of other people's opinions and focusing on the spiritual rather than the material). According to Pamela Reed, this can be achieved through altruistic behaviour, lifelong learning, creativity, keeping a diary and various forms of sharing wisdom with others. William Randall suggests that a vital component of the process is irony; it helps a person accept the ambiguity of life, be less serious about oneself and eventually one's own end. Successful aging thus proves a fruitful framework for the 21st century.

Successful Life Trajectories in Old Age

The paper presents interim results of a project currently carried out by a group of researchers, including the author, at the Institute of Scientific Information on Social Sciences of the Russian Academy of Sciences, Moscow. The project is devoted to individual successful life trajectories. By means of semi-structured in-depth interviews, it studies biographies of Russians who manage to adapt to social changes, change their life routes if necessary and thus succeed, those who gain more than lose on the way. Along with young adults (aged 22–35 years) and middle-aged people (over 36 years), older people (aged 55–60 years and over) are interviewed (the author is in charge of this part of the project). The latter continue working, start their own business or, retiring, master new areas of activity (computer and the Internet, foreign languages, creative hobbies) and feel satisfied with their life, therefore they can be said to be aging successfully.

Social Services in Five Nordic Countries in Times of Disaster

Guðný Björk Eydal, Professor Faculty of Social Work, University of Iceland with Carin Björngren Cuadra, Senior Lecturer, Department of Social Work, Malmö University, Sweden; Rasmus Dahlberg, PhD Fellow, DEMA and the University of Copenhagen, Denmark; Björn Hvinden Professor, NOVA, an institute at the Oslo and Akerhus University College of Applied Science, Norway; Ingibjörg Lilja Ómarsdóttir, PhD student, University of Iceland, Merja Rapeli, Ministerial Adviser, Ministry of Social Affairs and Health, Helsinki, Finland; Tapio Salonen, Professor, Faculty of Health and Society, Malmö University, Sweden.

The Nordic countries are known world wide for their extensive welfare systems often referred to as the Nordic or Scandinavian welfare model. Local social services are an important component of the Nordic welfare systems, and their role is to ensure the inhabitants with basic recourses, benefits, housing and services in times of need. There is a growing literature about the importance of local social services in times of disaster. The paper asks if and how the local social services are part of the emergency planning in the five Nordic countries, Denmark, Finland, Iceland, Norway and Sweden. First the paper provides state of the art on the issue providing an overview of the literature about the role of social services. The legal obligations of the emergency and social services are examined in order to provide the necessary data for the policy analysis conducted. The main characteristics of the services are examined in order to provide picture of the institutional organization in each country. Finally the models of social services in times of disaster for each country are compared in order to reveal if there is a Nordic Model of Social Services in times of disaster or if the countries have taken different paths regarding the policies on the role of social services in times of disasters.

EZAWA, AYA* (Leiden University, ayaezawa@gmail.com)

The Enemy within: Japanese Children Born of War and Discourses on WWII

One of the most significant aspects of the experiences of many Dutch-Japanese children born of war, born to Indo-European (Dutch-Indonesian) women and Japanese men during the Japanese occupation of the Dutch East Indies (1942-1945), is that their identity and existence continues to be defined by past and present discourses of WWII. Rather than their supposed racial, ethnic, or cultural characteristics as 'Japanese', it is the discourse about the Japanese at war that prevails in the Indo-European community in the Netherlands, and their heritage as a child of a reviled enemy that has come to define their personal life and identity and made them feel rootless and isolated. Even more significantly, the differentiation and marginalization many children born of war experienced took place within the family and community of their upbringing. Many grew up with strained relations to their mothers and step-fathers, making them feel like outsiders with no 'home' or 'real' family or community to fall back on. In this paper, I examine this process of identity construction in the context of the experiences of Japanese-Indo-European children born of war, who resettled to the Netherlands in the aftermath of WWII. Now of pension age, their stories shed light not only on experiences of marginalization as children of the enemy, but more importantly, the role and relevance of public and private discourses which have silenced their existence and contributed to their marginal status within their own families and communities. Based on life story interviews, this paper highlights the long-term impact of family and community memories of war on their personal life courses, as well as the ways in which children born of war have begun to engage with, and negotiate the meaning of their existence in the context of discourses of WWII.

Changing Sex Ratios and the Elderly Missing Women Problem in East Asia: Causes and Consequences

Since the introduction of the term „Missing Women" by Armatya Sen in 1990, several scholars have theorized explanatory factors and analyzed the extent of the phenomenon. Most of this research, however, focuses either sex ratios in the whole population or at birth and in very young age groups. We widen the

scope by discussing causes and consequences of elderly missing women. Such an elderly missing women problem might be the (summative) result of gender discrimination over the whole life course, of unequal sex ratios in special birth cohorts in the past, and period or cohort effects during the life course of these cohorts. The paper firstly systematizes these causal factors across the life span to explain the causes of an elderly missing women phenomenon. Secondly, UN population division data is used to provide empirical evidence to the extent of the phenomenon in East Asia, using countries from the Middle East as a contrast. By applying cohort and age group perspectives over time, the relative importance of the potential causal factors will be assessed. Finally, consequences for future development and social policy – for example, informal care needs in case of elderly missing women – will be dicussed.

Food and Risk - a Sociological Risk Discourse Perspective

In contemporary society, the risk concept has become an everyday expression referring to real and perceived situations that can be professed as dangerous. It has become easy to perceive life as more dangerous than in ancient time given the prevalence of negative mass media stories, as well as a political and policy emphasis on risk and security.

Food habits are among the most deeply ingrained forms of human behaviour and food and beverages, although central to life and pleasure might also carry some inherent or introduced risks of causing harm to human health and wellbeing. Risk is an all encompassing but fairly nebulous concept applicable to many facets of life.

Within the sociology discipline, risks have been analysed mainly from three theoretical perspectives: the socio-cultural risk discourse, the risk society discourse and the governmental risk discourse.

In this paper, I discuss the disparity between scientific knowledge and public perception of risks in relation to food production, processing and consumption, where scientific knowledge and public perception often contradict each other about what constitutes a risk.

Conflits Armés Et Changement Social à Cité Soleil (Haiti) De 1990 à Nos Jours: Une Analyse Critique De La Gestion Politique Et Du Rôle Des Religions

L´objectif de la recherche consiste à étudier les conflits armés à Cité Soleil comme élément de changement social et analyser le rôle des religions comme espace social et collectif de renforcement des liens sociaux et de réorganisation de la vie sociale entre les individus lorsque ce phénomène se produit. En effet, à Cité Soleil, commune de 22 km², de 252. 960 habitants et d´une densité 11.498,18 hab/km² (IHSI, 2003), située dans le département de l´ouest au nord de Port-au-Prince, la capitale, se développe, depuis 1990, un phénomène recurrent: conflits armés entre des groupes sociaux et, quelquefois, entre ceux-ci et les forces policiaires aidées de la Minustah. Ce qui débouche sur des affrontements violents faisant quelques centaines de morts. Sa fréquence et sa répétition nous imposent d´entrevoir trois paramètres. D´abord, il s´y trouve un problème sociologique à caracteriser, dont il faut déterminer le fondement social. Ensuite, il faut souligner qu´un problème de rationalité, en matière de méthodologie, pèse lourdement dans la balance de gestion politique de tels conflits. Enfin, si les deux premiers paramètres prennent en compte les aspects sociologique, méthodologique et politique de la question, le troisième s´intérèsse à montrer qu´il s´agit d´un champ empirique rempli d´acteurs politiques, religieux et sociaux, dont les interactions sont susceptibles de complexifier la construction de notre objet sociologique. Néanmoins, notre choix de Cité Soleil, comme champ de recherche empirique, se justifie par rapport à sa position géopolitique et stratégique en tant que, suivant notre analyse, l´un des espaces géographiques le mieux appopriés pour, non seulement, analyser politiquement ce phénomène et le rôle qu´il jouerait dans le procesus de changement social en Haiti, mais encore, étudier comment la religion, comme institution et croyance, se renforce durant ces conflits et comprendre dans quelle mesure les cultes religieux se seraient transformés en une espèce de marchandise.

Sociology for Transdisciplinar Innovation: Useful R&D for Solving Real Problems. Case Study.

If there is a process where **transdisciplinarity** must be a fact, that is the process of innovation and, in particular, **technological innovation in products and services**. The research reality of European universities and companies, however, does not always reflects the need for collaboration between different fields of knowledge. The transdisciplinary work between social and technological researchers (most complex than multidisciplinary, since it does not operate in parallel, but together) is the only one able to offer solvent innovations, from a technical point of view that, at the same time, **guarantee practical solutions to real problems**. It is usual, instead, that as a result of this inter-disciplinary distance,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

lots of **"ownerless" innovations** are generated, implying an enormous waste of economic and labor resources.

The methods and techniques offered by **sociology** show great potential for the organization, **guidance and systematization of innovation teams**. This paper presents the extensive experience of the research staff of the Department of Sociology I (at the **University of Alicante**) in the management of national and international innovation cross-disciplinary teams. Methodological conclusions of the detailed analysis of more than a decade of work in this field are presented. The **success stories, best practices, mistakes for learning and organizational management** improvements are also provided. The procedures used by the research team of sociologists, and its theoretical foundation, are set with the intention of spreading its usefulness as a tool in this field of application, justifying the **importance of sociological knowledge in managing creative heterogeneous teams** capable, instead, to cooperate harmoniously for generating technological innovations of great social impact. To conclude, **considerations** on the work that remains to be done, the possibilities of **expansion of the discipline** in this field and **teaching models** used in the University of Alicante for training future sociologists in this field are offered.

Situating Outsourceable Labor: Location Work and the Era of Transnational Service Expansion in the Global Economy

What happens to the work process when outsourced *service* jobs move to remote locations overseas? Building on conversations in the sociology of work, this paper directs attention to changes in the labor process observed in transnational service platforms. By working as a customer service agent for an American company that has outsourced to the Philippines, I examine the labor process within a third party, offshore call center. Revisiting the literature on economic restructuring toward services *and* global restructuring in fragmented service platforms, I account for observed yet understudied features of transnational service work by extending the discussion beyond the framework of emotional labor (Hochschild, 1983). Although service labor theorizing offers handles for understanding work in post-industrial economies, existing literature on service work does not yet fully account for work transformation taking place in globally-fragmented service platforms. Following changes in sociological analysis of the labor process, I argue that work in the transnational call center involves location work geared toward the production of proximity in remote, real-time services, where third-party vendors, clients, customers and workers are dispersed in various parts of the world.

The Making of a Transnational Workforce: A Historical View of Global Labor Deployment from the Philippines, 1974-2014

This paper provides a historical account of the growing and increasingly diversified deployment of Filipino workers in various parts of the world. Official government figures show that since 2004, more than one million Filipino workers are dispatched to a variety of occupations and sectors in 196 destinations worldwide. With the rise and facilitation of a brokerage state that has institutionalized channels for labor export, Filipino workers have become regarded as the most globalized workforce in the planet (Rodriguez, 2010). Taking stock of four decades of institutionalized labor export, I extend the labor export discussion beyond migration to cover three key modalities: overseas migration (OFW), special economic zones (EPZs), and transnational service outsourcing (BPOs). The study aims to explore an institutional and intergenerational connection between strategic labor export modalities. Harnessing key pieces from Philippine migration and outsourcing literature, and Philippine government statistics on OFW deployment and BPO expansion, I map out key processes, actors and mechanisms involved in the transnationalization of the Filipino labor force since the New Labor Code of 1974. Here, I link the analysis of 1) an enduring modality where workers physically move from one location *(overseas work)* to 2) a more recently diversified platform, wherein jobs and investments move while workers stay fixed in their locations. By looking at these deployment modalities as connected rather than separate arenas, can we develop a better understanding of how a transnational workforce emerges and expands? What can we learn about the mechanisms and dynamics of transnational worker circulation from the supply side case of a labor exporting country? I conclude with a research agenda for intergenerational research on the expansion of a transnational labor force.

The Same Job but Different Earnings. the Women Graduates' Experience from Catalan Universities.

The issue we address is related to the income gap between men and women who have gone through the process of university education. Since half of the twentieth century until today it has been a vast majority of graduates' students who were the first in their family to go to university in Spain. If we distinguish by gender are different trends (counterbalanced each other). So, we note that women during that half century began being less but ended up being as much than men, the reverse of what happened with the participation of men. We focus on the role of the university in the distribution of social opportunities and we pay special attention to the differences in the labor market indicator by sex. Within the university operates a process of homogenization that is diluted in the labor market as far as occupational hierarchies and salary concerns. Thus the aim of this presentation is to compare the employment situation of universities graduates by sex in the labor market insertion process.

We have a survey by the Agency for the Quality of the University System of Catalonia on the employment of university graduates, which explores the employment situation in 2014, of people who had graduated in 2010. From the analysis of contingency tables, T-test, analysis of variance and logistic regressions, different labor market indicators such as activity rates, unemployment and inactivity, job quality and special emphasis is placed on the salary situation of men and women are explored, in order to analyze whether there are differences. The comparison of the data allows us to observe that gender gap persist.

Gender and Public Security: An Analysis of Women in the Brazilian Polices.

This paper proposes a discussion on gender aspects underling the police institutions in Brazil based on a study of women's civilian (judiciary) and military (patrol) police in eleven states. The aim of this study was to understand and explain the power dynamics crossed by gender meanings in police institutions from three main dimensions: 1) work of policewomen conditions in the current context, considering that their entry in these institutions took place in the 80s; 2) forms of violence generated and produced within police institutions, which are predominantly male spaces and permeated by force, expressing the monopoly of legitimate violence; and finally, 3) how gender issues affect on women's careers in the police. The empirical research used focus groups with women of both police institutions nationwide. From the fieldwork we observed that there are processes that promotes invisibility of women in Brazilian police institutions, which are evident both in working conditions, as the institutional violence, as well as on issues related to career. The research allows highlighting the tensions and contradictions that has marked the process of integration of women in the police. It is an ongoing "insertion process", full of advances and setbacks, which needs to be constantly enhanced and updated by women's conduct, practices and strategies to obtain the approval and recognition of colleagues. Remains in Brazil, the challenge of building a citizen police the incorporate gender issues in its institutional policy.
