Scholarship on environmentalism of the South has hitherto paid scant attention to Southern environmentalism that is not focused on material concerns or immediate livelihood issues of the poor. This paper introduces the case of environmentalism in Iran, as an example of progressive environmental politics of the middle classes which is not directly concerned with material concerns. It traces the emergence of the environmental movement in Iran to the launch of a nationwide reform movement which began in the 1990s and facilitated civil society mobilizations. Hence, the paper contextualizes the environmental movement with reference to the previous Iranian social movements and their actors. It argues that the emergence and evolution of the environmental movement in Iran should be understood as a particular response to a particular state-society relation and with reference to the specific socio-political context of Iran after the revolution of 1979.

Big Textual Corpora and Mixed-Method Approach. Analysis of the M5S Institutional Blog in Rome.

The technological tools now available make it possible to download large bodies of textual data from the internet, to undertake varied and complex analyses, and to combine a myriad of research techniques and tools. They also make it possible to harvest the fruits of fertile interaction between extensive and intensive research, automated and non-automated techniques and qualitative and quantitative approaches, applied to either the global population or specific samples thereof. Intended as a contribution to big data analysis, this piece presents the most significant results of a study into the political communication of the Rome branch of the M5S, or Five Stars Movement, conducted through analysis of its blog. The empirical basis of this study was a big text corpus, comprising posts, comments and images, which brought together all blog material produced between the period immediately prior to the May 2013 administrative elections and the present day. This corpus was subjected to advanced statistical text analysis, as well as targeted hermeneutic and content analysis. Semiotic analyses of visual material were also performed, in addition to network analyses of blog contributors and analyses of communicational efficacy. The research team comprised experts from across several disciplines (General Sociology, Semiotics, Computer Science, Statistics, Economics) and a variety of institutions, including La Sapienza University, ISTAT and the Ministry of the Economy. The team worked in constant collaboration, adopting a mixed-method research approach. In addition to yielding interesting substantive results pertaining to an iconic case of institutional communication in Italy's modern political arena, this integrated research approach made it possible to conduct systematic data quality checks and to obtain results for a range of research subjects: cultural products, individuals, groups and relations systems.

Leisure Time on Virtual World; A Battlefield to Create Virtual Capital

Taking selfies of most personal moments and publishing them on Instagram has posed a serious question: Is there any leisure time left or the newfound virtual world has converted it to a battlefield of gaining more likes for our photos. Instagram is currently accessible in Iran. A simple cellphone camera is used to create "virtual capital" while achieving "real capital" in rigid and systematic structures of the real world is very difficult.

In this study, I have divided leisure times into 2 categories:

1- Active Leisure time: Time that is spent for increasing the virtual capital and using its real benefits by taking photos and films and publishing them on virtual world and gaining more likes. Creative presence on virtual world is also considered as leisure time.

2- Passive leisure time: Time spent as a passive observer to read or watch other materials on virtual world. In the passive leisure time, we are unwilling to create virtual capital or to create external opportunity for future benefits on virtual world.

I created a page on Instagram (@ba2charkhe) for this study. I asked my followers to ride bicycles in their leisure times, take photos of their cycling moments and send them to me to be published online. A prize was announced to be awarded to those photos that gained more likes. In a short time, this became so popular that I gained approximately 10000 followers in 6 weeks.

This fieldwork of mine is for online observation of behaviors of those who use their leisure times to create virtual capital and to turn it into a real capital. I am going to generalize this case study to the total field of leisure time: Leisure time has been turned into a battlefield to create virtual capital. The method of my research is virtual ethnography.

The Increase in Human Capital through Sharing Images on Virtual Space

It is clear that the virtual networks in Iran, compared with the classic media, is more reliable for citizens. That is because Iranian virtual media is less dependent to institutions and parties, and less controlled by the authorities. In this article we discuss the reasons behind publishing photos in Instagram.

Inspired by Bourdieu, we use the notion of capital to explain this phenomenon and expand the concept in our analysis. Being a member of Instagram, one can increase his or her capital. We propose two notions of capital; "Real Capital" and "Virtual Capital". "Virtual Capital" could of course lead, in a way, to increasing "Real Capital". We call, then, the sum of the two as "Total Capital".

One can make the capital in the virtual society through "false codes", the notion we may theorize under "virtual social association". This effect can be made at another level by the aggregation of these images in the media through hashtagging.

Construction of the ideal physical and cultural capital in the virtual world through a "manipulate identity" could increase the virtual social association and consequently the economic capital. We define the virtual capital in terms of "like" symbol in Instagram. "Like" is the objectified form of virtual capital where strict social structures do not let abrupt increase, a jump, in the person's real capital.

Our findings are resulted from a survey with sampling of 384 members of Instagram in Iran. The results indicate that people increase their capital by being present in the virtual communities. It is also shown that their behavior in their pages is different from the real world

Is the Treaty of Lisbon Neutral Towards Language Minorities in the European Union?

This paper analyzes the Treaty of Lisbon for language defining the linguistic obligations of the EU and the language rights of its citizens. The Treaty fails to address the rights of minority language speakers in the EU, including, most perilously, the rights of minorities who are seeking to secede from their own countries (Catalonia, Scotland) and minorities who use violence in their quest for political rights (Basque Country, Corsica). The paper calls for a more pluralistic approach to language legislation (Romaine 2013) and for *de jure* language rights for speakers of minority languages in the EU, especially for speakers of official minority languages, such as Catalan, Basque, and Galician in Spain, Scottish Gaelic and Welsh in the UK, and others (Faingold 2007). The reason to single out minority languages that enjoy some degree of official recognition in their own countries is that conflict between these languages and the majority language may exacerbate existing claims of self-determination or secession in the EU. Also, new language legislation could recognize the rights of some languages with territorial status but official without status in their own countries, e.g. Breton, Corsican, Occitan, and Sardinian. Explicit language legislation can help to solve conflicts between speakers of majority and minority languages by defining legally the status and use of such languages (Faingold 2004).

Trust and Public Support for Environmental Protection in Diverse National Contexts

Worldwide, most people share scientists' concerns about environmental problems, but they reject the solutions policy experts recommend. Why? I show that this puzzling gap between the public's positive concerns and normative preferences is due largely to a lack of trust, and particularly political trust. This is not the first paper to identify social and political trust as correlates of environmental attitudes. But, partly because of an overemphasis on statistical rather than substantive significance, previous studies have overlooked the greater importance of trust compared to other factors, and also the specific ways in which trust correlates with environmental attitudes. While perceptions "that humans endanger the natural environment" and a "willingness to protect nature" are in one sense twin dimensions of "environmental concern," I show that in another sense these are quite distinct things. Based on multilevel models fitted to two international survey datasets, people who are trusting do not perceive environmental problems as any more serious, but they nonetheless attach more value to environmental protection. By some measures, the same relationship holds cross-nationally as well. Preferences about protection and policy are therefore far from determined by people's beliefs and concerns. Meanwhile, an influential competing theory holds that support correlates primarily with left rather than right political ideology. The results here, however, show that this correlation varies substantially from country to country, unlike that with trust, such that in much of the world environmental protection is not a left-right issue (as it is, for example, in the much-studied case of the United States). In some places, if anything, it is a right-left issue.

Preventing the Rapid Spread of HIV Among Young Women in Sub Saharan Africa

The expansion of anti-retroviral treatment and more effective prevention strategies has had a significant impact on many countries in Sub Saharan Africa(SSA)--the most severely HIV affected region of the world. Since 2003,over seven million people have been put on ARVs, six million men have received voluntary male circumcision, and 21 million individuals have participated in prevention programs(Birx,2015). These efforts have resulted in a decrease in AIDS mortality and prevented millions of new infections. Yet,without substantial additional funding for these programs,there could be 28 million new infections,mostly in this region,-by 2020(UNAIDS,2014).

With global funding for HIV treatment and prevention essentially flat lined,it is essential to target populations and localities where the epidemic is spreading most rapidly. In Sub Saharan Africa,adolescent girls and other young women are disproportionately affected by HIV. Recent data shows that in 2013,380,000 adolescent girls and young women were infected with HIV in SSA. Over 80 percent of the new infections among adolescents in these countries were young girls(UNAIDS,2014). The objectives of this presentation are to describe the spread of HIV/AIIDS among adolescent girls and other young women in selected countries of Sub Saharan Africa ,discuss social and economic obstacles to their participation in prevention and treatment programs, and present evidenced based combination prevention interventions that are now targeting this high risk group. These core prevention interventions have been developed by PEPFAR and Global AIDS programs working in Sub Saharan Africa.

Músicos Callejeros: La Liquidez Del Espacio-Tiempo Social En Un (sobre)Vivir Disfrutando y Disfrutar (sobre)Viviendo.

Esta investigación se centra en músicos inmigrantes que desarrollan su arte en dos espacios públicos de Barcelona -los alrededores de la Catedral la Santa Cruz y de Santa Eulalia, "la catedral de Barcelona" y en el Parc Güell. La investigación busca comprender en qué medida las prácticas de vanguardia o alternativas del siglo XXI se relacionan con el sistema actual en diferentes aspectos de la vida social, el trabajo y el ocio. Esto es, de manera menos fragmentada y menos rígida, desde la liquidez del espacio-tiempo social contemporaneo señalado por Bauman, tensionando las fronteras construídas para estas prácticas en las sociedades occidentales. La diferencia sutil, pero importante en la ocupación de estos dos espacios públicos radica en la fuerza de la represión que la policía y/o el Ayuntamiento ejerce en cada una de ellos; en consecuencia, tenemos dos grupos diferentes de músicos tocando en estos espacios. Los que tienen permiso oficial para tocar en espacios públicos y aquellos que tocan sin permiso transgrediendo el sistema. A partir de la situación común de ser un inmigrante, en la que el desplazamiento espacial y cultural lo muestra en el lugar de lo diferente, del otro, lo confronta con la idea de la legitimidad y la transgresión, se provoca un giro que se expresa cuando se (sobre)vive disfrutando y se disfruta (sobre)viviendo desde las interaciones multiculturales experimentadas. Es decir, la investigación busca responder a la siguiente pregunta: ¿Cómo el papel de la coacción social influye en la relación entre el trabajo y el ocio, tensando la sociedad y las personas que comparten / rechazan vivir con las diferencias de los músicos callejeros inmigrantes, aun cuando esto constituye una representación de la multi e interculturalidad que define a la ciudad de Barcelona?

Adolescent Students As Media Fictional Characters: Preventing and Repairing Poor Engagements Between Teenagers and School through Media Literacy.

When economical and professional future has turn in Spain into such a difficult subject for youth, Education has to struggle with serious difficulties of presentism and early school leaving among adolescents: many teenagers are losing the hope in future and the will of learning. Together with a number of prevention programs that face this problem, Sociology of Art faces an important question: while looking for reference models to build up their own identity, which portrait of themselves is found (and chosen) by adolescent in films or series? How do these narrations represent their life as students and the importance, purposes and difficulties of their Education?

Media fictional narrations on adolescents as characters and target are used by teenage audiences when looking for references for their identity building. As a starting point for Media Literacy activities to help teenage students in this process, this research focuses on the representations of adolescent students proposed by different kinds of media fictional narrations. Three European narrations have been chosen in order to analyse and compare different genres, codes and values: the television series «Física o Química» and the films «Harry Potter and the Order of the Phoenix» and «The Class». A classic narrative analysis approach has been applied in order to encourage teachers to use this kind of Media Literacy activities by employing methodologies that they are familiar with. The results show that such a methodology could facilitate the comparative analysis of important coincidences between these examples (such as the importance of friendships and couple relationships) and also underlines meaningful differences (like orientation to the future). The study -done in Secondary Schools of Madrid during 2013 and 2014- shows the viability of the proposal in order to be applied with adolescents, even in disadvantaged or multicultural contexts.

"Fat for an Asian": The Embodiment of Stereotypes in an Online Asian American Community

Previous research suggests that diffferent racial groups have differing ideal body types, but Asian Americans have largely been absent from this literature. Thick Dumpling Skin, a blog that focuses on body images issues and eating disorders in the Asian American community, provides an opportunity to study this unexplored topic. Thick Dumpling Skin is highly interactive and features submitted posts from multiple users. Using qualitative content analysis to code archived blog posts from 2011 to 2014, this paper studies how online users in this community come to embody stereotypes regarding the Asian body. In my analysis, I discuss how users define the ideal Asian body in ways that make "thinness" and "Asianness" synonymous. To members of this community, being a "fat Asian" is a contradiction, and threat, to their Asian identity. Using the microaggressions literature, I examine the potential psychological consequences of not fitting the ideal Asian body. This paper also asserts that Asians do subscribe to a thin ideal, but it is not the same ideal held by whites. I conceptualize the need to attain the perfect Asian body as the embodiment of the model minority stereotype.

A Becoming-Revolution: Understanding Indigenism through Contemporary Sociological Theory

This paper aims to advance Indigenous conceptions of the world as a potential strategy that connects humans to their non-human environment. Drawing on the congruencies that exist between North American Indigenous thought and contemporary sociological theories is an attempt to highlight a renegotiation of human potentialities.

The primary purpose of this research is to expose the central tenets of Indigenous ways of knowing as not only valid but possible. At the crux of this argument is an emphasis on Indigenous understandings of the perpetual inter-relationships between species, space, place and time. These metaphysical beliefs not only help illuminate the ways in which the inherent state of the pre-colonial being has been compromised by imposed systems, but strongly suggests that a return to collectivity in both thought and praxis will allow for a necessary reimagining of our world.

In an attempt to bridge the epistemological-ontological divide between Western and Indigenous thought, I draw heavily from concepts found within contemporary sociological theory. Texts from Deleuze and Guattari on control societies, rhizomatic thought and the process of becoming, and from Hardt and Negri on the concept of love, help to reaffirm Indigenous ontology as revolutionary. The discussion of how human potential is quelled by systems of control offers an understanding of the potentially transformative interrelationships between humans and the universe. Thus, Indigenism sets the stage for a reinterpretation of a future, at the centre of which is a collectivity that is driven by passion and sustained by love. Thus, the use of this theoretical work in relation to Indigenous theories and practices emphasizes an anti-colonial contemporary society that protests inequalities and embraces interconnectivities. Ultimately hopeful, the remapping of human ways of seeing, feeling, thinking and living as inter-beings within the world intends to advance the Indigenous commitment towards breaking free of existing hierarchies.

Herstories of Urban Homelessness: A Sociocultural Examination of Inuit Women Living in Situations of Homelessness in Montreal

Increasingly, Inuit individuals are leaving their northern communities and relocating to southern urban centres to escape overcrowded housing, high cost of living, limited medical and social services and lack of employment opportunities. As a result of this migration, Montreal currently holds the second largest urban concentration of Inuit peoples in Canada. While the city is said to host a wealth of social resources, Inuit in Montreal are often confronted with difficulties related to language barriers, low levels of education, intergenerational trauma, racism, discrimination and cultural disparities.

That said, the challenges faced by Inuit women are even more numerous than those of their male counterparts, pointing to high rates of domestic abuse, an increased level of sexual abuse and further, the added responsibility of caring for their children. These difficulties and the scarcity of available resources specific to Inuit women in Montreal hinders socioeconomic success among this population. As such, Inuit women often find themselves without permanent housing in Montreal.

To date, the topic of Inuit homelessness in urban settings has been ignored, despite being inextricably linked to the lack of critical resources in the rural north. Indeed, academic research on street-involved Inuit women has yet to be written. My intention is to address the neglected gendered dimension of homelessness and Inuit identity in Montreal. The crux of this research aims to uncover the lived-experiences of self-identified Inuit women in situations of homelessness in Montreal. First, I explore the reasons that motivated them to make the journey from their northern communities to Montreal. Additionally I attempt to uncover whether they perceive their identity as being shaped by their current circumstances. Further, I ask what needs, issues and concerns they identify as being directly related to being an Inuk woman living on the streets of Montreal.

The Role of Objects and Technology in Stabilizing and Reproducing Early Hunters and Gatherers Societies.

Hunters-Gatherers societies has been considered the first model of "human" social organization, and the most durable (at least 90% of human history). Despite classic theories and concepts about this model of social organization, we'll argue that it raised up from a loose-knit network of weak ties.

In late Pleistocene the firsts Homo erectus abandoned the jungle niche for the vast dangerous Savanna, bringing whit them their weak ties based model of social organization. Hunters-Gatherers societies is the answer of hundreds K-years of adaptations processes to the new niche, resulting in a unique highly complex (for numbers and typologies of social ties) model of social organization. So unique, indeed, in his complexity that just us among all mammals have succeeded in stabilizing and reproduce it between generations.

The new model of social organization, born as a resulting of these adaptations processes (mainly guided by the need of protection from predators), is formed by 2 cores of social gathering: one at the population level assort by weak ties and the new nuclear family composed by strong ties. From Hunters-Gatherers societies on, hence, we are able to talk about ours socials organizations models calling them societies, because from then on we can observe the stable form of all other features that characterize the concept of society.

How could the Homo, alone among all mammals, stabilize and reproduce a model of social organization so complex? We'll argue, from an ANT prospective, that objects and technology has played - maybe still plays - a central role in these processes stabilizing ties and allowing each individual to manage a higher number and typology of ties translating the social complexity in social complication.

Mind the Gap! Analysing the Gender Gap and Crisis Effects on Occupational Paths of Young Graduates in Italy

In Italy working and career opportunities are strongly affected by gender differences, more than in other European countries. In last decade female educational level have been increasing more than male one, but gender gap does not appear to be reduced, especially in terms of labour market participation.

During the 80's, the increasing in education of female population allowed a massive and more stable entrance of women in labour market, but nowadays a new phenomenon is emerging of marked "gendered mismatch" between female education and (qualitative and quantitative) working opportunities and pathways.

Also, most of the literature in this field show that better female university curricula of young women, rarely become a comparative advantage by competing in labour market with their male colleagues. Recent studies show that young graduates women earn on average 116 Euros per month less than their male colleagues and have an unemployment rate of 26% compared to the 22% of young males.

The aim of this paper is to analyze, through a diachronic perspective, the impact of current socio-economic crisis on all these structural inequalities, in order to reconstruct and describe continuities and discontinuities in gender occupational structure, focusing on the highest and more qualified segment of the young labour force.

The analysis presented on the Italian case is based on Almalaurea survey between 2008 and 2014. Almalaurea is a consortium of 72 Italian universities, largely representative of Italian graduates.

Results show that there are (old and) a new risks of an increasing female exclusion, which is also a long term risk for the entire country: in the "Crisis eve" women tend to shorten or to give up their university education, mainly for economic reasons, by renouncing, at the same time, their main "protective factor".

Women in the Men's House: Negotiating POWER in Military Settings

This paper inquiries on power relations among researcher-researched in the military setting, with a particular focus upon the role of gender. Given the specific gender regime of the military, based on a gendered division of labor and a gendered structure of power, both formal and informal, gender represents a fundamental category to understand and explain inequalities and sometimes-abusive power relations in this setting. Moreover, drawing on intersectionality theory a broader concept of "inequality regimes" has emerged, claiming that subjects are always situated at the intersection of several axes of power and systems of inequality.

This approach is particularly appropriate for analysing the researcher-researched relationship when the first is a woman doing research in a men's house. On the one side, the research situation is often considered a one-way hierarchical process where power is exerted by only the researcher. On the other side, as a woman in a (quasi) all-male environment based on hierarchical order, also in terms of gender, the researcher can find herself in a subaltern position with relevant consequences in structuring the researcher-researched relationship.

Our field research experience in the Military, retrospectively examined in the paper , well clarifies how femininity represents the "otherness", the "excluded" and sometimes the "guest". The consequences are not done once and for all but they result from the interaction among subjects, with their multiple distinctive feature (role, status, rank, sex, age etc.).

Our analysis shows that the late transition to a mixed gender regime in the Italian military has not yet challenged the consolidated male hegemony; hence, gender played a crucial role in how research participants located, perceived and positioned us. Nevertheless, we were 'inscribed in a multifaceted power relation', where domination and subordination was in play from both sides and gender incongruence represented both a limiting factor and an asset.

Exploring the Online Practices of Self-Disclosure, Privacy Concerns and Gender Differences in the Time of Facebook

Within a relatively short time span, social media applications have intruded into all parts of life and have come to play a crucial role in contemporary culture and society. Online and mobile applications offer people the opportunity to participate in creating, sharing and consuming digital content and to engage in online conversation. In this contribution, we focus our attention on the most popular relationship networks, Facebook, and on how it reshaped the way in which individuals think about themselves and construct their identities. These transformations have potentially profound consequences due to the blurring of traditional boundaries between the private and the public.

Our study investigates the gendered privacy practices and concerns on Facebook by leaning on the idea of privacy management as a form of immaterial labour. We analysed if young Facebook users are more concern about the privacy against other users than against Facebook as a company or third-party partners, and also if privacy concerns and practices are differentiated by gender. A structured online survey collected from university students (aged 18-34, N=813) in Udine, Italy, is analysed. Our results show that students have just slightly more privacy concerns against other users than against Facebook and much less against third-party partners. However, women are consistently more concern about privacy related risk than men. We suggest that these results may account for different perception online risks between men and women.

Postcolonial Urban Imaginaries and the Politics of Belonging Among Japanese Residing in Shanghai

Shanghai has long attracted one of the largest Japanese expatriates problems of any city in the world, rising to close to 70,000 by the late 2000s. This paper describes the sense of belonging of some long-term Japanese migrants, examining their stories of connecting to the city and their strategies of coping with, or deflecting, anti-Japanese sentiment and the politics of wartime memory in the China. The study is based on interviews with over 40 Japanese residing for over one year in Shanghai conducted over the past decade. Interviews covered social relations with Chinese, Japanese and other expatriates, their sense of connecting to the larger city and community, and experiences of and attitudes toward the anti-Japanese demonstrations in the city. In qualitative sociological studies of Europeans and Americans expatriates in Shanghai, we see the importance of postcolonial legacies and connections with colonial period spaces and images. The politics of wartime memory makes such postcolonial strategies of belonging problematic for Japanese residents in Shanghai, but interviews do show Japanese residents engaging with Shanghai's prewar history through amateur historiography, tourism, and cultural consumption. The interviews also reveal the importance of social ties to Chinese residents, ranging from co-worker relations, ties to service providers, to dating and intermarriage. The resources for constructing a sense of belonging differ depending on age, gender, and the occupational niche occupied by migrants within the highly stratified Japanese migrant community in Shanghai.

FARRO, ANTIMO LUIGI* (Sapienza University Of Rome, antimoluigi.farro@uniroma1.it)

For an Analysis of the Global Reality

Globalization comprises the emergence of two kind of research questions. The first include various analyses challenging the hegemony of modern Western culture in explaining the functioning of societies and their transformation either through modernization or through a revolutionary rupture. The main analyses fall under: a) postmodernism which advocates going beyond the rationalization projects of social life and the idea of progress highlighted by the Enlightenment, Idealism or Marxism; b) postcolonial studies that affirm the need to break free from the grip that the West would continue to exert on the culture and life of the former colonies or their descendants; c) analyses considering that Westerners can no longer impose their vision of modernity and that there are "multiple modernities" held by different cultures. The second question concerns the search for an analytical model for a unitary explanation of contemporary global reality. This explanation usually focuses on: a) the global systemic forces, the power of conditioning and control in the various economic, cultural, social and political dimensions of individual and collective life at the different, local, national, regional and global scales. This domination is made possible by the control of financial, scientific and technological resources available to these systemic forces; b) the definition of a political system at the global, regional, national and local scales, that can represent the interests and cultural orientations of both the systemic forces and those of the individuals and groups opposing the domination in the name of the affirmation of the rights of each human being; c) the individuation of communicative and relational circuits, face to face, on line or through other technological tools aiming for the construction of new socialities though agreement between the differences and specificities held by every human asserting its rights against dominations.

FARRO, ANTIMO LUIGI* (Sapienza University Of Rome, antimoluigi.farro@uniroma1.it)

The Subjectivation of Collective Movements

The subjectivation of collective movements
According to recent researches emphasizing the individual agency in the collective movements, this speech suggest to analyze the individual involvement in the collective action as a subjective self-affirmation which individual pursue in order to assert his freedom from the dominant global forces which impact on his life. This subjective involvement in the collective action construction consists of an collective movements in constant tension between the individual's will to be free and an assertor of freedom and human rights, and the subordination to the constraints and powers of the diverse realities to which it belongs. Then the subject involving in collective action asserts its ethical call for the freedom and equality of human beings, facing the global powers that prevent the full expression of these principles. This individual's pursuit of autonomy and liberation is related to the same search engaged in by other individuals, who are likely to be affected by the same constraints. So the construction of collective movement is experienced through mounting inter-subjective relationships and on-line communications between individuals who are experiencing struggles initiatives at different levels of personal meaning. In this way collective action try to construct social conflicts with global systemic global powers.

Social Innovation, Public Policy and Organizational Learning: The National Homecare Program for Seniors

This paper presents the results of a research which aims to identify and characterize the learning developed by organizations in the framework of the implementation of the National Homecare Program (NHCPS) for seniors. In a national context of aging and increasing of the demand oriented to ageing population services, the NHCPS is formed as a social innovation that is structured from the paradigm of the right of people to access differentiated health and social services throughout life.

The NHCPS has two components (training of caregivers and care giving services) that are made by agreements between the national government and state public organizations in various jurisdictions (national, provincial and municipal) and nongovernmental organizations (NGOs) across the country. This work focuses on the characterization and description of the learning in problem solving by three nongovernmental (NGOs) in Great Buenos Aires studied by ethnographic approach during 2013-2014.

Older Workers and Caregiving in a Global Context: Methodological Challenges and Opportunities in Comparative Analysis

Increased longevity and an extended life course are great achievements on the one hand, but bring with them significant challenges on the other. While healthy life expectancy also has increased, the fastest growth has been among persons 80+, a life stage at which there is a greater likelihood of the need for care. Sustainability of the family care sector, the primary source of care for those in need, has therefore become a "hot button" policy issue in developed countries. At the same time retirement trends have made sustainability of the paid labour force an equally high priority policy issue. Given that the majority of caregivers also are employed, and many are struggling to maintain employment alongside care responsibilities, finding mechanisms for supporting employed caregivers is increasingly urgent.

The volume of research on the experiences of employed carers has grown substantially in the last decade within countries, especially developed countries. So too have the range of work-care integration strategies adopted by both public and private sector stakeholders. Comparing experiences across countries with different social, economic and political contexts can help highlight strengths and weaknesses of existing domestic approaches to supporting employed caregivers and reveal alternate approaches for future consideration. This paper draws on the experiences of the authors in attempting to carry out cross-national comparative analyses of existing national survey data on caregiving and employment in three Commonwealth countries, as well as other contributions to a forthcoming special issue of Journal of Cross Cultural Gerontology, to identify key benefits, and methodological challenges, to conducting such comparative analyses. We conclude with recommendations for measures that will facilitate future comparative research on combining paid work and unpaid care work.

Children's Conceptions of Otherness: Constructions of the 'moral Self' and Implications for Experiences of Migration'

Cultural pluralism is a common experience characterizing most societies; however how different societies engage with and manage such pluralism is quite diverse. This paper explores these processes at the level of everyday experiences and practices, specifically by investigating processes of identification and categorization that non-migrant children adopt to understand 'the other'. It does so by examining what children identify as being important to being a 'good person', that is their understanding of what constitutes the moral self and practices of moral agency. Through a multi-stage, multi-method qualitative study with children in Sydney, Australia, we reconstruct children's understandings to determine to what extent practices seen as necessary of citizens in 'diverse', 'multicultural' or 'cosmopolitan' societies – for example to be flexible in one's identifications, to have a sense of the 'global', of being adaptable to context rules - are also evident in children's discussions of the moral self.

Three themes emerge from the analysis: the normality of difference and the importance of the personal as moral; practices of justice; and the 'taken-for-granted' as the basis for categorizing the 'strange'. From what we can discern from

these three themes, we do not find evidence of a fetishization of difference or of a fundamentalised worldview that attempts to protect certain values from loss, damage or alteration. However we also find that the presence of strangers is unsettling because it often makes visible practices that were previously unnoticed or not reflected upon. By examining the identity work of children who are not of a migration background, we explore implications for how recognition claims made by children from migrant backgrounds might be received.

Children's Understandings of Well-Being As Expressions of the Moral Dimensions of Class Relations: A Comparative Study of Children in Frankfurt and Sydney

In this article we develop a reconstruction of children's understandings of well-being to explore how 'agency' is an affective experience which can be understood through a theory of subjective class practices. Such practices are, we argue, expressions of possession of socially valued goods and recognition of one's social value. They are also expressions of moral boundary drawing. In understanding these practices we make an explicit link between material conditions and valued ways of life, that is a concept of well-being. Individuals are likely to care a great deal about their class position in terms of recognition of their worth, including whether they are given forms of social recognition associated with the possession and demonstration of socially valued goods. However we show that this not only attends to how people 'practice' class, through ownership of material resources and expressions of taste but also practices of moral subjectivity, that is what individuals feel as though they need to do to be a 'good' and 'worthy' individual.

On the basis of two multi-stage, multi-method qualitative studies exploring what children define as important to their well-being, conducted in Sydney, Australia and Frankfurt am Mein, Germany, we reconstruct how children position themselves as moral agents within class relevant dynamics. In particular we demonstrate how practices of moral boundary drawing are involved in reproducing class distinctions that are critical to understanding children's experiences of agency and sense of well-being. We do this through exploring four themes: children's expressions of moral agency; shame; displays of competence and self-esteem; and expressions of disgust.

How the Prevent Counter-Terrorism Strategies Create a Muslim Outgroup and Might Increase the Threat of Terrorism

As a teacher in East London I used to enjoy heated religious and political debates with the Muslim students who I served. In 2014 these conversations abruptly stopped. I wanted to know why this had happened and to try to understand what the impact of this might be. This project which resulted from a masters dissertation provides some answers and raises some important questions about the State's relationship with Islam.

The suppression of conversations with my students corresponded with the alleged infiltration of British schools by Islamic extremists and resulted in the UK Government intervening to enforce the Prevent Counter-Terrorism Strategy. Analysis of the current and previous Prevent Strategies and the more recent Prevent Duty Guidance document found that they promote an alienating secular epistemology, reinforce the notion of a terrorist threat, create a Muslim outgroup and redefine 'radicalisation' to be associated with violence. The discourse revealed by the research is seen as part of a foucauldian technology that suppresses epistemes other than the secular and it is argued that the creation of an outgroup reinforces terrorist identities and increases the terrorist threat.

The methodology draws on numerous authors to inform discourse analysis and on Zizek's work on ideology to identify taken for granted knowledge. Contradictions in Government counter-terrorism discourse enable the identification of ideological constructs that would otherwise go unchallenged and remain unrecognised. Identification of such points of diffraction helps to define the secular episteme so that its phenomenological nature can be appreciated, helping to open the door for the postsecular. This project provides a new understanding of the State's relationship with Islam which needs to be recognised in the future to avoid policy that promotes the threat that it purports to suppress.

Golgata Community in Curitiba/Brasil – Possible Transitions Among Underground Scene, Music and Religion

This paper intends to debate the new existing arrangement among different juvenile groups for expressing closer links of lifestyles/musical taste: such as darks, rockers, head bangers, surfers, skaters, punks joining Christian churches, created to attend these groups and its cultural expressions. On this case, Golgota Church is presented, founded on the year 2000 by sheperd Pipe, that aggregates and remeans cultural activities of its audience, for its convertion mission and evangelization. The name Golgota refers to the hill where Christ was crucified. Below this name lies the motto: "Where the rocks roll", having other meaning for the Church's faithful - possibility of changing and redemption. The cult as ritual practice is made in a mixed way, which heavy metal music has pride of place. The realization of visual ethnography (videos/photos) allowed to identify visual elements that are elaborated by producing a new visual standard. The one observed here is how this visual standard made by visual, sound and expressive elements gain other meanings when dislocated from its original background of underground production to the scenario of religious practice. With Turner (1974) and Goffman (2011) the theoretical board is elaborated to analyze the cult and the imagery that are summoned on its constitution and development. In Mitchell, W.J.T. (1995) the process of image/sound/texts transformation is analyzed over the ritual process, highlighting from him and other authors the new meanings and its background of fruition and consumption.

Toward Human Rights Education in Nigerian Primary and Secondary Schools.

This paper discusses and interrogates the need to integrate of human rights education in the curricular of primary and secondary schools in Nigeria. Nigeria is signatory to the United Nations Declaration on Human Rights, a veritable platform on which freedom from political slavery was given to not a few modern nations especially from the time the World War II came to an end in 1945. Although, human rights education is a sensitive subject because of its centrality to development in the 21st Century but towards the middle of 20th century, the United Nations General Assembly at a meeting held in Paris, France in 1948, adopted Universal Declaration of Human Rights (UDHR). In its preamble, Article 26 of UDHR emphasizes that the need for individual to acquire education which will be directed to the full development of human dignity. The treaty is meant to protect the poor and the less privileged against the oppression, despotic rule, partial and total denial of a person's fundamental rights to life, dignity, education and worship. Thus, the rights to education and teaching of human rights education are intertwined with each other.it should be emphasized that there should be no obstruction towards these rights that are statutorily considered inalienable rights. This study will utilize both qualitative and quantitative methods of enquiry to ascertain the extent of integration of human rights education into the curricula of primary and secondary schools in Nigeria. Private and public primary and secondary schools shall be selected during the survey. Questionnaires shall be administered and structured and unstructured interviews shall be conducted. The study concludes by recommending the training and re-training of teachers and other education personnel who are responsible for dissemination of information, curriculum development amongst others.

Sociology of Constitutions: A Paradoxical Perspective

The fundamental concept of the constitution is changing rapidly. On the basis of the general formula one state, one constitution, the constitution, used to be seen as the sole and indisputable mother of the legal order, was consequently used in many convergent ways: by judges as the main tool for granting identity to their legal decisions, by political actors as the main criterion for defining the limits of their own legal interventions, and by the public as the main institutionalised norm for defending the abstract recognition of new rights or the elimination of previous constraints. Many parts of these legal and sociological narratives have now come to be regarded as outdated. Transnational organisations, economic interests that transcend state borders and emerging calls for greater autonomy from local communities all require regulations of such a scope that single states are coming to accept significant limitations to their own autonomy. Here some questions arise: is it possible to imagine a reliable constitution without a clear reference to a sovereign state? Can a plurality of states agree reciprocally to downscale their

own political roles, even in the absence of a corresponding meta-state and of a fully institutionalised new order?

Lifestyle Routine in the Structure/Agency Dynamics: Health Behaviors Enabled or Constrained, Cancer Screening As an Example

Participation in colorectal-cancer (CRC) screening, a life-saving, recommended, medical procedure, varies by socioeconomic status; individuals in high SES undergo screening more than others in low SES. These differences defy the tests being generally free of charge. The sociological perspective offered to clarify this paradox suggests taking into account the context of adopting health behaviors (screening being one example thereof) as part of a routine lifestyle. The dynamic structure/agency interface enables a range of enacting (or not) of health behaviors as part of a person's daily routine.

This analysis illustrates the role of routinely engaging in health behaviors as mediated by social-structural constraints and by agency-initiated choices. Study participants' daily-realities were elicited, as-well-as their perceptions and consequent health-related behaviors. Focus group discussions with individuals invited to screen were carried out in urban primary-care clinics in Israel. They were facilitated by the researchers, audio-taped and transcribed verbatim. Analysis was conducted based on grounded theory principles. Data analysis revealed that, vis-à-vis the screening invitation, participants related to the health-care system structure on one hand, and to their agency on the other. Deciding to adhere to CRC early detection was related to the screening perceived benefits, and embedded in an enabling social context. Screening avoidance stemmed from issues related to the interplay between specialist health-care services organization and participants' agency, crystallized in lifestyle routines, and to their personal higher priorities. Laypersons' explanations for adherence to CRC screening are not the opposite mirror image of their explanations for non-adherence; these explanations represent contextual elements (routine health lifestyle, health-care services accessibility) and are tied to different content domains (medical rationale for screening, insured members' unmet needs). We conclude by applying two sociological perspectives to interpret study findings: a. structure-agency, mediated by routine, and b. a relational perspective, emphasizing the adaptive interplay between doxa-field-habitus.

"Different Kinds of Foreigners": Russian Speakers' Stereotypes, Discourse Strategies, and Modes of Interethnic Communication

The proposed paper deals with Russian native speakers' perceptions and categorization of foreigners, their images and social roles prescribed to them on the base of sociolinguistic research on interethnic communication processes. Most studies on images of foreigners in Russia focuses either on historical or literary (or folklore) sources, or on ethnic stereotypes collected by sociological and socio-psychological methods (questionnaires, association tests, etc.). Meanwhile actual interethnic communication and discourse strategies used by Russian speakers when interethnic with foreigners from different origin and social status can reveal crucial information on the ways foreigners are seen and treated in Russia and role their "otherness" plays in Russians' self-identity construction. That's why it is important to combine various research methods and approaches. In my presentation I will first explain the term "foreigner" and peculiarities of its use in Russian. Then I will describe most popular stereotypes about foreigners and their types. But main part of my presentation will consist of analysis of data obtained during my own studies of interaction between Russian speakers and foreigners in different settings. As two contrasting cases representing important East vs. West mythological construction I will use Russian speakers' communication with foreign visitors from western countries in St. Petersburg and with Chinese migrant workers and traders in Transbaikalia. In the first case Russian speakers tend to play the role of overprotecting host, using discourse strategies aimed to minimize foreigners' participation in dialogue and present them with a remarkably formal and hypercorrect language form. In the second case Russian speakers either ignore Chinese speakers communicative needs or (as a form of "professional communication") use "broken language" which they are ashamed of and try to deny its existence. Different language attitudes and stereotypes, therefore, determine speakers' world categorization and influence actual communication.

Resettlement Policy and the Well-Being of Refugees in the U.S.: Are Political and Economic Incorporation Enough?

In light of current refugee arrivals in Europe, policymakers and scholars have been forced to confront new questions associated with large-scale refugee resettlement. As governments grapple with policy decisions related to refugee management and incorporation, arriving refugees face extreme uncertainty with regards to their social, political, and economic well-being. This paper seeks to reconcile the policy objectives of resettlement regimes with the myriad challenges that shape refugees' integration. Conflicting priorities are inherent in resettlement, as policies that privilege the "well-being" of the receiving state do not always align with the well-being of arriving refugees. Based on ethnographic fieldwork at a resettlement agency in California, this paper explores how refugees' welfare fits into the U.S. resettlement regime.

Resettlement invokes the normative dilemma of whether it is better to have a resource intensive program that can only manage to take a small volume of refugees each year or to offer resettlement to a large number of refugees but with a paucity of support. U.S. resettlement follows the latter model, welcoming more refugees each year than all other countries of resettlement combined. Nevertheless, in order to incorporate such a large volume of new arrivals, the U.S. emphasizes political and economic incorporation at the expense of cultural and linguistic integration (Lanphier 1983). By outlining refugees' "balance of rights and responsibilities" (Kymlicka and Norman 1994:360), the U.S. government actively shapes their political and economic inclusion, teaching them the terms of their membership. Through participant observation and interviews, this paper will critically examine how well top down policy aligns with the needs of refugees as they adapt to their new environment.

Philanthropic Activities and Their Political Implications during the Refugee Crisis in Hungary

The events of the last months have revealed an increasing contradiction between the political discourses and the actual practices of the EU concerning refugees and asylum seekers. Moreover, new dimensions of the contradictions have appeared exposing the national differences in migration policies. In this general picture Hungary plays a special role in that she denies solidarity with migrants both at the level of political discourses, and also in her direct political actions. A closer examination can show that in the humanitarian vacuum that followed from this the civil society remained the only source potentially embracing discourses of humanitarianism and solidarity, and practising compassion, that is, answering the actual basic physical needs of the migrants.

In our presentation we will investigate everyday reactions to this humanitarian pressure. Despite the general perception about the overall passivity of the Hungarian society controlled by a xenophobic government, several professional organizations and an even wider range of individuals and newly formed informal groups have initiated and maintained long-term support for the migrants. In the presentation we aim to highlight some results of a research project that investigates forms, perceptions and political implications of such philanthropic actions. We will briefly outline the social background of individuals taking part in such activities, as well as the level of approval or rejection toward them on the part of the larger population. Also, the relationship between such humanitarian support and attitudes towards (national or EU level) political actors will be briefly analysed, highlighting certain aspects of political implications of such humanitarian philanthropic activities.

The research applies qualitative methods, mainly interviews with volunteers of established organizations, members of new issue-oriented groups and lonely activists (approx. 20 interviews), and leans on a survey conducted on a sample of 1000 people representing the Hungarian adult population.

Age of Retirement and Human Capital in China, 2015-2050 Age of Retirement and Human Capital in China, 2015-2050

As China's aging population continues to increase rapidly, whether the country should adjust the official retirement age, and if so, how, is currently a major debate of public policy. This study examines the impacts of different scenarios of postponing the retirement age on the human capital of China in the next four decades. Based on extensive policy review for various proposals of retirement age adjustment, the size and quality of the Chinese working-age population from 2015 to 2050 are projected under nine different policy schemes. The ProFamy Extended Cohort-component Method is used for the projections with the most recent 2010 census data of China as the baseline. More importantly, we incorporate two aspects of human capital of the population - health and education - in the projection to take account of the quality of the work force. Through the projection, we show and compare various scenarios for changes in the size and quality of the Chinese labor force. We highlight the changes in the "productive labor force", working-age population with good health and education. Results suggest that substantial benefits can be gained not only be in the size, but also in the quality, of the labor force if China starts to postpone the retirement age gradually in the near future. The gain will be particularly notable after 2050 due to Chinese government's surged investment in human capital in the last few decades, particularly for Chinese females. Based on these projections, we discuss alternative policy options to adjust the retirement age in China and their implications for the Chinese human capital and economic development in the long run.

Factors Affecting Purchase Intention of Organic Food: The Importance of Trust and Risk Perception

Following a series of food safety crises in recent years, the overwhelming majority of Taiwanese are looking for foods and products that complement and facilitate a healthier lifestyle. Though there is some controversy over the details, organic foods nonetheless have a reputation of being healthier, safer and more sustainable than conventionally grown foods. More consumers have perceived that organic foods may contribute to better health through reduced hormones and chemical exposure and increased nutritional quality. Additionally, adding to its popularity, purchasing organic and natural foods has become somewhat trendy. As the organic market grows in Taiwan, a natural question arises: who are buying organic foods and what factors are associated with their intention to purchase organic foods? Previous studies have shown the association between organic consumption and several socio-demographic characteristics such as education, social class and religion. The intention to purchase organic foods is related to individual's health consciousness, consumer knowledge, and environmental concern. However, there is limited research exploring the effects and mechanisms of trust network and risk perception on the attitude of organic consumption. Using data drawn from the 2013 Taiwan Social Change Survey, a nationwide cross-sectional survey consisting of 2005 respondents aged 18 and older, this research aims to identify organic consumers and factors affecting their purchase intention of organic foods. Specifically, the effects of trust and risk perception on purchase intention will be examined and delineated by controlling demographic characteristics.

FERGUSSON, ROSS* (The Open University, ross.fergusson@open.ac.uk)

Anti-Social Policy: Governing Youth Unemployment in the UK

Drawing on extended empirical and theoretical analyses developed in a recently-published monograph by the author, this paper considers the impact of extended mass youth unemployment in relation to two connectable aspects of the harms suffered by young people who experience it in the UK.

The first concerns the labour-market dynamics of perpetual downward pressures on bottom-end pay rates for under-25s, in the context of deficits in the demand for their labour and the surplus of well-qualified young workers entering the workforce. Here, the continued application of the 'less eligibility' principle in welfare constructs financially unsustainable spaces which young people are driven to occupy, between enforced participation in workfare and work for sub-poverty wages.

The second aspect concerns long-standing highly-contested analyses of the supposed relationship between unemployment and crime, and the discursive and material criminalisation of young unemployed people. Here, stigmatisation associates non-participation in some form of pseudo-employment with petty crime, while homelessness and destitution foster survival crime at the interstices of vagrancy, begging and law-breaking.

These harms reflect the ways in which institutions and social and public policies mediate the labour market and wider social integration of young people. Policies conducive to the criminalisation of economically marginalised young people have begun to interact with the 'less eligibility' welfare principle, creating new conditions of uncertainty, precarity and exclusion. Understanding the dynamics of uncertainty and precarity requires an integrated analysis of the 'anti-social' policy interplays between the policy spheres of education, labour market, welfare and criminal justice that this paper outlines.

FERGUSSON, ROSS* (The Open University, ross.fergusson@open.ac.uk)

Global Actors and Policies on Youth Unemployment: Historical and Comparative Perspectives

In the early years of the 2007/8 global financial crisis, a number of International Governmental Organisations (IGOs) that had previously taken little or no interest stepped up to a global crisis of youth unemployment that had reached unprecedented proportions. They developed analyses of the issues and promulgated policy proposals, forging a new field of global policy. A detailed study of the policy analyses and interventions of nine major IGOs (Fergusson and Yeates, 2013) found competing, contested and often conflicting prognostications in this field. It also found notable shifts and convergences amongst some IGOs as they contemplated the severity of the crisis and adapted their responses.

Global mass youth unemployment now appears to be approaching endemic levels of persistence at almost ubiquitous scales. Diverse global policy actors continue to be active in this field, evidencing engagement with the common but divergent country profiles of youth unemployment, and crafting policy responses that might be portable, if not universalisable.

The paper reflects on the features and significance of international organisations' policy discourses and practices in relation to restructuring youth labour markets. It updates and substantially extends Fergusson and Yeates' earlier (pre-2012) comparative historical data and analysis of IGO responses. Based on original unpublished research, it reviews most recent (2012+) evidence of further IGO involvement in this field, and assesses whether there is evidence of continuing convergence and further shifts in their policy positions. It asks whether IGOs have re-interpreted the common drivers of (youth) unemployment, and contemplated new policies and modes of intervention that are capable of addressing the potentially profound social and economic consequences of depriving young people of the right to work.

The General Strike of November 2012 and Anti-Austerity Protests – Evidence from the Portuguese Case

The economic and financial crisis of 2008 contributed to intensify the discontent on a global scale. After a first increase of conflict there is, as of 2010, a further intensification of protest having as mobilizing axis opposition to austerity policies. In Portugal, the first signs of mobilization came from the trade union movement, but the emergence of new actors allowed its social ampliation. Two new trends emerged: the innovation of action repertoires, not only by introducing new forms of collective action but also by a somewhat renewed recovery of "old" instruments of struggle - including strikes; a significant growth of transnational mobilizations, including the choice of common dates or the denunciation of the role of global political and financial institutions, such as the IMF, the ECB or the EU.

In this article, we address the general strike of November 14, 2012 to, from the Portuguese case, examine the role of general strikes in this wave of protest. The study seeks to explore its insertion in the conflictual dynamics of this period, not only for their transnational dimension as on the relationship between actors - particularly between trade unions and new political actors involved in anti-austerity protests.

Therefore, we begin by looking at the changes in the power resources of organized labour seeking to identify their strategic challenges and possibilities of revitalization of collective action. Next, we present an overview of the contentious dynamics in Portugal, on the eve and during the anti-austerity protests between 2010 and 2013 and point out to the political, economic and social context in which they occurred. Finally, we seek to contribute to clarify the nature of this episode, raising some questions for further deepening the study of the role of general strikes as a strategic instrument of the working classes.

FERNANDEZ, KARINA* (University of Graz, karina.fernandez@uni-graz.at)

Trajectories of Homeless Youth in Austria

For almost 20 years there is intensive scientific examination of the phenomenon of homeless young people taking place. The German Youth Institute (DJI) established the concept of street-careers that is marked by a gradual shift away from "normal conditions" to a life on the street. In this proposal I want to present the results of a study in which I followed this concept. The aim of the study is to describe the patterns of street-careers. I took special interest in the triggering conditions and the processes and mechanisms, which strongly influence the patterns of street-careers. The research was undertaken in a scene of homeless young people in Austria. The chosen research methodology was a Grounded Theory Ethnography, which included a six-month participatory observation and 45 interviews. I developed a model, which describes the processes of street careers. The core categories are the reference to anchors outside the scene and the force field, which consists of suction and rejection. Depending on the combination of these forces, different course-patterns can be described. In comparison to the studies of the 90s, the analyses showed that due to social transformation processes these young people have to deal with more exclusionary mechanisms today. For example due to the increasing expulsion from the public space that has been increasing in Austria within the last 10 years, they have become vulnerable because they are no longer reachable for the institutions of social work. In the session, the transitions from youth to adulthood in the vulnerable position of homlesness and the impact this has on street carreers will be discussed.

Commodification of Domestic Labour and the Making of the Chilean Nation.

Drawing on fieldwork performed in Santiago 2014, I will reflect on the relation between current dynamics of commodification of care with State and upper class ideologies regarding womanhood, family and the nation in Chile. In addition, I discuss how this relation tensions feminist debates in decolonial contexts. In the interviews conducted, upper class housewives often describe their experience with paid domestic labour as a 'necessary evil', both in commodity terms (having a domestic worker) and in negative terms (feelings of betrayals, discomfort and guilt). Furthermore, they justify the employment of domestic workers mainly through two arguments: first, without them their upper class lifestyle would be impossible; second, they are doing workers a favour by providing a stable and 'good home'. This two-way justification –the total need (their own dependency) and doing a favour (the workers dependency)- intrigued me to further understand how this 'dependant' relationship dialogues with current forms of commodification of care in Chile. I follow the relation between this process of commodification and the dependency relationship by looking at the importance of domestic labour in the national culture making process. I will argue that domestic labour is further commodified insofar as it enables the reproduction of the 'Chilean happy family' –a State based project- which acquires predominance in a context of neoliberal policies and 'gender friendly governments'. Thus, the commodification of care reproduces the 'feminist promise' of autonomy for white upper class women promoted by the state after 2000, while justifying the inclusion of a 'strange domestic worker' in the intimate homes as a humanitarian act towards poor, immigrant and indigenous women. In this way, the State and the upper class family model can present itself as modern and gender friendly, without disassembling the traditional bond between nation and family.

Mapping the Innovative Profile of a Society Using a General Population Survey

Innovation is usually understood as the process of transforming knowledge and resources into value. Most of the approaches that study the innovation capacities of societies, as the so-called 'the innovation system framework', usually focus on the organizational and institutional structures that shape innovation. They recognize the importance of culture and informal institutions, although these approaches seldom consider other influential aspects at the societal level.

Our main point of departure is that innovation is a kind of intentional action closely interlinked with values that are situated in the specific social relations of people. For understanding the innovation capacities of a given society is necessary to take into account aspects of social life that have implications for generating and mobilizing knowledge and resources that may have socioeconomic implications.

In this paper we present the results of an exploratory study on the values, attitudes and behaviors related to innovation at country level. A general population survey representative of the Spanish society specifically designed for the purpose has been used (n=2400 face-to-face interviews).

We consider several dimensions related to innovation that can be observed through a general population survey: consumption of innovative products, entrepreneurship, attitudes to work, and attitudes to studies and learning. According to these dimensions, firstly we develop a typology of people and interpret the meaning of the resulting social categories as different degrees of 'innovation propensity'. Afterwards we explore the profile of the different types of people regarding their general social values and socioeconomic conditions. The analysis shows the important influence that both social structure and culture may have on behaviors related to innovation. The conclusions highlight the convenience to use sociological categories when analyzing innovation systems in addition to organizational structures and formal institutions.

Welfare Policies and Solidarity Toward the Elderly

In this paper we analyze the effect of welfare policies oriented toward the elderly on solidarity toward the elderly in a sample of European countries. The research question is whether more generous welfare policies crowd out solidarity. For this purpose, we analyze four waves of the SHARE database. We use multilevel analysis to estimate the effect of national variables on transfers toward the elderly, controlling for individual level variables. At the national level we focus on the effect of public spending on policies oriented toward the elderly after controlling for some other relevant variables, such as the proportion of elderly people, female labor force participation and unemployment. Our results indicate that expenditure in social protection toward the elderly has a positive and significant (albeit moderate) effect on the economic support received by the elderly (which is in line with the *Crowding-in* hypothesis). However, in the case of time transfers, we find that expenditure in social protection toward the elderly has a negative and significant impact on the time transfers received by the elderly (which is consistent with the *Crowding-out* hypothesis).

The Rise of the Invisible Majority

A second *Great Transformation*, encompassing four interconnected processes – the advent of neoliberalism, the European monetary integration, the inadequacy of the old welfare state, and the requiem of social democracy –, has dramatically modified the composition of Italian society. The paper establishes a link between this shift and the rise of the invisible majority. We define the invisible majority as a heterogeneous social group of 20 million potential voters, including unemployed, precarious workers, *neet*, and poor pensioners. These social categories constitute the majority of the Italian electorate; however, their instances and interests seem to be invisible to mainstream politics. Critically using median voter theory and analyzing the first post-crisis parliamentary election, we illustrate, what we claim to be, the first appearance of the invisible majority in the public arena.

HOPE and Quality of Life of Aging People WHO Have a Relationship with Same Sex People in Brazil

This research aimed to compare the levels of hope and quality of life of a sample of aging individuals (in the range of 40 to 65 years old) who have relationship to same sex people in a secret and open manner to society in Brazilian context. The instruments used for data collection were: Hope Scale of Herth (EEH) and WHOQOL-*bref*. The sample was divided into groups: (a) GA$_{on}$ (n=52): aging people

who have relationship with same sex people in an open society; (b) GF$_{off}$ (n=55): aging people who maintains their homosexual status in a secret manner. The data showed that the GF$_{off}$ presents higher scores of quality of life (psychological, social relationships and environment) and higher hope compared to the GAon group.

Trajectories of Desire: Notes about the Homossexual Aging in Digital Media in Brazil

The search for partners to homoerotic relations and the "desire" gained new aspects with the advent of digital media, in particular by the expansion of the commercial Internet in 1997 in Brazil. This context of creating flirting networks/love/sex more fluid, dynamic and mobile is socially produced and cleaved by social indicators such as income and education, for instance. This research analyzes through multimethod what are the divisions that affect the search for romantic/sexual partners in a group of 119 individuals (45 and over) from around Brazil, seeking or interested in homoerotic relationships and that use the rooms' portal chat Universe Online® (UOL). Anyway, discuss how the internet is marked by generational and historical differences that permeate education, income, power consumption and provenance.

FEVRE, RALPH* (Cardiff University, fevre@cardiff.ac.uk)

Educational Expansion, Egalitarian Individualism and Neoliberalism

Neoinstitutionalist understandings of the histories of various education systems consider individualism to be most important cause and consequence of educational expansion. This paper builds on this insight to suggest that the way educational expansion proceeded in the United States, and subsequently in many other countries, helped to prepare the political space for neoliberalism and the lurch towards inequality that followed neoliberal political settlements throughout the world. Of course expansion has happened in many different ways in different countries, however egalitarian individualism has provided many of the goals of expansion and some of the means. It is therefore ironic that more education has everywhere helped to create the conditions required for the shift in politics required for neoliberalism to take hold. This is as true of the US as any other country, indeed the achievements of egalitarian individualism in the US, most obviously in the form of universal comprehensive education, were unmatched for many years. The original driver for comprehensive education had been the egalitarian American Ideology of the mid-nineteenth century. It was later over-laid by a more competitive economic individualism which would have been welcomed by Herbert Spencer (and was detested by John Dewey) and which prepared the US for neoliberalism. The UK reached this point decades later, at precisely the high-point of equality in UK society. With the benefit of hindsight, we can see how, although educational expansion in the UK and other countries certainly proceeded very differently to the US, the same end-point of a competitive economic individualism well attuned to neoliberal politics was eventually reached in all of these cases, although at different times.

Sentimental Individualism and Anti-Slavery in the US and UK

There is considerable agreement amongst sociologists that individualism is one of the hallmarks of modernity. Knowledge of the historical development of individualism can nevertheless be a little sketchy. Many sociologists will know what they know of the history of individualism from reading Durkheim and Weber, blissfully unaware of the seminal contributions of Troeltsch and of the intense debate about the relative contribution of the Enlightenment and the Protestant Reformation to the rise of individualism. Hans Joas is amongst those who have recently revisited the debate. He comes down firmly on the side of Protestantism, particularly American Protestantism. Indeed Joas prefers to refer to the sacralisation of the person rather than individualism to underline his point. There is an empirical problem with his account, however: the persistence of support for slavery and and the slave trade alongside fervent American Protestantism. This paper presents an alternative view which has the additional benefit of explaining why it was in Britain, rather than the US, that a mass anti-slavery movement was born. It draws on the suggestion originally made in my book 'The Demoralization of Western Culture' that individualism also has roots in a third way of making sense of the world which is sometimes implicit in Protestant or Enlightenment arguments but not reducible to them (and perhaps closer to the account of individualism offered by Durkheim than Joas allows). This Sentimental Individualism developed in the UK before the US and influenced the development of Anti-slavery and many more nineteenth-century social movements besides. It developed in the US at a later date as a junior partner in the American Nationalist ideology of the mid-century.

Social Innovation - the Core of the Conversion to Organic

Social innovation (i.e. the rise and diffusion of new social practices or development of new interactions between individuals or groups) is at the core of the conversion from conventional to organic farming. Social innovation enables these technical and economic innovations associated with conversion, but it can also arise from the organic technical innovations themselves. Conversion means at least a fundamental change of the social as well as the material system.

Drawing on three focus group discussions with organic farmers and other key actors in Minnesota organic farming during 2011, this paper explores how the materiality of converting to organic practices leads to different socio-technical conversion strategies among farmers. We show how practices change after conversion and which new social practices can arise. We also draw attention to the significance of the state (governmental rules and regulations) that set conditions for this process and related practices.

We suppose that identifying materiality is key to understanding social innovations. Materiality at least creates new sites of the social (see practice theory). As a social innovation, the conversion to organic farming is intertwined with numerous material and political conditions. New practices, such as the direct marketing via box schemes or CSAs, give rise to new consumer – producer relations that affect the economic survival of the farm as well as the wellbeing of consumers. Similarly, social and political conditions influence decisions to adopt such practices.

Based on the focus group discussions, we give examples how a change in actual – partly policy influenced - food and farming practices can bring forward changes in broader social networks a wider social practices. Doing so we hope to contribute to the further development of the concept of social innovation by rooting it in changes of material based day to day practices connected with the conversion of organic.

Social Disqualification and Negative Identity: The Case of the Motoboys

The French sociologist Serge Paugan developed the concept of social disqualification in the study of how socially excluded people built their identities and their references about themselves.

He concluded that these people had a very negative image of themselves and they felt unqualified in society. Disqualification as a constitutive element of the individual's identity and reproduced in all the actions undertaken socially, as frequented places, consumption patterns, language and forms of self preservation.

This research studies the social disqualification processes in a group of professionals in Brazil is known as motoboys (delivery workers who use motorcycles). In Brazilian metropolises these professionals are known for riding motorcycles at high speed risky way. In most cases the motorcycle courier is poorly paid, receiving a number of deliveries. It's a case of precarious work. The violation of traffic rules and not using safety equipment reveal a way to ride in which it seems there is no concern for the preservation of their lives, it is a high-risk profession. Each year the number of motorcycle boys victims of traffic comes to thousands of people in Brazil. There is no known other category of paid work activity that makes so many victims annually in Brazil.

Analyzing the speeches of motoboys on field research and observation of their behavior in traffic, we hypothesized that for these people, the feeling of disqualification is so intense that one of contents that guides their identity construction is the vision of himself as someone whose life has no value. The loss of value of life as well as being directly linked to social and economic vision of disqualification, is linked to the loosening of other social ties, for which contributes the characteristics of motoboy activity as work disqualified.

MIRANDA, TATIANA* (Instituto Brasileiro de Geografia e Estatística, tatianamiranda1983@gmail.com)

The Last Hour: A Study about Homicides and Social Exclusion

The research "The last hour" objective record the stories of people who experience the social exclusion through the most stigmatized representation: as murderers and as prison inmates. The focus of the research are workers who only killed once, that is, these people are not part of groups that practice murder. The methodology used in our research is based on the reconstruction, by the respondents, the "last time" that preceded the murder and the identification of symbolic elements that surrounded him at relevant moments of his life. This moment empowers the breakdown of social prohibition to commit murder, while marking its entry into a socially-recognized group and labeled as "excluded". For Robert Castels (1997) marginalization is a process and this result of a dynamic of exclusion, which is produced in the fragility of their social ties.

Another author referenced, Pierre Bourdieu in "The biographical illusion," states that "a life is inseparably the set of events of an individual existence conceived as a story and the reporting of this story." We found in our research that all of the mentioned relations (leisure, family, religion) they are restricted geographically to the way that the individual travels from home to work and experienced in the gaps left over from the time not spent at work. Considering that all the activities carried out by respondents are poorly paid and require a commitment of time often higher than other workers, the limitations of social relations are difficult to overcome.

In this research, "the life organized as a story" brings us to the set of activities which form socially the individual, such as leisure, personal relationships, relationships work, sports or games as elements that were part of the construction of the break with the social code more important, which is that of not kill.

FIALKOVA, LARISA* (The University of Haifa, lara@research.haifa.ac.il)

Railway Dystopian Motifs in Late Soviet and Post-Soviet Russian and Ukrainian Literature

The representations of railways in fiction are overloaded with utopian and dystopian motifs. In the 19th-beginning of the 20thcentury, although some greeted this technical invention (e.g. I.Franko, N.Garin-Mikhailovsky), the dominant literary reflection of the new means of transportation was negative. When the focus was on the rail road, they were perceived as a road of death as a result of bad working conditions of many serfs (e.g. N.Nekrasov). As far as a train was concerned, a typical metaphor was of a fire-spitting dragon, a snake, an iron horse or just a monster (S.Stepniak-Kravchinsky, G.Grebenshchikov, S.Esenin). Trains were associated with accidents, chaos, suicides and separations (L.Tolstoy, F.Dostoyevsky, A.Blok). Later literature reflected also on other means of rail based transportation, namely metro and a tram. In the inter-war literature the building of rail road for some authors was connected to romantic self-sacrificing heroic deeds (N.Ostrovsky), and the locomotive was meant to fly into happy socialist future, which turned to be just Utopia. This view promoted by the Communist propaganda, was reflected in many songs about railways (e.g. Baikal-Amur Mainline, which was partially constructed by the forced labor). Other authors wrote about trams, strayed (N.Gumilev), beheading (M.Bulgakov) or suffocating (B.Pasternak) and about metro as allegoric Moscow's guts and as crippling hell (A.Platonov). Yet, train could be also a way for escape (B.Pasternak). A new phase in dealing with motif of rail transport started in 1970s with V. Erofeev, whose hero Venechka involuntary returned to the hell of Moscow after failed attempt to get to Paradise-like Petushki.

The paper will focus on railways, metro and trams as contemporary anti-Utopia in the fiction by V.Pelevin, D.Bykov, A.Volos, A.Lazarchuk and M.Uspenskii, Yu.Andrukhovych, S.Zhadan, L.Lusina.

Organizing Possible Futures: Organizational Democracy in the World Social Forum

The World Social Forum's (WSF) slogan 'another world is possible' invites its participants to develop projects for possible futures. The WSF is a place that facilitates the exchange of people-driven strategies to tackle economic, social and political problems from a transnational perspective. The organizers seek to provide a democratic space that is diverse and inclusive. The challenge that the organizers are faced with here is to define a format that reconciles the participants' different organizational styles and their expectations concerning democratic organizing.

The organizers' solution is to have a predominantly self-organized space with a rudimentary organizational framework that is supposed to facilitate inclusion and diversity in the Forum. The backdrop of this solution is that it raises issues of informal hierarchies, lack of transparency and weak accountability. These issues could be tackled by introducing more formal organizational elements in the WSF. I argue to the contrary that such a solution would miss the point of organizational democracy in the WSF. Based on my field work conducted at the WSF between 2012 and 2015, my aim is to show that questions of democratic organizing cannot be restricted to (formal) organizational structures. Based on Weick's (1976) idea of loose coupling and Ahrne and Brunsson's (2011) partial organization, I will argue that the dilemma of organizers of activist spaces is often not one between more or less formal organization. Rather, it is about seeking a form of internal democracy, which reflects organizational matters, networking needs and normative aspirations.

FIGOLS, FLORENCE* (Concordia University, florence.figols@concordia.ca)

Identities In-Between; Choreographing the Haptic

We perceive the other mainly through our gaze and by listening to their voice; manifestation of the visible and the audible body. In the blink of an eye, we configure and try to situate the other. How does construction of alterity unravel if we suspend sight and audition before we can name, categorize, identify him / her? Linking James Gibson's work on perception with my artistic practice, this paper echoes the sensible knowledge developed through choreographic experimentations held in spring 2015 in Montreal and in San Juan, Puerto Rico. I used choreography as an aesthetic means to pursue sensorial investigations stressing the haptic perception; the interplay between touch and kinesthesia in order to highlight the liminal space of the in-between.

In Montreal, I collaborated with two dancers from different cultural backgrounds, they never knew who their partner was; they were blindfolded and could not talk in the presence of the other. The suspension of sight and hearing allowed to intensify the haptic perception and its modulation as an ongoing flux destabilizing and re-composing alterity. After each rehearsal they documented their inner experiences in order to articulate their sensory journey. While their recorded testimonies gave access to the complex interrelation between the senses, the attention and the imaginary, their drawings (through the activation of fine motor skills) left a visible trace of the kinesthetic experience.

Inspired by Edouard Glissant's *"Poetics of Relation"*, the choreographic material developed in Montreal found a new "identity in motion" encountering different performers and sensory context in Puerto Rico. In collaboration with five dancers, who knew each other, I pursue working on "choreohaptic" propositions, in order to open spaces for other possibles relations, cross-breeding the here and there, while rehearsing and performing in the colonial patio *El Arsenal* "del Instituto de la Cultura Puertorriquena" in San Juan.

Commodification of Health Under Neoliberalism: A Comparison of the Israeli and the Spanish Cases

The present paper compares processes of privatization in health care in Spain and Israel, focusing mainly on forms of public/private mix, to evaluate concretely the 'variegated' character of neo-liberalization processes. Sociological thinking on global/local interactions contribute to understand privatization processes as simultaneously patterned by global neo-liberal assumptions and conditioning, therefore interconnected; and locally specific, modulated by the institutional, socio-historical and political characteristics of the different countries.

Privatization of health care takes three main forms, privatization of financing, privatization of ownership and the "enterprization" of the public system, blurring the boundaries between public and private. Both in Spain and Israel this last dimension is the central form of privatization and represents the main threat to the public health care system.

This paper analyzes the concrete institutional forms of private/public mix in both countries. In Spain, out-sourcing of services, private-finance initiatives and the "Alcira model"; all maintain relatively clear boundaries between the private and the public sectors. In Israel, forms of public/private mix have been forms have blurred the boundaries between the public and the private system: private insur-

ance sold by public sick funds, private for-profit hospitals owned by the public non-profit sick funds and public hospitals selling private services.

The comparison of the processes of privatization in health care in Spain and Israel, shows the variegated character of neoliberalization processes, the ways in which the global transition to a neo-liberal model does not result in convergence but in the "systemic production of geoinstitutional differentiation" (Brenner, Peck and Theodor 2010). The comparison shows the active role played by the local context in shaping the specific forms of a process of privatization originated in neo-liberal global tendencies. The paper illuminates the role of national and regional state apparatuses, civil society organizations and professional culture as initiators and supporters of privatization.

FILC, DANI* (Department of Politics and Government Ben-Gurion University, myridani@gmail.com)

Welfare Regime, Ethno-Class and Inequalities in Health: The Israeli Case

The Israeli welfare system is considered as a case of the Mediterranean welfare regime, the latter characterized by relatively late industrialization, labor market rigidity and segmentation, significant shadow economies, lower social spending than in social-democratic and corporatist countries, limited ability on the part of the welfare state to overcome socio-economic gaps and the centrality of family and religion for welfare. Israel's health-care system, however, historically matched the corporatist regime; having been central in the nation-building process and characterized by relative decommodification and status differences. During the 1990s, a paradoxical process took place, by which within a general tendency of recommodification of welfare, the health-care care system underwent a double process of transition from a Bismarckian to a universal model, together with the emergence of a flourishing private health-care sector. This complex interaction between the characteristics of the welfare system as a whole and the health-care system, is made more complex because of the role of the welfare system in reproducing Israel's ethno-class stratification structure.

The combination of the characteristics of Israel's economy, citizenship and welfare regime resulted in a stratified three-tiered ethno class structure, where Israeli Arabs occupy the lowest echelon, Israeli Jews from European or American origin the highest one, and Israeli Jews from Asian/African origin the middle one. The present paper shows how this ethno-class stratification is expressed in health inequalities (with significant differences in health indicators such as infant mortality and life expectancy), and the ways in which the organization of welfare, and especially of the health-care system, contribute to those inequalities.

The EU Enlargement and Green Movement in the Eastern Europe: From Environmental Justice to Environmental Modernization?

Strength of the green movement in the Eastern Europe was to a great extend build on presenting the environmental problems generated by the economic and social development in terms of differentiated impact and justice. The main perceived inequalities were in differentiated distribution of the environmental impacts between generations and/or among people. Yet in the last years of economic and social transformation, agenda of protest and justice was gradually replaced by the policy work and formulation of the environmental problems as technical challenges within the limits of the system. In other words, as a problem of environmental modernisation. The paper focuses on the EU and the EU accession process. The accession is accompanied by the applying countries by fundamental and deep changes in the legal system, policy framework, and policy practice. The EU has been actively involving green movement into the process and thus become important factor shaping NGO agenda, while in the same time provides crucial source of funding for NGOs in this region. The paper is based on the on-going qualitative research of NGOs from the Eastern Europe and West Balkan in particular. The EU enlargement process has provided NGOs with a unique position where the process can be used as a leverage to promote new policies, legislation and measures. Yet, are the NGOs really able to influence decision making? How the EU shapes agenda and work of the NGOs; and does the EU and the EU enlargement enhancing or weakening position of the NGOs in the society? We argue, that "professionalization" of the movement often led to resignation (or inability) to generate public support, partly because NGOs itself are often seen as part of the elites and detached from the issues of the environmental justice and social solidarity.

Group Pleasures: Collaborative Commitments, Narrative Gratification, and Fun in Unequal Micro-Cultures

As a consequence of their size and fragility, small groups depend on cohesion, including the assumption of fundamental equality among members, despite the status hierarchies that inevitable arise. How do group members survive and thrive, given inequalities? Central to the continuation of groups are occasions of hedonic pleasure that recognize attachment. These times are popularly labeled "fun." While groupness can be seen the cause of fun, we emphasize the effects of fun on group life, recognizing that on occasion group leaders strategically generate fun. Shared pleasure creates the conditions for communal identification, overriding the inequalities of interaction and status. Such moments serve as commitment devices building affiliation, modeling positive relations, and moderating interpersonal tension and differential power. Further, they encourage retrospective narration, providing an appealing past, an assumed future, and boundaries between the group and those outside that erase divisions. The rhetoric of fun produces interactional smoothness in the face of potential interactional ruptures. Building on the authors' field observations and on other ethnographies of group activity, we argue that the experience and recall of fun bolsters group formation, maintenance, and reproduction.

FINEDER, MARTINA* (Academy of Fine Arts Vienna, martina@fineder.at)

We Want Things Different – the Visual Culture of Growing Ecological Awareness and New Emancipatory Lifestyle Experiments in the 1970s

This paper explores the role of alternative media in constituting and propagating green-alternative lifestyle culture in West Germany throughout the 1970s. At the time, hundreds of magazines were published all over the country to voice the new lifestyle concerns that sprang forth from the New Social Movements (NSM). Magazines such as the *Pflasterstrand* (Concrete beach), the *plärrer* (Bawler), and *Wir wollen's anders* (We want things different) helped to spread the ideas of various strands of the NSM such as the environmental movement, the women's lib, the Sponti movement, and numerous left-leaning citizen initiatives. In addition, these papers understood themselves as practical event calendars as well as shopping guides for new groups of people for whom lifestyle had become less characterized by an affiliation to a defined social class but to ecological awareness and new emancipatory lifestyle experiments.

In their efforts to disseminate eco-social ambitions the magazines came to share a very specific "rough and ready" aesthetic, which was a result of feasibility reasons but also owed to the constant recreation, remediation, and revisualization of the ways people responded to the socio-political upheavals of their time: Among other things, the characteristic layouts in do-it-yourself style were designed with a great variety of typefaces, coarsely rasterized photographs, and simple hand drawings in black and white.

Through the analysis of the particular visual culture shared by these alternative media outlets, this paper aims to highlight the significance of shared communication patterns as both indispensable instruments in the foundation of a new collective identity as well as a means of distinction. This paper broadens the scope of investigation from debates about style and social class in a rather straightforward Bourdieuian tradition into a wider discussion about a shared visual culture that triggered ecologically, socially, and ethically motivated ways of everyday life.

FINGER, CLAUDIA* (WZB Berlin Social Science Center, claudia.finger@wzb.eu)

Factorial Surveys in Social Psychology: Institutional Constraints and Social Inequality in University Application Plans

Not all high school students who wish to go to university think that they will be able to realize this wish. Previous research has shown that this mismatch between educational aspirations and intentions is stronger for students from more disadvantaged social backgrounds. While aspirations are mainly a result of socialization processes within families and schools educational intentions are influenced by the institutional opportunity structure that confronts prospective students.

This paper therefore discusses under which conditions high educational aspirations of German high school students are followed up or discarded. It thereby focusses on the influence of four institutional characteristics of German universities - namely geographical distance, university reputation, information provided by universities and selection procedures – and analyses in what way they interact with the social background of students in shaping educational intentions.

This topic is approached with a factorial survey on application intentions for university programs that is integrated in a survey of around 1000 Berlin high school students who state high educational aspirations one year before graduation. Within the vignettes (here: descriptions of study programs) the levels of seven theoretically important dimensions (here: selection procedures, reputation,

denotes a presenting author. Abstracts are organized by first presenting author's last name.

distance, information, etc.) are varied randomly and - also randomly - assigned to respondents. This allows evaluating the relative importance of one dimension vis-à-vis the others and shows which factors are most important in explaining the existing gap between university aspirations and their (intended) realization.

The findings suggests that distance from home strongly constraints application plans for all students. Social background differences can mainly be observed with regard to the *level* of application intentions indicating that socially advantaged students are in general less constrained by the institutional characteristics varied over the vignettes. The effects of the vignette dimensions, however, do rarely differ between students from different social backgrounds.

FINGER, CLAUDIA* (WZB Berlin Social Science Center, claudia.finger@wzb.eu)

The Black Box before Transitions: Social Inequality in Application for and Admission to Higher Education in Germany.

Whereas social inequality in the transition to higher education (HE) is well documented, important processes that predate university enrolment are largely neglected in the literature – namely application decisions on part of the student and admission decisions on part of the universities.

Firstly, it is important to ask under which conditions high school graduates apply for HE programs. Institutional and structural characteristics such as university reputation, application/admission requirements or the location of universities are likely to interact with students' social background in shaping application decision. Given an application it is, secondly, vital to analyze the role of HE institutions in selecting students. Universities thereby function as gatekeepers in that they define admission criteria and interact with applicants.

I focus on Germany where access to an increasing number of study programs became restricted in the course of educational expansion. Additionally, admission requirements became more heterogeneous. In this context social inequality in the transition to HE can be expected to increase as social background relates to social and cultural resources and thus to differing information on the functioning of HE (access), application skills and support.

I use new data on Berlin high school graduates to approach socially selective HE applications and admissions. Data have been collected shortly after the deadline for university applications and during the following semester – when admission decisions have already been taken. We asked students detailed questions about their applications (and non-applications) as well as admissions or rejections that they received from universities. Additionally, we collected data on access restrictions, admission criteria and selection procedures for each study program that respondents mentioned and added them to the individual data. This unique data set allows an in depth analysis of social inequality at both thresholds: the decision to apply and the probability to become admitted.

FINK, ELISABETH* (Frankfurt University, lisfink@yahoo.com)

Conflict and Cooperation: The Relation of NGOs and Trade Unions in Bangladesh's Rmg Sector

A closer look at countries of the global south reveals the Eurocentrism that underlies the assumption regarding the close correlation between a strong presence of civil society actors and democracy. Whereas, in one context, NGOs are widely seen as progressive societal actors who make the state accountable, in the other, NGOs are critiqued for acting as parallel states which lack any accountability. This holds particularly true in the context of Bangladesh, where the NGO sector is exceptionally large and influential. Many Bangladeshi NGOs regularly receive funds from international donors. As a result, a significant depoliticisation of developmental NGOs, which mainly focus on the rural population of Bangladesh, was observed (Feldman 2003, Kabeer et al 2010, Stiles 2002). Within the last two decades, labour NGOs as well as some trade unions who work in the ready-made garment (RMG) sector in Bangladesh have similarly received growing attention by transnational civil society networks and various organisations.

Against this backdrop and based on my fieldwork in Dhaka, that took place between 2010 and 2012, the proposed paper sheds light on the relation between local labour activism and transnational collective action. Therefore, the following questions will be discussed: What is the relation between international donors, transnational civil society actors and local labour organisations? Is there any evidence of a transnational social movement unionism in Bangladesh's RMG sector? Are donors, through the help of local NGOs, weakening the role of trade unions? Are NGOs contributing to – as a trade unionist whom I interviewed put it – 'peaceful exploitation of the workers'? Given the high percentage of women workers in the RMG sector and the still commonly deployed stereotyped portrayal of the 'third world woman', what are the gendered implications of transnational activism?

Lessons from Marikana? South Africa's Sub-Imperialism and the Rise of Blockadia

The Marikana massacre on 16 August 2012 was a cynical act to silence South Africa's notorious industrial labour disputes. Instead of silence, mining companies had to subsequently deal with unprecedented strike waves intended to radically alter apartheid-like working relations throughout the country. However, South Africa's highly exploitative and resource depleting political economy has remained in place. What is more, the political elite has tried to ensure global markets that South Africa's extractive industries will remain a cheap labour, business-friendly profit haven (Bond, 2013). Also South Africa's admission to the BRICS countries has lubricated rather than altered the governments' neoliberal aspirations and uneven development in the country (see Harvey, 2006). In concert with its new BRICS allies, South Africa is aggressively promoting the expansion of carbon markets that will very likely put poor 'underpolluted' communities at risk of losing their livelihoods as they know it (see Böhm et al., 2012). South Africa's 'mineral-energy complex' is indeed well and alive. Numerous new high-emission mining and energy projects already worsen the social and environmental conditions of the most vulnerable communities (Bond, 2013). This paper will offer a critical analysis of the current 'resource cursed' trajectory of South Africa's political economy. In order to make sense of South Africa's embeddedness in the world economy, we are looking in more detail at new sub-imperial structures (BRICS) and not so new imperial structures (World Bank, IMF) (Marini, 1972; Bond 2013). To come to grips with the everyday contestation of high-emission mining and energy projects, we are exploring the implications of 'blockadia', a concept that prominently features Noami Klein's new book (2014).

Emotional Divorce in Iranian Family: Sociological Explanation of the Rate and Factors Affecting on Emotional Divorce Among Women

Divorce always had been discussed as one of the serious problems in contemporary society. Rate of divorce is increasing in the all of society. But it seems that a special type of divorce has the more prevalence in some country such as IRAN.in this countries, the legal divorce confront with cultural, economic and legal obstacles. This obstacles increase the emotional divorce in this societies.so couples live each other without lovely relation. However, the legal divorce is surveyed easily for visibility and availability by researchers. But survey and cognition of the rate and factors affecting on emotional divorce confront researchers with serious challenges for its latent trait. So this research surveys the rate and factors affecting on emotional divorce in Iran. The first, we review and survey the available researches about emotional divorce in Iran and later, the article survey emotional divorce in special sample. The method is survey and data is collected by questionnaire among 384 marriage women in Amol city (the city in north of Iran). The research applies theory of Antony Giddens about pure relationship and its damages in risky society family. Results demonstrate that respondents have medium rate of emotional divorce. Also contextual variables (age, age in marriage time, family income, person education, spouse education) have meaningful relation and reverse with emotional divorce. The primary variables include: spouse discontent, opinion misapprehension, spouse distrust, selfishness, and spouse-selected discontent. All of the variables have meaningful and positive relation with emotional divorce. Also, all of the variables together explain %68 variation in dependent. The results of research show special type of relation among women in Iranian society. Women in situation of emotional divorce select different strategies in confront with this problem. They look for pure relation in out of family as the problem solving.

The Democratic Value of Citizens' and Civil Society Organizations: A Comparative Study of Rare Disease Organizations and Their Representative Claims

The participation of citizens' and civil society organizations (CCSO) in health care decision-making is established very differently in countries all over the world. Research revealed that while in some countries stakeholders such as health care professionals or policy makers remain skeptical, in more and more countries CCSOs are expected to *represent* patients and health users in diverse settings of health care decision-making.

Against this development it is not surprising that scholarly attention for CCSOs has increased over the recent past. However, because of the lack of comparative cross-national studies our understanding of CCSOs is still limited. An important gap in the literature concerns the issue of representation. Most studies take the democratic value of CCSOs for granted. However, to really understand their democratic contribution to decision-making we need more insight into what representation of CCSOs means and how it is put into practice in different contexts.

In this paper we provide such insight using the concept of representative claim (Saward 2010). Based on document analyses as well as expert interviews with their representatives we explore whom or what CCSOs claim to represent, in what setting of health care decision making they do or wish to participate and on what grounds they base both their representative and participatory claims.

Since CCSOs have a different set-up and play a different role in different countries we use a cross-national approach. The comparative study focusses on rare disease organizations in Austria, Germany and the Netherlands.

Business Elites and Citizen Demands – a Case Study from Chile

Elites are usually ill-disposed towards the redistribution of resources. Attitudes change, however, with respect to poverty reduction and pro-poor policies. Historical accounts of the evolution of welfare states in the global North inform us that elites` support for poverty reduction is driven by the extent to which elites and the poor are interdependent, i.e. that poverty and the poor have a positive or negative impact on their welfare, too.

A possible reason to explain the scarce perception of interdependence between rich and poor in the developing world is the transformation of the boundaries of society and socialization ("Vergesellschaftung") itself. Elites involved in the creation of welfare policies in Europe and the US (identified by Swaan, 1988) reproduced themselves and obtained their legitimacy mainly within the boundaries of the nation-state.

We argue that the problem is not that contemporary elites lack a perception of interdependence as such. There is, in fact, a change in the social and spatial coordinates of interdependence. As C. Lasch (1994) pointed out, elites nowadays reproduce themselves mainly within transnational networks and are socialized in cross-boundary class connections and institutions.

Taking Lasch`s thesis as the point of departure, we will present a case study on the business elite in Chile. We will focus on the way the Chilean business elite uses recognition and acknowledgement enjoyed abroad as a strategy to block recent citizen demands for greater democracy and access to public goods.

Neoliberal Think Tank Networks in Latin America and Europe: Strategic Replication and Cross National Organizing

In our paper on neoliberal think tank networks in Latin America and Europe we accept the widely held belief that research and consulting by think tanks plays a major role in the policy making process. Based on individual country and comparative studies, the innovative character of think tank expertise is stressed in relation to national epistemic cultures. In contrast to mainstream think tank research we will stress the political character of think tank knowledge and challenge prevalent methodological nationalism by way of examining the transnational dimensions of partisan think tank networks. The chapter analyses the history and growth of neoliberal partisan think tank networks in Europe and Latin America. While the founding and networking as such can be considered an example of "strategic replication" necessary to advance discourses in the global, regional, and national knowledge power structures, cross national organizing ties the separate elements together and allows for the transnational diffusion and translation of neoliberal ideas, concepts, and social technologies in policy making.

SCHAFFARTZIK, ANKE (Institute of Social Ecology)

The Vienna School of Social Ecology – an Enrichment or Too Interdisciplinary a Challenge for Environmental Sociology?

We see Social Ecology as a highly dynamic interdisciplinary research area, drawing on several academic fields, such as on sociology and various natural sciences. The common denominator of this research field is not so much a shared label, but a shared paradigm. Its core axioms are that human social and natural systems interact, co-evolve over time, and have substantial impacts upon one another, with causality pointing in both directions. From this follows a need to develop concepts and methods that allow dealing with social and natural structures and processes on an equal epistemological footing.

The Vienna School of social ecology has evolved over the past 25 years. It revolves around two core concepts: social metabolism and colonization of nature. Social metabolism describes a systemic process by which social systems maintain themselves by energetic and material exchange, thereby using natural resources and generating wastes and emissions. There is an elaborate metric for this (MEFA material and energy flow accounting) that became also standard statistics used by Eurostat. Colonization – deliberate social interventions from the part of society into natural systems – is a concept that helps to link human labour processes to environmental impacts. One of the metrics for this is HANPP (human appropriation of net primary production), and it supports the analysis of land use and land use change. Another feature of the Vienna School is its dealings with long-term processes and developing a theory of socio-metabolic regimes and regime transitions that may also help to understand a potential sustainability transition. Finally, these concepts and methods are applied in many policy contexts, such as globally contributing to UN's Sustainable Development Goals, to European resource policy programs and to participatory processes in small island development.

State As a Jural Phenomenon. a Critical Defense of Leon Petra?ycki's Conceptions of State

The paper is in two parts, corresponding to the two ways adopted by Leon Petrażycki for addressing the social phenomenon called 'state'. In the first part, Fittipaldi discusses Petrażycki's hypothesis as to the way naïve people and jurists represent to themselves a *state*, *godusarstvo*, *państwo*, etc. Fittipaldi compares this hypothesis to those formulated by Petrażycki about: juristic persons, hereditas iacens, and the possibility of indeterminate right-holders. In the second part, Fittipaldi discusses the stipulative concept of a state devised by Petrażycki for investigating social phenomena scientifically. In this context, Fittipaldi examines some criticism levelled at that conceptualization, and tries to defend it from the perspective of a strictly psychological theory of jural phenomena.

FITTIPALDI, EDOARDO* (University of Milan, edoardo.fittipaldi@unimi.it)

Toward a General Concept of Norm for Sociology, Psychology, Ethology

Norms have been often reduced to *behaviors* or *linguistic* phenomena. The authors who do take into account emotions usually contend that norms are connected to emotions or that emotions are somewhat prompted by norms. This leaves unanswered the question of what a norm is.

The author proposes to reduce norms to dispositions to experience ethical emotions, namely, guilt, shame, anger, etc. Norms do not prompt ethical emotions. Norms are rather (to be defined as) dispositions to experience ethical emotions in case certain circumstances obtain.

For instance, if John experiences guilt for having done x, it is not that John experiences guilt because he violated the norm prohibiting x. The norm prohibiting x should be rather reduced to the existence in John of the disposition to experience guilt if he does x.

The isolated experience of an ethical emotion is not sufficient to speak of a norm. A disposition is required and thus somewhat a patternization of the circumstances whose obtaining prompt ethical emotions. With the exception of pride (that is an internal reward), patternization requires that the individual carry out a sort of inversion.

For example, the individual must rationalize into the obligation of doing x his experience of guilt or shame in the case he does non-x (or, better, does not do x). As for anger, the individual must patternize into her sense of being entitled to do x her disposition to react aggressively in case another individual does not show respect for her doing x, or takes some course of action incompatible with her doing x.

In some cultures patternizations further result in hypostatizations. The reduction here proposed makes it possible to connect the theory of norms to modern psychology and ethology (this is especially the case for anger, indignation, and De Waal's forerunners of guilt).

National Media Coverage and "Politicized Lawyering" in the NSU Court Case, Germany

Between 2001 and 2007 a three-person group calling itself National Socialist Underground was killing small businessmen across Germany. With one exception, these were German citizens. Most had a Turkish migrant background. Although the killings spread over a number of years, and the perpetrators also robbed banks and exploded bombs in ethnic neighborhoods, injuring many people, neither the police nor the intelligence forces took these criminal acts seriously. Along with the press, most dismissed them as "Döner-murders" and looked for perpetrators in the "migrant criminal milieus". After the same group allegedly killed a policewoman and attempted to kill her colleague in 2011, two male members of the group allegedly killed themselves while the third one – a woman – reported herself to the police. In 2013 a court case was opened in which she and some others are charged with accessory to murder. In the court case about 60 lawyers represent the victims' widows and children. In my presentation, I will depict the actions of these lawyers as well as the reporting by the press. To signal what is to come, the reactions are polarized: while one national newspaper has predominantly worried about how this court case affects the legitimacy of the German state, another has mostly worried about the migrants, giving the surviving family members voice and face. Similarly for the victims' lawyers: while some very openly criticize the German state for tolerating racist institutional discrimination in the police and intelligence forces, calling for decisive reforms, others seem invisible and "neutral". Time permitting, I will also report on the conclusions reached by the commissions of inquiry set up by some regional governments to clarify the facts of the case.

Youth Unemployment, Post-Industrialisation, and Economic Crisis: Comparing Vocational Education and Training Policy in England, Germany, and South Korea

Youth unemployment, albeit with considerable cross-national differences, is a major social problem across the OECD; and, unsurprisingly, it is high on the political agenda. Considering that many young people out of work have low skills (which has been described as a 'new social risk' in post-industrial societies), vocational education and training (VET) is widely considered a sensible policy strategy for improving the job prospects and the social inclusion of young people.

Whilst post-industrialisation (transforming skills needs and social risk structures) is a secular, long-term trend, the economic crisis of the Great Recession put some additional pressure on youth employment and VET systems. But, how have VET systems in different countries responded to the dual pressure of post-industrialisation and economic crisis?

In this paper, we analyse the policies in England, Germany, and South Korea. Both England and Korea, with NEET rates above the OECD average (19% and 23%, respectively), have considerable, obvious problem pressure, whereas Germany (10%) presents itself somewhat more favourably. Yet, in the German case, we need to acknowledge that the highly acclaimed German VET system is increasingly viewed as failing young people of low educational attainment; and in fact, many young people out of work do not appear in statistics because they are "parked" in 'transitional' educational and labour market programmes.

England, Germany and South Korea represent the critical cases in the VET literature. Germany is commonly considered the prime example of the apprenticeship model combining workplace learning with training and general education in vocational training schools ('dual system'), whereas Korea has traditionally been considered a government-led training system, where VET is typically provided through vocational high schools. By contrast, England presents a market-led training system, and it is widely associated with a low skills/low productivity equilibrium.

FLECKER, JOERG* (University of Vienna, joerg.flecker@univie.ac.at)

A Global Labour Market for Digital Work?

The pervasiveness of new ICT brings about new constellations of space and time for work in a wide variety of industries and business functions. Since the wave of offshoring in the 1990s and 2000s, service functions, including customer service, software development, creative work and administrative tasks have become highly dispersed in companies' search for lower cost and relevant skills. The relocation of work at a global scale, best epitomized by the ascent of India's IT and business process outsourcing industries, signaled the emergence of a *new* 'new international division of labour'. In addition to the dynamics of global value chains and networks, internet-based crowdsourcing platforms accelerate the delocalization of work. This development of new business models and forms of work enabled by the internet further contribute to 'new geographies' of work in the digital economy. What is more, work itself seems to move to global information spaces

and to become virtual when work objects are digital and tools and knowledge are standardized at a global scale with the Internet providing access to information spaces from all localities with sufficient connectivity. These processes intensify the worldwide competition between educated workers which results, in some circumscribed sectors and occupations, in a global labour market.

This contribution is based on the findings of the working group on ´New geographies and the new spatial division of virtual labour´ of the European COST Action 'Dynamics of Virtual Work'. It maps the emergence of, and the limitations to, global labour markets for digital work in IT, IT enabled services, creative industries and related business areas taking into account the dynamics of global value chains, the virtualization of organizations and the development of crowdsourcing platforms.

Getting Your Sociology or Interdisciplinary Program Accredited By Capacs (the Commission on the Accreditation of Programs in Applied and Clinical Sociology)

"Professionalizing" Sociology begins with the accreditation of an applied, clinical, or engaged public program in sociological practice by the Commission on the Accreditation of Programs in Applied and Clinical Sociology (CAPACS). Graduates of CAPACS-accredited programs complete a carefully-designed curriculum, ensuring prospective employers that these candidates possess a full spectrum of knowledge, skills, and practice experiences that distinguish them from other job applicants and entrants. Creating a highly educated and trained pool of practicing sociologists furthers Sociology's "professionalization," as these individuals possess educational qualifications, training, and field experiences to support their acquisition of association credentials, including the "Certificate in Sociological Practice" (C.S.P.), offered by AACS. State credentials such as registration, certification, and licensure, also may be attained, if supported by sociological practice legislation, comparable to that enacted by "professionalized" disciplines, such as Psychology and Social Work.

This presentation will consist of three tracks:

Dr. Michael Fleischer, CAPACS Chair, will present a brief history and overview of CAPACS, with an interactive slide-show and handouts, covering the CAPACS accreditation process and its benefits.

Dr. Norma Winston, CAPACS Vice Chair and Past Chair, will discuss the CAPACS Site Visit Process, particularly organizing and hosting meetings with university administrators, internship site supervisors, and program faculty and students. She will address how applicant programs can prepare for CAPACS accreditation, and provide examples of how students' benefit from their tangible practice experiences, from her perspectives as a Review Committee Chair, Department Chair, and Program Director.

Dr. Jan Fritz, a member of the CAPACS Board of Directors, Past Secretary of CAPACS, Executive Board Member of ISA, and session Chair, will discuss CAPACS's role in accrediting non-US programs, working with the Departmental Resources Group (DRG) of the American Sociological Association (ASA) in helping departments prepare for accreditation, and expanding CAPACS's presence in the Clinical Sociology Division (RC46) of ISA.

Visual Discourse As Viscourse: Conventions, Critics, and Chances Challenging the Analysis of Media Visuals in Media Discourse Practises

The paper is embedded in a research project on media representation of top elites in international politics as well as the visualisation of power, gender, fashion, and the body. The visual data consist of countless samples of media pictures/images/photographs that are spread by international media agencies. These photographs are recurrent and dominant elements of daily news. In journalist jargon, pictures documenting international summits of politicians are often referred to as "family photos". These "images of power" achieve almost "iconic status". While in former times, they were a side effect of political events, nowadays they play a central role in political programmes. Their diplomatic protocol is strictly regulated, every position is determined by function and hierarchy, and the politicians stand as representatives of their nations and sovereign states. The significance of these rituals and visuals should not be underestimated; they are undeniably historical documents and represent a narration on hegemonic masculinity and power. As part of the symbolic communication in politics, these pictures offer strong prelinguistic narration.

With text as well as photos different messages can be communicated simultaniously: relationship and tensions. The evaluation of this material demands different methods and but also specific methodological groundings and raises questions such as: Which effect does the viscourse of these photos have? How are

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

they related to language and text? In what relation can they be seen to discourse of gender equality? The competition of attraction between rational linguistic arguments and affectual visuals may cause very ambivalent effects: intensification, contrasts, contradictions, reassurance etc.

Two different types of photos will be presented in the paper: a) official and static group pictures of political top events and b) event photos of meetings and encounters out of motion – both types give examples for the challenges for methodological approaches.

What Is Political Ecology ? a Conceptuel Approach

In this communication I want to raise some results exposed in my book on political ecology (*Nature and politics*, Amsterdam 2014), based on the discussion of some french authors. Political ecology is usually hard to define. Is it a political party ? Is it a social movement, with broad mobilisations, agenda setting etc. ? Is it of economical nature, as the *Ecological Economics* school of thought or the « green growth » discourses are explaining us ? Are ecologists « believing » in climate change or collapses ? Are they neo-animists, or a new kind of scientists ? The questions are numerous. I used the following methodology : try to catch what political ecology is through debates that arose at the moment of its emergence, since 60s. A this date, two ideologies where dominating political debates : liberalism and 'socialism' broadly defined as class struggle, being reformist or revolutionary. We found four major controversies, in academic litterature : on 'rights of nature' (is it possible ? Rational ?), on political behaviour of ecologists (are they right wing or left wing ? None of them ?), on the economy (class struggle or free-market ?) and on science and religion. In this communication we try to sum up these findings. This methology has some limitations, as any other has some also. In this case 'ecologism' is being excessively homogeneised. But is had also some positive aspects : going beyond the apparent multiplicity and dispersion of what is called 'ecologism'.

FLORES, DORISMILDA* (ITESO / UAA, dorixfm@gmail.com)

Imagination/Action: Making Sense of Future in Online Public Expression By Local Activist Groups

In this paper, I discuss how local activist groups articulate global concerns and alternative proposals in online public expression.

The data come from a study based on a multi-sited ethnographic approach, in three communication spaces of activists —Internet, the streets, and the media—, with digital ethnography, semi-structured interviews with activists, participative observation in the groups' activities, and an analysis of local media coverage. This study was conducted in Aguascalientes, Mexico, with two local activist groups.

The main results show that imagination is a key element in online public expression by activists. Their messages usually follow three paths: 1) a critique of the contemporary world, with its inequalities; 2) a better world under construction, that is, the actions that activists do in the present in the pursuit of a better world; 3) the imagined better world, the futures they hope. In sum, there is a point of departure, a problem in the present; there is a hope, an imagined better world in the future; and there is a way between them, the actions in the present.

In online public expression, activists raise questions in three main areas: economics, politics, and culture. In an economic sense, they question the commodification of everything, and propose a different way of measuring the value of things, nature and people. In a political sense, they question the traditional representative democracy logics, and propose a more active citizen participation. In a cultural sense, they question the idea of only one possible future, and propose an ideal of social change, another world is possible.

Imagining the future is the core of online public expression of these local activist groups. Internet plays a key role, as a communication tool, but also as a space of struggle for recognition of alternative ideas about the future.

Participación Política De Organizaciones De y Para Personas Con Discapacidad En El Diseño De Programas Públicos En La Ciudad De México: Espectro De Organizaciones y Tipos De Participación

La participación política de las personas con discapacidad y las organizaciones que las representan en la Ciudad de México es un fenómeno que va aumentado paulatinamente a partir de la entrada en vigor en México en 2008 de la Convención sobre los derechos de las personas con discapacidad y su protocolo facultativo.

Aunque actualmente la discapacidad ya no es vista como un problema médico e individual y se reconoce como una condición social en la que las personas con deficiencias físicas, mentales, intelectuales o sensoriales al interactuar con diversas barreras, puedan impedir su participación plena y efectiva en la sociedad, en igualdad de condiciones con las demás; todavía hace falta la construcción y problematización por parte de las propias personas con discapacidad de sus ciudadanías y convertir a la discapacidad en una plataforma desde la cual reivindicar su identidad, y dar paso al planteamiento de ayudas para exigir demandas en el espacio público.

Esta ponencia examina a partir de evidencia de mi investigación doctoral, diferentes tipos de participación política de organizaciones de y para personas con discapacidad que tienen lugar a partir de una tipología que explica la estructura y función de seis tipos de organizaciones: 1) familiares-asistenciales para personas con discapacidad, conformadas alrededor de personas con discapacidades intelectuales; 2) organizaciones antidiscriminación de personas con discapacidad aglutinadas y dirigidas principalmente por personas sordas y con discapacidad visual, motriz y psicosocial; 3) organizaciones profesionales de la discapacidad, conformadas por profesionales médicos y de otras especialidades; 4) organizaciones empresariales en donde la discapacidad se configura como un negocio y 5) redes de organizaciones.

Cada tipo de organización sostiene diferentes intereses, intenciones y fines al participar. Al interactuar surgen por lo tanto diferentes definiciones de los problemas sociales de la discapacidad

LOCATELLI, LUIS (Federal University of Sao Carlos)

Party Membership in Brazil: Age and Polity Size in a Longitudinal Perspective (1980-2014)

Several studies have pointed to the decline of membership-based politics in Europe, with a growing gap between members and citizens in terms of age (Scarrow and Gezgor, 2010; Van Biezen, Mair and Poguntke, 2011). In Latin America, exploratory studies have suggested that membership levels are much higher (Dosek, 2014). According to the Brazil's Electoral Court, there are 15 million party members in the country, nearly 11% of the national electorate. The figure is impressive, not only because it is a new democracy, but also because it is expected that large polities have lower membership levels (Mair and Van Biezen, 2001; Weldon, 2006). Using an original dataset with the dates of birth and membership of millions of Brazilians who joined the parties between 1980 and 2014, this paper explores two main hypotheses. The first evaluate whether the Brazilian party members are becoming older, comparing 1) the age of new members over time and 2) the age of new members and the national electorate in each year. The second hypothesis explores the effects of the size of the polities on membership levels in a very favorable situation for a comparative analysis. As a federal state, the regional level is an important locus of power in Brazilian politics. There are high levels of heterogeneity in terms of size, socioeconomic characteristics and structure of competition across the 27 states. Nevertheless, the electoral and membership rules are identical between them, the major parties are present in all regions, and exclusively regional or local parties are prohibited (all parties are multilevel organizations). We compare, thus, the current and historical membership levels (since 1980) between the states. The paper tries to contribute to a greater understanding of party membership in Brazil, comparing the Brazilian case to the recent findings about Europe and Latin America.

Transnational Families in Romania. Facing New Opportunities and Risks of Intergenerational Solidarity

Recent demographic changes such as ageing, low-fertility and not the least, out-migration, characteristic to Eastern European countries, including Romania, bring into discussion the vivid question of the future of the intergenerational solidarity. In the context of the increasing geographical mobility of young people in search for better paid jobs, the existing need for personal assistance amongst elderly and an undeveloped formal care system, Romania faces new understudied dynamics of intergenerational support. Contrary to certain perspectives, which consider spatial proximity between adult children and their elder parents the indisputable enabling factor for intergenerational support transfers (Rossi & Rossi, 1990), emerging literature in the field of transnational families highlights that such kinship relations continue to exist even across borders (Baldassar et al, 2007). Using recent data from the nationwide survey "The impact of Migration on Older Parents Left Behind in Romania", which allow examination of intergenerational solidarity in the context of transnationalism, were revealed complex dynamics which involves both adult children as transnational migrants and elder parents as transnational non-migrants. Therefore, the multinomial logistic regression and

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the multiple correspondence analysis indicates, on the one hand, the precise role of the migrants as providers of remittance, and draws, on the other hand, the way in which other forms of support are distributed among the dyads. Despite a possible presupposition that parents who were left at home only are the beneficiaries of the support provided, the data show the opposite: elderly, depending on age, can be involved in both ways, as beneficiaries or as providers of help.

FOLEY, BENJAMIN* (Rutgers University, brf39@scarletmail.rutgers.edu)

A New Kind of "Color-Blind" Human Rights Discourse in a "Facebook World": Unpacking the Hierarchical Humanitarian Sensibility of Kony 2012

Human rights discourse has never been politically or culturally neutral. It has always been an ideology that formulates a racialized hierarchy between the savior and the saved. Here I explore how the online advocacy film KONY 2012 utilizes a sort of "color-blind" ideology associated with the "Facebook" demographic/ generation to reinscribe a racialized hierarchy between the savior and the saved. To do so I examine KONY 2012's representation of the "Facebook" donor's/ viewer's obligation to help others. I explore how this myopic lens emphasizes improved "race relations" while at the same time naturalizing the racialized politics of humanitarian intervention. Through a content analysis of the film, I argue that the "color-blind" humanitarian sensibility of filmmaker and narrator Jason Russell and KONY 2012 campaign supporters obscures the agency and autonomy of other humanitarian allies as well as Ugandan beneficiaries represented in the film. It also conflates American military power with the defense of human rights, and formulates a racialized ranking of "unacceptable" and "acceptable" suffering where a warlord merits organized protest, but poverty in resources does not. By employing a savior trope in a color-blind ideological frame, KONY 2012 is, I argue, a global racial project that reifies racial hierarchy without directly appealing to racial language.

FOLLONI, ANDRE* (Pontifícia Universidade Católica do Paraná, andrefolloni@gmail.com)

Determinism and Unpredictability in Social Systems: Can Law Engender Development?

Most of the complex systems studied by the hard sciences, such as physical dynamical systems, modify themselves according to determinant rules that can be described in mathematical terms. Those rules are what we call scientific laws. Laws of this kind cannot be violated – you can't violate the law of gravity. The determinism associated with these rules lead to the thought that scientific method can engender a kind of knowledge that is able to predict how a dynamical complex system will behave in the future: since you know the initial conditions of a system and the rules that govern its evolution, than you will necessarily know how the system will behave and also its final state. Chaos theory had shown how even systems governed by deterministic rules can behave in unpredictably ways, if the system is sensitively dependent on the initial conditions. Chaos theory is then responsible for the separation between determinism and predictability, at least in chaotic complex systems. Hence one of the most important epistemological consequences of chaos theory is to accept that science does not necessarily have to predict to be a real science, and that explain or describe does not necessarily involve the ability of prediction. This situation is even more important in the soft sciences, such as social sciences, since the behavior of the social systems' agents is governed by rules that can be violated, whether these are economical, ethical, legal or religious rules. So it seems like it is especially difficult to predict human and social behavior in the long term. If this is true, then every attempt to create a law to produce some social consequence is involved with a deep degree of uncertainty, and then complexity science in social sciences is even more complex than in natural sciences.

FOLMAR, STEVEN* (Wake Forest University, folmarsj@wfu.edu)

Social Tremors: Gendered Psychological Impacts of the 2015 Earthquake in Nepal

Lamjung District, less affected than other areas by the 2015 earthquakes in Nepal, experienced degrees of physical impact and psychological damage that varied widely in the area between Besisahar and the eastern border it shares with Gorkha. Results of a psychological survey of 180 adolescents collected in August and September of 2015 fail to produce a clear and consistent picture of the earthquakes' effects on mental health. Narratives from nearly 80 individuals, collected at the same time clearly demonstrate that while much individual variation exists, the April 25 and May 12 earthquakes' effects followed fault lines already extant in Nepalese society. Gender, caste and ethnicity illustrate how existing divisions in social structure account for much of the difference in how people experienced the earthquakes. Cutting across these divisions, the density of kin networks and the power of world views emerge as explanations for coping with the impact of disaster on individuals independent of the severity with which the earthquake disrupted their lives. Particular gender-based considerations of kin-based responsibilities figure prominently in gender differences. Large, dense social networks revolving around close kin appear as the most powerful explanation for psychological resilience, especially when combined with a rich ritual response.

AIDS, Stigma and Vulnerability: The Role of the NGOs in Providing Support

In this paper we intend to discuss the effects on positive social interaction in the mental health of people living with HIV/AIDS, based on the experience of the project Amigo Positivo, developed by the NGO Educativa, in collaboration with the National Network of People Living with AIDS, Brazil's Ministry of Health, and the United Nations Educational, Scientific and Cultural Organization. One of the most important effects on being HIV seropositive or living with AIDS is the stigma. People living with AIDS suffer discrimination, feeling excluded from social circles because a new identity is built for them. The fear of being excluded has the consequence of impoverishment of the social life, the feeling of abandonment. The effects on health (mental and physical) are devastating. Brazil has faced the AIDS epidemics with a strong political public program of prevention and control, followed by an efficient health support, with medical assistance and provision of drugs for those who need it. But this worldwide recognized health program would not exist if the NGOs have not begun fighting, in the early 80s, for public assistance and against prejudice and stigma. The stigma in that moment was very impressive: AIDS was a disease from evil; people living in sin (homosexuals, prostitutes and drug addicts) were affected due to their life styles. In a deeply catholic country like Brazil, this was a good argument against people with HIV/AIDS. Rebuilding a new identity, working against stigma and promoting positive interactions are the goals of many NGOs. For the Educativa: Ação para Saúde, Educação e Cidadania, a NGO working with people with HIV/AIDS in Alvorada (a city in the state of Rio Grande do Sul, Brazil), the main question to be worked is the fear of being excluded by friends, family and working circles

Empowerment through Intimacy: The Case of Czech Homebirth Controversy

Current debates on health care policies are often rife with emotional content pointing to competing values, beliefs and interests and raising through this competition the question about who is the relevant expert to decide over a health care measure, what knowledge counts as the right one and how this knowledge should be communicated. Not only patients are those who are being seen as increasingly empowered in these debates, but the citizen empowerment draws the analogy between the change in the relationship between patients and doctors and the interactions between experts and lay persons stated repeatedly in the current research on the role of discourses in public policies.

This paper analyzes the case of the Czech controversy around homebirth in order to show the dynamic of the empowerment and the specific role of intimacy in it. Czech home birth policy debate has raised to a controversy presenting homebirth primarily as a threat to the child's security, to maternal responsibility and revealing by that the conflict over professional territorialism between obstetrics, midwifery and mothers. In that way, the controversy problematizes the issue of citizen empowerment. By focusing on arguments for and against homebirth and by identifying the actors taking part in the debate the analysis suggests that the particular choice for a way of giving birth is being translated as a choice based on intimacy.

Intimacy refers here to the concern about the appropriateness of a particular emotional experience of birth and is transmitted through appeals to particular values and beliefs and interests related to the way of giving birth. In the analysis, the phrase "empowerment through intimacy" joins the recent public policy debate on citizen empowerment and the relationship between experts, patients and policy makers and traces how intimacy affects it.

Critique Between Renewal and Negativity: Some Comments on Social Ontology

The hereby proposed paper plans on taking up the concept of critique and, specially, the idea of a "renovation of critique", as brought forward by Luc Boltanski and Ève Chiapello foremost in their book *Le nouvel esprit du capitalisme* (*The new spirit of capitalism*), and problematize the answers presented by them in a postface from 2011, where they briefly address the problem of the "double ontology of the social world". To take this through the argumentation will synthesize the concept of "*network*" (*réseau*) as defined by them in order to understand its position among the clarifications and answers presented in the postface. If the authors make a reference to the development of Marxist thought and most notably understand how in the French context of the social sciences ontology develops into its rhizomatic or reticulaire formulation, I would rather direct my reflections to those contributions that can be found in the *Positivist Dispute in German Sociology* (*Der Positivismusstreit in der deutschen Soziologie*), with special attention to its "Introduction" by Theodor W. Adorno. The intention is to advance traits of this interpretation, allowing to focus on (some) sociological traits of Adorno's critique to ontology, therefore not discussing – what would be impossible in a short exposition – those (philosophical) pressuppositions, but rather aiming to delineate an immanent critique pointed towards the notion of social critique as suggested by Boltanksi and Chiapello, laying the foundation to better understand how a dialogue between so called critical theory of society and these two authors could direct itself to capitalism and therefore be appropriated to foster a critical debate on (social) ontology as an important and neglected theoretical aspect.

Dependence Theory and the Center-Periphery Relation (revisited) As Critical Stance

This paper proposal is delineated foremost towards two main questions. On the one side, it focuses on certain aspects of critique, and therefore will directly take up the argument found in the book *Dependence and development in Latin America. An essay of sociological interpretation*, written by Fernando Henrique Cardoso and Enzo Faletto, first published in 1970 and written during the second half of the 1960s, a seminal work of the so called *dependence theory*. This aims at shedding light on this pioneering interpretation of center-periphery relations, bearing a tight but critically distanced connection to Marxism when depicting its concept of *underdevelopment* (*subdesenvolvimento*) as a structural product of development, while at the same time emphasizing the relevance and core contribution of a sociologically oriented perspective to oppose itself to a dominant economic discourse.

Therefore it establishes a twofold theoretical counterhegemonic argumentation, challenging mainstream scientific views in terms of their disciplinary orientation as well as putting into question some of its central arguments. On the other side I wish to engage in a dialogue with other relatively seen more recent (critical) perspectives from what has been deemed as a peripheral standpoints. More specifically I seek to unravel the above reflections to circumscribe the theoretization of the Austrian-Brazilian thinker Roberto Schwarz, notably in his essays "Misplaced ideas" (1977) and "Nationalism by elimination" (or "National by subtraction", in a free translation of his Portuguese text, published in 1986), where he attempts to reflect on the originality and "placing" or "misplacing" of certain ideas. As far as I see it, going back to or elucidating these approaches could contribute steadfastly to postcolonial as well as decolonial thought in its form and simultaneously concerning its content.

Searching the Historical Origins of Legal Indicators: Revisiting the Stanford Studies in Law and Development (SLADE)

Legal indicators are currently an important part of legal discourse and perform various evaluative functions regarding the quality of rule of law, trustworthiness of remedies in a legal system, and levels of governmental corruption. Additionally, both public and private actors take very seriously contemporary indicators, such as the Rule of Law Index, Doing Business Index, and Global Rights Index. This phenomenon was termed 'mathematical turn' in legal reasoning (Restrepo-Am-

ariles, 2015) and has impacted domestic jurisdictions in their statistical analyses of justice systems and control of judicial efficiency (Fortes, 2015). Legal indicators are nowadays an important tool to understand the law in society. In this sense, searching legal indicators is essential for our better understanding of the world and how to improve our lives in the future. This paper will contribute to the literature on legal indicators by revisiting the Stanford Studies in Law and Development (SLADE). Following the insight that legal culture may impact legal development within different societies (Friedman, 1975), a group of scholars decided to collect comprehensive empirical data on a number of different jurisdictions with the goal of comparing and contrasting different features of legal systems by means of legal indicators. Unfortunately, because of lack of funding, such project was never entirely completed, but nonetheless their initiative was very important in generating insights on the potential creation of legal indicators and academic lessons on law and socio-economic development (Merryman, 2000).

Professional Emergence Under Pressure: The Cyber Security Arena

Cyber security has risen to prominence on the transnational political scene in recent years. The focus has been on the threat posed by potential adversaries to the critical infrastructure of nations. In the name of collective security, intelligence agencies are resorting to mass surveillance and privacy intrusions. In contrast, computer security specialists focus on securing end points of networks, approaching the manner more technically. This article explains why these two approaches are opposed to each other by employing the analytical framework of linked ecologies. Focusing on Denmark in a global context, the interview-based study examines the relations between experts in the business community and actors in both the political and academic spheres. There are early signs of an emerging profession characterised by high demand for cyber security services but low supply of professionals; new specific educational tracks in cyber security; and a re-coupling of the practical and academic domains which have hitherto been decoupled. However, there is no professional organisation to provide a conscious push for professionalisation. Instead, the development is driven by pressure from the political sphere and it is characterised by regulation efforts, standardisation, a call for a clear division of responsibilities within the state, and the rise of formal education. This leads to the emergence of a quasi-profession. Cyber security has become an arena of competition between different professions and different ecologies, and it is difficult to tell whether IT security experts or legal experts will dominate the policy arena in the future.

Narrating Genocide: Time, Memory, and Blame

Twenty years have passed since the Rwandan genocide. Scholars have analyzed how memorials and commemorations reflect and influence collective memories of the violence, yet we know much less about how Rwandans remember the genocide. In this article, we draw upon over 100 interviews with genocide survivors to assess collective memories of the violence. We find that Rwandans conceptualize the genocide as a watershed event that divides time into two distinct eras. When discussing the pre-genocide period, Rwandans focus on macro-level events and structures. This allows them to locate blame for the genocide in intuitions rather than on Rwandan citizens. By contrast, narratives of life after the genocide focus on perceived progress since 1994, effectively treating 1994 as time zero and shaping perceptions of the future as hopeful. Taken together, the allocation of blame and the perceptions of hope have significant implications for survivors' participation in judicial efforts, reconciliation programs, and other essential processes in post-conflict communities.

Dockworkers Against Austerity: Multiscalar Political Alignment and Campaign Success in Transnational Union Activism

Labor scholars and activists have called for greater international coordination among trade unions to respond to the assault on workers by the austerity agenda, but we lack a theory for understanding under what conditions labor unions at multiple levels (local, national, European) come together effectively to achieve campaign goals. The impact of the austerity agenda has not been uniform and international solidarity does not always deliver a victory, even in sectors where labor is well-organized internationally: through European solidarity since 2009, English dockworkers achieved a partial victory; Portuguese dockworkers achieved a full victory; and Greek dockworkers have thus far not succeeded in achieving

their goals. How do we account for this variation in success at resisting austerity despite strong international participation by the same actors in all three cases during the same period (2009- 2014)? The dockworker cases suggest that international solidarity is a necessary but never sufficient condition for the successful resolution of disputes, even in this highly internationalized sector of the economy. Instead, the most effective organizing necessarily ties together strong shop floor and community action at the local level with effective industrial action (or the threat thereof) at the international level, as in the Portuguese case. Strategies that rely too heavily on national political change at the expense of international action, as in the Greek case, or too heavily on international action to overcome problems at the local level created by the national union bureaucracy, as in the English case, have not met with success. Effective dispute resolution for the dockworkers, then, has depended on the successful articulation of union politics and strategy at multiple levels: in essence, exercising worker power in a coordinated fashion at the local and international levels while avoiding or overcoming the constraining effects of national union bureaucracies and political parties.

Imperialism, Anti-Imperialism and Regional Economic Integration: An Analysis of Strategic Orientations to Transnational Dockworker Coordination in Latin America

Comparative research at the regional level can help elucidate the greater challenges that workers in the Global South face in coordinating international action relative to workers in the Global North, as well as the logics behind different strategic orientations to international work. While labor internationalism in the transport sector in Latin America during the Cold War was largely the prerogative of State Department and CIA funded initiatives to further the interests of US imperialism (and rank-and-file efforts to resist those initiatives), today new initiatives are emerging to take their place. The International Transport Workers Federation (ITF), which continues to suffer heavy reputational damage for its on-going role in supporting conservative unions in the region, has seen its standing among Latin American dockworkers diminish as the International Dockworkers Council, a newer organization, avowedly rank-and-file led, militant and politically left-wing, has quickly grown its membership throughout the region in recent years. Yet, while the IDC enjoys robust participation and action in Europe, attempts to stimulate similar develops in Latin America have met with far greater challenges and less success. European dockworkers' strong and sustained coordination at the European level relative to Latin American dockworkers is the result not only of greater resources, but also of the far greater incentives provided by the unified regulatory framework imposed through the European Union. Despite the increasing economic integration brought about through MERCOSUR, a similar logic for cooperation of shared regional governance is still lacking in Latin America. Latin American dockworkers instead see greater strategic value in solidarity from powerful U.S. dockworker unions than within-region solidarity. Nevertheless, Latin American dockworkers emphasized multiple potential benefits of increased coordination at the Latin American level, ranging from political and economic pressure on states and employers to information sharing and achieving political goals beyond the workplace.

Identity and Upbringing: South Asian Young British Muslims, Love Relationships and Views of Marriage

Since Britain is becoming increasingly multicultural, religion, and in particularly Islam, has become more visible. A growing religious diversity has created new contexts and affected young people's identity and transitions to adulthood.

This paper draws on a book 'Identity and Upbringing' which explores parenting and growing in the context of South Asian (Pakistani, Bangladeshi, and Indian) Muslim families living in Britain. Here the focus is particularly on one question: how do young people's romantic relationships and attitudes toward marriage relate to important aspects of growing up and intergenerational relationships?

Romantic relationships are defining features of the teenage years (Connolly and McIsaac, 2011) but are often volatile, short lengthened, focused on present companionships and sexual experimentation rather than on the stronger levels of commitment more typical of the years ahead. However, psychologists have argued that teenagers' love relationships have important developmental value with implications for future attachment and identity development (Furman and Shaffer, 2003).

The paper draws on insights from interviews (N=52) conducted with parents and young people aged 14-19 years old in different regions of England. Findings suggest that the intimate lives of some of the young people in the study were secret and fugitive. Even though young Muslim' stories were not at all unique to their ethnic and religious groups, there was a sense that some religious and cultural norms posed some 'extra challenges' affecting the emotional sphere. Marriage was perceived as a family matter with specific functions, including the trans-

mission and perpetuation of culture and status. The preferences for intra-ethnic and intra-faith marriage reflected intergenerational differences about the importance of maintaining the continuity of religion and South Asian cultures, but also of social status.

Le Corps Dans Le Rituel De La Marche Sur Le Feu à La Réunion

Bachelard met en évidence que la connaissance première du feu se fait par un interdit social. Avant de connaitre le feu en tant qu'élément naturel, depuis l'enfance, les hommes savent qu'il ne faut pas le toucher, car il peut brûler. Dans la communauté des descendants des engagés indiens de l'île de La Réunion, département français de l'océan Indien, on marche sur ce feu « interdit » sous forme de braises ardentes. Or, bien que l'orgueil pèse sur le pénitent pour ce qui concerne la bonne exécution du rituel, il ne s'agit pas d'une question d'hubris envers les divinités, il s'agit le plus souvent du fidèle qui se fait offrande pour la divinité. À La Réunion la marche sur le feu est insérée dans un cycle cérémoniel religieux de dix-huit jours, où le temps et l'espace se sacralisent en crescendo afin de préparer les marcheurs à l'épreuve du feu. Le corps est soigné à l'intérieur par un régime végétarien et à l'extérieur par des bains purificatoires; le mental est fortifié par la concentration et la prière. La quiétude et l'abstinence sont nécessaires à la bonne réussite. Si certains marcheurs ne se brûlent pas, d'autres sortent du brasier avec des marques. Il semble y avoir une connexion entre la préparation et la réussite, et pourtant, même le fidèle qui se brûle, est heureux d'avoir accompli ce sacrifice. Le corps, soit-il maîtrisé ou « martyrisé », devient alors un corps oblation, un corps efficace, un corps narratif, un corps arme, un corps symbolique.

La proposition se base sur ma recherche de terrain (2013/2015) faite sur l'île pour la préparation de ma thèse de doctorat en Anthropologie.

Vanity Fairs Competition in the Service of Self-Esteem. on Modern Science and Post-Modern Media Culture

Vanity is an intriguing motive for competition. Whether you take it to mean excessive self-regard or just craving for attention, it denotes a drive that is both strongly self-centred and eminently social. It is self-centred since it is, in the last analysis, pursuit of self-esteem; it is eminently social since the self-esteem we can afford depends on our income of appreciative attention. The pursuit of self-esteem thus includes that one has to compete for attention. Vanity fairs are socially organised competitions for attention.

Competition for attention is no one-way affair. You have to offer something if you want do be paid attention. This means that the organisation of vanity fairs can be functional regarding the generation of some sort of supply. Vanity fairs thus wait to be utilized by society as exchange systems where goods and services are exchanged for attention instead of money. Since the pursuit of self-esteem is both tending to high standards and highly capable in mobilising energy, vanity fairs wait to be utilized by society as markets for particularly challenging demands.

The paper goes into two cases in point: modern science and post-modern celebrity culture. Both scientific communication and advertisement financed media are information markets where information is not sold for money, but directly exchanged for attention. Scientists working for publication work for the 'wage of fame', celebrities are the new class of attention rich who live from the masses of attention collected by media leaving the exchange of information for money behind. Both science and media culture lie at the base of contemporary culture in economically advanced societies. The paper is on the constitutive role that vanity fairs play for this culture.

(Re)Constructing Children's Play Cultures: An Exploration into the Work of Children App Designers

Even though the final use of games and toys aimed at children is often unpredictable, studies about products themselves, marketing strategies or parents' attitudes have demonstrated that children's play is a social construction involving various adults too (Brougère, 2008; Buckingham, 2011). However, the sociology of childhood has paid little attention so far to those who also shape directly children's play environments and practices, namely game designers and creators. When they design new products indeed, they adopt a reflexive stance towards children and anticipate how the latter will play: but where do their representations and assumptions about childhood come from? Are they coherent? And for instance, are they scientifically or intuitively conceived? An answer to this kind of questions will be given through the case of the mobile application industry which has developed in the past few years a large offer for younger and younger children, creating new markets as well as new concerns (Chiong & Shuler, 2010; Goldsmith, 2013). Thanks to semi-directive interviews with app developers, graphic artists or game designers, and to the analysis of children app companies' websites, I examine the definitions and the roles attributed to children during the design process: the study reveals important differences regarding, for instance, the actual presence of kids in the process, the use of external expertise about childhood, the degree of autonomy left to children or the balance between educational and entertaining objectives; it suggests that they can be explained, at least partially, by the specificity of the mobile app economy and by the creators' diverse professional cultures and experiences. Results additionally question the evolution of children's play cultures, especially under the influence of play practices from older generations.

FRANCZAK, KAROL* (University of Lodz, karol.franczak@wp.pl)

Circulation of Knowledge in the Public Discourse – Between 'popularization' and 'populization'

The main scientific objective of the paper is to investigate the practices of the circulation of knowledge in the public discourse. It discusses two models of circulation that can be labeled as 'popularization' and 'populization' of knowledge. The first one is identified with the traditional image of the activity of academic elites, which usually takes form of informing the broad public about scientific discoveries and translating the hermetic jargon of academic language so that it is accessible to a wider audience. The second model attempts to describe the process of losing the monopoly position of the dominant administrators of scientific knowledge. Observation of contemporary social practices leads to the conclusion that the number of areas and disciplines within which scientists can count on unconditional obedience is drastically shrinking. In many areas, their position is undermined by the skepticism of representatives of circles that do not have the institutional legitimation or are legitimized in a way that on the basis of scientific institutions is controversial (e.g. political activists, bloggers, artists, laymen).

Circulation of knowledge is considered as an important component of the modernization and anti-modernization discourse. Their components, as well as implicit and obvious ideological references are critically examined. This applies both to the overall transformation of the discourse, as well as the processes of its placement in the social reality, including the media. An especially valuable conceptual proposal for the description of 'popularization' and 'populization' is category of 'de-distantiation' (the reduction and weakening of distances in social relations) developed by Karl Mannheim. On the one hand, paper points to the importance of a pro-developmental model of bridging the gap between scientific and colloquial knowledge ('modernization de-distantiation'), on the other hand, paper recognize the growth of intensive processes of knowledge production that develop contrary to the present modernization discourse ('anti-modernization de-distantiation').

Conflict, Negotiation and Housing Policy Arena: An Italian Case Study

The aim of this ethnographic research is to study the housing policy arena of Firenze. The city is known worldwide for its touristic facade of Renaissance palaces, streets and museums; but under this surface, a tense and conflictive social field of fights for the right to housing is sprawling.

I have focused on the interactions between the local SMO Movimento Lotta per la Casa ("Fight for the Housing Movement") and local governance regime. I have used the concepts of governance and urban regime (Stone 1989) because of a relatively high degree of internal cohesion in this policy arena, which, in turn, is embedded in an articulated territorial government structure.

This policy arena is built on a vast array of subjects: the examined Movement, tenants' organizations, the net of squatted social centres and movements, three levels of public administration, quangos managing the social housing, other state agencies (owning some squatted buildings), and social workers. Are important actors also, on a general level, local media and police forces. I relied upon different techniques: direct observation and participation in the life of the Movement, non-directive interviews with key actors, observation of policing in rallies and evictions, and analysis of the textual and normative production of the main actors.

The relation between the Movement and public bodies is multifaceted: while the neoliberal "Word" is preaching an urban participative approach to decision making, grassroots participation is actively organized and produced in places as squatted houses, generating a challenge that institutions are not capable and/or willing to accept. At the same time, this Movement follows a path of adaptive communication with institutions: this approach is framed from the necessity to address the very material issue of giving a house to those who are excluded from accessing both market housing and social housing.

Social Marketing in Social Enterprises the Case of Sweden

This research explores Social Enterprises focusing on Social Marketing. It analyses how social marketing is used and its impact on social enterprises. Multiple cases were applied for data collection and semi-structured interviews, direct observation and written sources of information have been used to collect qualitative data. Cases on Swedish Social Enterprises developed with the aim to create employment and to empower disable people have been conducted in their real life context. The results reveal that social enterprises use relationship marketing and are people oriented. They develop networks with public authorities, businesses and they approach the general public to market the cause of their existence. It is indicated that social cause is important to be embedded in social enterprises marketing to develop positive image, influence public attitude and change behaviors in the society. It is argued that to succeed with social marketing the management of social enterprises should concentrate on the three relational P: s that is People, Process and Physical Evidence to develop relationships with stakeholders in their internal and external environment. The research advances theoretical understanding of social enterprises and social marketing by analysing work integrated Swedish cases and pointing out the importance of communicating the social cause of the business. Managers should recognise that networking with stakeholders is imperative for marketing of the aim of the social enterprise and can contribute making the cause of their presence and their vision visible and thus develop trust and legitimate the business.

Enhancing Gender Equity in Opportunities for International Collaboration: Policy Implications of Three Studies

International collaboration is important for science careers (Peters 2006). Research shows that internationally authored articles are more likely to be cited (Melkers & Kiopa 2010) and that "collaboration often has salutary effects with respect to socialization, training, transmission of know-how and the development of network ties and contacts critical to scientists' and engineers' career success" (Bozeman & Corley 2011: 612). US academic scientists are less likely than their counterparts in industry settings to collaborate internationally, and in some fields, women are less likely than men to engage in international collaborative work (Frehill & Zippel 2011). Finally, employers increasingly expect college graduates, including those from STEM fields, to have 21st century skills such as the ability to work in teams and global competence. Hence, the equity of opportunities for

students to obtain robust science and engineering experiences – beyond study abroad programs – is important to ensuring equitable access to careers in science and engineering.

This paper summarizes results from three evaluation studies conducted over the past decade, implementing multiple research methods to describe institutional policies that enable science faculty and students at various types of institutions to reap the benefits of international collaborations. The experiences upon which surveys and interviews were administered spanned 2001-2014; similar items included in all three studies enable synthesis of results across three diverse sets of participants (i.e., men and women; individuals from different types of universities and types of positions). Data from a working meeting of international experts on gender and cross-national collaboration are included. We examine U.S. scientists' assessments of issues related to gender and "comfort" in the international settings where the collaborations took place, making comparisons across world geographic areas. This paper closes with concrete policy recommendations for universities, government and non-government funders of international collaborations, and individuals.

Medical Doctors Practicing CAM in Buenos Aires: Taking Advantage of Market Opportunities and Carving out Niches of Integration into the Health System

Cross-national research in the social sciences has documented the rising interest of medical doctors in alternative medicines and emerging forms of integrative care. Centered mostly in the global north, the theoretical debates have focused on co-option dynamics between biomedicine and unorthodox health approaches on the epistemological level as well as on the institutional and the interactional ones where doctors and CAM practitioners interact, and only little empirical research has addressed the actual work of physicians who practice CAM. Based on in-depth, semi- structured interviews with 42 female and male physicians who practice Homeopathy, Ayurveda and Acupuncture in Buenos Aires, in this paper I examine the opportunities and constraints they have faced to practice CAM given the marginal position of unconventional modalities of care in the medical profession and in the Argentinean health system, where most CAM remain unregulated. The study shows that although the private health market does create incentives for medical doctors to work at the margins of the health system in terms of income and the recovery of autonomy in their work, some physicians have also mobilized to create spaces for integrative care in mainstream health services. In this way, they have been agents for institutional and cultural change by incorporating some CAM modalities into post-graduate medical education imparted in hospital settings and by delivering unorthodox medical treatments. Fieldwork was carried out in Buenos Aires City from 2009 to 2012.

Social Responsibility and Hospitals: An Overview about Values, Programs and Networks of Partnerships

Few studies tried to understand the values and the practices of social responsibility in the hospitals including in Portugal still today (Oliveira, 2012).

These studies highlighted social responsibility as being merely the result of the implementation of the biomedical model in the health. Much authors considered these studies inconsistent, because they did not contemplate the relational aspect that characterizes any concept of social responsibility (Zadeck, 2004).

The international institutions defend social responsibility as being the voluntary introduction of issues like as social equity, sustainable environment, competitivity and prevention of diseases in the strategic choices and in the networks of partnerships consolidated by managers of healthcare sector, with the goal to maintain universal coverage to all citizens and high level of quality of services produced EU (2001), UNESCO (2010).

We propose in this paper, study how the managers understand, formulate and justify the social responsibility concept through the analyzing of discourses, programs and network of partnerships.

The main goal of this study was identify and analyze the values (Garriga and Melé, 2004), the motivations (Almeida, 2010) and the logics of justification for social responsibility (Boltanski and Thévénot, 1991) invoked by managers in three different hospitals.

We believe that this study was very important because highlighted the main potentialities and the threats encountered by this sector.

This sector was conducted to adopt new management models and practices, typical of private sector (Silvestre, 2005), objectifying to catch simultaneously the sustainable management of financial resources and the universal access to the health services by the citizens.

The national agenda for the health sector PNS (2012-2016) defined social responsibility as the efforts that organizations and professionals dispense to create positive determinants of health.

Barriers and Facilitators of Palliative Care Communication in Aged Residential Care(ARC):a New Zealand Example

Background: Due to population shifts in recent decades, the health of older people is an issue of growing concern in New Zealand. Indeed, internationally, New Zealand has the highest number of reported deaths in aged residential care (ARC) (38%). Effective communication is a key component of both ARC staff palliative care training and family understanding. Lack of communication between facility staff, residents and their families can result in problems in implementing effective care plans thereby impacting on the quality of care provided. Working in collaboration with a local hospice, the Supportive Holistic Aged Residential Care Education (SHARE) intervention was designed to package and systematically foster palliative care knowledge transfer to clinical care staff.

Objective: We aimed to examine barriers and facilitators of palliative care communication in aged residential care (ARC) during a pilot of the SHARE intervention.

Method: The SHARE intervention was implemented in two ARC facilities for 6 months. Eight post-intervention interviews were conducted with management and staff to assess the impact of SHARE in improving palliative care communication.

Results: The intervention so far can be described as being effective in improving communication, especially in relation to keeping notes well documented and alerting registered nurses and health care assistants to resident weight gain and loss. English as a second language for some staff members hampered communication with families.

Conclusion: Relationships between hospice and facility staff, and consequently facility staff and patients are seen as key to effective communication and to the success of SHARE.

Construyendo Estrategias Para Combatir Desventajas Juveniles En El Mercado Laboral: Explorando Tramas Institucionales Locales En El Sector De La Construcción En El Gran Buenos Aires.

Esta ponencia, que focaliza en procesos de inserción laboral de jóvenes en el sector de la construcción en un mercado local del Conurbano Bonaerense, busca analizar comparativamente diferentes tramas institucionales intervinientes en las transiciones educación-trabajo, a fin establecer su incidencia en las trayectorias juveniles.

La construcción constituye un sector de entrada al mercado de trabajo de muchos jóvenes de bajos recursos. Es, junto con el comercio, una de las actividades que brinda mayores oportunidades de empleo a estos jóvenes. Se trata de un sector con altos niveles de informalidad y precariedad, contribuyendo a la reproducción de las desigualdades.

La construcción es, sin embargo, un sector heterogéneo: a la par que existen grandes empresas que utilizan tecnología actualizada, ofrecen empleos más calificados y formales, con protección sindical y cobertura de salud, hay empresas medianas en las que los trabajadores no suelen estar agremiados ni contar con protección social. Al mismo tiempo, el autoempleo en el sector es elevado, presentando altos niveles de informalidad. Asimismo, las diferencias salariales dentro del sector son amplias.

Por otra parte, en los últimos años el sector se ha visto favorecido por diversas políticas públicas que tienden a favorecer tanto el empleo como la formación laboral. Asimismo, el sindicato de la actividad ha jugado un papel protagónico en el impulso de ofertas formativas, en articulación con los empleadores y con el Estado. Es así que la construcción se caracteriza por una amplia heterogeneidad de circuitos formativos y de apoyo a la transición educación-trabajo, en los que confluyen diversos actores institucionales. Esta ponencia explora estas diversas tramas institucionales, indagando en qué medida algunas de ellas favorecen una mejor inserción de los jóvenes en el mercado de trabajo y, en tal caso, cuáles

FRIEDMAN, ELI* (Cornell University, edf48@cornell.edu)

Insurgency Trap: Labor Politics in Postsocialist China

During the first decade of the twenty-first century, worker resistance in China increased rapidly despite the fact that certain segments of the state began moving in a pro-labor direction. In explaining this, Eli Friedman argues that the Chinese state has become hemmed in by an "insurgency trap" of its own devising and is thus unable to tame expansive worker unrest. Labor conflict in the process of capitalist industrialization is certainly not unique to China and indeed has appeared in a wide array of countries around the world. What is distinct in China, however, is the combination of postsocialist politics with rapid capitalist development.

Other countries undergoing capitalist industrialization have incorporated relatively independent unions to tame labor conflict and channel insurgent workers into legal and rationalized modes of contention. In contrast, the Chinese state only allows for one union federation, the All China Federation of Trade Unions, over which it maintains tight control. Official unions have been unable to win recognition from workers, and wildcat strikes and other forms of disruption continue to be the most effective means for addressing workplace grievances. In support of this argument, Friedman offers evidence from Guangdong and Zhejiang provinces, where unions are experimenting with new initiatives, leadership models, and organizational forms.

Cities for CEDAW: Notes on Effective Intervention

Effective intervention usually requires involvement at more than one level. This presentation examines the efforts to support an international instrument - the UN onvention on the Elimination of all Forms of Discrimination Against Women - by involving cities. In the United States, the aim was to have 100 Cities for CEDAW by the end of 2015. These cities were each to develop a resolution; ordinance; gender analysis of cities activities, programs and issues; community-government monitoring committee; and implementation funds. A case study of one city - Cincinnati, Ohio - is discussed with special attention to the involvement of college students, community organizations and city council members.

The Contours of Participatory Dynamics in Sustainability Research at Science-Society Interface

In the area of (un)sustainable development the limitations of discipline-centred knowledge production within the exclusive realms of science have manifested themselves in malfunctioning feedback loops between science and political action. Consensus is emerging that traditional forms of scientific inquiry along clear-cut boundaries between scientific knowledge production and the societal usage thereof are not apt for managing complex socio-ecological systems and need to be complemented by more entangled ways of producing what is expected to be 'socially robust' and 'responsive' knowledge. Within sustainability research transdisciplinarity (TD), which aims at the integration of diverse forms of expertise ranging from structural-analytical knowledge to experienced-based knowledge, has emerged as a key notion. More recently the concept has also entered science policy and research funding schemes. The enthusiastic call for a transgression of science-society boundaries in search for sustainable futures notwithstanding, fairly little is known about the participatory dynamics unfolding in TD practices. Academic literature on the driving and constraining factors that shape the ways in which researchers, civil society actors, politicians or entrepreneurs – i.e. actors with distinct forms of expertise - jointly define concerns and (co-)produce knowl-

edge is scant. By (i) integrating different strands of literature on participation and knowledge co-production from Science and Technology Studies, TD research and development research as well as (ii) relying on first empirical findings from project case studies taken from a major research funding programme of the Ministry of Research and Culture of the State of Lower Saxony (Germany), this paper aims at unfolding the main factors determining the interaction of academic and non-academic actors in sustainability research. Particular emphasis is put on the extent to which values and expectations, including the (self-)ascription of roles to the different actors and the respective expertise they bring to the table, affect the participatory dynamics at the science-society interface.

Neet Experience As Driver of Social Exclusion? Strengths and Limitations of a Definition: Evidence from a Qualitative Analysis of Biographical Trajectories.

The NEET concept is playing a growing role in European social research. The Youth Guarantee programme considers NEETs aged up to 25 years old (29 years old in some countries) as target group of its policies within the EU. On the one hand, sociological literature claims that the NEET status can reflect and exacerbate the accumulation of multiple disadvantages. On the other hand, the definition subsumes under a negative label a heterogeneous population with very different life situations. This work aims to explore under what conditions the experience of being NEET (Not in Education, Employment and Training) can trigger the social exclusion process. In this study, such process is conceptualized as a chain of events across life courses leading to economic exclusion, social isolation and cultural exclusion. The subjective perception of being sanctioned by the social surrounding bears relation to the cultural dimension. We carry out a computer-based qualitative content analysis on 41 in-depth interviews. Our qualitative surveys have been conducted with subjects classified as NEETs according to Eurostat definition in two contexts representative of different regimes of youth transitions: 23 interviews (subjects aged 25-29) have been collected during 2014 in Rome as a part of a research project of Sapienza University, and 18 interviews (subjects aged 20-29) have been conducted by IRIS Institute in 2015 in Dresden. Five typical biographical pathways to NEET condition are identified and these pathways are characterized through risks of exclusion, patterns of family support, interaction with institutional actors and coping strategies. This paper argues that NEET rate is an indicator of the utmost importance of labour market marginality. However, our results show strong heterogeneity in life trajectories and support the idea that actor´s structure of interaction at micro level and retrospective data should be taken into account to assess the risks experienced by NEETs.

FRITZ, MARTIN* (University of Bonn, feuerkobra@gmx.de)

Welfare Regimes and Attitudes Towards Environmental Regulation

Different welfare regimes with their specific institutional setups embark on different pathways to establish ecological sustainability and to reconcile environmental issues with economic prosperity and social needs. Thus, (emerging) policies and practices of sustainable welfare vary among welfare types (Koch & Fritz 2014). In this paper it is asked whether these differences are reflected in public attitudes towards a) the role of the government in promoting environmental protection, b) the role of the economy and business and c) a more equitable distribution of environmental costs among the poor and the rich.

Comparative welfare theory suggests that universalistic, social-democratic welfare states are more likely to reconcile ecological, economic and social challenges which would then lead to the hypothesis that attitudes in these countries are most positive towards state regulations, the inclusion of business and technology and a fair distribution of costs. Contrarily, people in liberal, market-oriented welfare states can be expected to express more skepticism about state regulation and to prefer market-based solutions.

In this paper these hypotheses are tested empirically with data from the International Social Survey Program which covers more than 20 countries from different welfare regimes. Multi-level analyses are applied to estimate the effect of the welfare regime on environmental regulation attitudes. On the individual level sociodemographic and political orientation variables are included in the model. The results of this study contribute to a better understanding of the different ways how countries -depending on their institutional backgrounds- deal with the challenge of sustainable development.

Tracing the Diasporic Condition—an Interdisciplinary Analysis of Identity-Formation within the Bosnian Diasporas in Vienna

A current sociological research project on transnational identities conducted by one of the contributors is focusing on the Bosnian diaspora or the Bosnian diasporas respectively—e.g. Bosniaks, Croats, and Serbs—living in Vienna. According to the initial presupposition of this project, wartime, post-war, and migration constitute a very particular and tense context within which the Bosnian diasporas have to (re-)construct their self-images. The project aims to decipher these identities by analyzing interviews with Viennese Bosnians of different ethnic belonging. However, it seems to be most promising to enhance this genuine sociological approach by adopting the analytical tools of literary studies.

In our contribution we will focus on the analysis of prose literature written by Viennese authors migrated from Bosnia. Against the background of central insights from Juri Lotman's "Semiotic Theory of Culture", and post colonial theory (Edward Said, Gayatri Spivak) as well as classical theory of prose (e.g. Gerard Genette) we will analyze the structures of narration which are—according to our hypothesis—characterized by the aforementioned tensions evoked by war and migration. It is to be expected that this analysis will reveal aspects of diasporic identities which could not be captured by classical sociological approaches. In literature, social conditions and personal experiences are artistically processed and already reflected. The reconstruction of these conscious or unconscious reflections on reality introduces an additional level within the research about the self-images of Bosnian diasporas living in Vienna. By bringing sociology into dialogue with study of literature our presentation will, furthermore, make an important contribution to an interdisciplinary analysis of transnational identities.

Migration and Labour Politics in the Context of Industrial Relocation to Western China: The Regulation of Migrant Labour in Chengdu and Chongqing

Rural-urban migration in the People's Republic of China (PRC) has accelerated markedly since the 1990s against the background of an enormous augmentation of foreign direct investment (FDI) in manufacturing and an increase in domestic private enterprises. Over the last decade, the working and living conditions of the currently estimated 280 million rural migrant workers (*nongmingong*) have sparked increasingly vivid academic debates within and outside of China. Empirical research on migration and labour politics has, however, mostly been confined to China's developed coastal regions. It has thereby, so far, failed to capture the more recent phenomenon of relocation of industrial capital to Central and Western China and the related transformations in the Chinese development model. Since 2007-2008, the shift of private and export-oriented industries from coastal regions to Central and Western China has been accelerating, and the amount of foreign direct investment in those two still relatively underdeveloped regions is on the rise. Western Chinas is of particular relevance, as the development of the region has been defined as an essential national development goal by the Chinese central government.

Against this background, the paper will provide an empirical investigation into processes of industrial relocation to the emerging industrial centers of Chengdu and Chongqing. Based on the analysis of first-hand Chinese-language sources, semi-structured qualitative interviews with local state officials as well as trade union and NGO representatives, the paper aims to provide answers the following central research questions: What effects does industrial relocation have on the transformation of local labour relations and protest patterns of migrant workers? What strategies does the local state in Chengdu and Chongqing employ in resolving strikes and other forms of migrant labour protest? Do the latter differ from protest patterns and state-labour relations in China's coastal regions, and what are the underlying reasons for similarities and differences?

FUCHS, WALTER* (Institute for the Sociology of Law and Criminology, walter.fuchs@irks.at)

Challenges and Limits of Comparative Socio-Legal Research in a Post-National World: The Example of Adult Guardianship Law

The UN-Convention on the Rights of Persons with Disabilities (CRPD) has prompted a paradigm shift in dealing with the legal affairs of mentally impaired people. While instruments of "substitute decision-making" (guardianship, conservatorship) have been the traditional response of the law to the needs of persons deemed as incapable of handling their affairs for centuries, the treaty favors concepts of "supported decision-making". Following a human rights perspective and a predominantly "social" model of disability, the CRPD seeks to normatively guarantee the legal capacity to act even to people with the most severe cognitive or mental impairments. This ambitious goal can undoubtedly be viewed as a "future we want". Nevertheless, despite its origins in transnational discourses, the CRPD's practical implementation is confronted with a whole gamut of different national legal traditions. What is more, many welfare capitalist states have witnessed a historically unparalleled rise of the demand for adult guardianship in recent years. Whereas this is commonly attributed to demographic changes leading to more incidences of dementia, it will be argued that this explanation has some serious theoretical and empirical shortcomings. However, understanding the "history of the present" is critical for building a desirable future. The proposed presentation asks whether it is possible to identify determinants of the increased prevalence of substitute decision-making measures beyond the scope of individual national jurisdictions. It presents selected findings from a multivariate quantitative study in which Swiss and Austrian data were merged into a single dataset. It can be shown that the application of guardianship law is highly dependent on local legal cultures. Finally, the implications of these findings for the possibility of social change through international law are discussed.

FUCHSLEHNER, NORBERT* (Johannes Kepler Universität Linz, n.fuchsi@gmx.at)

Analysis of the Categories Religiosity and Secularity from a Quantitative Perspective

In general, the religious-secular dichotomy has been discussed by many scholars for a long time.

This paper aims to take a look at the categories religiosity and secularity from a quantitative perspective. For analysing the categories the Believing-Belonging-Matrix (Reitsma et al, 2014) and the data from the EVS 2008 will be used. Above all, the Believing-Belonging-Matrix combines two important aspects in the context of sociology of religion. It includes religious self-identification (believing) as well as church attendance (belonging). On the one hand, the matrix measures the categories consistent religiosity (believing and belonging) and secularity (neither believing nor belonging). On the other hand, it is possible to identify other categories that are not completely covered by the religious-secular dichotomy in a strict and consistent sense. Additionally, the matrix provides the categories habitual attendance (belonging without believing) and individual religiosity (believing without belonging).

First, the paper asks to what extent the four types of the Believing-Belonging-Matrix can be found in European countries? Second, the paper tries to illustrate which factors have an impact on the types of the matrix with the help of regression models.

Finally, the paper shows that from a quantitative perspective religiosity and secularity are still highly relevant categories in Europe. However, the differences between countries are remarkable. Nevertheless, the findings strongly support the view that believing and belonging as well as neither believing nor belonging are more common types than habitual attendance and believing without belonging.

Religious Mobilization in the Context of Cultural Path Dependency, Religious Practice and Modernization

Searching for examples of topics and forms of religious mobilization in Europe, it might be interesting to take a look at Pro-Life-Demonstrations, which are mainly organized by religious groups and take place in Rome, Berlin and other towns in Europe.

The aim of this paper is to analyze this form of religious mobilization in the context of cultural path dependency, religious practice and modernization aspects. Basically, the research focuses on the two dependent variables, the willingness to attend a demonstration and the attitude towards euthanasia. The paper deals with two main questions about religious mobilization.

First, what differences can be found not only between Western European and Post-Communist countries but also between countries in which its citizens identify themselves mainly as religious or not religious?

Second, what impacts do religious practice, cultural path dependency and modernization aspects have in this context?

In this paper the cultural path dependency is investigated by the Culture-Religion-Matrix, which I developed to explore differences between countries. On the one hand, the matrix distinguishes between Western European and Post-Communist countries. On the other hand, it defines a country religious, if more than half of the citizens identify themselves as religious, otherwise a country is seen as mainly not religious.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

On a bivariate level, correlations between the religious practice and the two dependent variables are conducted. On a multivariate level, regression models are expected to identify the direct impacts of religious practice, denominations and modernization. Above all, the differences between countries are analyzed according to the four types of the Culture-Religion-Matrix.

The findings of the study show that there are quite remarkable differences between the Western European and the Post-Communist countries.

The Diversification and Expansion of Higher Education: University Elections of Young and Families in Upper Middle Classes of Buenos Aires and Its Impact on Educational Inequality.

En las últimas décadas, la educación secundaria en América Latina se expandió, mientras la educación superior atravesó procesos de diversificación institucional y una mayor segmentación de la oferta en algunos países como la Argentina. Se fortaleció así un crecimiento segmentado por medio de circuitos educativos entre educación secundaria-universidad , que se articuló con cambios en los modos en que jóvenes y sus familias aprovechan o se apropian de una mayor oferta y oportunidades de acceso a la educación superior, de acuerdo a patrones de clase, género, territorio, etc. En el caso argentino a una expansión de la oferta gratuita de universidades públicas se le adiciona una diversificación de las universidades privadas rentadas, que contribuye a reproducir circuitos educativos y trayectorias formativas desiguales, según origen social, territorio y género de estudiantes de distintos sectores sociales. En función de ello, en este trabajo realizamos un análisis microsociológico de los modos de elección de carreras y sobre todo de universidades entre jóvenes de sectores medios altos y altos de Buenos Aires. Analizaremos las instancias etnográficas como ferias de carreras y jornadas de puertas abiertas de la universidad para con los futuros estudiantes, además de entrevistas realizadas a jóvenes y sus padres/madres sobre la elección universitaria, en el marco de una investigación desarrollada entre los años 2011 y 2015 en Buenos Aires. Describimos el modo de significar el tiempo disponible y la distancia espacial en el acceso a las universidades, y cómo las universidades territorializan su oferta y la dirigen a jóvenes de sectores sociales claramente desiguales. Analizamos también cómo los sentidos sobre lo público y lo privado (de acuerdo al tipo de gestión de las universidades) refuerzan la estructura simbólica de la desigualdades entre jóvenes de sectores pobres y jóvenes de sectores altos.

Comparison of Characteristics of the Anomie State of the Professional Members at an Organization with the Changing Institution Policy

This study observes and examines the anomie states of the professional members at an organization with the changing institution policy. The conventional theory of professionals is that professionals do not depend on organizations as they have a strong commitment to their occupations; however, in dynamic reforms of organizational systems, we found a different tendency. It was found through the interviews that researchers felt uneasiness and dissatisfaction as clerks did. When we analyzed their uneasiness with the type of work they performed and their position in the organization, the full-time researchers felt the greatest amount of uneasiness regarding this organizational shift, while temporary clerks worried about their job termination. This paper explains the above phenomenon by using concepts such as "relative deprivation," "the conflict caused by the old institution and the new institution", and "the dismantling of the researcher's community". The self-subsistence of a person depends on the social norms of the society. Therefore, we conclude that increased uneasiness is the result of the weakening of their superiority. In addition, because each professional commits to a specific field, it was difficult for the researchers to combine against the control of the managers and directors. This study concludes this phenomenon is a professional's anomie on dynamic organization.

FUJIYOSHI, KEIJI* (Otemon Gakuin University, fjosh524@hotmail.com)

Liberty, Harmony and Democracy: Why Democracy Works Ill in Japan?

This paper aims to describe the cultural background that hinders a democratic system from working democratically in Japan, by focusing on some words used in a daily life of ordinary Japanese people. As is well known, democracy has been gained by the people who want it in many parts of the world. There we can see

how people want to expand the area under their own self-decision. To simplify it, they just want to say "That is none of your business, it is my business," to their ruler. In this sense, democracy as a political regime corresponds to individualism as a moral stance.

It is important for a society to bring up its people to be "democratic" in order to maintain itself democratic. How can it be possible? Democracy is a social frame which allows people to say "That is none of your business," in a certain amount. How much amount of this saying does democracy need to keep itself stable in a society? This is a question far beyond the range of this paper but here I want to take a very common Japanese word "Omoiyari."

A Japanese word "Omoiyari" can be translated into kindness or consideration. The word is often referred as a key concept to maintain harmony in a society by Japanese people regardless of age, gender, social status. It is a common word for Japanese people when they are to solve a certain social or political problem in Japanese and even international society.

The word "Omoiyari" works to prevent people to say "That is none of your business," which results in the society with democratic system without individualistic moral. This paper tries to describe this mechanism observed in Japan as a case study on the relationship between stability of society and liberty of individuals.

Family Formation in China and Germany: A Study of National Cohabitation Patterns and Their Determinants

Implicit in numerous demographic work is the assumption of convergence: Sooner or later more and more countries will go through sequential stages of demographic change famously labelled as first and second demographic transition. Although countries worldwide are equally hit by global social and economic changes, the question arises if they also follow a common path of societal development despite their cultural idiosyncrasies.

This study focuses on two regions facing those common challenges, while being culturally highly diverse: East Asia and Western Europe. Recent evidence seems to confirm the convergence assumption as China experiences rising numbers of cohabitation, decreasing marriage and increasing divorce rates just like countries in the Western hemisphere did several decades before. One third of all recent marriages in China began as cohabiting unions, while marrying one's partner without prior cohabitation has become rare in the Western hemisphere. Due to its relevance in the process of family formation this study therefore concentrates on non-marital cohabitation as new and quickly emerging phenomenon. Despite constituting highly differing cultural contexts and national policy regimes China and Germany, as comparative case in the Western hemisphere, share characteristics such as population aging, high women's labor participation and widespread conservative family values.

On the basis of two nationally representative annual longitudinal surveys, namely the German Family Panel pairfam and the China Family Panel Studies CFPS, the cohabitation history of the cohort which recently turned 35 is examined. Sequence analysis, multinomial logistic regression and discrete time event history analysis is used to first detect national patterns of cohabitation histories i.e. the prevalence, occurrence and timing of cohabitation and, second, to analyze their determinants. Those results enable us to answer if and how national differences in histories, institutions, and cultural traditions create different kinds of risks and opportunities for citizens in East Asia and Western Europe.

Biodiversity and Climate Change in Central Africa: Perceptions, Attitudes and Policies

Central Africa's biodiversity represents 20% of Earth's species and is threatened by rural poverty and climate change. In the past decade, immense poverty (39% of the population) has contributed to unsustainable harvest of wildlife for economic gain. In the next 80 years, scientists predict that climate change will extirpate half of the region's mammals. As part of a multidisciplinary project supported by NSF Partnerships for International Research and Education (PIRE), we are developing approaches to conserve biodiversity under climate change that are evolutionarily-informed and grounded in the socioeconomic constraints of

Central Africa. The biological aspect of the project characterizes genomic diversity in nine taxa representing a broad taxonomic range. The socio-economic aspect examines the impact of park establishment and climate change in villages within the buffer zones of four recently-established national parks in Cameroon and Gabon: Ebo Forest, Mbam Djerem, Crystal Mountains, and Bateke Plateau. We hypothesized that households within the buffer zones would have greater access to plant and animal protein than controls.

To test this hypothesis, focus groups were conducted in five villages within the buffer zones in June and July 2015 (n=28 participants). Participants reported that climate change and spillover of large mammals from national parks are impeding the practice of agriculture. Climate change has shifted rainy season timing and increased cassava pathogens, causing crop failure. Elephants living in nearby parks routinely ventured into villages while foraging and destroyed agricultural fields. These unfavorable economic circumstances prompted the immigration of young people to urban areas (average villager age was 59 years). The findings suggest that conservation programs aimed to preserve wildlife in national parks should also provide payments or food shipments to buffer zone communities to compensate for crop losses, thereby reducing human-wildlife conflict in this biodiversity hotspot.

Rethinking the Reservation Policy in Contemporary India: A Local Point of View

The reservation system, which is an affirmative action policy, aims to ensure the right to 'equality of opportunity' for socially disadvantaged people in India. Since the policy was introduced in the Constitution of India, many arguments have been made regarding the policy, such as the actual effects of the policy as well as the appropriateness of criteria for entitlement categories. This presentation posits that there are both positive and negative aspects and influences of the policy. Positive aspects include social and economic elevation of the target demographic, an increased number of 'elites' arising among them, deeper understanding of their own rights, and activation of social movements. Conversely, the negative aspects include a widened gap between those who have the merits of the policy and those who do not, increased anti-reservation policy feelings and activities among non-entitled people, pervading jealousy of and antagonism toward the entitled people, and acts of violence against them triggered from such consciousness of the imbalance. This presentation focuses on the issues surrounding the reservation system in contemporary India, particularly investigating situations after the enforcement of the 73rd Amendment Act in 1992, which appointed the quotas to women, the Scheduled Castes and Scheduled Tribes in the village panchayats. The act has provided opportunity for the backward people to obtain power and influence and make positive effects on their community at the local level. At the same time, however, it has created another problem: recurring violate situations in the villages because of assertion of these rights, widened gap among entitled people and non-entitled people, and the persistent negative effects on people's everyday lives in the village. I will deal with this case from my field study in Uttar Pradesh, and will consider and rethink the effects of the reservation system from a local point of view.

The Rhizomatic Epoch of Contention: From the Zapatistas to the European Anti-Austerity Protests

This paper makes four central arguments. First, the occupy- and anti-austerity protests that swept the globe in general and Europe in particular are informed by a novel, rhizomatic movement logic and are constitutive parts of a broader rhizomatic epoch of contention, reaching back to at least the EZLN and the Global Justice Movement of the 2000s. Second, in order to appreciate and better understand the homology between these waves making up the current epoch of contention such as the EZLN/Global Justice Movement and European anti-austerity protests/Arab Spring/Occupy Wall Street, technological and capitalist dynamics and developments need to be brought (back) into the analysis. As such, this paper argues, that this rhizomatic epoch of contention has been emerging in conjunction with shifting dynamics of neoliberal capitalism and technological changes as well as in conversation with older forms of left social movement politics and the respective capitalist structures conditioning them. Third, the paper's epochal perspective is also well positioned to begin contextualizing and re-emphasizing the interactions between in particular Latin American and European groups and activists since the 1970/1980s, indicating the vital role of European-Latin American interactions for the development and proliferation of the currently dominating rhizomatic logic. Fourth, in truly rhizomatic ways, the current instantiation of this logic in Europe has adapted or seems to be adapting key tenets of earlier instantiations. Echoing developments in Latin America ("pink tide"), current European

mobilizations no longer sidestep state institutions as they used to during the so-called new social movement wave of the 1970s or the Global Justice Movements of the 2000s but seek to engage them including through the founding of new movement-powered parties or alliances that have of recent won general elections such as Syriza in Greece.

Reconciling Work and Family in a Multi-Active Society

The feminisation of the labour market and the persisting inequalities between men and women; precarisation at work; flexibilisation of work and working hours; the geographic movement of people; the diversification of family models; the aging population; the narrowing of intra-familial and community support networks; individualism; the value of children's well-being; the reconfiguration of spatial and temporal borders by information and communication technologies — these are among the wide-ranging factors that make work-family conciliation not only a problem faced by many people, but also a challenge that today's societies must find a way to surmount.

Institutions and governments are aware of this. Already, in the 1990s, the European Commission placed on its agenda the topic of 'reconciliation of work and family life'. The European Directive on parental leave adopted in 1996 constituted a strong signal in the countries of the European Union. In Belgium, many policies were pursued, including measures regarding leave of absences for family or time entitlement/career pause reasons, and those involving support structures for early childhood or services titles that enable externalising certain domestic tasks.

Still, we must acknowledge that these measures are ultimately corrections to concrete problems with work-family interface, but do not manage to provide a satisfactory, lasting overall solution. Why? Our argument is that these measures do not address the problem's root causes, that is, the way that productive functions (production of goods and services necessary to existence) and reproductive functions (the biological reproduction of humanity and its workforce) are societally given shape and direction, which we call the work-family regime. At present, we are not only witnessing the erosion of labour society but a related crisis in the work-family regime.

For this contribution, we must reimagine the system of work-family interface by referring to a scenario showing another normativity: the organisation of a multi-active society.

Going Green, Adopting the Rhetoric or Going Beyond? a Sociological Look at Environmental Transitions Theory

The accumulated scientific evidence on the unsustainable increase of the socio-environmental impacts of the economic activity during the anthropocene epoch is slowly filtering to the socio-economic discourses on development and growth with the so call "green" rhetoric. Examples of that are found in international policy programs, such as the European Union 2001 Sustainable Development Strategy, in industry discourses, see for instance the Ceramic Industry Roadmap of 2012, and even citizen believes (European Commission, 2014). However, there are confronted views on what should be done. For some, such as the ecological modernization advocates, we are on the right path and what is needed is to improve technologies. For others, however, the path should be changed as the limits to growth concern more than just production process and energy efficiencies (degrowth advocates). For both, however, innovation seems to be the clue for avoiding a traumatic transition. A body of research mostly active in the study of environmental transitions is the innovation systems perspective (Zeng et al., 2010; Markard et al., 2012; Weber and Rohracher, 2012) where the concept of environmental innovations is becoming widespread within the innovation systems analysis. The fact that in the development of the innovation systems perspective there has been a relevant influence of sociological concepts (Sharif, 2004; Geels, 2004) makes this concept to be very suitable to fit into the tool-kit of environmental sociology. In this paper the influence of 'environmental transitions' concept on environmental sociology is explored within the broader analysis of the innovations systems approach from a sociological perspective.

Promotion of Active Ageing through Activities in Rural Settings: Innovative Initiatives of a Regional Programme.

Introduction. The pilot project «Active Longevity in Rural Areas», carried out in the Marche Region (Italy) in 2015, aimed to maintain and stimulate psycho-social abilities, improve lifestyle and prevent isolation in older persons, through a wide range of activities promoted by agricultural enterprises.

Methods. Six farms were selected to carry out horticultural activities as well as training and workshops on rural-related topics with older persons. To measure the impact of these initiatives on participants, both qualitative (i.e. focus-groups) and quantitative (i.e. questionnaires) tools were administered at the beginning, in the middle and at the end of the programme. Qualitative data were analyzed through (software assisted) content analysis techniques, quantitative findings through mono- and bivariate analyses.

Results. Findings show that the performed activities improved participants' self-esteem and perceived self-efficacy, enhanced some competencies and promoted a healthier lifestyle, participation in community life and prevention of social isolation. A considerable result was obtained among some of the over 80 older participants, who reported to feel sort of "awakened" by the experienced activities. Environmental context, direct involvement in the activities, a pivotal role plaid by farmers as motivators and the small dimension of groups arose as key success factors.

Conclusion. The project provided a set of innovative suggestions to develop new models of welfare policies for active ageing in rural contexts. It showed that natural, non institutionalized farm environments can represent valuable alternative solutions to respond to the needs of seniors, especially when initiatives are developed on a smaller, personalised scale and carried out by attentive and motivated staff. The project might represent a valuable example of social innovation in this field, but further research is needed to achieve a structured model and inform future public policies in this respect.

GAHAN, LUKE* (La Trobe University, l.gahan@federation.edu.au)

Separated Same-Sex Parented Families: Troubling and Troubled By Family and Separation Discourses

Separated same-sex parented families are not only troubling the discourses and practice of family, they trouble the discourses and practice of family separation. This paper presents findings from an Australian qualitative study of separated same-sex parented families and explores their experiences of the restrictive power of heteronormative family and separation discourses.

When forming their families, same-sex parents could not take for granted traditional discourses and practices of family and parenthood and as a consequence they were required to make decisions on how to define their family practices. These decisions inturn shaped participants' experiences of separation and post-separation parenting.

Societal expectations of separation are framed by heteronormative discourses that ultimately involve one mother and one father. Consequently, participants were required to create their post-separation family without any clear social or discursive frameworks. Likewise, heteronormative family discourses define government separation policies and services. As a result, participants were often left without legislative protection or the ability to access non-heteronormative service providers such as family therapists, mediators, and lawyers.

Similarly, family discourses frequently position separation as troublesome and separated families as 'broken'. These restrictive discourses make it difficult for separating same-sex parented families to imagine the possibility of creating a trouble-free separated same-sex parented family. These discourses created particular troubles for separated same-sex parented families who frequently found themselves juxtaposed to the 'marriage equality' discourse of trouble-free, happy, and intact same-sex parented families.

Participants were acutely aware that existing family discourses and practices were frequently unable to provide adequate frameworks for their families or reflect their family practices during family formation, and ultimately, during their family separation. Nevertheless, the majority of separated same-sex parented families overcame discursive barriers and created new discourses that reflected the futures they wanted.

Public Policy Reforms, Organisational Change, and Workplace Resistance: Resistant Practices of Public Employment Angents in Switzerland

Under the growing economic pressures of recent years public employment services across Europe have been restructured. In an attempt to overcome old administrative structures seen as ineffective and bureaucratic, customer-oriented and service-oriented administrations were established with a strong output-focus. In my paper I present theoretical and empirical analysis of the perception and interpretative patterns of public employment agents dealing with various and often contradictory work requirements. I am particularly interested in the meanings they ascribe to public sector reforms and organisational innovations and their positioning within these meanings.

Focusing on the Swiss canton of Geneva, I draw from texts generated in interviews with emploment agents, from interviews with the organisational management as well as from protocols of participant observations of the actual work process. Interviews with labour union secretaries, document analysis of regulations of conduct and of policy documents complete my empirical data.

From a theoretical point of view, I intend to discuss the contradictions of entrepreneurial subjectivation, arguing for a Foucauldian perspective, where the subjectivity of the "whole person providing a service is at stake in an interplay of governance by others (the state or employment agency) and self governance. I discuss the rationale behind the "activation"-directive, focusing on power relations and tensions, which arise between state policies and regulations of conduct in employment agencies.

Taking the case of two consecutive strikes in autumn 2013 and spring 2014 of an important number of employment agents who work in the PES of Geneva as a starting point for my analysis, the paper contributes to the debate about organisational (mis-)behaviour and it illustrates the micro-politics of resistance within the institutional normativity and their impact on public policy making. Thus the paper aims at contributing to a fuller understanding of state transformation and post-Fordist gouvernementality.

Israeli "Social Justice" Protests Iconic Images

The Israeli "social justice" movement had two phases: the first one was initiation and establishment of the Social Protest - July 2011 – October 2011 - a democratic phase while mainstream media gave supportive coverage to the demonstrations

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and other activities; and the second phase - May 2012 – while Israeli police oppressed the protests, most of mainstream media disregarded it.

On the first phase, June 2011, Daphni Leef (b. 1986), was hunting for apartment to rent in Tel Aviv, she discovered that prices were beyond her financial ability, so on 11 July 2011, Leef opened a Facebook «event», calling her friends to join her in tents protest on Rothschild Boulevard in central Tel-Aviv. Starting symbolically on 14th July, many tents were erected, and soon after, thousands of young people from Tel-Aviv and elsewhere joined her, and tents camps began appearing all over Israel. Protest movement was called the "14th July", "Housing Protest", "Middle Class Protest", "Cost-of-Living Protest", "Social Justice Protest" and more. The overall encampments and especially the headquarters and main camp in Tel Aviv were evacuated brutally by the municipal inspectors on October 2011.

The second phase - May 2012 - the Social Protest raised its head Again - while severe police control and surveillance of activists: intimidation, violence and arrests of activists took place, the court supported the activists, and the activists video streaming restrained the police. The mainstream media ignored this phase of the protests except the elite daily newspapers Ha'aretz and its economic newspaper supplement The Marker. On the web was video streaming of the protestors site, documenting the police violence: dragging Leef aggressively to the police wagon for her detention.

The presentation offers analysis of the Israeli "Social Justice" Protests two phases by theoretical and empirical models of Image Events and Visual Iconology.

Can Environmental Knowledge That Reaffirms Sustainable Livelihoods be Maintained?

The dominant economic system has generated important and complex environmental and social problems, in hand with a transformation of worldviews. In many diverse places, different ways of conceiving and acting in the world have been lost, where a more harmonic relationship with nature and social life prevailed, alongside the loosing of associated knowledge and the ways in which it had been reproduced and transmitted. Traditional communities with a strong communal and socio-natural livelihood basis, as the indigenous community of *Santa Fe de la Laguna* (Mexico), have been and are still exposed to the influences that put at risk their sustainable livelihoods and associated social relationships, environment and knowledge, which respond to a conception of wellbeing based on an inseparable link between nature and culture.

Acknowledging the presence of livelihoods where meanings of life and wellbeing connect to natural times and processes, and that these permeate and constitute a whole cultural, social, economic and spiritual universe, this paper aims to contribute to the understanding of the complex relationships between the livelihoods of the community of Santa Fe de la Laguna and their environmental knowledge construction, reproduction and transmission processes. The focus of study is the community's livelihoods as a complex totality, which includes everything that provides continuity and meaning of life in the community (Baumgartner & Rist, 2011). Environmental knowledge, in this context, is present in all their life representations and socio-economic modes of organization, which in turn are inextricably linked. Comprehending the processes of their environmental knowledge construction and reproduction, could link to understanding ways of maintaining valued sustainable livelihoods. Recognising the influences and processes that could change or are changing their environmental knowledge and sustainable livelihood systems, may prove to be a valuable input in a process of collective critical reflection in the community towards a sustainable future.

Racism, Nationalism and the Asylum Seeker Crisis: Towards a Sociology without Borders

Political and media debates on racism often become a discussion on who or what is racist. As with many research questions, the concepts are complex and can't be reduced to a straightforward yes or no response. Racism cannot be understood as a simple binary of being racist or not racist. The very common refrain, 'I am not a racist but...' is often used to engender support for political policies, superficially represented as being in the national interest, while in practice pursue popular politics at the expense of vulnerable minority groups.

This is arguably the case in the ongoing political debates on asylum seekers and border protection policies in many western nation states such as Australia and the United States. Politics becomes driven by short-term electoral gain rather than by what is good policy.

The recent 'Reclaim Australia' rallies in Australia are a current example of patriot politics and a symptom of a failure of political leadership coupled with other factors such as the role of the traditional media and the growth and accessibility of social media. However, the critical consideration here is not just good political leadership but also the role of research and public sociology, or sociology without borders.

This paper focuses on racism in Australia and broader western society and explores the possibilities for research that can effectively engage in contemporary political debate and address a growing crisis in politics as nation states struggle with public opinion and policies that substantially address the global growth in the number of asylum seekers.

Everyday Struggle: Understanding Precarious Work and Life through Workers' Testimonies, Class Analysis and the Imaginary of Neoliberal Capitalism

Everyday struggle: Understanding precarious work and life through workers' testimonies, class analysis and the imaginary of neoliberal capitalism

This paper focuses on testimonies of precarious workers regarding their everyday, precarious life and survival strategies: what workers think, feel, how they get by and how they resist. The paper analyses precarious work as an intentional consequence of the neoliberal policies which attained global dominance in the 1980s and 1990s. Precarious work – involving part time, casual, and short-term, flexible or zero hour contracts – is a mainstay of neoliberal capitalism. It goes hand-in-hand with the decomposition of the welfare state and the global 'neoliberal' attack on the working class. For workers, precarious life is a calamitous admixture of calculation and desperation. On the one hand, work is the product of ever more fine-grained calculations by employers about marginal costs and benefits freed of any other considerations or obligations. On the other hand, the social life that precarious work engenders is marked by anxiety, insecurity, unknowable time horizons and struggle.

The paper draws from ongoing ethnographic research with local (Auckland, New Zealand) workers and activists, and links with an internationalist class analysis that contextualises everyday struggles and precarious life. New Zealand is an important site for such research. It was an early adopter of neoliberal economic policies in the mid-1980s, and these have been entrenched and expanded upon by every successive government, regardless of whether they are socially liberal or socially conservative. Indeed, such is the level unanimity in support of neoliberal policy settings between parliamentary parties and successive governments that New Zealand enforced a form of austerity in the context of sustained budget surpluses in the decade prior to the Great Financial Crisis (2007-2008).

GALINDO, JORGE* (Universidad Autonoma Metropolitana - Cuajimalpa, jorgegalindo45@hotmail.com)

Methodological Outline of the Theory of the Social Reduction of Contingency

In a time when the name of Talcott Parsons is generally associated with negative aspects of the discipline, I have no problem saying that this paper is heavily inspired by the "convergence thesis" that Parsons developed in his work: *The structure of social action*. I have to admit, however, that this inspiration is more methodological than theoretical. Like Parsons did in 1937 I start my theoretical outline with a reference problem, namely: the problem of double contingency. I will use this reference problem within the frame of the functional method in order to compare three important contemporary theories that, at least at first sight, would seem to be incommensurable. The ultimate goal of this comparison is to develop a theory of the social reduction of contingency. The theories that will be compared using the problem of contingency as a reference problem are: Pierre Bourdieu's theory of practice, Bruno Latour's actor-network theory and Niklas Luhmann's social systems theory. For the theory of the social reduction of contingency, the social is no longer conceived as a realm of reality made up of particular entities, but as a problem that can be solved through diverse social operators in charge of reducing double contingency such as communication, practical dispositions and materiality.

RC16-199.5

GALINDO, JORGE* (Universidad Autonoma Metropolitana - Cuajimalpa, jorgegalindo45@hotmail.com)

The Social Reduction of Contingency. Outline of a Social Theory

In this paper I will present the outline of a general sociological theory called: The theory of the social reduction of contingency. This theory is a new solution to one of the oldest conceptual problems known by sociology: the problem of social

order. By recovering Parson's reference problem of the double contingency inherent in social interaction, I compare three important contemporary theories to show that, contrary to what is believed, they are not incommensurable; and that if they are coherently combined, they can be the cornerstone of a complementary theoretical approach. The analyzed theories are: Pierre Bourdieu's theory of practice, Bruno Latour's actor-network theory and Niklas Luhmann's social systems theory. In the theory of the social reduction of contingency the social is no longer conceived as a realm of reality made up of particular entities, but as a problem that can be solved through diverse ontological instances such as communication, practical dispositions and materiality.

GALLEGOS, LUZ* (Universidad Autonoma de Nuevo Leon, luz.gallegos@yahoo.com.mx)

Mexicans Versus Mexicans: Coping with Everyday Ethnic Discrimination

In Mexico, colonialism is still part of the national reality. Inheritance of the Spanish conquest, physical violence and verbal linked with membership to ethnic minority groups is part of everyday life. However, discrimination is between Mexicans: indigenous *versus* mestizos. From a qualitative approach and considering the theory of Axel Honneth about recognition to analyze the data, we conducted a study aimed at understanding the ways of coping used by indigenous children and adults to ethnic discrimination. Through interviews and focus groups, we observed that the way that children and adults use to define themselves, coincide with the ways that dominant group and the Mexican government have expressed about these social groups. One of the preliminary conclusions of this work (a doctoral thesis) is that the conditions for political resistance are very limited when silence and self-identification as a vulnerable group are coping strategies regularly used by indigenous people. Coping processes focused on the subject preclude understand that ethnic violence responds to social asymmetry conditions beyond cultural aspects. Ethnic differentiation (targeting) on social policy is artificial and only strengthen the collective struggle will make possible social transformation. Subjectivity is built through affirmative actions; this kind of social policy is complicit in ethnic discrimination in Mexico. Discussing this issue is a way of coping it. Silence is not the way to social change.

GALLELLI, ANDREA* (University of Bologna, andrea.gallelli3@unibo.it)

CATALDI, SILVIA (University of Cagliari)

IORIO, GENNARO (University of Salerno - Department of Political Social and Communication Sciences)

Agape in Action: Overabound in Social Life.

Why sometimes people use own resources to help unknown others? What drives an entrepreneur to adopt expensive socially responsible behaviours? What prompts a public employee to spend time with a customer outside the working hours?

In every-day life there many social phenomena based on un-conditionality, disinterestedness, overabound. Such phenomena remain outside the field of explanation of approaches such as rational choice theory or neo-utilitarianism, being described as paradoxes of social action. But also solidarity or gift theories do not provide sufficient explanation for phenomena in which group identity or social ties are not the main motivations of action.

Drawing from critical theories, we propose to (re)introduce the sociological concept of agape-love as a theoretical frame for those social mechanisms that elude reification, quantifiability, instrumental thinking.

Agape-love, as formerly introduced by Luc Boltanski (1990), is focused on the present, avoiding any consequence calculation, refuses comparison and equivalence, doesn't involve reciprocity. According to Boltanski, agape must remain unaware for social agents, as any intentionality would lead action away from pure disinterestedness. We propose to reconceptualise agape, integrating it with theoretical insights by different social scientists (such as Honneth and Sorokin), with new reflexive and institutional accounts, and provide it with empirical foundation (Iorio, 2014).

We present the case of "suspended goods" and read it with the look of agape.

It is a relatively recent practice widespread in various fields (examples are suspended groceries, suspended books, suspended holidays) that consists in purchasing goods or services, which will be actually consumed by others who cannot afford them.

We argue that agape is a powerful concept, capable of linking micro and macro levels, useful both to enlighten agents' motivations in apparent non-rational (choice) situations, but also to describe the aggregate effects of collective behaviours that produce alternative economic regimes or welfare systems.

The Digital Divide and Technology Generations – European Implications from the Austrian Perspective

Background. Shifting towards an information society, the integration of older adults into information and communication technologies (ICT) poses a major challenge. Information-exclusion among citizens aged 50+ years results in a digital divide which intensifies social inequalities between European countries, genders and age groups. Reasons for this divide lie in the unequal distribution of access, competence and usage of ICT. The concept of technology generations (Sackmann & Weymann, 1994; Sackmann & Winkler, 2013) embeds seemingly age-related reduction of technology competences in a socio-structural/cultural context.

Methods.The OECD Survey of Adult Skills (PIAAC) assesses the proficiency of adults in key competences for participating in information-rich societies, including problem solving in technology-rich environments. Complementing PIAAC data with 36 qualitative interviews conducted with practitioners from senior education in seven European countries (Austria, Czech Republic, Italy, Portugal, Romania, Slovakia, Spain), spatial, socio-structural and temporal dimensions of digital exclusion are analysed.

Results & Conclusions. Results show that ICT-use and competences decline with age in all participating countries. This attends to external (i.e. costs, age-insensitive design) and internal (i.e. technological scepticism, security concerns, lack of competences) barriers and therefor to several "bottle-necks" of the digital divide, such as social stratification, lack of competences but also lack of simplicity of technical devices. However, the Austrian case study shows that technology generations play an important role in access to technology and technological competence.

Info-exclusion of older adults calls for a generational approach, considering cohorts with a similar "technological biographies". However, generation appears to be one dimension in the digital divide among many. Beyond, data suggests that life transitions (e.g. lifelong learning) can both form and transcend generational exclusion from ICT. Lifelong learning and generation-sensitive pedagogical models appear as one approach to entangle the digital divide in Europe.

Cultura Metro Como Modo De Relación: Investigación Interdisciplinaria Del Liderazgo Humano

La historia de la humanidad, en cada uno de sus trayectos, ha exigido líderes para movilizar el progreso, la transformación y el cambio; no obstante, la formación de líderes es una práctica ética, política y estética que exige pensar los contextos de manera situada y, sin lugar a dudas, *innovar* en relación con las condiciones y contingencias que el desarrollo mismo de las sociedades va imponiendo. En el caso de la ciudad de Medellín y su Área Metropolitana, en Colombia, en donde el concepto líder ha sido relacionado en ocasiones con la riqueza, el dominio de otros y el crecimiento egoísta de sí mismo, es ineludible pensar una condición de líder cuyo eje y cualidad sea el trabajo comunitario, la formación de sí mismo y de otros, y la capacidad para afrontar la transformación y el conflicto como posibilidades y oportunidades para formar y aprender a vivir mejor juntos. Es en este panorama que el la Empresa de Transporte Masivo del Valle de Aburrá - Metro de Medellín y la Universidad Pontificia Bolivariana diseñaron y llevaron a cabo la *Diplomatura Formación de líderes Metro: cultura como modo de relación*, como una práctica de formación humana que dinamiza y actualiza la Cultura Metro y permite que, cada vez más, los ciudadanos vivan una experiencia amable con su ciudad, puesto que se construyen con ella y trabajan activamente por su cuidado, su sostenibilidad y su futuro. De esta manera se realiza investigación interdisciplinaria del liderazgo humano, en una lógica comprensiva que entiende la cultura como modo de relación que construye relaciones entre personas que se lideran a sí mismas y a otros para la construcción de la paz, la calidad de vida y el bienestar para lograr una ciudad amable.

The Parent-Child Relationship in the Light of Qualitative Research on the Role of Video Games in the Modern Family

Whenever we think about video games, usually we imagine a world of people utterly immersed in virtual worlds (the problem of addiction, escapism, etc.) or we see it as a space for innovative and subversive cultural change.

But the reality of digital entertainment is more complicated. One of such non-obvious problems is the socialization of young gamers. The relation between parents and a young gamer is crucial for those considerations.

Indeed, in many well-known and respected studies (e.g. conducted by Entertainment Software Association or Interactive Software Federation of Europe) we can find questions about parental control or joint use of video games.

However, in most cases these are declarative and quantitative studies, which measure digital and cultural competencies only by means of survey questions.

In my research I decided to investigate the issue of this relation, but by use of qualitative methods (including in-depth interview). Moreover, I decided to research this problem by focusing on families that live in rural areas in Poland – from where I myself come from – to emphasize the role of personal experience in social research.

I hope that my paper will demonstrate some complexity of the undertaken subject and especially draw your attention to the problems of a group that seems to be underestimated in the field of game studies, namely country dwellers.

Unemployment and Free Time Patterns By Gender

Within the EU, the post-recession context is characterised by higher levels of unemployment than in the pre-crisis period, and by an important expansion of underemployment. These effects may constitute an important shift in free time and time autonomy among working age people, with consequences for their well-being, leisure patterns, and their ability to return to employment. However, there are only a few studies that link unemployment and free time. These studies show an important gender bias, since unemployed women tend to increase their time in unpaid household work, thereby limiting their possibilities of return to the labour market, as opposed to markedly increasing their leisure time. Unemployed men, on the other hand, tend to increase their study time. While devoting time to studying also does not increase leisure time, it certainly has an important impact on men's subsequent employability and chances of returning to the labour market. Time use studies can also inform us about important differences within genders regarding other variables such as education or income. Using the Multinational Time Use Study data we will do a comparative analysis of how unemployed and underemployed men and women spend their increased free time in some European countries. We will study differences both between and within genders.

The Social Construction of the Image of Ethanol As a Sustainable Fuel: Conflicting Discourses

Since 2003, the Brazilian sugarcane industry has made strong efforts to create and legitimate an image of sustainability for the ethanol fuel. Brazil is the largest world producer and exporter of sugarcane ethanol, internationally competing with the ethanol produced from corn in the United States. Domestically, the sugarcane/ethanol industry is one of the most economically and politically powerful segments of Brazilian agribusiness, generating a GDP of US$ 43.4 billion in the 2013/2014 season – an amount higher than the GDP produced in more than 100 countries worldwide. Once a traditional and conservator sector, the ethanol industry has passed through an expressive process of mergers and acquisitions, resulting in a highly globalized sector dominated by large multinational companies. The ethanol's sustainability appeal was boosted by growing environmental concerns that emerged in the past decades: air pollution, the limited supply of fossil fuels, the urgency for renewable energy sources, greenhouse gas emissions, climate changes, etc. The ethanol was, then, presented as the most competitive renewable fuel, an environment friendly solution for the problems that scientists, civil society, governments and the private sector intended to fight against. The Brazilian federal government had also played an important role in the promotion of ethanol as a sustainable commodity. However, the reputation of sugarcane industry in Brazil has not always been compatible with this image: bad working conditions, land concentration and land grabbling, soil and water pollution, the competition for agri-food areas, among others are some of the arguments that intend to contest the discourse of sustainability of ethanol. In this context, this paper proposes to analyze the discourses pro and against the pretense sustainability of ethanol. It will additionally identify the social actors involved in these discursive disputes and their strategies. It is methodologically based on document analysis and bibliographical research.

GANDA, ABHAS* (Central University of Gujarat, abhaskumar100@gmail.com)

The POWER of Knowledge: A Threat in Making a Better WORLD

The era of Industrialization with it brought complexities to the society and the human relation. It was marked by invention and discoveries of many new technologies as well as new disciplines to study the specialization which could not only help people get closer to a better life but in doing so it also created anomie by making the mass slave to technology. Amongst all these there was another point to be marked that is the emergence of sociology as a science involving the systematic study of the society and individual behavior.

Earlier it used to be assimilation of many subjects but with the advancement in the research and the social sciences many subjects such as anthropology got to be recognized as separate subject. Research and development in the sociology not just aimed at bringing into light the social issues but it also created a rift between the different societies. At one hand where it bound the people based on equity and equality it divided the same based on the basis of caste, race and class.

It can be said that in trying to solve some of the basic problems in the society, the social researchers created multifaceted problems. It is not the subject which created problem rather it is the practioners of the subject who manipulated it. It could be said that in order to remove the problems the researchers created more problem.

Thus, by involving some of the texts from upper caste scholars and the lower caste scholars the paper tries to question the direction in which sociology is moving or is it dwindling in between somewhere, by only showing the power of

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

knowledge and creating a divided society for the social scientists to rule through their knowledge.

Material Mnemonics and Mapped Narratives in Palestine/Israel

Since 1948 the re-designation of depopulated Palestinian villages as national parks has evoked Lippet's 'cartography of nowhere', as ruins and unmarked sites are subsumed in the process of material forgetting. Standing as material mnemonics, the sites are physically present, yet absent from the state discourse as the villages become *mise-en-abîmes* and place and space is nested in competing narratives. Recently, technology has taken a role in remembrance as apps, such as iNakba, enable commemoration to transcend film and photography, providing a quasi-virtual experience that enables the traveller in 2015 to visit a site that bears few to no traces of the former inhabitants. Juxtaposing dual narratives and material mnemonics, this paper assumes the Palestinian villages of Deir Yassin, Suba, Kufr Birim and Iqrit as case studies to determine the extent to which memory infuses static sites with the ability to counter contemporary narratives. Finally, the paper explores the utilisation of mapping in the practice and sustenance of national memory, and questions how far 'haunting' the land through commemorative tours, mapping and *in situ* story-telling prompts the locations to stand as *noeuds de mémoire*, as opposed to *lieux de mémoire*.

GANGNEUX, JUSTINE* (College of Social Sciences, The University of Glasgow, j.gangneux.1@research.gla.ac.uk)

Young People's Understandings of Social Media : Changing Perceptions and Reflective Practices

This research explores young people's practices and understandings of social media platforms such as Instagram, Facebook or Twitter. It uses qualitative interviews with young people aged 18-25 examining their digital practices on their personal devices. By adopting a critical perspective, the research transcends both top down approaches on social media, and binary frameworks that focus extensively on empowerment and participation, or solely on risks and online safety (van Dijck, 2013, Fuchs, 2014). Using Bourdieu's theory (1984, 1998), it provides more complex insights into young people's social media practices and how they perceive and negotiate these platforms. Thus the research investigates how social media platforms are both shaped by and reshaping young people's personal relationships, and how young people interrogate and reflect on these technologies in their everyday life.

The proliferation of social media coincides with the extension and individualisation of young people's transitions to adulthood (Furlong & Cartmel, 1997), as well as with the expansion of education, an increasing mix of work and study and flexibility in the labour market, and the desynchronisation of young people's schedules (Woodman, 2012, Wyn & Woodman, 2014). It is also embedded in a wider economical context of assimilation of work and leisure, and increasing insecurity (Sennett, 1998 , Beck, 2001, Standing, 2011). Within this context, the research examines the impacts on young people's personal relationships of increased capacities for connectivity, self-management, peer scrutiny and checking practices that these technologies provide.

The research, in particular underlines the impacts of social media in young people's relationships in terms of social sorting (Bourdieu, 1984) and normalisation of scrutiny as well as entrepreneurial and reflective practices (Giddens, 1991, Kelly, 2006). It focuses on young people's understandings of social media and also importantly looks at the shifting perceptions, negotiations and legitimacies of their media practices in their everyday life.

The Role of Asylum Related Organisations and Their Cooperation Networks at the Mediterranean Borders in the Context of the Common European Asylum System

A lot of boat people die on their way to Europe in the Mediterranean – the most dangerous see of the world. But which collective actors are involved in this process of the flight migration? Who can influence the asylum related situation and prevent the refugee disaster? In how far they cooperate with each other and which role do they play in this context? The teaching research project MAREM "Mapping refugees´ arrivals at Mediterranean borders" which is running at the Ruhr-University Bochum from 2013 till 2016 is dealing with these issues.

In the planned presentation the results of MAREM will be shown and commented. Some of the main questions of the project will be answered from the scientific perspective: Is there a European Asylum System in the making? Which role

do asylum related organisations and their cooperation play in this context and for the explanation of the gap between "talk" and "action"? The empirical results are based on document analysis and 100 expert interviews with the members of asylum related NGOs, state agencies, scientific and international organisations in Italy, Spain, Malta, Greece and Cyprus. It will be discussed in how far an analysis of the ego-centered networks of organisations in selected European countries can contribute to the understanding of the asylum related situation in the Mediterranean area. Multilevel institutionalist collective actor approach will be connected with the network analysis with the aim to answer the research questions mentioned above from the perspective of the sociology of migration.

GANTZIAS, GEORGE* (HELLENIC OPEN UNIVERSITY, SCHOOL OF SOCIAL SCIENCES, CULTURAL ORGANISATIONS MANAGEMENT, MSc, ggantzias@yahoo.gr)

Cultural Sponsorship and the Info-Communication Industry: The "Code of Digital Transactions" and the "Info-Communication Payment System".

The Info-communication industry is "changing everything" in our traditional sponsorship payment systems. The digital technology together with the big data has radically challenged how cultural organizations, banks and cultural sponsorship systems manage their everyday business activities. Digital payment platforms have changed how cultural sponsorship operates, tax payment systems develop, and governments function in the recent cultural, humanitarian and economic crisis. Mobile contactless payments together with plastic credit, debit cards and digital currencies are the main drivers to develop the info-communication regulation in the Greek cultural sponsorship system. Both mobile phones, as "digital wallets", and cloud-computing networks have introduced digital payment systems in cultural sponsorship fee market economies. The purpose of this paper is to examine the digital tax payment culture and the info-communication regulation in cultural sponsorship systems both globally and locally. It analyses the role of 'Digital Tax Payment Culture' (D.T.P.C) in sponsorship markets. It describes the cultural sponsorship crisis and explains why the Greek law 3525/2007 for cultural sponsorship should be revised in order to encourage investment in Greece. With this context, it focuses briefly on the multicultural payment model "Code of Digital Transactions" (CO.D.TRA) in Greece and Europe. Finally, it proposes the "Info-communication Payment System" (ICPS) as a new digital platform to introduce the multicultural payment model CO.D.TRA as a practical way for developing cultural sponsorship as a vital investment activity in recent cultural, humanitarian and economic crisis.

RC26-321.5

GANTZIAS, GEORGE* (HELLENIC OPEN UNIVERSITY, SCHOOL OF SOCIAL SCIENCES, CULTURAL ORGANISATIONS MANAGEMENT, MSc, ggantzias@yahoo.gr)

Info-Communication Payment Culture and Regulation: Global Control, Local Resistance and the "Digital Tax Payment Culture"

The concrete exercise of the 'Digital Payment Culture' (DPC) can be fruitfully examined against the theoretical background of regulation in general. Specific public interest principles to regulate info-communication payment systems have been framed over almost seven years with reference to wider policy issues, political, social, cultural and economic, which also form the basis for the various different general theories of regulation. No single theory or approach wholly explains all events in the history of info-communication payment systems in recent crisis, but most are relevant to the essential features that have characterised digital payment systems regulatory structures and operations over the years. Digital tax payments culture together with the domination of digital technologies in a free-market economy transform how the tax system processes information payments and how mobile money operates as a transparent, accountable and reliable system of payments in our everyday life. This paper briefly summarises some of the most influential theoretical models and assesses what explanatory value they have if applied to the situation of the "Digital Tax Payment Culture" (D.T.P.C) in recent cultural and economic crisis. Finally, it proposes the "Digital Tax Payments Culture" (D.T.P.C) as a three-pronged action programme to introduce info-communication payment systems as a practical way for countries, such as Greece, Spain, Italy, Portugal, Cyprus and France, to emerge from the recent crisis.

Neutrality and Discourses of Language Homogeneity and Diversity: The Case of the Basque Autonomous Community (1980-2012)

Basque and Spanish are the official languages of the Basque Autonomous Community (Spain) since the end of Franco's dictatorship and the proclamation

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of the Spanish Constitution in 1978. However, the sociolinguistic reality of each language differs greatly from the other. While Spanish is the language of wider communication and known by the entire population, Basque is spoken just by the 36.4% of the people. Following the official status of Basque and the language rights related to it, a language policy and planning process for its revitalization has been enforced since the early 80's lead by the regional government. However, this language policy is contested in the political arena of Basque Autonomous Community and the debate is continuously centered both on the social functions and roles that these languages should fulfill and on the ways to attain the desired scenarios. Likewise, these political proposals are accompanied by diverse and often contradictory ideological positions. This presentation will focus in those ideological discourses, emphasizing the ways in which neutrality discourses are presented and articulated in relation to language homogeneity and diversity discourses. A content analysis of the five political families' regional manifestos for Basque Parliament has been carried out between 1980 and 2012 for this purpose.

Issues and Dilemmas of Professional Military Education in Slovenia

In the beginning of 1990s when Slovenia in the process of acquiring its independence had been gradually building its own military various kinds of personnel were included in the military (with different education, military skills and knowledge, career background etc.). They performed their military roles well enough, however the military was under constant reforms and transformation. In 1990s there were evolution of the Slovenian Armed Forces (SAF) toward a full defence institution, then transformation into small professional military, in the "NATO military", in military that actively participates in international missions and operations, and lately also in the military that takes a significant part in civil protection and rescue. In general, a desire to be a modern military has been constantly posed. The demands to settle the education system for the military personnel were also constantly raised. Unfortunately there have been too many and too different ideas and suggestions how to do it. Consequently the system of education of military personnel remains an open question for the Slovenian military and a point of never ending discussions among the actors in defence ministry, SAF and several civilian education institutions in Slovenia. Among the issues and dilemmas there can be found the following: how many new officers per year does the SAF need? What kind of knowledge should they have? Shall a military academy be established or an existing study programs at the universities correspond to the needs of the military? Who shall provide the lectures? Shall the SAF's officers be educated in foreign countries? How to execute the staff education? Who shall pay for the education of military officers? How does the study program of defence studies fit to the needs of SAF's professional military education?

Green Ideas on Gender: Examining the Gender Effect on Environmental Concern in a Multilevel Analysis

Gender has been traditionally used as a control variable in studies dealing with environmental concern. In most cases research show that women are more environmental concerned than men. We distinguish four approaches that attempt to explain that fact: biological, cultural, structural and political. Using multilevel regression techniques and data from World Values Survey (6th wave, 2010-2014) we reject the biological, cultural and structural hypotheses, and following ecofeminism we propose an explanation based on feminist ideology rather than on gender differences. According to our data women are more pro-environmental because they are more likely to be feminist than men, but once that feminism is introduced as a control variable the effect of gender disappears. Nevertheless unlike ecofeminism we do not hold that feminism raises environmental awareness per se. Actually we observe differences by country regarding the effect of feminism on environmental concern. We consider the different traditions of feminism and ecologism as key factors to explain this variation.

Thinking a Different Way to Govern: The Challenge of Political Decisions in a Complex Society

Interest in the study of political decisions and their impact on the legitimacy of the political system lies in the main features that rise when observing a society like present-day Mexico, where there exists an unusual breach of rules,

great inequality and violated civil rights; all of which is enough to doubt the true possibilities of inference and decision-making that the citizen really possesses in democratic social life.

Political decisions in the Mexican context are often aimed under the power of elite groups isolated from the rest of population; thereby, the lack of representativeness in many decisions is part of the public landscape in which social discontent intensifies. However, in political decisions, the referents produced by protest movements do not represent all of the options that can be observed and analyzed in the political environment. It is precisely on this point that there is a possibility to observe and problematize the economic and corporative function of the state's decisions vis a vis the demands shown in the social discussions as part of a more detailed hetero-observation.

In the framework of a representative democracy, political decisions should be based on social referents that guide to the formulation of satisfactory answers to the whole of society and not just for the powerful few. Therefore starting from the rupture between public interest and political decisions in Mexico, it is important to think of a strategy for linking public demands, economic arrangements, and political decisions in this country as a theoretical and practical challenge of a complex society.

Social and Environmental Management of Mining Sector in Mexico. Zphilanthropy or Corporate Social Responsibility?

This paper deals with the study of the social and environmental management of mining companies in Mexico. The analysis makes discernment between philanthropic trend of Corporate Social Responsibility (CSR) and current trends that focus on improving the relationship with the communities where they operate. In order to systematize the types of actions that mining companies conduct in communities as part of its operational development. In that direction, it is part of the hypothesis that mining companies apply different measures of social responsibility and environmental protection are stricter in their host countries but become so lax as permitted by law in the countries where they operate.

In this context, this work has four main objectives

1. To systematize the actions carried out by mining companies worldwide in order to have a broad view of the best practices in the field of social responsibility.

2. To systematize the actions carried out by companies in the mining sector in Mexico as part of its social and environmental management in the communities where they operate.

3. Identify, classify and analyze the practices of social responsibility in the mining sector in Mexico.

4. Examine the environmental legislation that exists in Mexico that regulates the mining sector.

The Oil Industry in Mexico, Corporate Social Responsibility and Local Development. Social Clauses in the New Oil Contracts. Real Alternative for Development?

From the year 2012, a new type of contracts were created in Mexico that allowed, for the first time in over sixty years, that foreign companies are able to participate in the Mexican oil market.

In fulfillment of the requirements of the "Integral Contracts for Exploration and Production", the new operators must apply 1 % of their annual budget to social development and they have to set up Corporative Social Responsibility (CSR) plans, that could be applied during the extent of the contracts (25 to 30 years).These plans must contain propositions of concrete initiatives that could contribute to a sustainable development in the territories where the oil companies operate.

 The present paper approaches the context in which private petroleum companies have implemented actions of social responsibility capable of improving the situation of the localities involved in the petroleum activity. With it in mind, the first section of the text presents a characterization of the petroleum contracts and introduces briefly the term of extractivism as conceptual frame that helps to understand the oil industry. The second section, The second section discusses the characteristics of integrated contracts and provides an approach to the relationship between social responsibility and sustainability. The third part is led to analyze the social implications of oil contracts through the work realized by a team of the Universidad Autonoma Metropolitana, Unit Iztapalapa that has worked in diverse oil zones during last the three years. Finally, the fourth section presents concrete actions of social responsibility implemented by nine oil companies that holds integrated contracts and tries, through them, to respond two questions: a) Define whether CSR can become a real source of financing for local development and b) Whether the actions of social responsibility may represent the beginning of the creation of a viable alternative to extractivism.

GARCIA MACIAS, KARLA MARISOL* (Universidad de Guadalajara, kmgm_86@hotmail.com)

Lindas, Sexis y Aplicadas. El Orden De Género En Las Alumnas De La Escuela Secundaria

Esta investigación buscó comprender cómo las alumnas de la escuela secundaria en México manifiestan a través de distintas expresiones corporales el orden de género. El trabajo se realizó en dos escuelas secundarias de la Zona Metropolitana de Guadalajara en México y utilizó una metodología cualitativa, la cual se trabajó principalmente con las técnicas de observación, entrevistas y grupo de discusión.

Se llegó a la conclusión de que las alumnas de la escuela secundaria constantemente emplean resistencia ante los mecanismos de la escuela destinados a adiestrar el cuerpo, debido a que existe un orden de género que va más allá de dicha institución y contrasta con la lógica del orden escolar. La modificación del uniforme escolar, el arreglo constante de la apariencia física y el cuidado personal que tienen las alumnas de secundaria, más allá de ser una forma de rebeldía es una forma de adopción de normas y roles de género que rebasa la lógica escolar y se hace presente a través de éstos actos en la escuela.

Las distintas expresiones corporales de las alumnas y el desacato constante al uniforme escolar tiene diversos significados, el más conocido es el deseo de atracción hacia el sexo opuesto, pero también manifiestan amistad y empatía entre las chicas, ya que para ellas cuidar unas a las otras de su apariencia física también representa una forma de manifestar afecto y aceptación.

Usos, Sentidos y Definiciones De Lo Público. Formas De Participación De Mujeres Musulmanas En El Espacio Público Argentino Contemporáneo

Durante los últimas tres décadas el espacio público argentino presenció una mayor visibilidad de las minorías religiosas, entre ellas el Islam. Este proceso se generó conjugando eventos sociopolíticos acaecidos en la escena pública local -especialmente con la apertura democrática iniciada en 1983- junto a otros procesos ocurridos a escala mundial -entre los más significativos podemos mencionar la revolución Iraní en 1979- que dieron lugar a nuevas definiciones del Islam contemporáneo.

El objetivo de esta presentación se centrará en una reflexión sobre las configuraciones del espacio público argentino actual a partir del análisis de los usos y los sentidos que los actores musulmanes le otorgan.Se hará especial atención a la participación de las mujeres musulmanas tanto en el espacio público como en la comunicación pública: producción de imágenes (íconos y símbolos) y de una nueva retorica discursiva.

Teniendo presente las transformaciones del campo religioso argentino contemporáneo, analizaremos las formas por las cuales se construye y se usa el espacio público. En este sentido, la salida al espacio público y la participación en el diálogo público por parte de las mujeres musulmanas argentinas ¿puede pensarse como un conjunto de estrategias individuales de refortalecimiento y reafirmación de identidades de género e identidades étnico-religiosas en el marco de un espacio público plural y "multicultural"? ¿O más bien se trata de un movimiento más profundo de recomposición y restructuración del espacio público en general, del diálogo público y de la posición de nuevos actores religiosos en la escena pública orientados a escala global?

Attitudes Towards Childcare and Social Practices: The Case of Spain (1994-2012)

This paper examines the evolution of attitudes and social practices of Spaniards regarding childcare. For this aim, we use data from representative samples from the last three ISSP Special Modules "Family and Changing Gender Roles" (1994, 2002 and 2012). First, we compare the evolution of attitudes towards employment of mothers, preferred extent of employment for women during different stages of child raising and attitudes toward social policy related to childcare. Second, we analyze how social practices have evolved during last two decades: the distribution of childcare (and looking after other family members) among both partners and employment of respondent and spouse/partner in various phases of child raising. We find two remarkable results: first, an important difference between who Spaniards consider should be principal payers for childcare for children under school age and real social policies in Spain; second, there exist a gap between attitudes toward family roles and actual social practices.

Convergence of Gender Roles in a Globalized World: International Comparison of Family and Changing Gender Roles

This paper examines emerging and changing gender roles in different regions of the world. Using data on 12 countries from last three ISSP Special Modules "Family and Changing Gender Roles" (1994, 2002 and 2012), we compare the evolution of gender roles about motherhood and fatherhood and its relation with the extension of women as breadwinners around the world: four Western Europe countries, representatives of different models of Welfare State (Germany, United Kingdom, Norway and Spain) plus United States, three former Soviet nations (Russia, Poland and Czech Republic), two Latin American countries (Chile and Mexico) and two Asian nations (Japan and Taiwan). Data show that family change (measured both in terms of attitudes and social practices) is spreading from Western contexts to other regions of the world, although the pace of this change varies from one country to another, depending on cultural, economic and political factors.

Participation and Organization in Two Rural Communities in Ruiz, Nayarit, Mexico: Between Corporatism and Self-Management

In this paper the authors argue that reflection on the issue of participation and social organization in rural areas, cannot be understood without a local historical perspective and recognition of the productive transformations that have lived the farmers and their families from the implementation of a neoliberal policy that has impoverished conditions of rural life in Mexico. External interventions of the State, non-governmental organizations or local economic actors, via government programs or private interests, they have enabled, with own internal processes, different responses and practices of community participation and organization; some of them characterized as corporative practices and others with a self-managed way. What conditions exist either? What are the forms of participation in rural communities? What terms can transform the relationship with the State?

To answer such questions, we decided from the analysis of the productive and organizational evolution of the two communities to live together in the same region in the state of Nayarit in Mexico, but that given the characteristics of community resources and forms of intervention present through the years, they have outlined different ways and different conceptions of participation and organization. Methodologically, the road layout has been the ethnographic; techniques: semi-structured interviews and participant observation.

Art and Visual Resistance As Political Correctives in Hong Kong's Umbrella Revolution

Though visual traces of the unprecedented Umbrella Revolution in the Hong Kong Special Administrative Region (HKSAR) were feverishly expunged from the city's urban fabric and erased from icons of state power by the local Chinese regime in 2014, the furtive, recurrent, and pervasive resurgence of subversive images of political defiance since then represent a symbolic visual nemesis and repudiation of hegemonic myths of the putative demise and failure of the non-violent civil disobedience movement referred to as, albeit imprecisely, Occupy Central with Love and Peace (OCLP). Though commonly deployed in accounts by local and international mainstream media, the overseas community, and by Chinese and HKSAR governments, OCLP – as a notion of new social movement civil disobedience in a Chinese city striving for genuine universal suffrage – was quickly overcome by events in late-September 2014 before Occupy's scheduled commencement on China's National Day. Hongkongers' spontaneous moral indignation and outrage at excessive HKSAR violence against peaceful demonstrators, instead, ultimately gave impetus to the preemptive emergence of the Hongkonger uprising. Variously referred to as the Umbrella Movement or Revolution by participants, and vividly evident in the ubiquitous protest art and visuals situated throughout occupation encampments and subaltern online counterpublics, the popular groundswell tapped and visually expressed widespread latent cultural, economic, political and social tensions in society long obfuscated in official hegemonic discourses almost exclusively extolling 'One Country, Two Systems' (OCTS) success. This repertoire of street and Internet-based insurgent

images, is proffered as constituting a visual political corrective to the dominant forces' narratives of success and harmony under Chinese sovereignty – as do their continued appearance across the city post-Umbrella. Using on- and off-line participant observation and researcher and subject generated images, this paper investigates the new image politics of subaltern Hongkonger visual insurgency in the "era of [political] disobedience."

WG03-652.4

GARRETT, DANIEL* (City University of Hong Kong, dan.garrett@yahoo.com)

Not a Spy – Challenges and Observations for Visual Sociology during the Umbrella Revolution

As a competitive authoritarian political system on Socialist China's periphery, adversarial politicization of the Hong Kong Special Administrative Region (HKSAR) - a deeply divided society resembling an intractable conflict – has significantly increased over the last five years in response to overwhelming *One Country* domination by the Chinese Communist Party and its patriotic oligarchs administering the city. Symptomatic of rising subaltern resistance to hegemonic cultural, economic, and political oppression and continuing denials by Beijing of promised democratic rights for Hong Kong, the Umbrella Revolution of 2014 emerged following regime attempts to violently suppress a peaceful civil disobedience movement, Occupy Central with Love and Peace, that, in turn, led to a 79-day occupation of multiple sites across the city. Albeit largely peaceful, additional episodes of regime-on-protester violence using local police, pro-regime vigilantes and organized crime vividly punctuated an otherwise symbolic contentious performance by Hongkongers whose figurative resistance campaign persisted well into 2015 despite regime clearance of occupation sites in late-2014. Saliently, ringing the Umbrella Revolution and its predecessor civil disobedience movement was a broad hegemonic narrative of Western-led democratic color revolution, regime change, and foreign force intrigues behind the collective actions. Notably, the author, apparently as a consequence of his participant observation and visual sociology research on China-Hong Kong relations under the rubric of moral panics, was falsely accused of orchestrating the uprising; ironically becoming a folk devil of hegemonic moral panic himself. This paper discusses challenges, methodologies, and observations of the author, an American PhD candidate and former career national security professional, in conducting and depicting visual ethnographic research collected through off- and online field sites in the HKSAR during and following the Umbrella Revolution. The researcher is similarly situated in local post-Umbrella changes in protest culture and the political policing of pro-democracy visuality and counter-hegemonic visual resistance.

How Do Think Tanks Matter? Assessing the Impact of Study Centers on the Reshaping of Chilean Political Right

Since the poor results obtained by Chilean right wing coalition –integrated by the two traditional parties, UDI and RN– in the last presidential and parliamentary elections, the political sector has undergone a process of renovation revealed through various expressions: a generational turnover of leadership within RN and the UDI; the consolidation of a "liberal" current of thought, the emergence of new political organizations (Amplitud, in january and Evópoli, in april 2014), but also the rise of new think tanks and foundations altogether with a new generation of researchers concerned by subjects traditionally associated with the left: human rights, citizen participation, social inequalities. By reframing those topics, parties and study centers are joining efforts for the reshaping of a modern "new" right. This aim raises however a fundamental question that will be addressed in our paper: how do the seven think tanks linked to the sector matter in this renovation (if they matter), being part of a diversified and competitive subfield composed by four old and new political parties whose positions about moral subjects are not homogeneous? In order to answer the question, we will analyze the instances and the actors who participate in the ideological production, conservation or transformation of "the right", considering both individual and institutional levels. Recurring to biographical interviews, we will on the one hand reconstruct the trajectory of old established and emergent intellectual right-wing elites, searching to understand the variations in their perceptions about moral issues as a result of differentiated socializations and positions in the subfield. We will also examine the ideological production of think tanks on different topics, paying attention to its evolution in some cases, or to its novelty in others. Finally, we will confront these analyses with the results of a survey applied to the elites of the four parties in question.

GASPAR, SOFIA* (CIES-IUL, sofia.gaspar@iscte.pt)

Chinese Immigrant Communities in Portugal

For the last two decades, Chinese immigrants have been consistently growing in Portugal. The 2000's represent a period of time when immigration to Portugal has suffered an important increase, due to the implementation of some legal reforms devoted to migrant communities (Law nº25/94 from 19 August and Law nº4/2001 from 10 January), the political passage of Macau to China in 1999, and the economic reforms developed by China and their consequent impact on Chinese migration flows all over the world. According to data from SEF (Service of Foreigners and Borders) in 2014, there were around 21.402 Chinese citizens legally registered in Portugal that year.

However, Chinese Diaspora is relatively diverse in the country, reflecting the historical and economical context between Portugal and China. As such, economic migrants originating from Zhejiang (Eastern coast of China) are the most numerous group, followed by migrants from Macau (former Portuguese political region) and Mozambique (former Portuguese African colony). Moreover, in the context of the educational globalization occurred during the last years, a growing number of Chinese students are also marking presence in the country.

Having this in mind, the aim of this paper is to analyze the socio-demographic characteristics of Chinese migrant communities in Portugal using some the statistical data compiled by the Census 2011, and qualitative information (life stories) driven by in-depth interviews. This approach wishes to describe not only the different profiles of these four social groups according to their social, educational and professional characteristics, but also to frame the diversity of the Chinese community resident in the country on new emerging policies and new transnational mobility flows constrained by a wider European context.

Social Integration of Chinese 1.5 and Second Generations in Portugal

Chinese migration has expanded around the world, strengthening the transnational relations and networks between China and different nations worldwide. Within the South European context, Chinese immigration to Portugal has been growing consistently since 1990s. In 2014, the Chinese community was already the fifth most important ethnic group in the country. One question that has been emerging in this immigration context is the social integration of the Chinese community (both of first immigrants and their descendants) within the Portuguese society. Several authors had stressed that the level of social integration of first immigrants and their children is different within the host state. Immigrants' descendants tend to have a different socialization from their progenitors, particularly in what concerns to values and lifestyles, mastering of the language, social attachment and relationships, sociability within peers groups, and educational and professional integration in the residence country. The aim of this paper is to analyze the social integration of Chinese descendants settled in Portugal, focusing in some specific domains: family, peer groups, school education, and work. Particular attention will be given to the type of social relationships established by 1.5 (those born in China) and second generations (those born in Portugal) in each of these domains both within their ethnic (Chinese) and non-ethnic (Portuguese) residential communities. Quantitative (Census 2011) and qualitative (semi-structured interviews) data will be used in the analysis, as to understand which factors intervene on the social integration and life paths of each of these groups of Chinese descendants.

GATZEVA, MARIANA* (Kwantlen Polytechnic University, mariana.gatzeva@kpu.ca)

Social Capital and Group Homogeneity: Joint-Liability Lending in Thailand

Microcredit programs provide small loans to poor people organized in jointly liable groups. Given the lack of collateral, the group lending literature emphasizes the social capital of borrowers, specifically their ties to and information about one another through which they can monitor, sanction, self-select, and provide help and cooperation to fellow members. Group composition in terms of similarity of social characteristics of members and its effect on repayment is significantly less studied. Applying social networks theory to microlending, this paper explores the interplay between group homogeneity and social capital, and their separate and combined effects on repayment. I argue that group homogeneity is a key factor in analyzing group lending and the success of microfinance programs worldwide. Using data on borrowing groups of a microlender in Thailand, I assess the extent to which group homogeneity accounts for differences in the amount of social cap-

ital available to groups and in the risk of formal penalties for late repayment or default on a loan. I find that socially homogeneous groups tend to have less social capital in the form of monitoring, sanctions, and cooperation but such groups also suffer fewer problems with repayment. Contrary to most prior research, my results show that social capital can affect repayment adversely.

Present Futures: Utopia, Prefiguration and Their Meaning in the Refugee Struggle

The current high of anti-hierarchical forms of structure in the organizational practice of social movements since 2011 applies to a wide thematic range of phenomena. This accounts for their connection to a wider societal change in the age of the network society. In protest- and social movement-research these modes of organization are more and more being connected to prefiguration theory, that means the idea that social movement actors try to embody their political visions in their current actions. Through this they transport the future they are fighting for in their present actions.Facing the huge wave of forced migration of the last year, the question of understanding the meaning behind solidarity and support action in Europe is pressing.

Protest culture in the refugee struggle of the last decade often times focuses on the participation possibilities of refugees. In Germany since 2010 we have seen a wave of horizontally organized refugee self-organized struggles and urban camps, in which the enactment of human rights have been claimed and alternative network structures have been built. The values of human rights and solidarity embedded in these practices often times transcend the exclusive logic of the nation-state.

At the ISA 2016 session on "Social Movements and the Future they want?" I will present some empirical findings on solidarity networks where monetary and non-monetary resources are being shared as common goods. On the premise of a Grounded Theory-approach I will thereby theorize on the role of prefiguration and utopia in the enactment of a cosmopolitan solidarity. The research is part of my PhD-project on alternative refugee accommodation in Germany and Greece.

Hybrid Forms in Russian Cultural Space: Practices and Styles of «Neofolk» Movement

Purpose of this research was to study the Slavic neofolk movement as a form of youth solidarity, which unites the fans of folk music dealing with reconstruction of ethnic cultural forms in apparel, external attributes, symbols, rituals, gaming practices. Both global tendencies and specifics of modern Russian sociocultural space were taken into consideration. The empirical base includes the data of ethnographical observations at various events on Russian neofolk scenes, in-depth interviews with the participants and qualitative analysis of thematic communities on the Internet.

It was found that Slavic neofolk culture as a part of city space is the "imagined community", constituted with different kinds of subcultural associations with moving boundaries, changing membership and fragmented identity of its representatives. The results let us reveal the contradictoriness of the subject area, which seems to display a conservative turn of Russian culture (in such traits as longing for metanarrative, focus on the leader, opposition for the mobile "transcultural" layer of society, desire for hegemony versus the ideas of tolerance and multiculturalism), but includes the features of postmodernity as well (self-reference, commercialization, virtualization, theatricality, kitsch, transgression).

"Neofolk" is a sign system of the second order, built on the top of authentic ethnic subculture, so we are not dealing with the revival of traditional practices, rituals and artistic forms, but with their imitation and an attempt to reconstruct. This phenomenon requires a conceptualization in terms of continuous formation, as hybrid, decentered, self-referential and mobile network structure formed within ties of individuals, objects and ideas. Searching of sustained hierarchy of values, designing myths which could legitimate group actions, neofolk culture doesn't lead to desired equilibrium, creating, on the contrary, an eclectic mix of different cultural elements. The hidden risks such as politicization, ethnic and national superiority ideas, religious intolerance give us the issues for further research.

Economic Crisis, Austerity and Trade Unions' Response: The Irish Case in Comparative Perspective

This paper attempts to understand trade union responses to the economic crisis in Ireland. The 'Irish story' is one primarily of union accommodation and

cooperation. Conflict was present, but it was sporadic and generally sectional in nature, and did not reach the scale of mass mobilization witnessed in the other European countries that received financial aid from the EU-IMF. Why was Ireland different is explained by the nature of the contextual challenge, unions' ideological inheritance, organizational capacity, and the opportunity structures afforded unions.

Everyday Lives of Young Muslims in Germany. Effects of Living Conditions on Lifestyle and Well-Being

Social research about young Muslims is often biased towards problematic aspects of coming of age of a group of young people that is considered 'different' in religious and cultural terms. There is a lack of research that simply regards them as being young and involved in age-typical behaviour and activities like their non-Muslim peers. This article addresses this lack of empirical evidence regarding relevant aspects of the everyday life of young Muslims beyond contested issues like radicalization or Islamism. It is based on the representative AIDA-survey of the German Youth Institute conducted in 2014/15 among more than 13.000 young people aged 12 to 32 in Germany. In multivariate models young Muslims are compared with other young people with or without migration background regarding living conditions, leisure time, social participation, life satisfaction, social relationships and experiences of discrimination. Findings indicate that young Muslims are hardly different from other young people in terms of life styles and activities. Yet they are socially and materially underprivileged and exposed to specific disadvantages in relation to their status a social minority.

The Political 'hangover' of Coal in US Appalachia: Maintaining and Disguising Power Via the Multi-Layered Subsidiary Firm

How are we to understand the political power of the coal sector in the Appalachian coal-producing states of the United States? In this paper, I argue that there is a political 'hangover' of the coal sector that is lasting far longer than the period of objective economic importance of the sector. Economic data demonstrate a decline in coal's importance in the eastern US (Appalachia) fields over the last quarter century as western US coalfields were opened and natural gas fracturing boomed in the Appalachian region. Yet, the hegemonic ideological hold of coal has not abated. It is reflected, moreover, in state and national level politics of defending the coal sector against a so-called 'war on coal.' This paper will address how a sector in decline both (i) persists in holding onto its political power and also (ii) disguises its impacts and protects its corporate power. Both exist despite, or in reaction to, various threats, such as from anti-MTR (mountain top removal mining) activists and the Sierra Club's "beyond coal" campaign to shut coal-fired power plants, as well as the recent bankruptcies of numerous large coal corporations as the global price boom ended. The methodological approach of the paper builds on Prechel's analysis of the multi-layered subsidiary firm (MLSF). Using data from the Wharton Research Data Services (WRDS) and other databases, the paper will examine corporate ownership of coal corporations in the US. In addition, I will trace the declining importance of coal to county-level government budgets via severance taxes. This ownership and government revenue data will be juxtaposed to other indicators of the political power of the coal sector especially in local and state politics in the US.

Futures of Individualization in Cross-Border Migration: Patterns of the Post- Soviet Migration

The post-Soviet space is marked by migration flows crossing the newly established borders between former Soviet republics and moving to other directions as well. The migration is no more motivated and organized by state agencies as this was typical in the Soviet Union. Currently the migration flows consist of individuals who autonomously use and abuse the new structural openings in economy, politics and culture and do this in increasingly sophisticated ways. The process is a typical example of spreading the global structural and action patterns of individualization. What are its major structural determinants? What are the typical patterns of individual orientation, decision and action bringing about the migration flows? What are their impacts on the societies of origin and on the host societies? What are the prospects for changing motivation, strategies and effects of the post-Soviet cross-border mass migration? Answers are searched for by using data from field studies carried out in Armenia, Georgia and Moscow. The findings reveal strengthening of the institutional coverage of market niches as well as more intensive and efficient regulation of migration processes of by states. On the oth-

er side, the growing experience of cross-border migration and the stabilization of the local institutions have substantially improved the conditions for competent autonomous orientation, decision and action of migrants. The identified changes of the structural and action parameters of mass migration open the prospects for increasing efficiency and relevance of individualization in the course of mass migration in and from the post-Soviet space.

The New Political Discourse of Roma Activism: The International Romani Movement and the Language of National Self-Determination

Language and discourse are basic tools in political interaction, mobilization and legitimisation of social positions. The paper discusses language and discourse as key actors in the politicisation of Romani ethnogenesis and in the construction of Romani nationhood. The main research questions focus on the new political language that the International Romani Movement (IRM) is seeking to forge, the alternative frames it can provide and its unifying potential in serving as the basis for collective national identity. Some of the functions of this new political discourse are viewed as necessary for creating a sense of homogeneity, devising strategies for interaction and self-reflexivity or providing collective coping mechanisms against internal divisions or external threats, such as racism, discrimination and right-wing populism. Analysis involves decisions regarding the choice of language for different audiences at various levels of communication: the grassroots level, the language of Roma activism, the language targeting *gadje* (non-Roma audiences), relations with the state or interactions at the supranational level. Answers are sought to ways old and new values and traditions should be reflected and embodied in the language of Romani ethnonationalism, or in dealing appropriately with taboo and sensitive issues in Romani culture. The research applies political discourse analysis in selected texts from Roma policy documents, media publications, public speeches and interviews. Conclusions are made on the choice of power relations Roma resolve to engage in and contest, the means and strategies for achieving legitimacy through language and discourse, as well as important aspects of national self-determination, such as choosing between the languages of victimhood or citizenship.

GERBAUDO, PAOLO* (King's College London, paolo.gerbaudo@kcl.ac.uk)

The Indignant Citizen: From the Politics of Autonomy to the Politics of Radical Citizenship

The explosion of anti-austerity protests in Europe in the aftermath of the global financial crisis of 2008 has been accompanied by a profound reframing of protest culture. One of the most interesting trends in this context has been the adoption of discourses of citizenship in Southern European movements. This trend can be seen in "ciudadanismo" (literally "citizenism") in the Spanish indignados wave of protest, casting the citizenry against a corrupt political class, in the use of terms as "aganaktismenoi polites" (indignant citizens) in Greece, as well as in the discussions about new citizenship rights by popular assemblies in protest camps, and in the manifestos of key protest organisations. I will argue that the meaning of this new discourse on citizenship can be read at two levels. First, civic discourse allows anti-austerity movements to position themselves as a legitimate and inclusive collective actor unifying a variety of economic grievances produced by the financial crisis (indebtedness, unemployment, labour precarity) around the subject-position of the "aggrieved citizen". Second, the discourse of citizenship provides these movements with an empowering vision and a civilizing mission of re-appropriation of political institutions from which citizens feel excluded. The discourse of citizenship, and the radical reformist orientation that underpins it are promising developments in the attempt to marry idealism and pragmatism, in order to face the situation of social emergency created by the financial crisis and austerity policies. However, this approach also entails a number of problems due to the association of citizenship with nationality, and the risk of subsumption of social movements in the political class.

GEREKE, MARIKA* (Goethe University Frankfurt, gereke@soz.uni-frankfurt.de)

How to Get Towards a Sustainable Future? Examining the Opportunities of Local Communities in Conflicts over Agro-Industrial Projects

Local communities, NGOs and other social organizations increasingly form protest movements to fight the severe ecological and social effects of agro-industrial projects. As a consequence, socio-ecological conflicts over such projects continue to rise around the globe. Nevertheless, it remains largely unclear which socio-political negotiation processes actually take place in such conflicts and, consequently, what possibilities protests movements do have to shape the outcome of these conflicts because most social science research focuses on the macro-structural aspects (e. g. population dynamics or economic growth) of conflicts over natural resources.

This paper argues that the combination of an actor-centered political ecology and approaches from social movement research is fruitful to shed light on this research gap. The integration of both theoretical traditions allows an analysis of the opportunities of often marginalized local communities in a conflictual constellation of actors which is shaped by unequal possibilities to control the social dealings with nature. The usefulness of such an approach is empirically demonstrated by the comparison of two cases of local social protests against extractive projects in Peru which ultimately successfully prevented the implementation of these potentially devastating projects.

In order to understand the possibilities of local communities to shape their livelihoods in a sustainable and inclusive manner, the paper, hence, shows that it is necessary to consider the power relations with regard to the social control of nature.

GEREKE, MARIKA* (Goethe University Frankfurt, gereke@soz.uni-frankfurt.de)

What Kind of Future Do We Want? Power Dynamics and Negotiation Processes in Transnational Social Movements

In social science research social movements and civil society networks are mostly viewed as horizontal organizational forms in which solidly united actors "from below" together imagine and shape other, more just futures. Consequently, these actors are commonly considered as rather homogeneous entities which are marked by harmonious interactions and act in a unified manner vis-à-vis their opponents.

Contrary to this "homogenizing" view, however, a lot of differently situated social actors with divergent political priorities typically interact in such networks. Against this background, I argue that the way social movements imagine alternative futures should not be viewed as a fixed outcome, but as a result of complex and contested internal negotiation dynamics. By developing a theoretical model which integrates theories of power as well as approaches from social network theory and using the transnational agrarian movement La Via Campesina as an empirical example, this paper illustrates how controversial political issues are internally negotiated and shows that the political agendas of social movements are shaped by their internal power relations.

The paper's main implication for future research is that close attention should be paid to the so far underexplored social and political differences within social movements and civil society networks. How these differences are mediated may directly affect the imaginations and shapes of alternative futures as well as the possibilities of solidary and just collaboration.

The Hidden Political Agenda of Talcott Parsons's The Structure of Social Action

When Parsons wrote *The Structure of Social Action,* in the years 1933-1937, National Socialism had come to power in Germany, the European nation that he knew and appreciated from his sojourn at the University of Heidelberg, from which he had received his *Dr. phil.* in the 1920s. That *Structure* based its interpretation of modern capitalism on the work of "four European writers'", among them Émile Durkheim and Max Weber, stood as an antidote against contemporary American sociology's adoption of the principles of "survival of the fittest" and "struggle for survival", then the taken-for-granted credo of social theory. The pro-democracy anti-Darwinism perspective of *Structure* is used as a backdrop to understand how sociology in the 1930s and until today, embracing the Weberian methodology of "value freedom", is opposed to authoritarianism and totalitarianism.

Beyond Development: Future Visions and Aspirations to "Good Life" in Indigenous Bangladesh

Post-development criticism and moves to deconstruct the developed/developing dichotomy have urged development sociology to abandon its raison d'être. Nowadays, we are well aware of the fact that varying often contested notions of development exist but, at the same time, we usually get quite monotone answers when we ask people about development. Modernist notions of progress, usual-

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

ly related to individual aspirations to consumerism and life-styles, tend to dominate individual perspectives, leaving collective visions of a better future behind. Embarking on Appadurai's "capacity to aspire", this paper moves beyond standardized definitions of poverty and vulnerability and highlights the significance of strengthening the capacity to exercise "voice". As a cultural capacity, voice is embedded in social, political and economic issues and expressed in terms of collective action. Aspirations to the good life then are not only individual wants or preferences, but relate to particular systems of ideas that locate the individual in society. This paper thus seeks to conceptualize the capacity as a navigational capacity which enables individual and collective actors to change existing terms of recognition. Based on preliminary data from research in rural Bangladesh, the paper makes use of this approach to show how aspirations are taken up by an NGO, which explicitly seeks to refrain from planning methods prone with developmental power relations. Glossed in terms such as "indigenous development" or "alternative development", the strategies applied seek to integrate local "voice" with strategies of poverty alleviation and recognition of cultural difference. By bridging the levels of individual and collective voice, this paper seeks to develop a more clear-cut understanding of the diverse concepts and visions of future and how these relate to particular societal, economic and political conditions.

The Politics of Health Care Provision in Disadvantaged Regions: Germany, France, England, and Sweden Compared

Ensuring adequate health care is a core task of public policy in advanced European welfare states. Regardless of increasing numbers of health professionals (notably physicians), different European countries are facing growing difficulties to allow for adequate health care in disadvantaged (i.e. rural, structurally weak) regions. Thus, insufficient availability of health care in those areas is a subject of major concern. Our paper focuses on policy strategies tackling this problem in four European countries (Germany, France, England, and Sweden). These countries represent two main types of health systems (national health service, health insurance system) accounting for rather centralised (England, France) and rather de-centralised (Germany, Sweden) welfare states. The countries practice different modes of multi-level governance and of coordination with non-state actors in health policy. Moreover, they differ in terms of the role traditionally assigned to physicians, nurses, and other professions in health care (focus on specialist care in Germany and France vs. primary care in England and Sweden).

Our paper is developed in the context of an international research project comparing national policy strategies for the supply of outpatient medical care in disadvantaged regions. The project just took up and is co-funded by the German Science Foundation (Deutsche Forschungsgemeinschaft, DFG) and the French National Research Agency (Agence nationale de la recherche, ANR). We aim at analyzing how problems are being perceived and attempts for problem-solving regulation are being designed in these countries. Policy instruments chosen resp. envisaged may range from financial incentives for health professionals to settle in disadvantaged areas to a reorganisation of supply structures and a redefinition of health workers' roles. Thus, our project seeks to explore the change of the regulatory and institutional structures in different health care systems.

Complexity and New Media Representations

The analysis of complexity is so important as the study of the way in which complexity is communicated in today's world. So far the sociological debate has interpreted new media either within a technological perspective or through a critical approach. This contribution aims at presenting an analysis of the new media environment within the perspective of the theory of complexity. New media as the main conduit of today social communication represents both an hyper-complex environment in itself and the representation of an hyper-complex world. According to Luhmann sociology should be an unveiling science. However the same unveiling attitude hasn't been implemented by new media studies more prone to the hope of refounding the community and follow the fashion and the enthusiasm towards everything that is or makes the network. These two features constitutes, in Luhmann's view, an environmental noise with respect to digital communication. In "Theory of Society" Luhmann and De Giorgi consider the topic of the novelty of the communicative processes as an issue of systemic reduction. Following the same path the argument could be extended and be an attempt to read the luhmannian categories of the mass media reality and apply them to the new media context. Then it could be possible to think of new media as an organizational and territorial "network environment" and with respect to social communication as a new binary code of the new media semantic.

The Success of Sustainable Mobilization the Embeddedness of Movements Among Voluntary Organizations and Their Success in Mobilization

There are many studies explaining protest-participation generally, but much less are trying to explain the stability and steadiness of mobilization of particular movements or protests. Resource mobilization theory suggests that this success depends on the movement's embeddedness in organizational networks. Thus, we examine how contemporary movements are embedded in organizational networks and how this factor influences their success in sustainable mobilization.

During the past years, a number of critical and pro-government movements have emerged in Hungary. Given that the organizing-actors show great stability, thus often the same actors appear as organizers, one would expect that they are able to mobilize a similar number of participants from time to time. But this is hardly the case: While pro-government rallies are able to mobilize tens of thousands each time, the number of participants in critical movements is waving from a couple hundred to 50.000.

Therefore we examine how the capacity for mobilization depends on these movements' embeddedness in different types of voluntary organizations, (e.g. religious and environmental organizations or trade unions) and social movements Based on Baldassari and Diani's work (2007) we assume, that this mobilization capacity depends on the structure of the network of organizations. The more hierarchical a network is, the more stable the mobilization capacity will be, while movements embedded in less hierarchical networks are less capable to mobilize the same amount of people. On the other hand, in less hierarchical networks, we will find more actors who are able to organize protest events, thus the number of such events will be higher. Moreover, we expect that the different types of protests are embedded in different networks of voluntary organizations. We examine this embeddedness through a survey conducted in 2014 among the Hungarian adult population inquiries their participation in certain protest events and their affiliation to voluntary organizations.

Practices in Egalitarian Partnerships: New Findings from German Families

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In Germany, the birth of the first child is still closely connected with a re-tra-ditionalisation of gender roles: mothers step back from their career, at least temporarily, to devote to childcare, while the fathers focus on breadwinning. When the youngest child turns three years old, most families follow an „one-and-a-half-breadwinner-model" – with the father working full-time and the mother working part-time and being the ones who have to balance work and family. However, many parents desire a model in which both partners share paid work and family care to equal parts, in other words, a „really egalitarian partnership". The present study looks for these "really egalitarian partnerships" where paid and unpaid work is shared equally. The analyses are based on the AID:A II dataset, a large survey conducted by the German Youth Institute, Munich. Featuring a "Doing Family" section and in parts a multi-actor design (with both father and mother responses), this survey includes around 12,000 families with a child under 17 years of age. The data allows identifying "really egalitarian partnerships" from the sample and comparing them with other more or less egalitarian arrangements in terms of influencing factors of the distribution of paid and unpaid work. First findings suggest that the number and age of children, the education level of mothers and fathers as well as personal attitudes like gender concepts are closely related to the level of egalitarianism in families. The results will also shed light on the actual "doing family" in families with different wok/childcare arrangements: How exactly do they combine work and childcare, how did these arrangements come to be, what motives were important when deciding and how satisfied are they with their arrangements?

GETZ, SHLOMO* (Academic College of Emek Jezreel, shlomogetz@gmail.com)

The Israeli Kibbutz – from Commune to Cooperative?

During the last decades the kibbutz – a 'whole commune' uniting both production and consumption in the same entity, has undergone a transformation. The main changes are: In most kibbutzim members are paid a salary according their work (differential salary); they pay for most of the services (food, health care, education etc.), once free of charge; they hire workers and managers. The principle of self-management, once one of the flagships of the kibbutz is no more kept. Many office holders are not kibbutz members. Kibbutzim continue to keep democratic practices on major decisions, including elections of officers, admission of new members, approval of the annual budget and of major changes in the kibbutz way of life. Some researchers explain those changes as rationalization of kibbutz life, other as a transition from one type of economic institution –commune - to other types –hierarchy and market, due to "communal failure".

Do those transformations change the nature of the kibbutz as a commune? One claim is that the process the kibbutz undergoes is "a non-total revolution", while others claim that the abandon of some core principles of the kibbutz like differential salary change totally the identity of the kibbutz. Some theories of communal study predict that the process of decommunalization will lead the commune to become a regular capitalistic enterprise. The kibbutz can be defined now as a production cooperative. Kibbutz enterprises are collectively owned, decision making is made by the general assembly. Contrary to cooperative principles, kibbutz members can work outside the kibbutz and must live in the community. The kibbutz keeps some of its communal aspects like mutual responsibility

The contemporary kibbutz is neither a commune, nor a cooperative, and surely not only an economic enterprise. It may be considered as a unique way of life.

Linkage Between Leisure Time and Social Capital Among Iranian Youth

The paper is an attempt to study the relations of leisure time and social capital, while attention is paid to theoretical and conceptual aspects of these two constructs in the literature of social sciences. Also attempts have been made to study the impact and interaction between leisure time and social capital within the framework of extrication between the individual and collective leisure times as well as intergroup and intra-group social capital. Through a secondary analysis of national surveys data about the Iranian youth, the linkage between leisure time and social capital is statistically analyzed.

Overall, the findings of the present study show that the youth who spend most of their leisure time in collective leisure activities compared to the youth who spend their time in personal activities, enjoy more social capital – through the existence of social capital in the society, prepares the ground or opportunity for the formation and spread of collective leisure in the public of third places compared to private and personal leisure activities. If they possess the necessary conditions and capabilities, through presence in these places, the youth can reproduce and strengthen the indexes and constructive components of the social capital.

Rationality As Mental Representation: Decision-Making at the Cross-Roads

This presentation will discuss empirical results from an experiment and from an interview-based research which reveal the use of decision-making strategies pertaining to a wide variety of decision-making theories. In light of these findings, rational choice is reflected upon as one of many possible mental representations, alongside other decision-making theories, like multi-criteria decisions, bounded rationality and prospect theory. Both the experiment-based and the interview-based research investigated treatment decisions of patients with chronic illness. A mental representation in this case is a mental re-construction of a perceived reality or a cumulated set of perceived stimuli. In decision research this is a relatively new term (however not new in psychology and linguistics (Mental Models and Reasoning Lab n.d.; Wittgenstein 1922)) which has the potential to de-construct the classical boundaries between different decision theories (Loewenstein 2001; Mazur 2015; Arentze et al. 2008; Huber et al. 2011). As this research departed from the question of how people decide, it will be argued here, based on the empirical results and on current literature that it is not decisions or choices that are rational, at least not in the sense of decision as resolution. Instead, unlike in classical rational choice theory where rationality is given by preference properties, in this explanatory framework mental representations on which decisions are based contribute to the rationality or irrationality of the decision. More than this, since mental representations can be socially determined or learned, rational choices appear to be closer to social psychology than to economic theory.

The Diasporization of Educational Space: An Ethnographic Exploration of Power and Educational Experience within Iranian Supplementary Schools in London

This paper ethnographically explores the shifting power dynamics and alternative educational experiences which emerge when mainstream national (British) educational spaces become 'diasporized' through the educational practices of UK Iranians in the form of supplementary schools. Within the context of increasingly socio-ethnically diverse and educationally diversifying Iranian supplementary schools in London, I examine what types of spatial action constitute a 'diasporization of space' and what impact this has on the educational and self experiences of diverse children and young people. I posit that a great deal can be learned both theoretically and pedagogically by studying educational space and practice through the lens of diaspora studies. Chiefly, I argue that diasporization of national educational spaces gives off a unique type of 'democratic energy' which transcends both national and ethnic/diasporic structures and has the capacity to produce educational experiences which account more readily for the multiplicity/ multi-modality of students' subjectivities and can pave the way for more global or indeed cosmopolitan models of education. The paper draws on data from my ongoing research among UK Iranians which is funded by the British Council.

Authority of Khasi Tribe Women in India

The Khasi is one of the tribes living in Meghalaya state of North-East India. This tribe draws much attention of the sociologists, because this tribe practices matrilineal system characterized in terms of marriage, inheritance of property and matrilocal post-marital residence and other social relations. This is rare in other society

The khasi society of Meghalaya is such a society, commonly known as matrilineal where authority, title, inheritance, residence after marriage and succession are traced through female line. So, it is presumed that they do not require any special effort to make them aware and get social, economic, political, psychological understanding and knowledge to establish their rights along with men in their society as they are automatically placed on an esteemed level. Matrilineal society has been a source of great pride to the state.

The paper examined the dynamic roles and status of rural tribal women living in Meghalaya, especially of the Khasi women. More precisely, we tried to examine, how much control a Khasi women has over resources within and outside the family. It is empirically observed that the Khasi communities in its traditional arrangement both, men and women enjoy their restricted roles. It can be concluded that empowerment of women is evident in all its glory in Meghalaya's unique women centric society.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

It is observed from the survey that at present, the Khasi matriliny is in the transition phase and its future is still not properly defined.

GHOSH, SREYASHI* (Indian Statistical Institute, Kolkata, India, sreyashi19@gmail.com)

Beyond Spaces: Debunking the Public/Private Divide in Understanding Violence Against Women in India

The dichotomization of society into public men and private women has been the microcosmic reflection of the belief held many sociologists and social scientists, spearheaded by Talcott Parsons that men are fitted for the instrumental role whereas women are meant for the expressive role to keep the societal equilibrium intact. The lawmakers have always been rebuffed by the above exposition in their effort to legalize the private sphere and to bring it under the legal scanner, thus creating an illusion that public sphere is more dangerous for women in comparison to the private sphere, whereas the fact is far from the truth. Interplay of various factors, over the years has blurred the line between public and private making youth especially women equally vulnerable in both the spheres. Similarly, the unprecedented entry of women in the labour market post globalization has pressed upon the society the need to frame rules to ensure their safety in the public sphere. Violence knows no spatial segregation, if a woman is believed to have more chances of being victimized in the public domain she has equal or more chances of being maimed in private. To ensure unobstructed movement towards gender equality, the feeling of safety has to be created and maintained in both the spheres and this can be achieved by introducing various changes in existing legal framework and government policies.

In this paper, the author tries to debunk the idea of gendering space created to make women feel more secured in the private than in the public sphere while in actual reality victimization doesn't have a spatial characteristic. The paper argues, using the post modernist theoretical framework that idea of space is a patriarchal product which not only jeopardizes the mobility of women between spaces but aggravates the vulnerability of the youth in general.

GHOSH, SREYASHI* (Indian Statistical Institute, Kolkata, India, sreyashi19@gmail.com)

Justice-Served or Faked? a Critical Analysis of the Gender Just LAWS and LEGAL Procedures in India.

"Even where there is *de jure* equality, law in its actual functioning discriminates against women because legal agents interpret laws in patriarchal ways"- this critical perspective immanent in Nivedita Menon's book, *Recovering Subversion: Feminist Politics beyond the Law*, paves the way for the further exposition of the alleged gender just laws and procedures in India. Incessant struggles of the various factions of the society- starting from the social reformers to the feminists- in bringing the women at par with their male counterpart by advocating equality and violence curbing laws have created a society characterized by ersatz gender justice which has been unable to create a dent in the seamless patriarchal dominance. India is a land of multiple culture and also characterized by a high dose of intersectionality. Adding to India's pliable characteristic is the colossal rural-urban divide which has been difficult bring under an enveloping legal umbrella. Women, therefore, are doubly disadvantaged- first they are victimized for their sex and second they fall prey to the sectional divisions that maim the possibility of drafting a uniform civil code. Religious personal laws (RPLs) govern the conduct of the members of the various religious groups. Apart from the intersectional tyranny, there is tremendous patriarchal bias in framing and execution of laws in India, giving rise to a situation where laws can be described as 'male, gendered and sexist'.

In this paper, the author post mortems the inherent contradictions and limitations in the laws catering to women in India. Laws framed to achieve the desired gender justice sometimes jeopardize the same category of women for whom they are framed. This duality is also discernible in behavior of the judges, law makers and other defenders of justice giving rise to a situation of 'concealed patriarchy' which is even harder to deal with or remedy.

Courts, Law and Judges: An Ethnography of Judicial Reasoning in Sharia and Civil Courts

The paper is an etnographic foray into the field of judicial reasoning. In India, the phenomenon of 'legal pluralism' is conditioned and facilitated by commitment of the democratic state that confers an informal status to Islamic courts or Dar ul Qazas. The Article 29(1) of the Indian Constiution promises that 'any section of the citizens residing in the territory of India or any part thereof having a distinct language, script or culture of its own shall have the right to conserve the same.' The community judiciaries function within this Constitutional framework. At the same time, every citizen has the right to approach the civil courts as and when deemed necessary. This practice of judicial pluralism exists in uncomfortable tension with the Directive Principle of the Indian Constitution's commitment to the formulation of a uniform civil code. While the issue of personal law of religious minorities, especially of Muslims in India, has been the cynosure of the uniform civil code debate, there is paucity of ethnography on the procedure of adjudication in these courts and the litigants' experience of conflict resolution. The present study draws on ethnographic material of Sharia and civil courts at Kanpur and Lucknow. It attempts to show how a legally plural context, operative within the judicial system should make us rethink the categories of adjudication and judicial reasoning where family, kinship and gender are the key issues.

The Expansion of Legal Higher Education and the Access of Ethnic Minorities

We investigate the expansion of the teaching of law in Brazil, its reflexes in the state of Mato Grosso and the programs directed to the students of higher education belonging to ethnic minorities (Afro-Brazilians and Brazilian Natives). Such objective was guided by the research question that aimed at identifying the how and in which measure the relationship established among higher education students, universities and the appropriation of academic and scientific knowledge are strategies that aim at achieving cultural, symbolic and instrumental assets. The research methodology includes a mixed approach and a socio-historical approach, with a bibliographic study and documental compilation, starting from the creation and development of legal study to the implantation of the affirmative actions in Brazil and at selected institutes of higher education . We also conducted some semi-structured interviews with students engaged in the Program for the Inclusion of Brazilian Natives (PROIND) and with students of Afro-Brazilian origin engaged in the Program University for All (PROUNI). We approach the topic of university, the rights and the access of the Afro-Brazilians, the resolution of the Supremo Tribunal Federal on PROUNI and in which we analyze the results of the interviews, where we came to the conclusion that despite the different trajectories and challenges from the previous group, the transposition of limitations, imposed by the academic and social barriers on the Afro-Brazilian students, set them closer not only to obtaining a graduate degree in law, but also to conquering a new status within their academic communities and those of origin.

The Needs of Unacompanied Children Minors in Greece

The increase in the number of children and adolescents who arrive to Greece unaccompanied has abruptly and chaotically increased over the last fifteen years. It is estimated that during the period 2002-2011, approximately 4,000-5,000 minors, many of whom have been victims of political violence have arrived to Greece, under difficult conditions, as "illegal" immigrants. The number of minors seeking asylum form only a small group; the vast majority remain in the country illegally, because of ignorance, fear, administrative obstacles, possible pressures put upon them by the family left behind, etc. The lack of coordination between police and social welfare agencies, leave unaccompanied minors (who are not seeking asylum) often on their own and totally unprotected. Many of them suffer pre-migration trauma and post-migration stress, which may have deleterious effects on their psychological well-being.

The present study examines the discrepancy between existing legal framework and policies for unaccompanied immigrant minors in Greece and their implementation through placing emphasis on (a) the organizational framework of the existing services in Greece (location, how they are financed, kind of provided activities, existence of good practices,etc.), (b) the availability and accessibility of mental health care and specialist treatment for those in need, (c) the accessibility to educational/vocational training, (d) the availability of training towards improvement of expertise of health and social workers in working with refugees, particularly with minors. We conclude that the replacement of "top down" planning of services with ad hoc nature of short-term projects of service provision does not ensure sustainability in terms of continuity and integration into main stream health and social care provision.

Populism and the Democratisation of Democracy

The literature is unable to provide a clear definition of populism and adopts this term as a label for political phenomena of different kind. Populism is a range of both, political practices and discourses. As a practice, it explores ways to devolve power to the people opposing the political centrality of the elite with the controversial trust in the populist leader and a direct involvement of the 'people'. As a discourse, populism is the simplification of social and political issues leading to easy solutions and to the polarisation of positions (us vs them). All political parties adopt populist rhetoric, for example during electoral campaigns; subsequently they embrace political 'compromise' as the democratic common sense. The identification of populism and demagogy is misleading because it relates only to the discursive dimension (neglecting the practical dimension) and underestimates the wider use of demagogic discourse in the political sphere. Populist movements reject compromising the orthodoxy of substantive democracy that they claim to strive for.

Populist experiences are diversified both for their orthodoxy in the practice and for the degree of demagogy of their discourse. Populist phenomena range from xenophobic, racist or nationalist to progressive, participatory and innovative experiences that carry a utopian view of democracy aimed at improving the substance of democracy as opposed to the form. New experiences of populism, such as the 5 Star Movement in Italy and the Aam Aadmi Party in India, challenge in different ways the ongoing crises of democratic representation and provide utopian solutions which transit to experimental and controversial political experiences. This paper analyses to which extent and with which contradictions populist experiences contribute to the democratisation of democracy.

The Democratisation Potential of Participation – Comparing Emerging Political Movements in Italy and India

New political movements are often carrier of innovative perspectives, practices and participatory paradigms able to respond to the representative crisis experienced by traditional parties. The direct appeal to the people to take their own political destiny in their hands characterise these movements and provide an enriched concept of civic and political participation. A comparative research in this framework allows identifying commonalities such as root causes, challenges, alternative solutions provided, as well as differences in the history, structure and political forms that the movements assumes over time in different political, social and cultural contexts. In order to be innovative, new political movements include experimentalism, lack organisational crystallisation and are heavily shaped by the rhythm of the electoral process, which make their study both, challenging and interesting. Their appeal to 'The People' is a basic democratic claim to participation that is controversially fulfilled through local engagement as well as through remote participation in the internet. Are these movements effectively contributing to the democratisation of democracy? Which patterns of participation do they allow? Comparing new political movements in different cultural contexts, which evidence emerge to rethink democracy at the time of the globalisation challenges? This paper brings evidence emerging from the critical comparative study of the 5 Star Movement in Italy and the Aam Aadmi Party in India with a focus on the capacity and forms adopted by these movements to expand the level of civic participation.

Medial and Political Agendas: Monitoring Issues, Assigning "Political Ownership"

The links between media and politics are well known given political agendas are more and more medial ones; for instance in Italy political debate has increasingly become mediatised since the first half of the 90s (Diamanti and Lello 2005). On the other hand, media analysis has always been a convenient tool for research on public representation of certain issues or for developing sounding analysis of public political discourse. Traditionally media analysis has been conducted with limited corpora of texts (i.e. newspapers articles), which may be constructed as samples or as "windows" on a specific news-story. More recently, media analysis can take advantage of improved techniques capacities of data collection, storage and automated content analysis, amplifying the opportunities to expand both depth and scope of such kind of analysis. As showed by contributions published on technoscientific public controversies (e.g. Neresini and Lorenzet 2014), longitudinal analysis on medial representations can be done with good results validated by external sources. Therefore this approach may be useful in order to explore even more in depth the relationships between media and politics, both in general terms and regarding specific issues. This is the case of our contribution: mixing time-series and more recent data (last five-year period) trends of public issues will be examined on the top Italian daily-newspapers. The coverage of specific issues will be mapped across time and their endorsement will be analysed looking for the shifts in "political ownership" of specific themes; the analysis will consider general trend in the last 25 years and a specific focus on the most recent Italian political campaigns for elections. The aim is to show how the political agenda is constructed and represented in the media arena.

The Challenge of Biological Citizenship and the Role of Civil Society Organizations: A Framework for the Analysis

Contemporary Western healthcare systems are in a transitional phase, because they are experimenting a structural change of their nature. The first level of implication is concerned with the transformation of health concern into what has been defined as "healthism": it entails considering health as solely an individual matter, and a fundamental moral value. By elevating health to a primary value, a metaphor for all that is good in life, healthism reinforces the privatization of the struggle for wellbeing and the broader historical trends progressively shaping the "healthist society" in the neoliberal globalization era.

This normalization and responsibility process goes well beyond the boundaries of medicine and of the regulation of bodies (and minds, in the case of psychiatry): the biopolitics of the populations becomes a discourse and a practice about how subjects are conceived as good and "normal" citizens. This changing function of the healthcare system as institutions of social control through norms of health and practices of health education increasingly involving corporality as source of social identity, rights and obligations can be described as "biological citizenship". It is a field made up by new technologies which intervene upon the body at various levels, from the more superficial one of cosmetic surgery to the deeper of embryo selection and gene therapy.

However, we should consider biological citizenship as an ambivalent process: in fact, we can talk of an "active biological citizenship" as opposed to the merely passive one imposed from above: in fact, there is growing evidence of the importance of patients' associations, disease advocacy organizations, and self-help groups giving rise to new forms of subjectivation and collective action. These new kind of civil society organizations focus on the extension of rights, on the emergence of new possibilities of participation, and the choice-enhancing options of the new healthcare technologies.

GIBAS, PETR* (Czech Academy of Sciences, petr.gibas@soc.cas.cz)

At Home in the Garden: Urban Gardening As a Leisurely Activity, Homemaking Practice and Source of Health, Satisfaction, and Well-Being

Allotment gardens started to appear throughout Europe by the end of the 19th century and since then fulfilled diverse functions. They were promoted and understood as spaces of healthy and active urban recreation in natural surroundings, as sites to grow fruit and vegetables in times of shortages, as suitable places for families with children to retreat from harmful urban environment, and more recently as sites of potential resistance to late modern capitalism. In the paper, I draw on my long term research in allotments and focus on the experiential dimension of leisurely urban gardening. Allotment gardens colonies are infused with intense emotions by gardeners working in and taking care of their allotments. Continuous physical engagement with domesticated nature, the time spent in the garden and the unceasing care make gardeners feel rooted in their gardens similarly to the flowers and plants they grow. Gardens thereby represent a part of the gardeners' homes, dislocated from the places of residence (the flats) but similarly important to gardeners' well-being and long-term happiness. I argue that the garden becomes a component of home by means of localised, physically demanding, immediate but repeated embodied engagement with the spaces and materiality of the garden resulting in moments of (dis)satisfaction over the aesthetics of and the crop from it. Using ethnographic and visual research material combined with the data from semi-structured interviews from three allotments in Prague, the capital of the Czech Republic, I unravel the interconnection between activities employed in gardening and emotions and attachments that are formed and strengthened as their result in time. In particular, I enquire how gardeners practice gardening as a demanding and rewarding leisurely activity and how they conceive of its connection to their health, immediate satisfaction, long-term well-being, and last but not least, to homemaking.

GIBAS, PETR* (Czech Academy of Sciences, petr.gibas@soc.cas.cz)

Disassembling Home: Touch, Smell, and the Autoethnographic Exploration of Moving My Grandmother out

Home is not just a place where one resides. Rather, it is a fluid assemblage of different places related with various intensities to one's everyday life, sense of self and personal identity, although these are in constant change and exposed to on-going re-negotiations. In my paper, I draw on my autoethnographic study of emptying my grandmother's flat, after she had to move out, and recount the process of materially disassembling her home. Since autoethnography is an approach that describes and systematically analyses personal experience to understand more general issues (Ellis, Adams a Bochner, 2010: 1), I use autoethnographic research, notes as well as photographs, to explore the notion of home as an assemblage sustained and characterised by particular sensory experiences. The flat filled with objects used to be a coherent, if crammed, whole where my grandmother spent most of her life, my father his childhood and where I went on innumerable visits. As such, the materiality of the flat with its textures and smells was not only my grandmother's home but also part of my own, although spatially dislocated from where I lived. In emptying it, I gradually disassembled this coherent assemblage of things by moving and removing individual objects; I dissolved it into an assortment of things that changed their place, moved to other flats, were sold or thrown out. With them and in the process, the smells harboured by the things and their assemblages so typical and deeply remembered slowly dissipated. In my paper, I concentrate on my tactile and olfactory experience in disassembling my grandmother's home (and with it also part of my own) and on the connection between smells and objects, its importance and volatility. This helps me to pose questions and offer tentative answers about home as an assemblage, its temporariness and sensory groundings.

How Do People with Dementia and Their Carers Make Assistive Technology Work for Them; Innovation, Personalisation and Bricolage

In the United Kingdom Assistive technologies (AT) are being 'mainstreamed' within dementia care services. However little is known about the use of these technologies in everyday care. This presentation report on a study exploring the use of technology to provide dementia care in everyday practice. Qualitative, semi structured interviews were carried out with 29 people with dementia and their carers, and were subjected to thematic analysis. First the presentation details the scope and range of AT use in UK routine dementia care. A mixed care economy for technology exists within the UK, in which AT were used by people with dementia and their carers alongside everyday technologies in often innovative and novel ways in order to provide care. In practice much of the everyday use of technology in dementia care could be characterised by 'bricolage' (Greenhalgh et al 2013); the non-conventional combination of devices in diverse ways often differing from their original design. From using sticky notes as signage to networking smartphones and tablets within bespoke telecare systems, AT were used in combination with non AT products to provide personalised forms of care. Bricolage arrangements were driven by carers, in most cases with little assistance from formal care services. Factors driving the bricolage based use of technology included the ability of carers to act as bricoleurs, a lack of awareness of AT and AT sources, difficulties in sourcing AT products, a lack of flexibility in AT systems and a failure of AT's to address carer's perceived needs. While everyday use of AT among people with dementia can be characterised by bricolage, current design and delivery of products and services do not enable their use in this way. the presentation concludes by discussing the implications of bricolage in the provision of technology based dementia care, and how services can be re-aligned to better reflect the everyday use of these technologies.

GIBSON, GRANT* (University of Stirling, grant.gibson@stir.ac.uk)

"I Expected to be Slow, but Not This Slow"; What Can Parkinson's Disease Tell Us about the Embodiment of Masculinity As Men Age?

Little is currently known about how gender and age relations intersect within men's experiences of a variety of illnesses associated with older age. Parkinson's Disease (PD), a progressive neurological disorder predominantly affecting older men, provides an important opportunity to gain insights into the embodiment of masculinity as men age. Yet despite PD's consequences for both men's bodily states and for idealised, hegemonic notions of masculinity as they age (e.g. being physically strong and agile or productive in its abilities), PD's effects in relation to both ageing and masculinity have seen little empirical study. This presentation therefore explores PD in terms of its potential to disrupt men's bodies and a masculine, ageing embodiment. Data is presented from 30 narrative and semi structured interviews with 15 men of varying age who were living with PD. Drawing on the male body schema first developed by Watson (2000), PD disrupts a pragmatic embodiment expressed through men's occupational abilities, a visceral embodiment defined through the basic movements and intimate functions of the masculine body, and an experiential embodiment concerned with how men's bodies should act and feel. In addition, each of these three dimensions of men's embodiment intersected with men's expectations and experiences of bodily ageing, a process also informed by broader social and cultural concerns regarding the possibilities of men's lives as they moved through the life course. As such, an embodied, age based masculinity is central both to men's interpretations of the problems associated with PD, and their responses when trying to both comprehend its effects and build a new, post PD identity. This paper concludes by discussing the implications of gender and ageing in understanding men's experiences of PD, and this can inform the sociological and gerontological understandings of the embodied character of men's ageing.

GIGLIOTTI, ANGELA* (Centre for Arts and Learning, Goldsmiths, University of London, agigl001@gold.ac.uk)

Fugitive Spaces

As a methodological tool within Chicana feminist epistemology (CFE) the *testimonio* inserts my voice as a Chicana and enables 'different possibilities and interpretations of what exists in the gaps and silences but is often not seen or heard' (Perez, 2003, p. 129). The methods presented in this paper combine Deleuzian concepts, *testimonios*, and anecdotes as methodological tools with visual methods including photo and video elicitation. The paper explores the ethnographic processes as a collaboration with my students in the San Diego County Juvenile Court and Community Schools in Barrio Logan, San Diego and the contradictions posed by my role as both a Chicana and researcher— as having 'a foot in both worlds; in the dominant privileged institutions and in the marginalized communities' (Villenas, 1996, p. 714). The research locates assemblages within the anecdotes as 'artefacts of place' within Barrio Logan located in Atzlán (Somerville, 2010, p. 340). Specific to the context of this research is the acknowledgement that the 'hoods' and streets are also places of enduring memories and sites of pleasure, comradery, family, culture and love; to omit that distills our beloved barrios and neighborhoods to stereotypical crime ridden places that serve as fodder for moral panics. Drawing upon my intuition and experiences, I step aside from the deficit models and instead respond to Cahill's (2008) suggestion to equip my students 'to take up their own rewriting of the personal, social and political scripts that will shape their individual and shared futures' (p. 28). The papers argues the hybrid methodology I have developed creates a space for students and me to share stories in the flesh through the expressive arts as witnessing through *testimonios*.

Deviance and Social Control in the Society of a Postmodern

We live in the postmodern world. There are some characteristics of a postmodern society, which are important for understanding deviance and social control.

- *Globalization* of economy, transport, finances, technologies, and deviance (terrorism, corruption, drugs use and trafficking, human trafficking, arms trafficking).

- Active *migration* of people and as result of it is "the conflict of cultures" (N. Sellin). "*Hate crimes*" is a result of mass migration, conflict of cultures. The relations between the indigenous inhabitants and migrants is a modern problem.

- *Virtualization* of life and activity, including cybercrime, cyberdeviance. We live in the real world and in the virtual world. We will depend more and more on modern *IT*.

- Postmodern society is a "*consumer society*". The slogan "all on sale" realized in numerous deviance: street crimes (thefts, robberies, fraud) and white-collar crimes, including corruption, prostitution, etc.

- *Relativism*, relativity of realities and our knowledge of them. Deviance is not objective reality, but *social construct* (terrorism, prostitution, corruption, etc.).

- *Refusal of illusions* of the possibility of creation of "happy" society ("society of general prosperity"). The World Wars, Auschwitz, Holocaust, Hitler's concentration camps and Stalin's GULAG destroyed residual illusions concerning humanity.

- Totality and *system violence*, including violence of yje power (D. Becker, M. Foucault, S. Zizek). There are criminal violence, economic violence, religious violence, sports violence and another's.

- The fragmentariness of society, as a result of globalization, generates *fragmentarization of norms*. Interference of cultures, traditions, religions, aocial and ethnic groups "washes away" normative system.

- Catastrophic grows the *economic and social inequality* is the main factor of deviance. Grows the quantity and a share of "excluded" is the main social base of crime and deviance.

Connectivity in Later Life: Changes in Mobile/Cell Phone Ownership

In recent decades changes in social connectivity have become key features in the changing contexts of later life. Communities of propinquity no longer seem to be as determining of social relationships as they once were. Mobile cell phone technology and the Internet have redefined what it means to 'keep in touch'. Some have argued that these new forms of connectivity have created a 'digital divide' between those who have become active adopters of these technologies and those who have not. Using data from the British General Household Survey (GHS), we examined trends in mobile phone ownership amongst people over fifty during the period 2000 - 2009. Compared with the pace of change in ownership of other household technologies such as personal computers, dishwashers, fridge freezers and microwave ovens, the take up of mobile phones amongst those aged 50 and over has followed a much sharper rise. Based upon these findings, we suggest a more sceptical stance towards the ICT 'generational divide' which needs more detailed interrogation. Future research should consider the possibility that the divide is becoming a more short lived phenomenon, as successive cohorts of people aged fifty and over are becoming active participants in individualised networked communities.

GILLEARD, CHRIS* (UCL (University College London), CGilleard@aol.com)
HIGGS, PAUL (University College London)

Corporeality Versus Embodiment in Later Life

The place of the body became salient within sociology in the wake of the cultural turn toward identity, distinction and representation. In the sociology of later life, the social nature of the body has taken on various forms, as a source of social distinction, as a source of social division and as a vehicle of social agency. In this paper we propose to distinguish between thinking about the ageing body as 'corporeal' – in which the body of a person and the self of a person are considered potentially separate – and as 'embodied' – in which the body realises the self's identity and personal lifestyle. While the former (corporeality) serves to objectify age gender and functionality the latter (embodiment) serves to realise the person as both agent and subject. One way the divisions of later life can be understood is through the dialectic of corporeality (e.g. the fit vs the frail), while difference in later life can be better understood through the practices of embodiment (e.g. acting/not acting your age). The interplay between these two ways of having and being a body, in later life, we argue, provides a potentially rich framework for exploring both the cultures of the third age and the imaginary of the fourth.

GILLIERON, GWENDOLYN* (phd Candidate, gwendolyn.gillieron@fhnw.ch)

Plural Affiliations in Biographies: A Complex Positioning in Different Social Contexts.

Dominant discourses and attributions have a big impact on the daily life of migrant descendants. They are fundamental in the process of in- and exclusion of individuals. Descendants of binational families present a particular case, as they are at the same time in- and outsiders in the dominant society. However, their plural affiliations aren't yet recognized and they are challenged to position themselves within their mixed origin. The ambiguity of their origin is visible in the biographies, where they position themselves toward the hegemonic discourse and their own sense of belonging.

In the presentation I will discuss the examination of "being different" and the impact of (possible) attributions on the self-presentation of young binational adults. Further I will show how hegemonic discourses have a significant impact on what is told and how it is presented. In the biographies the binational origin is constructed in very different ways, according to the origin and the discourse about this origin. While in some narratives a construction of "being ordinary" or "being special" can be observed, others do not mention or even refuse to talk about their origin. In this case not only the experiences of the interviewee are relevant, but also the discourse and the context of the interview situation itself.

The presentation will be based on empirical example from my ongoing dissertation. I will show in which ways the construction of a biography is an interplay between the interviewee and the interviewer and the discourses and contexts they are situated in. I argue that in biographies about belonging the positioning of the interviewee and the researcher can be reconstructed, as well as more general social contexts that influence self-thematization of the interviewees and thus have to be reflected particularly.

How We Share Space: Social Categorization Processes at Work in a Residential Street Prostitution Area

In the center of Brussels, Belgium a couple of streets form the Alhambra neighbourhood. This neighbourhood is visited and inhabited by a variety of people since Alhambra is not only a residential area but also a commercial, cultural and a street prostitution area.

Although the Alhambra neighbourhood has a longstanding red light tradition, it's existence is threatened by gentrification processes. This sets the scene for urban unrest not only with people who bought property or opened a business but also for those working in and around street prostitution in this area. This results in small but provoking actions such as benches that are removed on demand of a group of residents who aim to discourage the presence of street sex workers but also street sex workers who harass residents with noise or litter. Interestingly, however, is that not all residents, commercants or sex workers perceive urban unrest.

This ethnographic research focuses on the perceived rest and unrest in the Alhambra area. In order to understand when rest or unrest emerges, we take a look at the social categorization process. By looking at the social categorization process, this research tries to understand when rests shifts into unrest and vice versa. The social categorization process gives us better insight in how and why actors categorize others and position themselves at the same time. This presentation reports on the different or shifting positions and categories that emerge in this area and how such categories and positions can only be understood by taking into account the everyday context of the Alhambra area.

Being There: Capturing Event with the Camera

Activestilles Collective is a group that challenges the known definitions in the realm of photography. They publish photographs in photojournalism platforms but the Collective members do not preform as photojournalist. They show photographs in street exhibitions but these exhibitions do not define them as artists. Although most of the Collective members initiated their work in Activestilles as activists this definition is also, they declare, in question. The indecisive stand rises strikingly indeed when one tries to define what they are doing during the event of photography.

In the paper, I show that the ambivalent position of the Collective members and how it is manifested in their photographs singles-out the work of Activestilles. In "Being there" I strive to understand this unique position by basing my analysis on the text of David Green and Joanna Lowry.

In the text "From presence to performative: rethinking the photographic indexicality" these scholars suggest a broader perspective on the connection between photography and the photographed image and our way of comprehending this connection. The authors re-think this relationship by offering a framework analysis of engagement that blurs the dichotomy between the event of photography and the photographed. With the help of the framework analysis of Green and Lowry, I suggest to perceive Activestilles photography work as "being there" rather than the common Bartheain notion on indexicality of photography as "it was there". The paper is an outcome of a multi-layered study that combines between discussions with the photographers of Activestilles, a critical examination of the photographs and the political context that marked their work. Through this examination and with this framework analysis I present an understanding of this performative photography of the Collective Activestilles.

Critical Reading of Human Rights Violations Visual Documentations By Palestinian Women in the Occupied Territories.

This paper focuses on the involvement of Palestinian women in the video documentation as part of the project of the Israeli human rights organization B'Tselem. It claims that the house/home is a site of anti-colonial struggle and that this development results from a specific socio-political situation and techno-ethical position. Based on analyses of the political situation in the West Bank, as well as consideration of films and interviews with Palestinian women who have been given cameras by B'Tselem, this paper examines the "spatialization" of visual activism: that is, the ways that Palestinian women's participation is allied with sites where political resistance intersects with a gendered setting.

Construcción De Subjetividades Políticas Juveniles En Barrios: El Papel De Las Organizaciones

La participación política juvenil en Argentina adquirió visibilidad en los últimos años. Según investigaciones previas desarrolladas en el área metropolitana de Buenos Aires, la misma está apoyada en la construcción de fuertes subjetividades militantes, como agrupamientos sindicales juveniles y movimientos piqueteros. El crecimiento de estas organizaciones, influido por procesos de crisis económico-social y reorganización del Estado, abrió cauce para el protagonismo de jóvenes en barrios populares.

Los barrios, con amplia tradición de acción social y política, sufrieron las políticas neoliberales de los años 90 que destruyeron lazos y experiencias de organización popular. En la actualidad, muestran una realidad de marginación donde actúan movimientos, organizaciones y programas estatales que proponen estrategias de desarrollo local y participación con resultados limitados. Si bien las organizaciones sindicales y los movimientos sociales han crecido, se advierten dificultades y tensiones en los barrios, tanto en los procesos de inserción como en la "distancia" para llegar a ser militante. Cuando este proceso es exitoso, se consolidan subjetividades militantes juveniles con características definidas. Entre ellas, las prácticas asamblearias, el desarrollo de proyectos productivos, la articulación en redes, las modalidades horizontales de toma de decisión, el lugar que brindan a "la juventud" como estrategia de acción social y política.

En la exposición se considerarán los procesos de subjetivación, los espacios y características de la participación y los caminos personales de inserción de jóvenes, analizando diferencias y similitudes con las tradiciones de militancia en Argentina. Finalmente, se considerará el papel de los procesos formativos y de inserción en los movimientos, una tarea que se reconoce indispensable para la consolidación interna tanto como para la construcción política en una perspectiva de cambio social pero que presenta dificultades y desafíos.

If Someone Is Black, He Is Suspect: Media Discourse and the Construction of Suspicion in a Brazilian Newspaper

This paper aims to discuss how language produces a suspicion against black people, through analyses of the way their images are constructed by the media. The methodology used in this research comprises data published in Folha de Sao Paulo – one of the most important newspapers in Brazil – to serve as basis for the selection of the news which composed the corpus. The discourse analysis focused on the "representations" of black people done dialogically throughout the centuries, as well as stories told as truth in order to maintain power relations and perpetuate the differences as a justification to preserve exclusion and violence. Therefore, we intend to provide visibility to racism, which institutionalizes and naturalizes inequalities in the relation between blacks and whites in Brazil. This paper showed the omission of this newspaper about the violation of black people rights under the pretext of media's neutrality, strengthening, this way, the negative representation of black people made by social, police and justice environments. Even though Brazil considers itself as a non-racist country and spreads the myth of racial democracy, based on the miscegenation occurred during its history, we understand that the transmission of this kind of discourse tends to keep the privileges of the hegemonic group within a split society – still marked by the sequel of colonization, which even after abolition of slavery reserved subaltern positions for black people.

GIORGINO, VINCENZO* (University of Torino, vincenzo.giorgino@unito.it)

An Enactive Approach to Social Innovation: Towards a Wise and Smart City

An innovative urban environment conceived as a Commons needs to be nurished by an embodied form of social sciences to guarantee a social transformation from within (Gibson-Graham et al. 2013, Gibson et al. 2015).

My proposal is mainly inspired by Viviana Zelizer's approach to the economy as relational work (Zelizer 2011). Its extended version differs from the original one as it includes single individuals as pro-active subjects of change. Its model of self is grounded on the emerging literature on wisdom in organizations/communities and contemplative (economic) sociology. The aim is to go beyond the dominant techno-oriented focus on Smart Cities in favor of a more inclusive and enactive model inspired by the work of the neurobiologist Francisco Varela.

Following these premises, soft and life skills are considered the pillars on which digital technologies can be effective in the pursuit of individual and common well being. This experience-based model offers an embodied, non divisive strategy to those who conceive scientific knowledge - as well the city, in which the former is created - as Commons. In methodology, it is based on a mixed method strategy that includes first-person, second-person and third-person methods.

References to recent transdisciplinary proposals for the Horizon 2020 European Research program (2015) will be provided.

GIORGINO, VINCENZO* (University of Torino, vincenzo.giorgino@unito.it)

Beyond the Divisive Approach in Sociology of Health. an Introduction to an Enactive Perspective in Health and Well-Being.

My presentation unravels the threads of four questions emerging from the invitation to this session. *What is healing in the contemplative perspective of health and well being? What is the conception of the body in it? What is the self? Who is suffering?* In Sociology of Health there is a long tradition of studies that take into account the transformation of the self faced by sick people, especially the chronically ill.

I will present a selected critical review of the interactionist research in the field to show how the self is observed and analysed.

Next to this area, it is appropriate to make at least a nod to those studies that take as object the diffusion of lay contemplative practices, for the most part highlighting the process of commercialization that runs through.

In these two sub-fields of study, the management of self appears a central concern: what I want to emphasize is that in both the main obstacle to sociological understanding is the dominant lack of something model ("Sociology abhores a vacuum": Rock and Downes 1988).

In the final part, on the basis of the enactive model of Varela et al. (1991) and of some empirical study in which I integrate current sociological methods with contemplative first-person methods, I argue that the potential of emptiness can be rediscovered in favour of the construction of an experience-based, post-constructivist paradigm in which human suffering is recognized and managed more effectively.

The possibility of accepting contemplative practices as embodied transformational social actions could change the current perspective, not only contributing to a renewal of its epistemological foundation but also offering enactive tools for the cessation or reduction of suffering itself (Bourdieu 1999: The Weight of the World Social Suffering in Contemporary Society).

Delinquent Self As a "Frame Trap": The Routine Processing of Inmates in Youth Detention Centers

This paper aims at analyzing how the staff of youth detention centers, while making institutional practices accountable, exerts control over inmates and contribute to impose a "delinquent self" on them. The analysis was based on a research developed in four youth detention centers in Brazil that involved interviews with staff members and observations. The activities of the process by which the institutional members produce the decision of releasing the youth were investigated. In these centers there was a system of privileges and punishments that was used to evaluate the inmates' behavior and to guarantee their compliance with the rules. The folk theories of delinquency elaborated by staff explain the criminal behavior as the result of poor life conditions and a lack of proper moral judgment derived from these conditions. Inside the institution, however, the youth is seen as capable of self-directing and changing his conduct. Once the adolescent is placed in the institution, his definition as a "delinquent"- emergent product of the processing by the juvenile justice system – becomes a *frame of reference* used by staff to interpret the juvenile's behavior. This frame, however, does not consist of a set of specific ideas with closed meanings, instead it works as an underlying pattern. If the adolescent shows anxiety toward the evaluation system, this is a sign of not being "ready" or changed enough. When he follows the rules and activities imposed, he is accepting the need to "change" his life, attitudes and morals. If the staff feels, however, that he is following the rules "just because" he wants to be released, it is an evidence of being intrinsically criminal. In something that could be defined as a *frame trap,* all the inmate's attempts to deal with his situation in the institution are used as evidences of his delinquent self.

From Non-Existence to Reluctant Inclusion. Fathers in Writings on Care

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

One of the central areas of western gendered division of labour is the care-taking of young children. Even though much has changed radically in the social situation of men and women in the Nordic countries in the last decades and the strive for gender equality is a generally accepted political issue, the division of labour regarding care for young children is still a hotly debated topic. In this paper I want to present the results of a study of books and periodicals published in Iceland in the 20th and 21st centuries that were devoted to instructing (potential) parents on how best to care for their new-born babies. Regarding the role of the father, three periods can be detected. Right up to the sixties, the father is almost completely absent, he is hardly mentioned. Starting in the sixties and seventies he enters the scene as a (clumsy) helper to the mother. In the nineties we enter a new period where the father becomes more of an independent actor and the tendency is to portray the parents as equal. Still, books are published portraying to address "parents" but where it is fairly obvious, not least in the pictures, that parent really means "mother".

GISLASON, INGOLFUR* (University of Iceland, ivg@hi.is)

Police, Protesters, Performance and Trust the Interplay during the "Pots and Pans Revolution" in Iceland 2008-2009

In October 2008 the Icelandic financial system collapsed and soon thereafter protests began. The movement gained momentum and most or all weekends saw mass demonstrations in front of the parliament building and other places in central Reykjavík. In December and January 2009 these protests became more violent with food, rocks and bottles being hurled at governmental buildings and/or the policemen protecting them.

The Icelandic police faced its most difficult task ever during these months, making sure that people could protest but also protecting buildings and members of the government. Very rarely did the police use violence even when facing angry mobs throwing rocks and bottles at it. On January 21st a unique incident took place in front of the main governmental building when some of the protesters broke rank and formed a human shield in front of the police urging other protesters to stop throwing things that could harm the policemen. The other protester very quickly complied. I have interviewed some of the policemen that were on duty during those days, particularly those who stood in front of the governmental building that night. I have also managed to locate and interview five of those who were the first to form the shield. On the basis of these interviews I want to discuss some of the facets of the interplay between protesters and the police and particularly the theatrical part of it. I also want to discuss what it was that the police did that on the one hand made the protesters try to protect it and on the other contributed to the general trust in the police. The police is the only public institution that actually increased its trustworthiness after the crash and is in fact the public institution in Iceland with the highest trust score among the general public.

GIULLARI, BARBARA* (University of Bologna (Italy), barbara.giullari@unibo.it)

Workplace Participation: An Informational Basis Issue?

As time goes by, employee participation in workplace has followed different paths in relation to the economic and political events of the different countries; nevertheless, employee participation is an ambivalent crossover between capitalism and democracy, due to the asymmetry in wage relationship.

In Italy, as elsewhere, the effort to favour more inclusive decision-making processes in workplace has gone hand to hand to actions aimed to provide to employees instrument to improve knowledge, needed to take part in society and to appreciate the sense of their work life experience (for example: extension of compulsory education, "150 hours" experience, etc.).

In the post-Fordist organizations, focused on flexibility and efficient management of human capital, individual knowledge is much worth; in this circumstance social knowledge is being privatised more and more and also collective belonging of employees is weakening. Also the participation of workers has met a substantial metamorphosis: unlike the recent past, nowadays, companies usually ask the employees for more participation and commitment in order to increase value, sometimes even including them in decision-making process.

In this scenario, the proposed paper stems from the idea that besides the institutional and organizational perspective of workplace democracy, the issue of participation in workplace requires analysis of situated working practices as knowing-in-practice, a collective activity emerging from the dynamics of interactions and cooperation. In a pragmatical perspective, with the support of Sociology of work studies carried out by the Author (on topics as work safety, training programs, local bargaining experience), the paper will focus on the processes of creation, circulation and use of knowledge in the workplaces, in the idea that the quality of informational basis of organizational choices (to paraphrase Amartya Sen's words) play a crucial role in order to convert participation in decision-making process in workplace democracy, in perspective of agency of people.

On the Road Again? Training Paramedics in Higher Education in the UK

Since 2003, like several other allied health professions, paramedic education in the UK has undergone a process of formalization. Whilst training previously took place 'in-house', over weeks-long courses within ambulance trusts, today, the main route of training and registration for new paramedics is through undergraduate programmes delivered by Higher Education Institutions (HEIs). Indeed, for the academic year 2015 there are 47 such university programs. However, over a decade since the opening of the first BSc (Hons) Paramedic Science, this process involves a number of significant challenges. Many registered paramedics and professional leaders view the delivery of undergraduate paramedic courses as unnecessarily-long and too 'theory heavy' and the process of professionalizing paramedic practice, including the formalization of education and training, is seen as a case of 'professionalisation from above' that is driven by managers and policy-makers rather than by registered paramedics 'on the ground'. Consequently, students find themselves at the centre of competing views held by the various 'stake-holders', including the host university, the professional body and practicing registered paramedics.

The main questions guiding this research study are 1) how do university lecturers, clinical mentors and students on university paramedic programmes in the UK negotiate occupational practice within the framework of HE skills and knowledge? 2) What are the implications of formalising paramedic education on the development of paramedics' professional practice?

The research draws on data from a) focus group discussions with students from one Paramedic Science programme at a university in the South of England, b) 15 in-depth interviews with educational and professional leads at the regional ambulance service and at the professional body for paramedics and the ambulance profession in the UK; with members of the academic team at the host university; and with registered paramedics working alongside students on the course whilst in placement.

Dementia and the Moral Order

Dementia is a neurobiological condition with various social and behavioral consequences. Neurological progress of dementia leads under certain circumstances to social and cultural challenges. The aim of the paper is to study and discuss how institutions try to control the social and cultural manners of persons with cognitive and biological restrictions because of dementia. People diagnosed with dementia are often inmates in social establishments or institutions meant to provide care for such patients. Part of this caring function is to control social situations through careful planning and governance of for instance eating situations. The study is based on observations from a day center in Norway. We are concentrating on the meeting of such biological issues as neurological decline and need for nourishment on the one hand, and how these biological claims are met and managed socially and culturally in institutionalized eating situations.

The study is informed by Norbert Elias ideas about civilization. To behave as a civilized person is understood as a normal and desirable form of behavior. Instead of using the term 'civilizing', we use the term 'domestication' to describe how professionals in institutional settings meet demented individuals. The study is also informed by the sociology of the body. The body is understood as a biological entity with biological needs and limitations but also as a normatively regulated social body. Ordinary social environments presuppose a well-functioning body with no anomalies. The demented body have some anomalies and institutions like the day care center are faced with the problem of how to civilize or domesticate the "demented body". Our paper focuses on how such challenges are managed in eating situations.

Mapping Parties' Positions on Climate Change in Pre-Crisis Greece

In the current study we examine parties' positions on Climate Change (CC) in pre-crisis Greece, documenting the evolution of the political discourse. In particular we examine whether the positions were differentiated across the left-right spectrum, if there was a political party that demonstrated an "issue ownership" as

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

well as whether the oppositional parties were more engaged in the CC discourse. In order to test the above we formulate a number of hypotheses which we test with data originating from the positions of the parties, as these were presented in three Greek newspapers (Kathimerini, Ta NEA & Eleftherotypia) over the period 2001-2008 (N=463). Data suggest that for the parties on the extremes, both right and left, CC was not a pivotal issue. However there was a consensus amongst the parties in the rest of the spectrum concerning CC. Moreover, CC political discourse gained momentum as the Eco-Greens entered the political arena in 2003 and successfully forwarded CC as an issue in the press, triggering an accommodating response from their ideological neighbors. While the Eco-Greens emerged as the strongest extra-parliamentary party in the 2007 elections, CC political discourse also peaked.

GLAS, MARJORIE* (IRIS, marjorie_glas@yahoo.fr)

L'atout De La Multipositionnalité Dans Les Carrières Artistiques : Le Cas Du Théâtre Français

L'histoire du théâtre public français depuis 1950 est celle d'une autonomisation progressive de la contrainte économique incarnée par le théâtre privé. Un groupe d'agents développe en effet à partir de 1945 un théâtre à vocation populaire, dénué d'intérêts commerciaux, dont l'objectif est la défense de la l'innovation en direction d'un public élargi.

L'incertitude économique qui découle de cet engagement est compensée par l'intervention des pouvoirs publics dans le financement de ce « théâtre populaire » : l'Etat d'abord puis les pouvoirs publics locaux vont peu à peu mettre en place un système de subventionnement supposé protéger l'autonomie du monde théâtral public vis-à-vis de la contrainte économique. Ces aides, par définition sélectives, font progressivement apparaître une concurrence nouvelle entre agents du secteur, d'autant que le soutien des institutions publiques devient un gage objectivé de reconnaissance.

Nous baserons notre étude sur le terrain d'une thèse en cours d'achèvement relative aux transformations du secteur théâtral français entre 1950 et 1990. L'analyse comparée des trajectoires d'agents issus de générations différentes nous montre que la réussite d'une carrière se constitue à partir des années 1970 autour de la maîtrise de trois fonctions habituellement séparées (Becker) : les metteurs en scène consacrés ont tous su cumuler des fonctions de producteurs d'œuvres (comme artistes), de distributeurs (comme directeurs de théâtres) et de prescripteurs (comme experts au sein de commissions institutionnelles). Cette communication souhaite ainsi montrer que l'intervention des pouvoirs publics, qui avait vocation à protéger les acteurs culturels de leur engagement dans l'incertain (incarné par l'innovation et le travail auprès d'un public populaire) a abouti à la constitution de nouvelles stratégies de carrières complexes où l'incertitude économique, loin d'avoir disparue, dépend maintenant en grande partie de variables relationnelles extra-artistiques. Cet exemple historique rejoint le constat fait dans d'autres professions de l'aspect indispensable de la multipositionnalité dans la réussite d'une carrière.

RC37-432.4

GLAS, MARJORIE* (IRIS / EHESS, marjorie_glas@yahoo.fr)

Le Théâtre Public Français Entre 1950 Et 1980 : Art Engagé Contre Théâtre Commercial Au Risque De L'institutionnalisation

La catégorie du théâtre « public » (ie subventionné par les pouvoirs publics), s'est constituée en France à partir des années 1950 en opposition à un théâtre privé accusé de dérive mercantiliste. Le théâtre public se construit sur deux principes centraux : l'innovation est posée comme un critère déterminant de consécration, en même temps que l'engagement politique constitue à partir des années 1970 le devoir de tout metteur en scène œuvrant au sein du théâtre public. Se constitue ainsi entre 1950 et 1980 l'idéal-type d'un théâtre « de création » émancipateur.

A la faveur d'un contexte politique et social spécifique (période de reconstruction après-guerre dans un contexte de forte politisation des débats avec la décolonisation et les luttes sociales), cette nouvelle catégorie fait émerger des critères de consécration en tous points opposés à ceux du théâtre privé : les agents en présence (metteurs en scène et « animateurs » chargés de l'action culturelle) défendent une radicalité esthétique formelle tout en développant les principes d'un art engagé à destination du public populaire en opposition au public bourgeois ; l'objectif du théâtre public est l'émancipation de la population, ce qui requiert un travail sur la totalité du territoire national (zones rurales, banlieues des grandes villes) opposé à la centralisation parisienne du théâtre privé.

Ce processus d'autonomisation du théâtre public va s'adosser à des financements publics provenant de l'Etat puis des pouvoirs locaux. A partir des années 1970, l'Etat va mettre en place un système de subventionnement qui tiendra peu à peu lieu de système de consécration artistique, au détriment d'une reconnaissance par les pairs. Cette communication, appuyée sur le terrain d'une thèse en cours (soutenance printemps 2016), veut montrer comment la revendication d'autonomie d'un art pur face au théâtre commercial s'est finalement soldée par

la constitution d'une catégorie fortement institutionnalisée, dont les logiques échappent aujourd'hui aux acteurs qui l'ont fondée.

Changes Across Cohorts in the UK in the Relationship Between Employment and Family Experiences and Working until or Beyond State Pension Age

Our study examines how the relationship between employment and family experiences and working until or beyond state pension age (SPA) has changed for different cohorts in the United Kingdom (that is, for respondents aged 55-69 at baseline born 1919-1933 in the UK Retirement Survey; 1922-1936 in British Household Panel Study; and 1933-1947 in English Longitudinal Study of Ageing). This is a critical issue as the UK, in common with many other governments across the world, is rapidly extending the working lives of older adults through the postponement of SPA and other measures. In particular, given shifting norms and expectations about men's and women's working lives and changing policies on SPA, future policy development will be aided by understanding how these relationships have changed across time and cohorts. To date, while we know that later-born cohorts are more likely to be in paid work in their 50s and early 60s in comparison to earlier cohorts, we do not know how these changes are associated with employment and family histories, health or socio-economic circumstances. Understanding the antecedents and consequences of change over time is essential if we are to use current patterns to suggest what might happen in future. It is also critical to the development of policy that minimises how inequalities may be perpetuated through the lifecourse.

GLISCH-SANCHEZ, DAVID* (University of Illinois at Urbana-Champaign, dlgs@illinois.edu)

"How Does It Feel to be a Problem?": Social Harm, Algorithms of Pain, and the Potential for Social Change

In this paper, I argue for the critical need to understand the experience of pain in relation to racism, patriarchy, heterosexism and other systems of oppression and the counter-intuitive role it plays in catalyzing social change. Pain is very rarely studied in the sociology of emotions; the one major exception is the experience of pain as it relates to health. As a result, Bendelow and Williams (1995, 1998) note that definitions of pain must necessarily broaden from current Cartesian premises that root pain primarily as a physical sensation resulting from some form of neurophysiologic pathology. Relatedly, Kiran Mirchandani (2003) has argued for the need to incorporate race and racism as an analytical lens to understand emotional labor. Unfortunately, within the sociology of emotion not many have followed in her footsteps (Wilkins & Pace 2014), even when emotions remain an implicit element, if not an invisible force, within many studies of race and racism. I utilize, algorithms of pain, a concept from my own work on queer Latina/o experiences of social harm, to understand the sociological work being done by the contemporary rhetoric and protest actions of the #BlackLivesMatter movement. I contend that #BlackLivesMatter seeks a fundamental and permanent shift in white algorithms of pain that results in the elimination of the white practice of "emotional segregation" (Beeman 2007); a paradigm shift that would lead to white algorithms of pain that recognize and care about black suffering and death.

From ‚Prosthesis' to ‚Post-Thesis'. Technological Cultures of Assistance in the Paralympics

The history of prostheses in paralympics and society of the 20th century has been narrated as one, in which a prosthesis assisted a disabled or deviated body in order to move in the social registers of a „normal" and idealized sports body. The artefact should only displace dysfunctionalized or missing parts of the athlete's body. Through the progressive development of prostheses technology and

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

training methods based on sport science, but also through the diversification of the body in the discipline of the paralympics over the course of the last decades, the cultural meaning and the social capacities of prostheses have changed significantly. The paper will explore this claim from a material culture point of view and through the lens of a praxeological analysis.

The paper is divided in three steps. First, the image history of prostheses in the 20th century in the paralympics will be reconstructed. I will show that the underlying concept of prostheses was one of what I call passive assistance. Secondly it will be shown how the artefact has changed its theoretical registers over the last decade. Drawing on insights from ethnographic research in training camps of paralympic athletes preparing for the games in Rio 2016, it will be shown that the relationship between the body and the technology is based on dyamic relations and „interactions". It will be shown how such a notion of „interaction" makes visible both, the affective capacities and diversities of the athletes' bodies, as well as the technological complexities, technical problems and unknown dimensions of a prosthesis. Thirdly, by drawing on the recent disucssion about posthumanism and enhancement, I will conclude by critically reflecting that the artefact ‚prosthesis' more and more turns into a mobilising ‚post-thesis', an active co-creator of humans' movement and subjectification that breaks with existing social orders and significations.

GOBEY, LAURA* (Deakin University, ljgobey@deakin.edu.au)

Visual Methods and Intersectional Research: The Advantages and Challenges of Using Participatory Visual Methods to Research Intersectionality

This paper discusses the benefits and limitations of visual participatory methods specifically the use of images. It suggests that intersectionality provides a theoretical and/or methodological framework for the incorporation of images as research data. However, this incorporation of images into sociological research is not done without its challenges. Photography is an important element in visual methods, whether this takes the form in photo-elicitation, photovoice, ethnographic researcher produced images or the use of pre-existing images, to name a few. Photovoice particularly has close ties with feminist theory and intersectionality has been argued to be one of the most important theoretical contributions to feminist studies and other related disciplines, yet there is still plenty of scope to develop methods appropriate for researching this theory. This paper will discuss the fieldwork stages and intial findings of my PhD research which investigates the lives and aspirations of young African migrant women in Melbourne, Australia, aged 18 to 25 years old through an intersectionality framework and using the combination of participatory visual methods and biographical methods. The participants in my study are asked to take photographs of their current realities and of those things that symbolise their aspirations. These images are uploaded onto a digital platform, taking the form of an online diary. The diaries are then being used to form the questions asked during semi-structured in-depth interviews with these young women, similar to those techniques of the diary-interview method and photo-interview/photo-elicitation method. I will highlight the advantages that I have found of this method for intersectional research in particular, as well as discuss some of the limitations and challenges of adopting participatory visual methods.

When All Roles Are Reversed: Studying Nationalist Youth in Gezi Resistance

In our field research (2014-2015) on the Gezi mobilization in Turkey(Istanbul, Ankara and Hatay), we came across several clusters of young Turkish nationalists who joined the Gezi resistance to their own surprise. One particiular group was a self-proclaimed political group even recruiting new activists. These young Turkish nationalists were previously close to Nationalist Movement Party (MHP).They are very active in social media, publish online journals, write to international and national news platforms and actively seek to be the nationalist opposition to what they consider to be the Islamist regime alien to the Turkish culture. Taking their inspiration from 19th century European nationalisms, they aspire to create a high culture of Turkishness that would fit into the 'Western liberal' paradigm. However, they retained all the xenophobic as well as the patriarchical thinking and language of the older generation of nationalists. In the field we were two women coming from radically different backgrounds than our interviewees. One of us (Derya) directly comes from a militant leftist family. Kübra also comes from a Republican background. Both of us have leftist and feminist worldviews. Hence we had this double uneasiness: On the one hand we were able to converse from an empathic point of view when the topic was the Gezi Resistance or opposition to the government. On the other hand, when the subject was the Kurdish issue and also when

the language turned really sexist, we felt like we were betraying both ourselves and our research agenda which was initially to understand a progressive social movement. So, there was a fluid positioning process both on the part of the researchers and the informants. The informants also changed tone and language when discussing these two different topics. In this paper, we would like to discuss the methodological lessons we drew from this double tension.

Spiritualism and Faith Traditions in Modern Iran: The Case of Rituals

It is tempting for sociologists of religion to regard the terms 'spiritualism' and 'individualised religion' in ways that are consistent too often with 'Christianity' and to use 'Islam' in ways that imply too much homogeneity, which is also far from spiritualism. It is as if 'Islam' is a single concept the adherents of which have all passed the same process and have no familiarity with anything other than the strict language and rules of *shari'a*. The reasons for attributing excessive homogeneity and *shari'a*-oriented views to 'Islam' lie partly in the media coverage of some Muslim groups in Europe and the Middle East and partly in the lack of good empirical research in Muslim countries. Taking inspiration from a social constructionist approach, participant observation and thirty semi-structured interviews in three *Maqbarahs* and cities in north-west Iran, this paper aims to report the results of an empirical research that reveals the very spiritualistic, esoteristic and individualistic version of 'Islam' in the context of modern Iran. It will also narrate the changes in the meaning of 'Islam' that have occurred in Iran during last thirty years. Far from institutionalised religion, each of informants reports their own views of 'religion' and reasons for choosing different venues for the practice of rituals: mosque (mainly local one), Imams' shrines, Imamzadehs' shrines, Hosseiniyehs, the faithful's houses, university mosque, streets or their private rooms. Indeed, 'Islam' in Iranian context is more associated with spiritualism, diversity and individual orientations, rather than firm *shari'a* guidelines, homogeneity and universalism.

Long-Term Transitions and Social-Ecological Transformations – Integrating Different Spatial and Temporal Scales

Transformation has become a buzzword in environmental policy and sustainability research. Current debates about transformations towards sustainability, however, are shaped by a normative bias and tends to emphasize transformation needs while socioeconomic crises and power relations are often masked. Moreover, they fail to integrate long-term and global trends at the one side and short-term policy making in a certain area (at regional or national scale) at the other. As a result, challenges of political shaping for complex societal change are underestimated or even ignored. This is in particular relevant concerning the energetic and material basis of contemporary societies. The presentation will introduce and elaborate on the concept of metabolic transitions, dealing with long-term trends in the energetic-material foundations, and link these analysis to the concept of social-ecological transformation, which addresses the crisis driven development of global societies and the power relations involved. The relevance of both concepts are illustrated by focusing on examples from bioenergy and on labour.

Bioenergy and in particular biofuels are often mentioned as an alternative for fossil fuels. Current research, however, clearly reveals both the negative biophysical and socioeconomic side effects of such transformation strategies, resulting in multi-scalar resource conflicts. In the case of labour we assume that the transition towards a low carbon society will have as many and equally far reaching implications for human labour as the transition towards the fossil fuels based industrial society has had. To analyse these transitions, the presentation will discuss the interrelation between socio-metabolic regimes and the amount of human lifetime spent on labour, the respective critical qualitative capacities of human labour power, and the institutional forms in which labour is employed. Both examples indicate the relevance of long-term trends in the energetic-material basis of societies and the need to investigate socioeconomic conflicts and power relations carefully.

The Politics of Austerity & Inequality: A Comparison of US and UK Policies Aiding the Poor

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

This research focusses on the politics of fiscal austerity in the US and Britain and its impact upon the housing poor. Austerity is a global and not exclusively US framed issue, and this paper will compare recent United Kingdom electoral support of welfare program reductions with US's inadvertent policy choice of budget sequestration. The specific arena of welfare state reductions that I focus upon is low income housing, as it tangibly reflects reduced financial support from Congress and from the British Parliament. The comparison of British and US policy choices in favor of increasing inequality differ in that the UK the public voted for a government explicitly committed to austerity while in the US Congressional contestation forced the imposition of unwanted budget sequestration as enacted in the Budget and Control Act of 2011.

 It has been argued that this current wave of budget cuts in government programs has the prospect for "destroying" the social welfare programs created under the US New Deal and a comparable harsh set of warnings have been issued for the UK. Analyses of "permanent austerity" have though empirically neglected the role of country-level policy choices which appear to modulate the direction and timing of harmful effects of austerity. This research examines the concrete manner in which diminishing housing subsidies occur in differing parts of the US and UK, and reveals varying degrees of fraying of the housing social safety net as seen through the eyes and experiences of public housing agencies and tenants. Public opinion polling data also show the declining support for social welfare programs, revealing a more recent strident tone. The paper reveals uneven levels of budget reductions with notable levels of resistance and contestation over the continuing reductions. The research is on-going with the expectation of further austerity cuts.

------ New Social Movements in Brazil: The Role of Politics, Mediators and the Mass Media in the Transformation of the Mobilizations and Protests in the Streets Today.

Since the TWENTIETH century, the 1980 Brazil lives waves of different cycles of mobilizations, protests and social movements organized. Until 1988, the main axis was the fight against the dictatorship, the country's political democratization, social rights and citizenship. After 1988 has had a long period of mobilization for the rights of specific categories. In this period, the process of democratization has led to construction of extensive network of State policies and support structures. Apparently, social movements had conquered spaces for meeting their demands in various areas of society. However, in 2013 erupt large demonstrations and protests and the scenario of the mobilizations radically changes in Brazil. They are organized by arrangements that are emergent and often loosely structured. As such, these forms and modes of organizing can be described as leaderless and structureless. However, there are some organizations of the "organizationless". The dynamics of leadership and participation in the kinds of demonstrations and protests are decentralized and they contest tthe hegemonic forms of power that have in the syndicates, and the agrarian movements.

This paper asks about the role of these organizations, the relations (or not) with state bureaus, agents of social control, corporations, local/regional/national politicians, and the mass media in this process. The leading hypothesis is that there was in the 2000-2010 a disconnect between social policies, social control created, and the real needs of society, especially the young. The paper addresses two basic questions: what factors and actors have played a decisive role in the mobilizations and protests on the streets from June 2013 in Brazil; and by social movements articulated policies and social control processes encouraged by the State, throughout the 2010, have not adapted to the changes that were occurring in the wider society? What news brings the brand new social movements organized and convened the population for major events from 2013. How they to organize?

Engaging Consent: Exploring Public Participation and Informed Consent in Biobanking

Biobanks for scientific research are dependent on samples and information from patients or other members of the public. Collecting, storing, and distributing these data and information is regulated by informed consent. On the one hand, informed consent is supposed to inform participants, while on the other it should provide a legal framework for biobanking. Actually, different biobanks use very different forms of consent - they range from narrow to broader consent models, from opt-in to opt-out models, or from static to dynamic models. Some informed consent sheets are up to 20 pages and longer, while others are just a few pages long. Being informative for participants while providing a legal framework for data storage and exchange opens up a wide range of complexities - also fostered by increasing trends for public engagement and novel data protective frameworks.

Against this background, we are going to reveal how ethical, legal, and social implementations regarding informed consent in biobanks are addressed in participatory practices. In doing so, we refer to data gathered within the Austrian BBMRI.at project, which is part of the European biobanking initiative BBMRI ERIC. Our empirical study consists of a qualitative in-depth analysis of (1) different forms of informed consent sheets applied in biobanking practice in Austria and (2) of discussions of biobank-stakeholder with members of the public. The discussions were organized as citizen-expert-panels, a method designed and realised in the project in order to link different forms of knowledge and to foster public engagement in the Austrian biobanking landscape. In our paper we will explore different examples of informed consent and linking it to rationales expressed during six citizen-expert-panels that were held in Austria.

GOKALP, DENIZ* (American University in Dubai, dgokalp@aud.edu)

Iraqi Media As an International Project: Gender Politics and Journalism in Iraqi Kurdistan

International actors have been involved in institution building in Iraq since 2003, which include helping Iraqis write a new constitution, defend human rights against state oppression, stop gender-based violence and build capacity for civil society. "A free media for democratic Iraq" has been promoted and supported by the US-led foreign governments to mark a radical shift away from state-oppression and the media strictly controlled before the occupation. International organizations including human and women rights groups have started to develop close relations with the newly emerging groups of Iraqi journalists and media activists. In the relatively peaceful context of Iraqi Kurdistan together with the optimism associated with the American occupation and the increasing salience of western discourses about human rights and democracy, an imaginary political space that would give Iraqi Kurds more freedom of expression has opened. Political and social issues such as the two-party domination, tribal oppression, corruption, patriarchy and gender-based violence have come to be discussed in the traditional as well as new social media outlets and faced retaliation from the Kurdish Regional Government and/or conservative sectors of the society. Focusing on media and gender politics in Iraqi Kurdistan, this article provides a provisional examination of the articulation between international agendas concerning democracy, civil liberties, human and women rights and Iraqi Kurdish journalism since 2003. Based on field-research and interviews with journalists in Iraqi Kurdistan in 2014, this study aims to shed light on 1) how Iraqi Kurdish journalism has (re)interpreted the principles of democracy, rights and liberties, 2) what has been the role of international actors in shaping the agenda for local journalists especially in addressing gender issues, and 3) how to explain the discrepancy between the international and local priorities when it comes to promoting one social or political issue at the expense of the other.

Regime Change in the Name of Freedom and Democracy: Neo-Liberal State-Building and Colonialism Reloaded in Iraq

The implications of regime change in Yugoslavia in the 1990s had been disastrous (and political violence always spills over national borders as asylum seekers,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

victims of war, trafficked humans etc.); and one would expect the powerful global actors to have learnt lessons from the tragic consequences of the externally imposed neoliberal reconstruction of the states in Eastern Europe. The invasion of Iraq in 2003 was a continuation of what was left unfinished in Iraq by the end of the Gulf War in 1991: 'regime change.' Regime change has been part of the global trend of neoliberal disciplining the divergent states of former colonies from Yugoslavia to Somalia, and Afghanistan to Yemen. Iraq was among the rogue states identified by *The National Security Strategy of the United States* in 2002, because it was an anomaly of decolonization like the other rogue states. Under the pretext of the WOT, Iraq was thought of an experimental case for restructuring the state and its relationship with the society in the Greater Middle East. The invasion of Iraq was the first step in reconfiguring the state-society relations from Iraq to Egypt, and Syria to Yemen. Drawing on the international literature dealing with 'rouge states', 'regime change' and 'neoliberal reconstruction', this paper aims to delineate the linkages between state failure, political violence and neoliberal reconstruction through military occupation. It examines the state-building process in Iraq since 2003 arguing that the so-called state-building process is a series of misguided international efforts based on a crude neoliberal ideology to regulate the war(s) in Iraq, as well as to normalize the tragic impact on Iraqi society of the complete dismantling of the Iraqi state and state institutions. The research supporting this paper includes fieldwork conducted in Iraq in 2014.

Global Social Policy Prescription Versus Local Realities: An Assessment on Pension Reforms in Turkey

Changing socio-economic conditions and emerging new challenges in welfare states endanger sustainability of social security systems and create new social problems globally. In this regard, emergent paradigm change has caused to unavoidable need of reorganization in the welfare states. The debates on financial sustainability of social security systems and the role of public in the systems have brought with pension reforms all over the world. In most of countries, pension reforms initiated by the international organizations –such as World Bank- are composed of two elements. The first one is *parametric reforms* which have limited access to pension benefits and reduced the level of pension generosity with the purpose of financial sustainability in the public pension programs. The second one is *paradigmatic reforms* which have led to a decreasing role of the public pension programs, along with an increasing role of supplementary private pension programs (occupational and individual pension plans). In this context, pension provision is provided by the multi –pillar systems. This study aims to analyze the feasibility of multi-pillar pension system in Turkey. The rationale of this study is to investigate the feasibility of multi-pillar pension system in Turkey in the light of the effects of private pension programs implemented in the different welfare regimes and the past and current experiences in Turkey. The experiences of paradigmatic pension reforms in different welfare regimes indicate that the characteristics of welfare regime; labour markets and industrial relations are the main determinants of coverage and sustainability of private pension programs. When the structures of welfare system, labour market and industrial relations in Turkey are analyzed, it can be said that there are big question marks related with sustainability of global multi-pillar pension prescription as a solution of pension system problems in Turkey.

Outsiders or Insiders in "the Own Society"? – the Experience of Adults Raised in Residential Care Institutions

The paper will present the biographical experience of being a stranger "in one's own society" on the example of biographical/narrative interviews conducted with adults (born 1959-1980), raised in children's residential care institutions in Lodz, Poland. The empirical basis of the presentation comes from the project "Institutionalized identity? The processes of identity development on the basis of biographies rendered by adults raised in residential care", 2011-2014. In the paper I will consider the phenomenon of stigmatising identity work performed by institutional and non-institutional interactional partners during the period of narrators' institutionalisation and in their adulthood. I will also address to the concept of the institutional space of impunity as the area of emerging of asymmetrical power balances in interactions between institutionalised children and adolescences and their care-takers.

The Chutes and Ladders of Migrant Incorporation: Legal Status Meets Canadian Newcomer Settlement Landscape

Migrant incorporation is a long-term, multi-level and complex process. Researchers concur on the importance of attributes, resources and processes that operate at the level of individual migrants, their households and networks, and on the significance of state and local immigration and employment policies, regulations and enforcement practice. A third set of institutional actors, settlement service providers, is increasingly recognized as shaping migrant incorporation. With this point of departure, we examine the early settlement of 300 Caribbean and Latin American newcomers in Toronto. We use our "chutes and ladders" framework (2013) to analyze systemic contingencies in patterns of incorporation that are contoured by legal status trajectories and variation in how clusters of newcomers interact with and are "read" by the settlement landscape. We argue that differences in the history of migration, social networks, racialization and predominant legal status at entry set the stage for organizing distinct trajectories and patterns of incorporation by first assembling distinct *clusters of settlers* or *settler subjects*. Legal status and other dimensions of social location, networks, migrant agency and social learning organize interaction with other people, institutions and organizations in ways that are patterned but also involve contingency. This indeterminacy stems in part from how newcomers interact with institutions and others. These encounters (or lack thereof) are shaped by formal rules of access, and by substantive practices, chance, notions of deservingness, and discretion. Throughout, newcomers seek information and learn. However, information quality varies, as do resources and social location, and the way migrants fit in to the landscape of settlement and other services, all of which shapes their capacity to translate knowledge into practice. These processes assemble the chutes and ladders of settlement.

Individualisation and Reflexivity in the National and Transnational Context: The Narratives of Social Transformations Among the Slovenian Youth

Due to changed dynamics of social life brought by post-industrial transformations of economic production, global connectivity and information assess, the processes of individualisation have permeated all aspects of social life. They may be seen as increasing differentiation between individual persons and the social system. While individuals are becoming increasingly autonomous, the growing complexity of the social system generates new challenges for them. Embeddedness into a spatially organised (segmental) community – maintained most visibly through the structures of the nation-state – has been relativized by the necessity of participation in a range of global (functional) subsystems, including the economy, education, mass media, religion, popular culture, etc.

This enables – but also demands from – individuals to deliberate upon their decisions and orient their actions in relation to different social and cultural contexts which trigger their cognition and encourage the role of reflexivity in various contexts. However, different modes of reflexivity in individuals' cognition and thus also their possibilities to deliberate upon the social context are influenced by the involuntary agential position of the individual given by birth (Archer 2003) and by the access to different material and symbolic resources ensuing from it and from further life-stances. The regular presence of individuals beyond national boundaries in trans-local, transnational social environments endows individuals with a high amount of resources, which encourages their agential emergent properties.

This is analysed in detail for Slovenia, as a case of comparatively successful post-communist modernisation, intertwining the country with rapid global transformations. The role of the intersection between differential access to resources and forms of identifications, particularly in relation to the nation-state, entailing also the differential modes of reflexivity, is explored through narratives of social transformations among Slovenian youth provided by in-depth interviews and combined with the secondary analysis of the cross-national survey data.

Russian Vs. 'languages of Small-Numbered Peoples': New Developments, Old Approaches?

In the early 1990s, after the disintegration of the Soviet Union, in the newly-established Russian state a number of 'language laws' were adopted. For a multi-ethnic country like Russia, hosting up to 200 languages, those locally initiated laws were symbolic acts of identity which were intended to fix the official status of ethnic groups in question. Those laws were also a reaction to the previously conducted Soviet language planning and policy when Russian was, on the

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

one hand, considered an officially recognized neutral language, but, in reality, dominated in every significant social segment. Despite the fact that 'languages of small-numbered peoples' (an official denomination), in Soviet times, enjoyed certain privileges as regards publishing policy and school education, the adoption of language laws was a distinct marker of dissatisfaction with the existing state of affairs.

The adopted laws played their purely symbolic role, and, since the time of their adoption, there have been hardly any activities detected on the part of governmental organizations. The situation with 'languages of small-numbered peoples' has even changed for the worse - the centralized policy of limited support was replaced by a complete indifference and lack of funding. At the same time, the last decade saw an unprecedented flow of official acts in support of the Russian language as a marker of Russian national identity.

One of the first public meetings held by the newly-established Governmental Agency for Nationalities Affairs in 2015 was devoted to language planning and policy, with a special emphasis on 'small' languages. The proposed presentation looks into the reasons and hypothesizes about the consequences of new initiatives in official language policy and into new developments and attitudes among national elites.

Oportunidades Educacionales En Territorios Urbanos y Rurales En Brasil

Brasil es uno de los países con mayor índice de desigualdad social del mundo, un problema que genera implicaciones en diversas áreas de la vida social, entre ellas, se encuentra la del campo de la educación. El país les ofrece a los diferentes individuos y grupos sociales oportunidades escolares desiguales en diferentes contextos. Este artículo tiene como objetivo discutir algunos de los contornos territoriales de esa desigualdad en el acceso a las escuelas. El estudio analiza las condiciones de la infraestructura de las instituciones públicas de enseñanza fundamental, relacionándolas a los territorios en las cuales se ubican. En consonancia con recientes perspectivas teóricas, este estudio desarrolla un abordaje social de la escuela y de las oportunidades escolares, inscribiéndolas en sus contextos y ambientes locales. En esta dirección, el trabajo analiza la estructura física, los equipamientos y los servicios públicos que existen en las escuelas de las áreas urbanas o rurales. Estas últimas áreas, territorios marcados por desventajas socioeconómicas en Brasil. Con respecto al diseño metodológico de la investigación, para caracterizar la infraestructura de las instituciones de enseñanza, en el estudio se utilizan datos secundarios colectados en el Censo de la Educación del año 2013. A partir de estos datos, el artículo categoriza diferentes perfiles de estas instituciones de enseñanza. El análisis de esta tipología revela que existe una gran desigualdad en la infraestructura de la red de enseñanza fundamental pública en el país. Además de esto, las instituciones clasificadas en las categorías con menor infraestructura se encuentran mayoritariamente ubicadas en los territorios rurales. En cambio, la gran mayoría de los establecimientos de enseñanza que presentan mejores condiciones materiales está situada en áreas urbanas. De esta forma, los territorios rurales en Brasil, además de poseer indicadores sociales desfavorables en varios ámbitos, también disponen de peores oportunidades educacionales.

School Infrastructure and Socioeconomic Status in Brazil

In the last decades, Brazil has just about reached the universalization of the access to school and education for children and teenagers, between the ages of 6 to 14. A similar phenomenon has occurred in other developing countries, mainly in Latin America, where the widening of the access to school took place as a result of, above all, the inclusion of the poorer population groups. Families and groups, historically excluded from the school system, started to attend educational institutions. This change was noticed and studied by the sociology of education in Brazil, which altered the focus of its research, going from discussions centered on the access to education to studies related to the educational quality. This paper is part of this collection of recent studies. The central question of this research enquires about which schools the low-income Brazilians study at and the infrastructure conditions of the educational institutions attended by different socioeconomic groups. With the use of data from the Education Census from 2013, this paper presents a categorization of the infrastructure of the elementary public schools. By forming the diverse institution profile groups, this study relates these different groups of schools to the socioeconomic status of their students. In order to identify the socioeconomic status of the students of each school, this paper uses the data from the Bolsa Família, social welfare program, which benefits poor and extremely poor families with cash transfers. Therefore, the schools were classified according to a scale of socioeconomic status, based on the percentage of students included in this Program. The relation between the infrastructure

conditions of the educational institutions and the socioeconomic profile of their students showed that the low-income groups have access to schools of worse infrastructure, confirming the inequality of educational opportunities between the rich and the poor in Brazil

Leisure in the Multi-Dimensional World of Existence: Limits and possibilities of women's social status in contemporary Latin American films

The cinema is a leisure experience appreciated by people of different ages and social classes in many parts of the world. Like other forms of art and entertainment, films depict social relations and subjectivities through images. Moreover, the camera lens teaches the spectator how to look at what is being filmed and that these ways of looking reappear in everyday social interactions. Considering that cinematographic narratives (re)produce senses and meanings about women, this presentation pretends answer the following questions: How are women and gender relations represented in contemporary Latin American films? Which are the visual and narrative strategies by which women gain visibility through the plot? How are the cultural contexts, with their tensions and conflicts, made present? What closes and opens the horizons of social imaginaries about women in Latin American films? The objective of this presentation is to analyze the representations of women in Latin American contemporary cinema according to the "sociology of absences" and the "sociology of emergences" systematized by Boaventura de Sousa Santos. To discuss the Leisure in the Multi-Dimensional World of Existence in the context of sociology of leisure, the challenge of this presentation is to understand limits and possibilities of women's social status in contemporary Latin American films.

NEVES, SOFIA (University Institute of Maia)

An Examination of the Media Portrayal of Femicide in Portugal

Intimate violence in general and femicide in particular are serious problems worldwide. Media and feminist research have been focusing their analyses on the portrayal of victims and perpetrators and the type of frames used by news media to report intimate femicide. International research related to media coverage of domestic violence and intimate femicide points out a set of common results: (i) the use of victim blame discourses, (ii) the failing to place the responsibility of the crime in the perpetrator or making excuses for the abuser, (iii) public sources (i.e., law enforcement) as the most commonly cited sources of information in news coverage of femicide compared to private sources (i.e., friends and family), (iv) the examination of the frame in which the media reports on femicide are reported as crucial for the understanding of the cultural considerations beneath media discourses on femicide, explaining why subtle violent patriarchal considerations on the events are reported.

Considering language is not just a tool of description or a medium of communication, but a central and constitutive feature of social life, and knowing that media help shape society's perception of social problems as well as public opinion of victims and offenders, we analyze media discourses to characterize intimate femicide in Portugal. With the analysis of femicide news, we aim to describe how national press exposes femicide cases, and understand what are the cultural considerations beneath media discourses on femicide, in order to reveal how public opinion is being (in)formed. To achieve these purposes, we will use critical discourse analysis in an empirical corpus consisting of news about femicide within romantic relationships, published between 2011 and 2014 (the last 4 years), in the most read national newspaper – Correio da Manhã.

In the end, we want to discuss ideologies, structures of power and social effects.

Life after Prison - Gender Differences in the Perceived Needs and Barriers of Prisoners Preparing for Reentry

Prisoner reentry is a complex and multifaceted problem. Studies suggest (i) those reentering the community are failing at fairly high rates in not perpetrating crime; (ii) punishment alone fails to change the individual and structural barriers faced by many ex-prisoners; (iii) reentry affects crime, and has social, political, and economic consequences for individuals, families and entire communities. In what concerns the prisoner itself, the stigma associated with the criminal past, as well as the social networks to access to social capital resources, significantly affects his/her reintegration after prison, and these difficulties ultimately also affect

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

public safety. Social capital and social networks produce and reproduce existing social inequalities.

Knowing that understanding how prisoners perceive their lives and the potential opportunities and constraints within their environments can provide important insight into their future involvement with crime, this paper aims to explore expectations and perceptions about the reentry process, through the views of women and men who are about to finish their prison sentences. Based on 45 interviews with male and female prisoners in two Portuguese central prisons, gender differences will be analyzed regarding both the expectations and perceptions of these prisoners towards the role of the prison in preparing them while inside prison walls, and the social factors considered relevant for their reentry process on the outside, such as family, employment, education, housing and peers. At the end, it will be discussed the gender specificities and convergences on the needs and barriers of the reentry process; and, consequently, what can possibly trigger recidivism in both groups.

A "Crude" Reality? the Use of Documentary Films and Other Media in Aid of Transnational Litigation: Lessons from the Chevron-Ecuador Legal Saga

The connection between documentary film and legal issues has lasted decades and grown more complex. Narrative storytelling via film as responses to litigation have solidified an entire genre of legal entertainment, from documentaries like *Food, Inc.* and *Hot Coffee* to biographical dramas like *Erin Brokovitch*. Yet, in recent decades, film has taken a more interactive role with the legal system. The 2008 film *Roman Polanski: Wanted and Desired* became the subject of an appeal when a prosecutor admitted, on camera, to coaching a judge toward a conviction. Polanski petitioned with an extraordinary writ, citing the film as evidence of impropriety and *ex parte* communication. *Serial*, a 2014 podcast, gained national recognition after an investigative journalist unraveled the court proceedings of a murder conviction from the year 2000, inciting a new witness to come forward with alibi testimony for a teenager convicted of first degree murder. As a result, an appeal hearing was granted, with new testimony admitted. It seems that the genre of film and podcast media creates a bridge between the court of law and the court of public opinion that may influence justice in more ways than one. Yet, the use of film and other communicative media may not always have a desirable affect, especially when employed during ongoing litigation. This presentation is based on research conducted on the use of the documentary film *Crude* in the two decade long environmental litigation involving the multinational oil giant Chevron in Ecuador. It discusses the use of documentary films in the course of litigation, the potential advantages and shortcomings.

La Reforma Educativa 2013 En México Zlogrará Elevar La Calidad En La Educación?

La reforma educativa 2013 en México ¿Logrará elevar la calidad en la educación?

Se planteó al inicio de este sexenio, la necesidad de realizar cambios en la manera de gobernar a fin de dar respuestas rápidas y oportunas a los diferentes problemas que presenta el país. Es por ello, que el Presidente presentó al Congreso de la Unión una serie de reformas constitucionales con las cuáles pretende modernizar y resolver problemas de diferente naturaleza, tales como: reforma energética, política, educativa, en telecomunicaciones, hacendaria y financiera.

Los problemas más apremiantes que presenta la sociedad mexicana son diversos, entre los dos más importantes resaltan: la inseguridad pública y la baja calidad educativa. La importancia que reviste darle atención prioritaria a la educación hace que el gobierno federal presente iniciativas al Poder Legislativo donde se aprueba la reforma constitucional en materia educativa el 26 de febrero de 2013 a los artículos 3º. Y 73 de la Constitución Política de los Estados Unidos Mexicanos. Pero lo sustancial aquí no solamente es realizar los cambios legislativos, sino también revisar las políticas públicas y elaborar el rediseño institucional correspondiente. Los problemas educativos y la baja calidad que reportan las mediciones efectuadas en las pruebas ENLACE y PISA seguirán con los mismos porcentajes promedio, esto es, en indicadores reprobatorios en los niveles de primaria y secundaria respectivamente, si no se instrumentan un cambio integral en la educación mexicana.

La reforma en materia educativa actual tiene como objetivo central el incrementar la calidad en la educación pública obligatoria correspondiendo al nivel preescolar, primaria, secundaria y medio superior. Esta reforma se centra en la creación y establecimiento del Servicio Profesional Docente y en la creación del Instituto Nacional de Evaluación Educativa como órgano autónomo. El análisis parte de documentación oficial y arrojará resultados propositivos para mejorar la calidad educativa.

La Enseñanza De La Comunicación En El Trabajo Social: Claves De Una Didáctica Interdisciplinar

El estudio de la comunicación ha tenido y tiene múltiples perspectivas, muchas veces dependientes de los enfoques otorgados por los campos científicos. De hecho, es uno de los campos en los que, a pesar de su corta historia, destaca por su "pluralismo teórico y metodológico" (Roiz & Muñoz Carrión 1986, 197) y su enorme interés interdisciplinar (Mattelart, 1997). Este pluralismo teórico es, sin ninguna duda, una de las mayores dificultades para definir los límites teóricos y metodológicos de la enseñanza de la comunicación en el Trabajo Social. Galindo Cáceres (2007) observa cuatro dimensiones presentes en el estudio de la configuración y trayectoria de los sistemas de comunicación: unas dimensiones básicas centradas en la difusión, y otras en la interacción. Ambas constituyen las dimensiones de primer orden del proyecto general. Sobre ellas se configuran otras dos dimensiones, en un segundo orden, que son la expresión y la estructuración. La connotación de comunicación interpersonal nos acerca al ámbito de acción del Trabajo Social. La comunicación intrapersonal (siguiendo a Gardner, 1995 y a Salinas, 2012), corresponde al campo de la psicología, el psicoanálisis o la filosofía, aunque será importante considerarlo porque entra en relación con el sistema de comunicación interpersonal, al menos si hacemos caso a los axiomas de la comunicación humana (Watzlawick, Helmick, & Jackson, 1985), a la noción de auto-interacción (Blumer 1981) y de la inteligencia emocional (Gardner 1995). En la comunicación interpersonal podemos diferenciar la interpersonal diádica y grupal; la diádica es relativa a relaciones persona a persona estrictamente y la grupal corresponde a las relaciones al interior de un grupo o entre integrantes de grupos diversos. El objetivo de la comunicación es exponer las reflexiones sistematizadas por docentes universitarios y las claves utilizadas en el aula para la ensañanza de la comunicación desde un enfoque interdisciplinar.

GONÇALVES, ANA* (Institute of Social Sciences - Lisbon University, goncalves-ana@campus.ul.pt)

On the Track of Fado

Fado is one of the most outstanding cultural markers in both Portuguese culture and that of Lisbon and its historical neighbourhoods. Accordingly, Lisbon's public venues — such as Fado houses, typical restaurants and wine bars — are important daily bases for the musical practices and the social interactions by which the Fado's cultural heritage is produced and sustained.

In order to gain a reflexive insight into those aspects, the analysis will be based upon the available official data, including statistics provided by the Portuguese General Inspection of Cultural Activities, and the about thirty interviews carried out with Fado singers, musicians and aficionados for whom this highlighted musical form of the city emerges as an integral part of their personal stories.

So, to sum up, what is proposed here is an approach in two steps to a specific musical scene, which is deeply rooted in the city and particularly vibrant and expressive nowadays: first, pointing out statistical evidence of its predominantly urban implementation and, then, assessing the relevance given to long-term relationships whereby Fado singers, musicians and aficionados are creating and cultivating cultural forms and spaces that have meaning and value to them.

La Situación De La Mujer Detenida y Su Rol De Madre

Argentina

Desde lo organizacional, la cárcel surgió y se ha desarrollado como una de las principales instituciones de las sociedades modernas. Su función central se ha constituido en torno a la reproducción y preservación del orden social a través de la regulación de la conducta y el control de los cuerpos de los reclusos y reclusas. Para ello, esta institución, se ha plasmado en una organización carcelaria omnidisciplinaria, caracterizada tanto por su alto grado de burocratización, como por el desarrollo y uso de técnicas disciplinarias centradas en la vigilancia y el castigo.

Por esta razón hay que analizar bajo qué condiciones las personas detenidas cumplen una condena y si, al obtener la libertad, pueden reinsertarse en la sociedad.

Dentro de esta realidad carcelaria la situación de la mujer, y específicamente en su condición de madre, debe entenderse dentro de la particularidad que tiene el cumplimiento de una pena debido, precisamente, a esa condición de género.

Una cuestión importante en este sentido, es plantear qué tiene de positivo y qué de negativo que una mujer esté detenida junto a su hijo o hija. La imagen materna es considerada de vital importancia para el desarrollo del ser humano,

por esta razón dentro del sistema carcelario se considera fundamental que los niños y niñas pueden estar con sus madres hasta que cumplan la edad necesaria para ser externados de las instituciones carcelarias. Se supone que esto fortalece el vínculo y permite que los niños puedan socializarse a través de esa relación materna.

Pero también es cierto que el ámbito carcelario no está preparado ni ha sido pensado, desde lo arquitectónico y desde lo normativo, respecto del colectivo infantil.

El Trabajo Interdisciplinario Como Experiencia Formativa En Estudiantes De Posgrado: El Patrimonio Cultural Hña Hñu En El Estado De Guanajuato, México.

El presente estudio muestra la estrategia de trabajo interdisciplinario y de aprendizaje entre expertos y estudiantes de posgrado, dentro y fuera del aula en la Universidad De La Salle, Bajío.

El equipo de trabajo, parte de la observación de un sistema social que se ubica interdefinido por distintos aspectos que le confieren una complejidad relativa. Desde esta perspectiva, es importante el acercamiento interdisciplinario que, de manera dialógica, permita construir preguntas prácticas pertinentes para ser resueltas desde las diferentes posiciones disciplinarias.

El problema práctico a resolver fue diagnosticar la factibilidad de un proyecto carretero en la zona indígena otomí de San Miguel de Allende, Guanajuato, desde el punto de vista histórico, arqueológico, antropológico, ambiental y sociocultural. Se trabajó dentro del aula con los estudiantes y fuera de ella, mediante el acercamiento a expertos de diferentes instituciones y disciplinas en el trabajo de campo; y en conjunto, la generación de una publicación monográfica en formato de libro y productos audiovisuales relacionados con dicha experiencia.

Las preguntas emanan del objeto y son planteadas desde los diferentes niveles de organización sistémica que integran factores ambientales, culturales, y sociales.

Por tal motivo, se optó por construir un equipo conformado por varios especialistas de diferentes áreas de enfoque: Arqueología, Antropología Social, Comunicación, Sociología, Historia, Metodología, Arquitectura e Ingeniería Civil.

Changes in Qol in Spanish Municipalities (2001-2011)

We use a list of 16 social indicators covering 8 QoL domains in 400 Spanish municipalities in 2011 to compute a composite indicator, using constrained Data Envelopment Analysis. These dimensions cover all the relevant aspects of QoL: living conditions, housing, education, health, safety, personal activities, leisure, environment. The computation of the Malmquist index using also data from 2001 allows to track the changes produced during this 10 years period. The Malmquist index is decomposed into a catching up effect and a joint development component. This allows interpreting the global evolution in terms of QoL for these municipalities and also to assess which ones have moved towards the frontier (catching up). The results show that the Mediterranear area has been the most affected by negative catching up, while the central-northern regions are still dominating the QoL frontier. The Southern regions show poor QoL scores, but no significantly negative catching up is observed. Overall there has been advancement in QoL conditions as represented by frontier shifts.

The Fluctuating Relationship Between Sociology and Politics in Chilean History (1950-2011)

This paper will attempt to sketch a history of Sociology in Chile and its relationship to politics. Inspired by recent developments in the sociology of intellectuals –shifting from intellectuals to interventions– I intend to trace changes in what type of sociological orientation is believed to be authoritative across different moments. In the process, theories become prominent and wane, other disciplines enter in competition, and different institutional frameworks (universities, think tanks, international organisations) and ways of understanding the role of sociologists (experts, activists, intellectuals) frame the relationship between knowledge about society and policymaking. Each of these moments –and the institutional and intellectual conditions that underpin them– leaves a substrata that is both the condition of possibility and the opposition against which each new generation defines itself.

In Chile's case, we start with the formation of internationally-funded FLACSO and ECLAC in Santiago in the early 1950s – which coincides with the formation of the first undergraduate degrees. These reputable institutions brought together both economists and sociologists and provided the first push for an international and professional –albeit distinctly Latin American– social science. This is followed by increasing specialisation with the objectives of 'development' and 'modernisation' in mind.

However, especially following Project Camelot's scandal, heightened political tensions raised suspicions on sociology –especially in a cold war context– and more critical and Marxist-inspired perspectives begin to dominate. This is brought to an abrupt end with Pinochet's coup d'état, and sociology is all but proscribed from universities, but not from think tanks. Hence, given the constraints imposed by the dictatorship, preoccupations shift towards technical aspects of policymaking and democratisation theory, while economics and political science gain prominence. After the Pinochet era, Chilean sociology start to expand once again, and begins the painful process of attempting to come to terms with its past.

GONZALEZ MIGUEL, FERNANDO* (THEMOLINO PROYECTOS, fergon1980@gmail.com)

Science, Complexity and Emotions: Proposals for a New Urban Sociology

The bursting of Spanish housing bubble introduced a practical problem in public policies, in people lives and in technical and scientific approach to town planning. This particular case calls to a paradigm shift. Several factors have triggered this need: the economic crisis, the establishment of a new "meta-value", sustainability, a growing demand for greater citizen participation and control of intervention activity in the city, as well as a revision of complexity and emotions. Recent political arguments are supported in technical and scientific considerations that reject the emotions and usually the complexity of the issue. Power, science and responsibility are needed to go through the objectivism of the arguments that dropped into the economic and social crisis.

This paper proposes a theoretical approach to this political issue. We have to take into account all urban aspects, not only physical reality and regulations, but the citizens, the social processes, changes and problems of cities and urban areas. This vision will provide us inputs for new planning practices and policies. However, we need to review the theoretical perspective. The paradigm shift in urban planning needs a multidisciplinary work, the management of a holistic, complex and systemic view of the city, not only as building and society, but also relations, environment and economy. In these days we need working teams capable of providing global solutions, and they are therefore crucial for leaders with vision and appropriate training to face the complexity of the urban reality and develop unified strategies of intervention.

The demanded complex view of the city has to consider emotions and feelings of the social actors. Professional teams and leaders involved in urban matters should develop methodology to include these key concepts in the way through the paradigm shift.

Social Impact of the Misuse of the Free Time

The increase in rates of violence and crime in the world constitute a complex social problem. In the state of Hidalgo, as well as in many other states of Mexico, the problem is urgent.

In the project "social impact of the misuse of free time" -that responds to the demand on "the future that we want to" -, we are looking at the "free time" as an indicator of time potentially associated with the violence and as a factor of social risk implicit in all ages.

Our attention is the construction of our own measures in the framework of human development indicators. The project analyzes the main physiological, social and cultural or recreational activities, from 18 to 25 year olds in the city of Atitalaquia, Hgo. We apply second order reflexivity and a heuristic strategy from Sociocybernetics, as well as the construction of complex systems from the Cybercultur@.

    * denotes a presenting author. Abstracts are organized by first presenting author's last name.

In the first part of our presentation, we present the codification criteria and the critical conditions of the region observed from different disciplines. In the second part, we describe the unit of analysis that will enable us to infer the most significant indicators for that group of young people in their socio-cultural conditions, and in the third part we present some results of the field work and the first definitions of these index of measurement violence in Atitalaquia.

VEGA LOPEZ, MARIA GUADALUPE (University of Guadalajara)

Traffic Injuries, Life Expectancy and Road Policies in Mexico and Spain.

Objective. To determine the impact of traffic injuries of motor vehicle (TIMV) mortality –compared to other causes of deaths- on life expectancy in Mexico and Spain during the three-year periods 2000-2002 and 2010-2012, considering the road policies and the vehicle and road infrastructure in both countries in recent years.

Methods. Based on official death and population data, abridged life tables in Mexico and Spain were constructed for the three-year periods studied. Temporary life expectancy and years of life expectancy lost (YLEL) for aged 15 to 75 were calculated by selected causes (TIMV, diabetes mellitus, malignant neoplasms and ischaemic heart diseases) and age groups in each three-year period.

Results. In Spain, YLEL decreased in both sexes from all causes studied, especially TIMV; this reduction was greater in the younger ages. In addition, temporary life expectancy increased. In Mexico YLEL by TIMV increased in men –mainly in young people-and remained unchanged among women. The male temporary life expectancy declined but increased slightly among women.

Conclusions. Reducing YLEL by TIMV in Spain has contributed to increased life expectancy. By contrast, the increase of YLEL by TIMV among Mexican men has contributed to the decline in male life expectancy. The greatest degree of development of road and vehicle infrastructure in Spain and the implementation of more stringent road policies in Spain than in Mexico in the last decade appear to some extent explain the results found.

Inequalities in induced abortion according to birthplace and educational attainment in a Southern European region (Basque Country)

Induced abortion (IA), an important indicator of reproductive health, has shown social inequality especially related to birthplace and education. Studies examining IA inequalities by birthplace suggested higher rates for IAs, repeated IAs and IAs performed in the second trimester of pregnancy among immigrants relative to native women. This finding was also observed among women with lower education relative to those with higher education. Although the intersection of social indicators of inequalities has been widely discussed in other health areas, few studies have examined this intersection on reproductive health. The study aimed to examine the independent and joint effects of birthplace and education on IA, repeat and IAs performed in the 2nd trimester among women residing in the Basque Country (Spain).

The study was a cross-sectional population-based study including IA of women aged 25-49 years residing in the Basque Country, Spain, between 2011 and 2013. Prevalence estimates and log-binomial regression were used to quantify the effects of birthplace and education attainment on all outcomes.

The results indicate that immigrant women exhibited higher probability of having an IAs (PR:5.31), repeated (PR:7.23) and 2nd trimester IAs (PR:4.07) than Spanish women. For educational attainment, we found a higher probability in all outcomes among women with a primary or lower education relative to those with a graduate education (All IA PR:2.51; repeated IA PR:6.00; 2nd trimester IA PR:3.08). However, no heterogeneity was observed for the joint effect birthplace and educational attainment on IAs, repeated and 2nd trimester IAs.

This study called attention to the importance of birthplace and educational level as key factors explaining not only an IA decision but also having a repeated IA or a 2nd semester IA and suggest a better understanding of these factors when designing programs for sexual and reproductive health education to reduce inequalities between women.

Mapping a Laggard: Climate Policy Networks in Australia

As a resource-rich country, Australia is heavily dependent on coal and gas: ninety percent of electricity is produced by fossil fuels and energy accounts for a third of commodity exports. The Australian Government has been a persistent laggard in climate policy. In 1997 Australia was one of three industrialised societies to negotiate a rise in emissions as part of its obligations under the Kyoto Protocol. More recently the Australian Government has strongly promoted Australia as an energy export platform, especially for coal and gas. In climate policy Australia now bucks the global trend: in 2015 the Grantham Institute's Global Climate Legislation Survey described Australia as 'the first developed country to take a legislative step back from acting on climate change'. This paper investigates what is distinctive about Australia's climate policy-making networks, to help explain its stance. The paper reports on an Australian component of the 18-country 'Comparing Climate Policy Networks' study. It analyses the results of survey and interview-based research in order to map the main influences on Australian climate policy-making. The paper compares these results with parallel investigations in other countries, seeking to account for variation.

GOODMAN, JAMES* (University of Technology Sydney, james.goodman@uts.edu.au)

The Coal Rush and Beyond: India, Germany, Australia

Coal is said to be a 'legacy' fuel. It is the main driver of climate change and is ostensibly the main target for climate policy. Climate campaigners now focus on coal as the primary form of 'unburnable carbon'. Yet coal has undergone a renaissance, fuelling both 'emerging' and established capitalist economies. This paper investigates the contest between drivers for coal and forces for a post-coal future across three countries, taken as contrast cases: industrializing India; post-industrial Germany; and extractivist Australia. It focuses on contestations over coal, fought out between corporate sectors, within the state, and between NGOs and movements. It finds the meaning and legitimacy of coal increasingly destabilised, with various contests over whether coal is a viable commodity or stranded asset, a strategic resource or resource curse, a foundation for prosperity or a threat to humanity. In the context of advancing climate change, coal's persistence creates new political forces and brings new models for post-coal society into view. As such, the paper discusses the three cases in terms of an unfolding agenda of realizing the social transformations that are required for effective climate agency.

GOODWIN, JEFFREY* (New York University, jgoodwin.nyu@gmail.com)

ISIL As a Transnational Social Movement

When studying recent social movements, scholars have tended to focus on participatory, pro-democratic, and potentially emancipatory movements to the neglect of authoritarian, exclusive, and anti-democratic movements which have nonetheless become very large and powerful in the new millennium. Perhaps no recent social movement has been as powerful as the Islamic State in Iraq and the Levant (ISIL), also known as ISIS (the Islamic State in Iraq and Syria) or simply the Islamic State. ISIL claims to have 100,000 armed fighters and many more supporters. The U.S. Central Intelligence Agency estimates that 30,000 foreigners have traveled to the region to join ISIL, including Europeans and North Americans. ISIL operates transnationally, in both Iraq and Syria, and groups affiliated with ISIL, if only ideologically, operate in several other countries, with as many as 57,000 total members. Most significantly, ISIL today controls extensive territory in both Iraq and Syria and is the effective government or state in these territories, which are home to millions of people. This paper examines the sources and limits of ISIL's popularity. What combination of grievances, hopes, and fears have led so many people to support ISIL? And does ISIL have the capacity for further growth?

GOODWIN, JEFFREY* (New York University, jgoodwin.nyu@gmail.com)

Session on Terrorism: Against Radicalization

This paper argues that scholars of political violence have misunderstood and misappropriated the concept of "radicalization." As a result, the radicalization perspective on violence and terrorism—by states as well as oppositional move-

ments—is problematic and misguided in a number of ways. First, there is no consistent definition of "radicalization" in the literature on the topic, and the word "radical" is often used simply as a synonym for terrorist, producing tautological claims. Furthermore, the perspective's core assumption—namely, that only radicals engage in political violence or terrorism—is empirically wrong, as is, accordingly, the claim that radicalization is a necessary cause of political violence and terrorism. In addition, the factors and mechanisms that allegedly cause radicalization (and thus violence and terrorism) which are discussed in the literature do not actually explain why a political group, state, or individual would employ violence in general or terrorism in particular. Finally, there is a consistent conflation in this literature of terrorist tactics with political violence generally. After presenting this critique, the paper shows how the radicalization perspective fails to explain an important empirical case, namely, Al Qaeda's use of terrorism against U.S. citizens.

Factorial Surveys in Social Psychology: Study of Perception of the Justice of Governmental Support Distribution Among Socially Excluded Groups

The report presents the results of pilot study which is aimed to development and testing of the questionnaire for measuring within mass survey the public's perception of the justice of governmental support distribution among socially excluded groups. The questionnaire oriented on using survey technique, which is based on experimental approach, named factorial survey design. In the process of survey, the respondents receive the descriptions of hypothetical situations, which could potentially be in real life. Those descriptions are called vignettes. The respondents should evaluate the possibility or even necessity of support provision from the state to the person that is trapped in the described life circumstances. The purpose of the analysis of judgments about various life circumstances from the different respondents is identify impact of separate factors and its interactions on the perception of certain groups of people (those who are involved in certain difficult life circumstances) as those who are need help, and therefore socially excluded. The dimensions aiming at formation of possible hypothetical situations were chosen based on the theory of social justice as well as criteria of needs, control and identity. During the pilot study, 65 respondents assessed 120 vignettes. The results of collected data regression analysis is the basis of conclusion about the possibility of applying the proposed questionnaire in the mass surveys; and the conformity of the received measuring results to the previously formulated in the process of the vignette universe construction hypotheses. The findings of pilot study indicates that such factors as the position in the labor market, presence of children, the status of internally displaced persons and level of income are the statistically significant factors in the decision making process of providing governmental financial support.

GORCIKOVA, MAGDALENA* (Faculty of Social Sciences at Charles University, magda.gorcikova@gmail.com)

The Impact of Socio-Cultural Background on Children's Literacy Development

This study assesses the general hypothesis which assumes the impact of socio-cultural background advantage on the literacy development, i.e. preschool reading activities result in children's cognitive abilities and pre-literacy skills in the beginning of primary school. We seek to answer the questions: To what extent are preschool reading activities (e.g. reading for pleasure with parents) influenced by parental education? And, how do these pre-school activities influence cognitive abilities and pre-literacy skills among pupils in the beginning and at the end of the first grade? Literacy development is studied among first-grade students using ongoing longitudinal survey measuring pre-reading activities and repeated measurements of cognitive abilities and (pre)reading skills at the beginning and at the end of the first school year.

The sample consists of 439 children between ages 6 to 7 in randomly selected 25 primary schools in the Central Bohemia region and Prague capital city. The indicators of preschool reading activities (regular child/parent reading, talk about a story they're reading, library visiting) as well as results from psychological tests measuring cognitive abilities and early reading skills (decoding, listening comprehension, vocabulary) is first examined for homogeneity and internal consistency. Second, the hypotheses of (1) preschool reading activities as well as cognitive abilities and pre-reading skills differentiation by parental educational backgrounds is assessed via generalized linear models (also controlling for gender and size of community), and (2) the longitudinal effects of preschool reading activities (from the beginning to the end of the first grade) on cognitive abilities and pre-literacy skills are assess by a model with repeated measures design. Prelim-

inary results reveal that higher family's educational background have impact on reading activities with a child at the preschool age as well as on children's cognitive abilities and early reading skills. Yet, the initial literacy skills at the end of the first school year are strongly influenced by early reading activities in pre-school age which are flourished particularly in high educated families.

The Visual Rhetorics of Victims: Photography, News and the Politics

Colombia has the longest armed conflict in the Americas, with a wide range of participants among which paramilitary groups, guerrilla, drug-traffickers, and the official army are the most prominent. Their main purpose has been controlling populations, people and businesses through illegal means. Nowadays, there are over seven million victims.

War takes place mostly in the jungles and rural areas, away of the main cities. As city dwellers we learn about the war mainly through mass media. The mediations mass media produces are, for the most part, embedded in several tensions that elude easy identification of its limitations. We identified five tensions: 1) dangerous and far-away areas hard to register, 2) government selective interests in making visible only certain events of the conflict, 3) new outlets exclude histories, characters, and view-points that do not respond to hegemonic readings and interests, 4) the editorial politics, its logic, privileges events of horror over the victim stories and, 5) photo-journalism has adopted visual routines that displaced the human dimension in favor of a stereotyped victim.

The articulation of these tensions configure visual rhetorics of war that reduce the victims to an *objetc - victim*. Thus, the individual from being a war victim becomes through a symbolic production a photography victim. The making of such 'victim' implies the *construction* of certain visual tale or documentary story that produces stress or tension on the victims identity.

It is here that it becomes important to ask for the visual routines if war and for the stereotypes if the 'produced' victims; two questions emerge: firstly, what is war documentary? and, second, what is victim? In addressing photographic archives I will develop an analysis of two cases, the campesinos of San Carlos and afro-descendants in Buenaventura, both characterized for being communities of resistance in Colombia.

Democracy Seeking Csos'social Performance

In countries with a recent democracy , as Mexico , where democratic rules and procedures are still not entrenched , and the practices and values that sustain democracy are not predominant , civil society organizations have an important role to play as monitoring mechanisms of succession and the functioning of citizen control instruments , and to propose topics for the public agenda.

The aim of this study is to evaluate the performance of organizations promoting democracy in different areas, including : transparency , accountability , election monitoring and democratization issues on the public agenda . The analytical framework is based on three pillars: 1) practical or functional performance , grounded on criteria of efficiency and effectiveness; 2) organizational performance , centered on criteria of legitimacy and involving internal decision rules , participation schemes , decision-making mechanisms , cohesion and 3) the relationship with the environment, where criteria of relevance and external legitimacy are used.

This paper will focus on social performance as evaluation criteria, that is, in contributions to the public good, taking into account the costs and possible negative consequences that the action of these organizations can produce. We assess the way CSOs carry out their activities promote positive outcomes for the public good, taking into account both positive or negative consequences may bring their actions in another area. Is also important to identify the factors that facilitate obtaining such positive results. We will analyse three CSO types: 1) those that are coordinated with international organizations and their objectives, recruitment forms and action strategies are taken from those organizations, although they have operational autonomy; 2) those associations which set their own goals and forms of action, irrespective of its ties with international organizations and 3) a third type, constituted under a model of corporate organization, rather than associative.

Secularization of Western European School System?

The formation of national education systems during the 19th century marks the beginning of modern schooling (Green 1990). During this process school as an institution has been established as a public institution (Herrlitz et al. 1984). Originally, education was part of the churches domain for centuries (Davie 2000) but became a fundamental feature of the state and replaced the churches from their responsibility eventually (Mann & Schinkele 2005, Lehmann 2007).

Based on the assumptions that "the religious and the secular are inextricably linked throughout modern European history" (Casanova 2009: 227) I argue that educational institutionalization follows basic patterns of secularization: religious institutions lose their social significance and their grasp on the agencies of social control and withdraw from their classical sphere of influence (Wilson 1982, Berger 1973).

The state was strongly aided by the Church's example of both administrative structure and claims to original sovereignty (Ramirez & Boli 1987). Next to these religious and political processes mass education is an outcome of economic processes and social power relations (Müller et al. 1997; Boli et al. 1985). Together those processes are responsible for differences in the institutional arrangements.

Hence, this paper will analyse the religious influence on modern schooling. To what extent does the church-based influence differs within the European school systems and why are there differences in their educational institutions?

According to Martin (1978) the different church-state nexuses influence social structures. They are interconnected by cultural heritage and religious pluralism. Next to these conditions the political system (Rokkan 1999, Archer 1979), the economic development (Cummings 2004) and social differentiation within a society (Soysal & Strang 1989) function as explaining conditions.

In general, it is expected that these factors explain different types of religiously imprinted educational systems.

Does Sexual Orientation Complicate the Relationship Between Marital Status and Self-Rated Health?

A large literature has established that health status varies by marital status, and that the apparent health benefits associated with living in a marital union vary in strength between men and women. A growing body of work is also detailing how the health status of adults living in same sex relationships compares to adults living in different-sex relationships – but due to current data limitations, very little existing research examines how health varies across detailed marital status categories for gay, lesbian, and bisexual adults. Our study contributes to this line of scholarship by drawing on aggregated data from the Behavioral Risk Factor Surveillance System (BRFSS), a repeated cross-sectional survey implemented by public health departments in each U.S. state each year. Our project contacted BRFSS coordinators for all 50 states, and for varying years between 2000 and 2010 identified 15 states that opted to add a question on self-identified sexual orientation to their BRFSS questionnaire. This allowed us to construct a probability-drawn sample of 13, 628 sexual minority (gay, lesbian, and bisexual) and 543, 384 heterosexual adults. This paper is investigating whether and how the relationship between self-report health and marital status (including married, divorced or separated, widowed, and never married adults, as well as those who report being a member of an unmarried couple) varies by sexual orientation. Additionally, we assess whether these relationships operate differently for men and women.

Civic Activism in Modern Russian Society: Peculiarities of Localization

Civic activism is a multi-level and complex phenomenon. Differentiation of political and non-political practices is one of the most important methodological aspects of its study. The results of studies conducted by the IS RAS show that over the past years 57% of Russians had an experience of political participation, and 34% had an experience of non-political participation. Despite the low level of non-political activism, its forms were more diverse, reflecting the direct incentives of its participants. Surveys revealed that one of the main causes of low civic activity of Russians is the lack of effective methods of interaction between the authorities and society. If the ability to create various political and social organizations able to represent their interests notes a third of Russians, the prospects to convey their interests to the authorities assess positively 21% and to influence the policy of the state only 12% of them. In this context, the protest movement of the early 2010s can be considered as an alternative form of communication, aimed at attracting the attention of the authorities to the opinion of general public. Civic engagement is unevenly distributed among the various social strata and groups,

the members of which have different opinions on urgency of the problems facing them, as well as on the effectiveness of their participation in solving them. It is not just about the level of involvement in socio-political activities, but also about the specific forms, methods and motivations of civil participation prevalent in a particular social environment. The variety of forms and methods of participation of representatives of various social groups makes civic activism an important area of social life, sphere of interaction between the state and society.

The Everyday Axomiya Canopy : A Study Among the Indigenous Assamese Muslims

The cosmopolitan attitude in Assam leads to consensus as well as contestations at times. It is very important to look into the pre-conditions of cosmopolitanism because it has undergone diverse interpretations and applications. The study would try to look beyond the normative understanding of cosmopolitanism as universalism or 'global citizen'. It basically intends to look into the lived experiences of the inter-faith relations between the Assamese Hindus and "indigenous Assamese Muslims" of the state of Assam and consequences after the coming of the Bangladeshi Muslim settlers. It will focus on instances of proscription when at times hampers the cosmopolitan setting and at other times benefits the interfaith relations. An attempt shall be made to look into the significant religious practices, everyday habits like food and dress, most importantly, gender relations among the specific groups in the selected field. The spread of Islam, unlike the Hindu tradition, is with a world view of monotheism. We see that the indigenous Assamese Muslims have associated with the religion and culture of Shankardev and have also taken initiation at the Neo-Vaishnavite cultural institutions. The study will put an effort to look into which class or section of people are engaged in such ritual crossings (where a Muslim plays the role of *Raam),* and their relationships in the everyday setting. It is to figure out whether such integration is a forced one or a voluntary one.

Capturing Dynamics of Changing Gender Inequality: Regimes, Institutions and Indices

The explanatory role of gender has been challenged theoretically by the question of whether macro or meso frameworks are more appropriate to capture structure and change, but more recently also by empirical evidence that the intersection of class and gender in shaping social inequalities has become more pronounced. Hence, there is a need of better theorizing class – gender relations in welfare and gender regime approaches alike. We argue that understanding intersectionality and its impact on inequalities requires a clearer theoretical framing of empirical research and adaptations of theoretical frames on the basis of insights gained from empirical research. We propose that neo-institutionalist approaches are better equipped than macro level approaches as they can grasp both long-term and short-term changes at the meso level of policies, organizations and collective actors. Moreover, such an approach can identify changes in inequalities empirically and link these to micro level data. However, findings from neo-institutionalist research on welfare and gender regimes generate a puzzling picture, indicating different directions of changes in inequalities for different sets of policies and outcomes by sub-groups, be it in the fields of employment, family policies, taxation or political representation. These contradictions in outcomes for inequalities also make it difficult to identify a single logic and clear impact of change within and across countries or regions. Attempts to provide a more coherent account at least on the descriptive level include indices such as the GEM or the GEI. Other approaches try to discern different types of institutional change in order to understand how incremental change can nevertheless be transformative and thus link up to regime typologies. We will engage in discussing the scope of these attempts for understanding current dynamics of gender inequality and their potential contribution for improving theorization of gender and class on the meso and macro level.

Placement Professionals Between the Ethos of Consulting and Requirements of a Market-Oriented Measurement System

Today, while many countries suffer from financial and economic crisis, Germany once the "sick man of Europe" now seems to be "fit as a fiddle". It is a widely

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

shared view that Germanys' economic recovery and crisis-proof has a lot to do with the Hartz reforms initiated in 2003. Therefore Germany is considered a model for the implementation of successful institutional reforms in an "Age of Austerity". A cornerstone of these reforms was the modernization of the public employment services led by principles of New Public Management. Its core element is a controlling system that measures the job placement officers' performance by using quantitative targets (budgets, fulfilling plans of measures, job integration etc.). This means that placement professionals are confronted with new tasks and working conditions (e.g. documentation, efficiency orientation). As a consequence, there is an area of conflict along the question of what rates as successful placement process. On the one hand, a professional ethos of consulting can be identified that is related to the ability to respond to biographically needs of job seekers and the way of communication, the quality of job offers and measures, or the reasonable interpretation of demanding and promoting. The recognition and motivation of placement professionals draw from a reflected satisfaction of clients. On the other hand, success is defined by the logic and criteria of the target system. On the basis of ethnographic research, we first elaborate the responsiveness of a highly abstract standardized controlling system to the professionals' everyday practices by internal differentiation. Second, we show, how the modified controlling system becomes practically translated and applied to the peculiarities of counselling interviews and finally, it will be demonstrated, how the continued development of the controlling system influences and/or even transforms the professionals' ethos in different ways.

Modeling Past and Future Global Population By Levels of Education

Education is an individual asset acquired mostly at young ages that is significant in determining one's future. Education is particularly relevant for the study of population as it is highly correlated with the three main population demographic behaviors: fertility, mortality and migration. Moreover, at macro-level, information on levels of educational attainment gives evidence on the stock of human capital available for economic development, itself a major determinant of well-being. In this context, and since the existing data collected in censuses and surveys suffer from many flaws – due to lack of consistency in the measurements of education across country and time - developing long time-series on the levels of educational attainment by age and sex is a valid endeavor. IIASA and VID within the Wittgenstein Centre (WIC), have a long tradition of including educational attainment, together with age and sex in population projections using the cohort–component multidimensional projection model. More recently, a simplified multistate projection methodology was also used to back-project the population into the past relying on one single dataset (the base-year) and hence providing information on education that is comparable overtime. My presentation will focus on the methodology and results of the latest round of projections and back-projections. The final dataset includes for 171 countries the reconstructed population by age, sex, and six levels of education expanding from no education to post-secondary education, from 1970 to 2010 and projections to 2100 according to expert argument-based scenarios. The projections presented in this talk require a large amount of information, ranging from base-year data on population disaggregated by levels of educational attainment by age and sex, to data on fertility, mortality, and migration by age, sex, and education for the base year, and, finally, to the assumed numerical values of these determinants according to the different scenarios.

GOULD, MARK* (Haverford College, mgould@haverford.edu)

Judaism, Christianity, Islam, Confucianism and the Emergence of Right Reason: Natural Law, Human Fallibility and the Transcendence of God

Notions of natural law and human fallibility, when constitutive of the logic of religious commitment, and when that commitment is dominant in the values of a society, predispose that society towards reasoned argument (and derivative social practices like the development of democratic procedures). Beginning with the distinction between original sin and *fitra* (human's natural affinity for God) respectively, in Christianity and Islam, I explore how the notion natural law, when coupled with original sin, and thus the fallibility of our understanding, predisposes Christianity to be compatible with democracy. The absence of a notion of natural justice and the belief in man's natural affinity for God, and thus the ability to follow precepts laid down by God, predisposes a contradiction between Islam and a democracy that composes laws from the people. Because God is understood as immanent within the Church in Roman Catholicism, the fallibility of humans derived from original sin is mitigated through the authority of the Church. In consequence, the relationship between Roman Catholicism and (the origins of) democracy is mitigated considerably.

Natural law, when coupled with a weak notion of human fallibility should, as in Confucianism, preclude the need for revelation. In Judaism, where there is reasoned access to a notion of justice that regulates God's actions and no belief akin to original sin, we nonetheless find revelation. I explore the effects of the way this revelation was understood, arguing that Judaic revelation established a pattern of religious commitment that constituted a tendency that transcended its origins, eventually obviating the need for revelation within the context of rationally-regulated disputation. While other social conditions for the genesis of democracy were absent in Jewish history, a tendency towards the rational and discursive adjudication of intellectual disputes became manifest, one that facilitated the emergence of natural religion.

Impact of Television on Muslim Culture: Anantnag District in Question

The present study deals with the process of globalization through television and its impact on the culture of Muslims living in the district of Anantnag, state of Jammu and Kashmir. Globalization in its one form refers to the extension of non-territorial social activities. The television has played an important role in transformation of culture through transcending geographical boundaries. As a process of cultural universalization and cultural assimilation, the impact of various channels that are broadcast on television, one can easily make out the effect that it creates in society. The Language, dressing, food habits, the marriage patters etc, clearly exhibits the sigh of departure from traditional culture.

Of the 300 families of Anantnag district that were put under lens, 40 % agreed that they have shed their traditional dress in lieu of western outfit. This is a clear case of deviation from traditional Muslim practice. Around 60 % acknowledged the usage of non-local language in their daily conversation. Religiosity has declined though people still rely on television for information on religious sermons and festivals.

There is an interesting trend of selective selection when it comes to the usage of alien cultural practices. People use discretion in accepting foreign cultures. Though the concept of glocalization is clearly visible wherein many aspects of alien cultures are molded to suit local practices, the process of assimilation is also simultaneously applicable. The detail impact of television on Muslim culture is discussed in full paper.

Fragmented Citizenships and Precarious Legality Among New Middle-Class Migrants: The Venezuelan Case.

The very early phases of Venezuelan emigration were gestated at the collapse of Latin America's state-led modernization and neoliberal projects, and when the cult and feasibility of hyper-consumption began a slow decline in the 1980s and 1990s. Its most intense and current phase began after 2000, in opposition to a re-emergent revolutionary utopia gestated under the leadership of Hugo Chavez. Chavez openly targeted the modernist aspirations of an increasingly beleaguered and downwardly-mobile middle class. Political polarization and increasingly fragmented citizenships are all but increasing. Studies about how immigrants construct legality and citizenship have yet to sufficiently scrutinize how such constructions are partly shaped by contexts of exit and, most importantly, by Latin Americans' increasingly fragmented and market-based practices and imaginaries of citizenship. The Venezuelan case can help illuminate how these under-examined processes evolve and what consequences they have for migrants and their communities. Theoretically, the paper incorporates a combination of approaches that hail from literatures as diverse as political economy of migration, cultural studies and the literature on consumption, legality and citizenship/non-citizenship. Empirically, the paper is based on more than 100 interviews with Venezuelan immigrants in the United States. Viewed through a transnational lens, an analysis

of interview responses of Venezuelan immigrants, afford us unexpected opportunities for also exploring some of the deepest expressions of Latin America's current economic, political and cultural crises and their impact on migration journeys and the precarization of legality and citizenship. In other words, the study of immigrants' strategies of legality and citizenship reveals as much about countries of origin as it does about countries of destination and the historical relationship between the latter and specific nationalities.

E-Qualified : An in-Depth Investigation of an Innovative Post-Graduate Program at a Greek University

In the definition of learning strategic objectives in recent educational legislation in Greece, it is claimed that a successful implementation of 'lifelong learning' strategies will contribute, on the one hand, to increasing employability, economic growth, social inclusion and adaptation of skills, and to fulfilling individual needs and aspirations, on the other. Among the most significant consequences of these LLL strategies was the proliferation of postgraduate study programmes across the Greek Higher Education Institutes (HEIs) in the last decade.

In our paper we will attempt to investigate the extent to which the above goals of graduates from an innovative postgraduate study program at a Greek University --offered through distance learning-- are satisfied. We will focus on the main factors that prompted these individuals to follow post-graduate studies, their evaluation of the specific programme, their views on the way post-graduate programmes operate in Greece, as well as their attitudes towards LLL in general. Additionally, we will highlight any potential correlations between these views, evaluations and attitudes, on one hand, and personal characteristics (age, gender, occupation, personal income etc.) or family characteristics (parental education) on the other.

The data that will be presented come from an empirical investigation that adopted a mixed method approach, which took the form of on-line self-completed questionnaires from a representative sample from a pool of graduates, over a period of ten years, supplemented by personal interviews and group discussions with a selected number of past and recent graduates.

The findings of this investigation are expected to have policy implications that relate to the effectiveness of post-graduate programmes and the expected benefits that they bestow to people who aspire to gain such credentials or have their skills upgraded and, thus, expect to have more secure employment prospects and/or more potential in advancing their working careers.

GOZEL DURMAZ, OYA* (Kocaeli University, oyagozel@yahoo.com)

The Role of Demographic Transformation in the Socio-Economic Foundation of Turkey

One of the foundational origins of the Turkish Republic was the drastic change in the demographic composition of Anatolia following the Balkan Wars of 1912-1913 and World War I. According to the population census of 1906, the Ottoman population in Turkey's current boundaries was about 15 million: 80% Muslims, 10% Greeks, 7% Armenians, approximately 1% Bulgarians and 1% Jews and other religious groups in small numbers such as Protestants, Armenian Catholics, Syriacs, Roman Catholics (Latins). In 1927 the population of Turkey decreased to 13.6 million despite high level of the Muslim immigration from the Ottoman territories that had been lost. This change was a result of factors such as the deportation of Armenians, the exchange of populations between Turkey and Greece and the high number of deaths in successive wars. This process greatly altered the composition of the population and the non-Muslim population decreased to 2.6% of the total population by 1927. This change in the demographic composition of Turkey corresponded to a significant era in Turkish history: the collapse of the Ottoman Empire and the establishment of the Turkish Republic as a nation state. Thus, this process of demographic transformation became significant in the socio-economic foundation of the new Republic. This presentation will focus on this transition period from the Ottoman Empire to Turkish Republic and tries to answer the role of demographic transformation, especially the Armenian deportation, in the restructuring of the Turkish society and also economy.

From Digitalization to "Disruption"? Service Networks in the German Energy Sector

Due to the liberalization of the European Electricity market and the German federal policy for the energy transition energy supplying companies have to completely reorganize their businesses. The digitalization of business processes, for example in the field of customer relations but also in the field of technical services, is prominent among the measures that are taken in order to tackle these challenges. This led to digitalized service networks between energy supplying companies, external data centers and software developers. These networks are organizational innovations as they require new management strategies and changes in the organization of work. Unintended consequences are as follows:

Though data management was outsourced energy supplying companies themselves still are occupied with testing and adapting the processes because policy regulations are very volatile and tacit knowledge of long-standing employees of the energy supplying companies is necessary to fix problems.

Outsourcing administration and management of customer relationships remains ambiguous as these relationships become increasingly important for business success

Gaining profit from digital outsourcing seems to be questionable. Moreover, collaboration with external service suppliers bears the risk to thin out the energy companies core competencies and to enable the collaborators to become competitors.

Based on neoinstitutionalist approaches of radical change the paper interprets qualitative interview material. We argue that organizational innovations were introduced due to external pressures such as a general management trend in the organizational field to engage in digitalized service networks and as the radical institutional change by the energy policy. As unintended consequences, instead of engaging less in some fields of business that were outsourced, companies now have to engage more, to interact with the counterparts in the service networks and to adapt their internal belief systems and working practices to the organizational innovation.

GRAF, STEPHANIE* (Red Interdisciplinaria sobre Racismo, Xenofobia e Identidades INTEGRA, steph.graf@gmx.at)

El Discurso Antisemita En México: Un Estudio De Casos Múltiple Entre Estudiantes

En el año 2015 se realizó un estudio empírico sobre el discurso antisemita entre estudiantes de licenciatura de varias universidades mexicanas. Se utilizó el método cuantitativo como herramienta de selección para llevar a cabo una investigación cualitativa: ésta investigación se manejó como estudios de caso, con el afán de rescatar lo singular que corre peligro perderse entre los promedios del métdodo cuantitativo.

En el análisis de los discursos aprobatorios a elementos del antsemitismo entre los casos elegidos, se puso énfasis en cómo esas posturas se vinculaban con otros actitudes frente a lo político y lo social. La presente ponencia se propone rescatar específicamente cómo se vincula la postura antisemita con actitudes discriminatorios frente a otros grupos minoritarios en México: se indagaba en las opiniones acerca de afrodescendientes, indígenas, asiáticos y árabes.

Un resultado obtenido fue que –superficialmente– el discuro antisemita se relacionaba negativamente con el discurso racista. Es más, muchos de los individuos se declaraban abiertamente antiracistas y reivindicaban una identidad mestiza, dentro de la cual se identificaban emotivamente con el polo indígena. Eso se explica con el hecho de que, en el imaginario de los individios entrevistados, el judío representa el opresor, en contra del cual hay que solidarizarse con los oprimidos. Esa postura coincide con una imagen del judío como responsable de todos los males de la modernidad, actitud categorizable como anticapitalismo fetichizado.

Si se mira este entramado con más detalle, no es necesariamente contradictoria la actitud aparentemente antiracista vinculada con posturas antisemitas. Los opiniones acerca de otras minorías en los casos analizados muchas veces se caracterizaban por propuestas paternalistas, de un afán homogeneizador, modernizador y eufórico del progreso. Eso permite comprender el antisemitismo y el antiracismo paternalista como expresiones de un discurso autoritario que no reconoce la autonomía de los sujetos a los que se refieren.

Handling Difficult Decisions in Professional Responses to DV in Germany – from Empowerment As Guiding Principle to "Entrance Card" Child Protection?

The paper will present and discuss initial research findings on intervention in domestic violence in Germany within the project Cultural Encounters in Interven-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tion Against Violence (CEINAV). Using the implicit cultural premises of intervention it aims to discuss ethical issues and dilemmas practitioners experience when facing difficult decisions in intervention with a view to advocacy for and empowerment of women.

Based on the research questions of the overall project, the five partners worked out a common methodology for all 24 workshops. The main impulse were a fictional "case story" for each form of violence, adapted as needed to fit the institutions of the country, and a set of "core questions" to guide discussions.

The paper is based on two workshops with practitioners (focus group methodology) in intervention against domestic violence. Using a fictional case story. The workshop discussions were transcribed and frame analysis was used to identify implicit and explicit discursive constructions of intervention and normative representations.

Advocacy is a guiding principle of the women's support services in Germany and explains violence against women as due to unequal gender power relations. This implies that the solution is to strengthen women by supporting self-determination and empowerment, helping women to discover their own resources, while respecting their will. The exception is notification of an NGO in case of a police ban which thus can be used as a door opener. However, many professionals expressed the difficulties and not being able to act. Domestic violence cases often involve children, which on the one hand some professionals saw as their "entrance card" via child protection if there was a possible endangerment of a child. On the other hand taking this "entrance card" can lead to action against the will of the woman which interferes with the principles of self-determination and professional secrecy.

The Introduction of Capitalism into the Family. New Forms of Paid Family Care and the Consequences for Gender Inequality

In most European societies in the mid-20th century senior care was mainly organized as unpaid work in the private family household, and was the wife's duty. Feminists showed that women's care responsibility was among the main reasons for women's labour market marginalization and gender inequality.

Since the 1990s most welfare states have strengthened social rights and infrastructure to the advantage of senior citizen care provision. As a consequence of this change, informal, unpaid work in the private sphere of the family has partly been transformed into formal, paid care work in the formal employment system in the public sphere outside the family. It is often overlooked that many welfare states have also extended caring family members' social rights and support. They have also introduced a variety of new hybrid forms of paid care work in family care work that share main features of work in the formal employment system outside the family.

The question that this paper aims to answer is: What are the consequences of these new policies towards paid family care regarding gender inequality? And how far do the consequences differ between different types of policies towards paid family care? The paper introduces a new, multi-dimensional theoretical approach to a classification of the new welfare state policies towards paid family care. This approach distinguishes different ideal-types of family care policies on the basis of the main forms and degree of generosity towards paid care by family members, and how far family members of care dependent elderly people are free to choose not to care because generous formal, paid care work in the public sphere is guaranteed.

The empirical study is based on a comparative analysis of different types of policies towards paid family care in 10 European welfare states, and of the potential consequences regarding gender inequality.

GRAHAM, NICOLAS* (University of Victoria, njgraham2@gmail.com)

Flow and Friction: Networks of Power and the Infrastructures of Fossil Capitalism

Recent critical scholarship has explored the importance of fossil fuels to capital accumulation (and the necessary mediating role of extractive industries to that relationship). Alongside this work, geographers and political ecologists have drawn attention to the importance of the 'networked infrastructures' that mediate or metabolize resource flows. Extending out from sites of carbon extraction, the pipelines, tankers, refineries, electricity grids and gas distribution infrastructures that serve to mediate energy flows, are integral components of the energy system and a critical aspect of our relation to nature. This paper employs and extends the concept of networked infrastructures via an investigation of the development of the liquid natural gas industry (LNG) in British Columbia (BC), Canada. It maps the web of technologies of extraction, transport, refining and export that are devel-

oped and are currently being proposed to facilitate the expansion of the industry, highlighting key networks of political and financial power expressed in them. While LNG continues to be promoted as a 'bridge' to renewable energy, such infrastructures, which are physical, durable and fixed components of the built environment, threaten to further lock in our ongoing reliance on fossil fuels, and cement the economic interests driving the carbon extractive sector. I conclude by discussing growing activism surrounding the infrastructures of fossil capitalism in BC, which concerns questions of local ecological degradation and represents a wider movement to address climate change.

Gender and Family Transformation in Globalization's Wake: The Indo-Trinidadian Case

There continues to be much debate about globalization, the scope of its economic and cultural effects, and its impact on gender relations (Acker 2004; Giddens 1990; Ritzer 2004; Schaeffer 1997; Steger 2010). Giddens argues that "*local transformation* is as much a part of globalisation as the lateral extension of social connections across time and space" (1990: 64, Giddens' emphasis) and Connell (2000) contends that in the post-colonial era, implementation of neo-liberal policies is transforming the "world gender order." Both masculinities and femininities are being re-configured in ways that remain to be more fully explored. Post-colonial economic restructuring in many parts of the world reorganized both men's and women's work with concomitant transformations in family life. Research on globalization processes often pays insufficient attention to the transformations within the family regarding gender roles.

This paper examines gender role changes among Indo-Trinidadian families in the post-colonial era. Interviews were conducted with over 60 men and women in Trinidad, West Indies. They spanned two generations—those who raised families after WW 2 period (a period of decolonization) and their children who began raising families as globalization intensified. Their experience is more complex than labor force involvement for women, since the latter were already productively engaged as indentured laborers and later as free agricultural workers. One significant change has been from arranged marriages to marriages of choice--a mark of the empowerment of women (Grahame 2006). This paper focuses on changes in women's and men's roles in reproductive work and analyses the conditions under which these changed. Notably, data reveal some men's growing engagement in affective work in relation to children. Rural/urban and class dimensions of change are explored.

Insiders, Outsiders, and Background Knowledge in Semi-Structured Interviews: Notes on Researching Transnational Families

Our project on Indo-Trinidadian transnational families employed semi-structured interviewing with a new twist—an insider/outsider team approach. We interviewed over 50 individuals in Trinidad (West Indies), the U.S., and Canada. The researchers were Kamini, a native Indo-Trinidadian, and Peter, a white American. In this paper, we explore how using insider and outsider cultural roles restructured the interview process in both anticipated and unexpected ways. As qualitative methodologists explain, interviewing is a reflexive process. What respondents can and will tell about their lives is intimately interconnected with what researchers are assumed to know and how that knowledge is exhibited. Those assumptions are complicated by the co-presence of insider and outsider interviewers, making variations in knowledge more visible. One dynamic is set up by the understanding that outsiders require more explanation of family practices and rituals because of limited familiarity with the culture. While that might seem an impediment, this permits exploring background knowledge that otherwise might be glossed over. Another dynamic is set up by the understanding that insiders have a deep familiarity with the culture and family experiences. This may lead respondents to provide shorthand accounts that need to be opened up further. In addition, there are situations in which the insider knows less, or differently, than assumed, and the outsider knows more, and differently, than assumed. Knowing too much, too little, or differently, all complicate the interview process but also open up new possibilities. This requires the research team to take an active stance, monitoring how both their knowledge, and their partner's, is displayed. In our interviews, "what the researchers know" was actively and closely managed in situ. Related issues about "what people know" emerged when families were interviewed as a group. We provide detailed examples from the field to illustrate the challenges and possibilities of this approach.

GRAHAME, PETER* (Pennsylvania State University - Schuylkill, prg11@psu.edu)

Pleasures of Place: Aesthetics, Sociology, and Tourism

Sociological studies of place tend to be concentrated in urban sociology and environmental sociology. Much of the attention to place there has to do with instrumental rationality (planning, administration, problem-solving, etc.) or moral-practical reason (justice, inequality, life chances, etc.). Recently some sociologists have suggested a third dimension: aesthetics. Zukin's cultural focus on "aesthetic power" and the "look and feel of cities" helps to point the way (Zukin, 1995). At a more general level, several European sociologists (G. Born, D. Inglis, J. Lane, and J. Wolff, among others) have called for freeing sociology from older conceptions of aesthetics focused on beauty, art, and high culture. P. Willis has urged studying the "lived aesthetics" of everyday sensuous experiences (Willis, 2005). In examining pleasures of place, I argue for a conception of aesthetics geared to understanding the social organization of sensuous experience in ways that are not restricted to art worlds or cultural elites. This opens up possibilities for studying popular, mundane, and profane aesthetics and the pleasures, tastes, fascinations, and aversions associated with them. Drawing on comparative fieldwork in Iceland and Massachusetts, I then consider how whales, geysers, marshes, puffins, thermal pools, glaciers, sharks, and dunes, and the like are taken up and reworked in aesthetic formations geared to different visitors' gazes (cf. J. Urry, 2011). In particular, I reexamine the idea that tourists experience Iceland through an aesthetic of extreme nature crystallized in the trope "fire and ice." I identity key elements of that aesthetic, and consider how they establish a frame for experiencing Iceland that both foregrounds certain kinds of sensory pleasures while marginalizing others. For example, why are thermal pools included, whereas reforestation projects are excluded? I then consider implications of this form of analysis for studying other pleasures of place.

Images of Social Policy in Brazil: A Comparison Between Governments

The analysis of official images of social policy in Brazil illustrates the utility of the concept of frame, developed by cultural sociologists, in comparative studies. The focus of this paper is the discourse of nine federal governments since the restoration of democracy, in 1985, and the three administrations of Getulio Vargas, president once called "father of the poor", in the 1930-1950s. A pair of inevitable problems in framing research is discussed: the nature of the concept (what a frame is) and its operationalization (where it is). Once solved the ambiguity and vagueness of theoretical and methodological use of this concept, attention is called to the recognition and comparison of frames in 12 inaugural speeches and 35 "Messages to National Congress", annual documents of Executive's accountability. Governmental understandings of four aspects of social policy are analyzed more closely: objectives, audiences, results, and obstacles. There were important changes in the meanings attributed to social policy (e.g. legitimation of beneficiaries) as well as continuities, such as the linkage between social development and economic development. This study also highlights pros of this perspective, as the solid approach of processes of framing changes, and some of its difficulties, such as minimizing the relational aspect of discourses and reducing frames to more traceable and measurable themes. It is also demonstrated that, due to its dynamic dimension, the concept of frame is more useful for comparative studies than repertoire and symbolic boundary, concepts equally adopted by researchers of the relations between culture and politics.

GRAZIOSI, MARIOLINA* (Università Degli Studi di Milano-Statale, mariolina.graziosi@unimi.it)

Identity in Contemporary Society: Identity As a Mask

The problem of identity was born with modernity in the process of individualization which posed the question **who am I ?** at its center. The same question seems to have lost this centrality in contemporary society where the process of individualization has assumed a radical aspect and the question **who am I?** is no longer at the core of individual consciousness. The tendency is to be what one wishes to be. Identity, once the heart of the personality, based on values and social roles, is now an individual project/fantasy, that changes according to the needs and wishes of the individual. My thesis is that individual identity is no longer a social construction but a mask used by the individual to act within a certain context. I will explore the individual and social consequences of this radical change. To address the question of identity is crucial given that identity is one of the keys for reading and understanding our times.

Morality and Freedom in Contemporary Society: Crisis of Values and a New Idea of Freedom

Freedom is central to the process of modernization, being one of its main values, along with equality and solidarity. It has always been linked to the question of civil, political and social rights. My thesis is that in late modernity, with the radicalization of individualism and the crisis of values, the idea of freedom has changed. It now means absence of limits, pursuing only one's own interests without considering the consequences for others. The new idea of freedom is deeply influenced by the idea of the free market and the survivor of the fittest, which has become dominant in the process of world wide globalization. In my paper I will discuss the relationship between freedom as a modern value and the changes it has undergone in contemporary society.

GREMIGNI, ELENA* (University of Pisa, elena.grem@libero.it)

Forms of Symbolic Violence in the Web

Today the Internet shows many examples of commercial conditioning that make this public space less and less free. Users often appear so deeply integrated into the market that they seem to be transformed into commodities (Bauman 2007), showing a specific "Schaufenster-Qualität der Dinge" (Simmel 1896). Furthermore, within the *cyberspace* it is possible to observe the exploitation of information produced by connected individuals: the most popular search engines and Social Network Sites reveal their belonging to a cultural industry that uses its users as consumers and producers (prosumers) at the same time. But this "third job" (Toffler, Toffler 2006) goes far beyond the exchange with the services offered and the pleasant entertainment hides forms of abuse. Users' behaviour is a commodity under the guise of information that generates wealth for third parties and may negatively affect unaware people's lives.

This paper uses the "clue paradigm" (Ginzburg 1979) in order to identify some "traces" (Benjamin 1927-1940) of a tendency towards a closure of the Web into "filter bubbles" (Pariser 2011) in the indexing processes market oriented by search engines, in the increasingly larger use of apps, and in the "mass" adhesion to popular Social Network Sites. The purpose of this research is to highlight some forms of hidden persuasion and exploitation that limit users' freedom even when there is no explicit censorship in the Internet. The "doxic" acceptance of contents, structures and tools of the Web indeed bars some kinds of knowledge and some different models of participation, with significant consequences on the social construction of reality. In conclusion, we can extend to *cyberspace* what Bourdieu said about hidden persuasion: "of all forms of 'hidden persuasion', the most implacable is the one exerted, quite simply, by the *order of things*" (Bourdieu 1992).

GRESSGARD, RANDI* (University of Bergen, randi.gressgard@uib.no)

Necronormativity – Death Politics on the Margins of the Law

Achille Mbembe defines necropolitics as the contemporary subjugation of life to the power of death – the sovereign capacity to define who is disposable and who is not. He uses the concept to probe the governmental control of movement in occupied Palestine, which he takes to be a separating occupation along the lines of the splintering urbanism, arguing that colonial occupation is not only akin to control, surveillance and separation but implies also spatial seclusion. This juxtaposition suggests that there is not only a structural resemblance between occupational separation politics and urban splintering, but also – more profoundly – a common enabling condition pertaining to spatial enclosure. Drawing on Carl Schmitt's concept of sovereignty, Mbembe identifies enclosure with radical exclusion, based on the power to decide on the exception. We may ask, however, whether the concept of necropolitics exhausts the potentiality of death politics. Contrary to Mbembe, this paper argues that the juxtaposition between colonial occupation and urban splintering is instructive to the extent that it widens our understanding of death politics. Rather than confining death politics to extra-legal action, the paper emphasizes the diffuse boundaries between legal and extra-legal violence characteristic of urban security politics worldwide, maintaining that 'ordinary' neoliberal urban governance tends to sustains racist, colonial formations by way of a geo-temporal splitting between desirable and undesirable populations. As distinct from extra-political necropolitics, which often involves militarized policing, focus of attention is on mundane, technocratic forms of death politics in terms of necronormativity, which signals continuity more than emergency. Coercive policing is still central to the understanding of death politics, but policing practices might be enmeshed in benign welfare or humanitarian programmes that serve to depoliticize and normalize violence within the norms of the polity, albeit on the margins of the law.

GRINDEL, ELISABETH* (Kaplan International Colleges, egrindel@gmail.com)

Disappointment or Cruel Optimism?

This paper highlights the unique position of temporary migrants in the debate around fulfilment and disappointment. Focussing on families of international students in a small English university town, I discuss how these participants experience their temporary sojourn in the periphery, and how they respond to initial disappointment with an appliance of 'cruel optimism'.

Before arrival, the partners of international students envisioned Britain to be a land of plenty with plenty of work, plenty of cultural diversity and plenty of networks. Later they arrived in a Northern English university town with a predominately white British population. Work is hard to find – especially for temporary migrants – and feelings of isolation and loneliness are daily companions.

In this paper I discuss how instead of allowing feelings of disappointment to determine their well-being, the families of international students in this study focus on their homemaking and apply cruel optimism, which names a relation of attachment to compromised conditions of possibility, to create what I call an intimate diasporic space in the home. I highlight how they use emotional domestic labour to create such a space, and how they envision their actions to be beneficial for their future careers.

GRININ, LEONID* (National Recearch University Higher School of Economics, leonid.grinin@gmail.com)

Cultural Evolution and Kondratieff Waves

Cyclicity is one of most important components of cultural macrodynamics strongly affecting cultural evolution patterns. The long cycles with a characteristic period between 40 and 60 years which are known as Kondratieff waves are good examples of such patterns. The theory of long cycles is one of few theories that give opportunities to make forecasts on the scientific basis. In the present paper, on the basis of the theory of production principles and production revolutions, we reveal the interrelation between K-waves and major technological breakthroughs in history and make forecasts about features of the sixth Kondratieff wave. We assume that the sixth K-wave in the 2030s and 2040s will merge with new technological revolution. This period will be characterized by the breakthrough in medical technologies which will be capable to combine many other technologies such as bio-, nano- and robotic technologies. The article offers some forecasts concerning the development of these technologies.

GRININ, LEONID* (National Recearch University Higher School of Economics, leonid.grinin@gmail.com)

GRININ, ANTON (Volgograd Social Research Center)

Cultural Evolution in the Long Run and Forthcoming Technological Revolution

The paper analyzes the cultural evolution in respect of its technological aspects from the beginning of the history of humankind. In the paper important problems are regarded. What determines the transition of a society from one level of development to another? One of the most fundamental causes are the global technological transformations. Among all major technological breakthroughs in history the most important are the three production revolutions: 1) the Agrarian Revolution; 2) the Industrial Revolution and 3) the Scientific-Information Revolution which will transform itself into the Cybernetic one. We introduce the Theory of Production Revolutions. This is a new explanatory paradigm which is of value when analyzing causes and trends of global evolution. The paper describes the course of technological transformations in history and demonstrates a possible application of the theory to explain the present and forthcoming technological changes.

In the paper we analyze evolution of the technological shifts which took place in the second half of the twentieth and early twenty-first centuries and forecast main shifts in the next half of our century. We present a detailed analysis of the latest production revolution which is denoted as 'Cybernetic'. We give some forecasts about its development in the nearest five decades and up to the end of the twenty-first century. It is shown that the development of various self-regulating systems will be the main trend of this revolution. We argue that at first the transition to the beginning of the final phase of the Cybernetic Revolution will start in the field of medicine (in its some innovative directions). In future we will deal with the start of convergence of innovative technologies which will form the system of MBNRIC-technologies (i.e. the technological paradigm based on medicine, bio- and nanotechnologies, robotics, IT and cognitive technologies).

Democratic Energy Futures through Real World Experiments? Proactionary Innovation and the Virtues of Nonknowledge

Public and political expectations targeted at ecology and technology call for more safety, certainty, or precaution. However, empirical research delivers insights on real world decision processes and everyday "experimental" practices that increasingly uncover how actors creatively cope with unavoidable uncertainty and ignorance and thus circumvent conventional approaches to risk assessments or classical evidence-based policies. This raises new questions on the attribution of responsibilities, ethical concerns, and the organization of scientific knowledge production in general. Put differently, whereas official rhetoric trumpets precaution and safety, the real world seems more entangled with what has been termed the proactionary principle or the proactionary imperative. In order to frame possible avenues towards innovation in a democratic society in the face of increasing uncertainty and ignorance, I will use the concept of real world experiments to highlight some of the conditions and processes that foster innovations in face of socio-ecological struggles building on empirical examples from renewable energy operation and the invitation of stakeholders to laboratory-like settings. Experimental processes in society can then be conceptualized as "real" experiments and laboratory activities as merely temporarily subordinated components of the larger experiment.

GROSSI PORTO, MARIA STELA* (Brasilia University, mariastelagrossiporto@gmail.com)

Police: Professional Identity and Social Representations in Brazil

In contemporary Brazilian society, police violence and his involvement in violent forms of conflict resolution are topics relevant to those who are interested in understanding the public security dilemmas. In this sense, this paper aims to analyze how are police forces organized, which relationships are there between this organization, the professional identity and police violence: how police organization and practices are represented by police officers and the effects of these representations for the way they understand their role as responsible to assure law and order. We believe that these representations have developments not only in maintaining law and order but also in ensuring all human rights. We still believe that such practices result from the symbolic universe through which police officers conceive themselves in terms of marks, belongs and identity records.

The paper is based on a survey that was structured using the Theory of Social Representations- TSR. The empirical goal was to obtain, and to compare, the social representations that military and civil Brazilian polices make about their organizations, practices, professional performance and relationships with society. We also compare social representations that police officers create about themselves and the ones they believe society creates about them.

The design of the survey was a sample structured by spatial divisions, hierarchies, roles and sex, comparing both polices: the sample is compounded by 399 questionnaires for the civil police and more 1,181 answered by military police officers, both male and female. Also, we have done interviews and focus groups.

The analysis focuses on motivations for the choice of the profession; the pride of the profession; representations of fear, stress, uncertainty and risk arising from police work; and how all these symbols affects police organization and daily performance.

GROTHE-HAMMER, MICHAEL* (Freie Universität Berlin, m-grothe@web.de)

The Non-Addressable Meta-Organization and Its Contribution to High Reliability

Today, there is a well-established research stream about so-called "High-Reliability Organizations" (HROs) within Organization Studies (e.g. Bigley/Roberts 2001; Weick/Sutcliffe 2015). HROs are organizations that implement specific processes of reliability in the avoidance and the containment of failures and unexpected catastrophic events. However, research on high reliability is, thus far, mainly focusing on classical single organizations or organizational units. Although there have been a few attempts to broaden this view to at least include organizational networks, no-one has yet asked if and how new forms of organization could contribute to high reliability.

From this standpoint, we will report on our findings from a qualitative field study. Building on Ahrne and Brunsson's (2005) work, we will show how firms, public organizations, and administrative agencies form what we call a Non-Addressable Meta-Organization (NAMO). In our specific case, this NAMO is concerned with the ongoing organizing of large-scale events at a multi-functional arena, and corresponding safety-related issues.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

In this respect, we make three crucial contributions to the existing research. First, we will present our theoretical concept of the NAMO. On this basis, we will secondly point out how this specific form of organizing allows the participating organizations to implement permanent, robust—and thereby reliable—meta-organizational structures (hierarchies, rules, positions, and communication channels) while posing as just a network. These characteristics produce an interesting phenomenon: while the NAMO can act as an organization, and thereby produce collective decisions, it is not addressable as a single system for externals. In this sense, it has no responsive boundary. Accordingly, we will thirdly show how this allows the NAMO to decouple its safety-related decisions and reliability processes from problematic external demands such as political and economic influences—which is usually treated as problematic when it comes to public safety (e.g. Rockett 1994; Henstra 2010).

GRUBER, MARIKA* (Carinthia University of Applied Sciences, m.gruber@fh-kaernten.at)

Migration As a Chance for Rural Regions – an Austrian Example

Introduction

The district of Hermagor is a rural, structurally lagging region in the southwest of the Austrian province Carinthia. It is very small, no more than about 18,500 people live there. Since the 1970s, Hermagor has constantly registered a strong population decrease, which is caused by two reasons: the strong out-migration (negative internal migrations balance) and the negative birth rates. The district is highly peripheral; it takes people up to 1.75 hours by car or up to 3.5 hours by public transport to reach the next centre. However, Hermagor can document a considerable positive international migration balance.

Methodology

The transdisciplinary pilot-study, which was undertaken in this form for the first time in Austria, was carried out in cooperation with the district authority of Hermagor and is based on the district's attempt to undertake steps to foster the integration process of the foreigners already living in Hermagor and to support the permanent settlement of international migrants in the region. The explorative, empirical-qualitative study aimed to examine why international migrants move to Hermagor and to explore the conditions and framework needed to foster permanent settlement. The investigation is based on:

In-depth analysis of secondary data (desk research on population, infrastructure, economic, and labour-market data),

semi-structured qualitative interviews with international migrants from different nations living in Hermagor.

Results and conclusion

The pilot-study shows the living conditions of international migrants in Hermagor, their need of support and integration infrastructure as well as the reasons for immigration in a rural region. Based on these results and taking the possibilities of political influence into consideration, a practical action plan was created which focuses on the migrant's life cycle and comprises three pillars: a friendly welcome, supporting activities, and measures for an improved living together in the community. Currently, Hermagor takes actions for implementing the first pillar.

GRUTZPALK, JONAS* (FHoV NRW, jonas.grutzpalk@fhoev.nrw.de)

"Ahead of Time". Police Work in the Future

When police officials define the duties of their organisation they often use a formula that says that police work consists of repression and prevention. Whilst we might have a pretty clear picture of what „repression" might look like, it is more difficult to grasp what might be meant by prevention. So German police officials often use another formula to describe that. They say that police needs to "get ahead of the situation" ("vor die Lage kommen") in order to be preventive.

German police law in fact draws quite a fascinating picture of the police as an agent who works in the future: "It is the police's duty to prevent hazards and thus to prevent criminal acts and to prosecute future criminal acts." (ASOG Berlin, §1 (3))

How police is supposed to do that is the question of my intervention. A part of the answer is the statistical one. Sherlock Holmes has beautifully described the statistical look into the future: „While the individual man is an insoluble puzzle, in the aggregate he becomes a mathematical certainty. You can, for example, never foretell what any one man will do. But you can, with precision, say what an average man will do. Individuals vary, percentages remain constant. So says the statistician" (Doyle 1890).

This statistical „discovery oft he future" (H.G. Wells 1913) (which might also be regarded as one of the many birthplaces of sociology) is widely used in the prediction of possible traffic accidents in police work. But what other sources and methods do police officers have to „prevent future crimes"? How do we find out about their concepts of the future and how might Sociology even be able to assist them to do a better job?

GUADARRAMA, ROCIO* (Universidad Autónoma Metropolitana, Unidad Cuajimalpa, rocio.guadarrama.o@gmail.com)

Trajectoires Et Identités Professionnelles à Risque. Le Cas Des Musiciens De Concert Au Mexique.

Ce document explore les dilemmes de l'emploi artistique dans un marché qui, comme c'est le cas au Mexique, tend à normaliser la précarité. Pour analyser l'impact de ce phénomène, on analyse les parcours d'un groupe de musiciens professionnels de la musique de concert, qui montrent les tensions entre une formation fortement influencée par certaines figures de référence et un marché contraire à ses aspirations vocationnelle et de prestige social. On peut ainsi observer, parmi l'élite des musiciens d'orchestre et des professeurs de l'enseignement supérieur, quelques trajectoires stables avec réalisation professionnelle alors que pour le reste des musiciens, les parcours sont plus aléatoires, les conduisant parfois jusqu'à la perte de leur identité professionnelle. L'hypothèse que nous soutenons dans cette recherche est que l'érosion de l'emploi stable suppose une combinaison changeante d'emplois principaux et secondaires tout au long de la vie des musiciens. Lorsque cette situation tend à perdurer parmi les musiciens, dans des conditions qui les amènent à travailler en dehors de leur domaine professionnel, et dans des activités moins qualifiés, nous identifions une trajectoire précaire ou risquée qui se caractérise par l'accumulation ou la succession de statuts diversifiés d'emploi. Pour discuter ce processus on adopte une méthodologie mixte avec une emphase sur les aspects qualitatifs de la profession. En suivant cette ligne de pensée, on analyse les types de trajectoires selon leur stabilité contractuelle et la combinaison d'emplois principaux et secondaires tout au long de la vie active des individus. Dans ce contexte, s'approfondissent les images que les musiciens eux-mêmes construisent sur leurs propres trajectoires, ce qui nous permet d'expliquer les différentes séquences d'emplois qui peuvent conduire à la construction des identités positives ou négatives sur leur profession.

Dealing with Uncertainty: A Social Theoretical Idea Beyond the Religion Versus Secular Dichotomy

The paper has two aims: Firstly, it will demonstrate that the categories "religious" and "secular" are inadequate to investigate peoples' worldviews empirically. Secondly, it will propose a social theoretical idea of how to overcome this dichotomy.

Empirically, the paper is based on a project that addresses the relationship between science and religion. Two ethnographic case studies were conducted in international stem cell research laboratories, one located in the Unites States and one in Germany. The starting question was in how far the religious backgrounds of the researchers matter for their scientific work. The analysis shows that there are indeed researchers who explicitly identify themselves as religious and who also legitimize their ethical standards and their data interpretations explicitly referring to a God or to rules of their denominations. However, there are many researchers who would identify themselves as secular but who also refer to transcendent concepts when legitimizing their ethical standards and data interpretations. Thus, the dichotomy of religious and secular is not instructive for examining underlying worldviews—this is even true when taking into account the various different definitions of "religious" by asking people for their religious self-descriptions.

The theoretical idea deriving from these studies is to overcome the religion vs. secular dichotomy by focusing on how individuals and societies deal with uncertainties. While the post-secular discourse still follows the idea of religion and science as separated spheres, the paper emphasizes the functional closeness of both, thereby following concepts of classical sociology and sciences studies: From these perspectives, science and religion are two ways of dealing with uncertainty. By investigating openly what people refer to in cases of uncertainty instead of classifying societies as religious or secular, it will be possible to identify underlying transcendent concepts in post-modern societies.

Entrepreneurship Among Pakistanis in Barcelona: Unravelling Strategies in the Context of Crisis

The emergence of ethnic economies owned by migrant communities is changing the urban landscape of many cities around the world. In Barcelona, the Pakistani community has developed an ethnic economy based on small businesses in different trade sectors which are spreading all over the city taking advantage of vacancies and exploring new markets. This article contributes to know the scope

and internal functioning of businesses from Pakistani immigrants taking three different neighbourhoods in Barcelona as a case study. The research concludes that the great concentration and development of Pakistani enterprises in this city is explained by the interplay of contextual and ethnic strategies which have to do with a favourable structure of opportunities in the current context of crisis and the sharing of ethnic resources through the networks of the community. Thanks to a mixed methods design, complementarity between quantitative and qualitative data has been ensured through the elaboration of a survey of more than 150 Pakistani establishments and in-depth interviews with key informants and entrepreneurs.

Postcolonialism, Hegemony, Gender and Development: A Much Discussed Discourse or a Failed Path?

The main part of the proposed paper is a theoretical discussion on hegemonic structures of development discourses. It takes a postcolonial perspective while having a gender focus. Thus, the paper addresses four keywords: hegemony, development, postcolonialism and gender. After a detailed discussion on how these four discourses are interlinked, it brings empirical exemplifications to make their interlinkages visible. It does so by taking South-India, in particular Telangana, as an example of how and where development has taken place. The paper analyses India´s status post her opening to the global market in the 1990s. Thus, the temporal perspective is of the last 25 years. The paper explores marginality of Dalits, religious minorities, LGBTQI and women. The proposed interdisciplinary study engages with sociology, development studies and gender studies and is an outcome of fieldwork conducted between 2011 and 2014.

RC37-433.5

GUENTHER, JULIA* (University of Vienna, juliamguenther@gmail.com)

Subjectivity Formations, Resistance and Sociological Knowledge of Dalit Writers in Telangana, South India

My paper addresses subjectivity formations and resistances of Dalit Writers and analyses how their literature influences sociological knowledge in Telangana, South India. Doing so, I examine texts by Dalit writers who take up a feminist as well as gender perspective. In those texts, the writers discuss a number of prevalent discourses in contemporary India, such as caste, class, patriarchy, environmental issues, power relations, and neo-liberal economy. My research shows how literature functions as a critical voice to hegemonic knowledge and how it can initiate resistance movements against unjust societal developments.

The research methodology is a discourse analysis of narrative interviews taken with the writers between 2012 and 2014. I further analyse their texts seeking to highlight an interlinkage between subjectivity formations, resistance and societal developments. In my research, I focus on Dalit writers from the newly established 29th Indian state called Telangana. The regional setting plays an important role in so far as it has formed subjectivities as well as traditions of resistance by Dalits and thus influenced feminist literature and sociological knowledge. Looking ahead, I question how these discourses continue as Telangana evolves. Which roles will literature written by Dalits play in ensuring that Telangana continues to be a state of critical writers, activists and thinkers?

The study draws from a transdisciplinary approach and incorporates sociological, feminist, post-colonial, and literary theoretical frameworks. The intersectionality approach of the paper discusses the various interlinked factors of sociological knowledge, resistances and subjectivity formations and therefore allows analysing these discourses from a broader analytical perspective.

GUERECA TORRES, EVA RAQUEL* (UAM Lerma, guereca77@gmail.com)

Mujeres, Conocimiento y Poder En La Conformación De La Sociedad Moderna En México

Esta ponencia analiza las acciones emprendidas por las élites feministas en México para construir espacios para la producción de información y conocimiento. Se considera al feminismo como una fuerza social y una fuerza intelectual que ha participado en el tránsito de los medios analógicos a los digitales, así como de las academias reales a las redes de conocimiento feministas. Por ello, se analiza la presencia de las mujeres en la sociedad novohispana como impresoras hasta la formación de espacios digitales para comunicar desde una perspectiva feminista, así como el tránsito desde las pioneras en educación superior hasta la formación de redes de programas y centros de estudios de género en México.

Para explicar este proceso se propusieron dos categorías de análisis: la genealogía y la cronotopía feministas que en conjunto permiten analizar el espacio,

el tiempo y la acción colectiva de las mujeres. Hay un vínculo histórico entre el periodismo, la academia y el feminismo, lo anterior se analiza a partir de la experiencia de las feministas pioneras y fundadoras en la construcción de la información y el conocimiento, espacios imprescindibles en sociedades que aspiran a ser democráticas.

La estrategia de las feministas, tanto en los medios como en las academias, ha sido formar grupos, redes, colectivos en los que se desarrollen saberes para, desde y sobre las mujeres. Visibilizar la historia de las mujeres en la sociedad es desarrollar conocimiento sobre las mujeres; misión inacabada y en la cual todas las disciplinas aún tienen saldos pendientes si consideramos medio siglo de presencia permanente de las mujeres en la academia ante, por lo menos, tres siglos de exclusión.

GUERRA, JOAO* (Institute of Social Sciences. University of Lisbon, Joao.Guerra@ics.ulisboa.pt)

Slippage in Sustainability – the Crisis Effects on the Gap

Based on some national and international survey results, and based on the Portuguese case in a comparative perspective, our aim is to analyze how environmental attitudes and practices can be further enhanced or hindered in a context of a multidimensional crisis that proved to be simultaneously financial, economic, political, social and environmental.

Our focus will be the areas of environmental and social equity in confront to a range of possible factors of civic action, environmental protection, and sustainability promotion. In our days, transparency based on public participation, availability and reliability of information, institutional trust and accountability are terms that, more and more, come out in the literature and in the deliberative fora for sustainability and environmental governance. Therefore, we will seek an approach that assumes the holistic concept of sustainability that considers those governance factors as 'silver bullets' for fighting against environmental and social degradation, and as key determinants for an inclusive and participatory decision making.

After all, although widely undertaken in speeches and political programs, this holistic sustainability approach globally remains shallow and ineffective (Redclift, 2005) both in social and in environmental quality achievements. At the end, it has mostly been limited to inaction and to wishful thinking (Dryzek, 1996, 2005). Features particularly sharpened in these times of socio-economic turmoil, whose end we cannot even guess.

Undocumented Migrant Women and Their Children in Chile: Implications for Chile's Crece Contigo Policy of a Child's Rights to Health.

For migrants, access to health services in Chile is determined by immigration status, meaning it is imperative to have documented immigration status or refugee status. For undocumented migrant, they can only access health services privately, since they lack documents that enable him to live legally in Chile. However, in the case of pregnant women, children and adolescents up to 18 years there is another provision. A year after the CHCC sub-system was implemented, the Ministry of Interior and Ministry of Health of Chile made public an "Agreement" by which access to healthcare, regardless of the immigration status of pregnant women, children and adolescents, and emergency healthcare, was made explicit.

Although the CHCC system does not refer directly in its guidelines to access by the immigrant community, actions to reduce maternal and infant health inequities are implicit for children and pregnant immigrants and children born in Chile to an immigrant mother (Chilean children) after an "Agreement" that enables access by these groups to the health system regardless of immigrant status. Despite this, it seems from documents analyzed that implementation at lower-level operational organizations of the health system and by healthcare teams has been uneven.

After more than six years of implementation of CHCC and the "Agreement", it is important to remember that the mechanisms underpinning adaptation between two state initiatives is essential if, first, the objective of protecting the health of pregnant women immigrants and their children is to be achieved (Agreement) and secondly, to accompany, protect and comprehensively support all children and their families through the actions and universal services provided for by CHCC. From this perspective, any action that is not made or is made late in maternal-child health works against what is hoped to be achieved in both strategies.

Music, Musicians and the Brazilian Community in Lisbon

Music, Musicians and the Brazilian Community in Lisbon

Brazilian musicians in Lisbon are part of a specific quota of the group of Brazilians in Portugal. The trajectories they undertake differentiate the trajectories of so-called labour migrants and skilled migrants. These peculiar trajectories coincide at a particular point: the transnational mobility projects these subjects engage are directly linked to production and consumption of Brazilian music in the Portuguese scene. I must point out that the consumption of this music in the country dispenses the presence and activity of these subjects, but is driven by it. That is, even before the significant number of Brazilian immigrants in Lisbon, consumption and dissemination of Brazilian cultural products were already part of the Lisbon cultural scene. However, with the intensification of Brazilian flows into the country, the supply of this cultural asset consolidates itself.

Brazilians are the most numerous group of migrants in Portugal, however, there is not a Brazilian community clearly organized and homogenous. This incipiency results from the diverse and diffuse ways the Brazilian population allocates in the country. In this paper, I intend to explore the means in which these diversity and diffusion, typical of this dispersed immigrant community in Portugal can be seen in the light of Brazilian musical practices in Lisbon. Musical performances are moments of reiteration of the presence of this diffuse community organization. Starting from ethnographic data and theoretical reflections, I try to explore the ways in which the movement of Brazilian cultural products in this urban context not only enables the transnational trajectory of musicians, but also enhances the presence Brazilians in the Portuguese capital.

Different Proposals for Measuring the Quality and Welfare of Older People in Europe through Composite Indexes

In this paper the analysis of the aging of European societies is consider as a key area of quality and social welfare. The analysis proposed is based in the methodology of European Foundation of Social Quality as it provides a framework that combines aspects of quality of life and quality of society model, which is an integrated vision that conceptualizes social quality as the confluence of individual and institutional strategies, individual welfare and social welfare. Thus, we propose that the way to grow old is crucial to the welfare of people and this is determined, in turn, by the social context in which it develops. This perspective of analysis is based on the use of social indicators; therefore, in the first part of this paper, we show a comparative analysis of a number of indicators in European countries that reflects on the one hand, the multidimensionality of this reality and, second, the differences between countries. The last part of the report, focuses on the analysis of some of the composite indexes which measure aging that in recent years have been designed and aimed, in most cases, to offer a single measure of the welfare of older people, trying to become tools for the design and development of appropriate policies and programs that improve the quality of life and welfare of the elderly. The ability to track trends over time and across countries provides an opportunity to improve public actions and therefore increase the quality of life of people in the short, medium and long term. This part is the most interesting of report because it exposes the main results of the comparative analysis carried out, becoming the first step towards the design and development of a composite index for measuring quality in aging in Europe, by the authors.

Significado De La Calidad e Integridad Académica, Desde La Perspectiva De La Sociología De La Educación

La investigación que se reporta, desde la perspectiva de la sociología de la educación, cobra su pertinencia para programas de posgrado en ciencias sociales y humanidades. Se realiza un estudio en el que se analiza el significado que tiene para los profesores la formación de recursos humanos, la calidad de dicha formación y la integridad académica de los productos de investigación, esto en relación a la ética social y educativa en el marco de políticas públicas de financiamiento para la ciencia y la tecnología en México. Para explicar el fenómeno es necesario analizar los conceptos de formación, calidad e integridad académica.

Con base en el objetivo de la investigación, metodológicamente se realizó un estudio cualitativo donde se rescató la subjetividad con que el profesor de posgrado intenta formar a sus estudiantes como investigadores éticos, lo que justifica la recolección de datos con entrevistas a profundidad, observación participante y análisis del discurso verbal, escrito y visual. El análisis fue de corte etnográfico en estudio en casos en dos posgrados en el estado de Morelos. En la metodología se explicitan aspectos éticos con respecto al análisis de los datos y se garantiza que la información de los participantes se utiliza sólo con fines académicos bajo un consentimiento informado.

Las categorías de análisis emergentes fueron: la formación, la calidad, la integridad académica, la generación de conocimiento, la producción académica, la vinculación y la formación de recursos humanos.

Los hallazgos refieren los tipos de relación entre la formación, la calidad y la integridad académica con: la generación de conocimiento, la producción académica en los posgrados,   y la vinculación para la difusión y divulgación del conocimiento en el marco de la ética profesional.

The African Diaspora Uprising: Blackness in the Making in France

Post-Imperial France is experiencing the color-line. In 1998, 40000 African-descended citizens commemorated, in Paris, the 150[th]anniversary of the abolition of slavery, and claimed moral reparation. That year, Collectif Egalité, the first organization labeled black went official, and shattered the hegemonic color-blind French ideology by demanding the recruitment of black journalists on French television. In 2003, a newborn organization, Capdiv, claimed the "improvement of the condition of Blacks". To harmonize these actions, and institutionalize a collective "black subjectivity", the Representative Council of Black Organizations emerged in 2005.

This paper addresses this sociopolitical dynamic within the African diaspora. From a critical review of the social movement literature, it invites to embrace this dynamic in the long durée. It argues that the mobilization of the African diaspora is not the mechanical result of French racism and exclusion practices, for racism and exclusion have been concomitant with black presence. The African diaspora's uprising is above all the outcome of a three-fold transformation of this demographic: a) its phenomenal growth as indicate many studies according to which the population of Antilleans was 9.5 times larger in 1999 than in 1961, and the number of Africans multiplied by 20.4 times between 1968 and 1999; b) its identity metamorphosis from Africans/Caribbeans to black French as the majority of this diaspora are French (born) citizens and not immigrants; b) its intellectualization, as well-educated components have outnumbered illiterate or hardly literate immigrants who hailed to metropolitan France from the Caribbean and Africa in the 1960s-1970s. Taking stock of this transformation, this paper will bring the agency of African diaspora - in the stead of French racism and exclusion - back in the center of the analysis, so as to answer the question as why a political mobilization labeled "black" occurred precisely at turn of 21st century.

El Sistema Nacional De Cuidados y Las Representaciones Sociales Del Cuidado De Personas Adultas Mayores En Uruguay

En el momento actual Uruguay se encuentra comenzando a implementar un Sistema Nacional de Cuidados, con la finalidad de producir un cambio en las relaciones entre el Estado, la familia, la sociedad civil y el mercado respecto a la responsabilidad y las formas de provisión de los cuidados a las personas en situación de dependencia. Incluye dentro de las poblaciones objetivos a las personas adultas mayores, como forma de dar respuesta a cambios demográficos, económicos, sociales, políticos y culturales sobrevenidos en los últimos años.

Este artículo realiza una descripción de las políticas que integran el Sistema Nacional de Cuidados y que se orientan a la población adulta mayor y plantea una discusión sobre el impacto que la implementación del sistema tendrá en las representaciones sociales del cuidado. Se discute, además, sobre los desafíos para la implementación que devienen de las representaciones sociales. Por lo tanto, son combinadas en esta discusión las voces de los actores involucrados en las prácticas del cuidado, y el contenido de los programas que hasta el momento se han implementado dentro del Sistema.

Se parte de datos cualitativos que surgen de dos proyectos de investigación desarrollados por el Observatorio de Envejecimiento y Vejez del Centro Interdisciplinario de envejecimiento de la Universidad de la República, que indagan sobre las representaciones sociales en torno al cuidado de personas adultas mayores

Transition to Old Age and Population Heterogeneity: A Comparison Between Two Latin-American Countries

With the significant gains in life expectancy that has been occurred since the last century in Latin-America, increasingly larger numbers of people reach the ages at which they are considered elderly. Old age have, on average, an approximate range of 20 years, and it could be much larger in the case of some people or specific social groups. Compared to other life stages such as childhood, adolescence or youth, old age appears as a more extensive step, which consequently, may designate a heterogeneous group.   Under this scenario, this work presents a discussion about demarcation of age categories, and more specifically, about the use of an age delimitation as the threshold of entry into old age. In that sense, we ask about the characteristics of older persons, how that characteristics have been changing in the last decades, and how they vary between different countries.

In this work we compare the characteristics of the transition to old age of men and women of different birth cohorts in two Latin-American countries that are at different stages of their demographic transition: Brazil and Uruguay.

Using data from National Research by Household Sample of both countries, the population characteristics that distinguish elders from adults are analyzed, focusing in three specific areas: the domestic sphere, the labor market and health conditions, attending at the differences by gender and educational levels. From the theoretical life course approach, elderly population is conceived as a heterogeneous group, and hypothesized that such heterogeneity has been increasing since the last decades in both countries but at different rhythms, making the experience of aging more diversified. To this end Entropy analysis is used.

Academic Discourses Across Epistemologies, Languages and Cultures: A View from the South

This paper will introduce different conceptual frameworks on '*interculturalid(e)/*interculturalism', 'multiculturalism' and '*transculturalidad(e)/*transculturalism', available to international research group members, and call for the need of international researchers to develop 'intercultural critical awareness' on epistemological negotiation and power relations. It will have in mind dynamic and dialectical North-South and South-North philosophical perspectives and postcolonial pressures. It will also offer and discuss new concepts such as 'glocal languages' and 'intercultural responsibility' as moving beyond the corresponding commonly used terms, '*lingua franca*' and 'intercultural competence', and address the controversy surrounding these terminologies. It deals with the attempt to define the idea of 'citizenship', at different levels, namely global, national and local, among international researchers and it will challenge them to build their professional and personal identities aaround such a multi-level horizon as well as to question their epistemological grounds against their plurilingual and intercultural backdrops. This paper is based on research carried out in a few Brazilian universities under the umbrella of the EU-funded project GLOCADEMICS (Marie Curie Research Fellowship, http://www.ces.uc.pt/projectos/glocademics/) and will therefore put forward a definition of the concept of 'Glocademics' within the scope of the research fields of Intercultural Communication and Internationalization of Higher Education.

Organizational Reliability : From Professional Organizations to Social Articulation

Various occupations working in a same High Reliability Organization (HRO), because of their working activities and their complexity, the nature of the hazards they deal with, can develop several organizations to manage industrial safety. By taking support on a specific HRO, this communication will show that the operators develop a "collegial" model (Waters, 1989[1]; Lazega, 1999[2]), the automation specialists develop a model of expertise (Caron, 2007)[3] and the assayers develop a model of the "joint regulation" (Reynaud, 1989[4]). They also develop professional safety cultures in conformity with these professional models of management. Gaps between representations and models of safety can occur. They are consubstantial with the complexity of the technical systems and even desirable when the managers seize the diversity of points of view and hazards to gath-

er specialized knowledge. They articulate them and develop a collective consensus which wins the collective approval. The coordination of the representations and the knowledge can also come out of cross-business spaces of deliberations. At least, the industrial safety is a reality, individually acquired according to the experiences and shared collectively by learnings. At least the performance of a productive organization is a result of on an articulation between organizational and professional cultures.

"Girls Today Are More Evolved": Sexual Agency in the Ressignification of Gender Discourses

This study analyzes the speeches employed in gender identity negotiations. An ethnographic study was carried out at a public school with 11-15 year-old girls, using the following methodological tools: participant observation, informal conversations, and group and individual interviews with students of both genders. The focus within this frame is on the group of girls self-titled "evolved". Their belief stems from the perception of power acquired by their maternal generation, which the former exercise. In a less oppressive social order, which promotes freedom and diversity in personality, the empowering speech synthesized in the "if I want it, I do it" boosts the competence and potential of girls seeking to assert their gender. The stigmatizing effect of breaking the "proper" femininity leads them to manage self-presentations that navigate the contradictions in contemporary speeches: they pose as "quiet and bold", but maintain apparent candor and passivity while experiencing control over their own desires. Sexual agency is justified by the symbolic re-appropriation of limitations currently in force: the objectification of boys through the fetishization of an active sexuality and the stance of female dominance. These (inter)subjective processes of negotiation reflect the complex relational conflicts and the micropolitics that surround sex, power and disputes within the intense (heterosexualized) social competition of the school environment.

Relational Aggression As a Form of Sociability Among Girls

This study analyzes conflicting relationships as a form of sociability that occurs in a game of differences and oppositions. An ethnographic study was conducted on two public schools with 11-15 year-old girls. The methodological techniques used were, participant observation, informal conversations, and in-depth interviews. In groups of girls conflicts are motivated by competition, group regulation and friendship protection. According to the interviewees, falsehood is a common feature, and based on this perception, they develop close, but fragile, relationships, which in turn tend to magnify the potential for conflict, which leads to long-term intimidation and aggression patterns. This is how the group exerts collective authority, and sets boundaries and discipline, what is, or isn't, acceptable in terms of personal exposure and moral conduct. Practices of exclusion, isolation and depreciation are a form of social interaction in which peer alignment and social hierarchy positions are negotiated. Relational aggression emerges as a practice and speech of control, surveillance and punishment of behavior that deviates from gender standards. Aggression (physical, verbal or psychological) integrates the process of negotiation and assertion of identity, and stands as a resource for social ascension or the expansion of its influence over its peers. In popularity disputes, rumors and gossip expose deprecated forms of femininity, but also engender excitement and entertainment in an environment marked by rigid rules of coexistence and behavior.

Carework in a Comparative Perspective: Exploring Professionalization Dilemmas Under Different National/Cultural Contexts

Different combinations of intersectional determinants shape social inequalities in care work once we take national and cultural realities in comparison. We argue that any discussion on the future of those inequalities requires attention to those combinations. The paper will address this question taking the Brazilian case as a departure point. National household surveys and Brazilian census will provide background information to explore the frontier between domestic employees and professional care workers profiles. Qualitative fieldwork conducted in Brazil (São Paulo), France (Paris) and Japan (Tokyo) will allow us to compare employment relations and working conditions among care workers in those different socio-cultural contexts. Combining quantitative and qualitative evidences two main issues will be addressed: how professional identities are expressed among care workers and domestic employees, and how commodification of care provision is embedded in different cultural realities, expressing various ways of linking production and reproduction

The New Economy and the Challenges Facing Emerging Countries: The Case of Brazil

The paper discusses the implications for Brazil - an emerging (latecomer) economy, characterized by socio-economic, historical and institutional particularities - facing the new paradigm of economic and social development based on knowledge capital and innovation. The paper elaborates on the way Brazil reacts to the challenges facing the rapid changes related to the new pattern of economic growth, by examining indicators related to the so-called new economy (investment in R&D as a proportion of GDP; number of patents granted; investments in physical capital and knowledge capital, among others), comparatively vis-à-vis some developing economies as the other BRICS member countries.

Data on knowledge capital and innovation, in particular, show that the country is ranked in a lower position not only in relation to the developed countries but also to its peers. The country's innovation performance shows mediocre results as the main innovation model is based on the use of imported machinery and equipment.

The paper's argument concerning the country's poor performance regarding the setting up innovative companies results from a specific developmental path characterized by the lack of an embedded institutional framework capable of supporting the requirements of the new context. The argument follows that this incapability in great part is due to the country's model of industrialization based on the import-substitution, oriented to the home market and favored by strong protectionism.

The conclusion is that the country needs a series of reforms that will not be easy to implement.

Institutionalising Activism at the Interface with Government: Examples from South Africa

Since the 1990s, many countries in the global South have adopted triptych decentralisation-privatisation-participation policies that have redefined responsibilities and resources of local government. The political importance of cities grew, and their responsibilities in service delivery broadened. This paper looks at public policies that are supposed to advance decentralization, to mediate between the state and 'disadvantaged communities', and to foster public participation among the 'urban poor' with the overall aim of eradicating poverty through efficient local self-governance. Based upon extensive empirical fieldwork in South African townships, I explore how civil society actors are integrated in the urban governance system. Specifically, I discuss the *Ward Committee System* established by local government and the *Community Development Worker Programme* introduced by the provincial government. How do these policies and programmes operate in political practice, and how do they intersect and become interwoven and contested at the urban level? I argue that the state's intention to recruit voluntary community workers and activists in order to professionalise them constitutes an attempt to appropriate civil society for specific political ends. Not surprisingly, then, these arranged encounters at the interface to incorporate 'civil society' in urban governance become mixed-up with inter/intrapersonal conflicts that are historically specific.

GUKELBERGER, SANDRINE* (Sociology, sandrine.gukelberger@rub.de)

Transforming Gender Relations through Women's Activism in South Africa and Senegal

Women's activism in South Africa and Senegal strives to transform dominant discourses and to effect institutional change, which remains a slow enterprise overall. Since the 1990s, both countries have adopted decentralisation policies that redefine responsibilities and resources of institutions of local government, and also introduced quotas for women. Hence, these decentralisation policies have institutionally strengthened the political importance of cities, broadened their responsibilities – and also enhanced women's formal role in politics.

Based on empirical fieldwork, the proposed paper discusses two cases of women's activism at the level of urban governance in Senegal and South Africa, focusing on the entanglements of social movements with formal politics. I argue that cities as a site of gendered urban governance provides broader insights into changing state-society-relations. The centralisation of power in cities and its social effects turns them into major sites of gendered 'contentious politics' (McAdam/Tarrow/Tilly 2001) whose matters often extend beyond municipal affairs, targeting the state and - since the neoliberal shift in the 1990s - supranational institutions. Social movements contain struggles between 'elites' with advantaged access to state power and 'challengers' with restricted access to formalised channels for political and social change.

While social movements – in all their diversity otherwise – are generally thought to act in opposition to the state, especially since they are not bound to it by contractual requirements like NGOs (deWet 2012), I will show how women activists in urban Senegal and South Africa maintain a dual positioning, which enables them to pursue both assimilative and confrontational strategies of engaging with the (local) state. Departing from the particular historical and social context of each country, the paper aims to identify similarities across women's activism.

Cultural Involvement and Cultural Preference of Ahiska Turks in the United States

The main purpose of this study is to understand acculturation process and psychological well-being of Ahiska (Meskhetian) Turks in the United States by examining the effects of ethnic identity, acculturation, satisfaction with life, mood states, discrimination, coping strategies, length of residence in the United States, religiosity and certain demographic characteristics such as gender, age, completed education level, and SES. The data has being gathered from Ahiska Turkish refugee immigrants in Jacksonville, Florida, US. In this study, acculturation process assumes as bi-dimensional which is not a zero-sum game. There will be used logistic regressions for acculturation process (cultural preference and cultural involvement) and ANOVAs for psychological well-being to analyze the associates and statistical significance between variables. The result will show how ethnic identity, satisfaction with life, discrimination, length of residence, religiosity, and demographic characteristics affect cultural involvement (integration-marginalization) and cultural preference (separation-assimilation) of Ahiska Turks and how cultural involvement and preference affect psychological well-being.

Inclusivist Understanding of Religion; Dealing with Disagreement and Diversity Via Said Nursi's Thought

Disagreement has always been a serious issue in the social life. Sometimes it is perceived as a gift and sometimes it is accepted as matter of conflict. Humans need to find strategies to cope with disagreement. Too many parts of the world witness the inability of humanity to live with difference. Many have died because of our inability to handle a disagreement effectively. In this study I will focus on the conventional approaches to this topic. For the modern mindset, the choice is simply a religious theocracy (which denies diversity) or an aggressive secularism (which allows diversity but only a privatized form of religion). Having looked at the traditional debate, I will discuss how Said Nursi (1876-1960), a famous Muslim thinker and theologian of Turkey, argues for a rich alternative, which affirms diversity yet also remains committed to the public nature of religious traditions. I will suggest that Said Nursi's inclusivist understanding of religion and theology can be an alternative solution for the problem arising from religious disagree-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ment. In my paper I will examine the original works of Said Nursi, the Risale-i Nur Collection, and give some examples from his life and interactions. Said Nursi's original terms "positive action" and "jihad of word and love" will be discussed to shed more light on religion's role in peace and violence.

The Role of the Court-Reforms in the Development of Modern Azerbaijan Society

Both in the judicial system and in the minds of the population, there are still problems with the past communist regime in modern Azerbaijan. The conducted surveyed allowed to show the character and the essence of this problem and identify the ways of improving the judicial system in the country in line with the requirements of a democratic society.

The majority of the surveyed believe that democratic transformation of society cannot be successful and private enterprises cannot develop without legal base and perfect judicial system that are capable of effective protection of private property rights, control after execution of the agreed responsibilities, protection of the rights of economical subjects, creation of stable conditions for the activity of native and foreign investors and foster creation of market relations.

One of the reasons for the judicial power not to be able fully satisfies demand for the services is the fact that this demand is artificially lowered because of the distrust of the population to the judicial system. The other reason that lowers demand for the judicial services is lack of economical growth, which doesn't foster growth of the need in resolution of economical arguments.

Study of the opinions of enterprise managers, representatives of the general population and judges and employees of the court machinery, analysis of their judgments and proposals allowed to reveal the most relevant problems related to the work of courts and render of the judicial services, to determine the paths for extension of population's and business sector's access to the judicial services, which will help to further improve the judicial system and will become a cause of the more effective implementation of the goals of the judicial reform in Azerbaijan.

Leisure and Wowens Political Leadership in Panchayatraj System of Karnataka:Acase Study of Bidar District.India

The study of leisure and women's political leadership is assuming importance all over the world, especially developing Asian country like India is in particular. The women constitute nearly half of the total population and this constitutes an important social segment of society. Their welfare and fair share in the development fruits is quite justified. No society can claim to be fair, free and equalitarian until its entire women folk, gets its due shared.... Gender equality in all walks of life is very much need of the modern welfare democratic society, gradual unfolding of opportunities in economic and other spheres of activities unfolding gradually in Indian society. However, the share of women in politics is very restricted. Their personhood however, now is being recognized and steps are being taken to put an end to such discrimination and exploitation. Their right to participate in political activity is now legally recognized.

Leadership is a process through which individual initiate for achieving common objective of the group of community by working together stimulates rightly point out "Be necessary for social science by those who hold any official position such as membership in panchayat boards. Leadership is technically indispensable, leadership and political socialization are two important concepts which are extensively used in this study.

The present study is an effort made to examine the socio-economic profile of women political leadership and their leisure in Bidar district of Karnataka state, confining to panchayat raj system which has emerged under new dispensation in the year 1994. The study also attempts to examine attitude of women regarding politics and their leisure for role of political socialization in shaping effective political leadership.

'European Trade Unions and Their Links with NGOs and New Social Movements: How to Explain Differences Between Countries?'

Trade unions are one of the major social actors operating at both national and international levels, and there is a long tradition of both country-specific and comparative research. The relationship between national trade union movements and non-governmental organisations, including 'new' social movements, has however mainly been studied at the national level and there are fewer comparative studies. This presentation will compare the varying patterns of relationships between trade unions and NGOs in five western European countries, based my jointly-authored book with Richard Hyman (LSE), *European Trade Unions: Hard Times; Hard Choices* (OUP 2013).

I will focus here on one of the key themes that we did not get a chance to explore in sufficient detail in the book: the relationship between unions and non-governmental organisations, including traditional NGOs and 'new' social movements, using data from five of the ten countries we studied: France, Germany, Italy, the Netherlands and the UK. Each country represents a particular European industrial relations model, and there are many interesting comparisons and contrasts between them in how and the extent to which they collaborate with NGOs, including new social movements. Three of the countries have two or more national confederations, divided ideologically, and there are also different patterns in the autonomy of individual unions within their respective national confederations, along with differences between governance and internal policy making structures. I will look at the degree to which all these differences affect the relationships between national union movements and NGOs. I will conclude that ideology and structure are both important in explaining the very different attitudes and practices in different countries, but that all the national trade union movements studied are moving toward closer relations with NGOs and new social movements during a time of economic and political crisis and union renewal.

Love in Turkish Cinema: I Don't Know Why I Love You

Man sees woman, woman sees man and they fall in love to each other immediately with an unbroken bound. This synopsis is the most commonly used method in Turkish Cinema. But what is the reason for this genetic overuse of love? And what can be the connection between the perception of love within the social structure and love as a phenomenon in Turkish Cinema? The social structure of Turkey limits romantic encounters between men and women other than in a smallest percentage of population. The power structure of family dynamics in Turkey strongly shaped by its traditional and religious background. This background is not affected by modernity because Turkey's power structure in 21th century mainly dominated by masculine, patriarchal, small congregational community erasing or not even creating social classes.   So these romantic encounters between man and woman fail to become a norm and turn into either melodramatic abuse or commercial consumption in most of the cinematic product. Thus love stuck into two dimensional aesthetic. The aim of this study is to elaborate on this connection through several contemporary movies which focus on love and some classics to measure time and social change.

In_Temperate Struggles – a Reflexive Debate on Intra-Organizational Research Projects on Intersectionality in a STEM University.

Universities constitute spaces of struggles through which different agents are trying to set foot and gain recognition. In this paper we want to shed light on struggles that happened in an Austrian public university in the course of a multi-layered change process towards more gender fairness. We thereto utilize our own experiences within this specific university and reactions towards our two intra-organizational research projects that aimed to unveil discriminatory, pre-reflective practices and facilitate a change process. The perceived reactions serve as vantage point to examine the power forces at play, which we reflexively debate in order to reveal the different sources of resistance and make them accessible to change.

The arena we focus on in this paper is the University we both currently work in, which – however – is just one of many examples. The University is the largest of three STEM (science, technology, engineering, and math) universities in Austria. As STEM university, the University defines its research as "cover(ing) the classic engineering disciplines" (University website). Similar to many other Austrian University, there is a horizontal and vertical segregation of female and male staff. Furthermore, intersectional interferences impact the chances of minority members, leaving a lot of space for fairness to be implemented. In this paper we discuss the encountered forms of resistance and – to a lesser point – support of fellow members of the University. By applying Bourdieu's analytical apparatus we reflexively debate the perceived practices of our colleagues. The level of analysis is less our personal, individual practice – which of course is embedded in the lived relations

and interactions with other agents – but the encountered relational practices such as recognition, resistance, and boundary heightening of our peers

GÜNTHER, ELISABETH ANNA* (TU Wien, elisabeth.guenther@tuwien.ac.at)

The »Ideal« Student. Intersectional Interference in STEM Education.

Despite several initiatives and policy measures the Austrian higher education in science, technology, engineering and math (STEM) is still hallmarked by an inequality regime. Not only are women are less likely to choose a STEM major, especially in typical engineering subjects such as electrical or mechanical engineering, but female and minority students encounter obstacles during their study time.

This paper traces the effects of intersectional interference at a specific Austrian STEM university. First, the administrative data of the university is analyzed with logistic regression analysis to show to what extent female and immigrant students have lesser chances to persist and graduate, even when pre-education and other factors are considered. A qualitative study than explores the interpretive frame of university teachers as well as students and beginners in the field of math, physics, and computer science. To grasp pre-reflexive stereotypes six openly moderated group discussions (4 with university teacher, one with advanced students, and one with beginners) and eighteen semi-structured interviews are analyzed. The focus is on university teachers, who as authority not only provide a learning setting but also act as guard of the symbolic capital associated with a university degree. The qualitative analysis unveils not only domain specific, excluding mindsets and a high individualization of responsibility but also several implicit stereotypes regarding the competencies of female and minority students as well as challenges for working students and students with impairment. The paper comprises the main results of my doctoral thesis.

Conceptualising Schooling and Education in Modern Society: A Theoretical Approach

In "schooled society" (David Baker, 2014), education is marked as an entity that provides leverage to one individual as compared to the other without its credentials. Amidst prevalent practice of "educational credentialism" (David Brown, 2001; Randall Collins, 1979), it's imperative to conceptualise schooling and education (primarily within the context of schools) in modern society, for such attempt would provide a tool for analysing the status and mapping the social change.

While it is largely true that modern society is schooled, as manifested by the state and embodied by individuals through the process of socialisation, this phenomenon is quite complex, as well as specific to historical and cultural contexts. With theoretical insights provided by Baker, Brown and Collins through their conceptual writings, this paper explains the complexity of schooled society, its complicity with social change, and the role of state in developing the system of education as we observe it globally.

The empirics of the paper are drawn from PhD fieldwork conduced from December 2014 to December 2015 in Dehradun city in Northern India. The paper is organised into three sections. First section discusses the theoretical explanation of the concepts: "credentialism" and "schooled society". Second section provides empirical description of Indian schooling system and brings forth the changing perspective of educators and students towards education. The final section critically engages with the aforementioned concepts and authors in an attempt to conceptualise shifts in perceiving and practicing education and suggests ways in which these shifts lead to creation of a new social.

Gandhi and Education: Theoretical and Practical Approaches to Conceptualising School Education in Modern Society

Influence of neo-liberal ideology on school education has impacted delivery, provisioning, and outcome of global practices of formal teaching and learning. The core issue, however, lies within conceptualising "education" per se, i.e. what does education mean to the educators and recipient of education. Contemporary scholarship in sociology of education does engage with this aspect but it fails to challenge prevalent notion of the purpose of educating. Its imperative, therefore, to examine the definition of education and explore multiple ways education may be construed across cultures and by a range of theorists. Moreover, it is pressing to provide a transnational perspective on education in order to understand global inequality in society as well as provide alternative trajectory to educational development.

With such background, this paper is an attempt to engage with education theorising and its practical implication through Gandhi's perspective. Gandhi—a global figure in international politics—was a philosopher as well as a practitioner of peace, morals, and education. His conceptualisation of Nayi Talim(new education) is informed by not only his philosophical ideas but also his practice of educating in a formal institution of learning.

The paper is organised into three sections. The first section outlines the prevalent notion of education through suggesting the need for transnational mobility of ideas (Connell, 2014) in order to address the issues and concerns pertaining to modern education globally. The second section discusses Gandhi's theoretical conceptualisation of education along with the possibility of practical implementation of such conceptualising. Finally, while suggesting how Gandhi's thoughts on education may provide an alternative way of doing and thinking about education, I examine its relevance to the discourse within contemporary scholarship of sociology of education.

Inequity in Child Health: A Case Study of Slum in Chandigarh (Sector 25).

Globally more than billion people reside in urban slums. Residence in slums is a risk factor for a variety of adverse health outcomes. Health inequity in world's burgeoning slums is the product of numerous complex, social, physical, economic, political and health inconveniences to children and their families due to extreme poverty, overcrowding, poor water and sanitation, substandard housing, limited access to basic health and education services, and other hardships (e.g, high unemployment, violence). Approximately one third of the developing world's urban population live in slums, including hundreds of millions of children, which accounts for one quarter of the total global urban population. Despite the magnitude of this problem, very little is known about the potential impact of slum life on the health of children and adolescents. Statistics that show improved mortality and health outcomes in cities are based on aggregated data and may miss important intra-urban disparities. Limited but consistent evidence suggests higher infant and under-five years mortality for children residing in slums compared with non-slum areas. Children suffer from higher rates of diarrhoeal and respiratory illness, malnutrition and have lower vaccination rates. Mothers residing in slums are more poorly educated and less likely to receive antenatal care and skilled birth assistance.

The Paper observes the health inequalities in one of the Slum of Chandigarh, India highlighting the problems faced by the children and concludes that by providing attention and understanding and addressing child health in slum settings is an important priority for paediatricians and those committed to work for the rights of the children and child health worldwide concerted efforts are urgently needed to assess health burden among slum residents at the community level.

Dams and Development: Stress Factors for Environment and Societies

Prior to 1947, water resource development works in India comprised mostly of diversion weirs or small earth dams not exceeding 15 to 20 metres in height. With the adoption of policies for planned development after freedom in India, a major priority for policymakers was in favour of large dams. The visibility, scale and sweep of mega-dams made them potent emblems of the reconstruction and regeneration of the battered economies of long-suppressed post-colonial nations. The national plans also attempted to incorporate wherever possible a multi-purpose orientation to dam projects, including hydro-power, flood control and navigation, in addition to irrigation. Although enthusiasm for mega-dam projects amongst policy-makers remains largely undimmed, a formidable body of independent empirical research into many of these large dams has established how their social, human and environmental costs have been ignored or grossly understated in the planning of these projects, and the expected benefits exaggerated. Despite these social and environmental costs, a major resurgence in dam construction worldwide is now under way, driven by infusions of new capital from developing countries and a public campaign by the dam-building industry to greenwash hydropower as a source of clean energy. The present paper attempts to analyze some of the social and environmental impacts of hydropower projects in India and especially those that result directly or indirectly from the omissions or commissions of policy.

Right to Adequate, Accessible and Safe Drinking Water in India: A Study of District Moga (Punjab)

The human right to water entitles everyone to sufficient, safe, acceptable, physically accessible and affordable water for personal and domestic uses. The right to water is also necessary for the enjoyment of others human rights including the right to life and human dignity, the right to health, the right to adequate food, the right to adequate housing, the right to development and the right to a healthy environment. The Supreme Court of India as well as the state high courts in many case laws have interpreted the right to water as a part of right to life under article 21 of the constitution as part of the fundamental rights of the people. Known for its green revolution world over, the state of Punjab has got recent global attention as a 'cancer state'. The state has an average 90 cancer patients per 0.1 million population - higher than the national average of 80 per 0.1 million population. One of the major reasons for the same is the highly contaminated water. The present study is on District Moga, which lies in the Malwa region in Punjab where the ground water is found to be contaminated with toxics such as uranium leading to a large number of cancer patients from this region around 136 cancer patients per 0.1 million population. Besides piped water supply services; Reverse Osmosis Systems have been installed by the state government in the problematic villages to provide safe drinking water to the people in this region. The present study analyzes the issue of adequacy, accessibility, acceptability and safety of the drinking water services (piped water supply and RO supply services) in District Moga.

Navigating the Education Marketplace: The Impact of Space and Place on School Choice Amongst Low Income Households in New Delhi, India

In India, as in many countries around the world, the nature of the education landscape is changing. Within the last decade private schooling has 'mushroomed', much of it at the low fee end of the spectrum, despite an on going public debate in which serious concerns have been expressed about the quality of many such schools and inequalities of access. At the same time, private-public partnerships and parental choice mechanisms are emerging as discernable government policy trends in the name of quality improvements for school education and the elusive national goal of universal elementary education (UEE). In order to better understand the implications of such policy reforms and the increased marketisation of education more generally for social equity, this paper will consider how socially and economically disadvantaged households navigate the diverse terrain of the contemporary education market at the local level. The paper will draw on case study data from an on-going ESRC funded doctoral study comprising in-depth interviews with parents/caregivers across two slum communities in urban New Delhi, supplemented with secondary survey data, field notes and close analysis of school documents and government policy texts. The data indicates that geographical factors (including distance to schools and perceived dangers in travelling to/from school), local market dynamics (the number and type of providers) and the characterisation of schools as either 'safe' or 'unsafe' spaces are significant in shaping parental schooling choices. Moreover, the dynamic between space and education is apparent in schooling choices that reflect community solidarities and dissensions, often on the basis of religion and ethnic identity. In this way, the community space and its place within the wider urban centre is shown to be central to choicemaking processes and to continuing patterns of social segregation and educational inequality that make 'choice' as a policy mechanism for quality improvement problematic.

GUROVA, OLGA* (University of Helsinki, olga.gurova@helsinki.fi)

Voluntary Precarious. Clothing Designers As Entrepreneurs in Russia and in Finland

This research is aimed at studying the careers of fashion designers as creative entrepreneurs in Russia and in Finland. Since the beginning of the 2000s the entrepreneurs had been labeled as "creative class" (Florida 2002); recently a new category - "precariat" – have become widespread (Standing 2011). This shift in view on creatives occurred in the context of rethinking of the creative work in terms of neoliberal change of the role of the state in welfare and citizens' well-being. Thus this research is aimed at exploring how entrepreneurial self is constructed in the context of the changing state policies towards small-scale entrepreneurs in the creative field and by fashion designers themselves; and how the designers interpret and deal with the actual conditions of their work. I consider creative entrepreneurship as a form of subjectivity that is produced at the state level through documents related to creative entrepreneurs and by entrepreneurs themselves through experience (including bodily and emotional) and practices (cf. Skeggs 2004). Methodologically, this research is ethnographic study focused on designers as self-employed entrepreneurs, who either work alone or have a company of 2-3 people, namely, micro-enterprises. I study the following groups of the designers: Russian designers working in Russia and the designers of Russian and of Finnish origins operating in Finland. Methods include in-depth interviews with designers and experts in each country and secondary data analysis.

His Money Is Theirs, and Her Money Is Hers Alone: Household Money Management in Two-Partner Russian Households

Using semi-structured interviews with 156 non-poor heterosexual couples, we investigate household money management and domestic power dynamics in contemporary Russian two-partner families. During the Soviet period, it was women who typically controlled the domestic purse in urban families: husbands were expected to give most if not all of their cash wages to their wives who would then make purchases to meet household necessities, similar to how money has been historically managed in American working-class households. Contemporary Russian household money management is changing in response to the neoliberal market reforms, including labor market and welfare policy changes as well as the rise of neo-conservative gender ideology. For example, following the resource perspective, when husbands' income increases significantly, they assume control over all or most of the family money. In this paper we explore money management in a small group of Russian couples with a breadwinner husband and a working wife, where the husband provides for the family needs, and the wife's income - usually a much smaller one -- goes to cover her own expenses. Wives value their incomes and view them as means of empowerment. Instead of a traditional conceptualizing of marital power as an ability to exert influence and control (whether because of resources or decision-making prerogatives), we shift the attention to power as autonomy -- an ability to evade control, and exercise some independence. While recent analyses of money management in Western families point to growing financial independence of spouses via "separate purses", we draw attention to an emerging trend of hybrid traditional-progressive money management among Russian spouses, and discuss its implications for intrahousehold gender inequality.

Understanding Consumer Credit through Comparative Lens

The growth and spread of consumer lending in the last decades necessitated the use of technology to quickly process a large number of loans. For many reasons, the application of these formalizing tools is incomplete and various forms of consumer credit shun formalization and instead depend on informal social ties or other foundations. Our paper focuses on consumer credit in Central and Eastern Europe where one finds a large variety of forms of credit addressing different social segments of the population. We discuss three sectors: mass retail lending (including retail banking, purchase credit and mortgages); fringe lending (includes payday lending and usury) and collectivist forms of financing (rotating saving associations and saving coops). We analyze the ways that the three sectors generate demand and recruit clients, screen applicants, and deal with non-payment. We compare how formalization and social ties are deployed in these different sectors of consumer credit market, and how they produce unique identities, classify clients, generate reputation, and enact justice. We also discuss how these formal tools and informal bases of consumer credit simultaneously reduce uncertainties, create new ones and affect social inequalities.

Reproducing Expertise. the Role of Young Scholars in Ipbes's Capacity Building Efforts.

Being an expert organization in the making, the Intergovernmental Platform on Biodiversity and Ecosystem Services (IPBES) faces the challenge to create an organisation which is able to facilitate a dialogue between science and policy today, and to remain credible, relevant, and legitimate tomorrow. In this, how do IPBES work to recruit and reproduce expertise needed for delivering assessments? How is new researchers socialized and integrated into the expert organizations' epistemic perspective and social practices? What function does reproducing expertise have in the institutionalization of expert organizations? These questions are

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

central for this paper, which analyze IPBES's pilot fellowship program for young scholars.

sub-regional assessment processes, thereby strengthening its capacity and knowledge foundations. The ambition is that the program will be expanded to eventually "create a pool of competent professionals able to carry forward the Platform agenda". The participating young scholars will have a unique position and role in the making of IPBES. Participating in the program implies that they will have to balance (i) the expectations of having both a contributory and a learning position; and (ii) the commitment to work pro bono(without any economic compensation) in an assessment processes with keeping engagement with home institutions.

Through a combined analysis of documents and interviews with IPBES representatives involved in the fellowship program, this study explores this program, in particular what capacities IPBES are looking for and what role the young scholars play in the assessment process as well as for IPBES general development. The analysis finds that there are both benefits and risks attached to the involvement of young scholars in the assessment process. By way of conclusion, some general remarks on the conditions of recruiting and socializing new expertise is raised.

Language and Integration Among Immigrant Populations: The Case of Spain

Spain experienced a substantial immigration boom in the decade 1998-2008 in a process that has been thoroughly analysed. The Great Recession struck the Spanish economy in such a way that employment decreased rapidly, posing enormous problems for certain groups. Among the people hard hit by unemployment were a great number of recent immigrants. However, problems regarding social integration in Spain were not as acute as one could expect by considering just the labour market situation. Factors like return migration, unemployment subsidies, and family networks may have helped to cushion the effects of the crisis. This paper considers the role played by Spanish language skills in this regard, given that about half of the immigrant population had Spanish as their native language, and given the language learning activity of the remaining immigrants. Using the recently published Labour Force Survey special module on the labour market situation of immigrants (INE, 2015), the purpose of the research is twofold. First, an analysis of the variables that influence Spanish learning efforts among the immigrant population will be carried out. Secondly, the determinants of employment outcomes will also be analysed, paying special attention to job-search methods, and to the role played by fluency in the four official languages that exist in Spain (Spanish, Catalan, Basque, and Galician).

El Futuro Laboral De Los/As Jóvenes a Través De La Educación? Lo Que Opinan Estudiantes Hombres y Mujeres Indígenas y No Indígenas De Nivel Secundaria y Bachillerato De Tenango De Doria; Hidalgo, México.

Aún en 2015 en México coexisten dos países: uno pobre/atrasado y otro relativamente próspero. Los datos sobre la distribución de la pobreza extrema son elocuentes. En muchos estados del centro y norte del país disminuye, en otros permanece y aún se ensancha. Destacan territorios donde la pobreza extrema es irreductible: Chiapas, Guerrero y Oaxaca, y algunas regiones de Veracruz, Hidalgo y Puebla. Las preguntas obligadas son: ¿Por qué éstas diferencias si México es un sólo Estado-Nación con políticas e instituciones para todos? ¿Por qué ahí? ¿Por qué no en otros estados?

Al examinar y explorar algunos porqués de la brecha de éstos dos Méxicos, se pueden señalar varias causas de la pobreza y atraso: informalidad generalizada en actividades económicas y baja productividad, apego a economías campesinas, resistencias culturales, pésima educación, ausencias de conductas emprendedoras y de un estado de derecho, falta de infraestructura, corrupción y violencia; además de escasa urbanización para elevar la productividad y bienestar social y la persistencia de una población rural dispersa en miles de asentamientos en condiciones ecológicas muy frágiles (suelos pobres, altas pendientes, escasez de agua), así como de deterioro ambiental asociado a la deforestación y erosión,

consecuencia y causa de pobreza campesina e indígena en estados donde hay mayor biodiversidad.

Bajo este contexto, se presentan los resultados obtenidos en la cabecera municipal Tenango de Doria, –de la región indígena "Otomí-Tepehua", del Estado de Hidalgo, considerada oficialmente con grado de marginación "medio", aunque en realidad es alta— y en la que se indaga si en estas generaciones de jóvenes se halla la idea de "estudiar para un futuro mejor", o si es un mito; y por otra parte, si éstos jóvenes ven su condición étnica y social como condicionante de sus expectativas futuras no sólo en el ámbito escolar sino en el mundo del trabajo.

43 Students Are Missing in Mexico: Racism and Ethnicity Around Narratives of Denial and Justice

The forced disappearance of 43 students and 6 killed at the hands of the police linked to organised crime has deeply shocked Mexican society to say the least. In this presentation my aim is to discuss, based on documentary data, why are there two very different versions of this horrific event. One version entails the official discourse characterised by the way it manipulates data and conceals facts thus conveying a fictitious and unreal narrative of events. The other version shows the tireless journey to each corner of Mexico and many places abroad of the student's parents delivering a message of justice and truth. The word "forced disappearance" has become normalised, somehow accepted, while the parents insist that as the students were taken alive, they want them back alive ("Vivos se los llevaron vivos los queremos"). An international commission has been allowed to investigate the case; forensic international experts have been summoned to find out what ever evidence of the 43 students is available. If the official discourse denies such a cruel atrocity, restricts investigation, and delays results, allows me to argue that institutionalised racism is rampant and overpowering, because the ones that are missing, and are the victims, are young students belonging to impoverish indigenous ethnic communities. Conversely, the ethnic identities of the 43 missing have turned them into a leading aspect concerning public visibility of the case.

GUZMAN, EUGENIO* (Universidad del Desarrollo, eguzman@udd.cl)
FERNANDEZ, MIGUEL ANGEL (Universidad del Desarrollo)

Two Generations, Two Social Systems

The changes in values and attitudes, particularly among young people is a phenomenon widely studied, but not from the perspective of emerging democracies after periods or authoritarian dictatorships, as is the case of Chile. This raises questions about the differences between the generations socialized during the authoritarian period (1973-1989) and later (1990-2015). Transitioning from a nondemocratic to a democratic society in itself should have an impact in youth culture, since it involves the passage from a system of tight control of media and scarce political and civil freedoms to one entirely different. We compare the two generations taking over two fundamental questions: firstly, what is the magnitude of change and on what attitudinal and behavioral dimensions it occurs. The second question regards to the timing and pace of the rupture or generational change.

The research involves the quantification of changes in socio-cultural values (abortion, divorce, gay marriage, drug use, etc.) and other dimensions (political-ideological identification, political participation and interpersonal trust and institutions) and an historical and cultural explanation of such evolution. At the same time, we evaluate how in the process of opening to the world, the values of young Chileans has been assimilating the Latin American and global trends.

To make these evaluations we use data from six chilean "National Surveys Youth" (comparable among each other) gathered between 1999 and 2013 for the 18-29 years group. This includes groups socialized in authoritarian and democratic periods. To contextualize, the results are compared with these of mature democracies (Europe, North America and Oceania), and the Latin American neighborhood, drawn from the World Values Survey.

Preliminary analyses indicate that the gap between values and internal youth cultures and the world are shortened, and the changing attitudes of young Chileans are increasingly associated to global trends.

Labor Practices and Expectations of the Russian Young Scientists and Innovators

We study the labor practices of young people engaged in science and innovation entrepreneurship, because it is necessary to increase labor efficiency. Was substantiated theoretical understanding of the impact of the expected opportunities on the behavior of young people. It is based, on the one hand, on the theory of D. McClelland, according to which the labor activity, the result determined by the interaction of three variables: motivation, individual abilities and qualities. On the other hand, to describe the relationship between motivation, incentives and job satisfaction expectations were used the theory of   V. Vroom and F. Herzberg's two-factor model. In the empirical analysis as influencing elements were considered the opportunities provided by the institutional conditions, labor motivation of a young man, ideas about their capabilities, expected results. Using the data of poll of young researchers and innovators of Russia carried out by the Institute of Economics and Industrial Engineering of SB RAS in 2011 (N = 1037), as well as the factor and cluster analysis, are constructed empirical behavior models of young scientists and innovators. Considering labor motivation of youth and the influencing institutional conditions, the effective and adaptive models of labor behavior are revealed. Results the work of the groups, practicing this model, and their job satisfaction were used as criteria of evaluation of the models. Among the effective behavior models identified two typical for young researchers and two more - for innovators. Innovators are practicing effective models less likely than young scientists (43 and 62%) due to the lack of development of institutional conditions. Adaptive behavior models are often practiced to avoid the risk and hard work.

HA, JUNGIM* (Ecoles des Hautes Etudes en Sciences Sociales, jungim0717@hotmail.com)

Parcours Migratoire Et Soutien Familial Chez Les étudiants Coréens De France

L'objet de cette communication est d'aborder la migration et la mobilité sociale d'étudiants coréens en séjour d'études en France. Si le nombre d'étudiants reste constant depuis les années 1970, leurs caractéristiques, leurs projets d'études et leurs rapports à leur famille ont largement évolué et se sont diversifiés (Campus France, 2011).

Aujourd'hui, le soutien aux études des enfants prend de l'ampleur dans les familles, pour encourager la mobilité de classe des enfants et l'originalité de leurs profils sur le marché du travail ou leur accès à des niches économiques, dans un contexte économique compétitif (Bourdieu, 1984).

Quels sont les modalités de soutien familial que requièrent ces projets d'études? Comment ont-elles évolué dans les vingt dernières années?

Dans le cadre d'une ethnographie des parcours biographiques d'étudiants coréens en France et leurs familles en Corée, cette communication restitue l'analyse de la comparaison de deux sous-groupes d'étudiants coréens (arrivé en France en 2000 et 2010.) L'objectif est de déterminer les évolutions des rapports des étudiants avec leur famille, les modalités de soutien et le projet de vie a posteriori, entre ces deux groupes.

L'analyse montre (1) l'importance des prédispositions biographiques sur le projet d'étude, la socialisation en France et le choix de rentrer en Corée: il varie selon le genre, la classe et l'âge et dépend de l'anticipation des attentes des parents par leurs enfants. (2) Il existe un effet de génération entre ces deux groupes, dans la logique et le fondement du projet d'études. (3) Enfin, cette recherche montre le basculement des idées ancrées dans les idéologies traditionnelles coréennes, qui valorisent le collectif et la famille, vers les logiques contemporaines de l'autonomie et de la réussite sociale personnelle.

HAAS, MARITA* (Vienna Technical University, marita.haas@tuwien.ac.at)

"I Was a Woman. I Was Skilled. I Had a Doctoral Degree and [I Was] a Foreigner". Migrant Coping Strategies of Women in Highly Qualified Areas

Coming from a Southern European country with restricted career opportunities and reduced economic possibilities, *Elena* leaves her hometown and family for an international career in science. Her initial motivation to "make more of her" is combined with a high pressure from her parents. Her journey and the acceptance of positions in industry and university research, however, also refers to a process of being marginalized in various aspects: As a woman, she is exposed to stereotypical role-expectations and normative concepts of what is believed to be socially appropriate for men and women (West and Zimmermann, 1987; Ridgeway, 2009). In organizations where maleness is regarded as a superior trait; believes about the "inferior" lead to specific expectations of an individual's ability and performance (Acker, 1990; Gherardi, 1994).

How do these normative expectations - which are, partly, contradicting each other - determine the process of her professional identity formation? And how does she, as a female migrant, working in a highly qualified area, deal with experiences of xenophobic discrimination?

Professional identity is formed through accumulated individual experiences within a profession over time and is strongly influence by norms, attributes, and motives for the profession (Ibarra, 1999). Biographical narratives make individual and institutional processes as well as their interrelation visible. They depict the continuous negotiation process how to deal with different role expectations and the question how to integrate them in the own biography. A particular focus on the self-presentation of *Elena* (cf. Rosenthal 1993; 1995) demonstrates that narrating and thus constructing the own biography are closely related with the process of professional identity formation. In her account we learn about the way how she used her biographical experiences to develop a coping strategy how to succeed.

HABTI, DRISS* (University of Eastern Finland, driss.habti@uef.fi)

Wellbeing Among Russian Physicians in Finnish Healthcare in Relation to Work and Personal Life

The rising global shortage of general practitioners (GPs) impends the effective functioning of primary healthcare (Thompson et al. 2009). Finland experiences shortages of general practitioners at primary health centres, which amounts to 6% in 2010 (Ruskoaho 2013). Of the total number of GPs, 18% were substitutes and nearly 6% recruited from labour-leasing companies (Ruskoaho 2013). Since inflows of foreign-born physicians potentially fill in these shortages in many developed countries, the inflow of physicians to Finland is low (Kuusio et al. 2010, Aalto et al. 2013). Better work conditions and remunerations are major pull-factors for global migration and mobility of healthcare workers. The socio-psychological work environment, related to interpersonal and social interactions in the workplace, plays major role in work-related wellbeing and job satisfaction of employees. In Finland, studies indicate primary care physicians have poor working conditions (Kuusio et al. 2010), not very satisfied especially in the public sector (Heponiemi et al. 2011), and are the most likely to quit their jobs (Kuusio et al. 2013). This study addresses the migration experience of Russian physicians in Finland, and particularly the question of wellbeing as health workers in Finnish health services and as migrants in Finland. How do these physicians conceive of 'wellbeing' and 'quality of life'? What are the factors they conceive to improve their wellbeing in the workplace and social-family life? And what factors possibly affect their wellbeing in negative way? Using biographical approach, data were collected from in-depth semi-structured interviews (26) to document the work-life experiences of Russian physicians. Among else, the interviews engaged into *wellbeing* and *quality of life* as conceptualized and lived experiences by respondents. The study aims to broaden sociological understanding on the issue of their wellbeing and health, and to inform about ways to retain GPs through improved policy in primary care.

Social Identification and Group Performance: The Effect of Different War Outcomes on National Pride, the Sense of Belonging and the Sense of Community Among Citizens

It is long been known that Identification with in-groups is motivated by the need to belong and to participate in bounded cooperative social units. Once the self is attached to a distinctive in-group, additional motives to achieve positive valuation are engaged. The context of real life conflict between groups has interesting characteristics that permit a close examination of some of the central assumptions in social identity theory. Individuals' aspiration to achieve a positive self-esteem may clash with their membership in a social group, when social comparisons are made with a clearly superior out-group (for example, following groups' defeat in a war). No empirical work on the effects of group performance on individual's social identity saliency has so far been framed within social identity theory and applied in the context of political science. The current research examines variations in social identity's saliency (including the components of national pride, sense of belonging and sense of community) of group members, generated by different war outcomes (victory, defeat, stalemate and agreement). The study also sheds light on the intricate relations between social identification of individual group members and group performance. This Internet based research, supports the conclusion that a positive group identity is sustained despite poor group performance, as no significant differences between groups were observed across parameters and conditions. The paper also addresses the psychological and sociological mechanisms that may account for the found effect, and discusses the importance of the findings in the realm of post conflict societies.

HADJICOSTANDI, JOANNA* (Univ Texas Permian Basin, hadjicostandi_j@utpb.edu)

Social Activism and gender-based student engagement through online classes

Although students are quite interested in learning about issues of social inequality and intrigued by the various ways theorists with different sociological perspectives explain these, chances are that the knowledge will remain on the academic level when they finish taking the particular sociology class that exposed them to an analytic view of the issues. As educators how can we encourage students not only to realize that they are capable of achieving social change, but to actively get involved in achieving social change? This paper concentrates on analyzing students' interest in social activism, and social inequalities through the analysis of their responses to various on-line discussion questions and in a MOOC of 10,000 students online class. The content analysis of those questions will be juxtaposed with similar discussions and papers from 4 university regular online Social Stratification classes. Gender differences will be noted and analyzed.

This topic is very important because we live in a world that is global and in a country, the USA, that is multicultural and multiracial, and its citizens have historically faced deep divisions and separations, that are deeply seated in its social institutions. Students of all backgrounds need to have an understanding of the socioeconomic and political issues involved in the social fabric of their cities and

countries. How are those different in US based courses as opposed to an International MOOC?

A lot of the material analyzed and discussed in a course like this presents itself to scrutiny, suspicion and very often resentment. It is very important to hold a neutral position in discussions and to present historical facts as clearly and in depth as possible, in order to allow for the students to gain access to critical thinking.

Public and Private Environmental Behaviors: Determinants, Differences, and Similarities Across Countries and Time.

After some substantial agreements at the 1992 UN Conference on Environment and Development in Rio, the environmental movement was characterized by optimism. This optimism, however, was short lived, after the subsequent failure of various agreements. Correspondingly, international comparative survey data also shows that individuals' support for environmental organizations and related public actions peaked in the early 1990s and have declined ever since. Private behaviors, on the other hand, have remained strong in many countries or have even increased in the same period.

Considering these contrarian trends as backdrop, this contribution investigates individuals' public and private environmental behaviors across countries and over time using data from the International Social Survey Programme of 1993, 2000, and 2010. Independent variables include various socio-demographics and attitudes at the individual level. At the country level, the international embedding of a society, its economic position and related ecologically unequal exchange as well as other national characteristics such the level of affluence and pollution measures are considered.

Methodologically, a multilevel analysis is applied that considers both individual and contextual characteristics as well as changes over time in a single model. A novel unbalanced time-comparative design is used, which allows to include countries regardless of how many of the three ISSP waves were fielded. This strategy allows to differentiate between over-time and cross-sectional effects, which has been done rarely in previous analyses.

The contribution thus speaks to two audiences: Firstly, to scholars who are interested in individuals' environmental behaviors, the changes of these behaviors over time, as well as differences and similarities in the underlying determinants. Secondly, it speaks to scholars who are interested in the methodological aspects of how to analyze cross-national and time-comparative survey data in unbalanced datasets.

FLESKEN, ANAID (University of Bristol)

The Ideal Compatriot' – the Influence of Global Ideas, Elite Discourse, and Changing National Contexts on Individuals' Perceptions of the Ideal Citizen

The definitions of citizenship and citizen rights have changed over the last century from more national loyalty principles to more inclusive concepts of global and natural rights. International institutions such as the European Union, but also an increasing global civil society, have undermined the concept of distinct and separate nations. Yet these developments are not uncontested. Globally, but particularly in Europe, anti-immigrant protest movements are increasingly visible while nationalistic parties gained influence in the political arena.

Considering such diverse trends as backdrop, this contribution investigates individuals' perceptions of an ideal citizen across countries and over time using survey data from the International Social Survey Programme. The dependent variable is based on the respondents' views on which characteristics are important for being truly British, German, Austrian, etc. – which were included in the 1995, 2003, and 2013 ISSP modules. Independent variables are various socio-demographics and attitudes at the individual level. At the country level, the international embedding of a society, dominant party views, and other national characteristics such the level of affluence and immigration are considered.

Methodologically, a multilevel analysis is applied that considers both individual and contextual characteristics as well as changes over time in a single model. A novel unbalanced time-comparative design is used, which allows to include countries regardless of how many of the three ISSP waves were fielded. This strategy allows to differentiate between over-time and cross-sectional effects, which has been done rarely in previous analyses.

The contribution thus speaks to two audiences: Firstly, to scholars who are interested in individuals' conceptualizations of a 'good citizen', the changes of these conceptualizations over time, and the underlying determinants. Secondly, it speaks to scholars who are interested in the methodological aspects of how to analyze cross-national and time-comparative survey data in unbalanced datasets.

The Future Is Not What We Thought It Would be: The Gap Between Aspirations and Actualisation in Post-Apartheid South Africa

This paper focuses on the experiences of previously disadvantaged South African youth residing in a rural township in Mpumalanga province. These young adults are controversially referred to as the 'born free' generation, growing up in a democracy that officially offers them equal opportunities yet continues to grapple with the legacy of apartheid. Despite the majority of 'born frees' facing poor education and high unemployment, existing research indicates ambitious future aspirations among this group, the presence of which has been linked to affirmative action policies and the pervasive rhetoric of freedom and opportunity in the 'new South Africa.' Drawing upon post-structural theories which recognise the historically embedded nature of identity, this paper explores the discourses which inform how the 'born free' generation account for their past, present and future lives. Through analysing empirical qualitative data, it considers the influences to emerge from schooling and home environments as well as other significant resources that young people draw upon as they develop their 'possible selves.' Informed by extant literature which indicates the gap between aspirations and achievement among South African youth, this paper employs a theoretical framework which explores the key dynamic of 'structure' and 'agency.' It reflects upon the extent to which these young adults recognise potential constraints on their ability to realise their aspirations, and the degree to which they deem themselves individually responsible for their futures. Drawing upon extant literature in the sociology of South African youth, this paper considers how few 'born free' South Africans make an explicit link between apartheid and their present life socio-economic circumstances. Informed by postcolonial theory, it argues that a historically situated awareness of present socio-economic circumstances can play a vital role in forming the critical consciousness necessary for young South Africans to create, rather than merely inherit their futures.

HAGEN, MALFRID IRENE* (MI Hagen, moliren@online.no)

Using Art to Signal Economical and Political Power

In this paper I look at the shifting interest and use of art in Norwegian business life and the Labor Movement during the last century. Collecting art is a way to signal economical power among private and corporate art collectors. Today, many corporate collectors look at the art as a factor for increasing the creativity and innovation among employees. The charismatic figure of the artist also seem to have become a new role model, in respect of how artist works, and how many new industries organize their work today; where the employees, similar to the artist, are free to work whenever and wherever they like. However, also political parties and movements use art to signal their power to rule or influence the society. Norway was governed by the Labor Party from 1935 to 1965, (in exile during WWII), and for 28 years between 1965 and 2015. Due to its long-term governing many claim that the Labor Party, and the Labor Movement, had a crucial role in developing the Norwegian Welfare-state. In the 1930´s the Labor Party used artists to create powerful political posters inspired by the Soviet-posters from the 1920´s, to spread their ideology and recruit new members. After World War II artists decorated many new public buildings in the spirit of the Labor Movement, depicting men and women rebuilding the society after the war. Periodicals, for example those of the Labor Youth Organization, often used art with motifs from working life on the front page. In the 1950s the Labor Movement encouraged their members to attend an art club that offered affordable high quality art to laborers. Obviously, art was popular in the Labor Movement during the middle of the 1900s, in a time period where most Norwegian businesses seemingly had little interest of collecting art.

Mind the Cancer Screening Gap Between the Medical and Laypersons' Languages

Acceptance of the medical rationale for colorectal cancer screening does not guarantee test-adherence, but its absence may withhold the undertaking of the recommended tests. This acceptance often entails clinical knowledge, but a significant knowledge gap in CRC screening rationale and principles separates between doctors and lay individuals invited to test. This gap consists of unique language use, as well as concepts, perceptions, and assumptions. The paper highlights this gap, which can be bridged by a two-way translation channel, with examples based on several studies carried out in Israel over the last two decades.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

We analyze how the major medical distinction between a *diagnostic* and a *screening* indication to undergo medical tests or procedures is taken for granted by medical personnel on one hand, yet, most often, poorly understood by laypersons seeking medical help, on the other. Another example is the assignment of medical meanings to everyday-life words in the relevant spoken language, with straightforward lay connotation(s). Additionally, lay persons' daily use of medical terminology, often does not imply their deep understanding of the issue, but rather the mere citation, in a slogan-like manner. These discrepancies lead to the conclusion that the premise of having a common spoken language does not guarantee a mutual understanding in general and in the delivery of health care in particular. In order for health care providers to address the issue, we propose to map (potential) misunderstandings using mutual, non-judgmental, reflexive tools such as questions, dialogue, information exchange and general clarifications in a direct exchange with lay persons.

HAHN, KORNELIA* (University of Salzburg, kornelia.hahn@sbg.ac.at)

Consuming and Expressing the "Sound of Music" Culture Among Tourists in Salzburg: A Link Between Immediate and Non Immediate Body Experiences

In this paper, I address the theoretical issue on how experiences mediated by "immediate" corporeal sensations and by communication technology are linked. This issue seems to be crucial to current Sociology which, though, often makes a clear theoretical distinction between immediate (and "real") experiences and virtual (and somehow distorted) experiences. Also, the classical scholarly work, however still tremendously fruitful, as e.g. the work of Erving Goffman to name only but one who has influenced General Sociology and the Sociology of the body at the same time, does not much refer to media technology, of course. My argument is that the interpretation of sensations should not exclude media communication and, also, that the classical scholarly work (Goffman, Alfred Schütz, Georg Simmel) can be adopted toward that argument. After a brief introduction to this theoretical argumentation, I extensively demonstrate the argument by drawing on qualitative, visual data derived from a project on the perception of the *Sound of Music* Movie. The project is based on interpreting body performances from tourists traveling to Salzburg and engaging themselves in organized *Sound of Music* Tours. It shows the "body as a vehicle for the expression and consumption" of a *particular* culture.

HAHN, KORNELIA* (University of Salzburg, kornelia.hahn@sbg.ac.at)

Quality Time and Enchanted Places. the Commodification of Sensory Experiences

In this paper, I argue that sensory experiences which are (still) subject to the non rationalized interpretation of human bodies become a resource for commodification processes. With this argument I do not refer to the emotion industry but rather to the tourism and leisure industry. Drawing on analyses of qualitative data (textual and visual) from this field, I describe two contradictory logics of time-space relationship influencing the corporeal performance. Eventually, I show that the contradiction is apparently dissolved in a new form of framing these situations: by highlighting *quality time* (as a short time with intensified experience options) and *enchanted places* (as a confined, but sensually enriched environment) within narrative scripts the demands of both, sensory experience seekers and commercial enterprises in late Capitalism, are met. Stressing the importance of narrative scripts for corporeal performances, I consider aspects of media cultures (remote communication and experiences) as theoretical approach to the Sociology of the body.

Life Satisfaction and Subjective Assessments of Success Among East-West Commuters in the Central European Region

This presentation addresses life satisfaction among East-West commuters in the Central European Region (CENTROPE). Reviewing the literature, the life satisfaction concept is seen to be applied – more or less explicitly – as a general indicator of subjectively successful migration. This interpretation is based on a theoretical presumption regarding the migrants' motives. Life satisfaction studies often conceptualize migration as an attempt to generally improve life, increase quality of life, or maximize benefits.

However, present research has mainly considered the consequences of migration for migrants' life satisfaction as a function of income gains. Other economic and non-economic outcomes of migration are less often thematized. Moreover, it is questionable whether high levels of satisfaction are to be equalized with subjectively perceived success in migration. Against this background, this presentation addresses three questions: (1) Which economic and non-economic factors affect commuters' life satisfaction, (2) which factors influence assessments according to which commuting has been beneficial for one's professional development and life in general, and (3) how is commuters' life satisfaction connected to subjective assessments of successful commuting?

This presentation is empirically based on quantitative (N = 1,342) and qualitative (N = 27) data drawn from a current research project dealing with residents of the Czech, Slovak and Hungarian border regions who work in Austria. Preliminary quantitative results indicate correlations between assessments of success and life satisfaction. Subjective assessments of commuting are strongly affected by relative gains in status within the commuters' home societies, educational levels, linguistic skills, experiences of dequalification, and transnational networks. Furthermore, the qualitative findings refer to the relevance of experienced discrimination. Overall, this presentation highlights several crucial subjective dimensions of success that are associated with commuting, yet are not exclusively attributed to economic factors.

Determinants of Social Cooperation: A Survey Experiment

Cooperation with others is clearly an important aspect of social integration. However, people's willingness to cooperate differs according to their socio-demographic characteristics. Moreover, the characteristics of a person one is potentially to cooperate with also affects the level of cooperation: people may show less willingness to help a person belonging to a different social group.

The aim of our research is to examine the determinants of cooperation, using a survey experiment method. As part of our survey questionnaire each of our respondents (n=479) were made to evaluate 15 hypothetical situations (known as "vignettes"), where a stranger asks for help ranging from small favours (i.e. a short phone call) to bigger requests (e.g. giving juridical testimony), and were asked about their willingness to help in these situations. Exploiting the intra-respondent variation of situations (gender, age, occupation, ethnicity and the residence of the stranger asking for help, as well as the hypothetical situation itself), our experimental research design allows us to run multilevel regression models and to examine causality between these characteristics and the respondent's willingness to cooperate. Moreover, since the survey database contains the detailed characteristics of the respondent, we also analyse the effect of status differences between the respondents and the stranger of the vignette (i.e. the stranger asking for help). Using this research design and data, our results provide evidence about the determinants of cooperation and establish a wider sense of the mechanisms of social integration and disintegration in a way that ordinary survey designs are not able to do in themselves.

HAJDU, GABOR (Institute for Sociology, Hungarian Academy of Sciences)

The Effect of Temperature Shocks on Health at Birth

In this research we analyze the effect of extreme temperature during the pregnancy on the outcomes of live births in Hungary. Birth registry data of more than 5 million newborns between 1970 and 2010 are matched with daily temperature data. Matching is based on the place of residence of the mother at the time of the delivery. Birth registry data that covers the entire population come from the Hungarian Central Statistical Office, whereas city-level weather data come from the Hungarian Meteorological Service. We calculate indicators of extreme temperature (e.g. the number of extremely hot days) for each trimesters of the pregnancy. Our dependent variables are birth weight, low birth weight, Apgar score, birth length, and pre-term birth. Although variation in weather over time is exogenous, we are able to control for important socio-demographic factors that might influence newborns' health, and even for unobserved time-invariant mother char-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

acteristics by performing mother-fixed effects estimates. In this way our study identifies causal effects.

Our main research question is whether temperature shocks (defined as occurrence of extremely hot/cold days) in utero influence health at birth. The second research question is the following: in which trimester is this relationship the strongest? Finally, we try to answer the question: how do the estimated effects differ between high- and low-status families?

In one hand, this study adds to the large and growing literature studying the effects of fetal conditions on short- and long-term outcomes (e.g. health at birth, education, labor market success, etc.). On the other hand, our research is also related to the literature analyzing the impacts of global climate change.

HAJDU, TAMAS* (Institute of Economics, Hungarian Academy of Sciences, CERS, hajdu.tamas@krtk.mta.hu)

Weather and Subjective Well-Being

In this research we analyze the effect of the weather on individual subjective well-being. Previous studies found inconsistent results. The classical and widely cited paper of Schwarz and Clore (1983) found that respondents reported higher levels of satisfaction and happiness on sunny days compared to rainy days. Although this results was confirmed by some studies (Kämpfer – Mutz, 2013, Feddersen et al, 2012), other papers concluded that daily weather conditions have no influence on well-being (Lucas – Lawless, 2013, Schmiedberg – Schröder, 2014). Others argue that the effect of weather on well-being might be significant, but it is unimportant regarding the estimated effects of major determinants of well-being: inclusion or exclusion of weather conditions in the estimated models on life satisfaction do not influence the coefficients of other explanatory variables (Barrington-Leigh, 2008).

The aim of our research is to provide new evidence on the relationship between weather and subjective well-being. We use data from a nationally representative panel survey from Hungary (TÁRKI Hungarian Household Panel 1992-1997, n=4500), and city-level daily weather data come from the Hungarian Meteorological Service.

Our research has two novelties. First, using panel data we are able to control for time-invariant person-specific traits that are important predictors of satisfaction. Second, while estimating the effect of the weather on the day of the interview is widespread practice in the literature, it is possible that weather on the day of the interview influences subjective well-being in a relative manner: compared to weather on the previous days. In other words, a sunny day might matter more if the previous day was rainy. In order to check this hypothesis, we estimate models including a broader set of weather variables. Our results might have implications for the comparability of well-being measures across regions and countries.

The Representation of Women in Iranian Cinema before and after Revolution(1979)

Culture can be studied as an intermediary of miscellaneous fields of art. Cinema is an artistic area with an interactive relation with culture. It can either affect culture or be influenced by it. The presence of women in Iranian cinema can be generally divided in two periods, before and After the Islamic revolution of 1979.

The theoretical framework of the research is the feminist film theory. Therefore, the research method is a combination of psychoanalysis and semiotics as the textual analysis. To this end, six box office hits produced from 1979 to 2010 through four different political eras have been chosen and were analyzed and compared with six celebrated pre-revolution movies. A qualitative procedure and the content analysis technique were means to this study purpose.

The research shows the changes of representation of women on the screen corresponds with Iranian women's successes in transition from the private to the public. Image of women on the screen has been partially a reflection of what women do or are trying to do in the society. Before the revolution, women's roles were limited to stereotypes of hysteric housewives, naïve girls coming from provinces and women of low morals. With the advent of the Revolution in 1979 and during the 8-year war, presence of women considerably drops off. But afterwards, women gradually established themselves in the cinema industry; employed and socially active women started to make appearances in the movies and sometimes played the main roles without hints of sexploitation.

On the other hand, the major issue that concerns western feminists about Hollywood film industry is objectifying women. This study intends to determine if as a result of obligatory Hijab (Islamic wearing) in Iranian cinema and therefore the lack of sexploitation, these feminist film theories are not completely in accordance about Iranian film industry.

Bhikkhuni Ordination and Digital Activism

Gender discrepancies, supported by religious traditions, continue to have negative effects on women's wellbeing. Such gender disparities persist in Buddhist societies and institutions, linked to cultural and religious beliefs and practices, which allocate a lower status to women by stating that female rebirth is a result of bad karma due to negative acts committed in previous lives. In some Buddhist traditions, in Asian as well as Western settings, nuns cannot ordain to the same level as monks, most Buddhist archetypes of enlightenment remain male and men hold positions of power and privilege within the majority of Buddhist organisations. Since the 1980s a global Buddhist women's network, Sakyadhita, has campaigned for gender equity and full ordination for women as Bhikkunis. This paper will focus on recent controversy surrounding British born Theravada monk, Ajahn Brahmavamso Mahathera's, the Abbot of Bodhinyana Monastery in Western Australia (WA), advocacy for equal rights for women within Buddhism. In 2009 Ajahn Brahm, as he is known, helped ordain four Bhikkhunis in WA, as a result of which Bodhinyana Monastery was excommunicated. In 2014, Ajahn Brahm's planned speech on Gender Equality at the United Nations Day of Vesak (UNDV) convention in Vietnam was withdrawn by the UNDV's International Committee. Both events generated significant online activity in Bhante Sujato's Blog, on the Bodhinyana Monastery website and in an online petition to invite Ajahn Brahm to deliver his paper on Gender Equity at the 2015 UNDV convention. This paper argues that Buddhist women and men, nuns, monks and lay people including scholars, are uniting globally to campaign for gender equality in Buddhism, drawing on *both* traditional Buddhist social theory and modern digital activism to further their aims.

HALAWA, MATEUSZ* (Institute of Philosophy and Sociology of the Polish Academy of Sciences, halam023@newschool.edu)

Productive Lives of Mortgages in Poland

Based on ethnographic fieldwork in households of the first postsocialist generation in Warsaw, Poland, this paper tracks the social effects of the rise of mortgage credit. In the last decade mortgages, one of the oldest devices of capitalism, proliferated in the Polish society only recently reformed into a market economy. It is an unlikely natural experiment that makes visible the properties and capacities of the mortgage as a social mediator in a space where there is no collective memory of what mortgages are or do, there exists no significant group of those who completed their payments, and mortgage contracts often reach further into the future than the history of market economy in Poland reaches into the past. How does the innovation of the mortgage get domesticated in household economies and become entangled in kinship networks? This paper argues that mortgages have "productive lives" across domains of economy, society and culture, and that they should be counted as significant actors in their own right that have the capacity to transform social relationships and shift subjectivities. The analysis will focus on young couples going on their own in their first apartment bought with the mortgage. I will investigate how the mortgages constitute both the affective and the monetary economies of the household, which become centered around financial and symbolic demands of repayment. I will examine how the mortgage participates in practices of relational work between the young couple and their parental households, especially around questions of family property and inheritance, as well as around ongoing intergenerational transfers of time and money. Finally, I will explore the social meanings of the mortgage in the context of processes of financialization of everyday life beyond the usual Anglo-American space in which it has been studied.

HALL, JOHN R.* (University of California, Davis, jrhall@ucdavis.edu)

Phenomenology of the Future: The Politics of Time, Institutions, and Collective Action

"Structural phenomenology" offers a novel approach to political sociology in that it is centered in understanding the relationships between social action and interaction, social temporalities, and institutional and lifeworldly structures. In particular, the focus on alternative temporalities of action offers a theoretical basis for analyzing alternative ways that individuals, groups, and movements construct futures, in part on the basis of both legacies, memories, and idealizations of the past. Additionally, the phenomenological focus on institutions in relation to actions offers a basis for opening up sociological considerations of alternative futures. In order to give empirical flesh to the theoretical bones of structural phenomenology as social theory, I will especially reference alternative constructions of the future in relation to climate change. These empirical considerations offer a basis for demonstrating how ideology and actions are bonded in alternative constructions of the future.

Migration and Music in Texas and Chile: Mestizaje, Hybridization, and Identity

In South Texas in the United States, Mexican American music, particularly the popular form of Conjunto, has been influenced by new waves of immigration from Mexico and Central America. Both Norteño and Banda have come on to the music scene, with new club venues and radio stations catering to new immigrants. Similarly, in Chile, the migration of individuals from Peru and Colombia has imported new musical forms. The purpose of this research is to study and compare the migration of musical forms in relation to the reconfiguration of identities socialization, and incorporation of transnational migrants into host communities. By utilizing ethnographies and life history interviews, this project will critically compare the migrant experiences of musical forms in and around San Antonio, Texas and Santiago, Chile. The authors posit that musical practices foment the creation of sociality in collectives of individuals from diverse regions, be they from Mexico, Central America, or Peru, Colombia or Ecuador. A second question posed is, to what degree or not is a new *mestizaje* identity being created? Or does the music help create enclaves that help immigrants retain their roots? For the purposes of this research, the new identities being formed speak to both the lived realities of the migrant peoples as well as the possibility of musical hybridization. The researchers are seeking to understand musical forms as representing organic intellectuals and, in that sense, more authentic, vis-à-vis commodified and rationalized forms of music existing in the hegemonic host culture.

Policy Analysis in Response to Population Aging: Long Term Care and Social Support for Older People and Family Caregivers

Aging in place is a core component of current public policy on aging in Israel. This is well expressed in the Long-Term Care Insurance law and provision of services that were developed alongside legislation. However, as a familistic society, care for older people is mainly a family responsibility according to cultural norms and values and under the law. We will discuss the government social policy and acts as well as responsibility to allocate resources and to formulate social and economic available and accessible services. Moreover, the intergenerational consequences of decisions taken in the planning and implementation of policies towards older people will be identified.

Using the Incremental Approach for public policy analysis, we will review government-institutional reports, decision making and legislative processes that were implemented in the last three decades, to analyze public policies and procedures that were enacted in response to the population aging care challenges.

State response to changes in care needs will be examined on three levels: 1. updating the legislation toward elderly and family caregivers; 2. allocating resources to answer the new needs of the elderly population and 3. developing public services and programs responding to the growing needs of family caregivers.

The analysis indicates that there was an attempt by the government to understand the meaning of economic and social implications of aging population. However, no clear-cut policy exists to deal with increasing care needs of the elderly and their family caregivers. Also, a slow and cumbersome decision-making procedure that does not trace the rapid changes was detected. Due to a lack of sufficient economic resources to develop new policies for services and/or programs for older people and family caregivers the government transferred most responsibility to the family without provision of adequate support to assist them with their caregiving roles along with other life commitments (work, children, etc.).

HALTON, EUGENE* (University of Notre Dame, ehalton@nd.edu)

The Moral Revolution/Axial Age As Progressive Regression

Karl Jaspers celebrated the era of "the axial age," the period around 600 BCE, as a triumphant breakthrough of human reflective capacities, a view echoed in Robert Bellah's book, *Religion in Human Evolution: From the Paleolithic to the Axial Age*, which celebrates the emergence of "the theoretic attitude." But as my recent book, *From the Axial Age to the Moral Revolution*, demonstrates, the previously unknown originator of the theory he termed "the moral revolution" in 1873, John Stuart-Glennie, took a markedly different view. Stuart-Glennie saw in it contradictions requiring further resolution in later historical development, and D. H. Lawrence, who I have shown also developed an independent theory of the phenomena twenty years before Jaspers, saw it as involving a tragic separation from the sustaining relationship with a greater bio-spiritual cosmos, a critique that has numerous implications for contemporary discussions of global sustainability as a moral as well as an ecological issue.

Drawing from these sources and from my own theory of history as involving a paradoxical contraction of mind, I propose a new way of viewing the moral revolution/axial age. History can be understood as the development of anthropocentric mind, contracting from long term evolutionary attunement to the informing properties of wild nature to a human centered outlook progressively dependent on human constructions of domesticated settlement. The axial "heightening of the specifically human in man," as Jaspers put it, may have come at the cost of disowning the living primate animal in man and the sustaining wild habitat of the biosphere. "Reflective" civilization was enabled to take one step further from the wild, not as progress, but as progressive regression, regressive in the sense that, far from controlling nature, humans began to consume it in an unsustainable Malthusian-like trajectory whose limits are being reached in our time.

European Disability Policy after the Uncrpd: Austerity Measures or Social Investments?

Adopted in 2007 the CRPD is the first UN convention to which the EU has become a party. Never have so many states become a party to a UN convention so fast. However, the CRPD is being implemented in the difficult context of the post-2008 global financial crisis and the current context of austerity and welfare reform across Europe. On this back-drop we ask whether the adoption of the CRPD in 2007 has led to a stronger and more unambiguous commitment to full and effective participation in society of persons with disabilities in Europe.

First, we examine to what extent the political agendas of the EU and European governments have included the goal of promoting the full and effective participation in society of persons with disabilities – and more specifically – the aspects

of such participation the authors frame as dimensions of Active Citizenship; opportunities for exercising rights and duties, living independently and making autonomous choices, and participating as individuals and groups in policy making processes of importance to oneself.

Second, we examine what existing comparative data tell us about the diversity and direction of disability policy in Europe. Has the financial crises starting in 2008 and the measures of fiscal consolidation in Europe involved a shift towards *austerity* in disability policy? Has disability policy in Europe moved in the direction of the kind of Social Investment strategy promoted by the European Union? If we can find trends in direction of one or both of these scenarios, have they affected European countries in the same way or to the same extent?

Third, the paper concludes by identifying the overall trends and some alternative scenarios for the future directions of disability policy in Europe.

Rates, Roses and Donations: Naming Your Price in Sex Work

The study of payment has remained interestingly under-theorized in sex work research, despite a growing body of scholars employing a labour rights framework to studies of the sex industry. This paper addresses this gap by employing an intersectional lens to analyse workers' decisions and perspectives on pricing practices in sex work. This is based on an empirical study conducted in 2013-2014 with 65 immigrant, migrant and racialized sex workers in Vancouver, Canada and Melbourne, Australia. Although analyses of pricing practices has been relatively under-examined in the sex work research literature (which has traditionally tended to focus on other topics such as sexual health, laws and regulation, vulnerability and risk, and working conditions), interviews with sex workers revealed decisions about pricing, rates, 'roses' and 'donations' to be a crucial site for constructing work personas, safety practices, and professional knowledge. Determining one's prices or rates in the sex industry is not a neutral, market-driven decision for many workers, but are infused with strong ideas about safety, character and industry that intersect with ideas about race, class and gender (of both workers and clients). This paper examines these dimensions before concluding with a discussion of the implications for sex work research and sex workers' rights efforts.

Stopped Clocks and Watches: Rethinking Modern Society and Clock Time

We can see stopped clocks and watches that are preserved in Japan. For example, they stopped at 2:46 (Fukushima), 5:46 (Kobe), 8:15 (Hiroshima), 11:02 (Nagasaki), etc. The function of clocks and watches is to tick away and show time. Stopped clocks and watches do not tick away time any longer. They have lost their function as a clock or watch. Nevertheless, these clocks and watches are never discarded because they are unusable. They are preserved as they are. Why are they preserved in this manner, although they no longer function as a clock or watch? I wonder if a stopped clock or watch shows the time different from the time that a working clock or watch ticks away.

About 110 years ago, Georg Simmel wrote "If all the clocks and watches in Berlin suddenly went in different ways, even if only by one hour, all economic life and communication in the city would be disrupted for a long time." He had the foresight to say that modern society cannot work without clock time. Needless to say, modern society does not work without the clocks and watches that temporally adjust the interactions conducted by many people who are spatially distant from each other. However, modern society does not just depend on clock time.

Edmund Husserl indicated that in each individual's consciousness, there is the time that accumulates vertically in memory in addition to the time that flows away horizontally. This is true of the social dimension as Alfred Schutz shows. While a working clock or watch ticks away every second of the time that is flowing away horizontally, a stopped clock or watch is showing the time that is accumulating vertically. In this paper I will empirically show this through research on commemoration ceremonies held in front of stopped clocks or watches.

HAMADA, HIROSHI* (Tohoku University, hamada@m.tohoku.ac.jp)

A Model of Zero Price Effect with Prospect Theory

According to standard expected utility theory, people will choose the option with the highest cost–benefit difference when they faced with a choice of selecting one of available products (or buying nothing). Recently, by psychological experiments, Shampanier, Mazar, and Ariely (2007) showed that people do not simply subtract costs from benefits but instead they perceive the benefits associated with free products as higher. Decisions about zero price products are empirically different from the forecast of standard rational choice theory. Their experiments

showed that people, who choose expensive option in non-zero condition, choose the cheaper option in the zero-price condition. However, they do not specify the mathematical condition of utility function that can generates such an inversion of preference or zero-price anomaly (Heyman and Ariely 2004; Ariely, Gneezy, and, Haruvy 2006). We give a general proof of existence of the condition of zero-price anomaly based on the prospect theory (Kahneman and Tversky 1979; Tversky and Kahneman 1981, 1992; Myagkov and Plott 1997). More specifically, we prove that the concavity at negative domain of value function is essential for the zero-price anomaly and explains the results of empirical experiments well. Additionally we test our proposal by psychological experiment which contrasts zero-price and non zero-price conditions. As a result, we succeed in showing that the prospect theory can explain the zero-price anomaly.

Appreciating Inequality: Providing Thickness to Discourses of the Powerless

Power imbalances that are ubiquitous in our society are irremediable not only because of uneven distribution of a variety of resources but also because of our collective preference for tidy and well-organized reality to which each of us mostly inadvertently ascribes particular evaluative/moral appropriateness or simply certain positive values. The sociology of language is expected to address the struggles for a better world in ways that take into account the irremediableness of power imbalances despite (or because of) each one's innate moral concerns.

By presenting a case in which employees of a bankrupted company posted messages about their uncertain future and anxieties on an Internet discussion forum (or a message board), this paper demonstrates that the analyses of mundane discursive practices can elucidate (1) how particular power relations are defined and sustained through actors' intricately intertwining concerns about evaluative/moral appropriateness, the factual/substantive understandings and the contextual relevance of their thoughts and deeds, (2) that each one is practicing ethics that keeps conversations going by accepting others' interpreting one's utterances in their own ways, and (3) that the power of words are significant because readers read their respective experiences into others' words in order to make better sense of reality.

Based on the analyses, this paper argues that the sociology of language can be re-oriented towards how researchers and their subjects alike can appreciate, rather than solve, power imbalances by paying more attention to each one's true but often ineffable sense of evaluative/moral appropriateness at a particular point in time and space. It will do so by diversifying possible alternative ways of configuring/re-figuring reality, or simply, plots. Diversifying plots engages researchers in reading their subjects' moral sentiments as well as substantive and contextual aspects of reality, and in writing in ways that reveal their implicit and context-specific assumptions and principles.

Discourse Analysis Re-Formulated As Engaged Practices of Thorizing Social Processes

In this paper, discourse analysis is re-formulated as one of the most effective methods with which to investigate social processes embedded in everyday language use. It does so by drawing upon narrative frameworks, typically theories about plot or emplotment.

The re-formulated discourse analysis deals with linguistic data as both synchronic and diachronic data. The synchronic data refer to data that can be classified into particular categories in accordance with particular coding schemes. The diachronic data are data elements of which are associated with one another in accordance with particular rules. Such rules originate in intuitively learned ways of acting/perceiving as well as a variety of institutions and cultural inheritances. Hence, by analyzing data as diachrony, processes by which particular social norms are emerging out of lay actors' language uses can be examined. More specifically, the diachronic connections are re-constructed (or created) by analysts' imagination by reference to the synchronic data to be achieved through coding. Such seemingly arbitrary imagination of analysts can be legitimated by structuring it not only with analysts' investigative concerns or research questions but also the constitutive elements of plot: acts, actors, scenes (choice opportunities), purposes and agencies, all of which should be predicated on the synchronic data.

After demonstrating some examples of empirical data analysis, the paper argues that by dealing with words as both synchronic and diachronic data, social processes embedded in everyday language use can be analyzed systematically in ways that address power relations, including the positionality of analysts. In the re-formulated discourse analysis, analysts engage themselves in their sub-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

jects' reality by imaginative construction of diachrony (or narratives). By engaging analysts in the subjects' power structures, research outcomes, i.e., theories and models, are expected to enhance engaged conversations between analysts and practitioners, thus, increase practical relevance.

Religious Groups and the State in Egypt and Israel: A Love-Hate Relationship

When the Egyptian army announced the ousting of President Morsy on July 3, 2013, following the massive anti-Muslim Brotherhood demonstrations of June 30, the fundamentalist Salafi movement announced its approval of its roadmap for restructuring Egypt's political institutions. Responding to criticisms and accusations of supporting the coup and betraying the Muslim Brotherhood, the deputy leader of the Salafi movement responded by saying that they did so to save the "Islamist project". The same justification was given by the movement for participating in the Committee of 50 assigned with the redrafting of Egypt's constitution in 2013. This attitude of the Salafi movement looks similar to the attitude taken by Agudat Yisrael, the ultra-othrodox non-Zionist party, toward Israel in 1948. Since then, the party has granted the state de facto and not de jure recognition. The logic is to prevent the fall of the Holy Land in the hands of the secularists. On the other hand, although the Muslim Brotherhood (Egypt) and Shas (Israel) seem to be part of the political system, they share the same hostility to the secular state, though their pragmatic outlook allows them more flexibility in dealing with it.

This paper seeks to compare the dialectical relationship between the state and orthodox religious groups in Egypt and Israel, focusing on the Salafi movement and the Muslim Brotherhood in Egypt and Agudat Yisrael and Shas in Israel. It will investigate the attitude of the Islamist and Jewish groups to their respective states, how they seek to use the state for furthering their "religious agenda", and how the state—on its part—is using these groups to enhance its legitimacy, in order to see if indeed there are similarities between the two cases.

Violence and Gender Relations: Contexts and Consequences of Violence Against Women and Men, Virage

The national survey on violence against women (*Enquête nationale sur les violences envers les femmes, ENVEFF)* conducted in 2000 was the first scientific operation in France to measure the extent of violence against women. Almost fifteen years on, INED has lunch a new survey that aims to update and extend statistical knowledge of violence against women and will broaden the field of investigation to include the male population. The project thus comprises a large-scale quantitative survey entitled *Violences et rapports de genre : contextes et conséquences des violences subies par les femmes et par les hommes (*Violence and gender relations: contexts and consequences of violence against women and men, *VIRAGE)* on a sample of 27,000 respondents (13,500 women and 13,500 men) aged 20-69.

Violence is a heterogeneous phenomenon that must be described in its full complexity and diversity. The aim is thus to establish a typology of forms of violence that will serve to distinguish victims' situations according to the type, frequency, context and consequences of the violence to which they are subjected. As the survey covers both men and women, this typology will provide a means to determine the degree of similarity and difference between the experiences of men and women as victims of violence. By identifying the gender of the perpetrators, the survey will also seek to describe the violence committed by men and by women and to place the study of violence in the context of gender relations.

Particular attention will be paid to studying victims' trajectories. How does violence alter victims' health and well-being, educational, employment, affective and sexual trajectories?

An other purpose is to fill the knowledge gap in certain areas, such as violence in the workplace, and to target minorities such as migrants, homosexual persons and disabled persons.

HAMILTON, LAWRENCE* (University of New Hampshire, Lawrence.Hamilton@unh.edu)

Downscaling Climate Survey Data — from Large to Local

Public perceptions about climate change, like climate change impacts and adaptation needs, tend to vary from place to place. The environmental, socioeconomic, health and policy importance of local impacts motivates ongoing efforts by physical scientists to downscale projections from global climate models so they better resolve local conditions. Localized information about public perceptions could be similarly important for adaptation planning, but local-scale social data (beyond isolated case studies) often do not exist. Howe et al. (2015; hereafter H15) recently took steps toward addressing this need with downscaling methods (multilevel regression and poststratification, or MRP) applied to national surveys in order to characterize climate-change perceptions in US states, and also in 435 congressional districts and 3,143 counties. Hamilton et al. (in press) tested the validity of their results at the smallest level through comparison with independent surveys conducted in 30 mostly non-metropolitan US counties. They found the H15 estimates unbiased and moderately correlated with independent measures, encouraging further research but with a caveat that MRP downscaling underestimates the true variance. Here we conduct a broader investigation using the H15 data together with 30,000 interviews from independent surveys to study the behavior of MRP in characterizing public views of anthropogenic climate change at small spatial scales. Although MRP exhibits fair criterion validity, an alternative and simpler regression-based method performs better in tests with two datasets.

Activism As a Means of Empowerment and Change. Experiences of the Changing Nature of Civic Organising.

Over the past twenty years forms of civic organising have grown in diversity and changed the relationships and ways of mutual engagement between people of all walks of life beyond recognition. The power of organising has become a power we all hold, as opposed to relying on the big machineries of campaigning organisations, unions, faith groups, political parties. More people than ever are activists for a better future. Technology, education, and awareness of rights has fuelled this trend to a point where many of the well-established civil society organisations are struggling to redefine their role, demonstrate legitimacy and adapt to a new age in which they are driven, again, by people's more independent articulation of needs and imaginations of a better future rather than being the professional instigators of such mobilisation which can and want to define and shape messages for political consumption. INTRAC's long standing work with civil society organisations suggests that the potentials for creativity, innovation and impact of new forms of civic organising are huge, yet they are also often still undervalued and not always welcome. Experiences also show that crossing certain thresholds of organisational capacity can be essential to transform civic activism, mobilisation and imagination of other futures into lasting drive for change. The paper will draw on our practical experience of civil society strengthening work from a range of regional settings and interpret it through the lens of concepts of social transformation based on the role of event and mobilisation. It will also reflect on the differences and similarities of potentials of new forms of civic organising for change in settings where access to technology is available and where it is not.

Desperate and Raging Minds: The Negative Consequences of Individualization?

What is remarkable is not only the significant decline in the mental health of young people, but also that conventional psychological and sociological explanations apparently cannot account for these developments (Due 2014). Hence, there exists a need for other kinds of explanations.

This paper attempts to understand the decline in mental health in children and adolescents as negative consequences of today's shift in individualisation. In sociology there exists a long tradition of such attempts to diagnose the social pathologies of the times (Honneth 1994).

The paper builds on Ehrenberg's (1999) diagnosis of depression as a consequence of individualization and Ziehe's (2004) diagnosis of the 'normal difficulties' of young people in school. The paper however attempts to apply a different perspective on the problematic. Instead of focusing on common, but ambiguous disorders and difficulties, the paper attempts to diagnose less common, but spectacular ones, such as anorexia and school shootings, as these appears to be more distinct pathological phenomena.

The idea is that they are keys to understanding the negative consequences of individualization (Hammershøj 2009). The hypothesis is that the desperate mind of the anorectic and the raging mind of the school shooter are exemplary for the pathological states of the modern individual. The findings of the paper are that is possible to distinguish four ideal types of social pathologies: Exhausted desperation (e.g. depression and stress), frantic desperation (e.g. anorexia and

cutting), grandiose rage (narcissism and road rage), and defiant rage (e.g. school shootings).

HAMMERSHOJ, LARS GEER* (Aarhus University, lgha@edu.au.dk)

Diagnosing Future Employability in Higher Education

The purpose of education is to prepare the new generations for living and working in society (Durkheim 1922). As the pace of change in society accelerates, however, it becomes less obvious what is the nature of the society that education should prepare for. Hence, today education is in urgent need of tools of orientation in order to determine the transformations of society.

The problem is that prognoses based on projections of exiting trends do not take into account that conditions change; on the other hand, scenarios of a shift from industrial to knowledge society tend to be too general and vague (OECD 1996, 2005). Instead, this paper attempts to diagnose what is important to learn in the future by employing social-analytical diagnosis of the times (Schmidt 2011; Hammershøj 2015).

The diagnosis consist of two traits: First, an interpretation of the tendencies of future employment drawing on specific analyses of the knowledge economy (Foray 2004, 2006) and studies of the probability of the risk of jobs being automated (Frey and Osborne 2013). These tendencies indicate how the conditions of future employment are changing.

Second, diagnosis of the times consists in a novel conceptualization constructed on the basis of these conditions. The idea is to construct a new concept of future employability in higher education using the Neo-humanistic educational concept of *Bildung* (Humboldt 1809) Employability is defined as the graduate's likeliness of gaining employment and of continuing to be successful in his or hers occupations (Yorke 2004, 2006).

The findings of the paper is that future employability consists in both 'academic *Bildung*' concerning the way the person relates to knowledge and 'vocational *Bildung*' concerning the way the person relates professionally to his or hers profession which has three aspects: interest in the job, professional judgment and being creative and innovative.

Ethical and Value Orientations through the Lens of Religiosity, Belief and Personality: The Case of Some Hungarian Settlements

This paper aims at scrutinizing the complex relationship of personal belief systems, individual religiosity, traditional/institutional religious practice and personal values. The research problem is whether traditional, new-age oriented or "patchwork" belief systems, denominational affiliations and congregational group membership are linked to certain value orientations. Based on the secondary analysis of the survey research conducted by the Károli Gáspár University of the Reformed Church in Hungary during the summer of 2015 in 5 mid-size townships reaching out to approximately 850 adult respondents, multi-variate statistical methods are applied including indicators of traditional and new-age spiritual belief items, religious belonging, religious upbringing and religious behavior. These are contrasted with a modified version of the 4-item Inglehart-test and a newly developed set of Weberian economical ethic values. The key questions are 1) whether traditional protestant religiosity is connected to Weberian economical ethic, 2) whether new-age spirituality is connected to postmodern value orientation and 3) whether "patchwork" belief systems can be characterized by any particular value orientation. New aspects are added by testing how personality and happiness mediates these relationships measured by a shortened version of Eysenck's Revised Personality Questionnaire and the Oxford Happiness Inventory. Results are controlled for social-demographical background (gender, age, labor status, income, subjective perception of social status, marital status, family size, and school attainment) where relevant. As the study applied a random sampling of households only on the level of the pre-selected settlements, the database should be regarded only as a pilot study to validate these measures in the special socio-cultural context of some Hungarian towns and villages inhabited by a partly secularized population coming from a multi-confessional background. However, within the obvious framework of its methodological limitations the paper aims at drawing conclusions in form of findings from local case-studies as well as comparing some results with previous EVS data.

HAN, SAM* (Nanyang Technological University, hansam@ntu.edu.sg)

Is the Return of Religion the Return of Metaphysics? or, the Renewed Spirit of Capitalism in Post-Secular Age

Thinkers associated with deconstruction, including Derrida himself but also Gianni Vattimo and John Caputo, inaugurated the "return of religion" in social theory in the 1990s. Most surprising about this intellectual moment was precisely that thinkers who claimed to partake in the project of *ending* metaphysics were arguing for the return of something that many would deem as being metaphysical. Of course, for them, the idea was that what was returning was not religion as such but something like "religion without religion," or "religion without metaphysics."

In recent years, there has been growing interest in some of the recent heuristics in the fields of "digital religion" and "everyday religion" within the sociology of religion. The net result of this interest has been the broadening of the traditional social scientific definitions of religion beyond belief to include affectivity, sociality (belonging) and experience. I take the significance of these conceptual contributions to the sociology of religion to bear squarely on questions raised earlier by deconstruction regarding religion outside of the bounds of religion. By tying particular studies of contemporary religiosity from digital religion and everyday religion with the larger question of "religion without religion," I bring to bear these resonant points with parallel developments on secularity and post-secularity. In assessing the major statements in the "post-secular" debates, including Talal Asad, Charles Taylor and Jurgen Habermas, alongside scholarship from "digital religion" and "everyday religion," this paper goes on to argue that living in a post-secular age can also mean living in amid the "return" of metaphysics, specifically under the regime of what Scott Lash has labeled a "metaphysical capitalism" that demonstrates similar values as contemporary religion.

Response and Responsibility in the Post-Human Present: Teilhard De Chardin As New Materialist

What are the prospects of ethics and ethical thinking after the ontological turn in social theory? This is a question that seems to follow much of the new thinking in social theory, as reflected in recent writings by figures associated with the new materialism, a line of thought that posits the interconnectivity of all things, whether human or not, on the plane of immanence. What these figures have in common is, of course, an ontology that differs a great deal from what Latour deems the "modernist settlement" that separated nature and culture. The intellectual sources of this move are well known and have been discussed thoroughly as well, including Latour, of course, but also Deleuze, Spinoza and Leibniz. I propose to posit another thinker that has mostly been left out in this discussion: the French Jesuit priest and philosopher Pierre Teilhard de Chardin, whose concepts of the "noopshere" and "total matter," bear similarities to the vitalist philosophy of the new materialist ontology in social theory. Moreover, I argue that his work is important for rethinking the concept of ethics in terms of response and "responsibility." In this paper, I will present an overview of the de Chardin's thought in a systematic manner as it relates to new materialism while also making specific connections to the ethical aspects of the ontological turn.

HAN, WEN-JUI* (New York Univesity, wjh3@nyu.edu)

Parental Employment and the Future of the Society: The 2014 Child Well-Being Study

Demographic and societal trends, coupling with globalization, in recent decades around the world have changed the forms of parental employment and thus the way we care for our children. Parental employment—both maternal and paternal—has evolved in recent decades, taking very different forms compared to decades ago. Long and non-day hours are becoming the norm for many careers around the world. Research using data from developed countries such as United States have shown that parents working at hours that are early morning, evenings, nights, or rotating shifts may have compromised children's well-being to certain degree. This paper builds upon and extends beyond the existing literature to examine, as the first, this issue using a sample of children in Shanghai, China. As families in China make up a great share of the world labor force population and Chinese children will make up a great share of the world population in the coming years, we need to understand the patterns of parental employment and how that may shape the developmental experiences of their children. We collected information on approximately 2,200 first-grade children who were attending public schools in Shanghai, China during spring semester of 2014. School administrators, first-grade classroom teachers, and parents of children were surveyed. About one-third of surveyed parents of first-graders worked at nonday schedules. Parents with nonday schedules compared to those with daytime regular schedules tended to be younger, lower-educated, receiving lower social support, and having more depressive symptoms. Children of parents worked at nonday schedule compared to their counterparts also tended to have worse social and emotional well-being and lower academic performance. As China has been and is experiencing fast economic development and transformation, attention is needed to how the macroeconomic changes and thus changes in parental employment may shape the future generations of world citizens.

SIEGEL, JUDITH* (New York University, judith.siegel@nyu.edu)

Parenting and Child Well-Being in Chinese Families with Multigenerational Trauma Exposure

Prior research has demonstrated that childhood exposure to traumatic events often creates symptoms of psychological distress, and can weaken resilience to future stressors (Coates & Gaensbauer, 2009). In addition, post-trauma functioning in adults affects other family members, including children, who may struggle with symptoms of emotional distress during childhood, and be susceptible to the harmful effects of future stressors (Schwerdtfeger et al., 2013). Research based on non-Western samples, particularly children, is relatively scant. This paper fills this knowledge gap by using a large contemporary sample of first-graders and their parents in Shanghai, China. This study examines the well being of youth in China whose families (parents and grandparents) experienced severe stress and/or trauma-related events. We used a sample of first-grade children and their parents in Shanghai, China (N = 2,282), to compare parenting experiences and the physical and emotional well being of children raised in trauma-exposed families with children in families who were trauma-free. Children whose parents and grandparents had experienced traumatic events were reported by their parents to have higher levels of externalizing (aggressive or delinquent behavior), somatic, and internalizing symptoms (withdrawn, inattentive and/or depressed behavior). The parents also reported marital conflict, higher levels of depression and health symptoms, and difficulty managing their children.

Sustainable Livelihood Recovery after the 2008 Wenchuan Earthquake in China

A mega-earthquake hit Southwest China in 2008, causing thousands of deaths and billions of economic losses. Along with the severe damages, development opportunities emerged in the recovery process. This paper examines the disaster impact and recovery in terms of livelihoods assets at the household level. Information from 415 households was collected as a two-wave panel data for analysis. Data was collected eight months after the disaster, and another follow-up survey was conducted in the summer of 2012. The results indicate improvement in terms of physical, financial, natural, human, and social capitals. With an increase of livelihood assets, inequality of financial capital and physical capital actually enlarged in the recovery process, but the gap of social capital decreased.

Meanwhile, the livelihood strategy changes within the families are also reported and analyzed.

Muslim Women Online: Giving Voice to Orthodoxy or Reform?

Discourse on Muslim women often focuses upon their supposed repression and submission – to the veil, to patriarchal cultures, to conservative forms of Islam. Muslim women are 'spoken for' – writers characterise them as voiceless and powerless, while simultaneously speaking on their behalf. This paper, instead, draws attention to Muslim women who speak – loudly – for themselves. Through an analysis of eight blogs written by self-identifying Muslim women, who proudly take ownership of their religion, their identity, and their authority to speak on Islam, I unpack the way in which Muslim women use the Internet to both reinforce traditional gender roles in Islam, and challenge these roles. I argue that the medium of the blog – an online 'diary' of sorts – blurs the boundaries between public and private space, and thus is an ideal location to challenge the (frequent) division of Islamic public spaces along gendered lines.

The paper is informed by the methodologies of feminist sociologists (for example, Devault 1990; Taylor 1989, 1996, 1998; Taylor and Whittier 1992) who prioritise giving autonomy and voice to women and women's experiences, whilst attempting to negotiate the political and ethical difficulties of using Western theory to describe Muslim women. The adoption of feminism by Muslim women has a contentious history – where critics (both male and female) see a Western theoretical construct attempting dismantle Islamic culture and history, some Muslim women have embraced feminism, arguing the principles can be adapted to the Islamic context. This tension is evident in blogs written by Muslim women—and this paper addresses the place of feminism and feminist language in Muslim blogs.

Muslims and Social Justice Activism in the US: Religious Charity or Political Dissent?

This paper is a preliminary study into the involvement of US Islamic organizations in social justice activism. Through an analysis of the online presence of Islamic social justice groups, I seek to address whether these activists and organizations frame their activism as religious charity, political dissent, or both. Informed by social movement theory and recent research into online research methodologies, the paper examines the relationship between Muslim social justice activists and organizations with secular social justice groups, and public authorities in the US. To what extent do the activists and organizations critique the cultural, political, and economic values of the US? In what ways do they position themselves as unique contributors to the social justice movement? Do they support or critique public authorities and existing welfare networks? The paper analyses the websites, Facebook pages, and public documents of Islamic social justice groups in the US to seek preliminary answers to these questions, as well as to assess the extent of involvement of these groups in the provision of welfare to their communities.

Islamic activism is, all too frequently, conflated with violent extremism. A small, but growing body of literature that seeks to engage with Muslim involvement in progressive activism informs this paper. The involvement of American Muslims in US civil society is an important way in which Muslim communities become involved in US politics and interact with non-Muslim Americans. Further, social justice activism gives Muslims an avenue in which they can safely express dissatisfaction with US cultural values and productively engage in activism to change those values.

HANK, KARSTEN* (University of Cologne, hank@wiso.uni-koeln.de)
STEINBACH, ANJA (University of Duisburg-Essen)

Young Adults' Sexual Orientation and the Interrelatedness of Inter- and Intragenerational Family Relations

Next to a long tradition of research investigating *inter*generational solidarity between parents and adult children, a growing number of studies also address *intra*generational relations between adult siblings. This seems important, because even though multigenerational (that is, 'vertical') bonds have gained in importance relative to nuclear family ties, siblings (that is, 'horizontal bonds') remain an important social resource over the life course. However, although we know that offspring and sibling characteristics are closely associated with both upward and downward exchanges of support in families, relatively little is known about the *interrelatedness* of inter- and intragenerational family relations.

Theoretically, one relationship might compensate for the other (*compensation* mechanism), or there may be spillover effects from one relationship to the other (*reinforcing* mechanism), but empirical evidence which of these mechanisms dominates (under which circumstances) is scarce. Moreover, we are not aware of any studies, investigating possible interactions with children's (siblings', respectively) *sexual orientation*, despite a rapid expansion of social science research on gay and lesbian family issues.

Exploiting data from the German Family Panel (*pairfam*) and extending a recent analysis of gay and lesbian adults' relationship with parents in Germany (Hank & Salzburger, JMF, 2015), we aim to contribute to closing this research gap. Our analysis draws on more than 6,000 interviews with young adults ('anchors') representative for three cohorts (1971-73, 1981-83, and 1991-93), who provided detailed information on various aspects of the relationships to their parents and up to four siblings. We primarily focus on inter- and intragenerational contact, emotional closeness and intimacy, as well as conflict. Our multivariate model accounts for an array of socio-demographic controls, individuals' socio-economic position, and for the anchor's sexual orientation, which we approximate by information on hetero- and homosexual partnership experiences.

Pathways of Professional Immigrant Musicians: Collaborations As Vehicles to Foster Social Mobility

My research project investigates the formal/informal music learning of immigrant musicians in Norway and how their professional careers develop.

This paper will discuss a key aspect of these musicians' musical life, namely collaboration. The act of collaboration encompasses a wide range of activities that a musician needs to undertake, from the difficult to mundane, from creation to commerce. At the same time it also shows the challenges that musicians with immigrant backgrounds face, some linked to their musicianship, others to their migrant status.

*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

I will examine how they challenge themselves to learn more and to experience or engage with musical expressions that are new to them. We will also see how it can be a challenge to find work or feel that they belong, again something they address through collaborations. Internally, collaborations challenge them to negotiate with their own traditions, but they can also redraw their identities as a part of this. Externally they are challenged by, or challenge, other people and cultures in order to overcome cultural boundaries, achieve a sense of belonging and gain new values, often as a result of acquiring, expanding and maintaining new and old networks. These and other challenges were met by my informants through open and serious engagement with "the Other"; other musicians and other musical styles. This engagement enables them to adjust and adapt musically, whilst strengthening their musicianship in a number of ways.

These challenges (and related struggles) occur in temporal and fluid fields that in part are generated by collaborations, where success and even struggle in one field provides a springboard of social and cultural capital to navigate through musical pathways to other fields and collaborations. Thus, these collaborations also foster their social mobility, something this paper will discuss in depth.

HARADA, HIROO* (Senshu University, h2@isc.senshu-u.ac.jp)

Happiness in Japan: From the Viewpoint of Age, Sex and Relative Wealthiness

This presentation is based on the results of two studies: Exploring Social Capital in East Asia: Community, Social Trust and Safety-net (2009-2013; study headed by Hiroo Harada) by the Center for Social Capital Studies, and its successor Forming a Social Well-being Research Consortium in Asia (2014-2018; study headed by Hiroo Harada) by the Center for Social Well-being Studies; both research projects are within Senshu University in Japan.

I mainly focues on a Web Survey on Lifestyle and Values for about 11,000 respondents in Japan conducted on February 2015. First of all I would like to explain several important and interesting findings of the survey.

First, the correlation between subjective happiness and life satisfaction from all samples of the survey results is rather high: the correlation factor is 0.836. Second, as predicted, the wealthier the household/personal income of the respondents, the higher their life satisfaction. Third, the life satisfaction's curve of the poorest is U-shaped according to age; that is, the life satisfaction of 30's /40's year old are rather low. To the contrary the life satisfaction of the wealthiest has become higher according to age: the value of 20's year old is the lowest and 60's the highest. Forth, the female's life satisfaction is almost higher at the same household/personal income level over all age than man.

These outcomes may be concluded from the compound elements of the social and economic position of the people. On the Forum I would like to declare the relation of these factors.

Local Social Services to Support Wide-Area Evacuees Following the Great East Japan Earthquake and Fukushima Nuclear Disaster

Since the Great East Japan Earthquake and Fukushima Nuclear Disaster in 2011, more than 50,000 people have evacuated outside disaster-stricken prefectures and dispersed throughout Japan. Many evacuees are living in unstable situations, wavering between returning to their hometown or settling down in new places; however, the Japanese government has not taken radical measures to improve the situations of evacuees. To help them avoid poverty and isolation, local social services in receiving communities have developed support mechanisms.

This paper examines how local social services are organized and implemented to cope with wide-area evacuation, based on surveys in Saitama prefecture, which has received 5,000 evacuees to date. We conducted participant observation and interviews and questionnaire surveys since 2011 to evacuees, support groups, and local governments.

Immediately after the disasters, local governments opened public facilities as emergency shelters, in which local non-profit organizations (NPOs) and volunteers gathered to supply living necessities and aid the evacuees. In the first few months, municipalities began to provide temporary housing for evacuees. Some local governments also developed policies such as exemption from water charges. NPOs began to hold gatherings and publish informational magazines for evacuees. Besides, door-to-door visiting activities are now being established in an effort to grasp each evacuee's needs, which were planned by NPOs in Saitama and municipalities in Fukushima.

In general, these local social services have been implemented to cover as many evacuees as possible; however, evacuees' situations are becoming more diversified depending on occupation, family structure, and other factors. The most serious difference among the evacuees is whether they were "forced evacuees" from the Evacuation Order Zone in Fukushima, "voluntary evacuees" outside the zone, or victims of the tsunami. Local governments and NPOs have concerns about how long they should continue these services and how much they should invest.

Outcomes of Adolescence and Perceived Life Chances in Romanian Youth

The transition from adolescence to young adulthood can be seen as a multifaceted process where social and individual factors shape young people's lives. Outcomes of adolescence can be seen as individual and social developmental tasks that prepare one to become a productive, healthy, responsible, well-functioning adult. This includes a minimal level of personal competence, personal relationships, personal well-being, the capacity for intimacy and social bonding, a healthy lifestyle and the avoidance of problem behaviour.

We intend to assess if school transitions and the worsening of specific outcomes of adolescence can explain the perceived life chances.

The Romanian sample of 3509 nationally representative high school students in their final school year (12th grade) was surveyed in Nov 2012-Jan 2013 in the first wave of "Outcomes of Adolescence. A longitudinal perspective on the effect of social context on successful life transitions" project. The 2nd wave of the longitudinal study took place in Dec 2014-Jan 2015.

The first wave questionnaire evaluated the educational situation (results, the intention continuation of the studies), the orientation toward the labour market (the entry on the labour market, their long-term work-related aspirations as well as their representations regarding career possibilities), their social capital (relations with family, peers from neighbourhood, friends), their well-being, health and risky behaviour. The second wave is oriented toward measuring specific outcomes of adolescence and toward taking into account life-course events and other social circumstances that could influence young people on their path to adulthood while a specific section is trying to evaluate the perceived life chances. The study is trying to evaluate if unsuccessful transitions (in education, labour market or other aspects of social life) is most likely to have an impact on perceived life-chances.

HARBOUN, IRIT* (Ben Gurion University, iritharb@gmail.com)

The Cost of Inaction and the Collective Action of Disadvantaged Minority Groups

Different theories offer varying explanations of the motivations for collective action, regarding emotional and instrumental factors. However, in the case of disadvantaged minority groups, longstanding conflict with the majority, a closed political opportunity structure and the difficulty of acquiring resources increase the costs and risks of the action. In light of these obstacles, what factors keep the involved in a sustained struggle? We argue that the development of such a collective action is a function of the perceptions of the group's leaders about the costs of inaction and the level of the group's solidarity, which is a fundamental component of social capital. Actually, the entrepreneurs' evaluation of inaction includes the instrumental cost of the status quo combined with the cost of giving up on symbolic goals such as recognition of their collective identity (by the state) and its formulation.

This argument relies on the connection between the cost of inaction and "relational goods". Relational goods can take many forms, such as social approval, the desire to be recognized or accepted by others, friendship and its utilities and so on. These goods, which depend upon interactions among peoples and require reciprocity, can only be enjoyed if shared with others. Thus, inaction threatens the "relational goods" and symbolic utility motivates the development of collective action.

To examine this argument, depth interviews had been taken with leaders of collective actions in the field of education, carried by Arab minority in Israel. Focus on education was derived from the fact that it is the arena whereby the state can influence the identity and future socio-economic mobility of its young citizens.

"Comradeship" in the Habsburg Army during World War One. the Sociology of Emotions Perspective

"Comradeship" in the Habsburg Army during World War One. The Sociology of Emotions Perspective
Collective violence, in particular violence in war, is still underrepresented in the sociological view. The same goes, with few exceptions, for the sociology of emotions. What people (mostly men) emotionally experience as members of military collectives in peace and war is, strangely enough, only rarely the subject of

closer scrutiny. In our days it is commonly understood that soldiers fight for a national goal, or at least driven by patriotic motivations. But in close combat these goals were much too abstract and too far away. Rather, one was fighting for the comrades lying next to oneself in the trench, and for the regiment´s honour. Particularly important were also the emotional ties to the comrades in the military units; often comradeship is mentioned as the only "positive" experience during the respective missions.

In my paper I would like to shed light on comradeship from the point of view of actors that is, in my analysis, from the point of view of k.u.k soldiers serving during World War I. In particular I want to focus on comradeship under the sociology of an emotions point of view. Which emotions are constitutive for "comradeship"? What was the importance of emotions such as shame, sympathy, compassion and revenge regarding the bond of affection between soldiers of the Habsburg Army during World War I? Which role did comradeship play during attacks and particulary in regard to the escalation of violence at the front?

HARINGTON, PHIL* (University of Auckland, p.harington@auckland.ac.nz)

Constructs of Professionalism in Civic Practice: Asking People at the Front Line.

It is highly plausible that a range of work from voluntary activity to paid employment will be expected to engage in 'civic practice'. That is to actively enhance community self-reliance, foster capacity building, increase participation, reduce barriers, develop community infrastructure or improving the health of the community, preserve or extend the visibility of arts, culture, and national identity, or empowering the voices of others to strengthen civic society. A range of people working to these ends were interviewed to examine if a construct of professionalism informed the way they framed their occupational identity and their practice. A fifty item scale was used to assess how much they valued characteristics of professionals across five elements of professionalism and their scores ranked. Discussion follows on how the respondents valued the knowledge, ethics, skills, research and reward elements of a professional domain. The results showed practitioners ranked all elements of professionalism to some degree. They rated items from only three elements in the top ten responses. They valued the forms of rewards they get from the work, the skills they brought to the job and the knowledge they were able to apply in the top ten responses. The next tranche of ten responses ranked ethics items highly while elements to do with researching practice or engaging in professional development – more training, attending conferences etc, were in the bottom tranches. Discussion of outcomes suggests that practitioners base their 'professionalism' in the focus and terms of their employment rather than the development of an occupational discipline or membership of a unifying profession. Discussion provides insight into the value of professionalism within an occupational domain and gives rise to debate on the scope for civic practice to adopt a professional identity.

Leading the Way? Male Ballroom and Latin American Dancers

Ballroom and Latin American dancing is a leisure activity where the use of the body, grooming and costuming is central to success. However, given that dance is more traditionally associated with girls rather than boys and that male dance partners are often in short supply this raises some key questions and contradictions about hegemonic masculinity. This paper specifically explores the narratives and experiences of male Ballroom and Latin American dancers, interviewed as part of an ethnographic study of a dancing school in the UK. The findings help to

diversify notions of masculinity and gender performance, as well as highlighting areas where male power continues relatively unchallenged.

The Japanese Brazilian Ethnicity Today. an Anthropological Theory about Post- Migration, Agriculture and Global Social Economy

Nowadays, Brazil continues being the country with the largest number of Japanese descendants in the world, with approximately 1.6 million people. The Japanese immigration to Brazil occurred throughout the twentieth century as a result of both countries' politics reform. It is important to highlight that from 1924 the government of Japan promoted alone this phenomenon. The most important characteristic was that all individuals belonged to nuclear families. From the beginning, those newcomers organized themselves in agricultural activities in the state of São Paulo. In 1927, some of them formed the CAC – Agricultural Cooperative of Cotia. This cooperative was the most important agricultural cooperative in South America from the 1950s to the 1980s. The CAC activities were not limited to agriculture, but also promoting the Japanese cultural aspects to coming generations, like the teaching of Japanese language. The social ascension of this community in the Brazilian context is remarkable, however, the profile of this group is not really homogenous. Also the ethical aspects of the Japanese Brazilian community are very difficult to identify due to its fast acculturation.

My doctorate thesis is about the acculturation process and the notable social ascension of a Japanese Brazilian community. The fieldwork has been developed in the town of Sao Gotardo, in the Midwest of Minas Gerais. In 1973, this region conceived an agricultural development program planned by the Brazilian military dictatorship territorial policy and the CAC. As a consequence, a hundred of Japanese descendants' families arrived to this location and settled their own ethnicity with the support of CAC. Today, the background is different: few of them have reached a social ascension and the CAC was extinct leading to the disappearance of the former ethnicity. This fact drove me to formulate my hypothesis: Was the Japanese ethnicity a global social-economic strategy?

HARRIS, CATHERINE* (University of Sheffield, c.e.harris@bham.ac.uk)

Translocal Lives: Social Reproduction Amongst Polish Migrant Entrepreneurs in the UK

Since EU enlargement in 2004, which enabled the free movement of workers, the UK has seen migration from Eastern Europe on an unprecedented scale, with flows from Poland being arguably and visibly dominant. One feature of this is Polish migrant entrepreneurship, with migrants establishing businesses to serve the local migrant populations, but also increasingly the wider market. As such, Polish migrant entrepreneurs have built lives in the UK, not only through establishing businesses but raising families, making friends and buying homes. In order to operate, these businesses rely on translocal relationships and linkages, often with family members elsewhere in the UK or remaining in Poland. A feature which is heavily apparent in the functioning of these migrant businesses and translocal relationships is social reproduction.

In response, the paper explores social reproduction through translocal exchanges within Polish migrant businesses in the UK. The research is based upon in-depth interviews with Polish migrant entrepreneurs in the West Midlands region of the UK, who migrated around the time of EU enlargement in 2004. In particular, the paper explores the financial relationships involved in such businesses which operate across borders, whilst maintaining local-local ties. This exchange of capital and financial advice is often provided by family (usually parents) who remain in Poland and as such demonstrates translocal social reproduction. The entrepreneurs' social relationships within the social network in which they are embedded, particularly those with family members, are critical in shaping entrepreneurial aspirations and behavior and are also explored in the paper. Entrepreneurial decisions are often based on a family-first rather than a business-first perspective and again have a translocal element.

The paper contributes to debates about migrant entrepreneurship and social reproduction through the concept of translocality and questions whether such factors are specific to migrant entrepreneurs or applicable to migrants more broadly.

HARRIS, JOSEPH AMBROSE* (Boston University, josephh@bu.edu)

From Neoliberalism to Universalism: Explaining the Emergence of Universal Health Coverage As a Global Norm

How do new ideas displace hegemonic ones? The neoliberal logic that gained ascendancy in the 1980s emphasized privatization of government services, the

weakening of social entitlements, and the liberalization of government regulation. The institution of neoliberalism in the developing world was driven by the Reagan-Thatcher revolution and supported by structural adjustment programs. This normative shift, aided by coercive institutions, led to the dismantling of state-run healthcare systems, the institution of user fees in hospitals and clinics, and the promotion of private health insurance – all of which had pernicious effects on access to healthcare. And yet, despite the fact that austerity and structural adjustment continue to play an important role in world affairs today, the turn of the millennium has witnessed a wave of commitments to universal healthcare in the developing world in countries ranging from Turkey to Thailand to Mexico and Ghana. Recently, this process has accelerated, and universal coverage has received major new attention at the international level, culminating in a UN resolution in support of universal coverage. This paper explores the emergence of a new norm around universal health coverage at the global level and advances an explanation that emphasizes the importance of negative evidence for weakening dominant norms and the importance of positive evidence for making alternative norms appear viable. The diffusion of new norms and displacement of old ones, however, depends on the strategic actions of norm entrepreneurs. This account illustrates the significance of interactions between the national and global levels and suggests that institutions with coercive powers that play key roles in the persistence of hegemonic norms can themselves be transformed to support markedly different new normative projects.

HARRITS, GITTE SOMMER* (Aarhus University, Department of Political Science, gitte@ps.au.dk)

MOLLER, MARIE OSTERGAARD (KORA, The Danish Institute for Local and Regional Government Research)

Hybrid Professionalism and the Use of Knowledge, Intuitions and Personal Relations in Preventive Welfare Work

Oftentimes literature on professionalism emphasise the use of knowledge in professional work. However, the character and use of this knowledge is not necessarily the same across professions or work settings, nor is it very well studied. Some scholars point to professional knowledge as being both theoretical and practical or tacit, and others point to the fact that the use of professionalism as well as professional knowledge may be conditioned on organizational and institutional structures.

This paper seeks a deeper and more systematic understanding of the use and character of professionalism and professional knowledge among public welfare professionals. Focusing on discretions with regard to preventive efforts in the Danish welfare state, the paper explores and compares how health nurses, child care workers and primary school teachers decide which children are in risk and thus eligible for extra support. In particular, the papers focuses on the ways in which these professionals make and reason about their discretions. Further, the paper analyses how the professionals themselves understand their discretion making. The paper demonstrates, how oftentimes the use of an explicit professionalism, theoretical and practical knowledge is weaved into the use of intuitions, common sense knowledge, personal experiences and what the professionals themselves call their relationships to the families.

The paper builds on 58 in depth, semi structured interviews with health nurses, child care workers and primary school teachers from four municipalities in Denmark. The interviews covers questions on professional practices, self-conceptions of professionalism and work, and descriptions of lifestyles and personal background. Also, the interviews use a vignette technique, presenting two realistic case stories and asking the interviewees to interpret the stories and suggest a solution, i.e. mirroring a real life situation with discretion making on preventive support. The data is analysed systematically, comparing both across and within cases.

HARTH, JONATHAN* (Universitat Witten/Herdecke, jonathan.harth@uni-wh.de)

The Advent of Massively Distributed Virtual Reality and Its Impact on Bodily Experiences and Identity Management

At least since Queer Studies one must assume that the potential abilities of the body always exceed what is permitted by culture. Currently, this limitation appears to be negotiated in terms of technical advancements. In the upcoming year of 2016 major companies will be presenting their first generation of Virtual Reality (VR) devices. It is highly anticipated that the social impact of these products and their technically induced immersion-experiences will be gigantic.

Therefore, I dedicate this lecture to the status quo of the technical standards of VR and its upcoming possibilities and uses. I would like to contextualize this technical point of view by the following theoretical aspects:

1) From a sociological perspective body is always considered as (culturally) observed body. Therefore body has is no longer static but poly-contextural. The possibilities of VR are able to make this observable.

2) Computers in general but especially computer-games offer elaborate »spaces of possibilities«, which are mainly characterized by the possibility of taking the role of someone else. The possibilities of VR are putting this to an even higher level by creating an immersive »space of presence«.

3) Each action in virtual environments must be seen as a hybridization of real-physical and virtual-software-based rooms. The so called »real world« and the worlds of virtual reality are fully intertwined. Therefore every involvement in VR must inevitably lead to new forms of habits, skills and cultural structures.

For the discussion I can rely on an empirical study (Harth 2014) with players of computer-games that focused on hybridization between these players and their digital avatars. This basis will be complemented by a still ongoing study that aims at spatial presence and bodily experiences in VR.

HARTH, JONATHAN* (Universitat Witten/Herdecke, jonathan.harth@uni-wh.de)

The Concept of Nibbana and Its Potential for the Transformation of Self- and Worldview in Western Buddhist Practice

In the main traditions of Buddhism (i.e. Theravāda-, Zen- and Tibetan Buddhism) one can find the commonality of a soteriological promise. It is the promise of nibbāna that aims at liberation from suffering.

For an empirical sociological approach this concept raises the question, in which way this religiously formatted knowledge of nibbāna could be integrated into specific life practices. How could this prominent but still abstract doctrine of Buddhism be converted into modern lifestyles (understood in terms of specific »world- and self-references«). The peculiarity of nibbāna is that it is not exclusively pointing at an afterlife, but on the contrary: the promise of nibbāna could be realized in this life. Thus, nibbāna aims at a transforamtion of specific habits and at a change in the attitude and perspective of one's own life.

Such a change of world- and self-view can be presented by the case of a practitioner who situates herself for more than 30 years in the tradition of Theravāda-Buddhism. Following the case we can observe her (painful and tedious) learning process to a new form of world- and self-view. Through her biographical narrations we are able to see how she finds from a worldview which focusses on enlightenment to an attitude that must be understood as a mainly pragmatic view of being here and now. The hereby accomplished transformation of habitual patterns can be interpreted in line with implementing the theoretical meanings of nibbāna.

The proposed contribution provides an empirically-led approach to the understanding of habitual transformation processes – in this case formatted by specific religious forms of communication (interaction with teachers and intensive studies of relevant documents) and self-studying through meditation. The empirical basis of this contribution is part of the research programm »Buddhism in the West« which is currently funded by Deutsche Forschungsgemeinschaft (DFG).

HARTNELL, HELEN* (Golden Gate University, hhartnell@arcor.de)

Assessing the Assessors: The World Justice Project's "Rule of Law Index"

Established in 2006 on the initiative of the then-President of the American Bar Association, the World Justice Project (WJP) claims to be an "independent, multi-disciplinary organization" that works to advance the rule of law around the world. The WJP initially set out to prepare an annual quantitative assessment tool. The first WJP Rule of Law Index (2010) assessed the 'rule of law' in 35 countries, while the 2015 Index provides comprehensive data from 102 countries. The empirical research presented in the WJP's indexes is sophisticated, both conceptually and methodologically, and offers much food for thought. Conceptually, the WJP assesses more than 40 factors across eight "primary" rule of law indicators which are "derived from internationally accepted standards." The WJP focuses on "how the rule of law is experienced in practical, everyday situations by ordinary people around the world." Findings are cross-referenced according to income and region, which facilitates comparison and makes it possible to identify systematic variations among the indicators.

Methodologically, the WJP uses original survey data drawn from households and from legal experts in each country. The WJP pursues "multidisciplinary collaboration" with dozens of legal and non-legal civil society groups.

The WJP Index is not limited to quality of justice issues, but its indicators include differentiated examination of the civil, criminal, and regulatory contexts, alongside consideration of broader 'rule of law' themes such as absence of corruption, the extent to which government is constrained (inter alia by the judiciary), order and security, the openness of government, and the protection of fundamental rights. My paper will critically assess the strengths and weaknesses of the World Justice Project's Rule of Law Index, as well as its potential contribution to the 'quality of justice' agenda.

HASEGAWA, KOICHI* (Tohoku University, k-hase@m.tohoku.ac.jp)

Beyond 3.11: Environmental and Risk Awareness after the Fukushima and Tsunami Disaster

The Great East Japan Earthquake and tsunami disaster and the Fukushima nuclear accident, this combined disaster is Japan's largest since the Second World War and one of the most severe in the histories of modern Japan and other industrialized nations. What lessons should we take on board in order to think about the relationship between society and nature ? The first point is the idea of coexistence with nature to teach us that 'we can only live within the bounds permitted by nature' and to remind us to have reverence for 'Mother Nature'. We cannot conquer or completely control nature. We can only listen to the voice of nature and live in harmony with it. We must accept that the Great East Japan Disaster is challenging us to make a radical shift away from the urban-centered, centralized economic growth policy that Japanese society has been pursuing since the Meiji era. Keeping energy efficiency and reducing electricity have taken root in society. The new policy to promote renewable energy has the effect of drastically increasing solar energy. The another major point is that the severe shock that resulted from this accident, the sense of fear over the spread of radiation contamination and anger and frustration toward the electric company and the government completely changed the public's attitude toward nuclear power generation. In the wake of the Fukushima accident, protest rallies began to exhibit a certain kind of energy buoyed by a sense of crisis or urgency and the number of participants increased rapidly. These protesters are not mobilized by traditional organizations such as trade unions. Baby boomers, families and young people voluntarily take part in these actions individually or in small groups.

Reframing Environmental Sociology from Downstream Perspective

We are facing an identity crisis of environmental sociology which will be a coreless and rootless research field, although this discipline came to be institutionalized and a lot of variety of researches are conducted under the title of environmental sociological study. I would like to reframe the environmental sociology as sociology of the downstream side in contrast with mainstream sociology primarily focused on upstream issues, such as production processes (Hasegawa, 2004: Ch2) . The term 'upstream' refers to the processes preceding the consumption of valuable resources—'environmental goods'—and 'downstream' indicates the processes that follow the use of those resources, including the release and disposal of waste and other environmental burdens—'environmental bads' (Hasegawa, 2004: 22) . Many types of environmental problems are caused by environmental burdens. Let's see air and water pollution released by industrial factories, noise pollution by bullet trains, aircraft and automobiles, climate change by GHG emissions, radio active wastes and radioactive contamination by nuclear power generation, waste materials, rubbish and so on. Environmental problems arise as a result of the upstream side, both production processes and everyday activities. What is the significance of the downstream perspective? First, this perspective allows to develop a unified scheme of grasping increasingly diverse and dispersed environmental hazards. Second, we can analyze environmental problems produced by upstream activities. Third, it is significant for making it possible to identify downstream problems at the focal point of all contemporary social issues. Forth, it allows to address issues of environmental justice, discrimination and social disparity. Fifth, in pre-modern, pre-urbanized society, the upstream and downstream were not polarized. Both sides were unified in the realm of everyday life, constituting a whole. We can conceptualize modernity in the terms of upstream-downstream perspective.

Experience of Happiness in Students' Daily Lives

This research in the nutshell is an effort in deep description of day to day lives of students and their experiences of happiness. The main question of this research is how students will experience happiness in their day to day lives. In order to answer this question we started to have an extended field research in two of the girls' high schools in the region six of Tehran. We used collective point of views and semi structured interview methods for collecting our data for analyze of collected data. We have had particular concurrent thematic approached. during that we have abstracted 4 essential concepts for answering our main question.1- Car-

nivalization of school 2- The daily friendship 3- Power of self realization 4- Self belonging

Base on these 4 concepts we could have better understanding experience of happiness among students. the meaning behind carnivalization of school is students interest to creating a gap in stablish orders and making an opportunity for bringing informal elements. The daily friendship is point out network of relation and friendship between students. Power of self realization is overseeing students confident in an official places and creating the opportunity for being themselves. Self belonging it is the deepest concepts of this research which is beyond the time and places pointing out students self controls.

Heroes, Victims, and Perpetrators: The Landscape of War Memories in Japan

How do memories of national trauma remain relevant to culture and society long after the event? Why do the memories of difficult experiences endure, and even intensify, despite people's impulse to avoid remembering a dreadful past and to move on? My project explores these questions by examining Japan's culture of defeat. It surveys the stakes of war memory in Japan after its defeat in World War II, and shows how and why defeat has become an indelible part of national collective life, especially in recent decades. Drawing on ethnographic observations and personal interviews as well as testimonial and other popular memory data since the 1980s, it probes into the heart of the divisive war memories that lie at the root of current disputes and escalating frictions in East Asia, known collectively as Japan's "history problem."

My project examines this divisive national project, drawing on the sociological insights of cultural trauma theory and collective memory theory. Contrary to the western stereotype that describes Japan as suffering from "collective amnesia," Japan's war memories are deeply encoded in the everyday culture, and much more varied than the caricatured image suggests. I identify three conflicting trauma narratives in Japan's war memories – narratives of victims, perpetrators and fallen heroes – that are motivated by the desire to heal the wounds, redress the wrongs, and restore a positive moral and national identity.

HASSLER, BENEDIKT* (University of Applied Sciences and Arts Northwestern Switzerland, benedikt.hassler@fhnw.ch)

The Growing Desire for Decent Work after Long-Term Sick Leave. How Temporary Inability to Work Changes the Work-Life Balance in Labor Societies.

Background:
Decent work is primarily, but not only, a matter of jobs available in the labor market. Moreover, decent work is also dependent on how individuals successfully establish a decent work-life balance, which allows them to recreate while they are not working. However, in "labor societies" (Arendt) people have a strong wish to fully participate in the labor market although the boundaries between labor and leisure are increasingly fluid. At the same time, there is a growing number of people with mental health issues in all OECD countries and especially in Switzerland. A lot of these mental health issues are caused by the interplay of vanishing possibilities for orientation in modern societies and increasing responsibilities (above all, at the workplace). This study shows that this toxic attitude toward employment sometimes changes during phases of long-term sick leave, while decent work becomes more important.

Methods and Results:
This analysis relies on a study on Disability Management in private and public companies in Switzerland, where employees were interviewed about their return to work experience after sickness or accidents. The data has been analyzed according to grounded theory. The results show a diminishing importance of labor in the personal life of individuals who experienced periods in which they were unable to work. On the one hand, because they experienced meaningful activities outside the workplace. On the other hand, because they were partially able to reestablish the boundaries between labor and leisure.

Discussion:
This study focuses on people who are able to influence their work-life balance. Not included, but even more important, are all those people who are structurally forced to have a certain imbalance between work and life. Nevertheless, the study shows a specific situation where the desire for decent work changes substantially.

Consumers on the Farm: Participatory Governance and Sustainability Transitions

The current regime of neoliberal food governance has been widely critiqued as being unsustainable. In response, a variety of initiatives have emerged to increase the sustainability in food and agriculture. On the one hand, there is a proliferation of sustainability standards and certification schemes, which increasingly take the form of multi-stakeholder initiatives. On the other hand, there are (re)localization of the food system movements, which have spawned farmers' markets, community-supported agriculture, and community gardens. While both approaches contributing to more sustainable food, neither model is without critique. The model of sustainability standards and certification is argued to exclude citizen participation and be undemocratic, whereas the (re)localization approach is often viewed as lacking legitimacy because of its reliance on laypeople knowledge. Furthermore, both of these models assume that consumer's purchasing behavior in the marketplace plays a key role in enhancing the sustainability in food and agriculture. Examining a Japanese consumer cooperative's activities, this paper investigates governance practices that integrate both expert and citizen knowledge in building a sustainable agrifood system. It also examines the role of consumers in transitioning agrifood systems towards more sustainable practices.

Legal Aid for Women

Access to justice as a practical and process based definition may be defined as capacities of people to use judicial institutions which shall bring solution to common judicial problems of the people. Women's access to justice deserves a special study due to their social status. Referral to judicial authorities, access to legal information, economic concerns in action filing processes, urban transportation facilities etc., poverty in general, education, inequality in processes such as everyday life and urban life may be deemed as factors which alter the positions of women in women's access to justice processes. Especially in civil proceedings legal aid is one of the important means of women's access to justice. In Turkey, legal aid in civil proceeding is conducted in two manners. First one is the system provided in Code of Civil Procedures and which provides to be exempted from proceeding costs. The other one is the legal aid offered by Bars. Here, the liability to pay the proceedings costs lies on the demandant, however, the attorney service offered is free.

This study is based on a field research that includes in-depth interviews with 11 women about their judicial process, interviews with Ankara Bar "Gelincik Project" and 3 NGOs (Human Rights Association, The Foundation for Women's Solidarity, and Flying Broom) that work with women. The aim of this study is to assess the legal aid system in civil proceedings and the status of women in access to justice processes which is foreseen that it should be accessible under equal conditions and which is one of the junction points with legal equality.

HAUFE, NADINE* (Vienna University of Technology, nadine.haufe@tuwien.ac.at)

Understanding Energy Consumption and Mobility Behaviour - a Starting-Point for Interventions to Change Individual Behaviour to More Sustainability

Despite of diverse efforts of policy makers and optimisation of technologies, the effects of residential energy consumption and mobility behaviour on the environment are great and continue to increase. In addition to individual technological and regional framework, it is especially user behaviour that significantly affects energy and transport systems.

Residential energy consumption and mobility behaviour are influenced by many of variables and show big variance between households, even within the same number, age, income and work status of its occupants in the same neighbourhood resp. the same building types. Understanding these differences is important for forecasting energy consumption and transport and for developing new technologies, programs and policy concepts.

In sociology it is assumed that it is possible to describe and explain behavioural differences with features of social inequality. Research into social stratification in modern societies has shown that the complexity of social activities cannot be explained by socio demographic and socio-economic variables alone. Attitudinal variables resp. lifestyle- and milieu-based approaches have thus finally been introduced in order to explain and understand individual mobility behaviour and residential energy consumption in more depth, and to segment the population into meaningful (target) groups (e.g. market research). Although none of the approaches can claim absolute superiority, attitudinal based approaches show advantages in providing starting-points for interventions to change individual behaviour to more sustainability.

This contribution explains theoretically why a differentiated view of behaviour is important, gives an overview of various segmentation approaches and shows

from a Viennese study, which comparing different approaches, how significantly are attitudinal-based approaches to explanation and understanding energy consumption and mobility behaviour.

This is one area of research of the PhD program "Urban Energy and Mobility Systems" (URBEM), which has been instituted by Wiener Stadtwerke Holding AG and the Vienna University of Technology (http://urbem.tuwien.ac.at).

HAAS, WILLI (Institute of Social Ecology, Alpen Adria Universitaet)

Enabling Conditions and Impediments to the Stabilisation and Mainstreaming of Low-Carbon Practices

Climate change mitigation is impeded, among other factors, by the so-called 'value-action-gap' in individual behaviour. Thus, social research is increasingly abandoning the individual and turning towards social practices as a more promising unit of analysis. Social practice theory marks a shift away from the analysis of individual behaviour and conscious choice of action towards routinized and interlinked social practices. Accordingly, low-carbon practices are alternative ways of doing things whose stable reproduction relies not so much on conscious individual choices, but on their routinisation as social phenomena. In order for such routinisation to be successful, certain conditions must be met: the material and immaterial elements of the social practice (e.g. infrastructure, competences, cultural norms) must be aligned and linked in such a way that the alternative behaviour becomes an integrated everyday routine. What, then, are the structural factors enabling or impairing the alignment of these elements and thus the stabilisation of a low-carbon practice? What role do institutional, political and legal framework conditions play in enabling or impairing the establishment of 'alternative ways of doing things' as social practices?

We analyse the emergence and stabilisation of low-carbon practices in two different types of community-based initiatives: eco-villages and low-carbon communities. We draw on six in-depth case studies in Germany and Austria, including interviews, visits and workshops. We focus on the different institutional, political and legal framework conditions of each type of initiative and on their role in enabling or impairing the development, stabilisation and potential mainstreaming of low-carbon practices. These framework conditions determine largely which practices can be stabilised and even mainstreamed and which are blocked. We expect to find characteristic differences between eco-villages and low carbon municipalities, from which we aim to derive lessons for climate policy beyond individual behaviour change.

HAVAS, ADAM* (Corvinus University of Budapest, elravaljc@gmail.com)

The Genesis of the Hungarian Theatre Field in the 19th Century

In providing an account on the historical process of autonomy of the fields of artistic production in the framework of a historical sociological approach, Bourdieu argues that the evolution of artistic fields in the broader Western context is governed by similar principles that might be interpreted on the basis of the field theory. By focusing on the evolution of the genesis and structure of the field of theatre in the 19th century Hungary, this paper considers issues at stake associated with Bourdieu's account on the social principles of aesthetic hierarchization, as a result of ongoing struggles between competing agents, in order to conserve or transform the field. The analysis of the historical process of differentiation of institutions and genres manifested in them, makes possible the designation of the socially determined laws affecting the evolution of the autonomous field of theatre. By concentrating on the Hungarian case, it will be intended, first, to test the Bourdieusien theory in a different socio-cultural context, and, second, to provide a model concerning the interdependencies between the economic, political and theatre fields. In the framework of the presentation the aim is to provide an account on the methodology of such a historical sociological research i.e. how the historical sources are combined with the model building purposes of the sociological investigation laying on the premises of Bourdieu's field theory in order to grasp the process of evolution of an artistic field: the theatre field in Hungary. Thus, by focusing on how the theoretical apparatus of the field theory functions on the Hungarian historical material some relevant consequences will be drawn with regards to the universal validity of the field theory.

Some Years Later – Perspectives on Diverse Worlds of Unemployed Adults: Consequences for Leisure, Lifestyle, and Well-Being

This presentation will provide a retrospective look at some predictable and sometimes surprising results of a multi-method study of the effects of unemployment in leisure, lifestyle, and well-being in Canada, and update its conclusions within the context of contemporary world-wide literature on the topic. Sixty unemployed adult Canadians with prior job history comprised the sample. The research employed in-depth interviews, quantitative experience sampling, and standardized questionnaires to collect data over a period of weeks and months. It provides substantial evidence that the lived experiences of people who are unemployed are incredibly diverse and that, although varied in form and preference, the need for leisure is as intense for them as for people who are employed. As noted in the ISA call for abstracts, "the biggest battalions in the reserve army of the unemployed are young people and those in 'late career.'" People in the present study broadly classified on the basis of in-depth interview responses as Planners and Connectors were predominantly comprised of older respondents, whereas those classified as Vacationers and Marginalized were, for the most part, much younger. Two to three sub-groups within each of those four just named provide additional nuance to the life circumstances experienced by respondents. Issues related to recreation activity patterns and constraints, mood states by time of day and day of week, leisure boredom, and social isolation will be explored. The data also speak to potential changes in public policy and social service agency management at Canadian local, provincial, and federal levels that will better serve unemployed people and their dependants, and enable them to use leisure activities to improve their lives.

Factors Influencing Foreign Qualification Recognition for Migrant Health Professionals in Australia, Canada and New Zealand

This paper assesses the extent to which health professional migration to Australia, Canada and New Zealand has transformed in the recent decade, in terms of scale, source countries, and migration mode. Within this context it defines major challenges associated with foreign qualification recognition (FQR), including growing government and stakeholder pressure to improve migrant health professionals' recognition and early employment outcomes. A range of innovative strategies are next described, based on Australian medical and nursing sector case studies. Finally the growing engagement of regulators in qualification recognition reform is examined, at a time when the question increasingly asked is whether regulatory bodies have the agility to facilitate 21st century labour migration flows. Key learnings are highlighted, of potential policy relevance to a wide range of immigrant-receiving countries which recruit migrant health professionals.

The Impact of Employer Preference on Migrant Health Professionals' Labour Market Integration - Key Trends in Australia, Canada and New Zealand

The role of employers in relation to economic migration has transformed in the past decade in Australia, Canada and New Zealand. Employers have a growing capacity to select and fast-track skilled applicants, both on-shore and overseas. They can increasingly choose migrants on a permanent as well as a temporary resident basis, while determining the scale of entries by sector and field. Based on major studies completed by Hawthorne for the Australian, Canadian and New Zealand governments, in addition to the World Health Organization, the International Labour Organization and the International Organization of Migration, these trends are explored in relation to medicine and nursing. The paper defines the human capital attributes sought – including employers' preference for migrant health professionals with advanced English ability, OECD qualifications, and host country experience. It assesses the extent of preference for temporary rather than permanent foreign workers, and for former international students qualified in the host country. Finally, the paper examines labour market outcomes for employer-sponsored compared to government selected professionals. It argues that the changing role of employers is highly significant, and involves important equity issues.

Predicting Welfare Attitudes By Precarity of Work Regime Using the European Social Survey and the European Working Conditions Survey

Esping-Andersen's *The Three Worlds of Welfare Capitalism* clearly demonstrated the relationship between labour markets and welfare regimes across Europe, with the welfare state emerging strongest where workers were able to mobilise to protect themselves against 'commodification'. The Varieties of Capitalism approach more recently argued that workers in marketised contexts would welcome commodification, while those with specific skills would have a stronger interest in the development of welfare protections. Each approach within comparative political economy has implications for the well documented link between the type of welfare regime and public attitudes towards welfare. Indeed, they suggest that more attention should be paid to the impact of workplace, precarity and employment regimes on attitudes to welfare.

This research uses the European Working Conditions Survey (EWCS) in tandem with the European Social Survey (ESS) to assess attitudes towards welfare across work regimes in the EU-15. The EWCS contains extensive information on both the employment relationship and the labour process for a random sample of households across Europe. However, it does not gather attitudinal data. The ESS contains demographic information on respondents including basic employment relations, a module on work and well-being in 2004 and 2010 along with extensive data on attitudes.

Multi-level latent class analysis has been used to estimate typologies of work regimes with varying degrees of precarity and how they cluster within regions across Europe. Using multi-level modelling, we have examined how exposure to certain types of work experiences, precarity and welfare regime shapes attitudes to social protection and social investment for oneself and others.

RC06-86.1

HEAPHY, BRIAN* (University of Manchester, brian.heaphy@manchester.ac.uk)

Troubling Convention and Reflexivity: The Continuing Significance of Family

Against the backdrop of debates about the ways in which legally formalised same-sex relationships reflexively trouble or bolster conventional family meanings and practices, this paper draws on a study of same-sex partners who were aged up 35 when they entered into civil partnerships in the UK to suggest the need to trouble how both 'reflexivity' and 'convention' are conceived in sociological debates on family.

By analyzing the ways in which civil partners and their close associates constructed their relationships as 'marriages' the paper illuminates the continuing significance of marriage to family as a social institution. Understanding the more general implications of this for contemporary family relationships requires reconsideration of sociological debates about whether contemporary relationships are defined by 'reflexivity' *or* by 'convention'. Rather, it requires paying attention to how, through 'reflexive convention', family as a social institution is maintained and invested in by people in their everyday lives.

The first section of the paper links theoretical arguments about the significance of civil partnership and same-sex marriage to broader sociological arguments about the contemporary nature of family relationships, highlighting the debate about whether sociologists tend to overemphasise 'reflexivity' or 'convention' in their analyses of these. The second section considers younger civil partners' claims about being 'married', and their reflexive deployment of family conventions to support these claims. It also considers how partners displayed fairly conventional (as opposed to radical) forms of reflexivity, in accounting for their investments in being 'married'.

The concluding section of the paper, draws on ethnometholodolically influenced ideas about the ways in which reflexivity and convention mediate each other to argue that claims about civil partnership as marriage illuminate the continuing significance of family as a social institution.

HEATH, MELANIE* (McMaster University, mheath@mcmaster.ca)

How Does Polygamy Challenge Islamic Feminism? Gender Equality and Group Rights in Mayotte

Debates over whether there can be an Islamic feminism have flourished in feminist circles. Susan Moller Okin incited controversy in her 1999 essay when she questioned the compatibility of multiculturalism, and the support of patriarchal religions like Islam, with the goal of attaining gender equality. She offered the example of France's approach to polygamy, which allowed immigrant men from former colonies in the 1980s to bring multiple wives to France, as reflecting a deep and growing tension between feminism and multiculturalism. Polygamy is a contested issue within Islam. Some argue that Islam approves limited polygyny, allowing a man to marry up to four wives, only when he can provide for the family and treat all wives justly and fairly. Seeking to institute this understanding of polygyny, Islamic feminists have mobilized to tighten the procedures for these marriages (Shuib 2005).

This paper offers the case of Mayotte—a French department where 95 percent of the population is Muslim—to ask how does polygamy challenge Islamic feminism? Mayotte is an archipelago located in the Indian Ocean. The name comes from the Swahili word for Mahore, Maote, and the Mahore identity is based on Comorian, Malagasy, French, and Creole cultural traits. In a 2009 referendum, the population overwhelmingly approved accession to become the 101st department of France, taking effect in 2011, when new polygamous marriages were banned under French law. According to the Overseas Territories Minister Marie-Luce Penchard: "The ordinance puts a definitive end to inequality between men and women." This paper draws on interviews with Mahoraise polygynous women, activists, and government officials to problematize this simplistic formula of how to end gender inequality. It considers the complicated role of Islamic feminists in negotiating a position on this cultural practice that continues unofficially under the radar of the French legal system.

HECHT, KATHARINA* (LSE, k.hecht@lse.ac.uk)

Economic Inequality and Government Redistribution: Perspectives from UK Economic Elites.

The UK has become more unequal since the 1970s. Top income and wealth shares have increased substantially. The share of the top 1 percent of total income increased from 7 percent to 15 percent between 1970 and 2010. Over the same period, the share of the top 1 percent of total wealth rose from 23 percent to 28 percent (Piketty, 2014).

How are these recent increases in economic inequality understood and experienced by those with top incomes and wealth? In particular, how do elite ideas about inequality relate to their attitudes towards government redistribution, those who live in need and whether it is the government's responsibility to reduce income differences between the rich and the poor? Due to the interdependence of poverty and inequality, it is important to understand how the advantaged perceive these issues (Reis, 2010). However, even though research by economists has demonstrated that the wealthiest 1 percent are increasing their advantage over others, there is little empirical research regarding how they perceive increasing economic inequality (Chin, 2014).

Findings from a mixed-methods doctoral study with 30 UK-based economic 'elite' respondents are presented. Elites are defined as "those with vastly disproportionate control over or access to a resource" (Khan 2012, p. 361) and conceptualised in terms of social class (Savage *et al.*, 2013). Attitudes expressed by respondents in semi-structured interviews will be compared with nationally representative findings from the British Social Attitudes survey.

Specifically, the paper discusses whether there is (still) an acknowledgement of the interdependence between rich and poor, as argued by de Swaan (1988). The findings will be compared to Reis' (2010) work on how poverty is perceived by Brazilian elites, assessing whether there is also awareness of social interdependence and feelings of efficacy to address inequality, but a lack of accountability to action among UK respondents.

The Crisis of Cultural Journalism Revisited. the Place and Space of Culture in Five European Newspapers from 1960 to 2010

Newspapers can be considered key institutions in producing, legitimizing and disseminating cultural classifications and aesthetical standards. A central part of cultural classifications takes place in the cultural sections: cultural journalists and critics are both gatekeepers and tastemakers, defining what counts as valuable culture and good taste. We will draw on newspaper data from the cultural sections of nationally leading newspapers from five European countries – *ABC/El País* (Spain), *Dagens Nyheter* (Sweden), *Helsingin Sanomat* (Finland), *Le Monde* (France) and *The Guardian* (UK) from time points of ten-year intervals between 1960 and 2010 to see how the structures of the newspapers examined change over time and in different socio-historical contexts, especially in regard to culture. Our data consists of full editions of newspapers (n=585) and individual articles on culture (n=11,775). We ask 1) what the place of the cultural section has been in relation to the other areas covered by the newspapers and 2) how culture has been discussed in a formal or structural sense – are there signs of the alleged and much-discussed crisis of cultural journalism in terms of shorter articles, more popularized content and more news compared to reviews? This paper departs from the expectation that the structure of newspapers reflects at least to some extent the structure of the surrounding society – and that the space and place given to culture to reveals a great deal about the role of it.

Mobile Lives in a Neighbourhood – Physical Mobility, Life Stories and Ageing

'Ageing in place' is a notion which captures the importance of ageing in familiar surroundings for older people. Place is often conceptualized as the local environment, e.g. the neighbourhood of living. However, in the modern mobile world, older people are highly mobile, virtually as well as physically. This means that the notion of place also has to include mobility and 'ageing in place' may have to transcend local boundaries. The aim of this paper is to discuss 'ageing in place' based on narratives of physical mobility, i.e. everyday mobility/transportation and residential mobility, among older people living in the same neighbourhood.

18 interviewees 65 years and older were asked to retell their lived mobility. All interviewees lived in the same neighbourhood, Ljura in Norrköping, Sweden. In this way all stories converged in time and space, in Ljura, at the time of the interviews. Some interviewees had grown up in Norrköping while others originated from the very north and south of Sweden, as well as from abroad. The experiences of and ties to Ljura differed clearly based on when the interviewees moved to Ljura as well as previous experiences of mobility in life. While living in Ljura, routinized everyday mobility was connecting the neighbourhood to other important places for the informants, e.g. a nearby forest, the city centre, allotments and places from the childhood. Multilocal living was also important where living in the neighbourhood was, depending on season, shared with living in the summer cottage or traveling for longer periods in a camper.

The life stories of mobility among older people living in the same neighbourhood illustrate heterogeneous ways of relating to the neighbourhood as well as the importance of mobility to link places of significance to each other. The paper discusses conceptualisations of 'ageing-in-place' in relation to these results.

Knowledge, Social Space and Climate Change: Cultural Differences in Handling Flood Risks in European Coastal Areas

Ways of dealing with climate change risks to create adequate resilience strategies for cities and regions differ depending on socio-spatial and cultural backgrounds. Actors who want to implement solutions have to consider differences in the knowledge of agents involved. Even similar climate scenarios from the natural sciences are treated differently. Thus to identify suitable coping strategies for cities and regions, cultural characteristics need to be taken into account. Consequently we have to ask: Which role do differences in knowledge and culture play in handling climate change risks?

To answer these questions I explore the shared knowledge of agents from spatial planning and coast protection from European coastal areas. In a quantitative survey agents assess possible risks and chances as well as adequate measures to cope with them. I investigate how their approvals are interconnected with culture defining variables like shared values, worldviews and socio-spatial identities. Furthermore, I consider how they inform and communicate about climate change related issues. More than 1.000 agents from European coastal municipalities in Germany, Denmark, the Netherlands and Poland gave their opinion.

In my presentation I discuss theoretical and empirical results with a special focus on flood related risks. The Intergovernmental Panel on Climate Change and others promote that water levels are rising in certain areas. Different coping strategies emerge in global and local discourse, e.g. protection of land (e.g. by dykes and other technical measures), accommodation (e.g. modification of infrastructure like implementing houses on pilings) or planned retreat (e.g. withdrawal of activities). Since different options exist, agents' strategy preferences do also differ. To describe and explain these differences, I use a theoretical framework build upon younger German communicative constructivism as well as attempts from American environmental sociology and social psychology.

Die Future of Youth Work: Changes of Society and Profession

Presently youth work is strongly changing. New social duties, but also new professional considerations push the youth work to develop new concepts and new services. Subjects like the relation of youth work and all-day school, youth work and employment, youth work and cultural differences, youth work and family problems, youth work and individual crises cause a change. Besides the role of the youth work between time out and support, between acceptance and education, between consumption and participation has to be reflected. In particular, the question how youth workers should be trained for these tasks is arising, because the present educational backgrounds are very heterogeneous. Career changers, graduates from courses and academics work together. Moreover, volunteers are important for the work, so that a relation of paid and unpaid employees exists. The presented study has qualitatively questioned 45 experts of youth work in youth centers, in the administration and in the training centres in Austria to get their perception and plans. Besides, employees (N = 92) and youngsters (N = 191) were asked with the help of an on-line tool to characterize the present youth work. The results try to illustrate the present situation of youth work and to derive at the same time existing and necessary developments for the future of youth work.

Ethnogeography As a Theoretical Framework for Examining Generational Dynamics within Transnational Shia Networks

The Twelver Shia community in London represent a minority within a minority. There are a very limited number of studies carried out with this community.

I aim to investigate how young Shia Muslims, involved with transnational religious networks, interact with and influence those transnational organisations. As part of my theoretical framework I have developed on ideas from the work of the philosopher of territorial rights, Avery Kolers. This paper will outline how I intend to use Kolers' conception of 'ethnogeography' in the context of understanding complex diaspora Shia identity construction. It will draw on findings from ethnographic fieldwork carried out in London during Ashura, 2014 and 2015.

In the Academic Study of Religion there is a growing understanding of space as being dynamic and socially constructed. This spatial methodology is useful in understanding transnational religious networks as fluid and adaptable. Despite the advantages of this framework, the emphasis remains focused on individuals within groups rather than on the group or community as a cohesive unit.

Kolers' conception of ethnogeography provides a means of defining group-right-claimants to specific geographical locations. Ethnogeography allows us to move from understanding the location of a single individual, towards understanding how a defined group views their social location in a given space. This is particularly relevant when questioning how young members of a religious community position themselves in a minority context.

The formulation of a distinctly Shia identity among the second generation Shia in London impacts on how the group identifies with and influences transnational Shia organisations. Issues such as language, ethnicity, and sectarian position, all play a role in how young Shia formulate an understanding of their own identity in relation to the communities around them. In this paper I will argue that Kolers' conception of ethnogeography provides a unique insight into understanding such contestations.

Governance without Government? Re-Introducing the State As Key Actor of Sustainability Transitions

The guiding vision of sustainable development has its roots in the age of neoliberalism and globalization at the end of the 1980ties and the beginning of the 1990ties. At this time, the diagnosis of"end of history" (F. Fukuyama) has been widely shared, celebrating the apparent victory of liberal democracy and capitalist market economy. The breakdown of the Soviet Republic, the political transformation in Eastern Europe, the introduction of (state) capitalism in China accompanied by the dynamic development of economic globalization and transnational civil society led to a devaluation of the societal role of the (nation) state institutions in theory and practice. The approach of "governance", focusing strongly on network governance and societal self organization beyond political steering became prevalent, especially in conceptual and practical approaches of sustainability and transition governance. In recent years, however, the importance of state institutions for copying with societal crisis and driving societal transformation has been proven, for example, in the aftermath of the global financial crises as well as in the German energy transition. Based on these observations it shall be argued here, that more attention needs to be directed towards the state as key actor of sustainability transitions. Taking Germany as a case study we will present a conceptual framework for the analysis as well as empirical results on the status-quo of the institutionalization of sustainability in national, regional and local state institutions. We will conclude by discussing the (renewed) role of the state in sustainability transition and we propose institutional, procedural and instrumental approaches for an effective transformational "sustainability state".

A Review of Theoretical Approaches to Study the Bologna Process in Educational Sociology from 2004-2014

This presentation analyzes current theoretical approaches employed by educational sociology researchers to study the Bologna Process (BP).

The BP was initiated by four European Ministers of Education in Paris in 1998 by signing the Sorbonne declaration and is now perceived as the most influential higher education reform in the last decade both inside and outside Europe. The BP has served as a legitimizing power to implement national reforms as well as to establish European reforms that had been developed before. Non-European countries view the establishment of a European Higher Education Area as serious competition with their national higher education systems as well as a window of opportunity for improvements. While the BP's impact has been global, its implementation has been strongly influenced by differing cultural backgrounds as well as by differing university levels and disciplines.

In this presentation I ask what theoretical approaches are employed to examine the BP in the field of educational sociology. A review of publications focusing on the BP, using the Social Sciences Citation Index in the Web of Science from 2004 to 2014 was conducted. Preliminary results of reviewing the 139 articles, reveal a large variety of theoretical approaches, such as institutional and neo-institutional theories, path dependence models, concepts of loose coupling, transnational communication and various governance models. A few of these studies develop approaches to include global as well as national influencing factors on the development of higher education systems.

Thus, there is a need to classify existing theoretical approaches and to develop a more comprehensive theory. The study presented here gives insights into the strengths and weaknesses of current theories analyzing higher educational systems and ongoing changes. It thus contributes to advancing theory building in the sociology of education.

Radical Alternatives and Their Political Embedding

As a consequence of prolonged economic, political and social crises, discourses on radical alternatives to development have gained ground in many parts of the Global South. In some countries, such ideas obtained political recognition and were even enshrined in constitutions, such as *Buen Vivir* in Bolivia, *Ubuntu* in South Africa and *Sufficiency Economy* in Thailand.

Our paper presents a research project which analyses these alternatives in a comparative way: Driven by various agents within different political contexts, we argue that a core strategy of these three alternatives is based on a discourse of indigeneity, i.e. a specific identity emphasizing local and traditional social models as a means to legitimise the demands of marginalized and exploited parts of the society. Apart form this commonality, however, the three alternatives have developed very differently. Whereas the idea of *Buen Vivir* was taken up and proliferated by left-wing emancipatory parties in Bolivia, the idea of *Sufficiency Economy* in Thailand has become part of an authoritarian conservative political project.

Drawing on Villaba (2013), we argue that in order to assess the transformative potential of a given alternative we need to look into the social and political processes by which this vision has been taken up beyond its local origins. It is within these conflictual processes that alternative visions are negotiated and consequently altered, modified or adapted.

Our empirical research is rooted in theoretical considerations about politics of contention and materialist state theory which emphasize the relationality and the adaptiveness of political actors. We will discuss questions such as: Who were/are the carriers of these visions? Which political strategies and strategies of contention dominate the struggle for alternatives? How can conflicting perceptions be integrated or related to each other within processes of generalization?

Social Theories and Methodology in the 1930s and 1940s in Austria and the US: The Case of Felix Kaufmann

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Social Theories and Methodology in the 1930s and 1940s in Austria and the US: The Case of Felix Kaumann

The paper will contribute to the discussion of democracy and social theory in the 1930s and 1940s by focussing on Felix Kaufmann. Kaufmann (1895 - 1949) published widely in jurisprudence, mathematics, economics and sociology both in Austria and, after his forced emigration, in the US (Cohen and Helling 2014). In addition to published texts his exteded correspondence with social scientists and philosophers will be used for insights into the intellectual developments during this period. Kaufmann's insistence on the possibility and necessity of a social science which is independent of world-views is relevant to a discussion of the pre-conditions of democracy.

Parents' Experiences of Caring Responsibility for Their Adult Child with Schizophrenia (ACWS)

Abstract

As a consequence of the latest psychiatry-related reform in Sweden and its implementation, related parties and family members have taken over from the healthcare system a large responsibility for the care of persons with a mental disability and illness. The aim of this study was to systematically analyze and describe the experiences of parents' care responsibility. The questions were: what are the experiences around the parents informal care activities and responsibilities, how do parents construct and manage their caring responsibility and with what consequences? Semi-structured in-depth interviews were conducted (16 h data recorded material) with eight parents who were all members of the Interest Group for Schizophrenia [*Intresseföreningen för schizophrenic* (IFS)] in Sweden. A deductive hermeneutic method was used for the interpretation of the data material. The parents endow their informal caring responsibility with meaning of being a good parent, responsible and accountable within the context of their personal and social relationships as well as to the psychiatric care representatives. In this tense situation parents' compromise between elements of struggle, cooperation, avoidance and adaption in their interaction with the world outside as well as the world inside.

The main conclusions and practical considerations: -It is crucial for the healthcare professionals to be aware of the perspective that reflects the parent's perspective of informal care responsibility to be able to support and conform care service to the parents. -There is a need for an in-depth debate about the psychiatric care's responsibility to support the related parties who are informal carers of psychiatric patients. -It is most important to establish a policy for how the psychiatric care is to be divided between the formal and informal care givers.

HELMAN, SARA* (Ben Gurion University of the Negev, sarith@bgu.ac.il)

Challenging the Israeli Occupation through Testimony and Confession: The Case of Anti-Denial Movements Machsom Watch and Breaking the Silence

This article analyzes the repertoires of contention and discourse of two Israeli anti-denial movements, Breaking the Silence and Machsomwatch. Through confession and testimony, both SMOs demand that Israeli society acknowledge its 'problematic present,' which includes human rights violations in the Palestinian Occupied Territories in a situation of ongoing ethno-national conflict, and insist that it take responsibility for this reality and act against it. It is based on the interpretative analyses of both SMOs reports. Reports are analyzed as narratives in the context of Israel's national identity and its main motives which are also constitutive of a culture of collective denial

The article compares the testimonial practices of Machsomwatch to testimonies of women in Truth and Reconciliation Commissions, and the confessions of Breaking the Silence veterans to those displayed in Truth and Reconciliation commissions as well as confessions of veterans during the war in Iraq and Afghanistan.

Confession and testimony are usually analyzed as blazing the path to a new and inclusive national identity (as was the case in South Africa). In the case of Israel, however, their adoption and mobilization destabilizes national identity and turns it into a field of contention.

HELVE, HELENA* (University of Tampere, School of Social Sciences and Humanities, helena.helve@uta.fi)

A Comparative Study of Future Horizons and Value Shifts Among Young Finns in Higher Education

Since the economic crisis began in 2008, Finnish unemployment rates have stayed relatively high and a new phenomenon among young people with higher education qualifications is a growing level of unemployment (Akava 2015). Statistics show that unemployment has increased by roughly 15% among the highly educated in Finland, yet only by 9% among the Finnish population at large over the past year. This paper analyses how Finnish students in higher education see their future and transition from higher education to working life. The paper will present views of the two research programmes, WORK-Preca (2008-2012) and NuorI-IHCCS (2015-2016). The first data set from university students was gathered in 2011, and the second in 2015. The research questions examined were: 1) How do students in higher education experience and interpret their future prospects? And 2) What kind of attitudes do students have towards education and work and how these are influenced by parents, friends, and society? The results of the study are compared from the viewpoint of changing life-styles, values, and future orientations among young adults. The value shift of students in higher education extends with attitudes towards society, environment, politics, welfare, and life-style. The results support the research hypothesis that the values of young people in higher education reflect deeper economic and social changes in society's values (cf. Inglehart and Welzel, 2005). The results are also discussed in the broader context of Finnish society and in the frame of work transitions among young people as agents of socialization relating to expected patterns of work value preferences associated with education and work life in Finland.

Subjective Well-Being and International Migration: What Kinds of People Suit Migration?

International migration, often motivated by the striving for a better life, improves the subjective well-being of only a subset of immigrants. Although it is well-researched how immigrants can make the most out of migration in the host country, little is known about what kinds of immigrants suit migration in the first place. Therefore, this article explores pre-migration personal characteristics of immigrants to determine what kinds of immigrants actually have the potential to derive greater happiness from migration. Data from the recently launched M(igration)-sample of the German Socio-Economic Panel (SOEP) is used for this purpose.

Towards an Optimal Measure for Subjective Well-Being: Experimental Evidence for Anchoring Effects.

Large-scale survey, such as the European Social Survey, The German Socio-Economic Panel, the Gallup World Poll, and the World Values Survey, all use slightly different questions wording regarding the happiness measures and life satisfaction measures. To improve credibility, the happiness field should come to a more consistent and optimal measurement of subjective well-being. In this study, we examine the impact of question wording on the self-reported score and then extended it to the examination of response formats. A key contribution is the examination of the the effect of anchoring that is caused by the presence of the words 'happy' and 'life satisfaction' in the question. We check the validity of our results with eye-tracking.

Public Art from the Ferguson Unrest

On August 9th, 2014, in the American city of Ferguson, MO, on-duty police officer Darren Wilson shot and killed Michael Brown Jr. The shooting was highly controversial because 1) Michael Brown was a black teenager and Darren Wilson was a white police officer and 2) several witnesses reported that Brown was holding his hands in the air when he was fatally shot. Immediately following the shooting, members of the Ferguson community sought an explanation for Brown's death. The Ferguson Police Department, however, refused to identify Brown's shooter, explain why Brown was initially stopped, or account for why Wilson used deadly force. Unable to get answers, a group of local residents gathered to protest near

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the shooting site. Ferguson PD responded to the protesters with exceptional force. They utilized tear gas, rubber bullets, noise machines, and mass arrests. In the months afterwards, people from around the country came to Ferguson to protest Brown's death and the Ferguson PD's use of force. During these months, some protest activity turned violent. Local businesses were burglarized, damaged, or set on fire. Many businesses boarded their windows after sustaining damages or preparing for possible damage. Dozens of these boards became the site of public art, primarily murals. While conducting fieldwork in Ferguson, I photographed this art and, later, I collected photographs from journalist, artists group, and protester websites. I then analyzed how the messages and images of art varied by time and place, particularly how the themes in the art differed between the early and later stages of protest and how it varied from East Ferguson to West Ferguson. In this presentation, I will 1) discuss the challenges of collecting data in a rapidly-changing public landscape; (2) explain the process of analyzing art using a geo-spatial and time-varying approach; and (3) outline the project's findings.

HENLE, STEVEN* (Concordia University,
　steven.henle@concordia.ca)

Experiential Educator at My Core

Part of the benefit of the experiential learning model is less articulated but important to highlight. Experiential learning provides students the opportunity to gain confidence. This needs to happen with the help of faculty support and good mentorship from community partners. The student learning, in this best case environment, creates a heavy workload for faculty to nurture the student through the experience which often entails deep learning. I would support the experiential learning model with the educational concept of scaffolding. During a capstone project, internship, fieldwork or related learning experience the university provides strong support (scaffolding) to help the learner gain skills, self-reliance, and competencies so that they can succeed. This should also include, beyond book knowledge and applied skills, the social competencies of the leisure professional. How does an animator motivate participants? How can a program planner evaluate programs? What does leadership and followership look like? I am trying to express the idea that the social mores of the workplace need to be learned, and this is best done through experiential learning, and it should be planned and not left to happenstance.

Derechos Humanos Como Mito Movilizador: Mujeres y Poblaciones Originarias En perú

En este ensayo analizamos las dinámicas entre las movilizaciones de mujeres y las de pueblos originarios desde mediados del siglo veinte. De manera más precisa, examinamos las convergencias/divergencias en torno al aprendizaje y re-significación de los derechos humanos, la construcción de discursos sobre la ciudadanía y la relación con redes globales.

Aún cuando en los dos casos interpelan los mecanismos de producción de la "otredad" tradicionales, no se estructuran solamente en torno a la política de la identidad. Por un lado, el feminismo latinoamericano que tuvo su última reunión en Lima (2014) elaboró una Declaración sobre "cuerpo y territorio." Por otro lado, la dinámica de las poblaciones originarias de la Amazonía, al lado de muchos pueblos pequeños, gira en torno a la protesta y negociación respecto de actividades extractivas, movilizados en torno a sus territorios ancestrales y nuevas formas de gobernanza corporativa.

Anclamos nuestro análisis en los estudios que hemos realizado sobre los movimientos de mujeres y de poblaciones originarias en el Perú del 2000-2015. Las investigaciones hechas muestran la relevancia de los vínculos de la sociedad civil con redes transnacionales en países con débil institucionalidad, con estados neoliberales en repliegue respecto de sus funciones reguladoras. Esto último marca un contexto diferente respecto de Bolivia y Ecuador. Proponemos que los derechos humanos constituyen un mito movilizador, enraizado en la experiencia local y de resonancia global, en torno a derechos individuales y colectivos.

HENSE, ANDREA* (SOFI: Sociological Research Institute Göttingen, andrea.hense@sofi.uni-goettingen.de)

Explaining the Emergence of Self-Perceived Precarity

Empirical findings show, that employees are increasingly concerned about job and income precarity, and that this affects their well-being and social relationships. Nevertheless, a theory-guided analytical framework is missing that explains why certain employees are more likely to perceive higher precarity than others. While psychological theories help to understand the cognitive part of this mechanism, the sociological part and the development of a theory-guided analysis of

socio-structural impacts are largely neglected. Thus, I will present an explanatory model that combines Lindenberg's social production function theory with Bourdieu's field and habitus theory. The resulting PFH-model consists of three parts: the production (P), the field (F), and the habitus (H) theory. Firstly, self-perceived risks are explained by unequal assets (factors of production, capital) for the production or substitution of wage labor. Secondly, a field-theoretical contextualization accounts for the social conditions under which the assets are employed. Third, a habitus-theoretical dynamization of the model takes preceding social conditions into account that generated the patterns of perception. The derived hypotheses are tested empirically using German panel data from 1985-2011. The production theory explains why employees with lower credentials, lower job status and fixed-term contracts perceive higher precarity. Moreover, people who live in households with a lower percentage of employees and a lower household income as well as working-class children perceive higher precarity. The field theory explains why rising local unemployment rates and reduced decommodification increase self-perceived risks. These perceptions increased constantly over the last decades and fundamentally after the Hartz reforms. But due to decommodification strategies they remained stable in the Eastern part of Germany and decreased in the Western part of Germany in 2008. Finally, the habitus theory explains why citizens of the former GDR and people who experienced unemployment and displacement perceive higher precarity.

Participation in Mhealth Evaluation: The Case of a Smartphone App for HIV Patients

The focus of this paper will be participation in the context of *technology development and implementation* in healthcare. The 'case' is a smartphone app for HIV patients, being developed in the context of the EU Horizon 2020-funded 'EmERGE' project, which aims to develop, implement and evaluate an mHealth platform to enable self-management amongst stable HIV patients in 5 clinical sites across the EU between 2015 and 2020.

People with HIV are participating in this through their involvement in the 'sociotechnical evaluation' of the process, led by the authors of this paper. While other Work Packages undertake economic and patient outcomes-focused evaluations, the sociotechnical evaluation is a formative, iterative and participative form of evaluation. This involves engaging the HIV community and patients in 'co-design' at all stages of the process- from design and development, through implementation to routine use- with the aim of achieving a better 'fit' between the technology and the care practices within the different study sites, as well as sharing learning about what 'works' both within and across study sites. Thus, it seeks not only to understand what makes for success in the implementation of new technologies in healthcare but to contribute towards the chances of success through participatory methods.

In this paper, we reflect on the first year of our work with the HIV community and highlight the challenges and opportunities that arise when seeking to engage citizens and patients in mHealth technology developments in healthcare. We reflect, in particular, on the 'performativity' of our methods and draw on Law and Urry's notion of 'enacting the social' to explore how our approach to evaluation might be understood as 'enacting the sociotechnical' in mHealth research. We consider the challenges of taking this approach as part of a larger study with a more conventional 'trial' design.

HEO, NAYOUNG* (Texas A&M University, nh7948@tamu.edu)

Natural Increase/Decrease in the Subareas of South Korea: Is South Korea Following the Pattern of Japan?

Of all the countries of Asia, only Japan has more deaths than births. In 2015 Japan reported having 8 births for every 10 deaths. South Korea, while currently having more births than deaths, i.e., 9 births for every 5 deaths, has a total fertility rate of 1.2 that is so low that the country will likely be following in the not too distant future the pattern of Japan, with more deaths than births.

Demographic research on natural increase and decrease indicates that it is at the subnational level of a country where natural decrease (more deaths than births) first begins to appear. Research on this topic at the subnational level in South Korea, is scarce if non-existent.

In our paper, we analyze the degree of natural increase/decrease among the 230 "counties" of South Korea for the years of the 21st century. We first describe the Rate of Natural Increase (RNI = crude birth rate minus crude death rate, divided by 10) for South Korea's counties for the years of 2000, 2005, 2010 and 2015. These descriptive analyses will inform us if some of South Korea's counties are moving toward having more deaths than births, or perhaps may already be there. Then we will estimate two multivariate regression equations, one for the

　　*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

counties of South Korea for the year of 2000, the other for the year of 2015. The dependent variable will be the RNI and the independent variables will focus on age structure and fertility. We hypothesize that as the proportion of elderly in a county increases, the RNI will decrease, and as the fertility rate of the county increases, the RNI will increase.

The Challenge of Researching Development Issues: A Methodological Proposal

Over the years, many studies focusing on development issues have been carried out. Given all the different theoretical positions and the many areas of study, the sociology of development has been a fertile field for the social sciences. However, the dissemination of the methodologies that have been implemented to investigate the sociology of development has not been as prolific. A methodological framework that facilitates in an effective and integrated way the research of all aspects of development issues is not easy to achieve. As is known, development issues include not only social and economic, but also cultural, gender, environmental and technological variables, to name a few.

So, how should development issues be investigated? How can we put together a set of research tools that will enable us to address the different aspects of development issues? How can we look beyond the quantifiable data and "visible" information of development issues? This presentation proposes some methodological reflections on how to approach the problems of development, considering not only different research techniques, but also different strategies to deal with complex research fields. Also included is a case study that illustrates the challenge of researching development issues.

HERBERT, DAVID* (Kingston University London, david.herbert@kingston.ac.uk)
HANSEN, JANNA (University of Agder)

Social Media and Multicultural City: A North European Comparison

It is well established that issues arising from immigration and the visible presence of especially Muslim minorities in Northern European cities have become controversial, and are much covered by the media, coverage in which the relationships between immigrants, Islam and majority society are often framed in conflictual ways (Larsson and Lindekilde 2009, Bangstad 2012). What is less well researched is how these conflictual frames are used, responded to, challenged and dealt with at a local level. This paper will report on the first phase of a mixed method comparative research project (Netherlands, Norway, Denmark) which attempts to capture the local dynamics of mediatisation in a polymedia environment in ethnically diverse areas of northern European cities. The paper will report on three groups of findings arising from our mixed method approach: (i) questionnaire results suggesting that discussion of media content on extremism can serve to reduce perception of cultural threat; (ii) interview findings on the use of/response to mass and social media by ethnic minority activists and (iii) social media analytics and interview findings which reveal how social media use both feeds into changing perceptions of neighbourhood and constructs forms of spatial inclusion and exclusion for some user groups. This evidence suggests that different social media platforms – given their different 'affordances' (modes of expression and communication they enable) - are associated with different kinds of stratification and segmentation, depending on their properties and local environments/cultures.

HERMAN, ALEKSANDRA* (University of Warsaw, olaherman@tlen.pl)

On the Need for Translation of Knowledge Between Generations. the Case in Ukrainian Minority in Poland in Gendered Perspective

I conduct the research on three generations of Ukrainian women living in Poland, who are representants of the uprooted minority (displaced in 1947 during Operation „Vistula"). Each of these generations grew up in totally different political and cultural conditions, which determined diversified strategies of maintenance of their collective identity. Simultaneously, each of them had to adapt their knowledge (obtained in primary socialization from the previous generation) in order to further exploitation. In each of these gnerations especially women actively advocated the survival of Ukrainian culture under a constant risk of majorization. In this way, she-representants of successive generations of the minority have gone from the trauma of uprootment and subsequent hidden cultivating their own culture in new – usually hostile – local societies, through a phase of buil-

ding the contact network in Polish diaspora, up to the contemporary phenomena of hybrydization and lack of rooting in local societies by own choice.

The dissimilarity of the three generations' experiences and observed cultural continuity recquired a common axis of analysis, which I seek in the concept of translation. This concept is widespread in a studies of multiculturalism, especially in the perspective of postcolonialism. I my speech the concept of translation will be used to analyze the variability of transferred knowledge of women which is customized by representatives of successive generations to the changing cultural and political reality. In this way I will try to point out its applicability in research on intergenerational cultural transfer of knowledge.

Presented results are a part of research in progress realized as the research grant of Polish National Science Center „Women in uprooted community. Agentic perspective in adversarially conditioned structure" [2013/11/D/HS6/04643].

Creative Professionals As Influential Stakeholder Group in the Preservation and Development of Latvian Song and Dance Celebration Tradition

The Song and Dance Celebration is the most characteristic cultural tradition of Latvia which is included in the Representative list of the Intangible Cultural Heritage of Humanity by UNESCO. Vast majority of society (25 %) is involved in the preservation of this tradition in various levels and through various forms of participation. Thousands of amateur singers and dancers all over Latvia create the majority of participants in the Celebration. However, there are also smaller and hypothetically significant stakeholder groups such as municipalities, cultural policy makers and creative professionals, such as choir conductors and choreographers etc.

We aim to identify different groups of stakeholders involved in the process and to understand which are the most powerful ones and what is the role of creative professionals in the preservation of tradition. In the study we shall apply stakeholder analysis approach, starting from the presumption that stakeholders are groups and individuals who can affect, or are affected by, the achievement of an organization's mission (Freeman 2010: 52). We plan to understand who are the main stakeholder groups by drawing a stakeholder map. Second step would be to clarify their interests using the stakeholder's matrix (Lindenberg and Crosby 1981), to identify the level of impact and power using the power versus interest grid (Eden and Ackermann 1998). We expect to understand the transactions among the organisation and creative professional group and to deduce their power and place in the stakeholder map and the organisational processes. Multiple data sources - qualitative semi-structured interviews, focus group discussions and document analysis will be combined.

The stakeholder paradigm and its implementation in practice are still relatively unexplored. Potentially the study will have practical implications in the development of policies for the preservation of Song and Dance Celebration tradition on a national and local level in the future.

HERMANN, CHRISTOPH* (University of California, Berkeley, hermann@berkeley.edu)

European Trade Unions and the Defense of Public Services

The recent and in some countries ongoing crisis in Europe was followed by unprecedented austerity programs. Apart from the recipients of social benefits and the users of public services, public sector workers were the main victims of the budget cuts. In addition to the reduction of employment numbers, governments introduced cuts in public sector wages and pensions, while increasing working hours and weakening employment security. In Southern Europe thousands of workers took to the streets to protest the austerity measures. However, the austerity programs were only the latest chapter in a several decades long history of transformation of public services in Europe which not only includes budget cuts, but also the liberalization, privatization and marketization of service provision. This paper takes the crisis as a starting point to analyze trade union strategies for the preservation and possible expansion of publicly owned and publicly provided essential services in Europe. Apart from strikes, these strategies include concession bargaining, campaigning and the fight for de-privatization. The paper will assess the success of the different strategies and discuss what this means for trade union struggles and for the future of public services in Europe.

Representative Employee Participation and Workplace-Level Innovation Processes: A Cross-National Qualitative Analysis of Labor Union Practices

Labor unions in manufacturing sectors are cautiously engaging with strategies of "workplace innovation" and "employee driven innovation". This involves dealing with topics that are traditionally considered management prerogative, incorporating forms of employee involvement that are less familiar or even in conflict with union structures, and adopting or re-working concepts and discourses such as "high performance work practices", "employee involvement", and "lean production".

In this paper, we explore these tensions and both the pitfalls and opportunities of such strategies from a union perspective. We do so on the basis of a cross-national, qualitative-comparative analysis of both thirteen company cases, and interviews. These interviews on the topic of representative employee participation in innovation processes were conducted in 2015 with union officials, employers' organization representatives, industrial relations researchers and policy actors in Belgium, Norway, Germany and Ireland.

The potential organizational-level pathways through which employee representative can engage in innovation processes are summarized and linked to the region- and country-level structural and institutional features that drive and sustain this engagement. We describe the challenges and required capabilities for such an engagement, for both employee representatives and their organizations. Finally, we locate and critically discuss this evolution in (self-perceived) labor union role in the wider historical debate on workplace democracy and employee engagement.

Global Professors in a Global World: National, Transnational and Crossbordering

Globalization has changed the world in many aspects which are relevant for all kind of 'knowledge workers' such as university professors. The configuration of the educational sector such like another market, the increasing necessity of symbolic analysts and other 'knowledge workers', are part from a scene where long-life education becomes essential for production and social reproduction. These global processes are dramatically increasing the needing of 'knowledge workers' and thus, the needing of higher and permanent education available through borders in a wide variety of issues. So a new kind of 'global professors' are appearing since the end of 20th century, and they are working in different countries or without moving but working through borders. This paper will discuss on general trends of market development in transnational work focusing in university professors.

New Professions in a Global World: Knowledge Economy and Knowledge Workers

Globalization has changed the world in many aspects which are relevant for all kind of 'knowledge workers', which is the case of most of professional jobs. The increasing necessity of symbolic analysts and other 'knowledge workers', are part from a scene where knowledge and professionalization processes becomes essential for production and social reproduction. These global processes are dramatically increasing the needing of 'knowledge workers' all over the world, but specially in emerging economies like Latin American, BRICS, Southern and Eastern European countries. In all those cases, new and traditional activities need new professionals to face new challenges in the global economy. The soy production activity in South America -specially in MERCOSUR countries- is a very well known case of commodity production growing up since 1990's with a lot of added value. This paper will focus on the production value chain of this activity as well as professions involved.

The Complexity of the Sensory Experience of Home on the Example of Window

This paper draws upon an anthropological fieldwork of lived experience of home. By the means of participant observation, qualitative interview and sensory ethnography was examined, how the dwellers perceive, exploit or modify their windows in order to raise the quality of their housing and create a sense of being at home. Window is an integral part of humane dwellings that mediates the contact with outer world to its inhabitants. Regarded as a place that interconnects the private space of dwellers with the public space outside the building, the window becomes a key factor that influences the processes of construction of the sense of home. Although people automatically associate the window with a view (and thus emphasizing the visual perceptions), this paper will show that the sight is not the main sensory modality that influences the feeling of home. Unlike acoustical and olfactory perceptions that the open window mediates, the view can be easily modified. Its qualities are moreover fully perceived only when the other sensory perceptions correspond to it or at least they do not interrupt it. This contribution will show how the smell and sound behind the window create a specific environment inside the apartment. Also the main factors that influence the sensory perceptions of home as a whole will be presented.

Public Policies on the Provision of Care for the Elderly in Cuba: Readings and Questions in Times of Change

The following paper shows findings on a research of public policies for older people's care in Cuba. Current socialdemographic processes –such as population ageing, the fertility rates downturns, the complexity of the socio- economic context, the diversification of family structure and migration processes- claims the need to rethink the social care's organization and the challenges that recent context brings to public policies. This research is focused on Cuba's most relevant third age social programmes, its difficulties and challenges given the current socioeconomic and sociodemographic scenario.

HERNANDEZ CASAS, DAVID* (UNAM, saladeltiempo@gmail.com)

Epistemology for a Sociopoetics on Dwelling

Mexico city has become a constant reminder of our failure as dwellers and designers of our habitat. Architecture and urbanism are two disciplines that have shaped the city and the way people inhabit it. But these have failed to account for a city that is for the peolpe and not just for commerce or politics and cars. Therefore, failed architecture and urbanism are only capable to produce wrong representations and practices of dwelling.

My research question is: What epistemological, sociological and artistic integrated processes might be constructed to look for a sociopoetics that aims to transform representations and practices of inhabiting our city? To achieve that porpuse I have integrated a theoretical corpus under a systemic perspective based on the Adaptive Model for Social Analysis.[1] Formed by: a) Piaget and Rolando Garcia's genetic and constructivist epistemology, b) Pierre Bourdieu's concept of habitus*[2]* and, c) a block of artistic, architectonic, urbanistic and philosophical discourses on dwelling. With these basis I can face the challenge to have a better understanding of *the habitus of dwelling* organized as a complex social system*, a*nd it also guides me into constructing an artistic practice that I call sociopoetics.

As part of the results of such sociopoetics, I present the project called "*Ciudad en segundo piso/Pie de casa de azotea"* as a series of artistic, architectural and urbanistic proposals designed by myself to come up with better ways of living within Mexico City's chaotic environment.

SER UN Buen Profesor. Valoraciones De Estudiantes Y Docentes De Posgrado SOBRE La Excelencia AcadÉmica

Se analizan los criterios que establecen estudiantes y docentes de dos programas de posgrado (maestría en Estudios culturales y doctorado en Estudios regionales) de la Universidad Autónoma de Chiapas para definir a un buen profesor.

Ambos programas se encuentran reconocidos en el Padrón Nacional de Posgrados de Calidad (PNPC) del Consejo Nacional de Ciencia y Tecnología en México (Conacyt), por cumplir con los requisitos para ser considerados de "calidad", entre los que destaca el contar con núcleos académicos conformados por profesores de tiempo completo que mantienen una alta productividad evaluable a través de los productos que generan cada año de manera individual, con sus pares académicos o con sus estudiantes (publicaciones, proyectos de investigación y de vinculación, direcciones de tesis, entre otros); asimismo tienen una orientación hacia la investigación que responde a un modelo "formación-investigación-innovación" que lleva a docentes y estudiantes a realizar investigaciones innovadoras y pertinentes que los vinculan con los usuarios de sus resultados.

La información que se refiere en la ponencia se obtuvo a través de dos técnicas: encuesta aplicada a los estudiantes y grupo de discusión con los docentes. Los estudiantes de ambos programas respondienron un cuestionario-escala en el que ubicaron la actuación de sus docentes (en una escala de inferioridad-excelencia) atendiendo a las dimensiones cognitiva, social, ética y afectiva. Para el caso de los docentes se organizaron dos grupos de discusión (uno para cada programa) en los que se abordaron las mimas dimensiones.

Los resultados obtendios ofrecen discrepancias entre los aspectos que valoran los estudiantes y los que llevan a los docentes a reconocerse como buenos profesores. En la ponencia se enfatiza la importancia que revisten las dimensiones afectiva y ética en sus valoraciones.

HERNANDEZ-LEON, RUBEN* (University of California, Los Angeles, rubenhl@soc.ucla.edu)

Chicanos y Veracruzanos: Música, Migración y Etnicidad En La Conexión Veracruz-Los Ángeles

El presente trabajo ofrece un análisis del campo social y musical construido en torno al son jarocho en el corredor binacional Veracruz, México-Los Ángeles, EUA, y de los intercambios sociales, culturales y políticos que chicanos y mexicanos sostienen en Los Ángeles y que se estructuran en torno a la ejecución, el aprendizaje y la reproducción del son jarocho en una variante conocida como "el movimiento jaranero" o "son jarocho fandanguero". El son jarocho es un género de música tradicional con raíces en el sur del estado de Veracruz y conformado por la confluencia de influencias culturales españolas, africanas e indígenas. Apoyándose en intercambios artísticos, culturales y políticos entre Veracruz y California que tuvieron lugar en durante la década de los 90, chicanos, inmigrantes mexicanos y veracruzanos (residentes en México) han establecido un campo de intensa actividad social a lo largo de los últimos veinte años. En concreto, dicho campo consiste de numerosas prácticas musicales y sociales a través de las cuales activistas y artistas chicanos interactúan con intérpretes y creadores veracruzanos en espacios urbanos y rurales en Veracruz y Los Ángeles, asisten a talleres de música, participan en festivales y fandangos, crean proyectos y redes de colaboración e intercambio y sostienen un diálogo con su contraparte mexicana en torno a temas relacionados con la creación y la autonomía artísticas. ¿Cómo fue establecida la conexión Veracruz-Los Angeles en torno al son jarocho y cuál es su organización social? ¿Cómo interactúan y se posicionan los distintos actores (músicos, activistas culturales, talleristas, representantes institucionales) en este campo social? ¿Cuáles son las motivaciones políticas, ideológicas, estéticas y sociales que han llevado a numerosos jóvenes y adultos mexicano-americanos a aprender, adoptar e interpretar el son jarocho en espacios como talleres, fandangos y representaciones en Los Ángeles, la región del sur de California y Veracruz?

Cultural Foundations and Brand Philanthropy: Rethinking the Role of Contemporary Art

This paper explores transformations in the non-profit sector with reference to the role of luxury brands in the establishment of cultural foundations. Its focus is the Louis Vuitton Fondation opened in Paris in 2014. Financed by corporate philanthropy, foundations are, following Payton and Moody's, (2008) definition of philanthropy, examples of 'voluntary action for the public good'.

However, the notion of 'public good' is in conflict with the role such organisaitons play in promoting and marketing the brands they represent. This paper goes beyond a critique of foundations as examples of marketing to argue that these types of non organisations challenge existing understandings of 'philanthropy', its contribution towards the 'public good' as well as the experiences of art's participation and luxury consumption.

The case study selected here is the last in a series of Foundations financed by the luxury industry sector that have emerged, mostly in Western Europe, since the 1980s. The paper will analyse the Fondation's ideological (mission statement), its financial arrangements, material resources (building, exhibition displays), and will also focus on how some of its key stakeholders (celebrities, consumers, curators) help lend legitimacy to the foundation, its mission and activities.

At the core of this paper is the proposition that the Fondation collapses the distinction between the consumption of art as a philanthropic object and the consumption of luxury products (such as those by the brand represented). In so doing, the role of art as a tool for critical expression, and that of philanthropy as a tool for social, economic, and in this case, cultural transformation are here turned into another spectacle for consumption. The paper will draw upon organisational theory of non-profits, consumer behaviour, arts participation, and Foucault's 'technology of the self'.

Following Population Dynamics and Family Changes in Rural Africa. "Slam", a Longitudinal Study in Mali.

The *Slam* ("Suivi longitudinal au Mali") project has been implemented in the late eighties to follow demographic and family trends in rural Mali, and especially to identify changes and emerging behaviors in a context often considered as static. The study is small-scaled (7 villages, 4300 inhab. in 2009) and based on a specific observation system, including different scales of observation (individual, family and community) and fuelled by approaches, methods and concepts drawn from the fields of population studies, anthropology and sociology. Two main quantitative surveys are conducted extensively (both sexes and all ages) and updated every 5 years: a follow-up survey, matching individual-level data from 9 censuses (1976-2009) and a life event history survey (marriage, fertility, migratory and religious histories). Qualitative materials include genealogical data, individual and group interviews and informal field observation over the long run. The paper will discuss the specific contribution of longitudinal data to approach family dynamics in rural Africa but also the challenges to build a comprehensive observation system and to maintain it over 25 years. Special attention will be given to two critical points: the inclusion of national census data in the local observation system and the necessity of knowledge dissemination as an integral part of the research program.

Totalitarianism and Collective Memory

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

In the paper I take Zygmunt Bauman's intellectual trajectory and particularly his problematic notion of liquid modernity as illustrations in order to highlight some of the differences between National Socialism and Stalinism. I argue that the differences in the way Stalinism is remembered reflect also real regime differences, particularly when compared to NS. For example, the categories of victims, perpetrators and bystanders, to use Raul Hilberg's famous distinctions, are much more intertwined, complex and partly also confused under Stalinism than they are in the case of NS. This means it takes real sociological, political and historical effort to gain some meaningful insight into the particular workings of Stalinism. I argue that instead of enlightening us on those distinctions Bauman's work does exactly the opposite; it does not allow for a critical analysis of both National Socialism and Stalinism and it avoids all meaningful talk about responsibilities. Looking at Bauman's own biography such sociological obscurantism might not be purely accidental. In a final discussion I will also address the question of why so many liberal and left-leaning admirers of Bauman have fallen into the same trap and have remained so uncritical vis-a-vis the narrative and conceptual framework of their idol.

Living Institutions: A Life-Course Approach to Evaluating Welfare-State Effects on Health Inequalities

The new field of scholarship that examines welfare-state effects on health inequalities is growing rapidly, but much of this work still assumes synchronuos causation, where welfare-state characteristics measured at a given point in time are assumed to affect social inequalities in health at the same point in time. This approach overlooks life-course scholarship on the development of health inequalities, and also misses historical changes in welfare-state instiutions. We assess the contribution of life-course exposure to more/less generous social citizenship rights to explaining social inequalities within countries and differences in heath between countries. We do this by merging life-history data from SHARE with detailed information on welfare-state institutions drawn from the SCIP/SPIN data. We then use this unique combination of welfare-state trajectories and life-courses to describe how people live the institutional arrangements of evolving welfare states. A decomposition analysis describes the relative contributions of welfare-state changes and social stratification to the distribution of population health.

Social Background, Mobility and Use of ICT Among the Disabled Lawyers in Surat City

The present paper makes an attempt to analyse the social background and patterns of intergenerational and intra-generational social mobility and use of ICT among the differently abled lawyers in terms of their religion, caste, class, sex, place of birth, type of schooling, parental background and reasons for entering into the legal profession. In pre-globalization era, the legal profession was dominated by the lawyers largely drawn from urban and upper caste background and hard to practice for disabled(differently abled) lawyers. However, with the process of globalization the legal profession has been transforming. The organization of court work has also been changing. The lawyers are using more and more new information and communication technologies in the organization of their work and in making contact with their clients through mobile phone, e-mail. Use of computer and internet has been significantly increased among the lawyers. The study hints that now the legal profession in the Surat city is becoming more and more inclusive.

HEYBERGER, DOMINIQUE* (Georg-August-Universitat Gottingen, m.heyberger@stud.uni-goettingen.de)

Live Stories Between Self-Sacrifice, Dependency, Overprotection and Neglect

My paper is based on my PhD research, for which I have conducted biographical interviews with mothers whose children were diagnosed with a disability during infancy. All interviewees continue to live with and take care for their adult disabled children.

In the UN Convention on the Rights of Persons with Disabilities, individual autonomy including the freedom to make one's own choices and independence plays a fundamental role for people with a diagnosed disability. Especially within the professional field of disability services, the transition into adulthood and subsequent independent living is seen as a major biographical aspect to fulfill the right of one's individual autonomy. The exercitation of this right therefore is seen as conflicting, when disabled children become adults but remain living within the family home. When mothers prevent the adult child from moving out and thereby not adhering to this generally expected step, accusations of physical, psychological, social and economic encroachments are quickly raised. In addition to the demanding caring responsibilities, they have to continuously demonstrate to the outside world why they "need" to remain the main care giver. The question therefore is, are these mothers keeping their adult child in a dependent life situation for their own benefit?

While these mothers are often accused of overprotecting their child and causing harm in that way, another question that arises within this research is that of guilt. Is it possible that some women sacrifice their own life, because self-inflicted or experienced violence, may have played a role in their child's diagnosed disability?

In this presentation I will discuss the perspective by which mothers and women express their „themes", how those themes are exposed, what they feel secure talking about, what they find difficult to talk about and what is possibly even unspeakable.

Mission Impossible? Meeting Donor Demands and Beneficiary Needs in Nongovernmental Humanitarian Aid Projects

In the past decade, budgets for development and humanitarian aid have come under pressure due to decreasing confidence of governments and the public in the effectiveness of aid programs. Nevertheless, there are substantial humanitarian needs with over 60 million refugees worldwide. The challenge of providing humanitarian aid quickly, effectively and appropriately thus remains. The question is if and how this can be best achieved, despite difficult operational circumstances such as security risks and political obstruction. This paper is one of the first to investigate whether and in what circumstances international humanitarian aid NGOs have been able to perform well in humanitarian crises in the past. We apply a reputational approach to humanitarian project performance by asking to what extent humanitarian aid INGOs have met criteria of donor appropriateness and beneficiary appropriateness. Appropriateness is defined as the extent to which aid activities are suited to the priorities of either donor or target groups/recipients. It is often assumed that a) meeting criteria of both donor and beneficiary appropriateness creates management tensions; b) donor demands are often dominant; and c) meeting donor demands might go at the expense of meeting beneficiary needs. We develop a theoretical framework based on the competing values framework by Cameron and Rohrbaugh. We reason that meeting beneficiary needs requires an organizational focus on flexibility, reflected in a strong internal focus on HRM and a strong external focus on local actors and needs, whereas meeting donor needs requires an organizational focus on control, reflected in a strong internal focus on planning, financial management and information systems and a strong external focus on donors and issues of accountability. We employ Qualitative Comparative Analysis on a subset of 90 manually coded evaluation reports comprising of evaluator statements about humanitarian aid project performance as documented in the Humanitarian Genome (see www.humanitariangenome.org).

Capturing Mixture and Convergence in Comparative Analysis of the Irish Diaspora and Contemporary Urban Multicultures

Lisa Lowe (2005) has raised problems with the comparative method seeing the origins of a focus on 'difference' as lying in Weberian sociology, she argues that mixtures and convergences are often lost in this kind of normative frame. Lowe advocated a *genealogical* study that retrieved the fragments of mixture and convergence 'lost through modern comparative procedures' (p. 412). My study of the Irish diaspora in two national settings, the USA and Britain, and of the role of 'the Irish' as socially constructed and as a form of self-agency in shaping their respective urban multicultures, takes inspiration from Lowe's critique. The study focuses on the significance of specific historical events and encounters in creating formatory moments or processes in the configuration of 'being Irish American' or 'being Irish in Britain'.

This paper deals with one part of the research, an examination of life narrative interviews with various generations of Irish identified people in London and New York City (NYC). The interviews in London are from research projects I have been involved in, and those in NYC from the Ireland House Oral History Collection, New York University. Oral sources reveal 'not only the history of what happened but the history of what it meant' (Portelli 1996, p.399). They are evidence of how popular historical consciousness is constructed. The paper will address: How can analysis of the life-narrative interviews help realize Lowe's call to capture fragments of mixture and convergence within comparison? How can those mixtures and convergences be identified? How can methodological issues arising from using data collected by oneself and by others in separate research projects in different countries be resolved? What does the analysis of 'being Irish American' and 'being Irish in Britain' add to our understanding of the durability and elasticity of ethnic identifications and future of urban multicultures?

Developing Pro-Environmental Practices within Community Based Initiatives: Eco-Villages and Low Carbon Municipalities

Recent years have seen a surge of community-based initiatives within Germany and Austria. These initiatives respond to climate change through the initiation and development of pro-environmental practices, as they experiment with alternatives to mainstream production and consumption practices, domesticate and develop novel low carbon technologies and engage in environmental social innovations. Their approaches to facilitating these activities can be extremely diverse, as they can differ in the way they initiate and link novel pro-environmental practices and the challenges they face in trying to develop and stabilise them over time. Whilst some initiatives tend to focus on sector-specific innovations (such as energy) and develop technocratic interventions into exiting mainstream practices, others have a stronger focus on linking pro-environmental practices in different sectors and have an integrative approach to initiating novel practices. Both approaches bring with them certain challenges and opportunities for facilitating pro-environmental practices.

Conceptualising the linkages between practices and the influence of interventions on current unsustainable practices is at the heart of social practice theory. Here, theorists have attempted to conceptualise how practices are linked together through time and space and co-evolve to either become incompatible or closely coupled. We examine such co-evolution of practices within community-based initiatives by drawing on six in-depth case studies, including interviews, visits and workshops. Two contrasting community-based initiatives are investigated: eco-villages and low carbon municipalities in order to firstly, draw out potential similarities and differences in the way they initiate and develop pro-environmental practices and intervene in unsustainable practices and secondly, demonstrate how certain material and social arrangements lock community members into unsustainable practices but also facilitate pro-environmental practices. In so doing, the paper aims to contribute to the literature on social practice theory and pro-environmental community-based initiatives, by exploring the linkages between practices and their configurations within two contrasting case studies.

Elites and the Limits of Western Power

Abstract: What can be said about the West's foreseeable future? Will the political, economic, and social resilience that brought the West to world dominance historically be sustained? Or will the West's politics, economics, and social orders become increasingly enfeebled and imperiled? This paper will argue that between now and mid-century elites in western countries must undertake and oversee a *conscious holding operation*. This will entail avoiding futile involvements in the internal problems of countries outside the West; cementing the West's economic and political integration; regularizing treatment of the millions of unemployed, underemployed, and demoralized westerners for whose labor there is no longer a clear or pressing need; inventing forms of useful work for these westerners to the extent it is feasible; inhibiting large and desperate migrations of people from outside the West; protecting decision-making processes in public and private institutions from paralysis; and above all, coping in major ways with the threat of environmental disaster. If this holding operation succeeds, the West may restore its historical prestige and sustain its leading world position. And if that happens, challenges to the West may gradually subside and make progress toward meeting global problems likely during the century's second half.

Toward Inclusive Alternative Learning Spaces: A Qualitative Study of Japan's Educational Support Centers

This paper explores alternative learning spaces in Japan called educational support centers (ESCs), which cater to students who are excluded from formal schooling due to reasons such as bullying or truancy. Local education authorities founded ESCs, which the Ministry of Education heavily promoted in the 1990s. ESCs rapidly expanded nationwide, and there are now over 1,200 in the country's urban and rural areas. There are no alternative choices for learning quite like ESCs, which offer open academic opportunities for students facing regional and economic disparities.

I examine the symbolic production of ESCs in order to shed light on their negative factors and ultimately make them more inclusive. To investigate the aforementioned negative elements, I carried out participant observation and semi-structured interviews at typical ESCs from 2012 to 2014. As supporting details, I used some data from questionnaires that I conducted nationwide from 2007-2015.

I summarize my major findings below:

(1) By building "alternative" spaces, a symbolic production of non-mainstream education occurs, which frequently requires ESC students or staff to prove the legitimacy of these centers. I describe how students behave very nervously when they go to and from the ESCs. I also explain how ESC staff members try to deconstruct and reconstruct the production.

(2) Personnel are often required to attach an educational meaning to ESCs. Since they are often set up in spare rooms in public facilities such as park administration buildings, ESCs seem unrelated to educational sites. Although it is effective to include students who have lost the motivation to study, educational success heavily depends on each ESC staff member's practices.

(3) Attendance at ESCs often depends on the economic and cultural capital of students' families since it is recognized as free-will. It is necessary to reconstruct "alternative" places as a foundation for socially vulnerable people.

Underemployment and Wellbeing Among Late Career Workers: What's Leisure Got to Do with It?

Although unemployment rates in Canada have fallen to near their pre-2008 recession levels, *under*employment rates have been rising. This increase is largely due to factors like organizational restructuring; re-employment in sectors where previous skills are no longer relevant; and an increasingly competitive, educated workforce. Unemployment and underemployment differ conceptually, but their wellbeing consequences are similar. These can include poorer health, higher depression rates, reduced self-esteem, and feelings of despair. Even so, the degree to which wellbeing is affected by underemployment may vary according to personal circumstances, such as whether people can access adequate resources, like income and social support, to lessen its effects. Leisure is a known coping resource for workplace and chronic stressors, and may be a helpful resource for those experiencing underemployment. This study examines how leisure mediates the underemployment-wellbeing relationship, and explores potential moderating factors among late career workers. Underemployment is a pressing concern

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

for this cohort: it can mean the loss of status, potential income, and future career opportunities, with implications for retirement planning.

Using data from Community Wellbeing Surveys conducted by the Canadian Index of Wellbeing (N= 2,562 full-time workers), we drew a subsample of 587 participants age 55 years and older. About one in five were underemployed based on subjective assessments of a mismatch between job requirements and their education/skills. Following a Conservation of Resources (Hobfall, 1989) framework, where people actively seek and conserve resources to withstand current and future stressful situations, we first examine differences between under- and adequately employed participants. Using linear regression with mediation and moderation, we found that reduced access to leisure-related resources including time for self and socializing, recreation and cultural opportunities in the community, as well as lower perceived income adequacy contributed to diminished wellbeing. Only perceived income adequacy moderated the relationship between income adequacy and employment status.

HILL, LLOYD* (Stellenbosch University, lloydhill@sun.ac.za)

Language and Academic Discourse at Stellenbosch University

This paper explores key aspects of the post-1994 *taaldebat* (language debate) at Stellenbosch University. Situated near Cape Town, Stellenbosch is the oldest historically Afrikaans university in South Africa. It is also a historically white institution with a paradoxical status in the post-apartheid higher education landscape: on the one hand it is a prestigious international research institution (ranked no. 2 in Africa, QS 2015), while on the other hand it is perceived by many as relatively untransformed, given that its undergraduate population is still predominantly white. In 2015 a series of protests organised by a new and predominantly black student movement – Open Stellenbosch – brought the complex intersection of race and language at Stellenbosch into the national spotlight. Open Stellenbosch and other interest groups have campaigned for the use of English as a medium of instruction at Stellenbosch. These protests came in the wake of the appointment of a new vice chancellor and the adoption of a new language policy. For political reasons explored in the paper, the term "bilingual university" is not used, but the December 2014 policy change nonetheless commits the University to using both English and Afrikaans as "languages of undergraduate teaching." The paper explores the controversial role that communication technologies and ideas about communication have played in affecting this shift to institutional bilingualism at Stellenbosch. I focus particular attention on two "tensions" evident in the production and consumption of academic discourses at Stellenbosch: firstly, a tension within the realm of identity politics between a discourse on "multilingualism" and discourses focused around racial discrimination and race consciousness; secondly, a tension between pedagogies that foreground "languages" as (parallel) channels for knowledge production and those that foreground "discourses" and "discourse practices" in global academic fields.

Securing Futures in Cancer Research: Harnessing Risk and Negotiating Boundaries.

This paper draws on literature from the *sociology of expectations* to explore accounts of UK experts in cancer research and clinical practice. The cancer specialists' accounts presented are taken from interviews undertaken as part of a project aimed at developing a research agenda for the next ten to thirty years in the four common cancers: (i) bowel and colorectal, (ii) prostate, (iii) lung and (iv) breast that will achieve early detection and prevention. Drawing on secondary analysis of the interviews, this paper provides a sociological exploration of both the experts' versions of the future and the interactions between the interviewer and research participant to show expectation *in the making*: the competing stories of what *is* and what *ought* to be the focus of cancer research now and in the (near) future. The building of a cancer research agenda is shown to be a contested future, represented by a *dominant* and *resistant* view of the cancer problem in which the promise of risk prediction and prevention jars with the complexity and uncertainty with which cancer presents itself both in the clinic and the laboratory. Cancer specialists must engage in performative strategies (Michael 2000) and boundary work (Gieryn 1983; 1999) to frame the present problem: what cancer is and how it can be detected and, subsequently, to claim credibility for a future pathway.

Fragmentation in Palestinian Society in the West Bank - Different Figurations of Palestinian Refugees Inside and Outside the Camps

The Palestinian refugee camps in the West Bank have been a center of attention for social research on Palestine and 'the Middle East conflict'.

In the academic discussion, the focus often rests on either the demands and the symbolic significance the camp population attaches to the 'right of return' or on the camps being 'hot spots' of resistance to the Israeli occupation.

However, the relations between the Palestinian refugees in general and more specifically the population of the refugee camps on the one hand and other groupings of the Palestinian society in the West Bank on the other have largely been neglected by social research. Internal relations and power balances between different groupings within the refugee camps, especially besides the political affiliations, have drawn even less attention. By using the framework of the Established-outsider theory by Norbert Elias (1994), we intend to discuss a) the relations between the refugee camp population and other, more established groupings of the Palestinian society (e.g. the 'urban middle classes'), and b) the internal fragmentation of the camp population. In doing so, we particularly focus on the intersection of different ways to (re-)present 'the Palestinian issue' in the context of a homogenizing nationalist Palestinian We-discourse and of different historical generations (in the sense of Karl Mannheim) which frame relations between different groupings in the refugee camps.

Our research, which is also part of our PhD-projects, is based on biographical-narrative interviews and participant observations we have conducted in the West Bank since 2011.

Girls Meet Deities: Deities in Japanese Pop Culture

Many mythological elements can be found in today's Japanese popular culture, particularly in manga (comics), animated (film or television) productions, and video games.

In this presentation, I will take a closer look at the manga and animation which feature girls who meet deities or turn into deities. I'll explore visual representations of Japanese deities and the relationship between these deities and girls in manga and animated productions.

Socio-Economic Implications of Japanese Hospitals Accepting Foreign Nurses Under Bilateral Agreements: Analysis of the Cognitive Burdens of the Hospitals

Since 2008, Japan has commenced recruiting foreign nurses under bilateral agreements established between Japan and Indonesia, Philippines, and Vietnam. As of March 2015, 481 Indonesian nurses, 337 Filipino nurses, and 21 Vietnamese nurses have entered Japan under the program. These nurses must pass the National Board Examination for Nurses in the Japanese language, within three years of such entry. Previous studies (Hirano et al, 2010) found that hospitals accepting foreign nurses under the program are disappointed with the significant costs involved, including the related economic and social expenses to support these nurses, before these nurses pass the examination. However, Tsubota et al (2015) reported that there were no significant causal links between the economic expenses and the willingness to recruit foreign nurses under the program. Although no correlations were found between the willingness to proceed with future recruitment and economic expenses, accepting foreign nurses is still a 'burden' for these hospitals (Nagano, 2015).

In the present study, correlations between socio-economic factors and cognitive burdens, represented by laborious and emotionally strained work of the hospitals on supporting foreign nurses were tested through bivariate and multivariate analysis. The strongest indicator of the level of cognitive burden was a given hospital's number of beds (beta=.384, p<0.05), followed by the type of hospital as a private institution (beta=.335, p<0.05), and the tendency of financial evaluation made by hospitals regarding their profitability should foreign nurses continue in employment over the long terms with the same institution that support them (beta=-.271, p<0.05).

The analysis indicate that the size and management system of the hospitals and likelihood of job settlement of foreign nurses after they pass the examination may be a factor correlated with the cognitive burdens of the hospitals accepting foreign nurses under the program.

Continuities and Changes in Family Policy and Familialism in Japan

In Japan, the concept of family policy is not used in laws and government documents, nor is it frequently discussed in academic studies on public policy. However, in the late 1990s, the government began attempts to coordinate and integrate policies and programs for families raising children under the banner of "Measures to Cope with Society with Declining Birthrate." The establishment in 2003 of the Basic Act for Measures to Cope with Society with Declining Birthrate accelerated development of this. As our earlier studies have demonstrated, a loosely structured system of policies and programs supporting families raising children, which may well be regarded as "family policy," emerged in the mid-2000s.

This study aims to elucidate the specific characteristics of the family policy that came into existence at that time, to analyze its continuities and changes over the past decade, and to examine how these factors relate to the persistence or decline of familialism in the Japanese welfare regime.

This study first traces the development of policy responses to declining fertility rates since the early 1990s, and attempts to explain how family policy with specifically Japanese characteristics was formed in the mid-2000s.

Second, it analyzes the course taken by family policy development over the past decade, paying particular attention to the effects of the administration changes in 2009 and in 2012. Tension and contradictions inherent in the family policy of the Abe administration are analyzed, as well as those between pronatalism and the goal to increase female labor force participation; between quantity and quality of childcare services; and between pursuit of work-family life balance and neoliberal labor policy.

Finally, this study examines how the development of family policy has affected, and been affected by, familialism in the Japanese welfare regime.

Toward an Integrated System of Service Delivery: Policy Framework, Instruments, and Challenges of Japan's Community Total Care System

Facing the projected rapid increase in the elderly population, particularly those aged 75 years or over, during the next decade, the Japanese government has pursued the creation of an integrated system of service delivery called the Community Total Care System (*Chiiki-hokatsu-kea-sistemu* in Japanese, CTCS) as the most important goal of long-term care policy.

The CTCS is intended to improve the efficiency of the system for service delivery and to guarantee independent living for older people, by integrating health, social, and related services and by shifting resources from facility-based care to community-based care.

This study aims to elucidate the nature of the CTCS, to analyze the newly introduced policy instruments for the improved functioning of the CTCS, and to examine the challenges facing the CTCS.

For these purposes, this study first examines the concept and framework of the CTCS in light of international discussions about integrated delivery systems and Japan's CTCS in comparison with its equivalents in the United States, the United Kingdom, France, and Sweden.

Second, this study focuses on some of the policy instruments that have been introduced recently for the improved functioning of the CTCS (e.g., all-inclusive payment of service costs to service agencies, the supportive housing scheme for the elderly, participatory governance of the local delivery system, utilization of information and communication technology (ICT)), analyzing their characteristics and effectiveness based on a review of policy documents, journal articles, and empirical studies.

Finally, this study examines the challenges facing the CTCS, especially the development and evaluation of innovative programs that are customized for local circumstances, the improvement of the quality of supportive housing for the elderly, and improvement in training and working conditions of care workers.

Internet Cafes of the People of Each Ethnicity, By the People of Each Ethnicity, for the People of Each Ethnicity: Temporary Migrant Workers in Singapore and Singaporean Policies of "Racial Harmony" in Hdb

The aim of this presentation is to clarify the problem between the integration policies of Singapore and temporary migrant workers in it by focusing on the concentrated areas of internet cafes and public housing (zone) for Singaporean citizens and permanent residents which are offered HDB (Housing Development Board).

The reason why I pay attention to internet cafes and public housing (HDB flats) zone for considering Singaporean integration policies is that public housing in Singapore play a role in a symbol of "racial harmony" of Singaporean people, and at the same time internet cafes as the main internet infrastructure for temporary migrant workers are eliminated from public housing zone by an ordinance enacted by Singaporean government. In this sense, the internet cafe in Singapore is something like a symbol of "racial disharmony" and in fact, according to my field survey, the concentrated areas of internet cafes in Singapore are the places such as Little India (Indian people), Geylang (Chinese people), and Lucky Plaza (Pilipino and Indonesian people) where temporary migrant workers of each ethnicity gather.

In my presentation, firstly I will figure out the concentrated areas of internet cafes in Singapore on the basis of my field survey. Secondly, according to my interview survey, I will demonstrate the relation between the different uses of internet cafes in each area and Singaporean policies of migration and integration including those of HDB flats. Finally, focusing on a speech of a Minister of State for Trade & Industry and Manpower at the 1st Foreign Domestic Workers Day held in 2010, I will discuss the importance of deeply understanding of the social and economic situations of temporary migrant workers not only in their working country but also in their home country in policymaking in matters concerning migration and integration.

HIRAYAMA, MAKI* (Meiji University, hirayama@meiji.ac.jp)

How the Sexual Revolution Hasn't Occured in Japan

Today more and more Japanese people turn their backs to sexual relationships.Sexless couples,'herbivorous' young men,virgin men and women in their 30's are increasing.

The difficulties of the Japanese sexual relationships were formed in long and complicated history,and now are still formed in new ways. But we can see the history on the whole as lack of sexual revolution,compared with Western societies.In this presentation we see briefly how the sexual revolution hasn't occued in Japan.

In modern Japan there were two public spheres on sexuality,one was honourable and formal,influenced with modern Western culture,the other was informal,holding premodern Japanese customs.Adult men were to live in both spheres but decent women were to live only in the former sphere.Commercial sexual service and porns in the informal sphere developed since 1960's and men became calable of realizing any fantasies with commercial sexual service easily.

Sex of married couple became more erotic after the WW2,but men and women had different background of puplic spheres,had communication gap in sexuality,-so the eroticization came to the limit.In 1970's and after,women became gradually the subjects in sexuality,and as the result the communication gap appeared on the surface.Many men have thought sexuality as the issue in informal public sphere,so they have hesitated from sex education,or science and philosophy on sexuality.

In the first decade of 2000 the Japanese came to think couples being sexless is popular and normal not finding the exit.

In Japan,sexual liberation occured which means the strict norm bonding marriage and sex became loosen,and the sex media and sexual service industry improved broadly,but sexual revolution didn't occure which means people subjectively project and act to change the situation of sexuality.Not a few Japanese feel insufficient for their sexual life but don't know how to change the situation even today.The making of a single new public sphere of sexuality for all would be needed.

Immigration Strategies of Burmese Refugee Diasporas: Between Burma and Japan

Burmese refugees living in Japan have fled from their home country for fear of persecution. In 2011, however, their homeland were said to be shifted to civilian rule. How did the regime transition change the immigration strategies of Burmese refugee diasporas? How did Burmese diasporas contribute to their homeland? How did the policies of homeland and settlement country make their strategies? This presentation aims to explore the immigration strategies of Burmese refugee diasporas between Burma and Japan. This presentation is based on the field work data carried out in Tokyo, Japan and Yangon, Burma. The data consists of interviews with Burmese refugees, refugee advocacy NGOs, Government agency, and other related personnel. I will discuss the following points. Burmese refugees found the renewed opportunities. Since Burmese government started the diaspora policies toward overseas

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Burmese, the return strategies, temporally and permanently, were found in the Burmese diasporas. On the other hand, since another refugees made their livelihood in the country of asylum, they tried to get more stable legal status and higher jobs. Other Burmese refugees engaged in the transnational activities. Since the country of homeland developed so rapidly, Burmese refugees started some transnational businesses including trading and traveling between two nations. After the regime transition, Burmese refugee diasporas have developed the new immigration strategies between Burma and Japan.

HLEBEC, VALENTINA* (University of Ljubljana, Faculty of Social Sciences, valentina.hlebec@fdv.uni-lj.si)

Challenging Issues in Evaluation of Home Care Services

Developing and introducing new policy measures and services for older people is a necessity in developed countries owing to rapid population ageing, related changes of family structures, and women's participation on labor market. Evaluation of quality of policy measures is an established part of public policies including different levels of evaluation such as nationwide administrative monitoring of services as well as users' oriented evaluations. Home care is a service designed to provide care to recipients own homes by care professionals and can vary from social care to community nursing or respite care. In Slovenia, the social home care was introduced on national policy level in 1992. Development of service was slow and fragmented. Detailed analyses of administrative data about organizational features such as number of users, the price of the service for users, the times of the day and week when service was delivered to recipients homes showed strong variations across municipalities (Hlebec 2010, 2013). The first representative survey of users of social home care, carried out in 2013 revealed that there is a group of users (about 20%) that find the service rather unsatisfactory mostly owing to intensive need for care (Hlebec and Filipovič Hrast 2014). In this presentation we will explore satisfaction with access (Penchansky and Thomas, 1981; availability, accessibility, accomodation, affordability, acceptability) from perspective of users and at the same time from perspective of their informal carers. First exploration of satisfaction with access shows that social home care users are unable to distinguish accomodation from acceptability and evaluate satisfaction with performance of formal carers as a single dimension while their informal carers distinguish between the two dimensions of quality. We will discuss implications of our findings with regards to quality of social home care, evaluation practices and methodologies.

HO, JOY QI YI* (Nanyang Technological University, joyho@ntu.edu.sg)

The 'Void' Is Not Empty: Space, Culture and Materiality at Singapore's Void Deck

The 'void deck' is a public space situated within Singapore's high-rise apartments and is utilised by both residents and passers-by alike. This idiosyncratic feature of Singapore's architectural landscape is arguably a 'nexus' between the initial vernacular *kampong* and subsequent high-rise housing. The proliferation and accessibility of the void deck enabled the space to be deeply embedded within the multicultural make up of Singapore, giving rise to a variety of personal narratives. This thesis aims to explore the material and ontological discourses present in the void deck.

The fieldwork was undertaken in Singapore and a spectrum of residential estates was chosen as sites for primary research. Primary research methods such as interviews and participant observation, coupled with literature review were used. These were supplemented with personal involvement in activities organized within the void deck – such as weddings, religious ceremonies and grassroots events.

Through the exploration of discourses involving the physical as well as ideological understanding of the void deck, this thesis contradicts the apparent 'voidness' of the space – suggesting a paradoxical relationship between the 'void' and its adapted uses. Therefore, there are implicit connotations within the ostensible explicit 'emptiness' of the void deck, alluding to wider social, political and cultural phenomenon.

HO, SEASON* (Hong Kong Shue Yan University, hoseasonho@gmail.com)

To What Extent Can Nationalism Account for Resistance to Foreign Culture? a Comparative Study on the Penetration of the English Premier League in China and Japan

The Barclay's Premier League (BPL) is deemed the most far-reaching football league in the world. Its culture and fandom have successfully penetrated into a lot of countries outside of Europe such as Asian countries. Same as other similar cases such as Hollywood films, in the process of exportation of BPL, associated lifestyle, cultural values and social norms are also exported and hybridized with local culture. Addressing to a central concern in globalization studies, exportation of BPL has encountered resistance from local culture, the level of which depends on many social and cultural factors.

This paper will explain the differences of BPL's level of penetration in Asia from the perspective of nationalism by using China and Japan as comparative cases. The current study will offer an overview of influences of foreign cultures in China and Japan and the BPL's development in both societies. By comparing the fandom towards their local league--Chinese Super League in China and J-League in Japan, people's loyalty towards the national team, and the fandom culture towards the Premier League in both cases, it was found that the strong base of Japanese nationalism is consequent to the low level of penetration of the BPL in Japan and facilitates to building loyalty to the J-League and Japanese national team. Yet, for China, people's selective and situational nationalism has rendered Premier League well-penetrated into the Chinese society and turned out to affect negatively the building of fandom culture toward local football league and the national team. It has also been observed that the popular BPL has changed tremendously the lifestyle of people in China.

One important implication of the current study is that nationalism is an essential determinant to the resistance of local culture to foreign culture. Arguably, it is the history and nature of nationalism that determine the level of foreign culture to penetrate into the local culture. Other implications on aspects such as fandom culture and localization of BPL culture will also be discussed.

Perspectives on the Umbrella Movement and the Adaptation of the Song "Do You Hear the People Sing?" Among Chinese University Students in Hong Kong

Songs are often associated with a movement of social change or government and social oppression. For almost three months in late 2014, the Umbrella Movement, with its name derived from the recognition of the umbrella as a symbol of defiance and resistance against the Hong Kong Government, involved mass civil disobedience. The 2014 Hong Kong Class Boycott campaign, respectively known as the 922 Class Boycott (which university students participated in from 22 to 26 September) and the 926 Class Boycott (which secondary school students participated in on 26 September), led a strike against the Standing Committee of the National People's Congress's restrictions on the nomination system for the election of the Chief Executive in the 2016 and 2017 Hong Kong political reforms. Using a case-study approach to the Cantonese adaptation of the song "Do You Hear the People Sing?" from the musical *Les Misérables*, this study will examine Chinese undergraduate and postgraduate students' (with a mix of participants from Hong Kong and Mainland China) perceptions of the political and social contexts in Hong Kong. The analysis of the paper will include a video assignment of this song that was a course requirement for students who were undergraduates attending the General Education course entitled "Music, Society, and Culture" in the first semester of 2014–2015, and postgraduate students participating in the master's course entitled "Psychology and Sociology of Music" in the second semester of 2014–2015, both of which were offered by the Department of Music, Hong Kong Baptist University. The findings and issues raised in this study will be useful for further research on how to improve and strengthen the learning outcomes of higher education in the humanities and social sciences and to introduce university students to different forms of social awareness, cultural expression, and other values education.

SCHWENKEN, HELEN* (University of Osnabruck, hschwenken@uos.de)

Domestic Workers' Organizing Strategies and Models: An International Comparison

Despite its reputation as a workforce that was "impossible to organize", domestic workers around the world have successfully formed organizations to build their collective power. While they share many common goals and strategies, they also differ significantly, depending on organizing traditions, extent of labour and trade union rights, and collaboration with trade union confederations. Whereas domestic workers' unions have existed in Latin America since the 1930s, they are a more recent phenomenon in Europe, where they are beginning to take hold in a trade union movement sometimes reluctant to include this "marginal" and precarious workforce. Efforts also differ according to migration status: in Hong Kong, Singapore and New York, domestic workers overcame cultural and linguistic di-

versity in an effort to reach common goals; nevertheless, the dependent (temporary or irregular) migration status clearly inhibits organizing.

Using data collected through field work in 13 countries (Brazil, Dominican Republic, Germany, Hong Kong, Indonesia, Italy, Namibia, The Netherlands, Nigeria, the Philippines, South Africa, Zimbabwe and the United States), this paper compares domestic workers' organizations' strategies and structures, with the aim of identifying and explaining patterns and points of divergence. Comparisons were made across variables, including outreach strategies, organizational form, position of domestic workers in the organization, and relationship to trade union confederations. Cases were then placed on a spectrum of organizing models, ranging from the "union" to the "associational" model (Ally 2005). The study reveals that organizing strategies, while they differ, work to overcome the sector's characteristics, namely its decentralization, informality, instability, low worker to employer ratios, and socially marginal status of the workers. The comparison also paves the way to theorize domestic worker power, applying concepts of advocacy versus social power (Jenkins 2002), associational versus structural power (Olin Wright 2000), and other social movement theories and labor studies' scholarship.

RC19-240.4

HODGE, CAREL* (University of New England, chodge4@myune.edu.au)

Who Are the Disadvantaged? a Case for Social Inclusion in the Education System of Small Caribbean Islands.

The purpose of this research is to discover how students who have special educational needs and are deemed "disadvantaged" are catered for within schools in the small island developing states of the Eastern Caribbean. The Organisation of Eastern Caribbean States (OECS) has seen some success over the years in harmonising and aligning the education systems, plans and strategies of their member states. While the sub-region has achieved international goals of universal primary and secondary education, whether the education systems are adequately meeting the needs of those with disabilities remains uncertain.

Inclusive education is being practiced in varying degrees and is treated differently within schools, within islands and within the regional grouping. How students with disabilities are treated depends on where they are situated rather than uniformly through the implementation of strategies and plans outlined by the OECS Education Sector Strategy (OESS) document. The OESS currently does not consider inclusive education an independent policy area, but have incorporated strategies among seven cross cutting themes.

For this study qualitative interviews were conducted with students, teachers, parents, policy actors and other stakeholders in three islands; St. Kitts, Antigua and St. Lucia between November 2014 and February 2015.

The data shows reoccurring themes of teacher education and training, resources and funding, stigma and discrimination as well as communication and awareness as contributing the lack of equity and equality in the practice of inclusive education in the sub-region.

The absence of an inclusive education policy with specific plans and strategies have implications not only for the quality of education received by those "disadvantaged" students, but all students within the education system in the OECS.

Widening Educational Inequalities in Smoking and Physical Inactivity Among Adults in Germany Between 2003 and 2012

Background: Since the early 2000s, several tobacco control policies, such as increasing tobacco taxes or bans of tobacco advertising, and physical activity initiatives have been implemented in Germany. The aim of this study was to investigate whether educational inequalities in smoking and physical inactivity have decreased or increased over recent years.

Methods: We used data from three cross-sectional national telephone surveys of adults in Germany carried out in 2003, 2009 and 2012 (n=37,052; age=25–69 years). Participants who smoked daily or occasionally were classified as smokers. Physical inactivity was defined as not engaging in sports or reporting 2 or less hours of sporting activity per week. The Slope Index of Inequality (SII) and the Relative Index of Inequality (RII) were calculated to estimate the extent of absolute and relative educational inequalities in smoking and sporting inactivity, stratified by survey year and adjusted for age and sex.

Results: In each survey year, smoking and physical inactivity were associated with lower education. Among the highly educated, the prevalence rates of smoking and sporting inactivity declined significantly between 2003 and 2012. Among the low-educated, these rates remained stable over time. Absolute and relative educational inequalities in smoking increased significantly between 2003 (SII=19.9; RII=1.81) and 2012 (SII=24.1; RII=2.28) (p-trend<0.05, respectively). With regard to physical inactivity, absolute and relative inequalities were also found

to have significantly increased from 2003 (SII=16.3; RII=1.29) to 2012 (SII=31.7; RII=1.76) (p-trend<0.001, respectively).

Conclusions: The findings indicate that educational inequalities in behavioural risk factors for chronic diseases and premature death have widened in the adult population of Germany since the early 2000s. These trends could lead to increases in social inequalities in health and life expectancy in the future. Inequalities should be considered in the evaluation of public health policies.

Think Tanks in the Knowledge Society: A Comparative Approach for Analyzing the Role and Impact of Scientific Expertise

Think tanks have frequently been described as intermediaries, as "switchboard organizations" between science, politics, economy and the civil sphere. Political consulting and the provision of expertise become increasingly important in determining responses to complex political challenges. Yet what think tanks actually do and why they seemingly thrive on a global scale remains a contested and intriguing question.

This contribution outlines a conceptual framework for analyzing the impact of think tanks on political decision-making and public deliberation in two political spheres. First, environmental politics provides a rich example representing a highly integrated international and inclusive field. Environmental challenges cannot usually be solved nationally. In addition the relevance of 'environmental issues' isn't limited to a single dimension (e.g. ecology), but spills over to other political fields like economic or security politics. Its because of this insecurity and interdependency of issues that political expertise is demanded.

Second, higher education offers a distinct set of questions. Traditionally a domain of the nation state it has become an international political issue. Higher education has itself become a vital part of national and EU strategies to reach political, economic and social goals. It is therefore crucial to ask whether (and how) Think Tanks became complicit in setting out this new agenda and tracing their influence on higher education politics.

In order to analyze Think Tanks' role and impact , we refer to different institutional contexts in politics, the economy or the sciences. Regarding the differences (liberal vs. coordinated market economies; majoritarian vs. consensus democracies) the approach draws on the comparative analysis of theoretically selected cases of EU member states to deepen the understanding of the role of Think Tanks on national and transnational policy making. By using a set-theoretic approach, the aim is to present a relational understanding of Think Tanks applicable to various institutional settings.

Young Europeans' Mobilities in Times of Globalization: Negotiating Foreignness in Tokyo and Singapore

This paper investigates the rising numbers of educated Europeans of middle class background who early in their professional career relocate to metropolitan Tokyo and Singapore. Japan and Singapore face population aging and workforce decline, which is why they have adopted policies to attract skilled foreign labor. However, the complex conditions that shape Europeans' sojourns in Asia have been poorly understood so far.

The comparative study, based on qualitative fieldwork in both locations, proposes that the two different city contexts attract different people in terms of lifestyle considerations, cosmopolitan attitudes and cultural fantasies. It examines what the destination countries provide for these foreigners by focusing on both career-related issues and social relations in the host societies. Due to these migrants' racial, class and national characteristics, special interest lies in how they negotiate their foreigner status and 'otherness'. It will be explored to what extent they eventually integrate and feel to be part of the host society. Furthermore, the researcher examines how these young migrants cope with the situation when expectations are not met and what this means for their future in this Asian city or elsewhere. It is suggested that these young Europeans entertain the dream of being free and independent in a globalizing world. Yet they are found to be caught by the locality they live in, of which they are reminded at various occasions. Such dynamics have implications for their long-term place of residence and career progression.

Causal Effects Between Socioeconomic Status and Health in a Life Course Perspective

Health differences between groups with different socioeconomic status (SES) are a well-established fact but there is debate about the underlying mechanism: Do people have worse health because they are poor or low-educated (social causation) or do they have less education and income because of poor health (health selection)? We study this question using retrospective data from the Survey of Health Aging and Retirement in Europe (SHARE, n≈25,000, 12 countries), the English Longitudinal Study of Ageing (ELSA, n≈7,000), and the US Health and Retirement Study (HRS, n≈8,500). The data include information about events and changes of SES and health from childhood to age at interview (50+). We use structural equation models in a cross-lagged panel design to study the correlated processes of health deterioration and the development of SES. Preliminary findings show, first, that both health and SES depend on their previous status. Second, education is an important mediator between childhood SES and adult SES. Third, health and SES only influence each other at the transition from adulthood to old age. Fourth, social causation is slightly more important than health selection in this transition. Our finding of relatively late mutual effects of SES and health suggest that only later in life when health deteriorates, it seems to be influenced by SES. Likewise only when health shows substantive variation in older age it has a measurable effect on SES. This does not imply an absence of effects in younger ages; it may be due to accumulative effects that can only be identified later in life. We discuss, first, differences between men and women, countries and alternative measures of SES and health, second, conditions for causal interpretation of the findings and, third, implications for policies against health inequalities in aging societies of the finding that both causal mechanisms seem to be at work.

Mortality By Different Dimensions of Stratification – a Comparison of Education, Class, Status and Income with Finish Register Data

This study compares the relation of education, class, status and income with mortality in Finland. It contributes to the ongoing discussion on how to measure social stratification for studies on health inequality. In a comparative perspective, we also explore which and how social dimensions are associated with mortality across gender, age groups, periods and countries. We compare our results to a similar study for Sweden (Torssander and Erikson 2010).

We use a 11% random sample from the Finish population in 1990 with an 80% oversampling of deaths. Our data includes information on education, occupation; individual taxable income, household taxable income, household disposable income; and mortality in a follow-up from 1991 to 2000. We do the same analysis ten years later with 2000 as baseline year and a follow-up from 2001-2010. We conduct separate analysis for men and women using Cox regression survival models to calculate relative risks of dying (hazard ratios) taking into account out-migration as a censoring event.

From the unique quantity and quality of the data we expect significant results on the relation between multiple dimensions of social status and mortality. This will concern gender differences, differences between income measures, age differences (35-59 and 60-85), differences between the 1990s and the 2000s, and differences to Swedish results by Torssander and Erikson. Our results will provide important new evidence on the best measurement of social status for studies of health inequalities, in particular with regard to the comparative question whether relevant dimensions of social status differ between gender, age groups, countries or periods. The question of measurement is crucial for exploring the mechanisms from social status to health. Our results will shed light on the relative importance of several suggested mechanisms and will reveal rather universal risk factors and those that differ between groups and contexts.

When Communities Participate in Primary Health Care: A Randomized Controlled Trial of an NGO Led Community Health Worker Program in the Philippines

In many developing countries public health systems are confronted with a significant shortage in professional health workers. In 2014, more than 4 million health workers were missing worldwide, based on WHO estimations. The short-age is recognized as one of the most important constraints in achieving progress in reaching long-term global health and development goals. Community Health Workers (CHWs) have been proposed as a cost-effective solution to address the enduring shortage. CHWs are lay health workers who, after receiving a short health training, work as support personnel in their communities. With their close relationship to the communities they serve as a bridge between their peers and the public health sector. Among other functions they promote good health behaviors, monitor treatment compliance, and perform small treatments. Besides national programs, NGOs have increasingly gotten engaged in developing and implementing own small-scale CHW programs. So far, little is known about the benefits and implementation barriers of such NGO led initiatives. In our study we evaluate a CHW program in the Philippines using a cluster randomized controlled trial (RCT) design. The program was initiated by a non-profit social development NGO operating in Metro Manila. Extensive data was collected in interviews among 1064 community members from 70 neighborhoods. In contrast to previous studies, we also collected information about the CHWs, e.g. about their competencies, motivation, and relationship to the community. We find that the CHW program has a positive direct effect on the health behavior and knowledge of the CHWs and their families. However, we do not find evidence for positive spillover effects to the communities. Our results suggest that the lack of spillovers is mostly due to missing information and mistrust towards the CHW's abilities. We discuss potential improvements of the program and derive policy recommendations that can be extended to programs in other contexts.

Convergences of General System Theory, Critical Realism and Theory of Society

This paper discusses philosophical, that is, praxiological, ontological and epistemological foundations of a theory of social systems. In particular, it addresses the confluence of critical thinking and systems thinking – of Critical Theory and Systems Philosophy – in the context of social theory. Critical Theory has its origins in the Frankfurt School going back to Marx and has developed since into a variety of different approaches. Systems Philosophy is considered as having its origins in Ludwig von Bertalanffy's General System Theory. It has been developing in the discourse about Evolutionary Systems and Complexity Thinking.

A special focus is given to the post-Luhmannian attempts to reframe the social (Wan 2011). They show a striking affinity of two strands: Critical Realism, on the one hand, that is grounded in some Marxian assumptions and dialectical logic, and Emergentist Systemism, on the other, as the gist of Systems Philosophy so far (Hofkirchner 2013, 2014, 2015, 2016).

In the light of those convergences, also some Luhmannian topoi can be revisited and interpreted so as to fit a more coherent social theory.

Cross-Border Trade Union Action in Europe in Times of the Euro-Crisis: The Case of the European Days of Action

The European Union is at present confronted with one of the biggest economic crisis in history. The hegemonic crisis management deepens the asymmetry of European integration (Scharpf 2010); neoliberalism is reinforced at the national and at the European level (Crouch 2011). The implemented austerity programs had a big impact on labour markets, social policies and work relations in a lot of European countries (Busch et al. 2012). Trade Unions responded to these developments by organising and mobilising resistance on a transnational level, e.g. the European Days of Action. For the first time in history trade unions of four different countries (Spain, Greece, Portugal and Italy) mobilized simultaneous strikes on the 14th of November 2012. Over 40 unions from 21 EU-countries showed their solidarity with decentralised protest actions at the same time (Larsson 2013). This form of cross-border coordinated trade union action may be astonishing at first

　　*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

sight – especially when one brings in mind the standard assumption that transnational union action faces chronic obstacles posed by institutional, cultural and language differences (Martin/Ross 2001).

In my presentation I'll present explorative findings on the history of the European Action Days and identify patterns concerning the participation rates of trade unions. The following questions will guide my presentation: Which unions did/did not participate in the European Days of Action and why? What constrains, but also: what opportunities have trade unions encountered in their attempts to organise and participate in the Action Days?

The empirical material of the research was gathered via online content-analysis and interviews with trade union activists from four different European countries (Bulgaria, Finland, Spain, Austria). First results indicate a big participation gap between unions from different member states. Union types and power resources seem to play an important role in the decision for participating in cross-border trade union action.

Researching the Global Financial Class

Our contribution develops a theoretical perspective on class formation in the context of global financial markets and presents empirical findings regarding the formation of a global financial class.

To date, class formation on a global scale has been researched from two perspectives. Firstly, as a "transnational capitalist class", based on the organisational structure of global corporations and international bodies of governance. Secondly, on the basis of "transnational professionals", who pursue international careers as highly skilled migrants, thereby creating a transnational social space. In contrast, we locate the basis for class formation in the communalities produced by the social embeddedness of markets.

Following arguments from Economic Sociology and the Social Studies of Finance, markets are structurally, culturally, cognitively and politically embedded in social networks, calculative and communicative practices, and political struggles. We combine this analytical understanding of markets with Pierre Bourdieu's field theory. It is argued that the forms of embeddedness translate into specific forms of economic, social and cultural capital, and that cultural and cognitive embeddedness produce a common worldview and habitus of market actors. Consequently, class formation becomes legible as rooted in practices of the economic sphere. In the case of finance, these practices are intrinsically geared towards a global horizon of valuation and exchange. Financial markets thus represent the site for the formation of what we term the global financial class.

Our approach thus reconceptualises the notion of (global) class beyond distributional properties and towards an analysis of the economic practices within specific fields of the global economy.

The Impact of Country Characteristics on the Level of (Late Life) Volunteering in Europe

Previous studies on volunteering have predominantly focused on individual-level determinants when explaining the likelihood that an individual engages in some form of volunteer activity. Studies rarely consider how cultural, economic, and institutional factors influence volunteering. The few studies that did, have thus far only examined the influence of macro-level factors on the likelihood an individual would volunteer, ignoring the level (or frequency) of volunteering among those who do.

The present study examines how the inclusion of macro-level characteristics can help improve our understanding of individual differences in volunteering, over-and-beyond the regular individual-level explanations. Given the changing demographics of the European population, special attention will be paid to volunteering among older cohorts. Using self-reported data on volunteering from the European Social Survey, we estimated multi-level ordered logistic models to [separately and simultaneously] analyse the effects of economic development, inequality, religiosity, educational attainment, level of democracy, and corruption at the country-level on individual volunteering. Moreover, cross-level interactions with individual-level characteristics were explored.

Results showed that older individuals are less likely to volunteer (frequently), but the extent to which varies between countries. Adding country-level characteristics to the multi-level model accounted for around 50 percent of the country-level variance. While less corrupt, more equitable and more democratic countries have higher rates of (older) volunteers, only the level of corruption was found to significantly influence the likelihood to volunteer at the individual level when the characteristics are considered simultaneously. The results concerning the level of economic development, level of religiosity, and average educational attainment in a country mirrored previous findings on the likelihood to volunteer, with higher levels of individual volunteering in countries that are more economically developed, are more religious, and in which a greater share of the population has had some form of college education.

An Extended Model of Vulnerability

Since 1990 the vulnerability model for understanding mental illness as influenced by both biological, psychological and sociological factors has been widely accepted within research focusing on the etiology of mental diseases. Yet, the exact influence of the three different factors has been purely defined and subject to basic disagreement. This paper tries to bring the discussion further by presenting an extension of the vulnerability model and a theoretical discussion on current results within neurology, psychiatry and sociology that might support a much more exact definition of the influence of different factors on mental diseases.

Basically, our extension of the vulnerability model distinguishes between two levels of vulnerability. The first level emprises the etiology of an impairment, we actually do not identify in any of the diagnostic systems. The second level comprises the interaction between the life-world of people with such impairment and the institutional systems of society as well as the conditions in the everyday life of people. This is the level where the social problems of these people can be identified and these social problems are the main indicators in the diagnostic systems.

On both levels neurological, psychological and sociological factors can be defined. Current research on neurological variations with respect to communicative abilities and the influence on the brain of stressors as well as a known diversity in normal psychological development can be related to current and classical sociological theories on stigma, symbolic interaction, discourses and communication. The paper will outline some of these cross disciplinary considerations, its emerging trends and possible solutions.

HOGSBRO, KJELD* (Aalborg University, Department of Sociology and Social Work, Denmark, kjeldh@socsci.aau.dk)

The Dementia Problematic - an Institutional Ethnography of a Life-World and a Professional Service.

This paper presents some of the results from an institutional ethnography of a life-world and a professional social work on two residential homes for people with dementia and some kind of challenging behavior. The two residential homes were subject to a one year ethnographic research comprising observations, interviews, questionnaires as well as talks and discussions. Professionals, residents and relatives were used as informants when trying to identify the basic problematics that defined the influence of discourses and regulating texts on the professional practice and the interaction between residents and staff members.

Dementia is a term covering diverse aspects of neurological functions disturbing communication and social interaction. It has no specific etiology but might be related to brain injuries, substance abuse or better defined neuro-degenerative diseases. The individual variance is significantly giving each person a specific profile with respect to personality, communication and social interaction. This is a challenge when trying to understand and present the life world of these people and the interaction between residents and staff members.

The final thick description of everyday challenges at the residential homes and its relation to discourses and governance contributed to the general understanding of the workings of such professional services in a modern institutional setting where the daily practice and communicative action is penetrated by institutional regulations, New Public Management, market competition and professional discourses. The final thick description seemed to widen the horizon of both staff-members and managers, disclosing the knowledge, experiences and conditions of the different groups and organizational levels leaving a rather huge material for reflection and contemplation. To the researchers it became a model for how institutional ethnography can be useful even when involving people whose life-world are rather inaccessible due to cognitive and communicative complications.

Deconstructing Austrian Identities: Components of the Bipolar System.

For deconstruction of the complicated term of identity we generated a theoretical bipolar scheme. In the framework of this scheme we are not going to investigate the types of Austrian identities in a positivistic-descriptive manner, but will try to decode the process of shaping their desirable forms.

The process of building up of identities is occurring within two theories: **«top down»** (politics of identity intrusion from authorities) and **«down top»** (preferences and values of individuals based on their traditions and wishes). These movements meet somewhere in-between forming desirable identities. There is another pair of opposed forces, which compose previous ones, but are acting along the different axis named **"local – global"**. In Austria these forces are represented by "**regionalism**" developed through Catholicism, "imperia complex", mountainous and therefore isolated landscape of the country, on the one hand, and **cosmopolitism** expressed in Austria through membership in the EU, socialistic determination of the government, migrant flows and geographic location of the country in the middle of Europe, on the other hand. In spite of the clear contrapositions of all these forces, in Austria we deal with their symbiosis named in ethnology and sociology Glocalization.

There are another two movements of identities construction – non-spatial and unconditioned. They challenge the conventional formula of identity – Identity = space + time + symbols – making first two components irrelevant and leaving only symbols, so that the new forms of identity appear. We will call them consumed and interactive ones.

In general, these dichotomies underline our investigation of recipes of desirable Austrian identities. In reliance of 17 interviews and content analysis of the press we are exploring the most relevant components of these opposed forces: stereotypes and patterns, based on postwar and imperia complexes, traditions and so called "European values".

HOLLERAN, MAX* (New York University, max.holleran@nyu.edu)

Europe's Exploding Edges: The Social Response to 2008 'crisis Landscapes' in Coastal Spain and Bulgaria

One of the most characteristic aspects of the European periphery during the important years of cohesion, 1995-2008, was the explosion of property markets: particularly second-homes, hotels, and suburbs. Much of the 'edges' of Europe were paved over using EU development funds, newly liquid credit, and revenue from direct foreign investment. This project examines the rapid growth of coastal leisure spaces and the social response to these developments before and after the 2008 crisis. It uses two cases: the development-saturated Costa Blanca in Spain, part of the original Mediterranean periphery, and the Black Sea coast in Bulgaria; the newest post-socialist periphery. It argues that much of the economic and urban development logic used in the Mediterranean periphery in the 1990s was adapted as EU institutional practice and reused in the post-socialist periphery in the 1990s and early 2000s.

The study analyzes political-economic reasons for the explosion of peripheral property markets, before 2008, as well as the social response to the expansion of coastal development. Using two years of ethnographic research with architects, developers, and environmentalists in Bulgaria and Spain, the paper will examine how notions of 'core' and 'periphery' changed before and after the 2008 property bubble. New coastal developments were often seen as spaces of aspiration but, after the crisis, quickly became spaces of disappointment and derelict spaces often reinforced the idea of peripherality. The paper, a segment of my dissertation, also has a specific focus on how stakeholders in urban development used growth to discuss and contest competing notions of Europeanness.

RC37-435.1

HOLLERAN, MAX* (New York University, max.holleran@nyu.edu)

Pop-up Engagement: Design Thinking, Museum 'Labs,' and Urban Problem-Solving

The project examines socially-engaged arts festivals and urban 'laboratories'—a field that has expanded along with the art museum building boom, but has attracted less ire because it incorporates and resolves calls from critics for museums to 'grow-down' and foster more engagement with the communities in which they are situated. Using two cases from New York City's Lower East Side (Sponsored by the New Museum and Guggenheim Museum), it analyzes the type of engagement museums create when they reach out to surrounding communities, and the ways in which they bring-in traditional neighborhood organizations. Museum-sponsored urban labs have stressed the need for creative class professionals to address urban problems through street-level interactions, forums, and educational festivals. Often, with corporate partners, museums have advocated for 'design thinking' and creative interventions to fix long-term problems like deteriorating public housing, access to healthy food, and polluted waterways. In examining these new spaces, we find a useful analogy in the settlement houses that dotted the Lower East Side one hundred years ago. Progressive Era reformers viewed American cities as ripe for intervention and manipulation through scientific management of social problems. The 'laboratory' metaphor has returned, this time, with design as the lens for examining and alleviating urban woes.

The use of design, not art, shows a telling difference in the way museums think about the neighborhoods in which they are situated. As New York's museums move to poorer neighborhoods they introduce more programs to 'connect' with local residents. It is telling that while high-income visitors can consume art, low-income community members need to be engaged through design, a field that tends to privilege bold, visual—often overstepping—solutions. While well-intentioned, the creation of labs to tackle urban problems marks a shift away from 'base-building' approaches advocated for by community who have been operating in these neighborhoods for years.

Multiple Discourses in Developing Intercultural Awareness: Talking about Blocks and Threads

This paper will consider how all of us employ multiple and often competing discourses when we talk about our relationship with the cultural Other. The primary example will be interviews with Algerian postgraduate students, who have just arrived at a university in the UK, about their intercultural experiences (Amadasi & Holliday in process). We found that these competing ways of talking about culture appeared alongside each other within conversations between the researchers and their interviewees as blocks and threads. Blocks are where we ask questions and get answers that encourage us to think about cultural barriers. They represent an 'essentialist culture and language' discourse. Threads are where we search for ways to share experiences – threads of cultural experience that we carry with us and draw from our prior experience but that can resonate with those of others. They represent a 'critical cosmopolitan' discourse that encourages travel across cultural boundaries and the contribution of prior cultural experience to this travel. (Holliday 2013)

We maintain the block mode of talking is easily converted into cultural prejudice because it stops the possibility for understanding and sharing at the point of tolerating an Other who can never be like 'us' – a putting-up with in times of low conflict that can feed aggression at time of high conflict. This is the default mode because of the way in which are wired within a global positioning and politics. The thread mode needs to be nurtured as an alternative form of engagement.

The Social Construction of Global Value Chains; A Case in Pharmaceuticals

The social construction of global value chains; a case in pharmaceuticals.
The focal sector of this study is the pharmaceutical industry, which, in its latest phase of global development, has engaged in 'internal sourcing' of research and development (R&D) capability from China. Designed to engender cost effective scientific discovery in highly competitive market circumstances, the relocation of primary discovery functions from 'West' to 'East' in major pharmaceutical concerns has been associated with the rationalization and disaggregation of international organizational structures and concomitant changes in forms of international staffing. Through invoking the concept of *global value chains*, a point of departure in this study is to recognise that international chains of production within knowledge- based MNCs are subject to social construction and manifest fundamental power asymmetry. Such a realization would conflict with assumptions derived from economics and international business literature characterizing

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

such internal corporate linkages in primarily transactional terms. Through an empirically based micro- level analysis conducted in China which brings to the fore issues of culture, ethnicity and language, it is discovered that micro political fault lines underlie the 'grass roots' organization of a 'knowledge based' international enterprise, and that the ascent of international value chains from the emerging economy perspective is marked by contestation and ambivalence.

The recognition that the organizational fabric of the MNC is constructed through social relationships, and not merely through impersonal economic transactions, inevitably brings to the fore the significance of human and institutional agents in moulding the social contexts occupied by the MNC. A trajectory of analysis, therefore, which looks 'inside out' from the socially constructed international division of labour constituting the MNC is therefore prone to expose the fragilities and fault-lines underlying the globalization process and prompts a rethinking of the more platitudinous notions concerning 'flatness' in the global economy..

HOLLOWAY, BECKY* (University of Sheffield, rsholloway1@sheffield.ac.uk)

Fitting in: How Young People in Employment at 16 and 17 Find a Place for Themselves in Policy and in Their Communities.

Young people in England are now required to participate in learning until they are 18 (up from 16). This new requirement for "participation" changes the way in which young people in employment are conceptualised in policy. Young workers, (around 1% of 16 year olds and 3.5% of 17 year olds) now find themselves caught between two larger classifications of young people; those in full time academic or vocational education or nationally accredited work-based training (all considered as "participating"), and those who are not in education, employment or training (NEET).

Drawing on interviews conducted with 30 young people, and administrative data of four school-leaving cohorts in one northern UK local authority area, this paper examines the impact that the new conceptualisation of pre-18 entry into employment has on the lives of young workers. It explores the first-hand experiences of young people, how they perceive themselves within their communities, and the impact of early employment and "non-participation" on their social circles, family relations, and living circumstances. The paper also argues that young workers are in great danger of falling between the gaps in youth support services; potentially receiving neither the re-engagement support offered to unemployed or inactive young people, nor the progression-support that young people in learning receive through their education or training providers.

In presenting this paper, a number of pen-portraits of young workers will be shared alongside the outputs from regression analysis of young people's post-16 participation pathways. The mixed-methods approach taken allows for person-level and trend data to be combined with specific examples of individual experience, and demonstrates that despite the frequent and numerous challenges they face, these are young people who can and do take a front seat in defining their place in society.

HOLMWOOD, JOHN* (University of Nottingham, john.holmwood@nottingham.ac.uk)

Moral Economy Versus Political Economy: Provincializing Polanyi

Despite Polanyi addressing the emergence of capitalism in Britain in the 18th and 19th centuries, there is no discussion of Britain as a colonial and imperial power. Moreover, the core conceptual apparatus of the book – the analysis of the three fictitious commodities of land, labour and money – appears to have no place for a treatment of 'race', except as a residual category of the 'social' in its resistance to market incursions. Nor is there a discussion of race in the many commentaries on Polanyi and attempts to update his work. I shall suggest that the original form of the commodity status of labour does not reside in *labour-power as a commodity*, but in the *labourer, himself or herself, as a commodity.* In this way, enslavement, rather than free-labour, can be seen as central to the development of capitalism and should no longer be seen as a residual form destined to disappear as capitalism becomes the dominant economic system as a consequence of capitalism's inherent logic to commodify labour power. I shall also suggest that this interpretation is consistent with other sociological accounts such as those of Durkheim and North American pragmatism where labour is seen as a *political*, rather than an *economic* category, albeit that the racialized aspect is not discussed by these writers. With this shift in analytical focus, I shall suggest that we will be able to understand the central significance of 'race' and also be able to better understand the return of unfree labour in contemporary capitalism.

HOLTMANN, CATHERINE* (Muriel McQueen Centre for Family Violence Research, cathy.holtmann@unb.ca)

A Place at the Table: The Challenges and Opportunities of Including Religion in a Collaborative Community Response to Domestic Violence

Since 1993 violence against women has been recognized by the United Nations as a human rights issue and the UN has provided norms and standards for holding governments accountable for changing the conditions that enable it to prevail. In 2008, the *UNite to End Violence Against Women* campaign declared that the most common form of violence against women globally is physical violence inflicted by an intimate partner. The World Health Organization estimates global prevalence rates for domestic violence at an average of 30% (2013). Domestic violence is a widespread and persistent social problem impacting women from all racial, ethnic, economic class, religious, sexual orientation, gender identity, and physical ability social locations. Best practices in addressing this problem include a collaborative response at the community level but the anti-violence movement in Canada has been slow to include religious voices at the table. This paper presents the findings of sociological research at the intersection of domestic violence and religion conducted amongst Canadian Christian and Muslim groups. Qualitative data was collected from over 100 women and almost 50 religious leaders and service providers in several studies. The findings indicate that religious teachings and practices offer both challenges and opportunities for women in these faith groups as well as for religious leaders and public service professionals who seek to support them in the journey towards safety. Within religious groups, women's lived religious practices challenge patriarchal gender roles. Religious women's beliefs and practices challenge the secular feminist anti-violence practices that rely on theorizing women as autonomous individuals and theorizing patriarchal religions as essentially misogynistic. Secular feminist anti-violence praxis challenges Christian and Muslim theologies and practices of gender hierarchies and the silence of religious leaders when it comes to addressing the problem of domestic violence within their congregations.

HOLTMANN, CATHERINE* (Muriel McQueen Centre for Family Violence Research, cathy.holtmann@unb.ca)

Partnering for Change: A Collaborative Model for Research on Violence Against Women in Canada

In the early 1990s, five centres dedicated to research on violence against women were established in universities across Canada. In Atlantic Canada, the Muriel McQueen Fergusson Centre for Family Violence Research (MMFC) at the University of New Brunswick was founded in order to understand more fully the issues associated with the abuse of women and children. From the beginning the MMFC has supported a collaborative approach to research and social change. Community-university research teams and projects have addressed multiple forms of family and intimate partner violence and violence against women. This collaborative model has proven effective in engaging various sectors for social change and is flexible in order to accommodate a diverse range of partners who want to address new issues that arise in relation to the field. Academic researchers, students, survivors, public service providers, community leaders, civil servants and criminal justice workers have come together to better understand and intervene in situations of family and intimate partner violence, providing safety for victims, holding perpetrators accountable and helping survivors and their families rebuild their lives. The results of this model of collaborative research have contributed to the development of resources for victims, recommendations for changes in legislation and social policy, increased funding for social services, tools for service providers, and heightening public awareness. This presentation will provide examples of the work from two teams: the Religion and Violence research team, which began with the founding of the MMFC, and the recently established Violence against Immigrant and Visible Minority Women research team. The outcomes of collaboration within these research teams show that an emphasis on collaboration demands a collective response to intimate partner violence – violence against women becomes everyone's problem. The paper will be situated within a feminist intersectional framework and the social science literature.

Why Do Happiness and Satisfaction Not Coincide? a Rational Choice Approach to Social Psychology

It is often assumed that people who are satisfied with their lives will be happy as well. In the literature on subjective well-being (SWB), the two concepts are often used interchangeably. In this paper, we use data from a postal survey carried out in Western Tokyo in 2014 (two-stage stratified random sample, n = 498) to investigate whether the two concepts really match.

Dividing respondents into "happy/unhappy" and "satisfied/dissatisfied", we find that while the general distribution patterns of the concepts are similar, for

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

14.8% of our sample evaluations of life satisfaction and happiness do not coincide. Especially large (53.3%) is the share of respondents who state to be "dissatisfied but happy". To explain this mismatch, we draw on rational choice theory.

It has been argued in the literature, that while happiness is evaluated with a long-term perspective in mind, life satisfaction relates more to the present situation an individual finds him-/herself in. We hypothesize that, as a result, what determines evaluations of both also differs. To evaluate their happiness, individuals will refer more strongly to factors which can be expected to be stable over the life course (i.e. educational achievement), while life satisfaction is evaluated to a greater extent in relation to factors which might be subject to change (i.e. occupational status, income). Using logistic regression to test our assumptions, we find that sociodemographic determinants of the two concepts of SWB do indeed differ in the expected way: Educational achievement shows a strong relationship with evaluations of happiness, while life satisfaction varies to a larger degree by occupational status and income.

This supports our hypothesis that happiness and life satisfaction are evaluated with reference to different factors and the two concepts should, therefore, not be used interchangeably.

Network Character: Social Character of the Network Society

In this paper I engage with Erich Fromm's (1941) theory of *social character* as a pertinent analytical lens through which phenomena relating to the transformative realities of network globalisation can be considered. By employing the theory of social character, the paper examines how technologically mediated social action intersects with and mutually enables the reproduction of the socio-economic requirements specific to a so-called network society. I deploy the concept of *network character* in order to capture the shared experiences and practices specific to increasingly interconnected and globalising socio-cultural milieus, experiences and practices no longer effectively captured by state-centralist paradigms. The properties of network character are explored through current empirical research. My analysis represents a novel sociological line of enquiry through which the transnational flow of material and non-material commodities, ideas, activities and identities can be better understood. The network character actualises a praxis that works to augment the network's global reach and influence across imperatives that are at once individual, social and systemic. As an analytical construct the positing of a network character allows for the acknowledgment of the dominance of technologically enacted social transformations while avoiding the pitfalls of technological determinism or apathy.

The Coming Home of Post-Industrial Society

The Internet and the perpetual state of connectivity that it supports are an indispensable part of late modern infrastructure from which no domain of society remains untouched. The home is not exempt from those transformations. In what is often termed post-industrial society, the home has come to operate as a space in which everyday private and public activities converge via the network; a domain in which individuals, institutions and markets assume common residency, routinely engaging in exchanges reflective of a post-industrial service economy. Does the omnipresence of personal mobile technologies teamed with the relentless requirement for connectivity alter the understanding, space and "feeling" of home? How does the home as private sphere transform in the context of universally accessible global information and communication networks? Has the home been technologically expanded or colonised? In late modernity the concept of 'home' becomes ambiguous. On the one hand, home represents a private sphere that is increasingly accessible to and accessed by digital networks and their users; an environment in which individuals routinely share the private with a public. On the other hand, in the network society home finds an extended representation in the digital space, it evolves into intangible locations in which the private transcends into the public; a private environment in which individuals routinely contribute to and engage with whilst in public. As I argue here, these dynamics can be conceptualised with the term the *post-industrial home*. With this concept I open up and situate the home as a transformed and evolving space of sociological interest. Discussion explores themes including solitude, belonging, privacy, identity, the family and work, and is supported with current empirical findings.

Family As an Elementary Unit of the Nation-State: Crisis of Democracy and Founders of Sociology in 1930s Japan

Nationalism, traditionally regarded as a necessary factor for democracy, can also be a dangerous factor, as shown in the historical experience of the 1930s. **How ought we deal with nationalistic emotion? How can we reconcile democracy and nationalistic emotion?** The author attempts to tackle this problem **from the perspective of non-Western society**. This presentation focuses especially on TODA Teizo (1887–1955), one of the founders of Japanese Family sociology and his work in the 1930s.

In 1930s, the democracy of Japan was in crisis. The conservative government and the army emphasized the significance of Japanese traditional nationality ("Koku-tai") and took advantage of people's nationalistic feelings. Many social scientists were forced to cooperate with them. However, simultaneously**, some sociologists attempted to reconcile democracy and Japanese traditional nationality**.

One of the most important topics among them was Japanese family ("Ka-zoku" or "Ie"). In Japan, family was regarded as an elementary unit of political society for a long time. Confucianism, a traditional moral philosophy in Japan, regarded family as the most important unit of political society. Japanese intellectuals from the 1930s were also interested in the political roles of family.

For example, TODA Teizo was interested in **family as the social basement of nationalism.** TODA studied abroad and learned sophisticated methods of social statistics at that time, and historians evaluate his sociology for its empirical method. However, TODA attempted to investigate the importance of Japanese family from the political perspective, **against simultaneous, non-rationalistic interpretations of Japanese government.** The author analyses TODA's unique understanding of nationalism and contributes to this session from a non-Western perspective.

Social Networks and the Well-Being of Low and High Status Migrants

Migration with its profound effects on the daily experiences of individuals is argued to have far-reaching consequences on mental health. The importance of social networks is well established both for successful migration and for psychological well-being separately, however the role of social networks on the well-being of migrants is yet to be explored. This paper thus investigates how social networks impact the well-being of migrants in Budapest. It compares international graduate students (high status migrants) and asylum seekers (low status migrants) in Budapest, where currently both groups have experienced some displacement but are facing very different levels of uncertainty. As the experience of economic hardship has been linked to heavy reliance on strong ties often at the cost of foregoing weaker ties, the paper proposes that the social networks of high status migrants are configured differently from the network of low status migrants. It combines methodological tools from social network analysis with in-depth interviews to capture the micro social structures and to explore the content, meanings and histories of these social relationships. Results show that even though the presence of strong ties is crucial for the subjective well-being of both groups, high-status migrants tend to have more sparse ego-networks due to their ability to maintain several weak ties besides their strong links. On the contrary, low status migrants tend to be part of a rather closed dense network, which they mostly rely on for otherwise unattainable emotional and material support. Finally, the paper also suggests that such a lack of weak ties amongst low status migrants could be a major obstacle to their successful integration.

Making HIV a Crime: Punishing Disease in America

When a new deadly disease emerged in American urban gay enclaves in the early 1980s, officials originally named it G.R.I.D. (gay-related immune-deficiency). American neoconservatives used AIDS as the latest evidence of America's moral decline, stoking public fears that the disease would spill over into the "general population" and demanding that states implement more invasive control measures. This paper explores how campaigns to criminalize HIV played out in three key states – Michigan, Tennessee, and California – and how HIV-specific criminal spread across the country in the late 1980s. Although largely symbolic at first, a criminal case against a gay man in Michigan man in 1992 opened the floodgates to a new era of criminalization. In the wake of that case, thousands of Americans have been incarcerated under HIV-specific criminal laws. Public health departments have inadvertently contributed by deploying new surveillance technologies intended to track and control their HIV-positive clients deemed a threat to public health, at times putting them at greater risk of prosecution. Although originally limited to HIV specifically, recent efforts in the United States to expand these laws to additional diseases such as hepatitis and tuberculosis suggest that punishing disease may become a new form of social control targeting epidemics. This pa-

Institutional Determinants of Early Job Insecurity in Nine European Countries

The aim of this paper is to map in nine national contexts how recent reforms in labour market institutions and policies and the skill formation systems may have affected the incidence of early job insecurity and the patterns of labour market entry/integration of young women and men. We discuss the following groups of measures in the paper: a) Active labour market policies and activation measures, b) Education and training systems, c) Unemployment protection and d) Employment protection, regulation of flexible jobs and wage setting.

By comparing the situation in nine European countries (Germany, United Kingdom, Norway, Switzerland, Spain, Greece, Poland, Bulgaria and the Czech Republic) paper should provide insight into the role of institutions in transitions of young people during first years after leaving the school system. This comparative paper uses nine rich national studies conducted during NEGOTIATE project as a main source of the information. Paper is based on secondary data analysis and uses various sources of information provided by nine national teams including international and national data and results of previous research.

What Have We Gained and Lost Along the Way?: The Rise and Institutionalization of Environmental Sociology in Japan

Japanese environmental sociology is like a "black hole." It constantly absorbs the world's latest theoretical innovations so diligently but without emitting any research findings of its own, making itself unavailable to the world outside. It is because almost all its entire literature has been written in a minority language, Japanese.

But is that the only reason for being a "black hole"? The Japanese Association for Environmental Sociology (JAES) is the world's largest academic association in the field of environmental sociology. It has been publishing the world's very first journal dedicated to the discipline since 1995. Why, then, has the established field of study as such become a "black hole"? The language barrier does not seem to explain it all.

This paper, therefore, tries to make the "black hole" visible, by portraying the present state of Japanese environmental sociology and the recent challenges it faces. By adapting the "institutional approach" by Philip Selznick, the author analyses the rise of the discipline in Japan in the 1970s-80s, focusing on what it has gained and lost through the process of growing into such an established field. In the days when the term "environmental sociology" still did not exist, researchers (who would later become the first environmental sociologists) in different sociological sub-disciplines struggled to analyze pollution problems by applying the concepts of their respective fields. Japan's environmental sociology arose out of the process of grappling with Japan's grave pollution problems. For that reason, going to pollution-ravaged communities and performing long-term research has become a tradition. The JAES has grown into an "institution" reflecting this tradition ("the infusion of values") and in turn shapes the mind-set of its members. The JAES no longer is a mere "organization" but, the author claims, has become an "institution" that demands internal commitment to its core values.

HORNUNG, BERND* (University Hospital Giessen and Marburg, hornung@med.uni-marburg.de)

Human Resources, Management, and Leadership in Turbulent Times. Stephen Covey from a Sociocybernetic View: A Point of Intervention?

Society is man-made, but when we are born into it and start acting, it is a given. Social processes are going on in structures given at that moment. Often they go on behind our backs without being realized, moving society in unwanted directions. Attempts at controlling and steering such social forces turned out quite ineffective, and organizational actors, which are supposed to do so (like governments), are quite helpless. "Social forces" does not refer to some global conspiracy group, but to the mechanisms and processes built into society at a given moment.

This paprer explores to what extent and possibly by what mechanisms human intention can effectively influence where society is going, also at the global level.

For coping with this situation it is proposed. to say definitely farewell to the machine paradigm of determination of social processes and to adopt a cybernetic view, conceiving individuals, social systems, and societies as navigating in troubled waters which cannot be influenced while social systems themselves can be steered. Covey calls this the knowledge-worker mindset.

Also individual, collective, and organizational behaviors are needed towards what Covey calls the habits of effective people, which corresponds to sociocybernetic principles.

With regard to the latter the present paper proposes that the ideas of the late Stephen Covey, a renowned researcher, consultant, and coach in management and leadership might show a way to develop such new and different behaviors the current state of the world calls for.

Covey calls this new orientation the "industrial mind-set" vs. the "knowledge worker mind-set" of knowledge society. He presents a coherent scientifically grounded approach which is not declared "systemic" or "(socio-)cybernetic" explicitly. Implicitly, however, Covey takes a systems approach and the paper will argue that it is fully in line with sociocybernetics and the new orientations e.g. John Raven calls for.

Navigating Career with Young Children: Japanese Women, Family-Life Balance and the Challenges of Professional Advancement

This study aims to clarify the factors at work in the interruption and continuation of the professional careers during the child care period. Compared to women in other OECD countries, Japanese females with higher educational qualifications tend to show a lower employment rate in the period when their children are in need of care. In Japan, career success is typically related to long-time employment leading to internal promotion within the one company. In reality, however, a high percentage of female workers change their job and employment status. This study is based on in-depth interviews conducted with Japanese female professionals, and compares two types of female career, namely an "interrupted" type of career with a career of the "continuation" type. The female professionals in the "interruption" type, generally experience changes in job and/or company, periods of time in which they take a "career break", and also they then experience restarting their career. Through this comparison we analyze the difference in the factors which affect their career interruption and continuation, in terms of their perception of a career goal, the necessary action they need to take to attain such a goal, and how they manage a work-family balance. In conclusion, this study proposes some "career strategies" for female professionals who experience career interruption. These include having clear goals and a strong will for career success and the mobilizing of possible resources for managing their work family balance. In some case the interruption period will be useful for their competence enhancement. This strategic attitude and the activities that flow from it are especially aimed at promoting satisfactory work conditions in the post- interruption period. Their strategies will also necessitate the building of a consensus in terms of resource allocation, particularly among family members, and especially with their husbands.

Aging As a Developmental Perspective

This qualitative research study compares a small sample of University students 50 and older with seniors at a community center. Their perspectives of aging were shown to be affected by societal views on aging and cultural values. Though aging was not feared by most participants, their concern about physical limitations, slowing down, and being less productive was noticeable. Body image was a reminder of these changes and the younger respondents, ages 50-59, were more concerned about these things than those 60 and older. The author relates these concerns to current societal values that are desired in individuals such as independence, productivity and remaining active.

(At)Tempting Extreme: Approxi/Mating X-Topia

This paper critically intervenes in contemporary extreme culture with a view to understanding if it offers any u-topian vision. For Bataille, "the extreme limit

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

of the 'possible' is that point where [human] advances so far that one cannot conceive of the possibility of going further" (39). Addressing questions of ethics and excess, the paper offers a combined reading of Bloch's 'Not-Yet-Become' and Bataille's 'general economy' of expenditure to approximate what 'extreme' *becomes.* It wonders if extreme culture provides moments of and spaces for *escaping* the 'already-in' and *reaching* the 'what-may-become.' A research in progress for years, the paper moves through four phases. The first section traces the changing conceptualization and praxis of extreme, from disgusting to popular, from sin to virtue (Biskind). The second and third sections offer critical reading of 'extreme film' (from *Saw* and *Antichrist* to *Squirmfest* and *A Serbian Film*) and 'extreme music' (from Speed Metal and Noise to Goregrind) to analyze how extreme culture pushes human sensory and cognitive limitations to incredible, often excruciating, fringes which results in the extension of human senses and expansion of human horizons. The discussion involves ethical and ethnicity readings: it questions if the transgression of sanity, possibility, and tolerance excites criminality, and examines what the prevalence of extreme culture in the Global North has to do with technocracy and hyperconsumerism. The fourth section inquires if extreme culture approximates X-topia, a virtual/imaginary socio-temporal phenomenon that can be approximated by crazy overreachers but never reached as, like infinity which cannot be reduced to the *idea* of infinity (Levinas), X-topia is both the infinite (referring to the mathematical etymology of x) and 'u-topia' (i.e. not-place). The paper wonders if the re-organization of sensory perceptions effectuated by technology-spiked extreme culture opens up space for re-thinking the appropriation of human senses for good.

HOSSAIN, MASHRUR* (Jahangirnagar University, mashrursh@yahoo.co.uk)

On Lifting the Quilts: Ethics, Autonomy, and South Asian Queer Films

This paper gives a critical ethical reading of select South Asian queer-oriented films with a view to underscoring issues of autonomy, choice, and obligation. Incorporating South Asian principles of ethics and North American and Continental 'ethical criticism,' the paper concentrates on the ethical concepts of *alterity* and *responsibility.* It views 'queer' as a political positioning, a site through which constructions and deconstruction of sex/gender occur. Queer is, then, both *being* and *doing*, a phenomenon which destabilizes hetero-patriarchal normativity. In this narrow sense, queer films are those that have signs to problematize and interrogate heteronormative hierarchical structures and offer ways out of suffocating conformity. Now, South Asia's interpretation of 'queer' is much different from that in the West. Queer *here* is more invisibilized and unacknowledged than stigmatized. Understandably, representation of and response to queer experiences involve a complex negotiation between dominant ethical considerations and radical anti-oppression affirmations. In its study of South Asian queer films, the paper concentrates on the three: Deepa Mehta's *Fire* (1996), an Indian-Canadian production; Humayun Ahmed's *Ghetuputro Komola*, or *Pleasure Boy Komola* (2012) from Bangladesh, and Visakesa Chandrasekaram's *Frangipani* (2013) from Sri Lanka. The paper is divided into five sections: (i) 'composition,' analyzing what Geophrey Harpham dubbed "ethnicity," e.g. moments of queer choice in the narratives; (ii) 'production,' evaluating questions of artistic autonomy and ethical obligations; (iii) 'distribution,' critiquing the didacticism of censorship and proscription; (iv) 'consumption,' evaluating audience response, ranging from fiery protest and criminalizing actors to informed recognition and celebration of differences; and (v) 'reflection,' arguing for a reflexive interpretational methodology which endorses writer-reader interactions. The paper contends that reflexive ethical approach has the potential to lift *the* quilts (alluding to Ismat Chughtai's controversial story, "The Quilt"), to promote and sustain an ethically-informed scenario that accommodates sex/gender alterities and alternatives.

Social Movements for Global Alternatives: Livelihood, Collaboration, Transformation

We live in a neoliberal era of multiple crises, social upheavals and political flux. Yet the continuing confrontation between neoliberalism and its alternatives creates new possibilities for social and systemic transformation. Critical analysis of ideological divisions among today's alternative projects/initiatives – via examining the historical, ideational, and practical roots of these differences – is important to understand past and present shortcomings and the continuing difficulties in creating coherent solutions. How do such projects construct alternative livelihood and social agency, beyond market-based individuation? To what extent do alternative initiatives engage collaboratively, and work across different approaches? The main objective of this paper is to examine how far the 'alternatives to capital' are being co-articulated, co-envisioned, and co-inspired, enabling cross-fertiliza-

tions, and integration. It proposes a comparative analytical framework to examine the co-evolutions and contestations between a number of case studies that are influenced by four major alternative ideologies, i.e. 'global Keynesianism', 'left inter-nationalism', 'solidarity economy' and the 'ecological commons'.

What Makes Us More 'Critically Open-Minded' in a Globalized World? an Australian Perspective

This paper defines and examines a new concept of 'Critical Open-mindedness' within an Australian context as a social-attitudinal collective phenomenon, This is in contrast to the popular social psychological notions of open-mindedness as a cognitive-personal attribute. Our main objective is to investigate the relationship between Cognitive Open-mindedness and Critical Open-mindedness. It draws on the data from the World Values Surveys (2005 and 2012) in Australia to operationalize both types of open-mindedness as composite indicators, composed of several dimensions. It then examines, using path analysis, the relationships of the two indicators on a number of mediating ideational, structural and behavioral determinants. Critical Open-mindedness is found to be more dependent on socio-economic factors than Cognitive Open-mindedness does. However, the former is significantly and positively determined by the latter, especially the Social Trust and Anti-authoritarian dimensions of it. Critical Open-mindedness is also significantly and positively associated with the individuals' tendency towards the political left, a cosmopolitan sense of belonging, a confidence in environmental organizations, higher levels of education (the most important structural factor), gender (being female), confidence in humanitarian organizations, interest in politics, experiencing discrimination, and independence at work. We discuss the implications and consequences of the lack of Critical Open-mindedness to our understanding of our behavior regarding a range of social issues, for example, the creation of "negative collective identities" and social divisions through intolerant behavior. In this context, we argue that the "social collective" acts as a determinant rather than the characteristics or quality of individuals. Finally, we consider potential policy measures for fostering a healthy critical open-mindedness in the context of an increasingly globalized multicultural environment.

Protecting the Right to Pursue a Livelihood for Foreign-Trained Professionals: Toward Building an Enabling Regulatory System

The literature developed in Canada on the impact of conditions imposed by professional associations on fundamental rights of foreign-trained professionals focuses on the right to equality, when the discussion should be centered on the right to pursue a livelihood. This article suggests the development of a post-welfare State interpretation on the right to pursue a livelihood based on the capabilities approach and the Enabling State. For foreign-trained professionals immigrating to a new country, empowerment starts with being able to earn a living in their profession as quickly as possible. The Québec-France Agreement on mutual recognition of professional qualifications authorizes partner professional orders in France and Québec to create a new regulatory system which seeks to strike a balance between their obligations to protect the public and to protect the right of French professionals to pursue a livelihood in Québec. As the Agreement states, the MRA regulatory system should be proportionate, the least restrictive possible and take into account the professional experience of applicants. However, French and Québec professional orders were not particularly successful in achieving this balance. To reach its full potential as an enabling regulation, this article suggests improvements to the MRA regulatory system based on the objectives of information, discretion and choice.

Institutional Imbalance and a Marketized Mentality in Europe - a Multilevel Elaboration of Institutional Anomie Theory

This research builds upon prior efforts to transport insights from a macro-sociological theory of crime – institutional anomie theory (IAT) – to enhance under-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

standing of an important individual-level phenomenon in advanced capitalist societies – a "marketized mentality." Such a mentality entails a strong commitment to the utilitarian, instrumental values of the market at the expense of more altruistic, expressive values. Drawing upon IAT, we hypothesize that at the individual-level, integration into selected non-economic institutions will inhibit the adoption of a marketized mentality, while at the macro-level, economically slanted imbalance in the institutional order will help account for cross-national variation in the degree to which individuals adopt such a mentality. In addition, we predict a cross-level statistical interaction: the buffering effects of integration into non-economic institutions at the individual level should be mitigated as institutional imbalance increases. These hypotheses are assessed in multilevel analyses with data from 25 European countries using the European Social Survey. The results are largely in accord with theoretical expectations, revealing how an institutional imbalance helps shape people´s value orientations by promoting marketized mentalities and by weakening the socialization effects of non-economic institutions.

Big Data, Big Theory: Moving Beyond New Empiricism to Generate Powerful Explanations

Big Data is said to be ushering in a new paradigm of empiricism in which volume allows data to speak for themselves without theory. Commentators proclaim the end of theory is nigh. In this paper we address this challenge by exploring how Big Data can work with sociological theory to generate more powerful explanations. We do so through discussing a major study that explores the viability of digital inclusion initiatives in Australian schooling. We present a combined methodological framework of user behaviour and network analysis with conceptual tools from the sociological approach Legitimation Code Theory ('LCT').

Our data comprises students and teachers' real-time behaviours of digital device usage (from 50,000 Android table devices over two years) at a high level of fine granularity. This dataset allows for an inductive analysis of patterns of usage and the network. However, these do not by themselves explain social practices – the patterns of behaviour themselves need explaining. This raises questions of the kind of theory capable of making sense of the results of Big Data analysis. We argue that the relational and realist nature of LCT enables it to enhance Big Data by exploring the organizing principles underlying diverse practices, contexts, beliefs and attitudes. LCT is able to take up and meet the epistemological and methodological opportunities and challenges of Big Data because it offers a flexible, multi-dimensional and responsive toolkit rather than fixed hypotheses or overarching theory into which data are fitted. Moreover, its relational nature grasps how components are related to changes in other components in a system and its sociological framework enables links between the inductively generated patterns of Big Data and the social actors involved. Bringing them together thus goes beyond the identification of patterns and frequency to reveal the often hidden organising principles helping to shape practice.

HOWARD-WAGNER, DEIRDRE* (University of Sydney, deirdre.howard-wagner@sydney.edu.au)

Indigenous Peoples, the Neoliberal Settler State and Trans-Generational Violence

In the neoliberal age, 'histories are taken to be over, past, evaporated, and in denial, yet the conditions of which, as they are buried, misremembered, mis-membered, remain very much alive' (Goldberg 2009). In the act of misremembering, mis-membering, and misrecognising Indigenous disadvantage as socio-economic gap, which is solved through "getting an education" and "getting a job" (Abbott 2014), the neoliberal settler states cultivates a 'wilful ignorance' (Samson 2013) in the perpetuation of historical and 'epistemic injustice' (Fricker 2007). This wilful ignorance not only evidences a deep epistemological attachment to western liberalism or 'liberal whiteness' (Wiegman 1999), which denies difference, erases Indigenous agency, invalidates Indigenous histories and subjects Indigenous peoples to further cultural injustices (Fraser 2014).

The paper explores this proposition as the standpoint of Aboriginal people who were interviewed as part of an Australian Research Council Discovery Early Career Research project in which interviewees situate Aboriginal disadvantage as a constellation of disadvantage that are an artefact and legacy of Australia's

settler colonial history and the institutionalized structuring of Aboriginal/settler social relations in Australia over two hundred years. Interviewee's express how injustice continues in the present neolibera moment of alienation and disempowerment and denial.

HOWARD-WAGNER, DEIRDRE* (University of Sydney, deirdre.howard-wagner@sydney.edu.au)

Indigenous Social Enterprises and Empowerment

The paper aims to make a substantial and new contribution to the emerging body of international research on Indigenous 'success' in the context of Indigenous organisations by focusing on the significance of the social entrepreneurship of Indigenous organisations, and their social enterprise, in community building, recovery and governance. In doing so, it describes the role of seven Indigenous organisations located in an urban locality in Australia in local Indigenous community building, recovery and governance, including the development of local wellbeing, empowerment and social change for the Indigenous peoples in the urban locality in which they are located.

To achieve this, the paper will draw on a three-year in-depth place-based case study of urban Indigenous success in addressing Indigenous disadvantage and promoting Indigenous wellbeing funded by the Australian Research Council. The study draws on sociological methodologies (in-depth case study, discussion circles, in-depth interviews and documentary analysis) and concepts (e.g. successful societies, community building, social entrepreneurship, social capital, power and agency) to achieve this end.

RC51-581.1

HSIAO, WEI-HSIN* (Universität Witten/Herdecke, weihsinhsiao@gmail.com)

User, Community and Communication

The concept of the user and the community has renewed its definition after the internet usage has seen tremendous growth. Comparing with the machine, the computers and their connections (internet or network) are entirely demanding on the continuous inputs of users. The concept of medium and communication offers us to observe how people are recognized as users and the relation of the users and the internet. The medium distinguishes user who is included and excluded. By contrast, the medium provides concrete forms, which enable users be recognized.

In this abstract, we presented an empirical study of the second-order approach, which clarifies neither users or internet are dominated. Flickr is a website and so-called a social networking platform. The users are gathered, observed and organized by Flickr. People were not familiar with each other, nor share photos until becoming the users on Flickr. The communication has started while they registered as an user or not by understanding and accepting the instructions of Flickr. Since Flickr assumes that the communication to people will be realized, people are divided into users and potential users who will possibly be included later. Up to now Flickr provides several forms which enable these users organized as communities. Under different forms of tags, keywords, topics, locations and photos we can find users tightly gathered as communities, and can easily be separated and reformed into new community. In summary, the conventional sociological analysis of users or virtual communities does not take the influence of the computer and internet into account. Nevertheless through communication, the users and communities are with dynamic in Flickr and the forms provided Flickr enable users transforming from individual state into communities.

HSU, ERIC* (University of South Australia, eric.hsu@unisa.edu.au)

On the Temporal Definition of Disasters: The Need for Complexity and Balance

It is widely recognized within the field of disasters research that disasters have both immediate and long-term societal impacts. However, some sociological accounts have tended to exclude slow-moving disruptive phenomena from their definitions of disasters by framing disasters as only rapidly occurring events. These accounts have warned against overly broad descriptions of disasters, as they run the risk of rendering the term opaque and meaningless. While this concern is well-founded, I find that there are ways of theorizing disasters as involving a protracted component that do not completely threaten the wholesale integrity of the concept. In this paper, I put forth a theoretical framework of disasters, which encapsulates—but also differentiates between—social disruptions that are focused as well as ones that are more temporally diffuse. This in turn calls into question some of the existing strategies for how to approach socially unsettling phenomena such as global climate change or droughts that unfold over protracted periods of time. In particular, I trouble the claim that gradually occurring dis-

　　*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

turbances to the social order ought to be instead regarded as social or ecological problems.

The Sleeping Body and the Concept of Agency

Despite being once largely overlooked, sleep in recent years has become a more widely accepted object of sociological analysis. The development of this area of study has helped to produce a more comprehensive understanding of the corporeality of everyday life. Within this field, researchers have come to recognize that sleep can serve as a valuable new prism into other sociological debates, such as those around medicalization, gender, and time. Additionally, researchers have come to view sleep as a rich sociological topic in its own right. At one level, this is because sleep can inform how key sociological concepts are theorized. The aim of this paper is to investigate how the bodily phenomenon of sleep prompts us to re-think how the sociological concept of agency is formulated and deployed. This involves analyzing Simon Williams's assertion that sleep is not a wholly voluntary, consistent, immobile or directly auditable act. I also scrutinize the claim that sleep does more than just re-calibrate some theoretical accounts of agency, since it questions the applicability of the concept altogether. By exploring how sleep impacts upon the conceptualization of agency in a multitude of ways, I further bolster the need to engage with sleep across the discipline of sociology, instead of within the boundaries of a narrow subfield.

Gender Role Attitudes and Housework Division in East Asia

Over the past few decades, condensed modernization and different state policies in East Asian societies have produced uneven progress on gender equality. In this paper, we examine 1) to what extent have gender role attitudes and housework division in China, Taiwan, Korea, and Japan changed over time, 2) have the patterns diverged or converged, 3) to what extent are gender role attitudes associated with the gender division of housework across the four societies?

We use data from the East Asian Social Survey 2006 module and the International Social Survey Program 2012 module. We restrict data analyses to married women who were or had a husband in paid work at the time of the survey. Results show that both gender role attitudes and housework division are changing over birth cohorts between 1940 and 1980, though at different pace, in these societies. Consistent with the prediction of modernization theory, Taiwanese, Korean, and Japanese are less likely than Chinese to agree to the traditional gender role. Yet, Chinese couples are most egalitarian in housework division, followed by Taiwanese, Korean, and Japanese counterparts. The inter-society gaps in husbands' share of housework have persisted, but appear to have shrunk across birth cohorts. The effect of gender role attitudes on housework division is smaller in China than in Taiwan, Korea, and Japan. We discuss possible reasons for such differences including family policies and labor market structure.

Overall, Taiwan, Korea, and Japan have shown a convergence towards other western developed societies both in attitudes and behavior. China, on the other hand, seems to be moving towards opposite directions, under mixed effects of different forces — return of more traditional attitudes after the retreat of state intervention in gender equality since the 1980s on one hand, and modernization and intensifying exposure to western culture on the other.

Approaching City Life through the Experiences of Commingling at Urban Food Markets: A Study of Two Marketplaces of the City of Lima, Peru

This study focuses on analysing the everyday commingling of people in urban public spaces with the intention of exploring the opportunities these could open for city dwellers to develop a sense of the city as common and a politics of being together led by a public culture of civic involvement. In that sense, this study proposes to analyse how contemporary urban spaces and the politics of the everyday life are experienced - and potentially reworked - by looking at the being-together of people around food in marketplaces.

The urban order, infrastructure and materialities, as well as the individuals and groups sharing the city are (re)interpreted through experiences of co-presence, in which diverse actors are exposed to likewise diverse imaginaries about the city and different others. In this regard, marketplaces are particularly interesting lo-

cations for this study given their still central role in the provisioning of food and livelihoods, as well as on the social and spatial configuration of many cities. Furthermore, this research attempts to generate insights about the way food takes part in the renegotiation of cultural constructions in which tensions of urban co-existence rely.

This research is situated in the city of Lima, Peru, where neoliberal visions of urban development reinforce persistent social tensions and inequalities through the various spaces of the everyday life. Those related to food and culinary activities are not exempted from these influences. An example of this is the current 'gastronomic boom' of Peruvian food, in which public and traditional spaces for food consumption have recovered relevance for city dwellers. This is bringing about positive economic outcomes, but the sociocultural implications are yet to be associated. Therefore, looking at food marketplaces provides an interesting approach to a potential renegotiation of people's visions and relations to the city and to its diverse dwellers.

Cuando Los Migrantes "Regresan": Trayectorias Migratorias Y Laborales De Los Migrantes Mexicanos Retornados a Mexico

Durante la administración del Presidente Obama más de dos millones de de migrantes mexicanos fueron "devueltos" a las ciudades fronterizas de México. Por otro lado, otros cientos de miles *decidieron* regresar en los años inmediatamente posteriores a la crisis económica del periodo 2008-2009. Es evidente que a raíz del incremento de estos flujos Norte-Sur se han originado modificaciones en los mercados de trabajo, en los centros escolares y en general en las ciudades y regiones mexicanas adonde llegaron.

En este trabajo presentamos algunos resultados de investigación acerca de los procesos de inserción laboral en la ciudad fronteriza de Tijuana, en el Distrito Federal y en Guadalajara. Se parte de la idea, expresada en medios de comunicación, de que la percepción acerca de los migrantes retornados es ambigua. Por un lado, se observa con recelo por las posibles presiones que los retornados pudieran ejercer en los mercados de trabajo a lo que se agrega que el pasado delictivo atribuido de forma general a los deportados, alimentaba un discurso de rechazo.

Junto con esa percepción se ratificó lo que algunas investigaciones previas ya habían documentado: ciertas habilidades de los retornados/deportados como el dominio del inglés son valoradas en algunos sectores económicos como los call center (Da Cruz, 2014 Hualde et al, 2014); además algunos de estos deportados han creado pequeñas empresas a su regreso.

En este contexto nuestro trabajo examina las trayectorias migratorias y laborales de los retornados y deportados en una perspectiva diacrónica evaluando tanto los limitantes como los diferentes recursos que utilizan a su regreso como competencias, redes sociales, apoyos institucionales y oportunidades en los mercados de trabajo locales.

Competition and Competence in Marketization of Teacher Force: Reinstitutionalization of Teacher Education in Taiwan

When the trend to diversity of teacher education in the world, the first issue is under condition of force marketization how to effectively control the quality of teachers. The desire to relax the market of teacher education and select outstanding teachers under the competitive logic did not seem to yield the effects expected as a result of the transforming social environment, especially in the context of Taiwan. in addition to dealing with the "overly prepared" nature of teacher education and the inability to control the quality of teachers purely through competitive market forces. While controlling the number of teachers, Taiwan also initiated the four-year "Enhancement Program for Teacher Education Quality" in 2006 in order to create benchmark-like role models and fulfill the goal of "adequate quantity and exquisite quality" and "retaining the good and eliminating the bad". In the *White Paper of Teacher Education* released in 2012, Taiwan declared again that it would adopt the standards-based teacher education (SBTE) policy. The hope was to cultivate high-qualified teachers under the marketized teacher education model where standards were adopted to control quality of teachers during their education process and to keep marketization and control at a balance to accordingly maintain existing marketized orientation of teacher education on the one hand and ensure a certain level of quality on the other hand.

In order to foster more competence of teachers in competition market force, this paper aims to apply the social closure idea introduced in class consciousness of the new Weberian theory to clarify the reinstitution of teacher education to rise teachers' professional standing and occupational reputation. When quality of

Individuals' Responses to Tornado Warning Polygons

In the United States, the National Weather Service has replaced its original county-wide warnings with graphical displays (i.e., tornado polygons) to more clearly communicate tornado risk to the public. However, it is still unclear how recipients interpret this warning message and, in turn, respond to the warning. To better understand this issue, this study conducted an experiment asking 155 students at Texas A&M University to rate the likelihood of being struck by the tornado and their expected responses to 15 hypothetical tornado warning polygons. The results indicated that most of the participants were likely to respond appropriately to the tornado strike probabilities (p_s) they infer from the warning polygons. Specifically, p_s ratings are highest at the polygon's centroid, lower just inside the edges of the polygon, still lower (but not zero) just outside the edges of the polygon, and lowest in locations far from the edges of the polygon. When the scenario positioned the respondents inside the warning polygons, they were more likely to expect to monitor additional information via television or the Internet. However, these scenarios elicited bipolar distributions on seeking warning confirmation from environmental cues, a desk clerk, or other guests. That is, people information search patterns were contingent on the content of the tornado warning and personal beliefs. Finally, respondents were more likely to seek a shelter and less likely to evacuate based on the warning. The study results will help meteorologists to better understand how people interpret the uncertainty associated with tornado warning polygons and, thus, improve tornado warning systems.

Who to Decide 'Good Job' or 'Bad Job'? a Bargaining Game of Production: Case Study from Pearl River Delta

By definition, precarious work means employment that is uncertain, unpredictable, and risky from the point of view of the worker. Workers therefore are reluctant to take precarious work because of those drawbacks. However, empirical fieldwork informed us that skilled workers (here the skilled workers refer to those workers who are familiar with assembling/processing jobs) in China, especially in Pearl River Delta, they choose to do precarious work (outside of the factories) willingly. From our preliminary interviews in Guangzhou and Shenzhen, workers reflected that they have some good reasons to choose these precarious work rather than regular factory jobs.

This preliminary empirical observation challenged to our pre-understanding of precarious work. We assumed workers were forced to take precarious work; our empirical data informed us the opposite reflection from workers in the Pearl River Delta. This observation triggered us to ask this paper's question: Who to decide 'good job' or 'bad job'? In order to answer this question, this paper will start from reviewing existing literature in relation to informal work, following we will indicate different understandings of precarious work. Moreover, this paper argues that the choice of 'good jobs' and 'bad jobs' for workers in China has already been conditioned by at least following two elements. First, most of China's production still stays in processing trade level, therefore those workers who are willing to take precarious work are the ones who have certain level of skills but their skills can't go further. Secondly, workers are conditioned by state-and-society's structure. Lacking of trade union or workers' organisational support therefore workers can't stand up in front of their employers; factory management is rather authoritarian rather than negotiable. This paper therefore argues that workers have conditional choice of 'good job' or 'bad job', in the case of workers in Pearl River Delta.

Mobilities and Representation. (un)Documented Migrants in Art

The talk addresses issues of mobility through a discussion of the art work "natalia, turn the light on" by Ioana Păun. This installation highlights the invisibility of migrant workers by using mobile selftracking technologies (lifelogging). The undocumented services performed by migrants comes to the fore and is visualized through calorie counters which are used to symbolically store the energy expended by the illegal housekeepers and use it to turn on the light in the exhibition space.

This art work takes up crucial issues of mobility and hybridization of contemporary everyday life. However, we want to critically explore the status of the migrants in the gallery. On the one hand, they are represented through diagram and light that draws attention to their precarious lives. On the other hand, they are silenced and reduced to abstract data information. This reproduces the capitalistic logic of exploitation and surveillance. Therefore, their visualized silence does not strengthen their agency. The art work uses the possibilities of mobile technologies to imagine a better world by giving migrant workers more visibility and discussing their low pay. However this promise shimmers within the art production and fades into the darkness of the migrant's future.

HUDSON, CHRIS* (Umea University, chris.hudson@umu.se)

Impossible Dream? Imagining an 'Alternative' City

The images cities project of themselves as safe and attractive places for all not infrequently collide with the everyday experiences of groups not fitting the city's dominant norms and thus constructed as 'out of place' in the public space. This can lead to feelings of fear and exclusion that bring into question planners' and politicians' visions of the inclusive, sustainable city open to all. Changing the city's physical form is relatively easy compared to changing the social relations, cultural meanings, traditions etc. in which that materiality is embedded (Plate & Rommes 2007). This paper explores how visual images and experiences of the city as an emotional space conjuring up feelings of e.g. pleasure, excitement, safety and fear can be used to challenge the 'straightjacket' of accepted meanings and "re-imagine" the city. Narratives of the city developed in focus groups of women from different backgrounds (class, ethnicity and age) in 4 Swedish cities, together with photographs taken by the women of places where they felt safe, welcome, insecure, excluded etc. were incorporated in a form of photo-elicitation (Rose 2012). This was used to stimulate alternative visions of the city. The analysis of the visions and the narratives was informed by a Foucauldian understanding of power as relational and productive (Mouffe 2005) and the city as discursively constituted and always in a process of becoming (Massey 2005, Sandercock 2003, Grosz 1992) and thus amenable to re-imagination. Although the gendered norms concerning the roles and behaviour of women and men in the city space continue to haunt, we found challenges to the dominant constructions of women as 'in place' in the private and as 'out of place' in the public. This opens up for using imagination to (re)claim and change the city and the way it is planned.

HUDSON, MARC* (Sustainable Consumption Institute, University of Manchester, marc.hudson@postgrad.mbs.ac.uk)

Learning from Failure: Local Climate Activism from Success to Stasis

In 2009 environmental activists in Manchester, UK produced a report on climate change that led to Manchester City Council engaging stakeholders in the creation of a radical 'stakeholder climate change action plan'. It included two headline goals - an emissions target (41% reduction by 2020) but also the creation of a "low carbon culture".

Six years on the plan is in tatters. Emissions targets are being missed (even in the context of a dramatic economic recession) and a low carbon culture has not yet been defined, let alone enacted.. Few of Manchester's elected councillors have even bothered to undertake 'carbon literacy training'.

These six years present an extremely fruitful case of what advocacy coalitions and issue entrepreneurs face when policy windows close because issue attention cycles, austerity hits, and bureaucratic inertia recaptures control.

Under what conditions, if any, is it possible for grassroots organisations to sustain institutional memory, to avoid the twin dangers of co-optation and burn-out, and to work within and yet 'against' local authorities? How can groups avoid the dangers of the 'smugosphere' and despair? (Hudson and Aburawa, 2016)   Under what conditions do new methods of organising (e-petitions, social media, videos) help to recruit and retain activists, thickening the web of civil society?

This paper will draw upon seven years of participant observation in climate activism at the local authority level, and interviews with activists, bureaucrats, politicians and business people. It conclude not just with a shopping list of' lessons learnt', but reflections on why social movements find it so hard to innovate beyond traditional repertoires of marches, rallies, petitions and symbolic action.

HUGHES, TRACEY* (University of Stirling, t.l.hughes@stir.ac.uk)

"Remember Me": Enabling Young People's Voice Regarding Their Futures, in a Society Striving for Economic Prosperity

This empirical paper is part of a PhD study which intends to explore the factors which contribute to selected case study schools, located in socio-economically disadvantaged areas of Scotland, achieving good educational outcomes for their pupils. The first stage of this sequential mixed-method study identified secondary schools in disadvantaged communities which were achieving good educational outcomes for their pupils. Then, through an embedded multiple case study approach, and drawing upon ethnographic practices, student experiences will be explored to further develop the understanding of the complex and interwoven ecological factors which influence these outcomes. The iterative and selective intermittent time mode (phased approach) of this research will allow for the progressive focusing of this study, as influenced by the experiences of students in these case study schools.

In particular, the research seeks to understand how young people negotiate, and act, within the restrictions and inequalities of the social world, when it comes to their ambitions and aspirations. How do young people view their future? What are their aspirations? How do they intend to negotiate and navigate these planned trajectories? What enables, and/or encourages, them to succeed? What do they think needs to be done to enable them to achieve further?   Are their restrictions? Do they need to, or have they, settled for more pragmatic realities?

In this particular paper, the emerging findings from the initial phases of data collection will be discussed – whilst being sensitive to the ecological framework and the view that "education cannot compensate for society" (Bernstein 1970). In addition, the potential and intended future directions of this topical study will be highlighted.

HUGHEY, MATTHEW* (University of Connecticut, matthew.hughey@uconn.edu)

Anomic and Alienated Fragility: The Generic Processes of White Racial Identity Formation

The bulk of research on "alienation" remains couched in Marxist and neo-Frankfurt paradigms, while a divergent yet commensurate approach to the subject's disconnect from others and one's sense of self is found in Durkheiminan and neo-functionalist notions of "anomie."   Both these concepts have found considerable purchase in the study of dominant racial formations—particularly in the study of white racial identity. Yet, the quantitative examinations of the correlation of whiteness with socioeconomic status, access to resources, and the paradoxical sense of alienation or anomie in the face of social privileges, has not illumined how or why whiteness functions to produce both a sense of alienation and anomie *qua* victimization or meaninglessness amidst a retention of social power in late capitalism. Accordingly, I plumb the extant sociological literature to develop a sensitizing and generic theory of the processes by which whiteness is formed and reproduced—drawing explicitly from the insights of Marx and Durkheim. I conducted a meta-analysis of mainstream American sociology journals and influential scholarly journals focused on the sociological analyses of race and ethnicity over the past century. I show how a century of sociological insights have uncovered robust patterns that white racial identity is continually reconstructed as a site of ontological alienation and anomie that facilitates simultaneous claims of (a) superiority, (b) victimhood, and (c) rationalizations for discrimination against others.

HUGHEY, MATTHEW* (University of Connecticut, matthew.hughey@uconn.edu)

Still the Tragic Mulatto? Manufacturing Multiraciality in Magazine Media, 1961-2011

On the heels of the 2000 US Census allowance of multiracial categorization, coupled with rising mainstream discussion of political, media, and sports figures' multiracial heritage (e.g. Barack Obama, Halle Berry, and Derek Jeter), questions over the meanings of multiracialism are quite prevalent. Scholars have highlighted how mainstream-oriented and black-oriented media—whether print, televisual, or digital—structure (multi)racial conflicts, concepts, and categories. However, sociological analysis has not: quantified media representations of multiraciality across a significant time period; examined qualitative differences and nuance among various forms of media that includes mainstream-oriented, black-oriented, and multiracial-oriented media sources, and; has not specified the precise

qualitative themes, frames, and discourse of that representation across time and media format. In addressing these gaps, a content analysis of articles from mainstream-, black-, and multiracial-oriented magazines published from 1961 to 2011 traces the rise, fall, and style of representations of multiraciality. The analysis demonstrates how varied media sources differently drew upon, resisted, and reproduced distinct understandings of multiracialism. The implications for this study illuminate the import of multiracial self-esteem, the return of biological essentialism and the medicalization of race, the intersection of conservative political movements and black interest groups in the fight for and against a multiracial movement, and the paradoxical role of anti-black stereotypes in multiracial representations.

The Cable Car and Urban Miracles in Latin America: Neoliberal Urbanisation and the Right to the City

This paper is about the use of the cable car as a disruptive technology in connecting divided cities – the divide between the formal and informal city – in Latin America. The cable car has become a symbol for achieving 'urban miracles' through innovative urban governance, planning and social participation. It has become an iconic technology and essential ingredient to attract support for urban development plans and international investment. Using Brenner's theoretical framework of 'new state spaces' this paper examines the rescaling of governance and development associated with neoliberal urbanisation. Its empirical focus is the cable car as a disruptive technology to address problems of traffic congestion, citizen insecurity and investment in the informal city in Latin America. The paper explores whether the cable car has become a Trojan horse for the expansion of neoliberal urbanisation in the informal city or whether it has expanded 'rights to the city'.

HUNEFELD, LENA* (Federal Institute for Occupational Safety and Health, Huenefeld.Lena@baua.bund.de)

Atypical Employment and Mental Health in Late-Modern Societies – a Review

Atypical employment such as part-time work, fixed-term employment and temporary agency work is a growing global phenomenon that affects more than 30% of the worldwide workforce (OECD 2015). The shifting towards atypical forms of employment is mainly driven by technological developments and an increasing intensity of competition in global markets.

As a result, the pressure on companies to adapt flexible to these ever-changing challenges can only be met by refraining from regular working contracts in favor of more dynamic working arrangements (Hohendanner & Bellmann, 2007; Walwei, 1995).

Atypical employment might be a helpful strategy to integrate unemployed persons into the labour market and to give them a new perspective. However, at the same time atypical employment is often associated with precarious labour/life situations and health impairments (Dütsch, 2011; Isaksson & Bellagh, 2002; Kvasnicka & Werwartz 2003). For example, several studies show that, compared to workers with permanent contracts, fixed-term and temporary agency workers are more likely to fall into lower income groups, receive only insufficient social support and that their work is often dominated by stressful working conditions like high job insecurity.

Within the scope of the research project „Mental Health in the Working World" of the Federal Institute for Occupational Safety and Health (BAuA), we systematically reviewed studies on atypical employment (including fixed-term employment, temporary agency workers, part-time employment, self-employment, and multiple job-holding) and its effects on various mental health outcomes. The results of our review show that there is an association between atypical employment forms and psychological morbidity. However, the results also indicate that the health risk of atypical employment must be evaluated separately for each form of atypical employment. We will present results of our systematic review and discuss the role of employment instability and stressful working conditions that go along with atypical employment in late-modern societies

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Temporary Agency Work and Mental Health in Europe – Decent Work As a Long-Term Goal

Temporary agency work is a fast growing form of employment in the European Union. From 2012 to 2013 alone, the proportion of temporary agency workers increased by 9,6 % (Ciett, 2015). On the one hand temporary work is a helpful strategy to integrate unemployed persons into the labour market. On the other hand this form of employment is linked to numerous health risks. Our systematic review that was conducted within the scope of the large-scale research project „Mental Health in the Working World" of the Federal Institute for Occupational Safety and Health (BAuA) demonstrates that temporary agency work is an important determinant of occupational health.

Based on 29 studies from Europe, our review shows that temporary agency work is associated with an increasing risk to develop symptoms of depression and burnout. In addition, compared to employees with regular contracts, temporary agency workers report less job satisfaction and motivation. These health risks are often attributed to the potentially precarious character of temporary agency work which results from insecure and harmful working conditions (Dörre, 2009; Dütsch, 2011; Isaksson & Bellagh, 2002; Kvasnicka, 2003; Wagenaar et al., 2012). Despite the statutory principle of equal treatment, various studies illustrate that temporary agency workers are more likely to be part of low income groups, that their work is often dominated by dangerous working conditions, and that they receive less training than regular workers (Becker & Engel 2015; Eurofound, 2007; Schuring, van Oosten & Burdorf, 2013).

In our contribution we will present empirical results of our systematic review. Given the potentially precarious character of temporary agency work we will discuss possible underlying mechanisms. Finally, we will focus on current legal regulations and future/ prospective changes in regulations capable of improving working conditions and hence health-related aspects of temporary agency workers.

Ethnographical Approaches on Familial Body-Related Practices As Well As Normative Discourses of Parents with the Focus on Gender

What importance does gender have in childhood? When does it become relevant for children? What does it have to do with body and sports? These are some of the questions raised in the progress of our ongoing research.

In the presentation some of the preliminary findings of the research project „Ethnographical approaches on familial bodyrelated practices as well as normative discourses of parents with the focus on gender" will be introduced. Our research is part of an interdisciplinary joint project which is supported by the Niedersächsisches Ministerium für Wissenschaft und Kultur from May 2015 to April 2017). The aim of our sub-project is to reconstruct normative discourses on gender and social practices, in which body and gender become relevant in childhood

The focus of the research lays on children at the age from six till ten and the gender-related ideas of normality of their parents. Gender differences are often pre-structured, stabilized or differentiated within family practices. In the research especially those practices, which are related to body and movement, will be explored. A particular aim of the research is to have a closer look at the relevance of gender in (different) given opportunities of learning and experiencing for children. From a sport scientific perspective the main interest lays thereby in the access to officially organized and self-organized sports.

To follow those research questions a mixed-method approach is chosen in our sub-project, which includes ethnographic observations as well as qualitative interviews.

WETZEL, JANA* (University of Vechta, jana.wetzel@uni-vechta.de)

Muslim Children's and Youth' Well-Being and Its Intersections with Different Societal Contexts

The concept of intersectionality focuses not only on the analysis of the intersection of social categories like gender, class, ethnicity with the main aim of identifying social inequalities. But, the approach also aims at analyzing how social categories do intersect with each other in every specific case and situation, and in respect to discrimination. The interwoveness of categories can therefore have – in interrelation with contexts and structures – different effects, either strengthening, or, reducing discriminating impacts for the individual (Winker/Degele 2009).

In Germany, the life of Muslim children and youth is characterized by specific experiences of societal discrimination related to widespread skepticism and rejection of Muslim religiosity and the religion of Islam (Shooman 2012: 54). In relation to Muslim children's and youth' well-being this raises the question how such discrimination experiences influence well-being.

We will present the empirical findings of group interviews (10 group interviews with two to six participants) in various mosques in Germany (female and male) children and youth, aged between eight and 24 (see also Hunner-Kreisel/Wetzel 2015). The data is analyzed with *Grounded Theory Methodology*.

We find that for Muslim children and youth religion and religiosity can have different meanings in different societal contexts (Tiliouine 2014). In this regard, the category of religion/religiosity can intersect – and this is what we want to present – with social space: Subscribed as "Being a Muslim" can lead to discrimination at school and society. While in the mosque or within the family "Being a Muslim" can create unquestioned belonging of security and the feeling of morale goodness.

KUGLER, JOSEPH (School of Kinesiology, The University of British Columbia)

YAN, PHILIP (School of Kinesiology, The University of British Columbia)

Older Canadian Men's Perceptions and Experiences of Physical Activity

In this paper, we consider older Canadian men's perceptions and experiences of physical activity. We draw on data from in-depth interviews with 22 men, aged 67-90 (average age of 76), who were diverse in terms of their incomes and levels of education. The men were largely homogeneous with respect to their marital statuses and sexual orientation as the majority were married and heterosexual. The men were asked about the types of physical activity they engaged in, their reasons for doing so, and how and why their levels of physical activity had changed or remained the same over time.

Our analysis of the data revealed three key meanings that the men attributed to physical activity: **a) physical activity as health promotion; b) physical activity as a means of fighting aging and ageism; and c) physical activity as embodied masculinity**. The majority of the men argued that they had a moral responsibility to engage in physical activity so as to promote their health and maintain their bodies. The men further suggested that physical activity was an important means of fighting the bodily realities of aging, including eventual future losses related to their health, independence, and functional abilities. In this way, the men asserted that physical activity enabled them to resist ageist stereotypes and the societal devaluation of older bodies. Finally, the men contended that physical activity enabled them to demonstrate their masculinity as they enacted idealized male characteristics such as strength, dominance, and sporting prowess. As such, the men expressed concern about how declines in their health might impact their abilities to be physically active in the future with concomitant threats to their sense of identity, well-being, and social currency.

We discuss our findings in relation to the extant theorizing and research pertaining to ageism, masculinity, and age relations.

Governing New Realities: The Negotiation Proceedings for the International Institute of Applied Systems Analysis (IIASA)

In 1972 in Laxenburg, near Vienna, scientists at the International Institute for Applied Systems Analysis (IIASA) started to work on methods of global modeling or the evaluations of models that dealt with complex social and environmental systems. Scientists of this new facility coped with advanced problems in society due to the growth and intensification of industrial production. They were sent by their member states to Laxenburg to enhance prognostic tools such as simulated mathematical models. Twelve members from Academies of Sciences (or similar entities) from the USSR, USA, FRG, GDR, JP, CDN, CZ, PL, FR, IT, BUL and the UK created with IIASA a formerly unknown discipline of "applied systems analysis". This lack of genealogy should liberate scientists from binding influences of specific national academic settings, although they shared a common nucleus through the traditions of systems theory, operation research, linear programming, cost-benefit analysis or game theory. Their focus was to improve methodological work in relation to human-nature and human-machine interactions. The controlling of urban systems, the measuring of environmental quality or the evolution of energy resource depletion provided first examples of research. IIASA became the rare case of an international think tank with a specific diplomatic role with a proper expert knowledge. I followed the main negotiation bodies between 1967 and 1972 to denote the diverging regimes of interest that were involved before they homogenized in the spectrum of applied systems analysis. I reconstructed the discourses whereupon the founding members of the IIASA contested the inertia, broke with blindness of evidence-bases or agreed with the efficiency of prior knowledge of representing reality. With this historical perspective I wanted to enhance the understanding of IIASA as an important actor in the history of modeling environmental problems and as a forerunner for the launch of the Intergovernmental Panel on Climate Change.

Top Gallerists As Key Players in the Globalized Visual Art Game

Until fairly recently, art galleries were locally bound to their circles of collectors and artists. Over the past two decades, a few players have managed to expand their deals into a mobile international network, alongside with some globally active art auction houses. They also play central roles in the admission process for the globally recognized art fairs, which are self-organized by associations of gallerists.

The rise and the business strategy of three contemporary gallerists will be reported: Larry Gagosian, David Zwirner and James Chang. From these narratives, conclusions for the social construction of aesthetic value in the global visual art game are drawn.

Age and Socio-Economic Inequalities in Access to Learning and Training in Later Life in the UK

Background: The drive to extend working lives across Europe raises concerns about the level of skills and training amongst older workers. To continue being productive until later in life it will be necessary to update one's skills throughout working life. This presentation will i) look at trends in engagement with learning activities in later life in England and ii) explore the impact of socio-economic and work-related factors on access to and engagement with learning activities in the UK.

Methods: The data are drawn from 2 nationally representative longitudinal surveys: the English Longitudinal Study of Ageing (ELSA) and Understanding Society (USoC). The samples are restricted to those aged 50-69 (ELSA, N~6400; USoC = 14,630). Participation in formal learning, i.e. work-related training, and non-formal or informal learning are analysed. Socio-economic position (SEP) is measured using a number of indicators such as education, occupation and income.

Results: The results show that those aged 50+ are less likely to engage in adult learning or to be offered work related training than younger age groups. Moreover the rates of participation in both formal and informal learning amongst the 50+ have been falling since 2004. There are also wide socio-economic inequalities in participation amongst older people. Those in lower SEP are much less likely to engage in or be offered learning and training. Those in full time work with fixed contracts are also more likely to engage in learning activities.

Conclusion: In order to support the drive towards fuller working lives the government and employers need to act to improve access to and participation in lifelong learning activities. Removing barriers to participation and reducing social inequalities in learning and training must be clear priorities to ensure that all can enjoy a fuller working life.

Neoclassical Economics As Style of Scientific Reasoning: A Sociological Study of Contemporary Economics

Since the 2008 financial crisis, a new wave of critique of mainstream economics has emerged. The critique, which may be seen as a struggle for a better world within economics, has been voiced both by students calling for pluralism and by heterodox economists challenging the mainstream. A common claim among the critics is that the discipline is dominated by a narrow neoclassical conception of economics, which critics claim leads to lack of explanatory power and real world relevance. In this paper, the enduring neoclassical dominance is approached as a problem to be explained sociologically. First, the meaning of "neoclassical" and "mainstream" economics is discussed through a brief literature review of recent debates about the meaning of the terms. I argue that neoclassicism could reasonably be understood as a relatively enduring intellectual style that seems to persist despite some recent diversification. Second, the paper presents preliminary results from an empirical study of contemporary Swedish economics. The empirical material consists of both interviews with active researchers, and expert evaluation reports on candidates for professor positions, both collected from top Swedish economics departments. Third, the material is analyzed using Ian Hacking's concept of styles of scientific reasoning. Such styles are historically enduring conceptions of ways of doing science that carry with them both ontological and methodological presuppositions and prescriptions. We may furthermore think of such styles as embedded within thought collectives that maintain a disciplinary core through boundary work, against other disciplines as well as against heterodoxy. The analysis of the case presented seems to indicate that the apparent stability of core tenets of contemporary economics can be effectively understood as a specific style of scientific reasoning. This paper attempts to explain how orthodoxy is reproduced, which should be of interest for anyone who wants to open economics to pluralism.

Trade Unions and 'new' Social Movements: Can They Work Together?

It is widely argued that European trade unions missed the ooportunity to present forceful and coordinated resistance to austerity. By contrast, protests by 'new' social movements have been far more prominent in many of the countries worst affected. The relationships between the two types of protest, and their protagonists, have often been strained if not hostile. But there have been more cooperative experiences. How far, and how, can the two vectors of protest be reconciled?

Can Youth Secure a Place to Stay in the Local Community, Under Individualization Society?

In this presentation, following problems are discussed while being based on a case of Japanese local community, problems how youth leaves the local community, and why they cannot return to the hometown. The youth have to leave a local community to get opportunities of better education and work. When youth leave a hometown once, it becomes difficult for them to come back. It is caused by the fact that opportunities of work in their hometown are hard to be provided, and the fact that it becomes difficult to find a place to stay in their hometown. In this discussion, a place to stay, the approval from others, individualization are keywords. In current Japanese local community, depopulation, low birthrate and aging, marginal village have become major serious difficult issues. The background of problems is depopulation of the Japanese whole society. Because depopulation decreases, the maintenance and management of sociality have become difficult. Because opportunities of work in their hometown are hard to be provided, youth's life maintenance tends not to be possible, and not to come back. In addition, the posture to receive youth is thought to become another important problem. It is not paid its attention so much, but it is important serious problem. In other words it is a problem of human relations and intermediate group, the places to stay of the youth as the social consciousness in the local community. A youth has intention to want to live in a hometown, but, on the other hand, tends to avoid the human relations of the community. Under the present conditions, the human relations of the community do not become social capital. In addition, parents, the family does not want to let youth return. Neither the family, relative, nor the community as an intermediate group, could take care of youth.

Neighbourhood Characteristics and Psychosocial Health Among Young Adolescent Living in Urban Slum in Lagos State, Nigeria

Adolescence is viewed as a product of specific social, economic and cultural forces. It is a period when adult personal and social identities begin to take shape through the process of social interaction. Therefore, identity formation is a product of a process of negotiation that takes place throughout adolescence, making them a victim of social structural forces. Therefore, adolescent may be more vulnerable to negative psychosocial health effect from distress and adverse urban slum characterized by congestion, high levels of unemployment, inadequate social services, extreme poverty, insecurity, crime, and hopelessness. The paper examines association of neighbourhood characteristic with adolescent psychosocial statues. Data for the study were obtained from a cross sectional survey among young adult, age 13-19, living in urban slums in Lagos State. Adopted a measuring scale for adverse environment and psychosocial attributes, data were analyzed using univariate and binary logistic regression analysis. The findings suggest among others that adverse neighbourhood characteristics in urban slum can be connected with unhealthy life style which reflects wide personal and social contexts and have implications for public health and social wellbeing. This paper calls for urgent intervention programmes and public health policy to addressing rapidly developing slum settlements in low income area. More research is also required to establish how these outcomes contribute to urban health challenges and insecurity.

Dominances and Diversities: Solidarity, Discontent, and Masculinity Among Young, Migrant, African, Male Entrepreneurs in Johannesburg

The aspirations of young African males towards attaining dominant models of masculinity motivates them to search for opportunities beyond national borders. Socially determined expectations of manhood such as breadwinning fosters this since their economies more often than not cannot provide meaningful employment for them. Yet, a consequence of emigrating is that these males travel with established understandings of being men, hence the affirmation that migration is a gendered experience.

While the growing body of masculinity-migration research addresses how these males negotiate their masculinities in the face of local masculine articulations in the host countries, a complexity less studied is how masculine relations among the migrant males themselves is manoeuvred. This presentation speaks to the latter subject.

Drawing on the theoretical framework of global critical studies of masculinities, this study interrogates how a 'clash' of differing migrant articulations of masculinities in the transnational space instigates discontent among male groups. It uses qualitative in-depth interviews to explore the voiced sentiments of 25 young, black, African male entrepreneurs in Johannesburg's informal sector. It anticipates that the young participants will be divided along national, ethnic and class lines as they forge livelihoods for themselves in the transnational field. Hence, how is migrant solidarity disrupted by affiliations with origin-centred masculine identities? What implications does this have for gendered relations among young people in the longer term?

The study redirects the debate of what it means to be a young male in the African diaspora to experiences contextualised in intra-continental contexts. Thus, it examines what a 'migrant-migrant' analyses means for constructions of masculinities, and ultimately social cohesion and development in an African transnational context.

Synthetic Measures of Multidimensional Well-Being: How to Aggregate?

Well-being is a complex multidimensional human and social phenomenon that cannot be reduced to any economic performance indicator. In order to take into account the multidimensionality of well-being in a context of increasing data availability, where effective synthesis of data is needed, the construction of indicators is of major concern.

Several subjective indicators have already been proposed and evaluated in European and International reports during the last decade to assess societal well-being as a reaction to objective indicators. To capture the multidimensional aspect of well-being through a reliable operationalization, several challenges come up: the definition of relevant dimensions of well-being (which depends on the theoretical framework), the quality of the indicators chosen (which depends on the available data) and how indicators are combined into a synthetic measure (which depends on the methodological approach). This paper aims to focus on the methodological approach by comparing three methodologies in order to construct synthetic measures of multidimensional well-being and thus show their advantages and shortcomings.

Different methodological approaches are proposed in the literature to construct synthetic measures, notably measures based on structural equation modeling (SEM) and on counting approach, two approaches that aggregate information. A more recent approach, the posetic approach (based on the partially ordered set theory) developed by Maggino and Fattore (2011), proposed not to aggregate ordinal information, but to create a synthetic measure providing different profiles from large data sets and to assess profiles by comparing them with benchmarks.

The main contribution of this paper is to compare three different synthetic indicators measuring multidimensional well-being and discussing the impact of aggregating. Each methodology will be implemented using the Swiss Household Panel (SHP) data, a longitudinal annual panel survey available since 1999.

Party Finance and Party Membership in Europe

One of the most controversial aspects of intra-party life concerns parties financing and its relationship with the internal organization. The evolution of the traditional mass integration party into more professionalized party implied an increase of the party budget . Media-centered and centralized electoral campaigns brought to a skyrocketing growth of financial inflow. This process ran parallel to the decline of party membership and voluntary activism, which turned into a sharp decrease in membership fees and private donations. The introduction of public funding schemes to political parties, thus, represented the privileged solution to face the new economic and organizational challenges of contemporary politics. The aim of this paper is to analyze the relationship between party finance and party membership in a group of European countries (Germany, Italy, France,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Great Britain and the Netherlands) characterized by relevant differences in both the public funding schemes and party organizational traditions.

Boudon's Theory of Cognitive Action - Between or Above Rational Choice Theory and Analytical Sociology?

Boudon is commonly recognized as either an analytical sociologist and/or a rational choice theory (RCT) sociologist. It is debatable whether he would subscribe unequivocally to either of the two camps. On the contrary, Boudon was critical both to rational choice sociology and analytical sociology. There is a difference in his understanding of RCT and analytical sociology. Boudon had much respect for RCT, recognizing its heuristic capacity in some domains. Boudon's basic concept of cognitive rationality was developed in strong opposition to RCT, but his idea was to make a more general model, that would incorporate RCT basics in his own theory. Although Boudon's view of RCT was somewhat reductionist, he shared the basic epistemological premises of rationality and methodological individualism with this approach.

It could be argued whether Boudon can be considered an analytical sociologist at all, since his model was developed almost without referring to analytical sociology. The usual common reason why Boudon should be placed in analytical camp is the concept of mechanism. This concept was more implicitly present in Boudon's work, and certainly more elaborated in Boudon's early work, than in his late "epistemological" phase. He was not so much interested in analytical sociology, although he was included as the author in publications on analytical sociology. Only in his late work, Boudon showed some interest in analytical sociology, openly criticizing its fundamentals as not very original. However, there are some links between Boudon and analytical sociology, especially the belief in "explanatory sociology" and value-neutral science, and presentation of the ideas in the form of an "epistemological manifest".

The Debate on Breastfeeding in Feminism

Breastfeeding is a highly polemical issue in modern feminism. Breastfeeding epitomizes the 1960s equal treatment vs. special treatment debate in feminism, but also the ambivalence of contemporary "gender perspective". The new model of gender equality promotes equality in private domain, share of responsibility, change of attitudes, values and life projects based on the new paradigm of gender mainstreaming. The new gender equality model emphasizes the role of a partner in breastfeeding, either as taking share in household labour, taking over the breadwinner role or providing emotional support. But it turned out that women's rights are not monolithic and mothers' rights may be in conflict with gender equality principle as a "new generation's vacuum cleaner" (Rosin) that alienates women and confines her to one-dimensional motherhood. The key question is whether breastfeeding has empowering or alienating effect on women. There are two opposite positions in feminism: one group of scholars (Hausman) see breastfeeding as a liberating practice (in line with "lactivists"), the other camp (for example, J. Wolf or Kukla) is criticizing breastfeeding promotion as a form of oppression. It seems that "pro breastfeeding choice" position has gained support among feminists after the scientific evidence for breastfeeding benefits started to be questioned recently.

Change of Japanese Lawyers after the East Japan Great Earthquake and Tsunami of 2011

The role of lawyers following a disaster was considered after Hurricane Katrina in 2005 (Morse 2011), but has not been extensively discussed. While the legal treatment of the East Japan Great Earthquake and Tsunami (EJGET) is partly discussed in some English writing (Leflar et al. 2012, Feldman 2013), this paper focuses on the role of lawyers after the GEJET, which has rarely been touched on.

Lawyers and bar associations began conducting legal consultations immediately after the GEJET. On-site consultation in the devastated areas was conducted by attorneys nationwide, who were dispatched from bar associations outside the devastated areas. Free telephone legal consultation for victims was administered by bar associations in the Tokyo area. There was also some successful lobbying activity by lawyers to make or amend statutes to support sufferers.

Backed up by the reforms to legal access after the 1990s, Japanese lawyers seem to have tried to support victims relatively well, including an outreach approach and campaigns for necessary legal amendments. According to a comparison of the activities of attorneys following the Hanshin Awaji Earthquake of 1995 and the EJGET (Nagai 2005 and 2012), their common features are basically the same; the provision of legal advice, defending victims using legal aid, making proposals for necessary legal changes and assisting community reconstruction. In addition, following the EJGET lawyers have been seen to be performing new functions which include supplying information to and from victims in the place of ruined local governments, providing ADR services, responding to the nuclear power plant accident and supporting evacuees from Fukushima.

This paper considers these changes seen in Japanese lawyers after the EJGET and their future prospects to cope with the disaster.

State Risk Discourse and the Regulatory Preservation of Traditional Medicine Knowledge: The Case of Acupuncture in Ontario, Canada

Alongside increasing Western scientific evidence of clinical efficacy, acupuncture – a practice with roots in traditional Chinese medicine (TCM) – has recently come into increased usage by biomedically-trained health care professionals. Concurrently, a regulatory trend in Canada, the United States and Australia increasingly permits biomedical professionals such as medical doctors, physiotherapists and chiropractors to perform acupuncture alongside registered TCM acupuncturists. While 'public safety' is an established parameter around which professional regulatory decisions – such as these – are commonly framed, risk is not a politically neutral concept. The case of Ontario (Canada), where ten professional groups were authorized to perform acupuncture in 2006 based on 'safety' grounds, exemplifies this point. In this paper we explore the implications of this for the regulatory preservation of traditional medicine practices and knowledge systems, as recommended by several United Nations bodies. We report on a critical postcolonial discourse analysis of two contrasting Ontario government reports preceding that jurisdiction's acupuncture regulations. The earlier (1996) report, produced when Ontario's regulatory lobby was largely comprised of TCM practitioners, integrates risk-related perspectives from both TCM and Western biomedical science. The 1996 report uses this 'inclusive' risk discourse to support a regulatory definition for acupuncture that aims to protect TCM knowledge, without excluding diverse professions from needling practices. The later (2001) report –reflecting the interests of an increasingly biomedical practitioner lobby - exclusively privileges Western scientific perspectives on risk, while implicitly denigrating TCM-informed views. The 2001 risk discourse ultimately supports an 'atheoretical' regulatory definition for acupuncture that subordinates traditional knowledge perspectives. Our analysis demonstrates ways in which state-constructed risk discourses may reflect particular epistemic underpinnings, carrying implications for the regulatory preservation of traditional medical knowledge across jurisdictions.

Fertility Decline and Background Independence

I maintain that fertility declines independently of its "background". Normally, fertility decline is thought to occur as a result of alteration in the socioeconomic background such as the decline of the infant mortality rate, urbanization, the level of literacy, and so on. This point of view has been regarded as equivalent to "demographic transition". However, the concept of demographic transition is so superficial, naïve and unscientific that it should be applied merely to the ostensible demographic phenomena, not to the mechanisms of fertility decline. The author regards this way of thinking, i.e., that the occurrence of fertility decline is dependent on socioeconomic background, as the "background dependence" of fertility decline. On the contrary, there is considerable counterevidence to the background dependence of fertility decline. The argument is made that background dependence lacks positive evidence and predictability and consequently, is falsifiable. That decisive counterevidence is introduced. I revive the diffusion hypothesis of fertility decline at the point of the number of children per couple as the reaction–diffusion process in a mathematical equation. Fertility decline in Europe in the eighteenth and nineteenth centuries occurred as a reaction–diffusion process independent of socioeconomic background. In Japan as well, fertility (the number of children per couple) declined independently of background. I provide ample evidences persuasively demonstrating this independence of fertility in Japan. The occurrence of marriage is also independent of socioeconomic background.

The Social Effects of Eco-Innovations in Italian Smart Cities

The European Union promotes the paradigm of ecological modernization and the effectiveness of eco – innovations (EEA, 2014). This is evident, in particular, from the political and financial support that the Institution is devoting to smart cities. Thus far, most of the 'smart' projects developed in European cities focus on the theme of the environment and its efficient management (UE, 2014).

However, what has not yet been adequately investigated, so far, is the issue of the social impact of these smart environmental projects (Beretta, 2015). In particular, what seems important is the question of whether the projects with environmental objectives also yield beneficial results from the social point of view, with special reference to the issue of social inclusion. Who are the real beneficiaries of the projects of eco - innovation? Do the benefits extend to all citizens? Or are they likely to go to only some sectors of the population, often the wealthier ones, risking - among other things - promotion of the phenomenon of eco - gentrification? In more general terms, can we say that smart cities represent the 'ideal' settings for the achievement of simultaneous environmental, economic and social development?

This paper reports results from research conducted on smart environmental projects implemented in Italy and presented at the Smartcity exhibition 2015 in Bologna, the leading Italian exhibition on smart cities. The project consisted of a qualitative analysis of the environmental projects presented, in order to analyze their social impacts, especially referring to the question of social inclusiveness (with 'inclusiveness of the projects' meaning that they cover/include all the different segments/groups of the population, from the strongest to the weakest and wealthiest to poorest). More generally, the analysis helps clarify whether the eco - innovations represent an effective tool for achieving sustainable development in the Italian context.

From Inequalities to Liberties: The Rise of New Social Movements in Contemporary Turkey

Taksim Gezi Park protests erupted in May 2013, following police violence against a group composed by environmental activists and Taksim neighborhood residents who opposed the demolition of the park and its redevelopment into a shopping mall. Thousands occupied the park overnight and the protest turned rather quickly into a wave of nationwide anti-government movement. According to Konda research agency's report, more than half of the protestors attest to be mobilised against the restriction of individual freedoms. While the actors defined themselves mostly as "ordinary citizens" distancing themselves from political parties and class/labor oriented movements, we can observe an undeniable pluralism in matter of rights based groups (mainly environmentalists, lgbtq, feminists) which formed the core of the movement. Not only these groups found a space to emphasize their identities but one can also state that one of the most important caracteristics of the so-called "Gezi Resistance" were the new solidarities formed between these groups. Although Turkey may be listed as a "global north" country in economy oriented reports, in means of society, urbanism, education or social movements it is clearly part of the Global South. In the 60's/70's, Turkey experienced a class and labor based, revolution oriented, socialist student's movement that distanced itself from the personal rights movements that were happening in the same time in north american or european countries. Today, in the aftermaths of the Gezi Resistance, we can observe in Turkey, the rise of identities and rights based New Social Movements that started to sprout very slowly in the 90's, with more than two decades of interval with its counterparts. In this paper, based on empirical research, we will analise the roots and the evolution of these NSMs in Turkey, and the impacts of both european/north american NSMs and the Turkish left-wing movements of the 70's upon it.

Standing Against Fathers, Husbands and the State: The Intertwined Repertoires of Women's Movements in Turkey

In this paper we intend to analyze four decades of women's movements in Turkey, with their various phases, diverse tendencies and the dynamic repertoires of action and discourse they built: from the left wing women's movements of the 70's, to the first and second generation feminists, from muslim women's identity movement to kurdish women's claims and finally to new solidarities between them as a major outcome of the Gezi Park Resistance. In this perspective, firstly we will briefly examine the emergence of these diverse but connected tendencies in women's movements history. In a second part we will elaborate the ways actors from groups claiming women's rights and/or feminism build their subjectivities and we will search for references to their counterparts, to their own past and also to international cases in this process. Finally we will try to start a discussion based on the role of Gezi Park and the Taksim Square as a public space were

actors could learn in experience how to be political subjects -different but unified; a public space promoting dialogue and even complicity between these diverse tendencies, all of them fighting neoliberal politics, male domination and state violence. We will end the paper with a special emphasis on women's groups actions developed around the solidarity movement during and after the curfew in Cizre.

EREMIA, DANA IOANA (Research Institute for Quality of Life)

The Role of University Degree in Youth Transition to Work

The deep changes in the labour market claimed for extending education and training time and generated a non-linear trajectory of the education within the individual life course. At the end o secondary education youth are facing a range of decisions, influencing to great extend even not entirely their adult professional career, among which higher education promises a better starting point on the labour market.

In the context of the universalization of higher education (Teichler, 2008), but restricted job opportunities mainly in term of reward, as has been the Romanian case in the last two decades, the study has a look on university graduates questioning the role the university has played in smoothing their relation to the labour market. Empirical evidence reveals functional reasons for the choice of tertiary education prevailing over the more inner reason of vocation or excellence in career. Among the former one can find delaying the entrance on the labour market, better position in negotiation for the desired starting point on the labour market, given by higher or larger range of qualifications, or the right answer to the fashion in qualifications in national, but as well in international arena in the view of a probable future migration.

The study is a step forward, testing this hypothesis based on an online quantitative type survey conducted by the authors, mirroring the structure of the tertiary education by domains. Social background, education, work opportunities and experience, motivations of these young people are looked as determinants for crossing the uncertainty of the transition to adulthood, in which developing professional competence is the key to success.

Between City and Village; Models of Dual Lifestyles in Russia

Town and country are the two poles in the continuum of settlement patterns. Each of them is a special world with its pluses and minuses. It is a foundation for their coexistence in the mode of complementarity. Although historically, urbanization has been and remains the dominant trend, there are a lot of forms of dual lifestyle involving living on two houses. Many of these forms have deep historical roots, but they acquire new capabilities in modern society.

Dacha lifestyle involves a combination of permanent residence in the city with seasonal stay in the countryside. Historically this way of life is associated with nobility, combining public service (mainly in town) with estates in the countryside. Currently this style is greatly democratized and by improving the transport situation the dacha zone is often located hundreds of miles from the big cities.

Labour commuting peasants is also a traditional form of dual lifestyle. Peasants often combined life in the village with regular work in the city. This form is widespread and today.

Downshifting as upward social mobility is a new form of integration of urban and rural lifestyles in one of the biographical project with the ordering in a sequence of stages: career in the city is exchanged for a quiet life in the countryside. The common economic base of downshifting is income from apartment leasing in the city.

Remote employment is a purely modern phenomenon, involving a stay in the village while working in the city using remote communications. The construction of rural houses, not inferior in comfort urban dwellings, is also a compromise between the two lifestyles.

The Politics of Change, Precariatised Youth Unemployment and Active Labour Market Policies in Nigeria

The insecurities suffered by the youth precariat class in Nigeria derive from labour market insecurity, employment insecurity, skill reproduction insecurity, income insecurity and representation insecurity, all of which point to largely steep economic, social and political insecurities. This labyrinth of insecurities, particularly as it manifests in bulging youth unemployment, further marginalises this class, and exacerbates its precarity. Since members of this class respond in the most vicious way by pulling at the fabric of social cohesion and peace or in the least by running a criminal economy aimed at achieving economic assuagement, serious commitment must be made by the political and economic managers of the state to address youth unemployment crisis in Nigeria. Particularly, a lot is expected from President Muhammadu Buhari whose anti-corruption and people-oriented policy disposition is expected to sire a democratic regime that will address the contradictions in the body polity and economy, paving way for greater youth employment in the country. Using a qualitative approach, this study will rely on secondary data from books, journals, academic, newspaper and technical reports, monographs and credible datasets to investigate those active labour market programmes that should be combined with a pragmatic politics of change by the new government in giving hope and a sense of belonging to the precariatised youth class in Nigeria by providing these disenchanted and precarious young Nigerians with decent livelihoods that can wean them off their resort to criminality and antisocial behaviours as survivalist measures to escape the hard economic realities in the country.

An Investigation of Meanings of "Trust" and Their Transition in the Surveys on the Japanese National Character and Other Related Surveys

Trust has long been studied as one of the underlying mechanisms enabling society to function smoothly. However, there are problems with measuring "trust" through social surveys. Because the word "trust" has a large variety of meanings, even if we use the same scale for measuring, it may be difficult to capture an identical aspect of it. This suggests that it is not enough to observe trends of response distributions of trust–related items separately for understanding changes in social situations. To grasp the actual situations of time trends on trust, this study investigates the conceptual structure of trust in the Surveys on the Japanese National Character, one of the oldest social survey in Japan conducted by the Institute of Statistical Mathematics, and other related services using a latent class model. As a result, we extracted three latent classes, named them "carefulness", "generalized trust", and "distrust (assurance)" based on values of conditional response probabilities of the model. Furthermore, we examined proportions of three classes in each survey. In 1978, the percentage of "carefulness" was the highest of all, but this gradually changed with the times. The percentage of "carefulness" has decreased gradually over recent decades. On the other hand, the percentage of "generalized trust" increased rapidly in the early 1990s, ultimately reaching around 50% in 2013. The results derived from this analysis may indicate that Japan has been shifted from the low to high trust society.

Mobilizing Networks to Circumvent Borders. the Migration Industry of Hiring Permissions in the Morocco-Italy Migratory System.

Based on in-depth fieldwork research carried out in the visa section of the consulate of Italy in Casablanca and with middlemen in Italy, this paper examines the ways in which Moroccans make use of work visas to migrate to Italy. Work visas are rarely used to hire workers. Instead, they are means to circumvent restrictive migration policies by mobilizing networks that connect aspiring migrants, middlemen and employers. An employer applies for a hiring permission that allows for obtaining a work visa. Hiring permissions cost between 7,000 € and 9,000 €. This industry does not result always in migration but often in deception. There exist three types of hiring permissions: regular and existing, forged, re-used. The first type is successful whereas the other two types only generate incomes for middlemen and no migration. However, this migration industry continues to develop. Another function of the migration industry emerges: not just facilitation, control, management but also deception. It is interesting to note that the displaced bureaucratic organization – the visa section – is not concerned with monitoring and fighting against such 'fraud'. This is not considered as a task of the consulate abroad but rather of Prefectures in Italy. This exemplifies the fact that, historically, Italy has never used visa policy as an external mechanism of immigration control.

Also, it speaks of a particular conception of the state: "what does the state can do? What can we do?" is the perception that officers have. Therefore, it can be argued that by following such a local arrangement, the migration industry of deception continues to develop.

Will the Twain Ever Meet? the Experience of the Emergency Services and the Local Community Services through the Blue Mountains Fires of October 2013

The research team for 'Community Connections: Vulnerability and Resilience within the Blue Mountains' drew members from Charles Sturt University, Blue Mountains City Council, and two local neighbourhood centres. The focus was vulnerable community members, in particular the aged and people with chronic illnesses. Soon after the research launch fires broke out in the Blue Mountains of NSW, directly affecting hundreds of households, four schools and many local businesses. Despite the frequent threat and occasional fire, the local community found itself relatively unprepared for the scale and devastation of this event. In addition, knowledge of vulnerable individuals and their needs was fragmented across the community and across multiple service providers.

The Community Connections team were ideally placed to document the recovery process and to collect narratives from vulnerable people as well as local leaders. The pressing question addressed in this paper relates to the roles and responsibilities of the local community services and the local emergency services. The role of the community services is recognised within the Australian 'National Strategy for Disaster Resilience 2011' where they are directed to share responsibility for building community disaster resilience. The community sector, however, is not often invited to the table of disaster committees and bodies.

Prior to the October 2013 fires in the Blue Mountains, the role of community services in strengthening community resilience was undervalued and relatively unacknowledged by the local emergency services. Likewise, disaster management was a foreign concept to local community services. This paper explores the Blue Mountains experience, where the fires initiated new growth in the form of collaborations and connections in the previously barren space between local community services and local emergency services.

International Houses' Humanist Policies Facing Everyday Life. Comparative Ethnographies of Three Student Houses in France, United States and Canada

"Creating a better world" is what the International Houses (IH) in the United States and in France are trying to put in place since the 1920s. The founders of these IH, philanthropist and humanist politicians, have tried, each in their own way, to "create a social network of international friends by making students from all over the world live together".

In order to analyze the impacts of these ideologies in practice, I conducted three ethnographical researches: at the IH in France, the IH in the US and a Graduate House in Canada. For four years, I conducted interviews, daily observations and collected archives.

First, I will compare the two IH's historical data to understand how they applied institutional engineering throughout time.

Secondly, I will confront the ethnographic data collected in these two IH to a similar work in an "ordinary" residence in Canada. Thus, I will analyze how these three institutional engineerings could partly influence everyday interactions and relationships between residents. For instance, I will describe their experience of injunctions to the discovery, meeting and cosmopolitan socialization in each residence.

Thirdly, in my three field works I will describe residents' daily life, on-line practices, social events, reunions after departures... We will see that all these in-going processes are interacting and negotiating within the institutional engineering. Thus, residents from the three houses are creating an order of interaction combining injunctions of socialization and interactional unpredictability.

By multi-level analysis, I will discuss the humanist ideology of the IH facing the realities of current international residents' experiences and practices. The comparison of the historical, institutional and ideological backgrounds of three fieldworks, as well as their practices observed in everyday life, will point at the regularities and differences and will offer the opportunity to increase generalization.

Formation and Transformation of Support for the Young People with Crisis in Transition: From the Perspective of Social Capital

In Japan, the increase in the proportion of young people with crisis in transition is constantly pointed by many researches since early 2000s. Those young people tends to experience reduction or localization of social networks, and it leads to the limited social capital. Significance of public youth support institutions launched in 2000s is repeatedly stressed. However, those services haven't yet to be examined in the light of the strategies for overcoming the difficulties about social network. This paper examines such strategies through the analysis of the Regional Youth Support Stations.According to Lin(2001=2008), social interactions are the basis of accessing social capital and can be divided into homophilous or heterophilous interactions. This paper coined the two types of difficulties for each types of inter-actions: constrained access to heterophilous interactions(hereafter abbreviated CAHI) and instrumental limitation of homophilous interactions(hereafter abbreviated ILHI). Connexions service, which is pointed to be the influential model of Regional Youth Support Stations, has regard CAHI as core difficulty and innovated the framework for it. But Japanese Government questioned the feasibility of the framework and introduced less effective one. And the ILHI has become focal point neither UK nor Japanese Government because one-to-one relationship with personnel has attracted more attention. But examining the changes at one local agencies opens up a quite different view. Local strategies for overcoming CAHI is fostering trust gradually with relative institutions through constant outreach and consultation. Local strategies for overcoming ILHI is creating opportunities to meet other young people with similar problems and to work for weeks or months while sustaining those relationships. The turning point was when personnel there have gradually found the importance of the homophilous interactions for young people's confidence and self-assertion leading to next career, and then invented programs focusing homophilous interactions.This work was supported by JSPS KAKENHI Grant Number 15J0673.

City Growth and Decline Cycles: A Comparative World-Systems Approach

World regions revealed regionally distinct trajectories of concentration and de-centralization of political and economic power over the long-run history. China is known to have formed a single centralized polity over most of the last 3000 years even though the East Asian region has experienced incessant warfare among neighboring polities. South Asia and Europe are known to have developed multipolity systems with a moderate levels of political concentration. A large literature has revealed that world regions have all manifested political centralization—fragmentation, or war—peace cycles. This study compares the world regions of East Asia (China), South Asia, Southeast Asia, West Asia, Europe, and North Africa to examine the contributing factors for the growth and decline of city and polity sizes and turning points for changes in the cycles of concentration and deconcentration network. This study empirically examines the ecological conditions, trade and political-military influences on the growth and decline of city population sizes. Further, the study applies the models of mutualism and predation in ecology to identify the strong factors for each of these historical cases.

Biographical Evaluation of Psychosocial Treatment in Psychiatric Clinics and Counseling Centers By Service Users

Inequalities in psychosocial care particularly affect migrant women and men. To find out about inadequate service but also possible examples of good practice in psychiatric clinics and counseling centers, service users who migrated themselves or grew up in a family context of migration are asked in narrative interviews how they experience and evaluate their treatment or counseling. Together with my students in Social Work, we are currently conducting this research as a pilot study in three locations, two psychiatric clinics and one counseling center. What is quite unusual about this research is that it was planned in cooperation with the psychosocial care providers at the clinics and counseling centers. Our cooperation in the "Intercultural Forum" in Frankfurt am Main (Germany) began in May 2010 with the aim of improving psychosocial services for migrants, for example, by introducing institutional changes and by offering treatment/counseling in the languages of migrants. Our previous research in the framework of the Forum consisted of biographical narrative interviews with psychosocial health care professionals. In the present pilot study migrant patients/clients at the three locations

are asked how they experience and evaluate their treatment or counseling. In my paper, I would focus on the analysis of these interviews as well as on the research cooperation in the context of the Forum.

Racial Gaps in Math Course Taking: How School and Classroom Segregation Shape Opportunities to Learn

The primary goal of this study is to examine how the social environment of public schools in the U.S., specifically glaring levels of between and within school segregation, impact the quantity and quality of STEM-related academic opportunities available to students of color during high school. Within racially segregated, high minority high schools, students of color are more likely to take advanced courses (Lucas and Gamoran 2002; Kelly 2009); however, these schools, which are most often located in high poverty, urban systems, tend to offer fewer opportunities for advanced course-taking and the advanced courses they do offer often lack rigor (Dougherty et al. 2006; Rumberger and Palardy 2005). In contrast, racially integrated and mostly white high schools tend to offer a greater variety of and more rigorous advanced course-taking opportunities; however, many of these schools employ curriculum-based racial segregation, also described as racialized tracking, that results in the underrepresentation of minority students in advanced courses (Loveless 1999; Mickelson 2001; Mickelson and Everett 2008; Tyson 2011). Although students of color (particularly black students) in racially mixed and mostly white schools gain similar benefits from advance course-taking as their white peers, they are less likely to take, and thus benefit from, advanced course-taking opportunities (Kelly 2009; Riegle-Crumb and Grodsky 2010; Tyson 2012). I use two waves (fall of 9th grade, 2009; spring of 11th grade, 2012) from the High School Longitudinal Study of 2009 (HSLS), a recent, large-scale, nationally representative dataset. These data are supplemented with school-level data from the 2009 and 2011 waves of the Civil Rights Data Collection (CRDC). The CRDC is the first national database that includes the racial distributions of students within key classes. I use measures of racial/ethnic disproportionality in advanced math courses as proxies of racialized tracking.

ISAAC, LARRY* (Vanderbilt University, larry.isaac@vanderbilt.edu)

Class Formation, the Strike, and the Public Sphere in the First Gilded Age

The conventional narrative of the long-term trajectory of the strike in the U.S. emphasizes a periodization with the following qualitative characterization: (a) early within-workplace struggles over the wage relation and union recognition; (b) the New Deal turn to institutionalization of collective bargaining and strike regulation by the state extending from the 1930s to the 1970s; and (c) the weakening of the strike and the decline of the house of labor over the past several decades. During this decline, scholars and labor activists alike have discovered the role of civil society/public sphere appealing to public opinion and community campaigns in labor's desperate struggles with capital, the state, and mass media.

There is much that is true in this conventional story. However, the image of civil society/public sphere's unique importance in the current period but not before, should be questioned. In an effort to rethink the role of the strike in recent years, I turn to the first Gilded Age—the highly contentious period of struggle between capital and labor during America's industrial take-off.

My focus is on labor's attempt to speak with the strike in class formative struggles emphasizing most heavily the interplay of three arenas that help us understand the class-specific structuring of the public sphere and strike during this formative period: (a) *reporting* the strike; (b*) policing* the strike; and (c) *lethal violence* in the strike. All three of these processes operated in/through, were constrained by, and constituted, in part, the public sphere thus playing a large role in shaping the fortunes of the labor movement.

I draw implications for understanding (a) class formation and strike activity during the early formative period, and for (b) the broader trajectory of labor's use of the strike, including the contemporary appeal to the wider public sphere.

Social Movement Schools: Movement Resource in Performative Challenges for Change

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

How do some individuals come to be determined, committed, effective, long-term movement agents? Learning is, of course, at least part of the answer. But what kind of learning? Where? How? We know that some learning can be done pre-movement involvement; i.e., people learn something about what movements do from a distance by consuming news reports, film, literature, or other cultural genres. People also learn through interpersonal communications with others who may have had movement experience. And we know that significant learning also occurs through direct involvement in movements, or learning on-the-job, so to speak. Yet there is another, largely ignored, answer to this question: social movement schools. By *"social movement schools,"* we mean those organizational spaces deliberately created by social movements to educate, mentor, train, and otherwise seek to prepare individuals for work as effective movement agents.

We: (a) marshal theoretical elements from resource mobilization, cognitive, and cultural approaches to movements as the motivation for focusing on movement schools; (b) develop a conceptual typology for comparatively assessing the range of forms taken by social movement schools; (c) illustrate several different types of movement schools through empirical case studies; and (d) formulate hypotheses to guide future research on movement schools. We suspect that movement schools are significant resources that may help account for the degree, duration, and efficacy of activist performance.

By conceptually highlighting movement schools, a host of new questions are generated for social movement scholarship, including: What kinds of movements tend to create distinct movement schools? What is the range of organizational forms of such schools? What kinds of schools tend to be most efficacious, and under what conditions? Social movement schools deserve the attention of social movement scholars and activists alike.

ISAKSEN, LISE WIDDING* (Department of Sociology, University of Bergen, lise.isaksen@sos.uib.no)

Ambivalence and Inclusion: Italian Middle Class Migrants in Norway.

This paper argues that welfare state policies influence transnational migrants' care preferences. The intention is to contribute to our understanding of how migrant mothers in gender egalitarian societies "do" their care practices according to expected normative ideas in sender and receiving countries.

Due to the economic crisis that hit Europe in 2008, young people and women experience increasing discrepancies between the social realities structured by the economy and the vision of a better future. As a response, they look for better opportunities abroad. In Norway, the number of Italian migrants are increasing.

This study explores how Italian migrants, situated within an expansive welfare state, embrace and confront gender egalitarian family norms and values. In Norway, gender egalitarian values are diffused generally across all social strata. Public services aimed at supporting the involvement of working mothers and fathers in childcare are socially recognized and popular. Italian migrants in Norway are materially and culturally situated within this context. How migrants from Mediterranean familialistic societies experience gender egalitarian norms, welfare state services, and local care arrangements, is discussed in this paper. I argue that migration changes normative preferences for care and leads to a re-thinking of the meanings attached to family values and care practices in the sending and receiving countries. Having their family histories in contexts dominated by familialism and traditional gender ideologies, being professional middle class mothers in a Nordic gender egalitarian society can be an ambiguous as well as an inclusive social and emotional experience.

RC45-523.2

ISHIDA, ATSUSHI* (Osaka University of Economics, aishidajt9@gmail.com)

A Bayesian Model of Image of Societal Distribution

In this presentation, I propose a Bayesian model describing the process of formation of one's image of a certain kind of societal distribution of societal resources, such as income and prestige. The Bayesian statistical model presuppose the process in which somewhat vague prior information (prior distribution of parameters in statistical terms) is updated by empirical data and then turns to be more concrete posterior information (posterior distribution of parameters). By application of this Bayesian framework, forming process of image of societal distribution can well be modeled as empirical model as well as theoretical formal model.

By employing this proposing model, I try to analyze people's image of societal income distribution and image of stratification in the society by using Japanese survey dataset, with the question through what kind of experience they formed their images. Examination of image formation of societal distribution would help to explain the mechanisms of perception of unfairness and inequality which is one of the important themes in the study of social inequality and social psychology.

Who Leaves Home in Japan? Differences Between Families and within the Family

Japan has been suffering from low fertility rates that have remained below the replacement rate for about a quarter of a century. One of the main reasons for the declining fertility rate is the increase in the number of those who postpone marriage or stay unmarried. Changing marriage behavior among young people is closely related to their relationship with the parental home. This study examines how the pattern of leaving home is associated with the socioeconomic backgrounds of the family (factors between families) and family composition (factors within the family). Previous studies documented the relationship between family socio-economic resources and children's decision to leave the parental home in Japan. However, these studies did not fully pay attention to heterogeneity within the family. The number of siblings and birth order, as well as the gender of the child, are likely to affect the decision to leave the parental home. Japan's low fertility rate (1.43 in 2014) implies that not only the number of babies who were born but also the number of siblings decline. According to the National Survey on Household Changes in 2014 conducted by the National Institute of Population and Social Security Research, the average number of siblings is 1.83, a decrease from 2.11 in 2004. It is not surprising to expect that such a decline in the number of siblings leads to changes in the allocation of resources within the family. Our data set comes from the Japanese Life Course Panel Surveys (JLPS) that followed up respondents aged 20–40 in 2007. We focus on three variables within the family: gender, the number of siblings, and birth order. Our findings show that the decision to leave home is affected both by socio-economic differences between families and by sibling composition within the family.

Film Showing in Public Spaces: Exploring an Impact of Cinema on Local Communities in Japan

This paper deals with film showing in public spaces and outdoor film screenings, and examines the relation between film showing and local communities in a case study of Tohoku area, Japan, after 2011 Earthquake and Tsunami. The paper examines how film showings have been reshaping public space and revitalizing local communities.

After 2011 Great Earthquake and Tsunami, there have been many support activities from arts and entertainment industry. Among those activities, this paper presents research on two cases of film showing in Iwate prefecture and Miyagi prefecture. In the coastal area of Iwate (the length of the coastline is about 200km), there is only one movie theater. Since May 2011, a manager of this theater has been doing film showing in elementary schools and junior high schools which are used as evacuation centers. By March 2015, he carried out film showing over 300 times. In Miyagi, since July 2011, a non-profit organization has been doing outdoor film screenings in local summer festival of Ishinomaki city. Movies are projected on the wall of a building, and folding chairs for audience are arranged at public open space which was made by tsunami. In both cases, there are various supports from movie industry, non-profit organizations, and municipalities.

Based on a case study, this paper aims to examine the role of film showing for reconstruction and revitalization of local communities. It also has a role to provide opportunities for people and communities to have cinema experience. Movie theaters also bring cinema experience, however, especially outdoor film showing provides more original experience. In other words, compared to movie theater experience, the audience of film showing in public space can have more elementary and original cinema experience.

ISHIJIMA, KENTARO* (Research Fellow of Japan Society for the Promotion of Science, lyn.isjm@gmail.com)

The Effectiveness of Hands-on Activities of AAC (Augmentative & Alternative Communication) Tools.

This presentation aims to investigate the effectiveness of hands-on activities of AAC (Augmentative & Alternative Communication) tools for patients of motor neuron diseases (MNDs). Although patients of MNDs like ALS (Lou Gehrig's disease) have difficulty in speaking or writing, they can communicate with others when caregivers are skilled enough to use AAC tools. Communication is an important human need, and patients have good reason to demand such assistance. However, caregivers may not have adequate knowledge on the subject because their credential curriculum does not prepare them for these tools. Therefore, some non-profit organizations (NPOs) have been trying to advise caregivers on how to use these tools to meet patients' needs.

Although earlier studies have pointed out that capable caregivers can use AAC tools successfully by encouraging patients to imagine using these tools, there is few studies, which deal with the process through which caregivers get capable. To improve the quality of assistance, measures to improve the caregivers' skills should also be examined.

The author analyzed the data of the questionnaires (n = 326) that were distributed to the participants of hands-on activities conducted by ICT Rescue Team, an NPO in Japan. The sex, age, and credentials of the participants were noted. They were also asked about their knowledge of the tools before the activities, comprehension after the activities, and confidence in using these tools clinically. The author used logit regression models to statistically investigate whether comprehension enhances confidence regardless of prior knowledge to measure the effectiveness of hands-on activities.

Results showed that it is possible for participants to become highly confident in using AAC tools after hands-on activities, even when they do not have much prior knowledge about these tools. This is objective evidence confirming that these activities have a positive effect on the communication needs of MND patients.

'the Right to Know Is the Right to Live': The Right to Information Movement in India

In India, the Right to Information (RTI) Act was enacted in 2005 after the people's movement demanded the right to information or the right to know, which had started in 1994 at a village in the state of Rajasthan. Encouraged by the RTI movement, many other rights-based legislative efforts such as the Right to Education or the Right to Food were set forward. Why and how was the idea of the right to information formed and rooted in people's minds during the progress of the movement? This paper examines the meaning and its implications of a slogan of the movement: 'the right to know is the right to live'. People considered the notion of the right to know primarily as a matter of the right to live rather than as a matter of freedom of expression. The movement was a part of a larger movement of eradicating corruption, which was crucially important for securing people's subsistence. This paper also presents analysis of the mobilization processes and the organizational character of the movement. Several efforts by the movement's leaders have contributed differently to the widespread popularity of the movement.

Effects of Remittances on Health Expenditure and Types of Treatment of International Migrants' Households in Bangladesh

Background: The economy of Bangladesh is characterized by remarkable progresses in the area of international migration, resulting in a huge inflow of remittances. Although a number of studies have attempted to analyze the effect of foreign remittances on household expenditure pattern, no effort has been made to critically analyze the effect of migration and remittance flow on health expenditure of migrant households. We sought to answer the questions: (1) Is there any effects of effect of remittance in the health expenditure of recipient households; and (2) Is there any effect on the pattern of treatment chosen by those households?

Methods: We analyzed the latest nationally representative data set, the Household Income and Expenditure Survey (2010) of Bangladesh. Descriptive analysis, standard micro econometric techniques were carried out. In order to distinguish the type of treatment a migrant household chooses, a multinomial logit model had been estimated. In addition, the plausible endogeneity problem of migration in estimating the model of health expenditure had been tackled by using instrumental variable method where distance from the remittance sending country was used as an instrument.

Results and discussions: Study showed that, a 1 percent increase in remittance tends to increase monthly per capita health expenditure by 50 Taka ($.65). Our estimation also found that, having a migrant membercouldhave significant impact on the type of treatment (e.g. government, NGOs, private and local home remedies) that a household will choose from. Thus international migration and resulting remittances can have significant implication towards the health status of households.

Conclusion: Given the resource constraints, the financing of health sector in Bangladesh requires careful planning and management. Being one of the highest remittance recipient countries of the world with a promising yet challenging health sector, findings of our study will direct better policy options for designing effective health sector strategies.

ISMAIL, ABDIRASHID* (University of Helsinki, abdirashid.ismail@helsinki.fi)

Transnational Somali Families and Children's Well-Being: The Case of Finland

Generation wise, Somalis are a young population, the youngest among the communities in Finland and over 50 per cent of its population is under 20 years old. However, Somali children and youth are facing a number of challenges, ranging from identity crises to lack of employment opportunity to delinquency, that are adversely affecting their well-being.

Transnational family literature studying child-wellbeing has addressed questions of how the long-distance separations between children and their parents impacted children's well-being. This paper intends to contribute to this literature by studying impact of parents' transnational ties and networks on the well-being of their children living with them in their country of immigration, Finland in our case. The goal of this study is to explore the relative impact of transnational aspects of the Somali family life on their children's well-being. The central emphasis is on how transnational engagements and networks of the family affect both the structure (divorce and prolonged inter-parental hostility) of the family and family involvement in children's well-being. Basic assumption of this study is that the structure and behavior of the family,which play a central role in the well-being of the children, is affected by the family's transnational life.

The study is based on data collected for two different projects: 1) A new four year study which investigates the experiences of Muslim, mainly Somali, women and men in Finland regarding lived realities of marriage impacted by state law and Muslim family laws as well as transnational family life. 2) A recent concluded study concluded aimed at identifying the challenges and successes in ensuring the integration of Somali immigrants in Finland, and understanding their experiences in major areas of their daily lives.

Veiling at the American University of Beirut: Religious Values, Social Norms, and Integration of Veiled Students

This study traces the history of the veil among Muslim female students at the American University of Beirut. Veiling on AUB campus has been in increase since the 1960s, and has reached its peak in the last few years. The increase in the number of veiled students is juxtaposed with the propositions of the institution's third president, and the first after it was renamed from the Syrian Protestant College to the American University of Beirut, Bayard Dodge. In Dodge's predictions, the exposure of Muslim youth to western liberal experiences would lead them to restraint Islam to their religion of birth and not of practice. Dodge also suggested that by unveiling, Muslim women would reach modernity.

The study questions the correlation between religiosity and the veil, and the validity of the hypothesis that the degree of religiosity changes with the form of the veil worn. Three prevalent veiling forms at AUB (classic, mild, and fashionable) were identified. Interviews veiled students are compared to others with non-veiled females and males belonging to different religions. The analysis serves in comparing the different social norms, religious exposure, and dress code choices. Most importantly, the larger question of the degree of integration of the veiled students at AUB is addressed, in light of the missionary history of the and the values attached to the veil in western liberal circumstances.

The major findings of the study include: 1) a correlation between religiosity and the veil, 2) a further correlation between the degree of religiosity and the form of the veil, 3) restraint in the dress code and avoidance of sharp and bright colors by veiled interviewees, 4) higher extent of participation in extra-curricular activities by non-veiled student is noticed, and lastly, 5) veiled females selectively surround themselves with a circle of friends from similar socio-religious atmosphere.

What Makes Teenagers' Addiction to the Internet Serious: On a Survey of the Problematic Internet Use of Schoolchildren in Japan

In Japan, the problem of the Internet use of young people was regarded as either cyber-crimes --- such as enticement, deception or false billing --- or as cyber-bulling among schoolchildren. However, in 2012, Japanese people began to focus on another problem: the Problematic Internet Use (PIU) or Internet Addiction. A study team of the Japanese Government (Ministry of Health, Labor and Welfare) executed a massive survey in 2012 and reported next year that about 8.1% of high school students, which amounted to 518,000 teens, were estimated to belong to the high-risk group. After this announcement, the topic of the Internet addiction became rather common on several mass media. But we have only few studies on this problem and not only parents but researchers don't know

what to do to decrease the risk of PIU. There are only few hospitals where "patients" or their parents can consult psychiatrists.

This paper attempts to investigate the risk factors of the PIU of schoolchildren. We carried out a survey in September 2015 on junior high-school children in Maebashi City, Gunma prefecture to probe relationships between students' PIU and several factors such as their values, attitudes, or behaviors. Through this analysis, we want to find out some clues to remove the risk before it becomes serious.

Shifting Modes of Incorporating Foreign Care Workers in Japan: Abe's Growth Strategy and the Intensification of Japanese Women's Mobilization As Productive and Reproductive

In Japan, the recourse to the foreign workers to deal with the ever growing needs for elderly care has been on the agenda since early 2000s. The actual change, however, has been relatively slow, due to the political reluctance to introduce foreign workers in general, but also because of the social momentum to professionalize the sector through the newly instituted Long Term Care Insurance, implemented in 2000.

It was under this circumstance that training programs for certified care workers and nurses started as part of Economic Partnership Agreements with Indonesia (2008), the Philippines (2009), and Vietnam (2014), resulting in a total of some 1,500 certificate holders over the past seven years. The figure is almost insignificant, compared to the currently estimated need for over 300,000 care workers. In 2014, more aggressive measures have been proposed by Abe's administration, with the aim of deregulating the economy and intensifying women's labor participation to revitalize Japanese economy, including three policy objectives: the creation of a new residence status within the immigration law for "care workers", the extension of technical internship program for "elderly care," and finally, the introduction of foreign domestic workers in the National Strategic Special Zones.

This paper will discuss the shifting institutional modalities of incorporating foreign care workers in Japan, the underlying stakes with regard to the growing social inequalities within Japanese society and the transformation of Long Term Care Insurance.

Mérida La Ciudad Blanca: Reflexiones En Torno La Blanquitud En Yucatán

Yucatán, tiene características históricas, demográficas y geográficas distintas a otras regiones de México, lo que ha provocado que las relaciones interétnicas se den de forma diferente a lo registrado en el resto del país. La ideología nacionalista mexicana revaloró la cultura indígena -como si ésta fuera sólo una- e identificó al mexicano como mestizo, es decir un individuo producto de la mezcla de dos "sangres": la indígena y la española. En Yucatán, en cambio, ser mestizo ha significado ser indígena maya, mientras ser yucateco significó, hasta mediados del siglo xx, ser de piel clara, de origen español o europeo y por supuesto pertenecer a una familia que por generaciones hubiese nacido en la península.

Mérida es una de las ciudades del país con más alta concentración de población indígena, poco más del 11.5% de su población habla maya. Si bien, el ser yucateco ha ido acompañado de un orgullo regional que se nutre de lo maya, de la cultura maya, la sociedad meridana marca **su** distancia respecto a los mayas contemporáneos, a quienes racializa, segrega y discrimina de muy diversas maneras. Mérida, la llamada ciudad blanca, es una ciudad marcada por el color donde es posible apreciar los fenómenos discriminatorios que en ella residen. El más notorio, pero también el más acallado, es el racismo y la discriminación hacia el mestizo yucateco, es decir hacia el indígena maya. En el norte de la ciudad viven los "blancos" o "blanqueados" y en el sur los marginados, los de tez más oscura, los de apellido maya. Este trabajo busca dar cuenta del papel que tiene la "raza", la etnicidad y la blanquitud en el imaginario de los meridanos.

The French Regional Health Agencies: Shaking the Professional Ranks, Shaping New Professional Figures?

In April 2010 the French Health administration was reformed: in each of the 22 French regions were created les *Agences Régionales de Santé*– the Regional Health Agencies from the merger of seven institutions. This reform was legitimated as a decompartmentalization and an increase of local democracy on health issues. However, it worked more in a centralization direction: it strengthened the regional institutions and weakened the former departmental units in charge with all the local health issues. This paper is a part of a political science PhD in progress.

We question the capacity of these new regional health agencies, as they result from an institutional merger, to build a common administrative culture (Peters, 2001). In this respect, a qualitative methodology (participant observation and in-depth interviews) provide empirical evidence. Our first findings seem to reveal the institutional merger as an opportunity to create new professional *positions* at a regional level. Being in charge with the preparation of the crisis local devices (Lascoumes, Le Galès, 2010) named "Plans" and with their monitoring, these agents performing some "métiers flous"(Jeannot, 2005) - "blurred occupations" - are the interface between central, regional, local levels of health administration. These positions are held by traditional civil servants (administrative, medical) occupying new positions and also by new agents recruited on fixed-term contracts. Old and emerging forms of professionalization coexist. Two notions often confront each-other: *occupation* and *duty (civil service)*. We mobilize a theoretical frame using the French sociology of institution (Lagroye), the sociology of professions (Abbott, 1988) to shed light on the new figures of health administration: the Regional Health Agencies. They are considered here as institutional figures of the "risk regulation regimes" (Hood, Rothstein, Baldwin, 2001) linking, through these new professional positions, the French State to other institutions in forms of national and international nodality (Hood, Margetts, 2007).

Older People's Use of Facebook: A Netnographic Research of an Online Community

Growing old is often accompanied by changes in social interactions, including communication patterns. There is evidence that older adults appropriate new communication technologies to maintain their independence and social connections (Wild et al., 2012). Furthermore, ICTs provide important incentive for grandparents to engage with social media to share photos and news from children and grandchildren, especially grandbabies. Considering Facebook as an emergent, global telecommunication practice, our study is focusing on Facebook by including older adults as users of this technology. Using a virtual ethnographic research (netnography) of a Facebook online community of grandparents from Romania, we analyse members' interactions, bonding, and support shared through Facebook. Netnography is a form of ethnographic research adapted to include the Internet's influence on contemporary social worlds (Kozinets, 2010) The netnographic approach allowed us to observe how the participants use Facebook, including: 1) how often they post information or communication using Facebook; 2) who they communicate with using Facebook; 3) what types of information they post or communicate about; 4) how Facebook is implicated (or not) in family bonding and communication. The results are discussed in relation to the importance of online communities in understanding everyday practices of ICT use at older adults.

Paradoxes of Social Change: Virtualization of Society, Glam-Capitalism, and Beyond

Conceptualizing social development requires new basis as expected by theorists 'global society' and 'information society' paradoxically became our past never being our present.

Globalization leads not to the 'global society' but rather toward networked enclaves of globality in big cities: Los Angeles, New York, Tokyo, Hong Kong, Moscow, London, etc. People in such enclaves experience globality as borderless sociality through intensive flows of consumer goods, technologies, migrants, money, media-generated images. Postindustrialization leads not to the 'information society' based on knowledge intensive production but to virtualization of society based on an image intensive consumption. People's social life is immersed in virtual realities of brands, image making, and communications through digital media.

Intensive commodification of images has leaded to overbranding and triviality of the virtualization strategy. That provokes shift of competitive advantages to hyper-virtuality of glamour. Now capitalism in postindustrial consumerism areas is transformed into glam-capitalism. Being since the 1930s specific life style or aesthetic form, glamour has become now rationality of newest version of capitalism. Glam-capitalism raises as producers in hyper-competitive market-place must glamour consumers and products must be aggressively beautiful to be intensively attractive for targeted groups. Value creation process now is related more to trends than to brands not only in fashion industry and show business but also in high-tech and financial industries.

Alternative movements like 'copy left' and 'pirates' violating 'intellectual' property rights challenge regime of glam-capitalism and represent the authenticity

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

revolt against hyper-virtuality of glamour. 'Anonymous' hackers and activists of the 'Indignados' and 'Occupy Wall Street!' exemplify movements violating norms and rules of glam-democracy. Reaction of glam-capitalists to alter-social movements is initially oppression and then absorption of alternative tactics as source of development. Creators of trends converging patterns of glam-capitalism and alter-social movements are on the move towards alter-capitalism.

IVANOV, DMITRY* (St.Petersburg state university, dvi1967@gmail.com)

The Past, Present and Future in the Perspective of Dialectical Theory

The dialectical negation and utopianism have enabled Marcuse to reveal the direction of modern society transformation. Utopia of 'Reason' in the 1930s was oriented to revolutionary movements. By the 1940s the rationalization thesis became affirmative discourse for organized capitalism, and utopia of 'Eros' became dialectical antithesis extracted from alternative values and life-styles of esthetic communities and hedonistic subcultures of radical intellectuals. By the 1960s the concept of desublimation became affirmative for consumerist capitalism, and dialectical synthesis of 'Reason' and 'Eros' in the utopia of 'Post-technological rationality' promoted new social movements: antiwar, feminist, ecologist, for civil rights of minorities. Since the 1990s post-technological rationality is affirmative discourse for postindustrial capitalism.

Marcuse's works provide us with model of social change through dialectical negation: marginal groups and utopian movements oppressed by dominant structures of the present are protagonists of the future dominant structures and patterns of agency. Our present is postindustrial capitalism based on virtualization of production and consumption. Social life is alienated into virtual realities of branding, image making, and digital networking. Intensive commodification of images leads to triviality of the virtualization strategy and provokes shift of competitive advantages to hyper-virtuality of glamour. Being since the 1930s specific aesthetic form, glamour has become now rationality of the newest version of capitalism. Glam-capitalism raises as products in hyper-competitive markets must be aggressively attractive and entrepreneurs must extract profits more from trends than from brands.

Dialectical negation now is driven by movements representing the new utopia: authenticity revolt against hyper-virtuality of glamour. 'Pirates', 'anonymous' hackers and activists of 'occupy' movements violate 'intellectual' property rights of glam-capitalism and rules of glam-democracy. Reaction of glam-capitalists to alter-social movements is initially oppression and then absorption of them as sources of creativity. Creators of trends converging patterns of glam-capitalism and alter-social movements are on the move towards alter-capitalism.

IVANOVA, ELENA* (Institute of Sociology of the Russian Academy of Sciences, ele6248@yandex.ru)

Engineering Activities in Russia: Historical and Methodological Approach

Features of engineering activities in Russia and processes of formation of engineering dynasties have been considered in a multidimensional social field, taking into account the influence of the state and the market in the context of historical change.

Dynasty as a special reality of social life is studied on the basis of a multidisciplinary approach (sociology, history, economics, and psychology).

Professional continuity in the field of engineering is, first, the choice of a particular educational strategy that will enable repeat the social position of the ancestors, secondly, the choice of a specific life strategy, which can be viewed from the standpoint of inheritance from our ancestors, and, thirdly, the choice of intellectual strategy, which provides the intellectual continuity in the form of preserving scientific schools and technology trends.

Identification of the social characteristics of engineering dynasties at different stages of historical development of Russia, as well as evaluation of the impact of socio-economic and political conditions of the existence this phenomenon are an important area of sociological research.

Note the following main factors of development of engineering activities: the creation of an effective system of higher engineering education and provision of the necessary social and economic conditions for the adaptation and professional development of graduates in certain professional circles.

Engineering dynasties in Russia were part of the professional elite until the 90-ies of the twentieth century. At the present time in conditions of economic and social instability there is a significant reduction of the role and importance of professional continuity, social, economic and cultural statuses of the engineer.

At the federal level does not stipulate mechanisms assigning the status of a professional engineer, rights, duties and responsibilities of engineers, there is no formalized system of standards and rules of professional engineering activities.

Postgraduate's Image about Future Scientific Work

Statistical data demonstrate that the number of postgraduate students in Russia has enlarged three times from 60 000 in 1996 to 130 000 in 2014. There were 13 190 postgraduates in Saint-Petersburg in 2014. Now, sociologists have not got adequate information about their views which are constructed through the process of postgraduate education. According the phenomenological methodology in focus of our attention are educational process as biographical situation of postgraduates, their action, motives and results, images about scientific work and necessary qualities.

The study employed data of expert survey which took place in autumn of 2014. Participants were recruited through e-mail invitation sent out to 21 Saint-Petersburg Institutes of the Russian academy of science and 4 Saint-Petersburg State Universities. We analyzed 151 responses, what is 2.0% of general community in SPb. Three groups of postgraduate students were chosen: natural sciences postgraduates (physicists, geographers, chemists, biologists, physiologists etc.) (n=48); technical sciences postgraduates (engineers, constructors) (n=50); humanities postgraduates (economists, sociologists, philologists, linguists etc.) (n=53).

Problems of formation of new generation of scientists are constructed as early as in the process of post-graduate education. Analysis of the motivation to enter postgraduate school and beliefs about research activities based on common knowledge about science, resources and effectiveness of work and problems it affecting, as well as some social characteristics allow obtaining a portrait of the "typical postgraduate student". Based on the analysis of the responses to the question about possibilities of gain in science, one can conclude that the postgraduate students think that scientific work as of a primarily individual, creative, well-paid, conferring scientific worker with a high social status "scientist", free from formal norms, and therefore allowing free mode of work that does not require physical effort.

IVERSEN, CLARA* (Uppsala University, clara.iversen@soc.uu.se)

Raising Issues of Risk Behavior in Medical Treatment Consultations

Medical interventions evaluate and deal with uncertainty and risk in relation to individual patients' health. In addition, they may also include measures to protect the general public against consequences of individuals' conditions. Such measures may be inoculation, anti-smoking campaigns, or assessments of patients' risk behavior. The present study explores how the double agenda of helping individuals and assessing their risk behavior plays out in medical interactions.

The empirical case of this presentation, video-recorded treatment consultations between Obstructive Sleep Apnea (OSA) patients and nurses in Sweden, takes place after a diagnosis is established and doctors and patients have agreed to try a specific treatment. The aim of the encounter is therefore to personalize the treatment and provide a basis for follow-up rather than gaining new information about the patient's problems. In addition, the consultations include the less patient-focused goal of assessing patients' risk of falling asleep. OSA is the world's most common sleep disorder and involves patients' respiratory airways collapsing during sleep. This often results in recurrent episodes of excessive daytime sleepiness. Consequently, the Swedish Transport Administration states that untreated OSA patients should have their driver's license confiscated.

The study uses conversation analysis to examine how nurses and patients manage the implications of questions concerning the risk to fall asleep involuntarily. The analysis shows nurses conducting a balancing act between risk work on different scales: gaining information as agents for the state and promoting social solidarity with the patient in front of them. It further shows how the participants raise and attend to expertise and experience as different epistemic domains with accompanying rights and responsibilities. I argue that an understanding of risk work benefits from taking into account how different agendas, epistemic responsibilities, and statuses are negotiated in social interaction.

IWAI, NORIKO* (JGSS Research Center, Osaka University of Commerce, n-iwai@tcn.zaq.ne.jp)
SHISHIDO, KUNIAKI (Osaka University of Commerce)

The Impact of the Fukushima Daiichi Nuclear Accident on People's Perception of Disaster Risks and Attitudes Toward Nuclear Energy Policy:Regional Differences and Distance from Nuclear Plants

Multiple nationwide opinion surveys, carried out by the government, major media (national newspapers and NHK), the National Institute for Environmental Studies, and the Atomic Energy Society of Japan, have revealed that the Fukushima nuclear accident have heightened people's perception of disaster risks, fear of nuclear accident, and recognition of pollution, and have changed public opinion

on nuclear energy policy. The gap of opinion on nuclear energy policy between specialists and lay people has widened after the disaster.

The results of 2012/2015 Japanese General Social Survey data show that the objection to the promotion of nuclear energy is strong among females, and weaker among young males and the supporters of the LDP. This is similar to the data collected after the Chernobyl accident. Among people who live in a 70km (80km in 2015) radius of nuclear plants, those who live nearer to plants tend to evaluate nuclear disaster risks higher. Distance from nuclear plants and the perception of earthquake risk interactively correlate with the opinion on nuclear issues: among people whose evaluation of earthquake risk is low, those who live nearer to the plants are more likely to object to the abolishment of nuclear plants. It is also found that the nuclear disaster has changed not only people's attitudes but also people's behavior. People have come to try to save electricity in addition to turning off electrical equipments frequently. It has led to the 5.1% reduction of electrical demands over the previous year in 2011, another 1.0% in 2012, 0.4% in 2013 and 3.0% in 2014. The level of commitment to energy saving is found to be correlated with opinion on nuclear issues: 80% of the proponents of nuclear reactor decommissioning have tried to reduce electrical consumption. The reduction of electrical demands has been people's manifestation towards the nuclear energy policy.

IWASAKI, YOSHITAKA* (University of Alberta, iwasaki@ualberta.ca)

Leisure and Meaning-Making: The Pursuit of a Meaningful Life through Leisure

Humans seek the pursuit of a meaningful, enriching life.[1-5] Meaning-making refers to a process by which a person derives meaning(s) from an activity[6] where leisure provides opportunities for meaning-making,[7-9] for example, through creative leisure[10] and spiritual leisure.[11] My paper will present a current understanding of the ways in which leisure promotes meaning-making that has implications for the field of leisure studies both conceptually and practically.

A recent literature review[12] based on 363 research articles linking leisure[13-18] and subjective wellbeing (SWB) identified meaning-making as a core mechanism to promote SWB. Meaning-making through leisure represents a freeing source for experiencing "infinite, liberating effects of leisure,"[19] while artists showed experiential (e.g., expressive) and existential (e.g., meaning, vitality, identity, & achievement) meaning construction of flow.[20] An integrative review of the literature highlighted culturally contextualized processes of meaning-making through leisure that involve both "remedying the bad" and "enhancing the good" in people's quest for a meaningful life.[7] Broadly, the role of leisure in meaning-making is line with an increasing emphasis on "positiveness" in the social sciences.[21,22]

Importantly, the role of leisure in meaning-making has practical implications. Creating a life of meaning was identified as a primary role of therapeutic recreation in supporting clients with challenges/limitations.[23] Living a life of meaning was a key theme found in research on leisure and successful aging[24] and on posttraumatic growth for people with spinal cord injury.[25] Not only was the role of leisure in meaning-making identified among elders with dementia through enhancing enjoyment, identity, and autonomy,[26] but such role was also shown among immigrants through promoting self-realisation, self-expression, and connectedness.[27,28] A recent study with adults with mental illness found "an inspiration for an engaged life" as an overarching leisure meaning-making theme.[30] Such leisure-generated meanings appear particularly salient to marginalized populations, including persons with disabilities and ethnic minorities globally.[11,29]

Housing, Slums and Urban Poverty in North-Western India: Sustainability in Question?

This paper seeks to examine the status of vulnerable sections in Urban India in General and the interlinkage of Housing, Slums and Urban Poverty in particular. It also attempts to focus these issues in the Regional Indian perspective and its comparative position in the northwest region and its states. In the housing condition it explores definition of houseless households, and the houselessness of the vulnerable Scheduled Castes population. The dimension of housing shortage of the vulnerable categories like the economically weaker section, low income groups has also been explored. The description is based on the secondary data, report of the various technical groups and empirical studies. The housing shortage for 2012 at All India level for the vulnerable section is placed at 18.78 million; the ingredients of housing shortage include the non-serviceable Kaccha houses, Obsolescent houses and Congested houses. The major focus on the housing condition is also analysed with respect to the weaker section located in slums in different regions, Northwest Region and its different states. A comparative picture is pre-sented of the acute situation of slums in different regions and their accessibility to the various social amenities. The area of concern of slum dwellers is based on the vulnerability assessment of slums in metropolitan cities like Ludhiana, Faridabad and Srinagar. In the discussion of poverty situation in different regions the sociological dimension of Culture of Poverty, conditions of vulnerability and its perpetuation has been specially examined. Finally, the sustainability issues with respect to the interlinkage of housing, slums and urban poverty have been raised with the possible solutions.

Social (Im)Mobility and Subjective Mobility: Peruvian Migrants in Sao Paulo, Brazil

Understanding social mobility has been the focus of economic migrations studies, but the attention has been on material conditions of migrants' incorporation. There is little on how individuals interpret their experience and their social mobility in the country of reception. This article analyzes how Peruvian migrants interpret their experience and social mobility in Brazil. Using the intersectionality framework for analysis and relying on ethnographic fieldwork and biographical-narratives, this article states that despite precarious work conditions, uncertainty and objectively immobile trajectories, migrants can perceive their experiences as successful cases of social mobility.

Brazil has become the core of South America's migration system as a result of multiple intra-regional migration flows, caused by the significant demand of labor that has accompanied Brazil's economic growth in recent years. In this context, Sao Paulo, the most important urban center in South America, is now a magnet for international migrants. Over the past 30 years, a particular transnational circuit emerged between the Peruvian Andes and Sao Paulo. The majority of Peruvian migrants, from rural areas and peasant families, face a paradox situation: they embody a regular migratory status and high economic precarity. Although they easily have a regular residency status in the context of MERCOSUR arrangements, they incorporate to the labor market mainly through the informal sector. Starting as street vendors, workers in the garment sector or employed by other Peruvians under a debt bondage regime, the pathway to a secure job may take years.

However, I argue that even immobile trajectories can subjectively be perceived as successful. Peruvian migrants emphasize narratives of entrepreneurships and see as temporary conjunctures their day-to-day struggles. In fact, social mobility perceptions lays not only in the socio-economical determinants of reception context, but also into the capacity of re-signifying social class, ethnicity and status from origin.

Catalan Language and Social Representations: Affective Experiences

The theory of social representations postulates that we construct social knowledge of situations, groups or objects that are significant, conflictive or relevant in the social reality. This knowledge is determinant in understanding where people stand in relation to object of representation, to know how the emotions attached to this object are socially modulated and which behaviours it influences. On a social level, language is an especially significant object; it is relevant to the social construction of reality and sometimes a source of conflict in intergroup relations. The relationship between groups and languages is fundamental to the development of identities, to relations between groups and to social cohesion in a territory. That is why studying the social representation of the Catalan language is important. Which social image has been created and, more specifically, which emotions or affective experiences are associated with Catalan? The data presented is related to this last objective: the emotions and affective experiences associated with a hypothetical situation of Catalan. Our sample consists of 364 university students from different parts of Catalonia. We use the free association of words with three different questions. The first is answered by the entire sample: **write 12 words you associate with the Catalan language**. The next two questions asks about feelings in two different ways. **Question A asks students: *in 12 words, write how you would feel if Catalan disappeared***. **Question B asks them: *in 12 words, write how you would feel if they made Catalan disappear***. One part of the sample answers question A and the other part answers question B. One hypothesis is that differences between the responses to the two questions will not differ; another is that affective experiences are organized into positive and negative feelings and into feelings that favour either an active or a passive response.

Neuroadaptability of Persons with Exceptionality in the Workplace

This paper explores the work experiences of 11 differently-abled individuals who are gainfully employed in both small- and medium-scale enterprises. It looks into their work environment specifically in terms of their relationships with neurotypical co-workers and their own neuroadaptability. The study made use of in-depth interviews, sociometric tests, and time allocation technique.

The results of the study indicate that people with mental exceptionality can perform the tasks expected of them. Despite their limited cognitive capacities, the subjects were seen to be relatively productive, as can be gleaned from the time allocation study. This signals that people with mental disability can indeed be employed, provided that the work environment is receptive to their limitations.

All of the subjects were described by their co-workers as being responsible and committed. The time allocation study results likewise indicate that the subjects were indeed able to perform their expected tasks, although there were a few instances in which they failed to do so, unintentionally or otherwise.

Most of the neurotypical workers are not aware of the conditions of the cases. In general, the co-workers did not show a negative attitude toward the co-workers with exceptionality. To be able to achieve a friendly work environment for persons with exceptionality, neurotypical co-workers must be made aware of the clinical conditions of their mentally challenged co-workers. Neurotypical co-workers need to understand the behavioral manifestations that come with autism and mental retardation, and they must be acquainted with ways in which they can handle and manage such behaviors.

Sources and Consequences of Happiness:the Sociocultural Constructs of Happiness Among Indigenous Hanunuo Mangyan Women

This paper describes the sources and consequences of happiness among Indigenous Hanunuo Manyan Women in the Island of Mindoro, Philippines. Data of this study is culled from interviews with 10 selected Mangyan women. The paper will discuss how the Mangyan women understand the concept of happiness, its sources, and its consequences in relation to their wellbeing. The paper shall also explore how happiness is manifested in various forms including but not limited to cultural artefacts such as rituals, poetry, dances, and other forms of material culture. The focus of the paper though is to highlight the socio-cultural aspects of happiness. Happiness in many indigenous societies is something that is shared collectively. For example, the Ambahan (oral poetry) of the Mangyan has to be recited along with members of the community. During recitation, people talk and laugh together. In the Ambahan, personification is used to describe the "self" as he/she relates to different situation including happiness, love, and death. This paper contends that happiness is both ephemeral and perpetual. Perpetual happiness is felt when they experience sound health, bountiful harvest, harmony with nature, ownership of land, and ability to eke out a living. Ephemeral happiness emanates from their relationship with other people

How Much Need for Truth within Conflict Resolution?

How much need for truth within conflict resolution?

During my studies over Transitional Justice in Argentina, I came across an original mechanism of prosecution: the *Juicios por la verdad*. They were a criminal procedure adopted in the Nineties, which aimed at the mere discovery of the truth. Based only on the enquiry phase, these proceeding-like instruments lacked one of the trial's goals: the injunction of a penalty to the perpetrator of a crime. The victims' families (called secondary victims) turned to the judges, claiming for the discovery of past atrocities and the whereabouts of the missing bodies. They demanded the satisfaction of their right to know the fate of their disappeared beloved, as well as that to bury and to mourn them.

Criminal legal reasons, the existence of amnesty laws and legal pardons, pushed the families to ask for truth, rather than for justice. Nevertheless, along with Argentina, other countries distinguished themselves for the same strain for truth, within the context of Transitional Justice. The spread of Truth and Reconciliation Commissions in South America as well as in Africa testifies an increasing attention towards the establishment of truth, as part of the procedure to solve a conflict. Involving the personal and the collective sphere of interaction, the process of truth revelation provides the community with a shared narrative, leading towards a nation-building process. On the other hand, the victim finds an answer to what Procedural Justice identifies as the need to rationally control emotions, through the acknowledgement of the crimes and their motivations. This rationalisation comes from the human desire to seek closure: the enlightenment over the fate of one's beloved delivers the victim from the anxiety of uncertainty.

A procedure that supports the broad discovery of truth, potentially through dialogue between the parties, will better satisfy this victim's need.

Politics of Recognition and Its Intersection with Social Stigma - a Study of Construction of De-Notified Tribes in Post Colonial India

What happens when recognition intersects with stigma? This question remains valid with respect to De-notified Tribes in India. De-notified Tribes in India emerged as an identity for the recognition of the communities which were once known as Criminal Tribes. The project of labelling 198 communities as criminals was managed by Colonial Rule by introducing Criminal Tribes Act (CTA), 1871, which implied that these communities were criminals by birth and practiced crime as a profession. In postcolonial India, in 1952, the repeal of CTA took place, which officially decriminalized the so called criminal communities and provided them a new recognition as "De-notified Tribes".

The concepts of stigma and recognition remain applicable to the case of De-notified Tribes where one can discover that the process of stigmatization of these communities as criminals was initiated during the Colonial Rule through CTA, 1871, whereas their recognition as equal citizens of the country took place in Post Colonial India since 1952 through De-notification. However, presence of DNTs in the society still stigmatizes their identity as criminals in contemporary India; such situation provides a scope to interrogate whether the state follows a process of recognition in response to the practice of stigmatization.

In view of the described scenario, this paper intends to examine the process of recognition in response to the process of stigmatization with respect to construction of De-notified Tribe identity in Post Colonial India. The paper would also try to comprehend the impact on identity formation when both the phenomena (Recognition & Stigmatization) exist simultaneously, as this remains the case with DNTs. The research shall also attempt to analyse whether recognition in Post Colonial India has contributed to deconstruction of social stigma on De-notified Tribes.

Social Trust and Demand for Redistribution. Is There a Crowding out Effect?

The debate about the relationship between social capital the welfare state has produced contradictory results for a long time. The crowding out hypothesis states that the growth of the welfare state would erode social capital, as the action of the state leave no room for non-regulated spontaneous cooperation. In sharp contrast, the crowding in hypothesis states that there is virtuous circle between the size of the welfare state and the stock of social capital in a particular country, since generous welfare states (specially those relying on universalistic programs) will produce a particular sense of fairness and solidarity toward fellow citizens. Yet, the empirical evidence testing the explanatory power of these theories is mostly inconclusive. To further our knowledge of this puzzle, in this paper I focus specifically on the relationship between social trust and preferences for redistribution at the individual level in a sample of European countries belonging to different welfare state regimes. In order to overcome the potential problems of endogeneity between social trust and redistributive preferences, and departing from previous studies, I use an instrumental variables approach. Results indicate that social trust has a negative impact on preferences for redistribution but this relationship varies substantially across institutional settings.

'Knowing Oneself ' : A Case of Spiritual Tourism

The global tourism industry has been changing since the last few decades. Newer forms of tourism are being vigorously promoted by not only the individual players but also by the governments. Terms such as eco-tourism, responsible tourism, agro tourism, and even volun-tourism have become the buzz words. A new emerging trend is "spiritual tourism" and it is being taken up very seriously by governments, state tourism authorities, even the United Nations agency responsible for global tourism - the UNWTO. In 2013, UNWTO convened the

***** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

1st International Conference on Spiritual Tourism for Sustainable Development in Vietnam.

In an age of materialism and endless consumption, what has prompted the interest in taking out time to explore the 'mind, body and spirit'? The traditional tourism (religious) in India connected the people with God whereas the new spiritual tourism offers to connect them with themselves. The new age travelers during their leisure time look for experiences that lead to self realization, strengthening of inner self, discovering one self and the world around. Increased urbanization, stress at work, stringent timelines, chaotic lifestyles, long hours at work have been found to be some of the reasons for burnout of young professionals (yuppies). The players in the tourism market have been quick to capture this opportunity and many sites have come up which offer 'spiritual vacations'. Such "spiritual vacations" may become a catalyst that brings greater enlightenment to the individual, increased understanding between different cultures and may even help to foster an emerging spiritual renaissance.

The paper attempts to examine the reasons for increased desire for spiritual leisure and the prospects available to satiate it.

Globalization, Media and Literature: An Enquiry into the Role of Media and Literary Institutions with Special Reference to English Language and Translation Practice

It was initially predicted that globalization would have a particularly positive impact on literature for writers in smaller nations writing in less popular languages. Publishers and writers alike hoped that globalization might break down barriers of borders and language, opening up new avenues in the process. Has that really happened? Or has globalization deeply enabled the writers and their ability to have their work published in new countries and translated into other languages? The relation between globalization and literature can be understood in terms of the role of media and literary institutions. English language and translation practice are important tools or medium in expending this connection. The impact of globalization on literature is manifold, with all its facets. On the one hand, the World Wide Web (www) allows even greater access to literary texts while on the other hand the publishing industry itself become more globalized and consolidated into multinational media conglomerates. The present paper discusses the various impacts of globalization on their work – good and bad; expected and unexpected with special reference to English language and translation practices in developing countries like India.

Assessing the Difficulty Level of the Curriculum: Chinese Students' Perspectives on the New Zealand Diploma in Business (Level 6)

The objective of this study is to explore the initial expectations of Chinese students and to enquire into their perspectives on the difficulty level of the New Zealand business curriculum (Level 6). The study also reveals the factors underlying their academic achievement. On the basis of the findings, this study summarises the internal reflections of the Chinese students regarding international education. The methodology consists of a qualitative study applying an explorative approach. Students from one Private Training Establishment (PTE) studying the New Zealand Diploma in Business (level 6) and academic staff are from the same institute were sampled for this research. Two different questionnaires were used to collect information from participants. To analyse and interpret the data, the 'thematic analysis method' has been used in this study. The findings reveal that the students' initial perceptions are mostly influenced by their own culture and familiar educational settings, whereas perceptions on the difficulty level of the course reveal an additional understanding of a foreign culture. The results of the research can help educators to understand learners in greater depth and may assise curriculum designers and policy makers to consider the cultures and values of target groups containing a large numbers of international students.

Neither "Petty Bourgeois" Nor "Outsiders": Self-Employment Heterogeneity and Political Alignments

This study aims to provide theoretical and empirical clarity on whether people in "new" and precarious self-employment support the same political parties as those in traditional forms. Theoretical clarity is needed as the voting literature predominantly perceives self-employment in terms of class-based theories or insider/outsider theories, i.e.: as a privileged grouping with shared interests as (potential) employers. Alternative perspectives, looking into the heterogeneity of self-employment, and focusing on self-employed "outsiders", have received far less attention. Empirically, quantitative data is needed: Previous voting studies have not been able to differentiate the self-employed, either due to the lack of relevant indicators or because of low-N problems. Focusing on the Netherlands, this study addresses these shortcomings by collecting and analyzing unique survey data among over 800 self-employed without employees, using the Solo Self-Employment Panel. The Netherlands are an important case as the recent rise in solo self-employment is among the strongest in Europe.

JANSEN, TILL* (University of Witten/Herdecke, till.jansen@gmail.com)

Beyond the Ontology of the Ontological Turn

According to Aspers (2014), the ontological turn lacks consciousness about its own ontological assumptions and does not theorize ontology adequately. It starts with a whole ontology of actors and practices and other theoretical elements that are taken for granted. Ontology is reduced to the social construction of actors – what basically makes the ontological turn a new version of social constructivism. Accordingly, the ontological turn today is not able to actually do what it claims: proposing a sociology beyond classical dualisms, as it is caught within its own ontology: "Such an approach will do little but perform ontology" (p.4).

However, the notion of an ontological turn may offer what it aims at, if we build a theory upon the very notion itself and do not think of ontologies as some part of a bigger (scientific) ontology. However, this would mean to build a theory of the social without an ontology of the very subject – which leaves us only with the possibility of a purely formal theory. Drawing on Hegels and Gotthard Günthers work on logic, we may conceptualize social order as compounds of closed, yet interconnected and self-animated logical spheres (contextures), each of which displays a positive side (ón) and a negative side (lógos). As contextures are conceptualized ontologically indifferent, they avoid e.g. the distinction of immateriality and materiality, language and world. Furthermore, they would not be something produced by actors. Rather an actor would be regarded as a such a self-animated ontology – which could empirically be anything, be it human actors, ghosts, machines, organizations or hybrids that produce their own order. In consequence, we would not study how human actors struggle with ontologies, but how ontologies struggle with themselves and each other. The human actor would only be one empirical form of such an ontology.

JANSEN, TILL* (University of Witten/Herdecke, till.jansen@gmail.com)

Towards a De-Ontologized Notion of Society

One of Niklas Luhmanns´ main theoretical aims was to build a de-ontologized theory. However, the very core of his theoretical design, the famous assumption that there are systems made at the beginning of "Social Systems", proofed to be the root for such an ontology of the social: His theory of society proposes a clear-cut set of systems that are thought of as existing, having structures, containing center and periphery. Luhmann ends up with a theory that in a certain way is the opposite of the theoretical design he aimed at. His later preference for other theoretical foundations (e.g. George Spencer-Brown, Gotthard Günther) can be regarded as a response to the shortcomings of his initial concept of social systems. However, his theorizing never fully left the solid ground of this very concept.

This raises the question for a new foundation of a theory of society that offers a higher degree of de-ontologized thinking. I would like to propose strengthening Günthers notion of polycontexturality that has been partly adopted by Luhmann, who is using it as a description for functional differentiation. Drawing from the idealist tradition (Fichte & Hegel), Günther formalizes social relations. Instead of assuming an ontologically fixed entity as social or psychic systems, he starts with the immediacy of being and reflexivity that does not have to be given a fixed ontological place but is thought of as logical area (contexture). Starting from this purely formal concept he develops a theory of multiple reflexive positions that link up to what he calls compound-contextures. From this perspective a theory of society would be less clear-cut and much more dynamic. The ontology of a society consisting of orderly function systems would give way to a vibrating notion of interlinked, ontologically not defined reflexive spheres.

The Demand for Equality in the Living Wage: Exceeding Calculation and Cooptation.

This paper is grounded in empirical research undertaken on a local Living Wage Campaign at the University of Auckland and seeks to draw from this particular site some fundamental problems and limitations that are equally significant to political organising around wage labour in general. This is not just a case of contractual disputes within particular sites of work and the negotiation of working conditions therein. Rather, within these particular struggles universal principles for determining social and economic value are questioned and contested. Immanent to existing systems of wages and the notions of value they express are the operations of inclusion and exclusion which universally characterise the dynamic of capital to count and differentiate. This dynamic is fundamentally governed by a logic of inequality. In failing to situate the living wage within the labour-capital relation, politics premised on universal principles of equality and justice are susceptible to corruption and cooptation in operations of exclusion.

To escape this containment of equality, this paper draws on the thought of Alain Badiou to formalise the counting operation of capital. It aims to demonstrate how Living Wage campaigns are at risk of reproducing and further entrenching existing systems of counting value and appearance in disqualifying some workers from legitimate claims to a living wage. On the other hand, however, it argues that there exists a demand for equality at the heart of the living wage claim that is always in contradiction with the logic of capital. This demand contains the possibility of a political truth in antagonism with the conditions in which these political goals could be realised. This paper ultimately seeks to establish a grounding upon which we can think what is possible for wage labour anew, from a decided position of equality that refuses to concede to the compulsion of capital to count.

Muslim Youths and the Effects of the Social and Poliitical Change Towards the Birth of a New Generation

The islamic society is knowing as other societies, many changes wich affect all the social, political, valuable, economic, and cultural manners.

The most affected by these changes are youths. Many researches and studies worked hard in order to understand and clarify the key of this change. There are at least two famous studies of this topic: on the first hand : one thinks that all

these changes are a result of the west-blow on the Islamic world. (the conspiracy theory).

On the other hand, the second reserchers refers in their analysis of the social structures to the deep reasons in society which leads to many changes. The most important reason is that the change of the youths's view towards the globe due to objective factors.

Therefore, having a new young generation which leads today's political and social change.

In this context, the research inclines to the second hypothesis which thinks that the changes that happend withe Arabic muslim societies were not at random, but due to objective factors affect mostly the muslim youths like :
- The accelerating and developing of the social change.
- The democracy and leberalism development.
- The educational revolution (the access to knowledge).
- The increasing of satisfaction in the live-world.
- A developed gronthing of globalisation (common awareness of vital issues).
- Anthority change (in the directions of nonviolent change).
- Demographic change and its relation with having a new youths'generations.

For all what have been said, i think that the big movements of change have been interacted to come out with a new youths' awareness.

More than that, it is an expression of a new muslim arabic personality with a collection of global and international values, namely, self-respect, liberty, justice and dignity.

The Sociology of Religious Transformations Individual Religiosity Among Moroccan Youths As a Case Study

The religious field is witnessing many changes in Morocco, as is the case in a group of countries. By providing an insight into many transformations. we present a number of indications related to the religious field in Morocco as it has been recently characterized by a quasi-break between producing and reproducing the religious values. Typically, this refers to the ending of the monopoly over the religious authority and the emergence of new leaders and elites who now manage to compete with the official religious discourse. However, they contribute to a partial break down of traditional cultural structures and face difficulties reconstructing new ones. This has been the result of a remarkable presence of the value of the individual over the group, accompanied by a growing role of media and technology and easy access to the information in shaping youth's new tendencies to employ reason and improvisation of attitudes to decide their religious inclinations. All this has immensely contributed to changing the religious discourse through a remarkable appearance of diverse religious and moral references in a way that pushed some sociologists to call it "a market of religiosity" that contains a wide range of options for consumers who pick and choose among multiple and new religious patterns.

In an attempt to examine the religious transformations in Morocco, we have conducted a survey over 460 male and female youths (aged from 18 to 35 years old), in a rural and urban region (City of Sale near Rabat), with the help of statistical data provided by the high commission for planning (HCP), depending on the targeted sampling method and departing from the main hypotheses: To what extent has diversity in religious references affected the emergence of the individual religiosity among the Moroccan youths, and what are its main aspects?

Education and longevity: a demographic perspective

In the second half of the 20th century, the advances in human longevity observed have been accompanied by an increase in the disparities between countries and regions. This variation can be explained using the convergence-divergence framework, which suggests that each major epidemiological change induces a divergence in mortality trends. Historical evidence indicates that the divergence phase is eventually followed by a phase in which mortality trends converge. Similar divergence-convergence stages related to epidemiological transitions can be observed in subnational groups within countries. The most advanced countries and population groups with the highest life expectancy levels can be regarded as vanguards who are preparing the way for others to achieve higher levels of longevity. Education is one of the strongest predictors of life expectancy. Scarce empirical evidence suggests that both relative and absolute mortality differences by education within countries have been increasing, even in the most developed and egalitarian countries. Such studies shedding more light on the changing mortality patterns of educational groups may provide new perspectives on human longevity and inspire further discussion about the possibilities for ex-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tending human life expectancy under the current macroscopic conditions at the national level. Using a demographer's perspective, the paper provides new evidence and insights about the persistence of longevity advances of high education groups in developed countries.

Factorial Surveys in Social Psychology: Justice and Impartiality

This paper develops a framework for studying impartiality in the four main processes of distributive justice -- the Just Reward Process, the Actual Reward Process, the Justice Evaluation Process, and the Justice Consequences Process -- proposes a method for studying two kinds of impartiality in the Justice Evaluation Process -- framing-impartiality and expressiveness-impartiality -- and reports the results of three factorial surveys carried out among college undergraduates in the United States. Framing-impartiality means that the Observer frames rewards (as goods or bads) in the same way for all Rewardees. For example, if an Observer frames a reward as a good for females and a bad for males, that Observer lacks framing-impartiality. Expressiveness-impartiality means that the Observer expresses a given magnitude of the Justice Evaluation with the same emotion for all Rewardees. For example, if an Observer judges two Rewardees as exactly equally underpaid but then shouts one of the Justice Evaluations and whispers the other (identical) one, that Observer lacks expressiveness-impartiality. Understanding these forms of impartiality is important because their absence could destroy the good effects of impartiality in other elements of the justice situation, such as the Just Reward Process. Identifying these forms of impartiality requires sharp tools, and in this endeavor the factorial survey is uniquely useful. Preliminary analyses of the data indicate that framing-impartiality is universal but that sizable proportions of respondents fail expressiveness-impartiality. Future research might explore these new forms of impartiality in representative samples of adult populations across several countries and with respect to other rewards, such as grades, bequests, and time in prison.

JASSO, GUILLERMINA* (New York University, gj1@nyu.edu)

Two Types of Formal Generative Mechanisms

This paper explores two types of formal generative mechanisms. Both are useful for the broad array of substantive generative mechanisms, at all levels of analysis, that lie at the heart of sociology and social theory.

Outwardly the two formal types look the same. Each has two parts, a small first part containing the premise(s) or assumption(s) and a large and growing second part containing deduced implications.

But inwardly they differ. In Type 1, the assumptions are known to be true, they may even be self-evident; or the assumptions may describe a set of arrangements under human or institutional control. Thus, the implications must be true. In Type 2, the assumptions are what Popper (1963:245) called "guesses" about the way the world works. The implications are testable, falsifiable predictions. If the predictions survive rigorous empirical test, such tests constitute evidence that the real world may resemble the world postulated in the guesses.

Thus, although the deductive apparatus is the same in both types, the two types have different properties and operate differently. Importantly, they lead to different empirical questions and tasks. In the Type 1 mechanism, the empirical task is to assess the conditions under which the assumption holds; deduction tells us that if the assumption holds, then the deduced implications must be true. On the other hand, in the Type 2 mechanism, the empirical task is to assess the validity of the predictions; the empirical status of the predictions tells us whether the assumptions are a faithful representation of the real world.

For concreteness, the paper provides an illustration of each of the two types, drawn from the status model (Sørensen 1979) and the wage-setter model (Jasso 2009). Close examination of the two illustrations increases our understanding of the two types of mechanisms, as well as of the embedded causal relations.

(How) Does Feminist Scholar-Activism at the United Nations Pay Off?

The United Nations (UN) continues to provide a stage for a diverse global women's movement and the production of global gender equality norms that, if utilized, advance gender equality in its member states. This paper focuses on how academics, i.e. feminist scholar-activists, navigate this forum of global policy development. The organization Sociologists for Women in Society (SWS) serves as case study, as some of its members have sought to influence UN policy construction through advocacy at the annual Commission on the Status of Women (CSW)

and to increase the visibility and applicability of feminist sociology in international policy making. In this paper I focus on themes that emerged from a sub-sample of in-depth interviews with current or former UN scholar-activists within SWS from a larger ethnographic study (2009-2012), and examine experiences of SWS members' engagement with UN politics and policy development since the mid nineties. Based on interviews, observations, and archival material, I trace the beginning of SWS' engagement with the CSW, and present personal benefits and challenges of members' transnational activist work. SWS does justice to its mission of serving as an activist organization through its work in the global arena but scope and depth of influence remain limited and contested.

Kinematics of Moto—Mobility: Women, Motorcycles and Social Acceleration

In this study, based on a qualitative research on women from Bucharest who ride motorcycles, we seek to present an analysis of the sociologist Harmut Rosa concept of *social acceleration* which refers to the constant speeding up of technology, social change and rhythm of life. We argue that moto-mobility is a new dimension of social acceleration. Contrary to Rosa's view, who thinks that motorcycles are the standpoint of modernity's need for speed and constant motion, we argue that the social kinematic of motorcycling is an example of a decrease in social acceleration, no matter how high is the actual acceleration and speed of the machine. Using date gathered through interviews and conversations with women motorcyclists, we seeks to study the paradox of high speed machine and reduction of social acceleration, as motorcycles are used as a way of social relaxation from the societal norms.

Diagnosis of Science Research. Discussion from the Science Policy Perspective

The presentation is going to investigate science from the European Union perspective and next more specifically refer to the Polish case study. The research is seeking answers to the following questions: a) what is/what are the model(s) of science in the contemporary European Union ? and consequently b) what is the understanding of science based on various discourses?

The suggested presentation is an ongoing PhD research. The main research problem is to conceptualize and empirically reconstruct the understanding of science. The research is based on the three steps of analysis: first one includes the methodology of grounded theory to make the analysis of legal documents from the sociological point of view, second refers to the media debate upon science and the content analysis is used and third assumes the process of conducting interviews with scientists and project managers. The analysis runs from the most abstract macro level towards more micro and concrete evidences in the process of reconstruction science understanding in Poland.

The perspective of science policy is highlighted to visualize the phenomenon of "politicisation of science", changing roles of scientists and discuss a contradiction between openness in science and bureaucratization of science. The key concept recalls the ethos of science understood as academic versus post-academic science where classical meaning of science is constituted on external factors driven by the pursuit of research funds (Sztompka 2007).

Digital Technology and Exclusion of Women: Occupational Segregation and Deconstruction of Stereotypes

The new technology particularly Digital/Information technology are now central to our culture and consciousness. It is not only playing an important role in terms of restructuring the economic and social structure but also reshaping work and employability relationships. One may argue that, since 1970's onwards the expansion of information technology has impacted our everyday life activities phenomenally. The speed, flows of information and communication technologies are now central to our economics. One may further argue that we have entered in to the Information Society, where informatics is the main component of Indian social structure. Many of our economic functions are increasingly organized around information networks and its associated technologies leading to multidimensional effects on the Indian society. Services like Information Technology Enable Ser-

vices(ITeS) offshoring, outsourcing, and the new notions of work have significantly influenced labour and Employment relations in India. Such changes have led to labour market flexibilities and have created differential impacts on social groups including women thereby reinforcing institutionally entrenched inequalities.

In this context, the paper tries to understand the exclusionary nature of the Digital technology particularly in case of Women, and also explores how the existing structural inequality is reinforced within the organizational set up of the Digital/IT industry. Secondly, it highlights on issues like occupational segregation, entrenched inequality and marginalization of women within and outside the industry while focusing on gender stereotypes, particularly feminization of work in this sector

On the whole, it tries to locate how these entrenched inequalities and gender divisions are influencing Information Technology Enable Service work patterns and employability thereby leading to increased insecurity among women within the industry in terms of their access to jobs, promotions, work timings, on-site mobility etc.

Mafia Apps: Assembling Alternative Geographies of Protest

Recent scholarship on ICTs and Social Movements has prevalently focused on the relationship between the protesters and their technologies during protest events or in relation to active phases of movements (Melucci 1995). It has also examined how ICTs facilitate the spread of messages and emotions, how they help to topologically gather people for mass demonstrations, or even how social movements seek autonomy in and from the media they use (Castells 2012; Milan 2013). This paper addresses the question of protest in a non-eventful scenario, in a moment of latency; that of the everyday struggle against the mafia in Italy. It analyses two mafia mapping apps, which are here seen as ingredients that not only facilitate but are in themselves agentic in performing different practices. From the mapping of eco-mafia disasters in the "triangle of death" in central Italy, to the highlighting of the mafias in the north, this article empirically analyses how these two apps are actively fighting the mafia. The apps are therefore here taken as agents (Latour, Bennet, Marres) themselves that make different constellations possible together with their human, non-human and discursive counterparts.

How to Generate Knowledge on Styles of Living and Acting? Comparing Different Approaches to a Core Concept in Environmental Sociology

In the discourse on sustainable development it has become commonplace that the runaway consumptive lifestyles which emerge in Western industrialized societies unleash destructive forces in ecological systems. Consumption, however, is not only a driver of economic growth in contemporary societies but also an indispensable condition of existence. Therefore, it is evident that governance for sustainable development needs in-depth knowledge on the consequences of different styles of living and acting.

In this paper I discuss different approaches to study lifestyles with regard to conceptual and methodological questions. In its first section I discuss the conceptual background of studying lifestyles in the context of sustainability research. It is assumed that the concept of style is the most appropriate tool for the study of social structures. Actors are considered to be creative in principle as well as free in their decisions to a certain extent. Furthermore, the concept is well suited to be concretized on different levels relevant for sustainability research. In the second

section I present several approaches dealing with style-based analyses of social structures to highlight the characteristics of the concept and the methodology. In addition to the classics I particularly focus on Bourdieu's sociology since he found an answer to the questions whether and to what extent style analysts can claim objectivity and validity for their research results. In section 3 these methodological considerations serve as an assessment criterion in the discussion of different style-based approaches to sustainability questions. I show how the idea of life-style research is operationalized in different empirical studies and discuss the strengths and weaknesses of the different approaches especially for questions of sustainability research. Finally, on the basis of this evaluation I develop methodological proposals for the study of styles of living and acting to understand the coupling of society to biophysical structures.

Vehicles for Change or Preservation? the Role of Think Tanks in Poland

Literature on experts' place in democracies and the epistemic dimension of democratic decisions is growing. For example recently, the unregulated role of policy professionals has been pointed out as an acute issue for democratic governance (cf. Garsten, Rothstein & Svallfors 2015). In order to secure the epistemic value of democratic decisions, expert knowledge seems indispensible. On the other hand, letting experts decide on political issues leads to de-politicization and weakened democratic control of decision-making. This article aims to study a certain type of policy professionals in a specific context - think tanks in Poland. Even though Polish civil society has gained much scholarly attention, this particular group of organizations has been rather overlooked.

The context of transformation designated a unique place for think tanks in Central and Eastern Europe (Kimball 2000), creating a demand for innovative solutions in the task of redesigning the social, political and economic landscapes. After initial flourishing in the early 1990s with an unquestioned aim of sustaining the pro-democratic reforms (Krastev 2000), think tanks now find themselves in an 'identity crisis'.

In this paper, I contrast the external and internal image of Polish think tanks to assess the role these organizations play today. How do think tanks present themselves? How are they represented in the mainstream printed media? What role and position in the decision-making system are they ascribed/do they ascribe themselves? Do they present themselves/are they presented as part of civil or political society? The analysis is based on a series of semi-structured interviews with Polish think tank leaders and qualitative content analysis of two major Polish newspapers.

Expansion of Upper Secondary Education in Mainland China, 1980—2010

Upper secondary education in mainland China (China, hereafter) has experienced a dramatic expansion during the period of 1980—2010. China is an illuminating case for analyzing the expansion of upper secondary education. This is not only because China's upper secondary education has undergone a transformation from elite, mass, and universal form for the last thirty years amid the rapid economic development since the economic reform in 1978. Moreover, the decision making and policy implementation in China are characterized by a top-down process. These special features render China as an illuminating case for studying the development of upper secondary education in the context of changing socio-economic development, in particular, the interplay between economic development and social policy in shaping the development of upper secondary education. This study examines the expansion process of upper secondary expansion, with special focus on the interplay between (a) growing demand from labor market and public preference, and (b) the educational policies in shaping the expansion of upper secondary education. This study mainly adopts the functionalism perspective to interpret China's expansion of upper secondary education. The dramatic industrialization and economic development drive a growing demand in labor market for skilled and educated workforce and a public preference shift for more education. In response the pressing demand and maintain a rapid economic growth, the Chinese government made serious attempt to (a) expand the system capacity of upper secondary education, and (b) promote vocational upper secondary education, which is believed to provide a skilled and educated workforce to meet the market demand. Moreover, in the post-expansion period, private schools have growing importance in the development of upper secondary education. This study also discusses the changing role of the government and market in the context of decentralization and marketization of education.

Non Suicidal Self-Injury As a Social Regulation Strategy: Experiences of Suffering Among Chileans and French Adolescents

During the last decades, there has been a significant rise in the prevalence of self-harm among adolescents on a global scale, particularly self-cutting ('Non suicidal self-injury' in the DSM-5). Since the late 70s, self-injury has been understood as a method of self-help, a strategy of affective or cognitive self-regulation motivated by internal-emotional-neurological psychopathology. This perspective fails to consider self-injury as a phenomenon framed in a complex system of interactions. This paper aims to show the way in which self-injury constitutes a sociological problem, exploring the relations between symptoms and socio-cultural factors. What makes self-injury an effective resource for individuals? What is its meaning and how is it experienced by individuals? How self-injury is expressed in different social contexts? To answer these questions, this paper describes the experiences of adolescents who have hurt themselves in Santiago (Chile) and Paris (France), using ethnographic observations and semi-structured interviews (n=30) in different health services.

Results: Self-injury is a behaviour that allows self-regulation of emotions and anticipation of impulsion. Self-injury is not an impulsive act, but a *process* that involves a system of meanings and interactions. Self-injury emerges when the individual does not find a way to contextualize or manage an intense suffering through his social relations. It is a way to regulate an emotion that cannot be normatively managed. There is an emotional tone that prevails in the hierarchy of emotions in the two local contexts: Chilean adolescents describe '*rabia*' [angry], while French describe '*angoisse*' [anxiety]. Sometimes when self-injury cannot be an effective response, i.e. when it does not produce an emotional and social regulation effect, suicide attempt appears as a possible act.

Conclusion: The aggression of the body tissue is not only a practice that aims to regulate the emotional experience, but also a strategy to regulate the social experience or social situation.

El Abandono De La Educación Secundaria Obligatoria De Las Jóvenes Españolas Gitanas

Los resultados que se presentan forman parte del proyecto de investigación "Género, educación e igualdad" de la Universidad de Alicante que tiene como objetivos conocer la situación educativa y vital de las jóvenes en barrios con alta vulnerabilidad social, para visibilizar situaciones de desigualdad, así como constatar la influencia que tiene en sus vidas la educación formal. Los seis barrios donde tiene lugar el estudio, que forman parte de la zona Norte de la ciudad de Alicante (España), cuentan con la mayor concentración de población inmigrada y gitana de la ciudad y, por tanto, con la proporción más alta de alumnado de origen extranjero y gitano.

A partir de los resultados de una "Encuesta sobre el origen y las expectativas del alumnado de Educación Secundaria" realizada a 943 estudiantes y de entrevistas en profundidad a mujeres estudiantes gitanas de educación secundaria, se constata una persistente desigualdad en la permanencia en el sistema educativo de la población de origen gitano en general y especialmente de las mujeres. El 42% de los estudiantes encuestados corresponde a alumnado descendiente de la inmigración. De entre el alumnado español, el 25,7% es gitano y se concentra en un 87% en el primer ciclo de la Educación Secundaria Obligatoria (ESO), lo que muestra una tendencia muy acusada al abandono escolar a partir de 2º de la ESO, especialmente de las mujeres siendo casi inexistente su presencia en el último curso de la ESO. Aunque distintos factores (económicos, sociales, culturales y de segregación espacial y escolar) siguen condicionando fuertemente su participación en el sistema educativo y, consecuentemente también su participación social perpetuando la desigualdad de género y de oportunidades, algo está cambiando entre las jóvenes estudiantes gitanas, como atestiguan sus relatos.

The Liquidity of Leisure Travel in Bogotá

As many now recognized, there is a significant increasing of alternatives ways of travelling more and more lately. In fact, the ethnographic research has much to say about this topic. One of the essential characteristics of the article is the fair approach to get to know tourists´ practices of their every-day life. Thus, I made almost four dozen of ethnographies with CouchSurfing members in order to obtain data collection, the fieldwork took place during the first semester of 2015. It should come as no surprise that most of the users of CouchSurfing have been backpackers since the foundation of the network. All of them were hosted by me, and we spent most of the time together in their stay in the capital city of Colombia, Bogotá. This phenomenon can also be observed in the references, presents, conversations and so on, among the members of CouchSurfing. Therefore, non-place, as a new reality lacks of identity, relation and history (Augé), for instance a hotel room. The article appraises the connection that exists between the conditions for anthropological places, as Augé outlines them, and the pursuit of hosts as a tourist in Bogotá. Reflecting on the Michel de Certeau´s background, one comes to get the large amount of practices of everyday life in a foreign country. The case, which focuses mainly on the 'fluidity' or 'liquidity' (Bauman) between an international guest and his leisure activities in a cultural holiday, may embody an empirical contribution to the debates of local culture protection by foreigners.

How New Technologies from the South Are Taken By the Economic North: Future Acceptance?

Indeed, current acceptance of new technologies from the Economic South faces an unpredictable future. The disparity of both scientific and economic capital from the Economic South with respect to the North constitutes a major obstacle for the development of new technologies in the South. Governments and institutions in the South are making efforts to facilitate not only the production but the distribution of new technologies that would produce revenues to both the sponsoring institutions and the technologists who develop such new products or services. However, due to the enormous disparity of means many times innovations arrive late to the potential buyers of patents. This paper shows how in an Economic South country, regardless of a number of obstacles to be overcome, it is possible to develop new technological devices and offer them to the global consumption in an unequal competition.

JIMENEZ ROGER, BEATRIZ* (University of Granada, beatrizjimenezr@yahoo.es)

New Patterns of Intergenerational Transfers: A Comparative Approach.

Population ageing represents one of the biggest demographic changes of the 21st century. This situation is characterized by increased longevity, with older people living longer and healthier. The new social and demographic patterns are affecting family types, intergenerational relationships and the social meaning of old age. At European level, data confirm the important weight of the elderly population; being more remarkable the population projections for that group in the short term.

Under these circumstances, it has become crucial to analyse the implications of this phenomenon and how it will affect intergenerational relationships and transfers. Several studies have addressed the key role of the family as an important factor in these dynamics and, more specifically, its function as a mechanism of intergenerational solidarity, especially in Mediterranean models, where the traditional family generates high levels of regulation and functional solidarity. However, more recently scholars have highlighted the concept of ambivalence, or the significance of conflicts in the process of understanding intergenerational relationships.

Data from The Survey of Health, Ageing and Retirement in Europe (SHARE) will be a first approach to show how these mechanisms (intergenerational ambivalence and solidarity) operate in Mediterranean context, focusing on the case of Spain. Although different authors have underlined the important role of the family in this context, we need to pay attention to the comparative aspects of different countries and their Welfare State systems to understand how, in light of the changing demographic trends, intergenerational solidarity and ambivalence could operate in different Welfare State regimes. Therefore, for its relevance and future prospects, in light of this changing demography and according to the different Welfare State regimes, we will study, from a comparative perspective, changing patterns of intergenerational transfers and new relationships between older people and their adult children.

Addressing the Poverty and Social Exclusion of People with Serious Mental Illness in the United States

People with serious mental illness across industrialized and developing countries experience economic exclusion with devastating consequences to their emotional wellbeing and social inclusion. In the United States only one in five is employed, although a majority expresses a desire to work. Up to half of all people with serious mental illness have incomes below to the federal poverty line. Furthermore, a large proportion live in the "poverty trap" of Social Security benefits - without sufficient income and assets to meet their needs, wanting to work and improve their financial situation yet feeling unable to increase earnings or assets due to the means-testing requirements of Social Security programs. Those who also belong to minority groups are likely to live in even greater economic exclusion. This is expected, since most racial, ethnic and sexual minority communities in the U.S. experience higher levels of unemployment, poverty and dependency than non-minority individuals, rendering them vulnerable to the compounded impact of disability and socio-economic disparities.

This presentation describes the results of a mixed-methods study in New York State examining the financial capability of people with serious mental illness and its impact on their emotional wellbeing and social exclusion. It also presents a peer-supported economic empowerment intervention model for people with serious mental illness currently being piloted for feasibility, acceptability and initial efficacy. This model includes strategies to help individuals with serious mental illness overcome systemic, community, programmatic, and individual-level barriers to economic inclusion; and to revert the impact of economic exclusion on emotional and social wellness domains - such as hopelessness, life dissatisfaction, shame, and social isolation.The relevance of these results and intervention model are discussed in the context of welfare and public health policies to address social determinants of health and disability, and socioeconomic inequalities, in the U.S. and other industrialized nations.

Sexism in Wireless China

Sexism in wireless China

This study explores gender bias and sexism as reflected in the Chinese cyber lexicon and discourse, drawing implications for the sociology of new media and for the sociolinguistic study of women in society. On the one hand, I examine cyber neologisms that construct and perpetuate gendered social categories. On the other hand, I analyze the appropriation of existing social categories for the sexist representation of women and femininity in cyber discourse. I show that the Chinese Internet provides an unprecedented discursive space in which anonymity in networked mass communication allows wide propagation and circulation of a discriminative gender ideology and gender policy, sexism, and misogyny. Furthermore, I make the observation that women participate in gendered discourses in the cyberspace that undercut their own power and perpetuate gender inequality. The fact that women themselves are part of the social currents that undermine gender equality in wireless China reflects a larger pattern of persisting sexism in Chinese society.

Developing Care Professionals: Possible Ramifications of the Professional Projects within Swedish Disability Care

This conference proposal is concerned with possible ramifications of developing new professional projects within the field of disability care in Sweden. One of the most important resources in welfare society are the care professionals. Particularly, for the realization of the socio-political goals of a community of respect, participation and good living conditions, and of strengthening the citizenship of people with severe disabilities. Care professionals have been portrayed as the ultimate cutting edge of politics and described as the medium through which national, regional and organizational ideas and objectives are transformed into practical actions. Within Sweden, attempts are currently being made at differentiating and establishing a professional identity for workers providing direct care to people with severe disabilities.

In the study upon which this conference presentation elaborates, we were concerned with care professionals own perspective on meaning-making and understanding of their welfare work as carers of people with severe disabilities, living in short-term residential care home (RCH). More precisely, why these care professionals chose to work, and choose to continue working, in these kind of short-term RCHs. This implies a dynamic interpretation of working experiences as socially constructed on the one hand, and structures of meaning about care work and professionalization, on the other. In other words, we examined how individuals contribute to producing perceived social reality and knowledge.

Building on the findings of our study, this proposed conference presentation contributes to elucidate and problematize what is identified as an ongoing professionalization of certain welfare efforts and activities within Swedish disability care. This is done by illuminating possible discrepancies between the meanings proposed by public officials and other interested parties, and meanings constructed by the care professionals themselves in regard to their profession and professional identity. Furthermore, possible ramifications of these discrepencies are discussed in relation to the particular professional project.

JOHNSON, ELEANOR* (Cardiff University, johnsone1@cardiff.ac.uk)

Moral Care: The Spatial Organisation of Work in Residential Homes for Older People

This paper examines the impact which the spatial organisation of work in residential care homes for older people has upon the quality of care-giving. It has been proposed that the privatisation of residential care in the United Kingdom has resulted in a dualistic market. Here, residential homes at the lower end of the market drive down costs in order to attract local authority purchasers of care. Residential homes at the higher end of the market, on the other hand, compete on quality, tailoring their services to meet the needs and demands of older people who purchase their own care. This paper examines one way in which this divergence in the costing of care has altered the manner in which care work is carried out: namely, how space is used. The paper draws upon an ethnographic study of two residential care homes for older people, which are located in the South of England. It found that, in the higher cost home, care workers enforced strict boundaries concerning the management of personal care activities and their resulting waste products. Here, care workers' use of space took a symbolic form. In the low-cost residential home, on the other hand, little was done to establish boundaries between 'clean' and 'dirty' matter. This paper considers the ethical implications surrounding the presence or absence of this symbolic boundary maintenance. In short, this paper captures how the spatial organisation of care work in residential homes becomes imbued (or not) with symbolic meaning. What is more, it establishes how pricing and funding differentials have a bearing on whether such meanings are established and/or upheld. The consequence of this is a deeply inequitable care sector where low-cost care comes at an ultimate moral price.

JOKELA-PANSINI, MAARET* (University of Bern, maaret.jokela@giub.unibe.ch)

Studying Women's Human Rights Activism: Position of the Researcher and the Role of in-and Outsiders in the Field

This paper investigates the position of the researcher in academic (women's) human rights activism and is based on fieldwork conducted on women human rights defenders in Honduras. The country's national elections in December 2013, which were regarded as the first democratic elections after the coup d'état in 2009, drew the attention of hundreds of human rights activists, journalists, bloggers, human rights observers as well as government representatives across the world. While conducting research in politically laden and polarized contexts – such as human rights activism in Honduras –researchers often find themselves between (and as part of) numerous actors, both insiders and outsiders. Drawing on feminist and social science theories and methodologies the study investigates the power relations between these actors, particularly outsiders, and the influence of such dynamics on the research project. The study shows that actors in the

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

field hold different aspirations and assumptions about the research context as well as the strategies for advancing collective struggles, which can be challenging for the researcher. The study suggests that rather than working separately, actors of different communities (research, journalism, non-governmental and governmental organizations, etc.) should seek to create common strategies for advocacy work on all levels.

JONES, HANNAH* (University of Warwick, h.jones.1@warwick.ac.uk)

Dissonant Belonging: Nation, Race and Immigration through a Queer Post-Imperial Lens

This paper develops possibilities for queering understandings of racialization, nation and migration by thinking through the linked histories and presents of Britain and Australia. A focus of everyday bordering in both of these countries is 'illegal immigrants', both in public performance (UK government signs telling irregular immigrants to 'Go Home'; Australian government publicity telling potential entrants 'No Way: You will not make Australia your home') and in treatment of those who are caught (Australia: confining asylum seekers who attempt entry by boat to off-shore detention centres and refusing the possibility of permanent refugee status; Britain: detaining irregular migrants for indefinite periods and forcibly deporting adults and children). Less often noted, British migrants in Australia are among the largest group of visa overstayers (hence 'illegal immigrants') – and it is likely Australians are among the largest group of UK overstayers, although data on this does not yet exist. However, they are much less problematized in everyday bordering practices than irregular migrants from elsewhere. In these exclusions from the potential for national belonging, an imagined familial, imperial logic persists.

Though both are multi-ethnic nations, this paper starts from the premise that these privileged statuses (as unproblematic migrants) stems from an understanding of a shared (symbolic) whiteness rooted in the belief in a transnational kinship (a legacy of settler colonialism)**.** Though notions of biological races are long-discredited, notions of 'family' persist in talk of migration, settlement and belonging ('the Motherland'; 'our Australian cousins'), alongside claims to live in a 'post-racial' era. This paper draws on feminist, queer, post-colonial and whiteness theory to examine the persistence of biological symbolism, questioning the ontology of family as a safe space of belonging. 'Queering' the imagined family of nation allows a theoretical framework in which to understand the dissonance of different forms of racialised national belonging.

JONES, HELEN* (University of Huddersfield, h.m.f.jones@hud.ac.uk)

Is Youth Work an Endangered Profession in England?

In 1997, shortly after Tony Blair became the UK's Prime Minister, France and Wiles asked, 'Is youth work still needed?' (France and Wiles, 1997). They examined whether key aspects of the profession continued to have currency for society, during an era they identified as 'late modernity characterised by a risk culture'. They concluded that Youth Services had potential to survive. At the time, across the sector there was a brief flourishing of optimism: some even believed that the new government would confer the hitherto-elusive statutory status.

What's gone wrong? Almost twenty years later few Youth Services survive. Youth work's potential role in contributing to the prevention of violent extremism and countering sexual exploitation (among other things) has not been developed fully. Graduates from Youth and Community Work professional courses achieve jobs: their skills render them highly employable but they seldom gain posts entitled 'Youth Worker'. Their knowledge is relevant but often they have to compromise their core values particularly concerning young people's voluntary involvement.

Late modernity has not been superseded but the Youth Service has vanished from many local authorities. Youth centres are being closed as government austerity cuts disproportionately affect young people. There is an ideological impasse between the Conservative government's antipathy towards parts of the public sector and youth workers' desire to 'make a difference' which translates into 'naïve radicalism' as France and Wiles phrased it.

My paper will focus on the current fragmented picture through revisiting France and Wiles's article and will consider possible futures for the profession in England.

Navigating the Sea of Epistemic Uncertainty in a World of Complexity

Living in the *Age of Complexity*, most scholars of complexity have no clear understanding of complexity. This state of art is very much part of what Helga Nowotny has called "the *embarrassment* of complexity" (Nowotny, 2013). This *embarrassment* "begins when we realize that old structures are no longer adequate and the new ones are not yet in place" (p. 1). She continues: "when it dawns on us that the categories we normally use to neatly separate issues or problems *fall far short* of corresponding to the *real* world, with all its non-linear dynamical inter-linkages" (p. 1). Her position seems in agreement with other complexity scholars who have noticed that complexity itself is still very much a contested concept. According to Melanie Mitchell "[M]any think the word complexity is not meaningful" (Mitchell, 2011). She also makes mention of the fact that to most complexity scholars there is not yet a science of complexity (see Mitchell, 2011, p. 299). Neither is a general theory of complexity yet available. So, it may be concluded that *understanding* complexity is still very much a problem in our 21st century of complexity. This problem may be linked to "a crisis of knowledge" (Cilliers, 1998, p. 121). Time is ripe to recognize this crisis and to deal with this crisis of knowing itself (Jörg, 2014). In my presentation, I will go deeper into the nature of the crisis: how this crisis is linked to how we view the role of complexity in the world. This complexity is still very much a *hidden* complexity. Complexity can manifest itself as dynamic, self-generating, self-sustaining, self-maintaining, and self-potentiating (Rescher, 1998). This the very complexity we cannot see, but which is part of the real world. Time is ripe to reframe complexity for the sake of dealing with this still hidden complexity.

Marathi Experimental Theatre: A Sociological Enquiry

Marathi Experimental theatre: a sociological enquiry
Abstract
Sociology of art is quite a neglected field in India. Art has always been seen as something very personal and hence individual centric. Sociologically speaking, however, every art is a political statement. The important contribution of sociology to the study of culture and arts has been to demonstrate the necessity of understanding the work of art and role of the artist in their social, political, and historical contexts. Experimental theatre is a general term for various movements in Western theatre that began in the late 19th century with Alfred Jarry and his Ubu plays as a rejection of both the age in particular and, the dominant ways of writing and producing plays in general. Marathi language experimental theatre is considered as something which gives a different world view. Marathi experimental theatre is believed to have started from playwrights Tendulkar, Alekar and Elkunchwar in 1970s. In the present study experimental plays from the time period of 1990s till 2014 are taken into account. Several issues of experimental theatre; right from the ambiguity surrounding its definition to its differentiation from commercial theatre are unresolved. Is experimental theatre trying to create a new cultural space? If so what is the purpose behind it? What are reasons behind confining its performances to certain places? Who are the practitioners of experimental theatre? What is the class, caste, gender dimensions of people associated with experimental theatre? These questions are largely unanswered. On this backdrop the present paper tries to analyze the relationship between contemporary experimental theatre and space in Pune city which is considered as the cultural capital of Maharashtra. This paper also attempts to explore the complex interplay of aesthetic, social, economic, cultural and political factors in case of Marathi experimental theatre.

Structural Coupling: Conflicts and Co-Evolution Between Religious Animal Release and Ecological Risk

This essay examines the animal release in Taiwanese Buddhism and the dissents it faces mainly from the environmental or animal protection groups. According to the German sociologist, Niklas Luhmann, these two fronts are regarded as separately closed social systems, operating religious and ecological communications respectively. They produce autonomously their own elements of which they consist. The relationship between the religious and ecological systems can be described as a "structural coupling". In such a coupling, each system takes critics, dissents and conflicts from outside seriously, but their interplay is not casually determined. Related systems experience dissents as irritations and undergo a process of inter-translation.

This essay first introduces the concepts of autonomous self-organization of social systems and structural coupling in light of Luhmann's theory. Luhmann's theory offers an interesting frame to examine empirically the interplay of animal release in Taiwanese Buddhism and the ecological risks it may cause. This seems to be a promising way to explain how a system thematizes the irritations from outside as its own problem and offers only solutions with which it can connect internally, avoiding the presumption of a pre-given consensus and line-determination.

The Withdrawal and Comeback of Subject from Niklas Luhmann's Perspectives

This article will study the human existence and related issues in the modern society based on Niklas Luhmann's theories. It takes the problematic of subject seriously and tries to connect with the increasingly popular de-subjectivation and reconstruction of subject in the fields of sociology as well as sociological theory. Guided by Luhmann's theoretical concepts, this project wishes to comb the different dimensions and levels of human picture, clarify their relationships and point out the contribution, limitation and further perspectives of Luhmann's theory. It will concentrate on withdrawal and comeback of subject, namely on the switch of questions from "What *is* the subject" to "How is human regarded *as* subject". By so doing, it will give the human a subjective position sociologically and explore the reasoning of human as subject, without appealing to transcendental subject and his ability. Concretely speaking, this article will take consideration of social structure, emotion, body and material object into the formation of subject. It will also explore the consequential issues involved in the process of withdrawal and comeback of the subject, for example, alienation, aloneness, deficit of meaning, disintegration and narcissism epidemic, analyzing the subjective identity and its possible risk in the modern society. Based on the theoretical reflection, this aarticle will try to figure out a more appropriate frame to grasp and interpret the different, controversial and paradoxical dimensions of individualization.

Social Innovation to Address Social Exclusion Among Youth: The Case Study of Two Deprived Neighbourhoods in Barcelona

We are currently living in a society very much shaped by a heterogeneous, fluid and shifting nature, which defines young people´s actions and interactions, and the way they address emerging challenges. Amongst these, the current crisis and background of austerity policies are no doubt a main concern that affects them. New patterns of social inequalities have emerged, characterised by unforeseen rates of unemployment, discontinuities in education trajectories, delays in emancipation from the parental home and a dramatic decay in welfare provisions. In this framework, cosmopolitan cities like Barcelona are spaces where such inequalities are especially evident, yet with significant intra-territorial differences.

Stemming from the original data gathered within a current multisited ethnographic investigation across 10 EU countries, this paper aims to examine social inequalities and socio-spatial exclusion experienced by young people in Barcelona. In particular, it analyses the recent history of the social and urban development of two neighbourhoods during the last four decades to identify different patterns in the responses to social exclusion. The location of the neighbourhoods, the urban regeneration policies, the programmes of social intervention, the presence (or absence) of collective action and the socio-demographic changes in both areas are key elements that have shaped different ways of tackling inequalities through social innovation. Notwithstanding the normative connotations of this concept, we argue how social innovation has been promoted by social policies and institutions, but also by civil society and young people themselves. This relates to the classic debate on bottom-up or top-down schemes of governance, with varying degrees of organisation and institutionalisation. The results evidence two heterogeneous and dynamic models of approaching social innovation: a traditional self-management approach increasingly disarticulated in one area, and an assistance-related approach with growing competition and privatisation in the other one.

RC36-418.2

JUKKALA, TANYA* (Södertörn University, tanya.jukkala@sh.se)

Alienation and Interaction: A Symbolic Interactionist Perspective

In a general sense alienation can be understood in relation to the dual structure of human existence as individual and as social being, or as subject and as object, where the failure of achieving a synthesis between these two elements results in estrangement or alienation both from the self and the world. The symbolic interactionist tradition could be conceived of as addressing exactly this problem. An understanding of the structure of human existence as dual is central to the symbolic interactionist tradition as is articulated f ex in the idea of the 'looking-glass self' (Cooley) and in the dialectical relation between 'I' and 'Me' (Mead). Moreover, a synthesis of this duality can only be achieved in human interaction, in and through which the individual becomes a self, and which is inseparable from the individual as a self. The present paper explores the potential in the symbolic interactionist tradition for considering possibilities of overcoming alienation in human interaction, including the development of the self and human socialisation. Special attention is given to the social ethics embedded in the symbolic interactionist tradition, emphasising a sympathetic understanding of the other and personal growth through increased sympathy, in terms of being perhaps particularly relevant. An understanding of processes of alienation and possibilities of overcoming alienation in human interaction is indispensable for understanding alienation in the 21st century.

Perception of the Youth Movement Toward an Equal Society: A Case Study of Thailand

In Thailand, the social inequality was defined as one of causes of political conflicts and polarization, therefore, by the older generation movement, the national reform program which highlights on promoting social equality has been developed as a way to reconcile the divided society. However, Thailand in next twenty years will be in the hands of younger generation, especially the youth who are in the social movement. Nowadays, there are many active youth movements in Thailand, for instance, **Dao Din** [star of earth] **Group**, **New Democracy Group** and **Children of the Villagers Group at the Burapha University**; therefore, it is worth to understand what the social equality they want and how they will create it. The paper aims to illustrate the perception of the youth who are in the movements toward social equality, environmental movements, democratic movements and alternative development movements. There are two main research questions: (1) what do they think about the social inequality in the context of divided Thailand? and (2) in their views, what are the major challenges in moving toward the equal society and how could they overcome it? By interviewing the key informants who are the younger in selected movement, the paper outlined the discourse and discursive practices of youth movements about complexity of social equality. Finally, by comparing with the idea of social equality of the older movements as identified in national reform agenda, the paper also analyzed what were the gap and overlap idea of social equality among the youth and prior movements and how to accommodate it.

2011, the Continuation of 1989?: Measuring 2011 Protest Waves in the Global South on the World-Historical Perspective

Are protest waves of the year 2011 the continuation of protest waves of the year 1989 or even before? One of the most distinguishable features of the protest wave in the global South over the long 20th century is the interrelationship between worldwide radical mobilizations and the worldwide intensification of nationalism and democratization. According to overall mapping out world-historical pattern of protest events, compiled from the *New York Times* (1875-2012), there are found four key movement clusters of the period and the region in popular protests in the global South: the years during the great resistance for national liberation and democratization in Latin America, Asia, and Africa in 1930s and the late 1950s, Asia and Eastern Europe in 1980s, and the Middle East and North Africa and Southern Europe in the early 2010s. As considering the protest waves of 2011 on the world-historical perspective, key findings could follow: 1) Quantitatively, the frequency and the duration of protest waves of 2011 is almost similar to the protest waves in the late 1980s but smaller and shorter than the protest waves in 1930s and 1950s. 2) The protest waves of 2011 are mostly located in the global Peripheral regions, while the protest waves of 1989 emerged in mostly the global Semi-periphery. 3) In terms of goal or opponent, there are shared similarities of protest waves between 1989 and 2011. Both are the great resistance for democratization, that is, "struggle against exclusion" rather than "struggle against exploitation."

Emergence of Agrarian Prosumer (AP)

This study aims to bring out the concept of an emergent actor of "Agrarian Prosumer (AP)" in the era of consumerist and/or post-Fordist productivist society of agriculture and food. In order to do this, we will focus on the process of "immaterial production" in a closer relationship between producers and consumers with a Korean case study, *Hansalim* cooperatives. While most of the members just enroll for the purpose of relieving food safety concerns, some have emerged as engaging in (re-)producing knowledge, information, communication and affection between the urban and the rural.

Actors of Agrarian Prosumer (AP), first and foremost, enlarge the scope of agricultural production mode through their immaterial labors which represent a reciprocal understanding, mutual learning and caring for the rural. Not just do urban consumers constitute the actor, but rural farmers play a significant role in awaking their potentiality as a producer and empowering them as a subjective agent. Interestingly, they have transformed the local and organic food-scape through a growing attention to their immaterial labors rather than stick to the food quality itself.

In the sense of opening a new production mode beyond the geographical local and environmental organic, the product, which AP actors produce, would be considered "*lorcanic*" (local + organic) food. This paper concludes with mentioning the political project of AP actors by creating or revitalizing a "space of intimacy" between the urban and the rural.

La "Ley Maria Da Penha" y La Alteración Del Paradigma Contra La Violencia a La Mujer

Debido a la existencia de estereotipos machistas en las más diversas sociedades, los casos de violencia contra la mujer son una infortuna realidad global, tales violaciones son de difícil reparo y muchas veces no llegan a lo conocimiento público.

En 2006, después de décadas de luchas de los movimientos y organizaciones feministas nacionales, la ley N° 11.340 fue sancionada en Brasil, popularmente conocida como "Ley Maria da Penha", esta se tornó referencia en legislación para tratar acerca de la complexa temática que abarca la Violencia Domestica. La ley objetiva crear Juzgados de Violencia Domestica y Familiar contra la Mujer, allá de establecer medios para reparar las violaciones sufridas en lo ámbito doméstico, visando que ocurra la protección de los Derechos Humanos.

Violencia de género y el machismo son factores que callan las víctimas, las amenazas hechas por los agresores ocasionan un silencio dañoso para la mujer, evitando que ella rompa con la perspectiva de victima; otro factor de extrema preocupación es la falta de preparación del judiciario a tratar de los casos, visto que la óptica machista continua presente en un local lo cual debe adecuar-se a los cambios sociales y garantizar la igualdad entre los ciudadanos.

Después de casi una década de existencia de la Ley N° 11.340, muchos paradigmas no fueran rompidos, haciendo con que esta continúe siendo una gran idealización. La humanización en lo judiciario ocurre de manera gradual, pero a indiferencia de muchos juristas acerca de la violencia sufrida contra la mujer torna la ley una utopía, inviabilizando efectivas reparaciones y protección a las víctimas.

Science, Policy and Societal Needs: Renewable Energy Research in Portugal

Over the last decade, Portugal promoted an ambitious plan to foster the growth of renewable energy technologies in its energy system. The program was largely successful, with wind power going from a residual presence to being the second source of electrical production in the course of ten years. The goals for deployment were accompanied by an increasing prominence of the role of research and development in energy policy and a political discourse centered on the opportunity for the country to take a lead technological role in the development of renewable energies. This was also a period of growing investment in the national R&D system, with a steep increase in human resources and competitive funding opportunities, and of reconfiguration of academic activity, promoting a tighter interconnection between universities and the private sector.

The favorable political climate allowed for a consolidation of this area of research with the formation of new R&D units, research groups and graduate programmes, as well as an increase in R&D expenditure in the private sector. Given the centrality of energy issues in contemporary societies and the part renewable energies have to play in the future of energy systems, renewable energies present

an opportunity to explore the changing dynamics between policy, private sector and scientific research. This presentation proposes to add to this discussion by drawing on a diverse set of data sources encompassing policy documents, official statistical data, bibliographic and project databases, and interviews with researchers.

This presentation is based on the work developed for the PhD programme in Sociology, in progress at the Institute of Social Sciences, University of Lisbon and funded by the Foundation for Science and Technology (FCT).

How Transnational Families Are Seen to be "Troubling"?

The authors argue that Lithuanian society is shaped by meaning-making institutions producing knowledge about migration and migrant families. Daily life is mediated by representations of 'low mobility' discourse based family policy as well as "truthful" images of migrant families in press and TV broadcasts. The authors builds upon A. Strauss' insights about the significance of 'awareness context' for interactions and personal identity.

The article discloses the situation in Lithuania, a country that experienced intensive emigration since its accession to the EU in 2004. Readers are presented with the analysis of official documents, conducted from 2005 to 2012; the results drawn from mass media and the study of migrant families conducted from 2012 to 2014 and funded by the Research Council of Lithuania.

The presentation reflects on how mass media (press, Internet portals, and TV documentaries), national legislation (the National Conception of the Family Policy of the Republic of Lithuania) and conceptualizations held by survey respondents shape migrant families. The brief overview of representations of 'low mobility' family narratives included in different official documents, mass media and conceptualizations concerning migrant family aims to disclose how 'low mobility' family discourse is a source of trouble to transnational families. The ideas of J. Baudrillard's simulation theory and insights of N. K. Denzin on subversive analysis of realistic visual texts are followed by E. Goffman's ideas on stigmatization.

Further the authors aim to disclose how socially accepted family meanings used in Lithuania change upon time and how 'multi-local' family narratives emerge. The data obtained from the representative survey carried out in 2013 confirm C. Smart's assertion that the changing reality of family life alters the way individuals think about families.

Using Visual Methods to Describe Migrant Family Change

The purpose of this paper is to provide an example of using two mapping methods to study how migrant family changes are conceptualized and how these changes are viewed to be overcame. The paper is a reflection on a completed qualitative research of migrant families in Lithuania conducted in 2013-2014 as a part of the two-stage mixed methods research study funded by the Research Council of Lithuania.

The authors introduce the research design aimed at the analysing the study participant's 'voices'. The qualitative research corresponds to four selected criteria: 'participatory' research (e.g., M. Fielding; S. Bragg); 'image-based' research corresponding to the tradition of visual sociology (e.g., J. Prosser; G. Rose); maps are used as the means to facilitate the study participants' narratives (e.g., I. Levin; L. Spencer and R. Pahl); two visual methods ('Role-making' map method and 'Concentric circle' map method) are combined with the goal of developing more comprehensive knowledge about family changes. 'Role-making' map method is a four step research scheme designed as modification of 'My family' mapping method, introduced by I. Levin. 'Concentric circle' map method is used as it is suggested by L. Spencer and R. Pahl.

The cases of selected migrant families are examined to disclose the way family members were interviewed and the research data was processed. The authors present the analysis of the lists of family changes and maps for overcoming hardships caused by changes, obtained with the help of the 'Role-making' map method. Further, the authors examine the repertoires of emotional support by analysing the maps of significant persons constructed with the 'Concentric circle' map method. The authors conclude with the advantages and limitations of using visual methods to study family changes.

Indonesian Health Policy Development in a Global Context

Global social policy literature has engaged intensely with the role of global social policy actors, particularly international organisations, in influencing the social and health policies of developing and transition countries. Less common are country specific case studies assessing the global governance context within which national policy development and reform takes place.

This paper attempts to understand Indonesian health policy development from such a global perspective. The global governance context is understood as the production of country-specific knowledge and recommendations (prescriptions) by a number of different global social policy actors (international governmental and non-governmental organisations, foundations, and the like) used to advise (or influence) national social policy makers and processes. These specific prescriptions are discussed against the background of more generalized global social and health policy prescriptions developed and spread through global discourses and networks. The findings are derived from extensive document analysis and a number of expert interviews with Indonesian policy makers and the representatives of different international governmental and non-governmental organisations in Jakarta.

KABBANJI, LAMA* (Institut de recherche pour le développement, lama.kabbanji@ird.fr)

Exploring the Effects of Border and Immigration Policies on the Strategies of Refugees from Syria

According to the UNHCR, Syria is the first provider of asylum seekers in 2013 in 44 industrialized countries. 56351 applications were registered in 2013, most of them in Europe, and particularly in Sweden and Germany, followed by Bulgaria, the Netherlands, the United Kingdom and Austria. These figures are very low when compared to Syrian refugees registered at the UNHCR in neighboring countries. In april 2014, the UNHCR stated that Lebanon became the country with the highest proportion of refugees compared to the national population in the world, with more than one million refugees from Syria living on its ground (a quarter of the population). Since the beginning of the war in Syria, Lebanese immigration and borders policies had constantly changed, in line with the increase and dynamics of refugee's flows from Syria. The same applies with regards to policies (formal and informal) implemented in some transit countries such as Libya or in destination countries in Europe. These changing policies affected in many ways the living conditions and strategies developed by Syrians and Palestinian Syrians. This presentation aims at exploring these effects through an examination of:

-    Borders and immigration policies in different destination countries and their evolution since the start of the Syrian conflict
-    The effect of these policies on the strategies developed by refugees from Syria, in particular Palestinian-Syrians, particularly mobility strategies

This presentation is based on an on-going research project started in early 2014 in Lebanon. It is based on multi-sited participant observations and interviews conducted in different countries/localities among a small group of Syrians and particularly Palestinian Syrians who fled Syria starting from 2012, and were followed by the researcher since early 2014. This research is also based on the analysis of key policy documents and newspaper articles.

KADI, SELMA* (Eberhard Karls Universitat Tubingen, selma_kadi@gmx.net)

Diverging Strands? Multiple Approaches to Studying Older People's Technology Use

Older people use new technologies less than younger people. Due to multiple reasons, they are more often excluded from use. Simultaneously, they include negative stereotypes (e.g. later life and new technologies are incompatible, older people are not able to use new technologies as good as younger people) into their own learning experiences. Using the example of internet use in later life, I will compare different approaches from the social sciences for analysing older people's technology use (e.g. domestication theory, human factors, technology generations, feminist technology studies). Ageing is conceptualized in various ways in these approaches – some emphasise physical ageing processes or the social construction of ageing, some treat ageing as an individual's attribute, others

highlight age relations. Technology is likewise defined differently – e.g. as means to cope with disabilities related to physical ageing processes or as social process. I will discuss opportunities for an analysis of technology use which can integrate some of these concepts and take the diversity of older people's experiences into account. This is all the more important since high hopes are put on the improvement of older people's quality of life through the development of new technology.

Clinical Application of Caring for Cancer Survivors through Writing to Originate a Sociological Study

Purpose:
To verify the practical effectiveness of using a creative writing session as supportive care for cancer survivors
Design
Qualitative and quantitative study
Methods
After the first author proved the significance of writing in her sociological study about cancer patients' stories, we implemented six writing sessions and evaluated the practical effectiveness as complementary care for cancer survivors. The participants were five cancer survivors: four breast cancer survivors and one ovary cancer survivor. A writing session was held monthly from October, 2014 to March, 2015. Each 90- minute writing session included writing, group discussion, short break (to relax), and answering questionnaires. Writing topics in all sessions were chosen by the participants themselves except for the first session. After all the sessions were completed, we conducted one-hour self-structured interviews with the five participants individually.
Results
Through the interviews and questionnaires, we found that this kind of writing session put patients' feelings in order, lightened their hearts, or gave a chance to retrace the past. The patients responded that they could face their true feelings during the writing sessions, and that they found an opportunity to think about the importance of life and living positively. As far as the questionnaires, the evaluation scores became higher gradually. The discussion after writing helped the patients share their experiences and their connection looked deeper.
Conclusion
The first author proved in her previous study about cancer patients' stories that the act of writing facilities to create oneself anew, consider oneself, and find the meaning of oneself. In this study, the participants could make reflection of themselves and get energy to live with a positive mind through writing. Our study confirmed that the clinical application of caring through writing was very meaningful for cancer survivors. We also found that the discussion itself was beneficial for the patients in addition to the writing session.

The Transformation of an HIV/Aids Social Movement in Northern Brazil: A Case Study of the State of Amazonas

This manuscript focuses on the influence of public health policies on social action related to the HIV/AIDS epidemic in Northern Brazil. It is a case study of these relationships in the state of Amazonas. Federal funding provided by these policies has had multiple effects on the HIV/AIDS social movement in Amazonas. On the one hand, this fiscal support has strengthened some AIDS social action groups so that they could organize nonprofit organizations which effectively work for improvements in the rights of infected persons. While on the other, once these grants were offered, the community based organizations began to compete intensely among themselves for them. This inter organizational competition has resulted in a substantial weakening of the HIV/AIDS social movement in Amazonas. My analysis will explain how the governmental grants have profoundly impacted the HIV/AIDS social movement for a decade(2003-2013). The presentation will show that the public financial support resulted in the community based organiza-

tion's (CBO) legalization and formalization, but for many of them it also meant a change in institutional mission. Acceptance of the public funding has in many cases meant that they no longer work with and empower the most vulnerable groups affected by the HIV/AIDS epidemic. The data for this study came from in depth, personal, unstructured interviews with HIV/AIDS social leaders in Amazonas. In conclusion, the Amazonas case study shows how the sociological context has profoundly shaped and redirected the mission of an HIV/AIDS social movement in Northern Brazil. We must keep in mind that participants in a social movement may have goals that are very different from public policies of the wider society.

Alteration and Non-Belonging As Forms of Agency in Societies of Conflict

The biographical narrative approach allows listening to the individual's story in social contexts. Especially in conflicted societies where conflict groups are strongly referring to antagonistic versions of history, biographical narratives might challenge the exclusive national collective storytelling.

Israel is an example for a conflicted society and my paper focuses specifically on Arab and Jewish Israelis working in the field of Coexistence Education. Coexistence Education is neither part of an official political agenda of the state nor part of a public discourse on education in Israel. Choosing to work in this field indicates a certain position as 'not established'. In fact, in this field of work we can observe negotiations of conflicting positions such as history and cooperative actions of 'not established' members of society. Forms of agency in this conflicted field are closely connected to the individual's life story and they represent a tension between individual positioning and social expectations.

The analysis of life stories of Arab and Jewish Israelis results in positionings of alteration and of non-belonging. Alteration is presented as an individual position towards processes of collective storytelling as well as towards social norms and familial settings.

Non-belonging implies an individual arrangement in a social context to establish new forms of political empowerment.

Theses positionings create an alternative community where cooperation and friendship are coping strategies of outsider positions. Therefore, outsider groups construct new strategies of action as a form of group agency.

I would like to discuss these two forms of positionings of outsiders by raising the question in how far they can be reconstructed as learning processes in the course of a life story and also, in how far these outsider positions interrelate with established positions in society or alike with other outsider groups.

Relocation after Bachelor Degree? Spatial Mobility of Students on Their Way to Master Programs.

Many years have passed since the establishment of bachelor and master programs in course of the bologna process. However, knowledge about the new crossover between BA and MA programs is poor. *Previous research* has focused on descriptive statistics and on social selectivity at this new crossover. Moreover, research about the labor market entry has shown that family circumstances, former mobility experience and local employment perspectives influence mobility at this stage of life course.

Our research aims to answer the following *research questions*: Under which circumstances do students decide to change their university between BA- and MA-programs? In how far do individual and domestic characteristics determine the propensity to get mobile? Which regional factors influence this decision of spatial mobility?

Based on rational choice and matching *theories* changing university when starting a master program can be seen as an opportunity to improve local labor market perspectives, especially in terms of prospective career goals. Expectations of future income and demand for skilled workers differ between regional labor markets in Germany. Based on cost-benefit considerations students should decide to change university if the expected future gains of relocation exceed mobility costs. Thus, we expect students to have a higher likelihood to change their university in case of havinga small local business network (hypothesis 1). Moreover, we expect that weak local family ties enhance the likelihood to change university (hypothesis 2).

Data from the graduate study 2009 is used to analyze this crossover during university time. *Methods* applied include multi-level logistic regressions as data is hierarchical nested.

Knowledge of these mechanisms will be useful for universities as well as for companies and municipalities. It will draw up *implications* on how to deal with networks between universities and local companies.

Intergenerational Transmission of Pro-Environmental Values and Lifestyles: How Is the Ecological Habitus Reproduced?

As Haluza-DeLay wrote, "a crucial goal for formation of a more sustainable society is an ecologically appropriate logic of practice living environmentally without trying which is founded upon the routinization embodied in an ecological habitus" (2008: 206). While in recent decades sociological studies have explored pro-environmental practices and more sustainable lifestyles, the resilience of such lifestyles and their reproduction has been under-researched; there are relatively few empirical studies on the endurance and intergenerational adoption of an "ecological habitus." Our paper is based on data from the third wave of the unique longitudinal qualitative research (1992, 2002, 2015) on households and individuals living in voluntary modesty, reducing their consumption on an everyday basis (Librová 1999; 2008). We focus particularly on the everyday practices and routines of the grown children of the original participants in the sample from 1992 and 2002. We ask whether and how the children reproduce the value orientation of their parents, or define their own, and how they relate to their parents´ lifestyles under changing socio-economic and cultural conditions. Adopting the technique of in-depth biographical interviews and observation in households, we focus specifically on aspects of everyday consumption practices (household furnishings, leisure time activities, daily shopping and alimentation, etc.) in the context of their reflections on childhood in voluntarily modest households.

KALASHNIKOVA, MARGARITA* (St. Tikhon's Orthodox Humanitarian University, m.v.kalashnikova@rambler.ru)

James March's Technology of Foolishness (Moving toward a Playful Civilization?)

As a result of the realization by various social scientists that the postulate of rationality of human behavior is inadequate to capture actual human behavior, a concept of "bounded rationality" is formed in the science as one of the main prerequisites for the analysis of the behavior of individuals in various fields of activity. The model of bounded rationality serves as a methodological basis of the behavioral theory of the firm, within which a lot of questions from the field of organizational decision-making were highlighted. James March proposed a model of decision-making - by individuals, organizations, social and cultural systems - based on release from the logic of reason and use of sensible foolishness. Playfulness and playful behavior are at the heart of the "technology of foolishness." This method allows experimentation, acting unintelligently, irrationally and foolishly. The playful strategy creates productive behaviors at all levels of human activity and can contribute to the transformation of people, organizations, and the social structure as a whole. In the light of these ideas of James March, a question can be raised as to the vector of development of modern society, where the process of gamification expands to increasingly wider spheres of life of people. Even the science revises generally accepted criteria of the development of scientific knowledge, which is now understood as a variety of probabilistic narratives. Does all this mean that humanity, by abandoning rationality as a cultural universal and switching to a playful format in its activities, moves to a new level of civilization development, transforming into a playful society with playful forms of thinking and behavior? Let us recall the words of the great poet W. Shakespeare: "All the world's a stage, and all the men and women merely players" or in other words "mundus universus exercet histrioniam."

MIKHEYEV, IGOR (St. Tikhon's Orthodox Humanitarian University)

Pitirim Sorokin's Model of Altruistic Transformation of Society

In the middle of the 20th century, P. Sorokin, a well-known Russian-American sociologist, founded the Harvard Research Center in Creative Altruism. The main goal of the Center was to study the phenomenon of unselfish creative love and identify whether this love could be used to build a harmonious society. Scholars

involved in the Center's activities assumed in their studies that neither political, nor economic, military, educational or other means possessed by humans could provide a solution to social problems, mitigate existing conflicts, as well as establish peace and social order. Further advance of the humankind is possible only if it is based on the moral improvement of its members, increase of altruistic feelings and creation of a strong potential of altruistic love having a huge transforming power. Since altruistic love is the basis of social solidarity and the highest form of human relationships, the humanity is facing a paramount task to produce, accumulate and use more altruistic energy. Therefore P. Sorokin suggested about 30 methods and mechanisms (from physiological and biological ones such as formation of conditioned reflexes, habits, to those being of intellectual and social nature, i.e. creative incentives, self-reflection, self-analysis, rational beliefs, pressure of public opinion, spreading heroic examples, etc.) aimed at maintenance and dissemination of altruistic behavior in all spheres of human activity. Moreover, these methods and mechanisms aimed at altruization of the society and culture. At the same time, P. Sorokin believed that such steps were not utopian, but could be implemented in practice. It seems important that clinical sociologists consider whether such ideas and methods are applicable in the current situation within the field of clinical sociology in order to solve social issues, balance interpersonal relationships and make advanced social changes

LGB Discrimination and Diminished Sense of Belonging: The Role of Community Leisure Facility Use As a Buffer

Despite progress towards equality, sexual minority adults (e.g. lesbian, gay, bisexual; LGB) continue to experience discrimination. Discrimination undermines a sense of belonging to the community (Meyer, 2003). Leisure participation can be a valuable resource for coping with marginalization. In particular, recreation facility use may enhance sense of belonging. Thus, community facility use maybe an important resource for LGB adults to overcome the alienation that stems from discrimination.

To test this, we draw on data from a group of community-based surveys collected by the Canadian Index of Wellbeing (CIW). The purpose of these surveys was to collect information on quality of life in diverse communities focusing on municipal facility use, health and wellbeing, and sense of belonging. The full sample size for this project was approximately 6900. We focus on the 125 individuals who identify as lesbian, gay, or bisexual. Among the LGB adults mean age was 54 (SD= 14) and 58% were women. Discrimination was assessed by asking participants to rate how often they feel discriminated against because of their sexual orientation. Participants also rated their sense of belonging as well as how regularly they used 11 different municipal leisure facilities (e.g. library, park, etc.) in the past year.

In linear regression analyses the more discrimination LGB adults felt, the lower their sense of belonging to the community was. Facility use was tested as a buffer in an interaction term (discrimination X facility use) that was statistically significant. Probing of this interaction showed that at high levels of facility use there was no significant association of discrimination with sense of belonging (b= 0.06, p= n.s.), but at low levels of facility use discrimination was associated with diminished sense of belonging (b= -0.39, p< 0.01). This finding suggests facility use buffers the impact of LGB discrimination on feelings of alienation.

Iranian Asylum Seekers and Refugees in the Contradiction of Conservatism and Secularism: The Case of Denizli, Turkey

This research aims to discuss the socio-cultural dynamics of Iranian asylum seekers' and refugees' working and living conditions in Denizli, Turkey. The establishment of the Sharia regime in 1979 led to repressive practices in Iran. Many Iranians having been oppressed by the reactionary regime, forced to seek for asylum and settled in various European cities. Similarly, people from Iran being political opponents of the regime, LGBTs, Christians, Baha'is and other secular Muslims having fled from Iran because of their identity conflict, sought asylum from Turkey in recent years.

Denizli is one of the satellite cities in Turkey being a transit country for Iranian refugees and asylum seekers aiming to migrate to Europe. The city is located between secular coastel and central Anatolian cities having strong conservative characteristics. Existing in a complicated modernity paradigm in which conservatism and secularism intertwine, Denizli differs from other designated satellite cities. Thus, the main problematic of this research is to explore the socio-cultural conditions procreated by the complex features of late-capitalized Denizli for Iranian refugees and asylum seekers. Besides, the capacity of Turkey's asylum policies with regard to providing advantages for Iranians is a matter of interest.

Based on this problematic, a qualitative, ethnographic and explorative field research is going to be conducted with fifteen Iranian refugee and asylum seeker residing in Denizli. In order to analyse the cultural, political and sexual characteristics of respondents, their life stories should be regarded. Hence, unstructured, in-depth interviews are going to be used as data collection techniques. The study has importance due to its capacity of finding out the ontological disengagement arising from the cross-cultural experiences of Iranian refugees and asylum seekers in the complex social structure of Denizli.

Bureaucratized Morality, Institutional Durability: Organizationally Mediated Idealism in the Peace Corps

Worldwide, millions engage daily in channeling their social values through occupations. Some do it through entering "helping" professions, by working for social organizations, or by becoming activists. A striking similarity among these occupations is that organizations mediate them. A daily context that can influence participants' experiences, organizations can both amplify and diffuse ideals, and engender cynicism. This project thus looks at how altruistic aspirations interact with bureaucratic routinization, to understand what happens when individuals with lofty social ideals enter an organization that may be inconsistent with those ideals. My case study is Peace Corps, which is, like many other social organizations, a necessary compromise between participant ideals and the mundane realities of being a sustainable bureaucracy. Using data from an ongoing cross-national comparative study between Peace Corps programs in three countries, interview data from more than 140 returned volunteers and staff, I show how bureaucratic organizations (through which most idealism in the US is channeled) mediate people's social commitment. Findings suggest that volunteers are similar in important ways to other activists, both in terms of collective identity and political motivations. Volunteers have similar needs as activists (collective processes, etc.) that the Peace Corps, understanding itself as a knowledge rather than as an activist organization, does not meet. Lacking structures for dealing with the "big" questions about development and international relationships, volunteers experience a decoupling of the program's goals and what they perceive it to do. They resolve this cognitive dissonance via a) increased conservatism, in which they come to understand the *recipients* of services as unworthy, or b) in a critique of the organization itself. I develop a clearer theory of the effects of "on-the-ground" workers in ideologically motivated fields that, instead of focusing on the psychological elements of burnout, emphasizes the structural-organizational factors that act on participant ideals.

Voluntary Work and Generous Unemployment Benefits As a Replacement for the Loss of Manifest and Latent Benefits of Paid Work

As the risks associated with growing labour market deregulation and flexibilisation are increasingly shifted towards individuals, an increasing number of people are likely to experience unemployment, which may result in declining mental health and wellbeing. Therefore it is important to investigate how these negative consequences of the unemployment could be reduced. Drawing on the Latent Deprivation Theory, Agency Restriction Approach and Beck's vision of civil labour, this article examines the extent to which voluntary work, supported by unemployment benefits, can compensate for the loss in manifest and latent benefits associated with paid work and thus improve unemployed individuals' wellbeing and mental health.

Using multilevel data from the European Quality of Life Survey for unemployed individuals in 29 European countries and various external sources, this article finds that in countries with more generous unemployment benefits, all unemployed people, regardless of whether they volunteer, have better mental health, and higher happiness, life satisfaction, and life fulfilment. We also found that unemployed people who volunteer more regularly are more likely to have

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

better mental health in countries with higher unemployment benefits, compared to unemployed people who do the same level of volunteering in countries with a lower level of unemployment benefits; and unemployed people who volunteer frequently report that their life is more worthwhile than the unemployed who do not volunteer.

The main conclusion is that although voluntary work constitutes an alternative source of activity and identity which gives people feeling that their lives are worthwhile, the generosity of unemployment benefits is vital for maintaining good mental health and high level of wellbeing during unemployment. These findings indicate that Beck's vision of civil labour in multi-activity society can only become a reality if voluntary work is combined with generous welfare benefits.

An Explanation for the Increased Rate of First Marriage of the Cohort Born in the Year of the Fire Horse Using a Two Sex Model Based on the Concept of the "Encounter"

The year 1966 was the Year of the Fire Horse in the Chinese calendar. In Japan, the influence of this tradition accounts for the very low number of births in that year - approximately 3/4 of that in the previous year. Twenty-nine years later in 1995, the probability of first marriage by age for the generation born in the year is unnaturally high compared to immediately younger and older cohorts.

If we consider the population pyramid in detail, the range of ages marrying the cohort born in the Year of the Fire Horse is considerable. Therefore, in order to calculate the correct probability of first marriage it is necessary to control both male and female populations together. This requires presentation of the two-sex model (marriage function). Assuming the number of first marriages m differentiated at time t as m', the male population as M, and the female population as F ($M < F$), the probability of first marriage k is $k=m'/(M(1-(m/M))(1-(m/F)))$. The denominator then represents the number of "encounters" between males and females. Solving this differential equation permits derivation of the marriage function $kt=K=(F/(F-M))-ln((M/F)((F-m(t))/(M-m(t))))$. The "distortion" associated with the Year of the Fire Horse is considerably reduced when the probability of first marriage is calculated using this model.

Of course, this Year of the Fire Horse Effect is not unique, and appears whenever there are irregularities in the population pyramid. The probability of first marriage is currently decreasing in many East Asian countries. In order to clarify the causes of this phenomenon it is necessary to eliminate these effects from the original data using the two-sex model.

KAMMERER, MARLENE* (University of Zurich, kammerer@ipz.uzh.ch)

Analyzing Discourse Networks –the Politics of Climate Change Mitigation in Switzerland

The analysis of discourse networks is a useful instrument for understanding the conditions under which specific political decisions are made. Cleavages often offer a helpful explanation for general contestations over specific policy issues. Political actors tend to formulate their policy preferences according to their positioning in a political space that is constituted by the most relevant political cleavages. However, as cleavages are usually stable over time, they are not sufficient to explain short to medium term dynamics in policy processes. Thus, it is important to also consider the political context of a policy i.e. issue linking and actor constellations. This paper investigates the Swiss policy discourse on the revision of the CO_2-Act between 2009 and 2013, which is the centerpiece of climate change mitigation politics in Switzerland. Specifically, it asks to what extent the discourse on climate change politics can be explained by divisions over general value orientations manifested in political cleavages or by the political context. Methodically, a combination of discourse network analysis and inferential network modelling allows to analyze what kind of political actors support which policy preferences and why. Discourse network analysis is helpful for mapping ideological relationships and identifying actor coalitions; inferential network analysis enables to model the process of formation of ideological ties. The study expects to demonstrate the significance of structural characteristics of the policy discourse. Whereas general political cleavages are important to understand the division over climate change politics on a general level, the political context plays an important role in the policy discourse when it comes to specific objectives and instruments.

Coexisting Mechanisms from Bonding/Bridging Social Capital to Subjective Well-Being

Subjective well-being or happiness is one of the most important but controversial frontiers in social capital research. Subjective well-being itself is essential for rational choice sociology because it has been regarded as the ultimate goal of rational actions during the history of social sciences since Aristotle. However, in spite of an old story from the viewpoint of civil society that bridging social capital should bring about a good and efficient society, empirical evidences from survey data on the relationship between bridging/bonding social capital and subjective well-being have been often inconsistent with each other not only between different societies but also even within a society. This paper aims to propose a new perspective based on an empirical evidence that there could be more than one causal mechanisms between bridging/bonding trust and well-being which take turns in appearing or sometimes coexist with each other in the history of a society. The data were collected by a web survey conducted on February 2015 in Japan. The respondents (N = 10,419) were 20-69 year-old pre-registered monitors whose number were assigned proportionally to the latest census distribution in terms of age, gender, municipality size, and region. Latent class regression analyses discovered two contrasting latent classes regarding the relationship between trust and well-being. One group has a *negative* interaction between bridging and bonding trust to well-being, but the other group has a *positive* interaction between them. The respondents in the latter group have higher education, income, and bridging and bonding trust than those in the former group. This finding suggests a possibility that bonding and bridging trust *complementarily* promote well-being at some stage in the history, but in the process of modernization they turn to contribute *synergistically* to well-being.

KANASZ, TATIANA* (The Maria Grzegorzewska University; NIP: 525-00-05-840, tkanash@aps.edu.pl)

Helping Relation: Between Pride and Shame. Buying Food for a Hungry Person in Poland: A Case of an Internet Discussion

The present case study examines feelings and perceptions of people who occasionally buy food for a needy person in Poland. It is based on 500 selected Facebook comments. The aim of this study is to reveal typical emotional reactions towards helping a hungry person. The theoretical framework of the study is built on the sociology of emotions, namely Arlie Russel Hochschild's concept of the emotion management and feeling rules, and Candance Clark's concept of sympathy margin.

This is an interesting case because it attracted a lot of people (including the media) in a short period of time opening a discussion on the moral condition of Polish society. When Tomasz Motylinski (who is an IT worker, rather unknown for the public) published a private Facebook post about his experience of buying food for a poor man on July, 2014, 170 thousand Facebook users liked his post, and 1.5 million people visited his Facebook page.

Asking someone to buy something to eat creates an interaction order with various emotions and unequal power relations. On one hand, people providing aid feel proud due to their sympathy (becoming a sympathy donor toward a poor), on the other hand, they feel a sorrow (sad and disappointed) that their help is just momentary, they are not improving a status of a needy person. Samaritanian way of conduct towards a hungry poor person arises two basic emotions in the observers: some feel compassion, others are hostile and they stigmatize both a poor person and his or her virtue. Yet, the receiver of aid stays silent in the media discussions.

KANEKO, MASAHIKO* (National Defense Medical College, kaneko@ndmc.ac.jp)

Types of Profession-State Relationship

This presentation shows a comparative study of profession-state relationship. The method of managing the qualification of profession varies among countries. In Japan, the Ministry of Health, Labour and Welfare, the governmental ministry, manages the medical register (*Iseki*) and hands out administrative punishments such as withdrawal of medical licence or suspension of practising medicine, and conducts the national examination for medical practitioners. On the other hand, the General Medical Council, the statutory regulator out of the government, manages the medical register and hands out punishments such as withdrawal of medical licence or suspension of practising medicine, and monitors and checks the curriculum of medical schools in UK. This difference is properly explained by Freidson's discussion (2001). He presents the typology of profession-state relationship. The reactive-hierarchical state suggests the bureaucratically organized state ministries staffed by professionally trained officials who themselves establish and administer regulations and institutions designed to serve the interests of professions. The professionals are "in" the government. On the other hand, the reactive-coordinate state represents the circumstances of officially recognized private interest groups exercising powers delegate to them by the state. The professionals are "out" the government. According to this typology, Japan is the reactive-hierarchical state while UK is the reactive-coordinate state. We should try to find appropriate health human resources policies and plans in accordance with types of profession-state relationship.

Educational Tools for Social Change Among Youth on the Thai-Burma Border

This action research project explores the practical application of Paulo Freire's critical pedagogy in an intensive history course involving thirty-four youth participants from Burma. The course is contextualized as a crucial element within a residential, long-running post-10 social justice education program on the Thai-Burma border. Community-based initiatives like this one serve ethnic populations displaced from Burma to Thailand by civil war, operating schools that double as change agents in the struggle to end widespread injustice and promote genuine democracy in Burma.

Due to their non-formal nature, these educational institutions are ideal environments to nurture and explore the applicability of critical pedagogy as a revolutionary tool—one that is most often attributed to Paulo Freire in his landmark publication, *Pedagogy of the Oppressed*. Literature exists demonstrating how Freire's ideas have been tested and widely discussed throughout the Americas (Brookfield 2005; hooks 1994; Shor 1996), but little has been written about what happens when these principles are practically adapted and applied within a Southeast Asian, and specifically, multiethnic Burmese context.

This educational experience illustrates how the classroom functions as a place where new ideas are tested, alliances formed, and power shared, establishing foundations for future social action. Teaching and learning are evaluated utilizing the strategies of democratic learning through a student-generated curriculum. The teacher also doubles as the researcher in this work, which was submitted to the University of Bradford's Department of Peace Studies (UK) as an MA dissertation and awarded a distinction.

Through reflective analysis, narrative writing, and critical engagement with relevant pedagogical literature of the last forty years, this study investigates the results of Freire's ideas when implemented on the Thai-Burma border, and the ongoing implications for teachers and students of revolutionary education.

Impression Management in Greek Pre-Election Interviews

Clayman and Heritage (2002), Heritage and Clayman (2010), claim that there has been an adversarial turn in political interviews, with journalists asking more adversarial questions, or initiating micro-arguments (Montgomery 2011). Tolson (2012) in his longitudinal examination of UK pre-election interviews (1983-2000), has noted that journalists do not comply with the expected journalistic norm of *neutralism*. Within the Greek context, Patrona (2011) in her examination of journalists' questions has identified a similar trend, claiming that: "by breaching the conversational standards of neutralism, Greek news journalists essentially claim and assert the legitimacy of this new – 'deregulated' – type of television news journalism" (ibid:174).

Politicians, as Clayman and Heritage (2002) and Bull (2003) - among others - have shown, tend not to answer but evade and/or resist answering adversarial questions. In this paper I examine politicians' answers to adversarial questions within the Greek context and more specifically in televised interviews during the 2012 Greek elections campaigns. Investigation of the form and function of politicians' answers, in relation to the development of the talk-in-interaction and the form of (televised) news interviews in general, has revealed that Greek politicians instead of 'simply' evading and/or resist answering adversarial questions, 'strike back' using techniques journalists themselves use to challenge politicians. This results in the 'deregulation' of the news interview in two ways: firstly in the transformation of the typical Q-A news interviews sequence, with a third move being added where the journalists account for their adversarial move before moving on with his/her agenda. Secondly the metadiscursive nature of the challenges and counter challenges exchanged, shifts the focus from the content of the interview to its performative aspect. In other words there is a shift from of the political manifestos to the rules of the interview game and who of the two interactants is the fairest player.

KANTER, HEIKE* (University of Potsdam, kanter@uni-potsdam.de)

Iconic Power. the Everyday Editing of Press Photographies.

This paper is based on a research in the role of press photographies in constituting and shaping society in the field where media, politics, and the general public interact. In every published photography, newspapers implicitly present their specific perspectives to a public which is supposed to accept them as valid und objective representations of reality. Framing the pictures is inevitable but, at the same time, excludes possibly competing interpretations. As a rule, this "iconic power" rests on the implicit assumption that photograhies present reality as such.

This assumption will be reinforced as its social production remains hidden. Nevertheless this "iconic power" should not, as a rule, be understood as an outcome of intentional strategies. The decision to publish the "right" photo in the "right" frame is part of a routine. Thus, photographies which are published in newspapers are a product of normal routines of the editorial staff who on a daily basis select, crop and modify them. This activity can be understood as shaped by a habitus – in the sense Bourdieu gave to this concept - of the persons actively involved in the publishing process.

The interpretative method used here largely follows the "Documentary Method" (Bohnsack). The starting point for empirically grasping the effect ot the habitus is the tentative reconstruction of formal structures found in the picture itself. On its basis, is is possible to explore the cognitive perspective of those involved in shaping and placing the photographies. By contrasting several photographies which approximately represent the same situation but are published in different newspapers with differing political orientations it is possible to find access to the perspectives characterizing those different papers. Their editorial habitus is part of a visual culture. It is expressed everyday in publishing pictures.

KAO, SHU-FEN* (Fo Guang University, sfkao@mail.fgu.edu.tw)

Citizen's Initiatives and Energy Democratization in Taiwan

With the urgency of global carbon-reduction and the emphasis of sustainable energy, "energy transition" has been adopted by many countries in 1980s. Although the government in Taiwan has launched several nationwide conferences on energy issue with the attempt to reach social agreements on so-call "energy transition," public participation, action guidelines and consensuses are insufficient due to the lacking of serious discussion of national vision and inter-generation justice. In the end, with the discontinuation of the fourth nuclear power plant and disputes from coal-powered plants, the energy transition has turned into nurturance of another centralized and grand-scale green-power industry in order to fill the gap of electricity. The civil obligation of frugality and public participation of local communities are thus neglected and remained a vague image. However, in the energy transition plans of major countries, the participation of local citizens and local governments are indispensable during the implementation period. In this paper, employing the perspective of "energy democratization" and "co-evolutionary innovation for sustainability," the author analyzes citizen's initiatives and local strategies of renewable energy advocacies, action networks and their impacts on socio-technological innovation and community empowerment ...etc. in Taiwan. To answer these research questions, major stakeholders, such as industrial sectors, local activists, NGO members, government decision makers and experts are interviewed and invited to participate in focus groups discussion. In addition, content analysis for documentary data related to green power generation and local energy advocacy are utilized. This paper aims to analyze the nature of socio-technological innovation driven by citizen's initiatives and the challenges from social, legal and institutional dimensions that community actors might face. Based on the findings, the author hopes to seek policy remedy and to deliver suggestions to strengthen public participation in reaching energy democratization.

Journalists As Cosmopolitan Actors in Climate Change Communication? Exploring Taiwan Case

Climate change as globalized "risk" is one of the most pressing issues of our time. It has been revealed that the media plays a key role in shaping public perceptions and policy agendas. This paper derives from an approach relating "reflexivity" to public sphere within today's globalized communication landscape, which allows to combine the framework of reflexive cosmopolitanism with "reflective interdependence" (Volker, 2014) in order to assess fine lined communication trajectories across digital networks. In other word, given the advanced stage of digital spheres nowadays, journalists are "connected" across world regions and are now situated in highly complex communication flows, ranging from traditional news agencies to thematic social media sites. Within such a digital "networked" context, in addition to constructing national "risk" perceptions, if journalists construct globalized "risk" perceptions as well? It is critical to explore on the "pattern" in which journalists perceive climate change and how they engage with "news" across such a globalized digital scope of sources? Employing in-depth interviews with mainstream journalists along with other social actors, such as scientists, media experts, and policy makers in the field of climate change research, this paper aims to identify the "reflexive" axes, constructed by journalists in Taiwan, and discover the way in which journalists in Taiwan assess different horizontal sphere to construct climate change within their professional context.

Informal Employment and Subjective Well-Being in Europe: Evidence from the European Social Survey Data

Work constitutes one of the main spheres of human life. Hence, a person's perception of work, or a type of job in particular, may affect their subjective well-being. The absence of any written labour contract, also known as "informal employment", leads to uncertain prospects and an unstable low income situation, resulting in low job satisfaction. This paper attempts to reveal the impact of informal employment on subjective well-being in European countries by examining the differences between countries through employment protection legislation. Informal employment in countries with liberal employment protection legislation has a less negative effect on the subjective well-being of employees, than countries with strict legislation. The results, based on European Social Survey (2010) data, demonstrate a negative relationship between informal employment and subjective well-being. Countries with strict labour legislation face lower levels of subjective well-being due to a higher share of informal workers and a greater difference in happiness scores between the insiders (permanently employed) and outsiders (informally employed).

Third Gender: The Challenges for Developing Countries

The term third gender describes individuals who are considered and are identified as of female gender. The Europeans and other countries, named it as 'transgender' or 'transsexual'. It is one of the great challenges for India, because India is the only country where the tradition of eunuchs is prevalent. There are about 1 million of them, though their role in life has changed drastically from that of royal servants and friends. They persist as a marginalized and creative subculture in deprived urban districts of Bombay, Hyderabad, Ahmadabad, and Delhi. They do have widespread presence as T-G communities in southern India, Pakistan and Bangladesh. With demands for proper identification, the Central Bureaus of Statistics (CBS) has included 'third gender' in the Census scheduled for 2011.

The paper is focused on 48 T-Gs living of border areas in the state of Maharashtra and Karnataka and used snow ball sampling method. The third-genders are deviants in the sense, they have been exploited for immoral traffic and someone is carries of venereal diseases also. They have no future and are unable to come out of the situation in which they have been put by their sexual position. They have become a community which is not liked by greater society in spite of the fact; they cater some ritual and religious needs of public. They do not have any specific economic role and are not sure about the income. They are poor community and a victim of public ridicule.

The third-gender indulges in prostitution and in the drug traffic for their livelihood. It is necessary to educate them and give suitable jobs and protection to avoid further problematic situation in the society. Practically, the problem is not with their inclusion but is how can we stop the blind faith that creates T-G?

Ageing Problem and Old Age HOME in Sangli, India

The twentieth century has witnessed the widespread urbanization in the industrialized countries of Europe, North America and Japan. This drift is steadily spreading to the Third World countries too. The new industrial structure with its political and social value system together, tend to alter the social structure of society.

The industrial order tends to place greater emphasis on achievement and productivity. This so-called modern, political and civil society does have more emphasis on individual activities and achievements both. In India the position of old people in the society is still party rooted with past traditions and family norms. It is therefore relevant and worthwhile to examine the developments. The status and role of aged in the traditional society is a prelude to this particular research study.

In India we find rapid changes in economic and social aspects but are eroding traditional status and roles as well the support structures for the old persons. The urban literates are very well aware of the excessive demands made by urban industrial ethos on individual's resources and these aged persons are facing many problems because they are neither offered with any pension scheme nor do they have any other needed social security.

The present research study focuses on the position of the traditional and modern values in determining the social positions and compensations for the old persons. In Sangli city, there are only two oldage homes. Under the study, out of 110 old persons 25 males and 25 females are selected from two oldage homes.. The honour and prestige, the aged enjoys with the family or contradictory, the extent of loss of status and roles they face, is assessed in the research paper.

High School Youth's Fear of Crime in Turkey

All individuals have potential to commit a crime in modern society. When we think about that everyone also has potential to be a victim of that particular crime. In this context, it could be expected that individuals can be afraid in their everyday lives with the increased media coverage and information opportunities. Thus the term, "fear of crime" defined and while there have been plenty of studies done on the topic; its emergence and studies on the Turkish society is relatively new. In this study high school students', aged 15 to 18 and mostly neglected in previous studies, fear of crime are investigated. The study tries to explain the relation of different perspectives and how they affect fear of high school youth. Both individual variables and social variables are examined. The most important variable that affects youth's fear is identified as gender. Female students reported higher fear of crime levels than males with pointing the origin of their fear is media. While media is also the origin of the most male students' fear, being in a high crime rated neighborhood came as second origin differing from their female counterparts. Also most feared crime types, taking precautions for not to be a victim of a crime, the crime types that's been affected most when seen or listened from media etc. differs between both groups. Explanations about causes of this situation and recommendations were made about how to reduce this fear difference between both groups and what type of policies are needed for the future generations.

Invisibility of Intern's Labour: Is It Working? Is It Training? Is It Playing?

An unknown number of young people are doing internships globally. What we are seeing in the working world is an explosion of internships and interns. There are estimated to be about one to two million young people only in the United States doing internships each year and many of them are doing multiple internships. Many of these internships are unpaid and illegal. So the interns who are working under these conditions lack basic workplace rights. Yet the growing sense of insecurity and fear for future drive young people, especially university students and recent graduates to do internships with the expectation of gaining experience and guaranteeing jobs. The internship has become a widespread form of precarious employment among young people. It is mostly an unregulated world which is often used by employers as a means of obtaining cheap labour. As Ross Perlin says "unpaid internships have become standard practice across the globe" making interns' position legally ambiguous. Therefore their position in the work place requires invisibility. This paper aims to explore the world of internship by drawing on the feminist theory of invisible labour and it will be argued that normalisation process of precarisation contributes to this invisibility. The discussion will be based on an ongoing research conducted among university students and recent graduates who are doing or completed internships in various fields in Istanbul, Turkey.

Defining the "Migrant" Resident in Vienna. the Non-Definition of "Migrants" in a Developer's Competition for "Intercultural" Housing Estates and the Consequences for Housing Allocations

The former train station "Nordbahnhof" is currently one of Vienna's largest areas of urban regeneration. An entirely new neighborhood is expected to be completed by 2025. In this paper, I explore the planning and building of subsidized estates following a housing developers' competition under the banner "intercultural housing". By 2014, around 650 apartments were built in six different "intercultural" estates. The competition envisaged the living together of "migrants" and "non-migrants". A quota of 20% "migrants" per property was established, without however providing a definition for that. In fact, defining "migrants" became part of the competition itself. Therefore, housing developers were faced with the task of specifying which persons would be understood as "migrants" by the use of which terms. The housing corporations opted either for explicitly indicating a group of possible "migrant" inhabitants, such as "refugees", or for keeping "silent" until the final allocation of the apartments. The special interest of the paper lies in this "silence" and its consequences for the allocation process. The Viennese housing provision system gives great power to single employees of housing corporations, which means they effectively decide the allocation of certain subsidized apartments "by themselves". In some cases such employees "silently" labeled potential residents as "migrants" without explicitly defining what makes a migrant. It was not necessary to provide a definition, as persons in charge thought they knew whom to see as "migrant". Also applicants seemed to share a similar understanding, thus consenting to their being ascribed as "migrants". I will show how "intercultural" housing projects turn into the reproduction of the stigmatization of certain population groups. Thereby various terms, both of longstanding and of recent use, are overlapped: "foreigners", "guest workers", "poor residents of `migrant´ neighborhoods", "migrants" such as "intercultural people".

Reduced School Dropouts and Lower OECD PISA Scores: Controversial Impact of Rural Schools on Education Policy Efficacy in Latvia

The number of Latvian population constantly decreases due to low birth rates and extensive emigration, furthermore – national level mobility from countryside to capital is widespread. Therefore, population density in rural areas is declining, and in turn – number of pupils in rural schools. Policy planners emphasize three strategical pillars of Latvian education system - quality, accessibility and cost-effectiveness – and statement that every child, regardless of place of birth and socio-economic status should be able to receive qualitative education.

At the same time Latvian pupils' achievements – the result of quality of education system - are at mediocre level in the international comparative educational evaluations. Unfortunately, OECD PISA results and centralized examinations in national level shows strong growing difference in pupils' achievements between urban schools with high results and relatively low results of rural schools. Also, rural schools receive much of the criticism in relation to the lack of cost-effectiveness – the number of pupils is very small, therefore teacher – pupils ratio is low, which creates a negative impact on the efficiency of the education system in the national level. At the same time, studies confirm that schools closest to the residence provide higher accessibility and reduces early school drop-out, that is undoubtedly crucial for human capital development in situation characterized by significant income inequality, high risk of poverty in families with children.

Considering forecasts related to depopulation trends, aim of this research is to seek evidence based solutions for "smart shrinking" of education institutions network in Latvia - identify ways to reduce infrastructure maintenance costs, to develop innovative approaches to education accessibility and equity by cooperation between municipalities.

KARNER, CHRISTIAN* (University of Nottingham, christian.karner@nottingham.ac.uk)

Biographical Subtleties and Subaltern Resistance Against Everyday Nationalism: Asylum-Seekers in Austria's "Megaphon"

Building on previous research (Karner 2007, 2011), this paper offers a qualitative analysis – underpinned by central concepts in critical discourse analysis (CDA) – of a form of speaking back to and resisting everyday nationalism/ racism. The discussion focuses on the Austrian monthly street magazine *Megaphon*, which is sold predominantly by asylum-seekers in towns and cities throughout Austria's south-easterly region of Styria. *Megaphon*'s central features include biographical accounts co-produced by asylum-seekers and local, Austrian authors. These monthly life stories condense the pre-migratory, migratory and post-migratory experiences of individual asylum-seekers for the Austrian/ Styrian public, thereby challenging many of the everyday stereotypes and "topoi" that define mainstream media representations of "the other" and of a growing "asylum crisis" in and far beyond Austria today.

Jointly produced by local writers and forced migrants, these accounts further avoid the kinds of "epistemic violence" (Spivak 1988) typical of many a dominant discourse about subaltern others by members of dominant majorities. Instead, by offering "emancipatory" (Fraser 2012) registers of co-production involving both the relatively privileged and the structurally marginalised (Karner 2011), these monthly life histories provide powerful examples of the previously or otherwise silenced "coming into representation" (Hall 1989: 25).

This analysis draws on a large corpus of relevant materials: i.e. all *Megaphon* issues published since 2005. Further, it employs some of CDA's most powerful conceptual tools – particularly those of the *deixis*, or "rhetorical pointing" (e.g. Billig 1995) for the purposes of reproducing boundaries, and of the *topos*, or "structure of argument" (e.g. Reisigl and Wodak 2001) – to demonstrate how the argumentative structures of nationalism/ racism are challenged by *Megaphon*'s counter-discourse. The latter is thereby shown to subvert nationalist stereotypes and exclusion through both its methods of production and circulation and through its linguistic-rhetorical features.

KARNER, TRACY XAVIA* (University of Houston, txkarner@uh.edu)

Constructing Status and Reputation: Celebrated Leaders By Their Own Design

In this paper, I will explore the construction of celebrity status by charting the path of two photojournalists who decided to create an international photography festival in Houston Texas with little more than an idea. Today, Fotofest is one of the largest photography festivals in the world, the oldest in the United States and will host its sixteenth biennial in spring 2016. Founders Fred Baldwin and Wendy Watriss incorporated Fotofest in 1983 and now it is recognized as one of the most important photography events in the world. In 2014, over 275,000 people attended the six week biennial, coming from 43 countries. More than a thousand (1,159) artists participated, coming from 40 countries and 37 US states, and exhibited in 130 art and civic spaces throughout the greater Houston area. Additionally, 200 photography events were held that included talks, performances, art events and more—all together contributing an estimated $1.5 million in revenue to Houston businesses. Beginning with a vision, their network of other internationally known photojournalists and awards for their own photographic work, Watriss and Baldwin set about creating a biennial that has elevated them to celebrity status in the photography world. Data come from ten years of participant observation, archival research and interviews. Findings include identifying the components of their celebrity, the various strategic partnerships they engendered, and how they symbolically linked their own success to the Fotofest brand. Tracing the processes of celebrity formation in occupational groups or specific communities, like the photography world, can add greatly to our general understanding of status and reputation construction.

Being Different: Neurodiversity and Neurosocial Subjectification

What is it like to be normal? This question can hardly be addressed without a frame of reference. Just like deviance is only perceivable in relation to a certain norm, normality can only be framed as such in relation to variation. What is it like to be different? For those with experiences of marginalization, isolation or exclusion, this question may trigger many answers. Being different can manifest in numerous ways: being too short or too tall, too slow or too smart, belonging to the "wrong" gender or ethnicity, or being different in any other way from a specific reference group or set of norms. Distinction is a basic form of sociality enrolled to reduce complexity and constitute individual and collective identities. Modern medicine, as a normality regime, establishes distinctions by defining boundaries between health and illness. A striking example in this context is the definition of "sociomedical disorders", which are characterized by variant emotional states, limited cognitive efficiency or deviant social behavior. Among these impairments, ADHD or Autism Spectrum Disorder not only seem to display an increasing prevalence but also remain contested. On the one hand, stakeholders (e.g. individuals affected or patient organizations) promote these diagnoses to gain recognition and access to health care benefits. On the other hand, labels such as ADHD, are widely criticized as ways of medicalizing social deviance. The Neurodiversity social

movement aims at removing the medical label from such conditions and suggests framing them as neurological differences instead. Being neurodiverse nevertheless provides a crucial basis for processes of subjectification and communitarization that originate in and build upon neurological interpretations. The proposed submission follows an explorative approach and aims at identifying central issues to propose a strategy for further research on neurodiversity.

KASHANIPOUR, JASMIN* (University of Vienna, jassikash@yahoo.com)

The Performing Body: An Ethnographic Field Study with Life Drawing Models

When presenting their body, life models differentiate between performing and appearing. Since they associate performing with subjectivity, presence, and expressiveness, they see the act of performing as something "different from somebody coming, taking off the clothes, sitting down, and making the naked body available". Most of my interlocutors describe their profession as *performance*, implying that there is *movement* in the act of posing, even when they must stand still, be silent, and avoid direct eye contact. Referring to "emotions", "presence", "sensuality", "expressiveness", or "energy", they suggest that the relationship between model and artist is determined by transference and counter-transference rather than by symbolic interaction. In their view, poses which are listless, *challenge and disturb* the gaze; and poses which reveal expression, sensuality and emotion *attract and draw* the gaze. Thus, perceiving themselves as performers, some life models describe performance as an act which goes beyond "creating pictures for artists" and beyond appearing or representing bones, flesh, skin, and hair. It involves drawing the gaze.

While emotions are invisible, embodied emotions are visible. The still and silent body speaks; its language is emotions. Each performing body has its own language. In the same setting one body is frightened, the other is ashamed, the third one feels joy. The body is the "embodiment of dynamic human relations" and a medium of "influence within the artwork itself" (O' Reilly 2009: 17). In this regard, this paper aims to present how contemporary life drawing models whom I studied with, describe the ways how socio-cultural and political dynamics shape perceptions of and understandings about the human body, and how those perceptions and understandings influence the embodiment of pain, joy, shame, fear, and moreover, of the self and the other.

KASSIR, ALEXANDRA* (EHESS, alexandrakassir@gmail.com)

"Civil Marriage, Not Civil War!" Anti-Sectarian Activism in Post-War Lebanon

This study examines the struggle of young anti-sectarian activists in post-war Lebanon. It discusses the youth aspirations, efforts and challenges in becoming actors of their own lives and agents of change in a state of permanent political instability, very vulnerable to regional turmoil.The sectarian regime is a multifaceted power sharing system that entails both the distribution of the government and administrative posts among the various confessions and the relinquishing of the personal status jurisdictions to the religious courts. By rendering the citizen-state relation mediated by the sects and their affiliated political parties, it very much hinders the various attempts towards building a more democratic system. In this context, the anti-sectarian wave, a predominantly youth-led grassroots movement operating outside the realm of conventional politics, has been largely overlooked. Using a participatory methodology based on the activists' reflexivity and self-analysis of their action, this study sheds the light on the youth subjective experiences and "alter-activist" mode of engagement. It first, reveals how the participation in the movement is not a mere political stance but an affirmation of the self against a system interfering in the most intimate aspects of their daily lives and is in itself, a transformative experience. Moreover, it discusses how this "subjectivity path" simultaneously brings the youth closer and away from achieving their democratic aspirations. If their shared mistrust of institutional politics and their commitment to ensure a means-ends consistency are among the main challenges for an effective impact in the realm of conventional politics; the fragility of this mode of engagement simultaneously constitutes its strength. It allows the youth to overcome both the potential obstacles linked to the recognition of religious particularisms in a plural and divided society, and the political deadlock to fabricate democracy in the "here" and "now", in this context of political instability.

Local Conflicts and Global Norms: Transitional Justice and the Struggle for a Better World

Since the mid-1980s states that had been confronted with a bloody past have attempted to come to terms with their history through transitional justice instruments such as ad hoc, special or hybrid international criminal tribunals and truth and reconciliation commissions. Over a period of only thirty years, more than fifty instances, mostly associated with periods of radical political change following past oppressive rule, have occurred in countries of Latin America, Africa, Asia, Central and Eastern Europe, and currently even in Arab-Islamic states, like Tunisia and Morocco, too. Based on a conception of world society theory the paper identifies international and trans-local agents who contribute to this global diffusion process of norms, standards and institutions of post-conflict justice and illustrates domestic socio-legal implications of the new global legal regime of transitional justice through an analysis of the current process of dealing with the legacy of the past in the Kingdom of Morocco.

Le Néopopulisme Comme Pratique Sociomatérielle Organisée: Une Analyse De L'effet D'embrayage Des Médias Du Web 2.0.

Le néopopulisme comme pratique sociomatérielle organisée: Une analyse de l'effet d'embrayage des médias du Web 2.0.

Discours néopopuliste, médias sociaux, web 2.0, rôle des médias, analyse des communications, analyse des métacommunications, effet d'embrayage.

Jo M. Katambwe

Université du Québec à Trois-Rivières.

La recherche a isolé deux types ou catégories de reformulation du discours politique (Durand & Lits, 2005) dans les médias : celles qui proviendraient des médias d'élite et celles qui proviennent d'autre part des médias tabloïds (Mazzolleni, 2005, 2003), voire *people* (Dakhilia, 2009). Le Web 2.0 et les médias sociaux en général, puisqu'ils constituent une nouvelle façon de médiatiser l'information (Castells, 2001, chap.7 ; Castells, 2009, chap.5 ; Rissoan, 2011), ont une manière propre de reprendre et de reformuler l'action et le discours politique. Dans cette présentation nous faisons la proposition que les médias sociaux introduisent une nouvelle catégorie de reprise ou de reformulation différente des médias d'élite et des médias tabloïds et produisent un « effet d'embrayage » sur les processus et modèles organisant sous-jacents à la communication néopopuliste. Nous mettons à l'épreuve cette proposition d'un nouveau rôle informationnel des médias du Web 2.0 par le biais d'un examen de la congruence (« fit ») entre d'une part la structure de la communication néopopuliste, à savoir ses processus et modèles organisant, et d'autre part le mode de fonctionnement des médias sociaux. Une analyse sociomatérielle (Orlikowski, 2009 ; Barad, 2007) des médias du Web 2.0, une analyse thématique des messages (Semprini, 1996 ; Mucchielli & Paillé, 2013) ainsi qu'une analyse des reformulations et donc des métacommunications ou des évaluations (Martin & White, 2005) de la presse et de la littérature savante serviront à montrer l' « effet d'embrayage » produit par la correspondance de ce discours néopopuliste avec les affordances et les fonctionnalités des médias sociaux.

KATERNY, ILYA* (MGIMO-University, jasonhue@yandex.ru)

Morphogenesis of Neo-Social Relations: Normative Dimensions of Trans-Mobility and Mixed Communications

Symbolical and structural difference between the ascriptive reality and the different region of achieved statuses has always been supposed beyond all question due to well-known historical, or specifically evolutionary rigidity of such distinctions as (racial) white and black, the man and woman, and furthermore the human and non-human, the animate and inanimate, the physical and non-physical. These ascriptions have played a major role in legitimizing emergent norms of "paramount reality" throughout the history of grand civil gains - from abolition of slavery to recognizing the rights of sexual minorities - but at the same time they have poorly been redefined. However, on-going social changes make profound interventions into ascription. We are witnessing arrival of the neo-sociality, which is marked by conspicuous peculiarity of diluting fundamental ascriptive dichotomies: *(1)* between human and subhuman (i.e, the rights of animals); *(2)* between cultural ontology and natural one (i.e., transrases, transsexuals); *(3)* between intelligent entity and anorganic one (i.e., robots), and also *(4)* between physical and non-physical existence (i.e., e-money). A new brand social phenomena of heteroclite statuses and identities with normative uncertainty has emerged. Thus, we need to introduce and define one more type of normative morphogenesis, along with the noted R.Merton's innovation and aberration, that would characterize the phenomena. So is the 'transgression' (R.Caillois, G.Bataille) interpreted as the modern way to overcome limits of ascription and to call various mixed positions into being. Diversity of autonomous transitions and coactive switchings into the mixed positions falls within the concept of 'trans-mobility' - from fetuses to bodmods. When subjects and objects with transgressive statuses and identities are socially involved and enacted, it constitutes fast increasing area of the mixed communication - from the Internet of things to already no surprising sex with robots.

A New Meaning of Mental Health in Japanese Net World

This presentation focuses on the shift of the usage and the meaning of the words on mental health. Generally, ill health can be a reason of removing love interest in others. However, some exceptional discourses have become known in Japanese net world.

Menhera is a net slung that indicates people who needs some mental health care. It is a compound word that consists of mental, health and a suffix, er. Originally, people who may come to BBS about mental health were called as menheraa(men-heal-er). Later, it changes to shorter and menhera is sometimes used as a kind of discriminative words. However, only recently, we come across menhera as some positive meanings, for example kawaii(pretty, lovely).

In parallel with it, a typology of girl characters becomes popular. It categorizes girl characters of games, especially dating simulation games, animations and sometimes every girls and women in a positive sense or as an attractive point. Yandere is a type of the girl who has a disposition of blind love sometimes to the degree of mental disease. In a precise sense, manhera and yandere are different: menhera is narcissistic personality and yandere is borderline personality. However, these two words are the most distinctive on the change of the meaning about mental health and disease.

It has been often said that their dependency on lover sometimes can be attractive and menhera/yandere oriented is a kind of projection for the person who has been impossible of achievement in love or human relationship. However, not only within boys' eye to girls, but also this new meaning of mental health spreads to the girl's fashion and identity. This tendency makes the conventional analysis invalid. We also see bandages and eye patches as fashion items so that we have to reconsider the meaning of health and disease.

Wealth Management : The Need of the Hour for Post Retirement Security

The better health and sanitation conditions in India have increased the life span. Life expectancy in India is moving up and up with each passing decade . It was 49 years in year 1970 , increased to 64 years in 2011 and is set to increase upto 73-76 years in 2040-50 . As a result, number of post-retirement years increases. Retirement is one of the most important life events many of us will ever experience. From both a personal and financial perspective, realizing a comfortable retirement is an incredibly extensive process that takes sensible planning and years of persistence. Even once it is reached, managing retirement is an ongoing responsibility that carries well into one's golden years. In India, the fact that a mere 11 per cent of India's working population has some form of social security planning for their old age, retirement planning holds a great significance Everyone dreams of having a perfect retired life living in peace and bliss. They tend to be myopic and are not saving sufficiently for old age. Having a perfect retired life is possible with proper planning before one retires and all retirement financial plans must offer income for life. After working hard for the majority of life, facing financial insufficiency due to poor financial planning offers a depressing thought. They have to choose the correct investment avenues or investment tools which the post retirement offer the option of liquidating the money in case of an emergency as well as offer substantial returns that can make give financial security for lifetime. Indian investors face lot of challenges when it comes to retirement planning. This paper tries to address the issues by providing solutions on how to calculate the retirement corpus and the features, positives and negatives of some instruments suitable for retirement planning

KATZ, STEPHEN* (Department of Sociology, Trent University, Skatz@Trentu.ca)

Gaming the Aging Brain: Digital Cognitive Performance in the Shadow of Dementia

This paper explores the articulation of aging, memory, performance and cognitive fitness through online, self-tracking and digital brain games, as part of a critique of 'neuroculture' and its pervasive discourse of brain plasticity. Neuroculture is theorized as a convergence of brain sciences, popular images, lifestyle industries, gerontological advocacy and medical technologies aimed at the optimization of cognitive function for older individuals. Neuroculture is also marked by an absence of attention to the social and environmental determinants of health and the relational, interactive conditions that make memory and cognition possible. As background, the paper comments on: a) the role of scanning and imaging technology in opening the aging brain to biosocial experimentation and to public attention, b) the influence of pharmaceutical discourses and their metaphorical vocabulary of 'neuro-protection', 'cognitive health' and 'memory fitness' that slips between clinical states of 'maintenance', 'improvement' and 'enhancement', c) and

the spread of culturally ageist expectations for unfailing and infallible memory skills across the life-course. Data are drawn from marketing, advice, corporate, science, research and internet materials, including historical images of brain, memory and aging to provide a genealogical perspective on how we think about the aging mind today. Discussion focuses on the construction of performance of successful aging through brain games. While critical research questions promotional claims that brain games improve cognitive fitness or brain plasticity, the promise of brain-games lies in its field of play, represented through compelling techniques of score-keeping, shared profiles, and testimonials by experts. Conclusions consider how brain games extend the ambiguous image of aging itself, as both positive and improvable, and negative and inevitable and raise the larger question of the meaning of normal aging in the shadow of dementia, where increasingly broadened stages and symptoms are shaped by social forces that stratify new bio-identities.

Gender Equality and Work-Family Spillover from a Cross-National Perspective

This paper examines how gender role attitudes at the individual level interact with gender equality at the country level to influence women and men's experiences of negative work-family spillover. We use data from the 2012 International Social Survey Programme, including its Family and Changing Gender Roles IV module. Our sample consists of 20,679 respondents from 34 countries. Our dependent variables are work-to-family spillover (WF) and family-to-work spillover (FW). Our main independent variables of interest are gender role attitudes, work hours, family hours, and family status. We also include a country-level gender inequality variable, drawn from the 2014 Human Development Report. Our analysis consists of country-specific OLS regression and multilevel mixed-effects models. We find that women and parents experience higher levels of both WF and FW spillover than men and non-parents while those who are married experience lower levels of WF and FW spillover than those who are single. Work hours increase both WF and FW spillover while family hours increase only FW spillover. Those with more egalitarian gender role attitudes report lower levels of WF and FW spillover than their more traditional counterparts. At the country level, we find that those who reside in gender unequal countries experience greater levels of FM spillover. We also find some important interaction effects. First, mothers experience less WF spillover than fathers. Second, egalitarian women experience less spillover than egalitarian men. Third, while those who live in gender unequal countries tend to have higher family to work spillover, the effect of living in gender unequal countries is reduced for those who hold more gender egalitarian attitudes. Overall, we see that gender egalitarian attitudes at the individual level reduce spillover for women but increase spillover for men and that individual egalitarianism reduces the negative impact of country-level gender inequality on spillover.

ALMQVIST, ANNA-LENA (Malardalen University)

Responses to Changing Parental Leave Policies in Sweden and the UK

This paper compares the perceptions and experiences of British and Swedish parents following major parental leave policy changes in their respective countries. Sweden has been long known for its early introduction of parental leave in the 1970s and their introduction of a non-transferable 'daddy month' in 1995, which was extended to two months in 2002. The UK, on the other hand, lagged behind throughout the late 20th century. By 2010 the UK policy continued to reflect a strong male breadwinner model with 52 weeks of maternity leave and only 2 weeks of paternity leave. In 2011, the UK introduced Additional Paternity Leave, which extended leave up to 26 weeks. Our study examines parental leave decisions and perceived workplace support following the changes in policy. We draw on data from 32 interviews with Swedish parents conducted in 2008 after introduction of the second 'daddy month' and 22 interviews with British parents conducted in 2012 after introduction of Additional Paternity Leave. Not surprisingly, our findings show that Swedish fathers, particularly those whose partners were work or study oriented, took longer leave than British fathers. Nevertheless, there remain some gender differences as Swedish men are more concerned about their employer's and work mates' opinion than Swedish women. British parents cite low benefit, gendered expectations, employer assumptions regarding maternity versus paternity leave, and limitations to the policy. We conclude that Sweden's non-transferable paid parental leave policy promotes more gender equitable work-life balance arrangements. This should be further supported with the planned extension of non-transferable leave to three months in 2016. While the UK's recent introduction of shared parental leave in 2015 is a step in the right

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

direction, we expect the large historical imbalance in leave taking between British men and women would benefit from introducing non-transferable paid paternity leave.

Meanings and Social Practices: Changing Pattern of Water Consumption in Western Himalayan Region

Water, a universally available fluid resource, is differently treated in different contexts and therefore obtains different meanings. These meanings are not only embedded in the various "signs" and "symbols" (Geertz) but in the "social practices" (Schatzki) that mark a region. Thus, deriving from practice theory (Reckwitz) the paper attempts to trace these meanings and social practices to understand water in the Chamba region in Himachal Pradesh. Drawing from its historical past, there is an attempt to understand how meanings and practices affect each other to produce and reproduce newer meanings and practices over a period of time.

Meanings of water are determined by 'absence' or 'presence' of different water bodies that characterize a certain region. Various water bodies form combination of water sources that are utilized on an everyday basis by the people. In the context of Chamba, a region marked by presence of various water bodies, the meaning and practices of water have undergone a change over time with introduction of piped water supply. Introduction of piped water supply has led to a re-classification of water giving rise to newer combinations of water bodies available for the people. In and through the descriptions of the meaning making of water as a social process, this paper is an attempt to explore the relationship between meaning making, social practices and consumptions pattern of water which is not only embedded in social practices but also in daily routines in the region.

KAVACIK, ZUHAL* (Universitat Hamburg, Zuhal.Kavacik@wiso.uni-hamburg.de)

Economics in Art and Artists in Economy

While in the field of economics the artistic critique of materialistic forces was inherited into new forms of organization, e.g. autonomy and creativity of employees (Boltanski/ Chiapello, 2005); and within the arising creative industries new ways, of achieving innovation and productivity, were discussed (cf. Bilton, 2007; Caves, 2000; Howkins, 2001). Conversely, the influence of neoliberal attitudes on society (and art) has been discussed within the framework of Governmentality Studies, addressing primarily the formation of the "entrepreneurial self" (Bröckling, 2007; Rose, 1998; Voß/ Pongratz, 1998): This self has been understood as an identity norm bearing constant pressure on individuals on the basis of economic efficiency and entrepreneurial calculations. The logics of optimization have been regarded as partly conflicting and thus leading to paradoxes and aporias of integration (cf. Beck's 'risk society'; Giddens' 'active self'; Rosa's 'social acceleration').

However, a recent study by Eikhof and Haunschild (2006) suggests that this antagonism between the identity as an artist and as an entrepreneur can be bridged by the phenomenon of "lifestyle", which they call "bohemian entrepreneur". Following these findings, the aim of this work is to link the two opposing fields of studies - the economic and the sociological - and scrutinize the different ways in which artists manage the link between art and business within their individual lifestyle.

For this end, I will use empirical data from a current project (Geimer, 2015-2017), particularly semi-structured interviews and group-discussions with artists. In order to understand how implied norms lead to artists' actions, the documentary method (Bohnsack, 2003) with enhancements concerning the reconstruction of identity norms made by Geimer (2014) will be applied. The advantage of this research lies in the exploration of the interplay between social and individual factors in the context of the outlined neoliberal social changes.

From Occupy Wall Street to Occupy Sandy: Socio-Technical Infrastructures As Social Movement Outcomes

Research on the consequences of social movements focuses on four types of outcomes: political, cultural, biographical, and economic. However, a fifth type of outcome tends to be disregarded: the creation of socio-technical infrastructures that can form the basis for further cycles of mobilization. This paper analyses this fifth type outcome by focusing on the case study of Occupy Sandy. Hurricane Sandy, the second costliest hurricane in US history, hit the shores of New Jersey on the 29th of October 2012. Apart from FEMA and the Red Cross, disaster relief was also organized by a loose network of Occupy Wall Street activists who appropriated the social networks and digital tools created by the movement to coordinate a relief effort of stunning scale and efficiency. Based on in-depth interviews with Occupy Sandy activists, this paper traces how the Occupy Wall Street digital tools were used for disaster relief. Such tools included a CiviCRM email database, as well as the online conference call and chat capabilities offered by the InterOccupy network. This infrastructure was re-assembled and combined with tools found elsewhere, including the amazon.com wedding registry. However, the Occupy Sandy relief effort was also based on the social networks constituted by Occupy Wall Street. It mobilized activists who had previously collaborated in Occupy Wall Street working groups and teams. It was also supported by a web of relations that Occupy Wall Street activists had created in their local communities as a result of neighbourhood actions and assemblies. These networks were enriched with the influx of new volunteers for the relief effort, which resulted in a significant expansion of Occupy networks. Tracing this shift from protest to disaster relief, this paper shows that socio-technical networks constitute a tangible outcome of social movements that should be taken into account in future research on the subject.

KAWABATA, TOMOKO* (Hokkaido University, tkawabata@high.hokudai.ac.jp)

The Situation of the Harassment Prevention in the Japanese Universities

The aim of this paper is to show the importance of building the collective view of the definitions of the harassment towards the harassment prevention.

In January 2012, the Japanese Ministry of Health, Labor and Welfare publicly announced the definition of workplace harassment. They also recommended that each industry should have their own collective view on the definition of the harassment. However according to Kawabata(2015), 40% of 396 Japanese university respondents out of 1137 universities surveyed in the complete count survey in 2013 answered that they had no guidelines for harassment prevention. And according to Naruse et.al. (2015) , the number of the types of harassment and that of the terminologies of their definitions of the harassment diverse among the Japanese universities. It is difficult to perform a national survey to get the right picture of the situation of harassment prevention in Japan.

It is necessary that the universities as the major institutions of higher education should have a collective view on the definition of the workplace harassment to prevent it. For example, all the UK universities have "Human Resources" and full-time qualified staff for the "Dignity and Diversity" office. According to Kawabata (2015), the UK universities have the collective view on the conceptual definitions of the harassment and their efforts of the harassment prevention is successful. The practice led by the central government in the UK could be one example to be taken into consideration.

Reskilling Vietnamese Nurses Under the Japan-Vietnam Economic Partnership Agreement: An Analysis of Practice Examination of Japan's National Board Examination for Nurses Given in Vietnamese Language

As globalization accelerates, more and more nurses are on the move across borders for their professional development. Since 2008, Japan has accepted 547 Indonesian nurses and 412 Filipino Nurses under the Economic Partnership Agreements (EPAs) between Japan and each country. Under the EPA program, foreign nurses must pass the national board examination (NBE) for nurses in the Japanese language within three years after they enter Japan. Many previous studies indicated that it is difficult for foreign nurses to pass the NBE, as indicated by the latest passing ratio, 7.3% (March 2015). Vietnamese nurses, following Indonesian and Filipinos, have accessed the labor market in Japan since 2014. It is obvious that Vietnamese nurses need help to pass the NBE.

In this study, a Vietnamese version of the 103rd NBE (held in March 2014) for nurses in Japan was given to Vietnamese nurses, who were selected as 'candidates' to go to Japan. The aim of this study is to find the pattern of choosing the correct answer in the practice examination by controlling the language barrier. Amongst the 129 participants, no one satisfied the acceptance criteria of 40 points or over for General Questions, and 167 points or over for rest of the questions. By area of nursing, Japanese examinees represented the highest correct answer

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

ratio in Geriatric Nursing (83.7%), whereas Vietnamese nurses scored highest in Holistic Care of Nursing Practice (54.0%).

The result of the study indicated that there is a great difference in the percentage of correct answers between Vietnamese and Japanese examinees. We must consider that socio-cultural differences between two countries, such as differences in the scope of nursing, the health care system and the nursing education program may cause such differences. Therefore, instructing Vietnamese nurses by stressing these areas is necessary for the success in Japan's NBE.

KAWASAKI, KENICHI* (Komazawa University, kken@komazawa-u.ac.jp)

After the Death of Lee Kuan Yew Will Freedom of Art Espressions Are Possible in Singapore?

Since in 1989 Singapore art policies began and have been established cultural institution now a day. Within these 26 years in every genres of art infrastructures have been made and elaborated by mainly National Arts Council (NAC). Actually they have been strongly designed and supported by economic factors like Economy Development Authority (EDB). And in 2015 two big changing factors were emerged. One is the death of Lee Kuan Yew, and another independent day of 50 years from Malaysia. Both are giving strong effects on the future of Singapore art policies and cultural institutions. In my presentation I would investigate them on the basis of my research in August 2015 in Singapore. Just before the death of Lee Kuan Yew, a new long term plan was launched by NAC in 2012 and already modified the old organizational structure. NAC just moved from MICA(Ministry of Information, Communication and the Arts) to MCCY(Ministry of Culture, Community and Youth). It means that a new distinction was executed and Singapore government divide the art structure by NAC and cultural/entertainment industries by MCI(Ministry of Communication and Information). Under the new situation how have art expressions been dealing with a standpoint of the past censorship in Singapore. I would consider the above point, and seek a possibility of the art expression. Moreover the situation of artists would be improved forwardly? Anyway both the death of Lee Kuan Yew and 50 years independence would closely related the transformation of Singapore art expression in the future.

Offshore IT Service Outsourcing and New Labour Export: Japanese Migrant Workers in Chinese Software Parks in Dalian

This paper examines IT service outsourcing from Japan to software parks in Dalian in northeast China, and a new form of labour migration associated with it. Since the mid-2000s, an increasing number of educated young Japanese service workers have moved to Dalian as part of employers' cost-cutting strategies. The main 'skills' required for these jobs are a native-level understanding of Japanese language and culture. Alongside local Chinese employees, they work at call centres and other workplaces in the lower echelons of the IT sector, being paid in Chinese Yuan and earning much less than they would earn in Yen in metropolitan Japan. These Japanese workers are included in the local labour markets as skilled foreign workers on relatively high incomes by local standards, yet excluded from the workforce in Japan and its benefits by virtue of being in Dalian. Based on a micro analysis of the day-to-day tasks they undertake throughout the process of knowledge transfer and localisation, this paper demonstrates the essential role these exploitable precarious workers and their transnational mobility/movability play in integrating China and Japan, Asia's two largest economies, in the global value adding chains. It argues that the phenomenon of 'labour export' introduces the idea of labour migration as a way to access 'privileges' such as secure employment, humane working conditions and better work-life balance. This destabilises the concept of labour protections and worker entitlements, simultaneously including and excluding these workers from citizenship rights as they cross national borders.

Neoliberalism and Work Ethos: The Transformation of Primary Health Care in Turkey

Turkey's primary health care service has undergone radical transformation within the past decade. General practitioners,who were public servants in the previous system,responsible only for providing free primary health care in Health Posts, now became contract workers and they are now expected to perform an additional managerial role in Family Health Centers: not only providing health service but also taking care of the logistics of running these health centers, sub-contracting nurses and other staff. Reformers claim that the capitated pay-

ment system will encourage family doctors to own their enterprise more strongly than before and to provide higher quality service to patients since they will be in competition with others. I conducted over 60 interviews with family doctors and nurses who work in family health centers in four different cities in Turkey, and I followed their political mobilization against the health ministry on issues concerning their rights and what they define as neoliberalization of health. They report that thesemarket-based measures lead to the treatment of the patient as customer, over-prescription of medicine, decline in preventive medicine, friction among co-workers and a change in their work ethos from a spirit of craftmanship to entrepreneurialism. One could see the incentive structure in place as part of a larger systemic change that redefines the nature of their labor and their relationship to the public and the state. The governmentality perspective goes beyond the mere description of policies or ideologies of neoliberalism, and "centers on the techniques of rule through which the conduct of individuals and communities are governed at the micro-level" (Lovell et al.) However when talking about the conduct of individuals, in terms of the encouragement of certain behaviors and performances; the individuals these scholars have in mind are patients.

KAZIBONI, ANTHONY* (Department of Sociology, University of Johannesburg, anthonyk@uj.ac.za)

The Lindela Repatriation Centre from 1996-2014: A Theoretical Explication of Human Rights Violations

This article is based on media content analysis of more than 230 newspaper articles written on the Lindela Repatriation Centre from its establishment in 1996-2014. This centre is "one of South Africa's largest facilities for the holding of undocumented migrants" (Bosasa, 2015). The articles were sourced via SA Media's official website http://www.samedia.uovs.ac.za. The articles overly depict the centre as a hub of "human rights violations" (South African Human Rights Commission (SAHRC), 2014; Democratic Alliance (DA), 2015). The study juxtaposes the South African Constitution's Bill of Rights, and how this was supposedly in consonance with the establishment of the centre, to the grotesque human rights violations that have occurred there since its inception. In light of this, this article draws on the theorising of Giorgio Agamben (1998), and particularly his theoretical contribution of the "homo sacer," one who has been left behind or been excluded from the territorial boundaries that confer the rights of citizenship. The detainees at the centre are, therefore, to a great degree living in a "state of exception." In the "state of exception" the legal order becomes in force only by suspending itself (Mika Ojakangas, 2005: 9). In this article, I argue that undocumented immigrants are often treated as "bare life", as individuals who are subject to the suspension of the law within the context of the centre. Since they are non-citizens of the recipient state, these actions culminate to xenophobia, which Owen Sichone (2008) argues that its manifestation is "a gross violation of human rights."

Why Russians Do Not Afraid Economic Sanctions? the Counterrhetoric Strategies of the Print Media

International sanctions against individuals, businesses and officials from Russia have become one of the iconic topics of 2014. Possible consequences of these actions were actively discussed in the media. In 2014 the central and regional press published 92,155 articles on this issue. The sanctions also attract a high public attention. According to surveys by the Levada Center, this issue was repeatedly named as the most memorable events of the month previous to the wave of survey (21-28% of respondents). However, there is an unexpected fact that economic sanctions are not perceived by the population as a problem. Opinion polls show that a large proportion of Russians do not see the negative effects of the issue both for the country as a whole and for themselves personally. At the same time Russian food embargo is evaluated even positively. Therefore, it is necessary to answer the question: "Why Russians do not afraid economic sanctions?"

The report analyzes key strategies of deproblematization of the economic sanctions (and Russian food embargo) which were used in four leading Russian printed editions from March 2014 to December 2014: Rossiyskaya Gazeta (pro-governmental, 945 articles), Novaya Gazeta (oppositional, 396 articles), Argumenty i Fakty (popular mass newspaper, 258 articles) and Kommersant (business magazine, 1574 articles).

Newspapers use a wide range of deproblematization strategies. Some of them are aimed to refute the importance of the problem as a whole (unsympathetic counterrhetoric), others - on proof of insolvency of the proposed ways to solve it (sympathetic counterrhetoric). [Ibarra, Kitsuse, 2003]. We conclude that in case of discussion on economic sanctions unsympathetic counterrhetoric prevail. Most popular strategies are "antipatterning", "telling anecdote" and "counterrhetoric of insincerity" in terms of Ibarra and Kitsuse. The report describes most striking examples of these strategies and makes an inference about their weak and strong points.

KAZUN, ANTON* (Higher School of Economics (Moscow), International Center for the Study of Institutions and Development, akazun@hse.ru)

Social Responsibility of Russian Lawyers: Factors of Engagement into "Pro Bono" Work

In many countries, the community of attorneys provide free of charge legal services to those who are unable to afford them. This practice is essential for the protection of the basic humanistic principle of the equality before the law (according to our data, lawyers estimate that only 46% residents of Russia can afford an attorney). In recent years, an intensive debate started in Russia about the ways of the development of free of charge legal services. In current survey, we consider the factors of the engagement of Russian attorneys in the provision of two different types of free of charge legal help: work in criminal proceedings at the court appointment (according to the 51 article of the Code of Criminal Procedure the court must provide an attorney to the defendant who is unable to pay for this services) and working "pro bono publico". Based on the data from the representative survey of 3317 attorneys in 35 regions in Russia we conclude that work at the court appointments is economically determined practice for the lawyer. Lawyers with low experience, human and social capital are mostly involved in these practices. In contrary, "pro bono" services are often provided by attorneys with high human and social capital. They are also more reputation-oriented and less benefit-oriented. Thereby, we show that the engagement in different types of free of charge legal help depend on the status and the position of the attorney within the professional community, in particular, economic, human and social capital of lawyers as well as their ethical values.

KEDRA, JOANNA* (University of Jyvaskyla, joanna.kedra@jyu.fi)

Learning to See: Three Approaches to Journalistic Photography Interpretation

Contemporary society becomes increasingly visual, while the formal education does not always follow these dynamics. Although good education should provide students with certain qualifications, such as the ability to interpret, create and think in terms of images, that is, visual literacy skills (Avgerinou, 2001), the classroom activities often lacks of real engagement with visuals. Thus, the question remains if todays' learners are visually literate citizens, and if not, how the formal education can help them to achieve this goal? In this paper, I argue that visual literacy is an essential teaching, crucial for the socialization process of todays' new media participants, who are required to constantly interact with images. In addition, each attempt towards visual literacy development is an important step for learner's individual growth in visual sensitivity, which, in a longer perspective, can lead to more conscious participation in contemporary visual culture.

In this paper, I present and discuss three various approaches and tools for the interpretation of journalistic photographs, which can be used as exercises in visual literacy. The first tool, the Press Photograph Story Analysis model, was inspired mainly by Peirce's Sign Theory. The second one is an intertextual approach to photography interpretation, which concentrates on connotative content analysis with minor attention to photographic context. The third tool is a compilation of elements of visual semiotics, visual rhetoric, Barthes's concepts of *studium* and *punctum*, Barrett's (2010) principles for interpreting photographs, and compositional interpretation (Rose 2012). The tools are illustrated by extracts from students' interpretation of journalistic photographs. All presented approaches were designed to facilitate learning and teaching in the higher education context.

The Governance of Extremist Risk in British Universities

The Prevent strategy to counter extremism in the United Kingdom, which has recently been put on a statutory footing with the enactment of the Counter-Terrorism and Security Act 2015, seeks to extend the governance of national security beyond the State. Through efforts to responsibilise various sectors, including but not limited to, education, faith, health and charities, a 'hearts and minds' approach to intervening in the radicalisation process at the earliest stage is sought to be embedded in sectoral governance regimes. This study explores engagement with, and implementation of, the Prevent strategy in British universities. Central to this engagement is the adherence to logics of risk and resilience. Several issues are given particular consideration: the problematisation of extremist risk at universities and how this has shaped the approaches to counter it; the adoption of novel techniques to counter extremism and the suffusion of these techniques with existing governance techniques; the effect that the implementation of Prevent and the formulation of these techniques has on the *habiti* of university personnel. The study adopts a multiple case study research design and focuses on three British

universities. Documentary analysis of internal policies and procedures is supplemented with semi-structured interviews with key personnel within the university in a effort to move past the 'blueprints' of governance and analyse how they are actualised in practice.

KELES, JANROJ YILMAZ* (Middlesex University, J.Keles@mdx.ac.uk)

Religion, Migration and Social Capital: The Case of Kurdish Alevis in the UK

Drawing on a qualitative study with Kurdish Alevi diaspora members of diverse age, gender, political affiliation and class in London, this paper examines the relationship between social capital, migration and Alevi faith and Alevi organisations in the UK. The Alevis constitute the second largest faith community in Turkey and are a heterogeneous community with a range of different ethnic, cultural, political and linguistic backgrounds. Due to their faith, Alevis have been subjected to discrimination and suppressed during the rule of Ottoman Empire and the period of a Turkish Republic. Until the 1970s, the majority lived in rural areas and practiced their beliefs secretly. However the urbanization, migration and political polarization of the Alevi community since the 1970s and in particular since the 1990s, and the global rise of identity politics have contributed to a shift to a publicly-expressed identity with demands for the constitutional recognition of Alevi faith in Turkey and equal status with dominant Sunni Muslim. Due to migration, Alevis (mainly Kurdish Alevis) constitute a significant population in Western countries where they have established their religious and political transnational organisations and networks. The reconstruction of Alevi identity, tradition and belief along with a strong transnational mobilisation has led to a 'revival of Alevism' in Western countries including the UK. This paper contributes to four threads of scholarship: Diaspora, ethnicity, religion and social capital. The focus on these threads is intended to develop a theoretically informed link between faith, migration and social capital. Performing a religion is not only a psychological relief or spiritual capital but is also about having opportunities to access material resources, skills, social support and multiple types of solidarity. I argue that these aspects provide a good ground to conceptualize diasporic Alevi faith as a form of social capital for Alevis in the UK.

"Returning Home": Experiences of British-Kurdish Young People in Kurdistan-Iraq

"Returning home": Experiences of British-Kurdish young people in Kurdistan-Iraq

The phenomenon of "return" migration has not only become an important feature of sociology of migration but is also an emerging issue of economic and political significance. A significant number of British citizens with Kurdish ethnic background, in particular young people born and/or educated in the UK have left to Kurdistan–Iraq to work in the public and recently booming private sector industries including education, health, oil and communication sectors. However, little is known about the motivations and the decision-making of the British-Kurdish young "returnees".

This paper discusses the strategies used by returnees to build (digital) social networks and the process of settlement, adaptation and socio-economic participation in their "new" home. The "returnees" play a crucial role in post-conflict reconstruction, however as we know from the literature every return migration entails cultural, political and economic disappointments and conflict in the imagined homeland. This paper will analyse the social and political structural problems and cultural values causing disappointment among some "returnees" and led to a sense of alienation and circular migration back to the UK or elsewhere.

KELLY, CHRISTINE* (University of Ottawa, christine.kelly@uottawa.ca)

Towards Crip Futures: Non-Profit Disability and Health Organizations in Ottawa, Canada

The government of Ontario, Canada introduced legislation in 2005 that promised an accessible province for people with disabilities in 20 years. The 20-year target conveyed a concrete sense of commitment to disability inclusion, yet it was far enough in the future to avoid major disruptions of our social and economic systems. Despite this apparent progress, a quietly covered news story in February 2015 announced the government would scale back compliance activities related to this policy. The Ontario accessibility legislation presents the liberalized promise of inclusion as a visible marker of progress, yet this inclusion is perpetually positioned in future-tense. Or as Titchkosky comments in *The Question of*

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Access (University of Toronto Press, 2011), disability remains "not-yet" a priority even in policies that explicitly claim to accommodate disabled bodies. Instead, 'now' is characterized by austerity measures that target people with disabilities and chronic illnesses, for example, dramatic changes to the Social Development Partnerships Program that provides grants to support disability-related organizations. As such, inclusion becomes a distracting discourse that shifts attention away from other policy trends that dramatically undermine disabled people and their organizations.

On this backdrop, I introduce a qualitative study exploring disability and health non-profit organizations in Ottawa, Canada. Through 25 in-depth interviews with Executive Directors and focus groups with diverse youth with disabilities, this study considers who comprises disability communities and how they are faring. Incorporating the perspectives of disabled youth and interrogating how the organizations engage youth offers future visions that disrupt our current policy and service responses to disability. The study reveals a complex picture of disability communities, the changing roles and tactics of disability movements as well as radical visions of crip futurity (Kafer 2014) that supplant the perpetual delay of disability politics in Canada and elsewhere.

Convoys of Care: Reflections on a Methodologically Complex Study

Rarely do researchers use longitudinal qualitative methods to study older adults and their care networks, including the full complement of family members (spouses, children, grandchildren, siblings, etc.) who participate individually and collectively in care activities. In this paper, we introduce our study, "Convoys of Care: Developing Collaborative Care Partnerships in Assisted Living" and tell its methodological story. We share knowledge gleaned from our in-depth study of frail elders, their family members, and paid caregivers using formal and informal interviewing and participant observation. We discuss the now-complete first of two two-year waves of data collection during which we followed 28 focal residents and 155 of their care network members in four diverse assisted living settings located in the southern United States. Following Corbin & Strauss' (2010) Grounded Theory Method principles, our data collection and analysis take place simultaneously and involve reflexivity and memo-writing. Using data from twice-monthly research team meetings, field notes, and memos, we critically reflect on our design and ensuing methodological implications. Our analysis identifies six broad study features that make our research innovative, but that also create challenges. These features are: our research focus and topics of inquiry; scope and complexity of design; nature and modes of data collection; frequency and duration of data collection; research context; and analysis strategy. We consider the benefits and challenges associated with these design features as they pertain to recruitment and retention, data collection, quality, and management, research team work, researcher roles, and ethical considerations pertaining to participant and researcher risk. We conclude by identifying methodological transparency as essential to cumulative knowledge-building. Such transparency fosters informed and ethical research decision-making and is necessary for the advancement of scientific theory, methods, and substantive knowledge, particularly in relation to sociological studies of family life, relationships, and caregiving.

KEMP, STEPHEN* (University of Edinburgh, s.kemp@ed.ac.uk)

Puzzling about Realism and Contradiction in the Ontological Turn

In this paper I reflect on one current of thought within the ontological turn, the post-ANT theories of writers such as John Law and Anne-Marie Mol. In works like *The Body Multiple* (Mol) and *After Method* (Law) these writers have put forward persuasive arguments in favour of the idea that the socio-technical world is enacted and performed through the practices and understandings of actors (and actants). Nevertheless, it is worth considering the potential parameters and limitations of this approach. In this paper I want to examine two key issues. One is the extent to which enactment-based ontologies have a lingering commitment to realism. Programmatic statements from writers such as Law suggest that realism is something to be done away with. However I will argue that enactment-based theories rely on a minimal commitment to realism. A key example of this is that in 'demonstrating' processes of enactment at work these theories make implicitly realist claims about the character of the socio-technical realm before and after an enactment has taken place. The second issue that I want to examine relates to the intertwining of epistemology and ontology in enactment-oriented approaches. Law argues that a social scientific account can legitimately be contradictory where socio-technical reality is itself contradictory. But this raises tricky epistemological issues including the puzzle about how we distinguish between cases

where a contradictory theory is correctly capturing contradictory reality, and cases where such a theory is simply confused and in need of correction. I explore the extent to which enactment-oriented approaches offer a satisfactory answer to this question.

Does the Adoption of Inclusive Selectorates Influence Party Membership?

The Literature on party politics has identified two distinct phenomena: democratization in leadership and candidate selection methods (Pilet and Cross, 2014; Cross and Blais, 2012; Kenig, 2009; Kittilson and Scarrow, 2003; Bille 2001; Hazan and Rahat, 2010) and a decrease in the number of party members (van Biezen, Mair, and Poguntke, 2012; Scarrow and Gezgor, 2010). However, there is evidence that within the broad picture of membership decline, there are patterns of seasonal growth. These may be explained by the adoption of inclusive selection methods that give members a voice in determining who the party leader and legislative candidate/s will be. So-called 'instant membership' had been recognized in Canada and Israel, two of the nations which had early and long experience with inclusive methods (party primaries). This instant membership entails a rapid growth in the number of party members prior to primary contests, followed by a sharp decline when the contest is over, as members do not bother to stay. In this paper we try to investigate whether similar trends in party membership can be traced in other nations that have adopted inclusive leadership selectorates. In other words, we ask whether, and in what manner, a change in the rules of games has affected the number of party members, by creating incentives for enrolling as (short-term) members. For this end, we use two large datasets that were recently made available: MAPP's party members' dataset (van Haute and Gauja, 2015) which provides merged data of membership figures in over than thirty nations, and leadership selection dataset (Pilet and Cross, 2014) which provides data on thirteen nations.

Community Engagement and a Movement Toward Ecological Sustainability: Case Studies in Shanghai China

Considering the question of what it requires to make welfare societies ecologically sustainable, I propose that community engagement plays an important role in the actualization of reduced carbon emission targets set at upper government levels and implemented at local levels. I explore this hypothesis through the examination of the relationship between community engagement and pro-environmental behavior. I consider the role of the community and a sense of community in developing pro-environmental behaviours that will contribute to the achievement CO_2 emission goals in urban China. Urban China has been selected because China is the global leader in CO_2 emissions, has the largest population, the majority of which is living in urban areas, and China has wealth gaps that are representative of other developing nations and becoming increasingly common in more developed countries. China is also at an economic and industrial developmental stage wherein growing populations have some financial surplus that allow for increased consumption, making China's consumption habits and environmental behaviours important to follow as they could provide lessons for other developing and developed countries.

In order to understand the relationship between community engagement and environmental behaviours the concepts of community and sense of community are examined within case studies of waste separation and community engagement in Shanghai. Through interviews with community residents, building managers and local party officers I look at three important factors first, the implementation methods of the recycling project, second the existing levels of a sense of community and finally, community engagement behaviours. Through interview, discourse and observation analysis I assess these factors in correlation to the success or failure of the implemented project. From the results we can begin to understand the role of community engagement and the contribution it can make in the reduction of overall CO_2 emissions through the development of pro-environmental behaviours.

Servicing the City: Service Work and Urban Space As Opportunity for Labour Organizing

Against the background of recent city-specific ordinances which regulate hours of work and conditions for service workers in several American cities, this pa-

per interrogates what possibilities might exist for retail workers in contexts like South Africa, where national legislation governs labour standards. Where cities market themselves a sites of investment, how might 'service' be a means toward worker organizing in local labour markets? In the context where logistics is seen as the key site of strategic bargaining power, does 'service' offer an alternative to retail workers? This paper examines the historical and discursive meanings of service—burdened as they are with race, class and gender relations—within retail spaces and in workers' deployments, with a focus on South African supermarkets, including most recently the entry of Wal-Mart into South Africa. Through the lens of service, I seek to bring together discussions of consumption and labour.

Training Young Scientists at a Mexican Public University: Overcoming Academic Segmentation and Creating New Forms of Knowledge

Scientific production and PhD training are today a world wide enterprise. Most countries are increasing investments in science, technology and innovation. However, the literature emphasizes mainly productivity indicators and the description of "world class universities", to the detriment of data on complex processes of institutionalization at regional universities. This research addresses that void by focussing on the development of high level PhD training in the sciences at a state university in an emerging economy.

Premise. Universities of this type in emerging economies went through two transitions: the move from a teaching institution to a research university, and currently the struggle to overcome traditional disciplinary boundaries in research and graduate training to promote inter-disciplinarity and innovation. What challenges do they face today?

The framework flows from the comparative literature on graduate training, the social construction of boundaries in science and neo-institutionalist sociology. Based on evidence from extensive interviews and documentary sources at the University of Puebla, Mexico, this research documents:

The academic and governance changes that made this institution one of the first state universities in Mexico to establish research and doctoral training in the 1980's in the absence of a developed national policy framework. Its rapid adaptation to and utilization of a new national policy environment for S&T in the 1990's. Recent successes in innovation in some fields and collaboration with local firms. The selective emergence of new regimes of knowledge production and doctoral training that transcend traditional disciplinary boundaries. The stresses faced by other disciplines in adapting to the current policy and scientific environment.

L'émotion a-t-Elle Un Genre ? Filles Et Garçons Face à La Violence Et Aux Incivilités à L'école élémentaire

Articulant différents moments et espaces de la socialisation enfantine, la "vie scolaire" intègre des expériences d'exclusion, de violence et parfois de harcèlement. Filles et garçons vivent-ils les mêmes situations ? Réagissent-ils de la même manière ? Si la nature des émotions éprouvées semble similaire, les types de violences vécues et les réponses proposées donnent à voir nombre de différences entre les deux sexes. On peut cependant constater que ces différences sont atténuées à l'issue d'une expérience partagée de socialisation à l'empathie des élèves.

Nous commencerons par présenter l'enquête et ses objectifs, puis la méthode particulière élaborée afin de recueillir les données auprès des enfants. Enfin nous présenterons les similitudes et les différences de représentations, d'expériences et d'émotions entre les filles et les garçons. Nous finirons par le constat inattendu d'une différence d'impact de l'expérimentation en fonction du genre des enfants.

Recueillir L'expérience D'enfants: De La Théorisation Enracinée à L'innovation Méthodologique. Violence, Harcèlement Et Empathie Du Point De Vue D'élèves De 9 à 12 Ans

Recueillir les expériences de violence et de harcèlement à l'école d'enfants (âgés de 9 à 12 ans) et regarder la manière dont la compétence à l'empathie impacte ces situations, tels sont les objectifs de cette enquête. Nous proposons dans cette présentation d'expliciter la face cachée du processus de recherche à savoir notre cheminement. La théorisation enracinée nous a menée à l'innovation méthodologique pour approcher au mieux ce

phénomène et cette population particulière. Le va-et-vient entre terrain et théorie, et la construction d'un questionnaire ludique visant à « faire parler le terrain », en évitant de manière optimale d'imposer nos préconceptions, nous a conduite à une réflexion sur le recueil de données en sociologie. Les mots des enseignants, des parents ne sont pas les mêmes que ceux des enfants. Les enfants ne disent pas qu'ils sont "harcelés" ou "victimes ou auteurs de violence", ils se plaignent qu'on "les embête", qu'on les "traite" qu'on se moque d'eux ou que "personne ne veut jouer avec eux". Afin de donner la parole aux enfants nous avons choisit de construire un questionnaire ludique sous forme de bande dessinée. Après avoir été passé à plus de 400 élèves, les dessins et réponses ont donné lieu à un travail de recodage sous forme de séries de modalité. Permettant de produire des statistiques.

Advanced Manufacturing Implementations Transforming Production Systems: Insights from an Interdisciplinary Young Scholars Research Group Focusing on the German Textile Industry

Currently, one hot topic among industry practitioners and engineering academics is *Industrie 4.0/industry 4.0*. This predominantly German-coined term and its corresponding engineering science and innovation policy debate is comparable to global scale ideas like *industrial internet* or *advanced/smart manufacturing*. Basic assumptions are:

1) blending of physical and virtual environments by Cyber-Physical Production Systems (CPPS) integrating computational, physical, and social processes in human/nonhuman interaction networks, and
2) integrating such CPPS in the Internet of Things (IoT).

Regarding the vast range of possible applications, some scholars praise IoT and CPS for having "the potential to dwarf the 20th century IT revolution". Such recent developments have futhermore spurred interest in the social sciences, referring to questions (to name but few) of individual and organizational adaptation of such production systems, ethical, legal, and (macro-)social impacts (ELSI) like educational and socio-economic aspects. Therefore, such emerging production technologies pose challenges relevant for discussion at the ISA Forum, because, as the constructive technology assessment (CTA) approach puts it, of their uncertainties combined with promises.

Our contribution draws on insights of the so-called *SozioTex* interdisciplinary young scholars research group (prae- and post-doc level). We outline key technical, social, ethical, legal and educational aspects derived by such advanced production systems. In this context, we focus on stakeholders' expectations (shop floor personnel, business/technology managers, as well as other governmental and societal actors), e.g. questions of strategic and operative objectives in introducing such systems, as well as their constellations/relations and resulting potential conflicts. Finally, we discuss methodological as well as theoretical issues arising from such an explicit interdisciplinary approach aiming at feedback from session participants which will stimulate our proceeding work in a twofold manner: i) considering our stated project goals as well as ii) our processes of doing everyday research in an interdisciplinary research effort.

The Everyday Data Collectors: Privacy, Surveillance and Cloud-Based Smartphone Applications

The term "Cloud Computing" (CC) describes models in which users access networks, servers, platforms, and applications as ubiquitous, shared pools of scalable, rapidly provisioned computing resources. Undoubtedly, CC is important for allocating and distributing IT resources: Concepts like Internet of Things or Big Data require dynamic and efficient management of storage, transfer capacities, and computational power.

Furthermore, a significant share of actual everyday communication is realized via cloud technologies; especially when considering the steady rise of global smartphone usage: Smartphones are extraordinarily dependent on CC infrastructures; finally, such infrstructures provide devices and installed applications with full functionality. Hence, with growing interconnectedness of devices and apps/services, different kinds of data are increasingly related to one another, frequently combining big-data-assets with individual data.

Consequently, CC must be considered a relevant technological phenomenon, deeply interwoven with a broad range of social and societal structures and processes: E.g., although not explicitly designed as surveillance technologies, smartphones bear the potential to (and do!) form an extremely dense surveillance network which extends into the most private realm. But the system of ubiquitous visibility emerges, quasi, as a by-product—often borne by seeking gains in quality of life or convenience through the use of such devices.

We explore this issue of privacy and surveillance against the background of cloud-connected smart portable devices drawing on first insights of a recently established interdisciplinary research project on social acceptance of cloud-based smartphone applications. We gain insights into visions and fears that individuals harbor concerning smart artifacts and the socio-technical network they constitute, as well as their expectations about technology's impact on privacy and its influence in terms of behavioral control. The paper concludes with an outlook on the question of trust in smart devices and some implications for their design.

Ethnic Diversity within Israeli Healthcare Organizations: Manifestations of Racism and Strategies of Coping

Introduction: Increasing workforce diversity in healthcare organizations enhances cultural competency and narrows disparities in health. Yet while the challenge to provide appropriate care to people of different ethno-cultural backgrounds in healthcare organizations has been studied extensively, racism towards ethnic minority health professionals has rarely been investigated. The public healthcare system in Israel is an interesting research field. Its workforce includes a relatively high proportion of Arab professionals who operate within the context of the Israeli-Palestinian conflict.

The objective of the research was to examine how racism is manifested as a social process across macro, meso and micro levels of healthcare organizations, by studying racist manifestations experienced by Arab physicians and nurses who work in Israeli public hospitals, and how they cope with these manifestations.

Methodology: During 2013 and 2014 we conducted in-depth interviews with 23 Arab physicians and nurses who work in Israeli public hospitals that serve a mixed Jewish-Arab population.

Findings: The Arab physicians and nurses we interviewed described various racist manifestations, ranging from refusal to accept treatment from an Arab professional, through verbal abuse, to physical violence directed against them. Nurses reported more racism at the micro-level (patients, their relatives and colleagues), while physicians reported experiencing discrimination at the meso-level (in hospitals and medical schools) and macro-level (policy and legislation). Arab nurses and physicians were found to employ diverse strategies of coping.

Conclusions: Israel has a policy to recruit healthcare professionals from linguistic and cultural minorities, but has no special guidelines on how to cope with racism towards them. The silence that envelops racism turns into denial, as evidenced by the lack of specific policies. Studying the issue of racism directed against minority health professionals is important for the formulation of effective coping strategies.

Alash Orda – the (Un)Finished Kazakh Nation?

This paper looks at the *Alash* movement, the Kazakh national movement led by Russian-educated Kazakh intellectuals in the Russian Empire at the beginning of the 20th century. It aimed at creating a Kazakh nation that would be on par with the Russian and European nations in an attempt to gain political and economic rights within the Empire. The *inorodtsy* (resident aliens) status, of the Kazakhs, resulted in their exemption from political rights, because they did not constitute an evolved and enlightened nation. The intellectuals established new teaching methods in order to enlighten the nomadic Kazakhs and discussed their economic modernisation by sedentarising and adopting an agricultural livelihood similar to the Russians. The movement turned into a political one, as the Alash Orda political party was established and the Alash Orda Autonomy was declared in December 1917. However, as a result of the political situation and the Russian civil war that was unfolding, with the weak military capacities and missing state structures, the Alash Orda Autonomy could not withstand the Bolshevik power that took over. The following questions are explored: can it be argued that the Alash Orda to have had an influence over the subsequent delimitation of the Kazakh SSR as a nation within the Soviet Union? If so, what are the legacies of the movement in present-day Kazakhstan today? The paper will close with a wider inspection of the significance of imagined nations that intellectuals propagate and how this is accepted or rejected by the people they include within this vision.

Europe One Hundred Years from Now: Towards Democratic Control of the Economy

The core values *liberte, egalite, fraternite* were proclaimed in the 19th century but did not result in durable institutions that gave flesh and blood to these principles. When by the end of the 21st century Europe was 're-invented' in a second Enlightenment which led to the United States of Europe (see twin paper for RC 07) these values were re-examined and broadly debated. Also *democratie* was re-examined and now intrinsically linked to freedom, equality and solidarity, as an ideology on its own - replacing the 'invisible hand' of neoliberalism by the visible citizen, in an economy that was democratically controlled.

For long private ownership had been the foundation of the economy. This was engrained in national constitutions of EU member states as well as in the officious Constitution of the EU. This relationship between democracy and capitalism was now revised as democracy is incompatible with the full primacy of private ownership - especially in as much as it yields owner power over other people's life. Social ownership was the new perspective: wheras private ownership remained respected in the private domain - in the public domain the production of goods and services came under democratic control.

The European Constitution was changed (in 2100) and stipulated the primacy of social ownership. It also elaborated principles of economic redistribution as well as direct and indirect forms of democratic control of the production process. Moreover, a generous welfare state ensured the realisation of equivalence and solidarity.

Ownership could still yield capital income to investing private owners but the running of the enterprise and the distribution of accumulated wealth were subject to democratic procedure. The concepts capitalism, communism, liberalism and socialism were thrown in the trash. Production relations were no longer a permanent conflict between capital and labour but a partnership of capital, labour and other stakeholders.

KETTE, SVEN* (University of Lucerne, sven.kette@unilu.ch)

Are Customers the Better Donators? Financing Dilemmas of Non-Profit-Organizations

Since Non-Profit-Organizations (NPOs) cover their expenditures mainly by raising donations, they are strongly oriented towards donators. However, within the last 10-15 years the number of NPOs has been increasing significantly and, therefore, also the competition for donations (i.e. money) between NPOs. As an attempt to cope with this reinforced state of competition (at least some) NPOs try to exploit new ways of raising money—especially by engaging in own business activities or establishing collaborations with business firms (e.g. by providing consultancy services).

The paper focuses on the effects such an expansion of stakeholders has on NPOs. Drawing on statistical data concerning the German NPO sector as well as on the analysis of the case of *World Wildlife Fund* (WWF), it will be argued for three main outcomes: First a tendency towards professionalization within NPOs, second a tendency towards organizational narcissism, and third a financing dilemma. In sum, NPOs that attract a large number of donators (resp. a huge amount of donations) signal relevance and legitimacy to business firms, which makes them a favorable partner. On the other hand collaborations with business firms make NPOs suspicious in the eye of donators. Consequently, their success (large donation amount) becomes a precondition (in terms of establishing business models) as well as a threat (in terms of potentially decreasing the donation amount and, thus, relevance and legitimacy) to even more success.

By illustrating the (effects of the) inter-relationships between different stakeholders (i.e. donators and customers) and NPOs, this paper also directs attention to illegitimate forms of NPO financing, which - in conceptual respects - might make Neo-Institutionalism open to an analysis of the dark side of success.

Neglected Money. How to Grasp the Organizational Problem of Money Supply?

This paper starts off from an empirical as well as a theoretical observation. Empirically it can be observed that organizations have a fundamental need for money whether we look at business firms, Non-Profit-Organizations, political parties, hospitals or any other organization. Organizational access to crucial resources usually depends on the capability to pay—e.g. salaries for professional personnel (the precondition for continuity) or rents for office rooms (the precondition for addressability).

Theoretically it can be observed that most organizational theories reflect on the general need for resources but usually without reflecting on the specific quality of organizations' ubiquitous need for money. For instance, whereas Resource-De-

pendency-Theory (RDT) explicitly addresses organizational resource dependency from a power relations perspective, the Sociological Neo-Institutionalism (NI) refers to resource issues indirectly by not conceptualizing legitimacy as an end in itself but a means of securing access to different kind of resources. However, even if the organizational need for external inputs is widely unquestioned, the *specific quality of the need for money* is concealed by the overgeneralized concept of resources.

By shedding light on this theoretically neglected need for money, the paper aims at theorizing this common pressing organizational issue and thus keeping it visible. Therefore, it will first illustrate the way RDT and NI neglect the organizations' need for money. Then, a typology of four modes of organizational refinancing will be suggested: compulsory levy, alimentation by the external environment, alimentation by the internal environment, and sale of self-created outputs. By briefly comparing business firms and NGOs, the benefit of explicitly and systematically addressing questions concerning the organizational need for money will become obvious. Finally, an extension to the NI approach will be suggested.

Effective Advocacy in Georgia

The presentation discusses advocacy efforts to influence the policy development process in Georgia. Advocacy is defined here as one of the most important methods for achieving sustainable change. Advocacy organizations are main actors in this process. The question raised is how nonprofit organizations carry out effective advocacy to influence policies and the implementation of change.

It is important to explore the nonprofit organizations' advocacy work and networking with a focus on activities and outcomes. It also is important to discuss the tools they use for identifying a problem, monitoring and evaluation.

Qualitative research is used to give a picture of the advocacy work of nonprofit organizations. A comparative analysis is made of the work of advocacy organizations to provide a deeper understanding of effective advocacy in Georgia.

"Identity Crisis in Rural Peasant: A Study of Villages Around Aurangabad City"

"Identity crisis in rural Peasant: A study of villages around Aurangabad City"
India is changing with extraordinary pace. Post 1991 period is transformation period for India. In those years India has witnessed drastic changes in several areas. With rapid urbanization, economic growth, rural development and globalization there is marked structural changes in cities and villages India. Some cities have extended their size and there are demographic,physical, economic,technological and environmental imbalances within such mega cities. A big city is an oasis for rural poverty. People from rural area attracted towards cities. The cities are influenced. There is structural transformation in villages. An understanding of the nature of functional relationship between the villages and cities is necessary villages which are near or around cities have been changed and changing rapidly. In this changing scenario culture, values and whole picture is changing. The characteristic of village are missing in terms of traditions, ritual, type of family,primary relationship, and the living standard etc. Unique culture of rural urban societies is being created. This specific study it is attempt to find out what fundamental changes has been found in the villages around big city. The study has been to analyze following objectives.

1. To find out economical changes among the villages surrounded by cities.
2. To analyze the social changes in the rural peasant in influence of city environment.
3. To study 'Identity Crisis' among villagers in post lPG period.

A survey has been conducted in the four villages closed to Aurangabad city in the state of Maharashtra. These villages are Chikalthana,Shendra, Waluj and Chitepimpalgaon. Twenty five families from each village have been selected by prurposive Random Sampling method. Interview method is used for data collection.

"Leisure Pattern of RURAL and Urban Indian Housewives'

The emerging pattern of leisure is deeply influenced by changes in social structure, economy & technology process in society. There are drastic changes in lifestyle of Indian people due to Globalization, Modernization & Liberalization. Villages are totally changed in all aspects. Villagers are following urban lifestyle that is dressing, food habitant, entertainment etc. Nowadays, everywhere most people whether man or woman, child or adult are engaged in doing a job or activity hence they don't get leisure. Traditional entertainment structure is totally changed over the last three decades. Rapid changes have been taking place in leisure pattern between rural and urban families due to advanced communication technology like T.V., Internet, Media etc. So the leisure pattern of rural and urban housewives is changed.

The paper highlights in assessing the leisure pattern of rural and urban housewives based on quantitative and qualitative data collected in Aurangabad City & surrounding villages of Maharashtra (India). In this paper 100 rural housewives & 100 urban housewives were randomly selected for study. The Researchers tried to unfold the following objectives.

1) To find out leisure pattern of rural and urban housewives.
2) To assess the role of leisure in there stressful life.
3) To find out relationship between SES & leisure pattern.

Racialization of Cultures of Violence By State Institutions: The Case of Western Switzerland

The Federal Office for Equality between Men and Women, mandated by the Swiss Federal Council, published in 2011 a study on gaps in research in the field of intimate partner violence. This report attests that researches articulating "gender" and "migration" need to be conducted to better understand this type of violence. It suggests particularly investigating the relationship between on one hand, cultural characteristics and conditions of migration and, the other hand, the occurrence of violence. This trend to seek the causes of "domestic violence" – as they call it- in the migration or the so-called "culture of origin" is also found in several programs offered by cantonal offices for equality. This point of view exposures challenges in the case of State institutions in charge of the struggle against domestic violence. Different explanatory models that can be invoked to understand this type of violence may lead to different institutional response, depending on how the "clients" are perceived by agents of these institutions. The subject of this thesis is to understand how these institutions categorize their "clients", manufacture the difference between them and how this categorization leads to differential treatment of the cases. The concepts developed by the Boundary work and the Intersectional perspective, will be useful for understanding of this categorization. For this communication I will expose my first results based on participant observation in a refuge center for victims of intimate partner violence and a hospital service in one canton of French speaking Switzerland.

KARAMI, NASSER (Bergen university)

Media; The Main Tool for Problematizing the Environmental Issue; Case Study: Iran

Disasters related to meteorological, hydrological and climate hazards cause significant loss of life, and set back economic and social development by years, if not decades. According to paleo-climatology evidences, the Iran's up and downs in different historical periods are significantly related to climate changes.

Because of the hyperactive climate change in the Middle East, the region, especially Iran is exposed to terrible drought, desertification crisis and severe land degradation which all have serious straightforward impacts on global security. Political, social and economic insecurity, violence, fundamentalism, immigration, terrorism are a few impacts of this new condition. But neither the government nor locals are not enough aware of the disaster which is threatening the civilization in Iran.

In this regard one important duty of the experts and academics is problematizing the environmental issues to persuade the target groups to care about the environmental problematics.

In this project, in the framework of a practical project, we have practically studies the role of media to promote sustainability awareness, change attitudes and behavior to improve locals' capability and resilience building among residents focusing on three goals: 1. Drawing the attention of public and governmental to hyperactive climate change in the country; 2. Understanding the social, political and economic impacts of desertification of the region on local and global level. 3. Introducing a comprehensive adaptation program compatible with post-normal climate. In this regard, media is an important instrument both for locals' empowerment and to introduce new adaptive life style components. Local informal communities, virtual media, social networks and a few of independent media (e.g. newspapers, magazines etc.) are some of media instruments which are utilized for information distribution among local residents.

Monopoly of the Bar in Russia: Perspective and Support of Ordinary Members

In the Post-Soviet period the legal assistance in Russia became much more liberated and free. A lot of legal professionals created their own business or acted as individual entrepreneurs in different levels of growing Russian legal market. New status of the Bar (in Russia it is associations of criminal defenders, recognized by the state) was officially established again in earlier 2000-s as a non-governmental and civil part of the Russian legal profession. There is no strong institutional hierarchy: bar's members ("advocates" in Russian) had to join to one of the regional chambers, which are, in their turn, associated with the "umbrella" organization – Federal Chamber of the Bar. Regional chambers' members enjoy their monopoly as criminal defenders. But the civil and administrative litigation remains open for all professionals, working without any membership in professional associations. This internal heterogeneity of Russian legal market is officially considered as problem of legal profession: there are no general standards, neither an institution to implement and control them. Since 2010, debates on professional monopoly have became more intensive, and Federal Chamber of the Bar plays an important role in these discussions pretending to voice of all legal professionals.

This paper is focused on the discourse of Bar's monopoly in Russia and based on public documents and expert interviews. It also presents the results of the mass survey of members of 35 regional chambers of the Bar (3317 respondents): the majority (more than 90%) supports the idea of monopoly, considering non-equal competition with non-organized lawyers. But there is also an opponent view: some lawyers did not trust the chambers' leaders and insist that monopoly would not decide the problem of professional standards and ethics. The paper considers this Russian case in the context of problem of globalization and unification of legal field around the world.

From Sociology of Development to Sociology of Global Development

This paper tracks the trajectory of shifts and trends in the studies of development. Starting from the post World War 2 development studies, this paper will examine the interplay between changes in the political economy of the global system and argue that the end of the long and sustained Cold War in the 1990 has created a multi-polar global system replacing the Atlantic hegemony. The shifts in the really existing global system in the Twenty-first century have led to a profusion of development theories, some were rooted in earlier experiments at one level and a macro-theories of global development on the other. Drawing from the development experiences of a number of Asia-Pacific countries, this paper will explore how instutuional theories of development intersect with culturalist theories in some cases yet an integrated and holistic theory or theories are yet to take root. A great deal of rethinking is needed to develop an integrated theory of global development that would be able to address the interconnected nature of development challenges facing te world.

Has Development Entered a Post-Human Rights Era? Reuniting the Generations of Human Rights for Sustainable Development.

Since the 1990s, development research, policy and practice has embraced a human rights agenda. Many attempts have been made to inform development with human rights concerns, align development agendas with human rights frameworks and integrate human rights in practice via the adoption of 'rights based approaches' to development.

Yet, recent research suggests that human rights has lost traction in the post-2015 development consensus (Brolan et al 2015). This is worrying, given that these findings were for health rights, arguably the most advanced domain of rights in practice, and a fundamental underpinning for global struggles for health justice. Expanding the humanitarian relief agenda may meet immediate human needs where development has failed, but has the development community left human rights behind as a project and a principle?

We confront the possibility that development has entered a post-human rights era, and consider the possibility of rediscovering and rehabilitating human rights within the sustainable development agenda, as well as the major challenges and

barriers to doing this. Responding to a fundamental provocation for human rights to move from victims' justice to survivors' justice (Mamdani 2014), a rights-based development agenda involves three elements: deeper democratization of development processes, incorporation of environmental principles into human rights and development of concrete arrangements for harm reparation and benefit sharing. This re-aligns the elements of participation, benefit-sharing and environmental protection, which have evolved along divergent paths. We argue that the time has come to reunite the 'generations' of negative, positive and collective rights in the pursuit of sustainable development. The liberty to demand rights and equity in enjoyment of rights must be complemented with a commitment to solidarity, understood as common, but differentiated responsibilities to re-distribute power and resources required for sustainable development to become inclusive and non-discriminatory, while remaining within 'safe spaces' of ecological and social survival.

Practices of Intimacy: Preliminary Results from Focus Group Interviews with Mothers and Daughters in Hong Kong and Japan

As the first stage in a larger project comparing mother-daughter relationships in Japan and Hong Kong, we conducted focus group discussions with mothers and adult daughters. Our sample included (a) heterosexually-identified and lesbian-identified daughters, in two age groups, 28-40, and over 40, and (b) mothers of heterosexually-identified daughters and those of lesbian-identified daughters. In this presentation, we will focus on the "intimacy work" daughters commit themselves to with respect to their relationship with their mothers and also identify the role of the partner in this. Preliminarily, in Hong Kong, we found that lesbian-identified daughters seemed to set a higher standard or ideal for the relationship and put more effort into it than their heterosexual counterparts. The latter, especially those who are mothers, seemed to be less critical of their mothers but at the same time also shied away from building an emotionally intimate relationship. Further, lack of conformity to gender and sexual norms seemed to be a source of tension less between mothers and daughters than between mothers and their relatives, which in turn could be deflected through the daughters' socioeconomic achievements. Comparable effects of socioeconomic achievements were not observed in the Japanese context. In addition, the actual relationships between mothers and daughters seemed not to be so different between the two groups of daughters except that the lesbian-identified daughters showed a tendency to attribute the nature of their relationship with their mothers to their sexual orientation. In contrast, a sense of taken-for-grantedness seemed to characterize the relationship between heterosexual daughters and their mothers. We hope to further analyze how the presence or absence of effort daughters put into the relationship with their mothers could reinforce family or gender norms, and how this might differ in different cultural contexts.

The Contested Positioning of Black Women in the South African Academy: What Should Come First, Their Race or Their Gender?

Black Women have always been marked as the other. In post-apartheid South Africa the imbalances of race and gender have not disappeared they are instead re-appearing in new ways. Black women's exclusion is not institutionalized anymore however their experiences of the South African Academy illustrate experiences similar to those experienced during apartheid and colonialism. Their professional ability is under constant scrutiny; they are forced to constantly proof themselves, they are mostly found in the lower levels of the academy, they are made exotic when in higher positions. This paper goes further to interrogate how the intersections of race and gender for black women puts them in a difficult position, as fighting patriarchy means disunity with black men, whereas solely fighting racial oppression creates an internal discord's as it is impossible to separate themselves from their personal issues as black women. The paper concludes by indicating that the intersectionality of race and class puts black women in a position where they are on their own, as they can't choose to be black and not woman and woman and not black.

"Why Did They Do It?" Muslims, Terrorism and the Boston Marathon Bombings

On April 15th 2013, at the annual Boston Marathon in Boston, USA, two bombs exploded, resulting in what has been widely described as one of the most significant acts of terrorism on US soil since 9-11. On April 18th, when photographs of the suspected perpetrators were released, there was intense public speculation about their racial and religious identities. Later on that day, the suspects were identified as two brothers, residents of the USA who were Muslim and of Chechnyan origin. We explore media narratives and commentary on the April 15 2013 Boston Marathon bombings, with the goal of better understanding the social construction of the suspects, the Tsarnaev brothers, as "Muslim terrorists." In this paper we focus on a 5 day period following the attacks, beginning with April 18th when the suspects were identified and caught. This was a period of intense public reflection and debate on explanation – the question of why did they do it. We conduct a framing analysis of explanations, drawing on materials from The Boston Globe, The New York Times and the online news section of CBS.com. We look at a range of coverage and commentary, including reports, essays, commentary, op-eds as well as readers' comments on these sites. Our findings suggest a range of competing explanations operating, including a "school shootings" narrative that turned to explanations of mental illness, family dysfunction, alienation from peers and exposure to a violent youth masculine culture. The "school shootings" narrative competed with one of the "Muslim terrorist" that explained the acts of violence as expressions of the religious identity and background of the suspects. Our analysis highlights the fluid, contested and ongoing character of Muslim racialization as well as the mediating role played by local and national histories in shaping these processes.

Caring for the Special Child and Transnational Parenting

A growing literature highlights the significance of transnational strategies of survival and mobility. These strategies include those of mothers and father who seek jobs abroad in order to earn money to support the children they have left behind in the country of origin. When the legal options are available, parents may also seek to eventually bring their children with them to the place of migration. In this paper I explore these dynamics in relation to a specific set of circumstances: the presence of a child who is disabled or sick. In general, the potential role played by medical conditions in migration decisions is unexplored and this is certainly the case with respect to the negotiation of transnational parenting in relation to a disabled or sick child. I draw on preliminary data from two sources in the discussion: the legal hearings on 2 reported asylum cases in which the difficulties of caring for a special needs child were prominent as well as 3 pilot in-depth interviews with immigrant parents in the USA, one involving a special needs child who remained in the country of origin and the other two with disabled children living with them in the U.S. Along with an extensive literature review, I draw on this preliminary data set to map out a series of questions, both theoretical and methodological, on the relationship of children's disability or sickness on the character of transnational parenting.

Non-Standard Employment and Risk: How Can We Capture Job Precarity Using Survey Data?

In the mid-1980s, Ulrich Beck noted that employment relations in contemporary societies are becoming fraught with risk and uncertainty, as traditional, full-time jobs which used to last a lifetime are being replaced by fragmented careers consisting of repeated spells of short-term jobs with multiple employers. This change is well-illustrated by the rise in non-standard employment (fixed-term contracts, temporary agency work, etc.), which are commonly associated with less economic security. Currently, a much-debated issue concerns the social and political significance of the emergence of the so-called precariat, a social class consisting of people for whom uncertainty and unpredictability of life circumstances and employment relations make it impossible to plan for the future, forcing them to live on a day-to-day basis (Standing, 2011). However, it remains unclear how the precariat may be defined and operationalized. Treating formal contractual status as a basis for identifying precarious employment is likely to be misleading, as research has shown non-standard employment to be heterogeneous with respect to working conditions and chances for achieving stabilization. Although survey research has found a correlation between fixed-term employment and perceived job insecurity, this relationship is far from universal. On the other hand, perceptions of security may also be misleading as indicators of precarity, as they are compounded by psychological coping mechanisms and perceptions of reference group status. This analysis attempts to disentangle the complex relationships between non-standard employment and perceived insecurity, in order to provide grounds for a more adequate conceptualization and measurement of job pre-

carity. Specifically, I assess the extent to which the relationship between worker contractual status and perceived job insecurity are conditional on various job and respondent characteristics, such as occupation, age, family situation, and others. The analysis is based on multi-level regression models including interaction effects, using data from the 2010 European Working Conditions Survey.

KIERSZTYN, ANNA* (University of Warsaw, Dept. of Philosophy and Sociology, chaber@is.uw.edu.pl)

Skills, Inequalities, and Overeducation: The Perverse Effects of Educational Expansion in Poland

The last decades were a period of rapid educational expansion, giving raise to questions regarding the extent to which labor markets can accommodate the growing number of college graduates, and concerns that this change, rather than improving the labor market chances of individuals and reducing social inequality, may foster overeducation and skill mismatch. This paper seeks to assess three hypothetical explanations of the latter phenomena offered by the literature, each with differing implications for social inequality. The first assumes that the job structure is unresponsive to changes in the supply of workers with varying levels of schooling, and educated workers compete for a limited number of high skilled jobs. Thus, educational expansion fosters an increase in inequality, as some graduates, particularly those from unfavorable backgrounds, are pushed into jobs with lower skill requirements (Thurow, 1972; Spence, 1973). The second hypothesis assumes that people voluntarily accept jobs for which they are overqualified in order to gain the experience and training necessary for career development, and views overeducation and skills mismatch as short-term phenomena occurring at the beginning of a working life (Sicherman & Galor, 1990; Sicherman, 1991). The third hypothesis attributes overeducation to the fact that people with the same educational credentials differ with respect to their actual skills, which are also determined by experience, cognitive ability, or the quality of schooling offered by various institutions (Green & McIntosh, 2007). These issues are examined on the basis of data from the Polish Panel Survey POLPAN, 1988-2013. First, I analyze the extent to which overeducation / skills mismatch are associated with individual socio-demographic characteristics, local labor market opportunities, job mobility or cognitive capacity. Second, I assess whether overeducation can be regarded as a stepping stone or a dead-end for workers, using random-effects logistic regression models relating overeducation to its lagged value.

KIJONKA, JUSTYNA* (University of Silesia in Katowice, justyna.kijonka@us.edu.pl)

If I Had Only Known... (Spät-)Aussiedler Migrants from Upper Silesia in Poland to the Federal Republic of Germany Are Taking Stock of Their Lives

The paper discusses the problems of migration and the lives of migrants from a long-term perspective, their fulfilment and disappointment and is based on research that I carried out on migrants who came to West Germany from Upper Silesia between 1970 and 2000 and received (Spät-)Aussiedler status. The people who were interviewed have spent most of their lives in Germany, have different identities and many years after emigration are reassessing their decision to migrate. The research was carried out on different generations – the first generation, the classic 1,5 generation and the second generation. The respondents were from various social classes, professions and occupations.

According to German law, many Silesians were able to migrate to West Germany as (Spät-)Aussiedler. The reasons for migrating were different and ranged from a real German identity through labour migration to exile ("Solidarity" activists). An important push-pull factor was the fact that Poland was not a democratic country and suffered from economic problems especially in the 1980s. In the bad economic situation – also in the nineties – migration to West Germany as "ethnic Germans", which was combined with financial support from the German state seemed to be the best solution for many Silesians.

The purpose of my research is to examine who are the (Spät-)Aussiedler from Upper Silesia nowadays; what do they think about their migration; in their opinion was it a good or bad decision, especially after 1989 and after the EU enlargement, after which Poland has changed and there are new life possibilities. I am also trying to answer the question what determines whether migrants consider their decision to migrate as one that brought fulfilment or disappointment and who might consider themselves to be a winner or a loser.

Cultural Constraints for Mental Health Care in Japan: Patterns and Correlates

An extensive body of literature has documented the under-utilization of mental health services among Asian populations, regardless of where they live. While Japan is one of the Asian countries where the mental health care provision system has improved substantially in the past decade, it is still reported that 80% of those with 12-month DSM-IV disorders do not receive any mental health services (Naganuma et al. 2006). According to the World Health Organization's (WHO) psychiatric epidemiological surveys, the estimated under-utilization of services in Japan was considerably higher than that found in other developed countries (WHO 2004). The cultural climate, which includes the stock of cultural knowledge surrounding mental illness among the public in Japan, is considered one of the important causes of this under-utilization and of the resulting health disparities. However, previous studies have not fully examined whether and   how constrained the cultural choices are among the Japanese population. This is partly due to the methodological limitations of these studies which have not yet explored the types of mental health care Japanese actually suggest in case of mental health problems and which social factors shape such decisions. As a part of the Stigma in Global Context—Mental Health Study (SGC-MHS), we examined culturally acceptable suggestions for mental health problems in a nationally representative sample of Japanese individuals. The results of the preliminary analyses showed that there are several different cultural patterns in the recommendation of mental health care among the Japanese. Furthermore, the results of regression analyses showed that these patterns are affected by various social and psychological factors, including the beliefs and attitudes toward those with mental health problems.

Social Capital As a Moderator Variable Between Neighborhood Characteristics, Perceived Environmental Safety and Mental Health

The role of neighborhood characteristics and perceived environmental safety in the process of mental health and illness has been investigated in a large number of studies. However, since only few studies used multi-level data sets the associations between individual characteristics and environmental conditions are rarely understood so far.

In this study the effects of neighborhood characteristics and subjective safety on mental health of people in urban areas will be investigated. The study sample consists of 3000 inhabitants of a larger urban conurbation in Germany. Subjective safety, experiences of criminal victimization, subjective assessment of social capital and mental health status were assessed by means of a representative telephone survey. Data on socio-economic neighborhood characteristics were gained from local statistical offices. Individual and neighborhood data were linked at the basis of 130 statistical areas. Data were analyzed by means of hierarchical regression model with the person at level one and the environmental characteristics at level two.

Main target of the analysis is to understand the role of social capital as a moderator variable between environmental conditions, perceived safety and mental health.

KILIC, AYKUT* (Bogazici University, aykutkilic@gmail.com)

Squeezed Between Commodification and Formalization(s): An Ethnographic Case Study of Precarious Work

With the demise of formal wage work across the globe, labor scholars have increasingly focused on the growing sections of the "precariat". A significant literature has burgeoned examining the politics of precarious workers, where they are identified as the protagonists of a new labor politics. However, this argument should be well contextualized, where an intense theoretical focus on neoliberalism obscures serious attempts of de-commodification through social assistance

programs in global South. In this sense, Turkey occupies a *sui generis* position. Despite the lack of a mature welfare system, there are no comprehensive social protection policies reaching out to the lot of unemployed and working poor populations. Therefore, broader questions on livelihood and social reproduction move to center stage while discussing unorganized conditions of precarious workers despite poor wages and working conditions.

Part of a multi-sided ethnographic study on working conditions and social reproduction mechanisms of precarious workers employed in Istanbul's second biggest industrial organized district, this paper contends that substantial formalizing interventions in social security, health provisions, housing and access to financial opportunities make workers much more dependent on labor market through a relentless discourse on economic stability and calculability of midterm goals. Here, formalization does not connote social citizenship endowed with certain rights. Rather, it's extended by piecemeal within the dictates of uneven capitalist development.

In summary, this case study tries to understand how strictly market-led interventions in the field of social reproduction can reshape and regulate workers' perceptions of precarious work despite a strong commodification. A historical comparison seems to provide a partial answer: Since processes of commodification highlighted as evidence of neoliberalism predate the neoliberal era in Turkey as in much of the global South, workers' conceptions of precarity are essentially shaped by a comparison of benefits acquired during different periods with a similar labor market insecurity.

Formal Mechanisms of Justice-Seeking in the Eyes of Children

This study focuses on children's knowledge concerning and possibility to use formal mechanisms of justice-seeking, which are, at least supposedly, open to children, for the purpose of protecting their own rights. The importance of the study is that it's carried out by both adult and children researchers. Therefore the planning and execution the study was based on the principles of child participation.

The study has 4 basic questions, which were set by the adult researchers, as follows:

Do the children know mechanisms of justice-seeking?
- an they access to these mechanisms?
- Can they exercise such mechanisms?
- What types of mechanisms would they prefer?

The adult researchers also planned the study for a 5-week period, each weekly session lasted 1,5 hours. For their voluntary participation, all the information was shared with the students of 7th grade of a secondary school in Istanbul.12 students volunteered.

The first two sessions were designated for empowering the children researchers on justice-seeking mechanisms and doing research. After that, they decided to divide into 2 groups by their interests. While a group made a survey to obtain information from their school friends about justice-seeking, the other group experienced the mechanisms via phone and internet, to see how it works. During this process, the adult researchers only facilitated the study.

The results of survey, 115 students participated from 5th to 8th grades, showed that children rarely know methods of justice-seeking and very rarely believe that these methods work for them. The experience of children researchers on application via phone or internet confirmed that projection. Claiming personal information, using "adult" language and hierarchic approaches made applications difficult for children to complete. The alternative mechanism they demanded based on their need to an easily accessible tool, both physically and qualitatively.

How Migrants Do Family: Citizenship Entitlements, Family Rights, Gender and Social Stratifications

While physical controls at borders and internally, and related practices such as detention, expulsion and deportation, remain important tools in European states' approaches to migration management, a further key instrument adopted operates through allocating differential rights to different categories of migrants in their entry, residence, labour market access and social / welfare entitlements. This results in a hierarchy of stratified rights among migrants – 'civic stratification' (Morris 2002) – whose particular positioning within which is a critical factor shaping their labour-market experiences. Less often acknowledged is that embedded within patterns of civic stratification is a hierarchy of family-related rights. Thus, migration policies also produce systems of what Kraler (2010: 15) terms 'stratified reproduction' – 'the ability of migrant families to reconstitute their families during

processes of migration'. This article examines the inter-relationships between the systems of civic stratification and of stratified social reproduction, and how these impact how migrants 'do family'. It takes as its case study the agriculture sector of Southern Sicily in Italy, a labour-market sector which has become a migrant niche in recent years in the context of the global restructuring of the international division of labour, and focuses specifically on Tunisian and Romanian agricultural workers. The former are Third Country Nationals and the latter, since 2007, are European Union citizens; as such the two groups occupy deeply contrasting positions with Italy's migration regime. Drawing on 30 semi-structured interviews with Tunisians and Romanians and ethnographic observations of their living and working conditions, we examine how family-life is configured within the opportunities and constraints rendered by their migrant status. We conclude that while socio-legal entitlements have an important bearing on how migrants 'do family', so too do gender and family norms related to childrearing and the division of domestic and paid labour.

Insights from Canada's Settlement Industry: Exploring Agency Data on Migration

Incoming temporary migrants are increasing as a proportion of total migrants to Canada, and the trend seems unlikely to reverse in the near future. The growth in temporary residents presents challenges to a host country that bases its policies and programs on a predominantly permanent migration model. In line with this model, data on temporary residents are lacking, and this gap is likely to expand, particularly under the current political regime, which has as an agenda what has been characterized as an "attack on science." Consequently, our knowledge about this population is extremely limited and we are pushed to consider non-traditional sources of research data. In this paper, we explore the feasibility of agency administrative data as a potential source of data on permanent and temporary residents. Based on an online survey of non-profit organizations in the Greater Toronto Area and five focus group discussions with senior agency staff, we discuss the opportunities and barriers.

The Importance of Relationships for Well-Being Among Transnational and Intact Migrant Families from South Korea

This paper focuses on recently arrived Korean families in Canada who lived under different circumstances, some migrated together with their immediate family members (intact) and others lived in split households (transnational). Using data drawn from the Toronto Korean Families Study – 2011 Survey, we draw a comparison between transnational and intact families from South Korea in Canada in terms of their patterns of engagement in their familial and social relationships. We also pay close attention to the affective quality of their relationships and how it affects their well-being, defined as (1) a subjective assessment of their physical and mental health and (2) their satisfaction with different elements of their lives. The results of this study are expected to inform our understanding of how transnationalism shapes the association between relationships and well-being.

Negotiating Reactions to Multi-Racial Tensions: The Civic Roles of the Multicultural Church in Korea

Korean society has become increasingly multiracial and multicultural in the global age. As the immigrant population has steadily grown in Korea over the past 25 years, it has caused demographic changes and social problems such as racial discrimination, undocumented workers and employment instability. Both governments and NGOs have been emphasizing social integration; however, the problem of ethnic and cultural tensions between domestic citizens and immigrants has been treated too lightly thus far. This research examines how citizens understand, support and negotiate with immigrants, on the basis of their life-world, through various activities in religious communities.

This study demonstrates cultural dynamics through citizens' participation and immigrants' negotiation at a personal and communal level. We conducted participatory observation at three multicultural churches (immigrant-centered, citizen-centered, and integrated church) and interviewed 30 members. The results of this study reveal that an integrated church model contributes heavily to the successful social integration of immigrants. At the community level, church communities serve as a refuge for immigrants, preserving their dignity and providing well-being services. At the personal level, individual Korean citizens come to understand the customs, cultures and values of immigrants while they empathize with and resolve difficulties immigrants face in the areas of employment, international marriage, and children's education. Meanwhile, domestic citizens and immigrants come into conflict due to divergent interests, but accept and embrace each other as a result of authentic global citizenship as Christians. Furthermore, through such interactions with immigrants, Korean citizens improve their civic skills in a global context. But despite these positive developments, challenges remain in resolving the problem of a church power structure where decision-making is centered on Korean citizens.

In conclusion, multicultural church communities would play significant roles in the public spheres where citizens adopt and practice a multicultural citizenship for the social integration in the better world.

KIM, MINZEE* (Ewha Womans University, minzeekim@ewha.ac.kr)

Human Rights Education for Higher Education in Korea

The second phase (2010-2014) of the World Programme for Human Rights Education calls for an action for human rights education in higher education. While the plan has been widely promoted, there has been little national level research analyzing human rights education in higher education. Human rights education in higher education is important not only for educating ethical citizens committed to human rights but also for knowledge and expertise to meet current human rights challenges. Using empirical data on human rights education at both undergraduate and graduate levels in Korea, this research examines and evaluates human rights education in higher education in South Korea. Findings suggest that human rights education in higher education in Korea has not been accessible to students majoring in broad range of disciplines but to few social science and law majors. It also lacks academic programs specialized in human rights, which is essential to create knowledge and experts in human rights. Implications and future directions are discussed.

Consuming Commodified Cultural Hybridity: A Study of Korean Media Consumption By Vietnamese in the Czech Republic

As part of a larger research project on Vietnamese migrants in the Czech Republic, this study focuses on the sociocultural context of transnational cultural practices.

In the process of catching up with the Western media, the Korean media industry has blended Western and Asian values in its products. The Korean industry has been studied as a typical case of cultural hybridity that demonstrates local appropriation of global cultures in which deeper cultural-hegemonic relationships are embedded, and this hybridity typically reflects Korea's late, yet rapid, entrance into the global media flow. Korea has indigenized modes of Western media production while developing its own local tastes that reflect traditional values.

The ingredients composing products of Korean cultural hybridity are greatly appreciated by the Vietnamese in the Czech Republic. Participants commonly identify shared cultural values and modern-urban style as main reasons they consume Korean media. This study finds that they nurture their own cultural hybridity by discursively reflecting their marginalized cultural life and by idealizing the path of Asian modernization. They express "shared-cultural-value taste" by contrasting Korean media to Western media. On the other hand, although "modern-urban-style taste" reflects Western cultural hegemony, the young migrants stress that the stylish products are made in an Asian country, which is often referred to as "more developed" than their host, the Czech Republic. Many participants believe that Korea and Korean media have successfully navigated the path of Asian modernization, which Vietnam has only recently joined.

The media practices of Vietnamese migrants might merely indicate consumption that reflects the regional media industry and trends. However, they give meaning to their consumption by projecting their hybrid identity, which reflects both regional (traditional) and developmentalist identities. Finally, this study argues that transnational media practices could shape a standardized cultural hybridity of commercial media products in a given context.

KIM, YANG-SOOK* (University of Toronto, yangsook.kim@mail.utoronto.ca)

A Comparative Study of Organizing Co-Ethnic Migrant and Local Women Workers in the Care Market of South Korea: Challenges, Strategies and Successes

This study explores how discursive contestations over the definition of *good care* and the *ideal care worker* shape the collective organizing strategies of migrant and native-born workers in paid care work. Drawing on the case of South Korea, this study focuses primarily on the differences between two groups of women

workers who are marginalized differently but face common issues from doing low-paid, devalued and precarious work: co-ethnic migrant women from China and native-born Korean women in their 50s and 60s. Since the late 1980s, Korean Chinese women have started crossing the border to work in informal sectors. At the same time, the South Korean state has encouraged all women, especially working-class women, to take jobs as care workers to cope with the care deficit of the nation. Drawing upon preliminary fieldwork conducted with a local domestic workers organization and a Korean Chinese ethnic organization, this study explores how contrasting notions of ethnicity and nationality create different and unequal sources of support for domestic workers to improve their working conditions through collective organizing. In the case of native-born workers, I find that the notion of Korean ethnicity is closely linked to narrowly-defined discourses of cultural and political membership that link workers' rights to South Korean citizenship. In the case of migrant co-ethnic workers, I find that Korean ethnicity is drawn from beliefs about a shared cultural heritage that goes back to the division of the nation, enabling them to identify themselves as Korean, not South Korean. This broadly defined notion of a Korean ethnic identity allows them to organize ethnic-based organization and to develop discourses of rights based on pan-Korean ethnicity, but impedes the development of links to workers' organizations.

Self-Expression Via Clothing Fashion on Social Media: Focus on Japanese Youth Culture

This presentation examines platforms for self-expression via clothing fashion, using quantitative data from a 2014 survey conducted by the Japan Youth Study Group. In Japan in the 1980s and 1990s, just as Jean Baudrillard(1970) pointed out, fashion was closely related to the urban, consumer landscapes. A variety of fashion items was used in producing and displaying one's image, while the individuals interacted with countless, nameless others even in the midst of their self-productions, thereby increasing their affinity for the urban space that functioned as the site for seeing and being seen. The city works as a stage for extending the displays of one's own production. Yet as Japan entered the 2000s, the urban setting shed its role as stage(kitada 2002), and consumption that was once an urban experience no longer served as the space for fervently projecting one's identity.

My analysis results have not been able to confirm any correlation between self-expression through fashion and urban experiences and consumption spaces. This report examines whether, within contemporary Japanese youth culture, social media now serves as a stage for self-expression through fashion.

Signals, Indices, and Statistical Discrimination in Hiring

Some scholars conjectured that Spence's signaling games with an index would serve as a model of statistical discrimination in the hiring processes, which should explain the following facts observed in industrialized societies: first, the mean educational level for men is greater than that for women; second, the mean wage for men is greater than that for women. In order to examine whether the conjecture is supported or not, I formulated a generalized version of these games, assuming that the educational level is a signal of productivity while the gender is an "index" of productivity, and followed the procedure of refinements of perfect Bayesian equilibria to eliminate unreasonable outcomes. My analysis reveals that a "curious" consequence is derived from the separating equilibrium that survives the Intuitive Criterion in the refinements: the mean wage for men would be equivalent to that for women. As the employers are assumed to know that the educational costs for women are greater than those for men, they would believe that women with shorter years of education have the same productivity as men with longer years of education and therefore offer the same wage for the men and the women. I also examined some modifications of the model that might resolve the difficulty in explaining the gender gaps in education and wage.

KING, NEAL* (Virgnia Tech, nmking@vt.edu)

An Aging Male Turn in the Study of Hegemony

Conflict sociology pointed toward a 'male turn' when Connell theorized the hegemonic effect of masculinity in the 1980s. Defining masculinity as all that groups do to distinguish men, most sociologists now theorize it as distinguishing men not only as different from women but as better fit for valuable work and deserving the un(der)paid care of women and subordinate men. The study of men thus offered progress in the study of hegemony. Just as second wave feminism had increased women's claims to pay for their work, continuing deindustrialization and decline of labor union has altered the breadwinner role for many men. Today, a large anti-aging industry sells men a chance to fight to regain their privileged status. Drawing on interviews with nine middle-aged men and ten middle-aged women in the U.S., I show that the men approach the anti-aging preservation of bodies in ways that distance them from consumer roles and focus on performance at work and at athletic play, emphasizing the "fight" and "work" in ways that women do not. I conclude by suggesting that the study of middle-age manhood offers a unique vantage on the operation of hegemony. Acceptance of ideals of manhood can lead aging men to hold themselves personally responsible for the exclusion that they anticipate enduring in old age, offering a rare opportunity to test Connell's widely cited theory. This may not require an 'aging male' turn in sociology, but it does suggest the importance of intersectional analysis.

KINK, SUSANNE* (University of Graz, susanne.kink@uni-graz.at)

"Biology Appeals to Women. Women Do Not like Math" – Stereotypes and Implicit Gendering of Scientific Cultures in Chemistry and Geology

The differentiation of science in numerous disciplines or research areas leads not only to changes in the scientific landscape and therefore to a rejection of Snow's thesis (1959) of the Two Cultures, but has an impact on the research of gender in scientific cultures as well. On the basis of qualitative interviews with scientists at Austrian Universities the paper points out the heterogeneous epistemic and social practices in chemistry and geology and especially highlights aspects of gender. But how does one go about analyzing academic gender norms when measures of gender equality politics have been introduced at universities that have affected the way scientists talk about gender and their field? Why is it that, even though informants claim gender neutrality in their field, men and women are still unequally represented in natural sciences? With the help of a comparison between professional descriptions of the field and the way scientists talk about gender the paper is able to show that social perceptions of gender are *implicitly* incorporated in scientific cultures. It illustrates furthermore the different styles of how social ideas of gender are embedded in scientific cultures. For example in theoretical chemistry among other things it is the gift for math which is denied to women, in classical geology the important strength for the geological fieldwork or in organic chemistry it is biology which apparently helps women to enter the field. Even the analysis elaborates on the one hand the difference of stereotypes and gender norms which are enrolled in the epistemic and social practices of the chemical and geological fields; it shows on the other hand that all fields implicitly are marked as male. This still consisting masculine gendering of the scientific cultures contributes to the persistence of women's discrimination and gender inequality across all career patterns in natural sciences.

KINOSHITA, SHU* (Japan Society for the Promotion of Science, mohitori@gmail.com)

Deviances from "Normal Life": When the Category "Dementia" Becomes Relevant in the Life of a Person

In this presentation, I analyze how the category "dementia" becomes relevant in the life of a person. It is known that "many dementia patients will already have lack of insight in the early stage of the stages of the disease process and therefore will be unaware of problems" (McKeith & Fairbairn 2001); thus, awareness by family or friends will be important. Sociological studies on early stages of dementia have focused on conflicts among the persons involved (Gubrium 1986). "Personality changes" and "difficulty doing normal tasks," which represent early symptoms of dementia are always vague. Opinions may differ on what troubles can be termed as dementia symptoms, which leads to conflicts, especially among family members, on whether elderlies should be taken through the official diagnosis process. Although many studies have focused on disagreement, little attention has been given to consensus building. Considering the abovementioned studies, I examine Japanese cases, especially Ms. K and her daughters. How was Ms. K defined as having dementia by her daughters? I emphasize the following point: our decisions regarding the early symptoms of dementia should always be based on each elderly's life course and normal patterns of everyday life. For example, whether someone has "difficulty doing normal tasks" is highly dependent on what kind of task was normal for the elderly individual (e.g., accounting, cooking). However, if we do not know the elderly's personality, we cannot tell whether it has changed. In other words, the "normal life" is an important criterion of what is deviant and should be diagnosed as dementia. In conclusion, I would like to state that the knowledge about each elderly's normal life is privileged knowledge of the family (Gubrium & Holstein 1990). Dementia is highly elaborated as a professional concept but also requires mundane reasoning and knowledge of the family.

Biodiversity Conservation and Sustainable Livelihoods through Ecotourism: A Prospective Look in Northeast India

The communities and the northeastern region of India, which has rich biodiversity 'hotspots', have conserved and sustainably used the region's natural resources based on their traditional belief systems and ecological knowledge. The region with its distinct culture and geographical entity still remains in many respects an 'undiscovered tourist's paradise'—and has huge potential for development of 'eco-tourism'. It has been advocated within the academic literature that ecotourism intend to enable communities to benefit from the use of natural and cultural resources available to them by fostering sustainable socio-economic development while maintaining the integrity of those resources. In short, ecotourism can integrate conservation of biodiversity with sustainable livelihoods of local communities. Given the paucity of information and research on ecotourism in the region—this study attempts to explore the awareness, concern, perceptions of and support for ecotourism among residents living adjacent to the tourist sites. Based on my study of the enchanting Dzukou valley (a tourist destination) located at the border of the Indian states of Manipur and Nagaland, this paper tries to understand how and to what extent ecotourism has the potency to preserve the environmental and cultural heritage of the region and rural communities? . Using secondary data, in-depth interviews, a survey, and participant observation, the study also locates the prospective areas and opportunities of potentiality of ecotourism which can strengthen both rural livelihoods and protect biodiversity. The study also seeks to find out the future prospect of ecotourism in the region.

Dams, Indigenous Peoples and Resistance: An Exploration through the Case of Manipur, India

Opposition and resistance to developmental projects like dams and hydro-electric projects are increasing in most parts of the Northeast region of India today. Often, these projects mean the destruction of their resource base, forcible eviction and displacement from their traditional homelands and a threat to their cultural identities and subsistence. Based on two case studies in Manipur–the Mapithel Valley Multipurpose Project on the Thoubal River and the Tipaimukh Hydroelectric Project on the Barak River, this paper examines 'dam' as a site of contestation between the state's led development agenda and the affected indigenous people. Based on field experiences, the paper discusses the competing value in relation to 'resource use' and 'ownership' systems. While the minorities indigenous peoples (Nagas and Kukis) are asserting their inherent rights over land and territory demanding separate autonomy, the state government too is pro-actively pushing 'development' and the 'land reform policy' in the hill areas. The indigenous people have opposed this dam by asserting that it will displace the inhabitants, threaten their means of existence and violate inherent rights over land and resources. Resistance often invites military intervention thereby increasing state repression, which is evident from the field. The conflicts generated by dams have a spillover impact on all major issues affecting the politics of Manipur today. The controversy over dams invites serious deliberations beyond the mere dam construction and its social and ecological impacts but also gazes the various dynamics and interplay between politics, culture and natural resources. This paper attempts to reinvigorates the very political closure approach which emphasizes state's hegemony through forceful intrusion into the life, livelihood and 'life world' of indigenous people and infringement of their customary land rights.

KIRCHHOFF, NICOLE* (TU Dortmund, nicole.kirchhoff@tu-dortmund.de)

Child(hood) As a Successful Product of New Fatherhood?: Changing Relations in the Inner Space of Family

The family as a primary authority of socialisation is changing. This change is negotiated in public and private discourses and can be pinned down within a new and active understanding of fatherhood. In my paper I reconstruct concepts of families by considering representations of parenthood through photographs as well as couple-interviews. The concepts of families are marked by the coexistence of modern and traditional elements, especially regarding the father's position. I based my research first on mass media pictures of fatherhood and second on interviews with heterosexual couples from East and West-Germany. The used method is a combination of the biographical-couple-interview and group discussions. In my paper I will follow the question of how the politically intended - and socially approved - gender discourse affects the position of the child within the social space of the family. The evaluation of interview excerpts is realized by the

documentary method of Interpretation. My input suggests that the position of the child within the family triad, as well as the parental expectations that are marked by envisioning a "successful" or "soon to be successful child", are becoming more expressed. In my paper I will discuss: 1. how this process occurs along the backdrop of gender, 2. how does parental history and experiences lead to orientations that are manifesting themselves in the child, and 3. how this assumed re-evaluation (higher value) of the position of the child suppresses unsolved problems and obvious needs for action within the couple.

KIRCHHOFF, NICOLE* (TU Dortmund, nicole.kirchhoff@tu-dortmund.de)

The Image Discourses of Adolescents: "Group Work Process" As a Catalyst to Talk about Bodies

"Good looks are not important!" - this is what young people, aged twelve to fourteen, say, if they are asked for their preferences of body representations. But: when they are confronted with medial body pictures, you can observe, that the opposite is true: Then bodies are *"horny"* or *"fucking awesome"*, *"athletic"* and *"sexy"*. Or even not: in the worst case bodies are *"unsportsmanlike"*, somehow *"amorphous"* – and so to speak *"gay"*! In my paper I introduce via case-study fragments a research conception, which increases the **verbal** method of the **group discussion** on the **visual** level by the **"collage of images"** and by the **"group-selfie"**. Their triangulation (as a closed *"group-work-process"*) is to help us record and with that understand better body (re)presentations of pupils also in the context of sport in- and outside school than by exclusively verbal approaches. In order to that I want to talk about methodological questions of my qualification-work which is based on a current project at the TU Dortmund, which focusses on adolescent migrants in comparison to autochthonous pupils: Its goal is to evaluate how gender, social class, migration and their intersections predict the socialization process of teenagers regarding their body images and cultures. The originally planned method of group discussion in the framework of the Documentary Method is suitable to identify collective orientations. However we already have been anticipated and which has been proven through experiences in the field, problems arise during discussion, if we are focussing on questions concerning the body and thereby only stay on the verbal level. Along empirical examples firstly I want to discuss in what way it's difficult for pupils to talk about bodies and secondly to outline how the extension of the group discussion through methods of the Visual Sociology turns out as a catalyst.

Doing – Undoing – Redoing? the Everyday Representation of Gender Patterns in Youth Scenes

Rockabilly, Sport Climbing and Visual Kei are three (youth) scenes which, at first glance, could not be more different – be it in terms of activities, habits of (self-)presentation or the scenes' geographic origin. However, the three scenes also have something in common: they all are global-historic movements which are adapted, transformed and interpreted within local contexts of present modern societies. Moreover, as youth-scenes, Rockabilly, Sport Climbing and Visual Kei are conceptualized within the context of individualized, popularized and globalized societies, as a prototype for post-traditional forms of social affiliation due to the dissolution of traditional forms of social affiliation, particularly youth scenes offer a new type of operational framework in which individuals can pursue their interest for a common topic; regardless of their social background. This, commonly hedonistic quest for pleasure, involving only a minimal amount of self-commitment makes scenes attractive for a variety of social agents. Most notably, they offer an opportunity for them to meet like-minded people.

The question, to which extent gender-arrangements are affected in this context of hedonistic enjoyment, has not been systematically studied, yet. The research-project "Scenes, a Prototypical Social Field for (Re-) Negotiating Gender Arrangements" will attend to this research gap. Initial findings will be presented. In doing so, we will discuss the question in how far gender-patterns are reactualized, ironized, questioned, tested, denied or even traditionalized in these three scenes. In this regard, we consider group-discussions the best method to (a) inquire gender-patterns and -arrangements that dominate and are considered self-evident within the field and to (b) capture their linguistic legitimization. Our goal is to facilitate a deeper understanding as to the question if, or in which way, scenes are a prototypical field for (re-) negotiations of gender-arrangements.

The Visibility of (Gendered) Competence in Sport Climbing

Sport climbing is not only distinct from others modes of climbing or mountaineering because of shorter routes and a more frequently interaction with others. But when asked about the differences between women and men, sport climbers pre-eminently refer to differences in the act of climbing, climbing movements and attitudes towards climbing (a) – it is all about the action on the wall which is sometimes understood as gendered specificities. First and foremost, members of the scene differentiate between agents who they consider more or less competent (b). Within the triad of ability, motivation and appreciation, they categorize all people while they climb. Anthropometric aspects or other options for the characterization of personalities are said to be almost irrelevant. Sport climbers are (primarily) interested in how others move within a climbing route, what they can learn from them to improve their own climbing and how they can compare oneself to the other. They are able to assess a climber's competence in terms of "ability" and "motivation" by "reading" her/his performance. That is why they do not deduce "ability" from the physiognomy of a climber's body. Only a body in a (associated) motion indicates an either more or less high competence.

In order to read competences, the observer is expected to possess certain movement and observation qualities herself/himself (c), since the climbing movement, considered most competent, combines several facets like body use or the (right) "reading" of routes. Nevertheless, a climber's competence is not bestowed individually, in account of the display of the climber's skilled movement; but is ascribed in the presence of other climbers or by analyzing pictures. Which of the three competence aspects are gendered (how) and for which aspects gender is (made) rather 'invisible', is part of the negotiation of (gendered) competence in the act of climbing.

The Model of the Future and the Social Ideal in the Consciousness of Modern Russian Youth

In the totalitarian and authoritarian ideologies the present sacrifices to the future prosperity. The Soviet society was directed to the future. The building of communism was that the most important task, which combined several generations. The whole system of state propaganda was aimed to inspire people what kind of future they had to dream about, what they needed to restrict their needs consciously for.

During the transformations, occurred in Russia at the end of the XX century and at the beginning of the XXI century, the transition from a single targeted ideal of the future, introduced into the consciousness of people, to pluralism of ideological values in modern Russian society has happened.

This is in youth when a person actively forms his social expectations, develops the system of value orientations and ideals. In spite of the economic, political and social problems the youth are always oriented towards the future. Therefore, it is important to study the changes occurred in the minds of young people in recent decades, including models of the future, social ideal.

According to data of all-Russian polls over a half of young Russians (57%) do not have idols or heroes whose example they are ready to follow. Most young people (54%), but not all of them, are sure that the main moral norms are influenced by time and are always important.

The dynamics of the youth value orientations has become a subject of the study conducted by us for the last 18 years among students. Within our study framework it was important to analyze whose future worries the youth first of all: their own one or their country's. What period of time do the youth plan their future for? What is the future of Russia and who or what does it depend on in the youth imagination?

Co-Constitution of Protest Repertoires and Performances through Protest Cycles

Extant literature on social movements and protests has stressed the need for incorporating relational mechanisms in order to explore how actors, practices and repertoires co-evolve as protests unfold (Tilly, 2007). This paper establishes a dialogue with the current literature by proposing a methodological approach to tackle the relational dynamics among actors and repertoire. Rather than assuming relationships as ex-ante and given to the protest cycles, or conceiving the protest repertoire as given and bounded in a 'tool box' (Swilder, 1986), we suggest that relationships among actors and mobilized repertoire co-evolve. Social actors might engage in specific performances not only to promote their protest, but also to distinguish them from other counterparts. Conversely, joint events that involve a wide range of social actors might lead the former to silence specific performanc-

es that could put in jeopardy the contingent coalition. Further, the emergence of not-predicted forms might set social actors against each other. In order to explore these dynamics, we explore the protest cycles that took place in Brazil, during the month of June of 2013. We built a unique database of protest events, comprising around 800 events collected from newspapers (i.e. Malinicka, Tindall & Diani, 2013). Each event was codified and includes (inter alia) actors involved, form of action, form of repression, action target (Franzosi, 2004). The relationship between actors and forms of action constitute a longitudinal affiliation network. The evolution of performance network is formalized, yielding 'protest grammars' (Mohr & Rawlings, 2010), while the network among actors provide a glance at the evolution of coalitions (McAdam & Fligstein, 2012). Actor-based modeling (i.e. Siena) is applied in order to model the co-evolution of this network's two modes.

Willingness to Use Test Data and Its Impact on Teachers' Relationships

The extant research on standardized tests and their effects on educational units has shown that tests' data is useful to educators if (properly) used (Coburn & Turner, 2011). In contrast, educators' arguments on the 'ceremonial' dimension of external evaluations lead to poor data usage. Recent studies have shown that how test data is used by teachers is guided by institutionalized incentives (Hamilton et al, 2013), organizational culture (Sandholtz, 2012), individuals' beliefs and practices, and how change is communicated (Coburn, 2004). Further, institutional conflicting signals impose higher uncertainty, requiring from schools' leadership a sensemaking role and selective decoupling from stakeholder's requirements (Crilly et atl, 2012; Haack & Schoeneborn, 2015). As a consequence, the social relationships among teachers and between teachers and principals directly impact reform (Daly et al, 2010) and consequently the odds of successful data usage. Throughout this study, I probe two aspects among these factors. First, I investigate how teachers present and sustain their beliefs related to external tests. Second, I explore how teachers' relationships are impacted as a result of their willingness to use tests' data. For these purposes, I conducted in-depth interviews and focus groups at four public schools in São Paulo, Brazil. Findings show that the higher the willingness to use external tests', the closer the relationship with the school's leadership. Hence, the causality direction might be inverted, which removes the burden from the school's leadership towards more systemic design. Second, teachers selectively choose the external tests that will serve as primary institutional guidance, depending on the quasi-market they want to serve. Yet, even when teachers present high willingness to use test data, they express their rejection towards using this data for teachers' evaluation and assessment of career progress. I conclude this article with a discussion on implications for public policy in São Paulo, Brazil.

Disconnect to Reconnect: The Construction of New Media Risks and Solutions As Paradoxical Feedback-Loops in Organizations.

Following the argument of an ongoing process of mediatization, we observe a number of new uncertainties, risks and perceptions of risks regarding the influence of new media in organizational contexts. Forms of these risks are closely related to concepts such as overconnectivity, junk information or permanent availability. The responsible digital technologies "are often presented as posing risks to users" and are at the same time a „source of new concepts of risk", as Deborah Lupton pointed out. As these risks are always closely connected to constructed concepts and therefore hard to grasp empirically, the question arises how the organizational construction of risks and uncertainties can be systematically analyzed. With our presentation we would like to give an insight into the question of: a.) How organizations conceptualize and build business models revolving around a specific conceptualized risks regarding new media, b.) Provide a product or service which should hold a solution to the inner organizationally constructed risks whilst c.) They maneuver themselves into unexpected paradoxical feedback loops in which their solution threatens their own business model. Thereby we observe that organizations tend to one the one hand reflect deeply on their conceptions of risks whilst at the same time they are commercially bound to reflexively look for public concepts of risks in order to stay ahead in the respective market. So in order to adjust accordingly to the interplay of differing concepts of risks, from within the organization and from outside of the organization, we argue that organizations are bound to find what we call "mild solutions" in order to keep their business model running. These "mild solutions" seem to function as an Antidote as well as a driver regarding the construction of risks around new media, which is why we would conceptualize this process as a form of reflexive mediatization

The Development of Lexical and Conceptual Representations in Sheng

Language research on lexical representation reveals that representation attaches meaning and language to culture. This paper investigates how the use of Sheng (language spoken in Kenya) texts produce and promote social values. The paper further investigates how the use of Sheng contributes to maintaining or changing values. We use the reflective theory which proposes that language works by simply replicating or imitating a fixed "truth" that is already present in the real world (Hall, 1997) as a guiding tool in the text analysis. Findings reveal that Sheng words represent social values, changing values, social groups (according to ethnicity, age, class), events and issues (war, death, work). Sheng texts carry concepts which words can be mapped to. Sheng is a language that emanated out of code mixing and switching between English (official language), Swahili (national language) and a blend of some local languages spoken in Kenya. Sheng was first spoken by the urban youth in the slums of Nairobi in the early 80's who felt the need for belonging; being a part of a group. A good majority of the population in Kenya currently speak Sheng.

Relevant Education

In this paper I propose that higher education generate skills that are more or less relevant in different occupations and industries. If different educational fields have different occupational and industry dependent human capital contribution, I expect to see a higher wage premium for people with a relevant education. The key challenge is to classify which educational fields are relevant for which industries and occupations. To do this I will use the systematic occupational and industry coding in Norway and relate this to the different educational fields and programs. Further, I will also use a purely statistical approach where I measure where candidates are allocated in the Norwegian labor market. Since the Norwegian labor market is characterized by collective wage bargaining, especially in the public sector, I will also analyze how sector interacts with the effect of having a relevant education. To examine these questions I will use rich data from Norwegian public administrative registers covering the entire Norwegian population. Using the longitudinal structure of the data I can look at labor market changes within persons; this will help to account for any selection problem based on individual abilities. Preliminary findings show that having a relevant education is associated with an increase in wages. This premium vary between different educational fields, with the largest wage effect for programs of professional study. The effect of having a relevant education is larger within the private sector, compared to the public sector.

Integrating Immigrant Religions in Comparative Perspective

As the debates over multiculturalism in recent years have made clear, religion has loomed large as a factor in the challenge of achieving national unity while simultaneously preserving diversity. Compared to language, for example, it is far more likely to be a source of contestation at present, aside from unique cases such as Belgium. However, as Rogers Brubaker has recently argued, religious pluralism in liberal democracies is robust. At the same time, religion—especially Islam—is often seen as an impediment to integration. Raising this issue in comparative terms, Richard Alba and Nancy Foner have argued that in North America, religion tends to be a bridge to inclusion, whereas in Western Europe it is a barrier, whereas Christian Joppke and John Torpey have argued that when focusing on legal and institutional factors, trans-Atlantic differences are not particularly pronounced. This paper critically examines the work of these scholars and others who have offered to date the most sustained attempts to address the topic of religion and immigrant integration, attempting in the process to build on this work in order to distil a revised comparative framework that offers enhanced analytic precision.

KJELLMAN, ARNE* (Stockholm University, Computer and Systems Sciences, Sweden, kjellman@dsv.su.se)

The Limits of Knowing and Re-Emergence of Human Feeling in Science.

This presentation, which builds on the "Subject-Oriented Approach to Knowing" (SOA), discusses the limits of human experience and knowing. It shows that the phenomenon of life cannot be understood unless the concept of *human feeling* is re-introduced into science at a very fundamental level. The claim is that in the very moment a subject/thinker/knower introduces "matter", or the like, as something real or distinct from the subject, she has introduced a crippling matter/mind distinction from which human knowing can never recover.

With the SOA, the dichotomies of truth or falsity, right or wrong, fact or value disappear, and the role of science as a pursuit of 'truth' is undermined. Heisenberg's uncertainty principle applies to all forms of decision as such also truth assessments, which are now relativized along the lines of Protagoras' ancient suggestion that "Man is the measure of all things." As such all decisions are intimately tied to his feelings by means of the SOA's model of human consciousness and knowing, which is in many respects close to Henry Poincaré's 1898 proposal. This also means that all knowledge endeavours can be grouped under the same umbrella, as the physicist Ernst Mach once suggested, and the cleft between the social and natural sciences is removed.

The idea of a common objective reality gives way to the idea of a private universe – a 'priverse' – belonging to each and every person, and laboriously constructed on the basis of purely private experience. It is to mankind, or at least science, no longer any need to fall back on some ultimate 'external' power of intelligence or omnipotence. Man is by reason fully capable of handling life without the guiding principles or laws of some all-mighty God, and is consistently free to embrace 'internal' God/gods of his own personal desire.

KJÆMPENES, WENCHE* (UiT The Artic University of Tromso, wenche.kjempenes@uit.no)

The Use of a Five-Actor Model Approach to the Study of Professions and Professionalization. Examples from a Comparative Study of the Fish Health Work Field in Norway and Scotland.

Professions in a modern society are closely interrelated with that society's institutionalization processes (Halvorsen, 1994). I suggest, based on my comparative research work on professionalization and division work in the fish health field, that in order to understand the implication of institutional changes for professions one can use a five actor model including practicing professionals, other professions and/or knowledge-based groups, state, users and universities (Kjæmpenes, 2013). This model is complex and based on, and follows closely, a four-actor model developed by Burrage, M, Jarausch, K. and Siegriest, H. (1990). The assumption is that actors in a work field (political field) involve at different times depending on their interests, resources and strategies. The interaction between the actors, as well as the national context and the dynamics surrounding the field influence the outcome of the interplay of the actors in a new work field. Whether the result of this interplay is a stronger profession, a new profession, or deprofessionalization is influenced by the national context and should be studied empirically and in a comparative perspective.

My empirical study showed that the effect of professionalization of the fish health field, related to the development of the fish farming industry in the 1980s, was crucial for the rapid development of the Norwegian and Scottish fish farming industry. The demand for knowledge-based advice in fish health had opened a new field of work. The establishment of education and research institutions in both Norway and Scotland placed fish health as something different from only a marine science field or veterinary science field.

By using the five-actor model as a framework the actors' interest in professionalization processes revealed. Professionalization processes is about professions or knowledge-based groups that want to be part of a system of professions, but also about large institutional processes both national and international.

Collectively Imagined Futures and the Conflict over Brazil's Belo Monte Dam

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Brazil's Belo Monte hydroelectric dam, which is projected to be the world's third largest dam when completed in 2019, has been the subject of local and international debate for more than three decades. Dam proponents have long argued that Belo Monte will offer clean energy while also bringing development to the region. Opponents counter that the project will lead to a host of irreparable negative outcomes. The conflict has intensified since 2011, when dam construction began and the region's social and environmental landscape started to change.

This paper draws on an ethnographic study carried out in Altamira, the city most affected by Belo Monte, during the first two years of construction, to show that the conflicts over dam construction are largely based on collectively negotiated, yet disparate visions of the future. I introduce the concept of "collectively imagined futures" to highlight that these visions evolve and are negotiated within and between groups. This paper focuses on housing related issues to investigate how and why groups change their visions of the future and how this impacts relations between groups as they make claims. I show that the process of collectively imagining the future can expand alliances in surprising ways but also constrain partnerships and constrict opportunities for engagement.

I argue that we can gain both empirical and theoretical insights by using the lens of collectively imagined futures to look at how the debate over dams plays out at the local level. This lens calls attention to the fluid nature of group boundaries, and highlights how visions of the future are constantly being reshaped and renegotiated. This adds to the scholarship on struggles over dam construction by going beyond the polarized distinction between those who support such projects and those who oppose them.

KLIMCZUK, ANDRZEJ* (Warsaw School of Economics, klimczukandrzej@gmail.com)

Crisis, the Silver Economy, and the Depopulation of Rural Areas: The Case of the Podlaskie Voivodeship (Poland)

One of the main challenges of social and economic policy in Poland in the early 21st century is to adapt its institutions and organizations to the requirements of an ageing society. Rapid population ageing combined with depopulation has significant effects at regional and local level such as increased demand for the social and health sector services, investments in the public transport, and removal of architectural barriers. Moreover, ageing changes the structures of the family, consumption, innovation, and productivity of the human work.

The population ageing and depopulation lead to the growing importance of phenomena such as skills and labor supply gaps, intergenerational solidarity, and a digital and robotic divide. At the same time, increased life expectancy favors the development of goods and services for older workers, older consumers, and older investors.

The main goal of this paper is to present the emerging concept of the "silver economy" on the example of the Podlaskie Voivodeship (Poland) in the context of the global economic crisis of 2008. Main ideas and assumptions of a positive response and measures aimed at tackling the consequences of population ageing and depopulation will be discussed. The paper will focus on the critical review of concepts presented in strategy documents of Polish government, regional development strategies, and the "Analysis of Economic Growth and Innovation Areas of Podlaskie: Geriatric Rehabilitation Sector."

The summary will contain conclusions relevant to theory and practice. The discussion will be centered on the coordination and integration of social services with regard to the concepts of welfare mix, welfare pluralism, and multilevel governance.

Local Social Innovations in Ageing and Intergenerational Solidarity: Policy Strategies in Cities of the European Union

The Active Ageing Index (AAI) 2010-2014 clearly shows that the quality of life of older people in the countries of the European Union is highly differentiated in various socio-economic fields. Thus, there is a need for studies that will focus on social innovations that are consistent with the United Nations concept of a "society for all ages," which is crucial for the implementation of the Madrid International Plan of Action on Ageing.

The central thesis of the proposed paper is that in recent years in the European Union there have been significant investments in innovative social services for ageing societies. However, these solutions have not been evenly widespread in the EU in terms of generational and territorial solidarity and cohesion. There is a need to focus on scaling up the impact of these innovative social services. This requires a better understanding of social innovations in ageing and intergenerational solidarity through the comparison of (1) the AAI with (2) clusters of European welfare states, and (3) various databases of social innovations in ageing.

Research methodology for the proposed paper will be based on literature review and case studies. The first part of the paper will discuss the theoretical concepts. The second part will include comparisons between the EU countries

regarding the AAI and welfare states typologies. The third part will focus on the comparisons of social innovations between countries and in "model regions" that are developing the "silver economy." Data (national profiles and best practices) from few sources will be used: the WILCO project, Social Innovation Europe, EFID, WHO, AFE INNOVNET, Changemakers, the OECD "Sustainable Urban Development Policies in Ageing Societies" project, and EMIL.

The summary will contain recommendations for entities of socio-economic policy on the EU and national levels and suggestions for future-oriented research directions.

Press in the Service of the Pharmaceutical Industry: Medication Coverage in Israeli Online Newspapers

The importance of providing the public with accurate, balanced, and objective information about drugs is reflected in their unique regulatory status. As such, Direct-To-Consumer Advertising (DTCA) of prescription drugs is banned in the media of most countries, including Israel, as is embedded marketing. Also, Israeli medical ethics requires that physicians avoid participating in commercials for medical and other products. Furthermore, a 2011 law mandates physicians to disclose their relationship with pharmaceutical companies. Also, Israeli journalist ethics requires exclusion of commercial content from journalistic texts, and that media coverage of controversial issues be balanced and objective.

Over 60% of Israeli internet users look online for medical or health information for a family member or themselves and 14% asked doctors to change their medications due to online information. Thus, the purpose of this paper is to analyze medication coverage in online newspapers in order to examine the pharmaceutical industry's role and relationship with journalists, physicians, and academic researchers in promoting new medications. Biased coverage might harm public health and raise state expenses.

The study examines whether norms and laws were met in medication coverage in three Israeli online newspapers in 2010, 2011 and 2012 to provide the public with balanced, objective information. The level of coverage balance is assessed by the ratio between content promoting drug usage and content limiting it, using framing theory. We evaluate the relative prominence of information sources, applying advanced countervailing powers theory, which describes key players in the health market.

Results show that most of the medications cited are prescriptions drugs. This points to the pharmaceutical industry's trend to promote these medications for subsidization by the state through public pressure. Moreover, the high rate of articles citing pharmaceutical industry as information source points to biased coverage in favor of medication usage, ignoring their risks and side effects.

Consuming Europeannes, Eating Deliciously and Digesting the Soviet. Changing Tastes and Food Practices Among Russian Speaking Middle Class Migrants in Germany

Food prepared, indulged and talked about at kitchen tables, fast-food counters and other tables of migration is a crucial element in encountering different spheres of the receiving society, creating relationships with new and old "Others" and maintaining transnational affiliations. Food nurtures not only nostalgic desires but also the need to reflect and remember one's past and connect it with the present. Thinking about embodied experiences of migration, my paper addresses the transformation of tastes and appetites in the context of Post-socialist migration to Western Europe. In a first part I will sketch out the relevance of my interest drawing on intersectional feminist understandings of migrant experiences and the contributions of food studies to understanding food economies and geographies in migration. The second part will be based on biographical interviews with and participatory observation among Russian Speaking middle class migrants in Germany, which I conducted as part of my PhD Thesis. I will speak about shared palates and memories and the desire for and appropriation of new tastes. I address the sense of disgust, discomfort and familiarity and the experience of being ethnicized or exoticized based on food desires. Those dimensions of embodied experiences allow, as I will argue, a deep understanding of the fine and often invisible and discrete lines of the social geographies which migrants experience, cross and create in their daily life's. They also reflect broader issues as post-socialist migrant's femininity, practices of care in their embeddedness with sexual identities, class and race. With this perspective, I will introduce a grounded reconstruction of practices and embodied aspirations of migrants beyond the reification of ethnic and cultural affiliations that still haunt migration sociology. In the last part I will briefly reflect

denotes a presenting author. Abstracts are organized by first presenting author's last name.

on employing biographical methods in the context of understanding embodied experiences.

"Coming to Terms" with One's Own Professional Practice – the Possible Role of Narrative Interviews for Self-Reflection and Self-Assurance of School Social Workers

School social work is an emerging field of practice of social work in Germany. While there is a significant body of "programmatic" literature on school social work, more research is necessary in order to understand the work processes and the challenges practitioners face in this professional field. In my dissertation research I therefore aim at the reconstruction of interaction processes of school social workers and central problems they regularly face in their professional work.

The empirical basis for my research consists mainly in work narratives (Riemann 2000) of school social workers about their casework with students and their families. The analytical process is based on a Grounded Theory perspective (e.g. Glaser/Strauss 1967) and follows steps of the narration structure analysis (e.g. Schütze 1983, 2007).

In this paper I will focus on the question, how school social workers deal with the problem to gain certainty about the consequences of their own work with regard to confusing, blurred and sometimes chaotic case developments. It can be problematic for professionals to appropriately reflect their own practice with its possible mistakes or the feeling of being overwhelmed by the dynamic of the casework process. At the same time it can be difficult to self-assure oneself of the impact of one's work within the student's biographic development (c.f. Riemann 2000). On the basis of my empiric material, it seems appropriate to approach this question in two steps:

Firstly, I will highlight how the described problem emerges as one of several central difficulties and practice dilemmas within the professional "arc of work" (cf. Strauss et al. 1985).

Secondly, I will discuss strategies of professionals for dealing with these problems and ask, which potential – but also which limitations – lie in the interview situation itself to allow for this kind of "evaluation work" (cf. Schütze 1984).

KLUGER, ELISA* (University of Sao Paulo, elisa.kluger@gmail.com)

Think Tanks and Economic Policy Debate in the Brazilian 2014 Presidential Election

Over the last 13 years, two sets of think tanks coordinated by Brazilian economists were created to gather those who have similar perspectives on economic matters, to produce knowledge and promote debates about the economic policies. Even if they aren't officially connected to the political parties, they tend to aggregate economists from different political fractions and are very active in electoral campaign periods. The first one to be created was the Casa das Garças, in Rio de Janeiro, that congregates many economists that have worked for the Social Democrat government, which held the federal administration from 1994 to 2002. Once they lost the presidency, they decided to create a think tank intending to articulate the economic debate, coordinate the criticism and start to design programs for future elections. A similar version, the Centro de Debates de Políticas Públicas, appeared in São Paulo in 2014, also committed to the task of enhancing the economic debate and elaborate alternative public policies. On the other side, most of those economists who support the Workers' Party administration, which has been in office since 2003, are assembled under the Centro Celso Furtado de Políticas para o Desenvolvimento. The center is named after one of the first and most famous Brazilian development economists: Celso Furtado, thus, they associate their political visions to his legacy and perspectives. The goal of this communication is to compare the events promoted and the written material produced by each one of these organizations in 2014, which was the last electoral year. The analysis of the content produced by them and of the positions occupied by those economists in the social space will be based on the knowledge accumulated, over the last 5 years, by a PhD research on the field of economists in Brazil.

Photo Sharing in the Digital Age. How Mobile and Online Media Are Used for Photo Creation and Sharing of Everyday Experiences.

Photographs have always been important for building and maintaining social relationships (Van House 2004). Since the rise of amateur photography between 1880 and 1900 analog photographs serve as "objects of remembrance" creating collective memories and providing other people insight into individuals' lives (Bourdieu et al. 1990). In an age where computer-mediated communication and mobile phones with integrated digital camera have become integral parts of everyday life, photos can be shared directly after they were taken, via mobile messenger (e.g. WhatsApp), social network sites (e.g. Facebook) or photo sharing websites (e.g. Pinterest).

The main aim of this presentation is to identify motivations that lie behind online photo sharing, the ways that are used for sharing and how the people decide which photos are chosen to be shared be shared with whom. The findings of an online survey with 398 German-speaking Internet users are put in relation with scientific studies about analog photo sharing. It turns out that some basic motivations and gratifications of photo sharing are independent of the technological aspects. But differences in the analog and digital photo sharing behavior appear too: Due to digitalization and computer-mediated distribution most participants report having a huge amount of personal pictures on their computers or mobile phones which are used to share photos with others. But at the same time, the advantages of this quick and cheap way of photo distribution are also recognized as somewhat problematical. The users are aware that online pictures can really easily be reproduced by others and could be shared with even unknown people. Additionally, the users do not want to make all types of photos visible for all of their online contacts. Therefore, online photo sharing is a well reflected process in which the users decide for every single photo with whom they like to share it.

KNEIDINGER-MÜLLER, BERNADETTE* (University of Bamberg, bernadette.kneidinger@uni-bamberg.de)

"Wherever You Go, Wherever You Are, I Am with You... Connected with My Mobile". the Usage of Mobile Text Messages for the Maintenance of Family and Romantic Relations.

Mobile phones play an important role in the everyday communication especially in close relationships. They allow to stay in contact with the loved ones independently from the actually position of the interaction partners. As the high popularity of short message services (SMS) showed in the 1990th and early 2000th, mobile phones are not only used as an alternative for landline telephones but lead to a new significance of written messages (Grinter/Eldridge2001; Ito/Okabe 2005). Today, SMS are complemented or even substituted by messages that are sent via Internet-based mobile messengers as "WhatsApp". This presentation gives answers to the question how written messages via smartphones are used in the everyday communication of family members and romantic couples. Data from a two-step qualitative study with 20 young adults (20-30 years) will be presented. In the first step, all participants recorded their mobile communication behavior for three days using a standardized diary (n≈3400 messages). In the second step, all participants are asked in qualitative interviews about their usage habits and experiences of mobile communication. The study reveals that written communication via smartphones is not only used for the coordination and organization of everyday tasks but for a very special form of relationship maintenance: by the exchange of a large number of mobile messages in the course of the day, family members and romantic partners stay in continuous contact with each other even if they are physically separated ("connected presence" Licoppe 2004). The diary data reveals significant differences in terms of contents and motivations of the messages that are exchanged between family members or romantic partners and those messages that are sent to friends or acquaintances. Whereas mobile communication with friends happen quite frequently in co-presence of other interaction partners, mobile messages with family or romantic partners are mainly exchanged when the user is alone.

KNOEBL, WOLFGANG* (Hamburg Institute for Social Research, direktor@his-online.de)

How (not) to Theorize Processes: Lessons from the Past

The paper will *first* give an overview on debates within German historiography when in the 1980s prominent historians such as Christian Meier or Wolfgang J. Mommsen seriously attempted to theorize (historical) processes. As this overview will demonstrate, the different lines of arguments all encountered enormous problems and ended in a somewhat aporetic situation. In a *second* step, the theoretical insights of the first part will be used in order to confront more recent attempts by sociologists such as Andrew Abbott and Charles Tilly and to ask whether and how the two different historical and sociological debates might be able to stimulate each other and – more precisely – whether and how the debate on social mechanisms will indeed help us to come to terms with the problem of theorizing processes. In a *third* and last step it will be asked whether the somewhat big and robust processual terms used within the social sciences ("bureaucratization"; "individualization", "saecularization" etc.) are really the best tools in order to analyze large-scale social change.

RC35-411.1

KNOEBL, WOLFGANG* (Hamburg Institute for Social Research, direktor@his-online.de)

Social Theory in a Global Context

In the last two or three decades social scientists had to learn that assumptions concerning the robustness and stability of social processes and structures cannot be held as self-evident any longer since the outcomes of social actions are far more unpredictable than is usually assumed and that events and their surprising occurrence have to be taken into account in making sense of social reality. If this is so, then social theory has to rethink some of its basic methodological and theoretical assumptions particularly with respect to its attempts to analyse global trends and phenomena and to theorize a kind of a "global modernity". The paper will address the following questions: Which types of accounts can social scientists give in order to grasp reality? Can they still speak self-confidently of laws and/or general social mechanisms or must they rather rely on narrative methods and how does that touch the ways how macro-sociology is done? The main answer given to these questions will be that social theory indeed will have to take on the problem of 'narrativity' which at the same time also means that main stream social theory will necessarily have to thoroughly historicize all its categories. If this task is taken seriously then, so it is argued, a fruitful exchange between 'traditional' approaches within the social sciences on the one side and postcolonial thought on the other can emerge. Whether such a fusion of insights from different sociological camps might help us to define "global modernity" remains to be seen, however!

Scaling up Housing First-Pilots – Drivers and Barriers

There has been an increased interest in Housing First services in Sweden over the past few years. The model was first developed in New York by the organization Pathways to Housing. The growing interest for Housing First as a response to ending long-term homelessness is seen not only in the US and Canada, but also in Europe. One reason for this is the bulk of evidence showing high housing retention rates in Housing First services compared with traditional services. This paper aims to analyse the drivers and barriers that hinders or facilitates the scaling up of Housing First-pilots. One of the research questions is, if it is possible to incorporate lessons learned from the Housing First-pilot into the existing system of homelessness services. In other words – is it possible to put new wine into old bottles? This is an on-going research project on Housing First-services in Sweden, with the specific focus on the Housing First-pilot in the city of Helsingborg. The empirical material consists of in-depth interviews with project managers, support workers and other stakeholders. We intend to present some tentative results of how the principles of Housing First can be implemented within the social housing program. We also intend to describe some of the key factors necessary for scaling up Housing First-pilots.

Beauty and Inequality: Is It Rational to Invest in Beauty Capital in the Life Course?

(1) Research Question:
Economics has revealed that good-looking people earn more than others. Thus, it looks rational to invest in beauty as human capital. However, it is not yet specified whether such physical attractiveness affect the whole life course such as education, occupation, marriage, and child-bearing. So, this paper investigates the impact of looks on the life course.
(2) Methods:
We use a representative sample in a city in Tokyo, Japan with N=283. Looks at the age of 20 are rated by respondents themselves in a 10-point scale.
(3) Results:
Beauty increased earnings, chances of promotion, numbers of lovers before marriage, and those of children. But it had no effects on education, occupations, nor chances of marriage. So, we found some beauty premium and some plainness penalty in their life courses.
(4) Conclusion:
Beauty pays in a part of the life course. This suggests that physical appearances may work as human capital. If so, rational people will invest in "beauty capital" to raise their values in the labor, romance, and marriage markets. The next step should be to clarify how such beauty capital is formed, accumulated, and transferred to other capital.

Voices and Self-Reflective Discourse of Facilitators Involved in Japan's Autobiographical Writing Movement

I examine the effect of self-reflective discourse by facilitators who have been involved in the autobiographical writing movement as semi-professionals through the reconstructive analysis of their biographical narratives.

In Japan, life writing as a social movement has flourished several times since the early 20th century and especially from the mid-1980s to the 1990s, during which time, the self-publication of autobiographies as *jibunshi*[self –history] became a fad. It can be said that this fad has been revived in the two decades following the end of the 20th century.

One of the characteristic of this kind of writing is the act of "writing together," whereby autobiographical writing is collectively practiced by groups. In such gatherings, individuals in a position of providing advice and guidance, i.e. facilitators, assist with the production of autobiographies.

In Japan, there are no formal professionals who specialize in the writing of autobiographies. However, there are semi-professionals who provide advice on how to write autobiographies and who are recognized as facilitators. Such individuals help with the production and publication of autobiographies and, in that sense, are "a second kind of producer" (Plummer 1995:21).

Such facilitators typically have regular jobs, for example, as scenarists, novelists, scholars of Japanese literature, school teachers, or journalists, and apply various knowledge and skills acquired in their professional careers when providing advice. However, their self-reflective narratives may have more of an impact on the actual writing of autobiographies than their professional knowledge and skills related to writing, printing and/or book binding.

It is the facilitators' self-reflective discourse a contemporaries or as individuals who have overcome hardships in life, more than their professional careers, that stimulates the production of autobiographies. I will illustrate this point through reconstructive analysis using a number of concrete examples of such self-reflective narratives.

Youths Not in Employment, Education or Training: A Comparison of Austrian Federal Provinces

Authors: Christina Koblbauer[1], Johann Bacher, Dennis Tamesberger, Heinz Leitgöb
Due to the limited relevance of traditional labour market indicators for youth unemployment, researchers and policy-makers focus on an indicator known as not in employment, education or training ('NEET'). In that context Austria is mentioned as good example because it has one of the lowest NEET rates in the European Union (Eurofound 2012). Nevertheless regional disparities within Austria are less recognised. The objective of this research is to deepen knowledge concerning the causes of differences in the NEET rates between the federal provinces in Austria and to specify individual and contextual effects by using multilevel analysis.

In order to reach the objective as outlined above a secondary data analysis is performed. Socio-structural factors that are considered to be relevant for regional disparities in NEET rates: sex, age, size of municipality, country of birth and citizenship. Institutional and economic characteristics that are perceived to have impact on NEET risk: role of general and vocational education, level of expenditure on active labour market policy and number of vacant jobs. To identify effects of individual and contextual characteristics on NEET rates multilevel models (Hox 2010) are calculated in Stata. In addition interaction effects between contextual and socio-structural variables are analysed.

First findings show, that between 2006 and 2013 NEET-rates differ substantial between the Austrian federal provinces. Multilevel analysis indicates that high importance of dual training, high number of vacant jobs and high level of expenditure on active labour market policy can make a significant contribution reducing the number of NEETs

Approaching Young Adults' Future Conceptions of Life in Old Age: Methodological Challenges

Due to demographic changes such as increased life expectancy and declining birth rates European societies are currently often labelled as "aging" societies. For scientists, politicians and journalists the changing age structure is not merely a positive development, but with regard to pension-insurance-systems it is often discussed as a severe societal challenge. In this context individuals are confronted with the advice to start planning for old age rather sooner than later (Ekerdt 2004). This claim is in line with processes of individualization, in which the own biography should permanently be (re-)constructed, planned and therefore turns to a "biographic project" (Hardering 2011). From a sociological point of view it is highly relevant to analyze what kind of future concepts young adults develop concerning their life in "old age", which processes play a role in forming future concepts and moreover how those future concepts may be interconnected with concrete planning activities for old age. Drawing on material from my ongoing PhD project, in which interviews with young adults in Austria are conducted, this paper is going to focus on methodological challenges emerging when studying young adults' long-term future concepts, e.g. how to deal with the vagueness of future concepts for old age. Further, it shall be discussed how the interconnectedness of future conceptions and biographical decision-making can be approached empirically by relying on a phenomenological perspective (Schütz).

Policy Coherence Paradoxes

The EU claims policy coherence with a primacy for social policy under its Social Policy Agenda.The European Year of Development (2015) commits to policy coherence to ensure that sustainable development in the low-income countries informs EU agriculture, trade, investment, fisheries and other policies. The UN-based SDGs (Sept 2015) implicitly reinforce a commitment to coherence; this agenda is universal, addressing action in each country, as well as each country's global role. This paper engages with these coherence challenges. We propose examining the role of one EU member state, Germany, as a global policy actor, looking at 4 paradoxes:

1) SDG Goal 10 on reducing inequality challenges the German government on its responsibility as a development actor, as well as in addressing national inequalities with respect to the labour market, gender, income and wealth inequalities, and education. SDG10 would require substantial income and wealth redistribution within the country, as well as a considerable increase in ODA flows and a redistribution of value-added along global production chains.

2) Conflicts between EU and SDG goals related to employment and ecological sustainability vs conventional economic growth and export orientation, are another paradox. Example: the conflict over retaining lignite (Braunkohle) production in the interest of conserving employment clashes with a commitment to decrease CO2 emissions.

3) Another set of contradictions can be identified around trade agreements, such as the TTIP that fundamentally undermines SDG 12 on sustainable consumption and production.

4) In line with the EU's neoliberal economic policy, Germany supports austerity-oriented fiscal policy. This will conflict with the commitment to universal social protection in all countries, as well as with delivering on any of the SDGs – in Germany, in the EU, and globally.

The paper will reflect upon the implications for policy coherence in the context of national governments as global social policy actors.

Fulfilling the Promise of the UN Convention on the Rights of People with Disabilities through the Evolution of Organisational Forms in the Disability Service Sector

The UN Convention on the Rights of People with Disabilities (UNCRPD) envisions an "emerging future", in which disability is no longer seen as a minority issue or individual problem, but as result of inadequate or even missing support. This shifted understanding, embedded in a human rights discourse, challenges service provider organisations. This has been affirmed in the EU Disability Strategy which addresses the need for a transformation from institutional to community-based support. The paper is part of my on-going habilitation project on the evolution and development of organisational forms and learning frameworks in regard to the disability service industry and it`s perceived (in-)ability to fundamentally affect the intended (transformational) change. In my paper I will show how the disability service industry in Western countries, following the first (pre-UNCRPD) movement towards de-institutionalisation, has become locked in an efficiency based organisational care model. In its wake the former seamless biographical take of „total institutions" has gradually been re-engineered into a continuum of services and programmatic solutions intended to assist individuals to graduate to increasing levels of independence (Meissner 2014). This development however seems unable to deliver the promise of the UNCRPD leaving a majority of people with severe disabilities in ever repeating cycles of lifelong preparation. The paper is based on a series of generative Interviews (Scharmer 2009) with (organisational) leaders who have shaped the evolvement of an independent disability service sector in Austria in the past thirty years. Furthermore it takes into account (theoretical) frameworks on the intersections of economic, organisational and consciousness evolution (e.g. Glasl 1994, Scharmer & Käufer 2013, Laloux 2015). Through this approach a grounded framework of current challenges and potential leverage points is taking shape and which addressed the needed organisational and leadership evolution towards participation of people with disabilities based on principles of self-management and democratisation.

Articulating "Together-Ness" - Image Practices of Young People in Thailand, Austia and Vietnam

Articulating "Together-ness" - Image Practices of Young People in Thailand, Austia and Vietnam
Converging media technologies (smartphones, social media and the hybridization of both) are used around the world to micro-coordinate interactions and to manage knowledge and relationships. In particular the everyday lives of young people worldwide are increasingly becoming "mediatized". Particularly since the proliferation of 3G mobile standards new modes of digital self-expression, practices of life-streaming and lifelogging as well as new emotional modes of communication have evolved.

Young users in Europe and South-East Asia seem to adopt these media technologies in order to foster *social embeddedness* in a culture of constant flux. Sharing pictures online, which facilitates the expression of feelings, has become a central practice of group affirmation.

During the contemporary period of rapid social transformation also described as globalization the constitution of youth subjectivity takes place within a number of salient discourses.

Referring to an ongoing research project, this paper analyses the locally shaped creative practices of visual online impression management among young people from Thailand, Vietnam and Austria focussing on the articulation of diverse subject positions.

As youth in contemporary societies live hybrid worlds encompassing a variety of local, regional and global identity discourses, practices of visual impression management online are expected to reflect highly complex subject positions. Youth media cultures are both – local and global – as they adopt globally available technologies while at the same being embedded into immediate and embodied economic and political relations.

Applying a combination of segmental analysis and qualitative group interviews, the research project concentrates on how the relationship of self and other as well as "together-ness" is articulated on the network profiles of young people in Austria, Thailand and Vietnam.

The Relevance of Future Expectations Referring the School-to-Work Transition

A longitudinal qualitative study of youth with different school careers and backgrounds during transition to the vocational system will be presented. The project follows a qualitative approach and focuses the vocational orientation processes of adolescents who attend a general education qualification path of a vocational college. The project deals with the question of how young people experience school during transition and its use for the (future) orientation process. Using the reconstruction of narrative biographical interviews, the relevance of vocational colleges compared to other socialization areas such as family, peers and leisure should be analyzed. A longitudinal part of the study also aims to examine the development of work attitudes and future plans. The project is contributing at the intersection of youth research, vocational education research and school research. Taking the stance of the praxeological sociology of knowledge I used the documentary method to reconstruct different kinds of habitus formations. Bourdieu pointed out the relevance of future plans and its relation to different kind of fields and practices.

(Re-)Framing the "Downtown People" of Haifa

How are photos being transformed in their journey from their production to the final performance in an exhibition? This lecture focuses on a photography exhibition by Hamody Gannam, "Downtown people", which was exhibited at the Haifa City Museum (Israel) in 2015-2016, and analyzes the role of the curator and the photographs' printer as "Co-Creators". We contend that the Co-Creators' interventions led to a significant change of both form and content of the Downtown peoples' framing and representation. This change reflects a shift away from the photographer's gaze of the everyday in an Arab neighborhood of Haifa, toward the Israeli establishment gaze.

Gannam's photographs focus on the everyday life of small local business owners and of Arab families from different religions alongside Jewish families in a predominantly Arab neighborhood. "The Photographs", writes exhibition curator, Inbar Dror-Lax, "seek to look directly at the places and people who are barely visible to passersby in the renewed urban area, those that had been excluded from the public discourse." Despite this declaration, a thorough investigation of the exhibition and the catalog shows that the curator and the printer have framed the photographs ideologically, altering their original meaning.

Two forms of re-framing will be discussed: one which is focused on **form**, meaning the decision to exhibit blurry photos while the catalog presents the original focused photos, as well as the decision to print the exhibited photos in small sizes. These two decisions were explained by the curator as ideological.

The second framing relates to **content** and bares meanings of subordination: in both the exhibition and the catalogue the downtown people's series were divided into religious categories, perceived "less dangerousness" than the national classification.

By looking into the Co-Creators' interventions we highlight the process of translating everyday life into a museum's exhibition.

Mehubarot: Visual Biographies in a Televised Docu-Realism

The Israeli television series *Mehubarot* ("Connected") aired on the Israeli TV on July-August 2009. The five participating women were asked to document their lives with a video camera for at least one hour every day. The final cut was produced by the series creators. In light of the series' success, the network produced a follow-up series in 2010, this time featuring five men.

The paper discusses the phenomenon of a photographed intimate diary which gradually unfolds an ongoing biography. Unlike blogs or videos uploaded to the internet, which are contemporary precedents for this kind of intimate exposure in the public arena, the genre under discussion relies on established conventions of television and cinema to convey authenticity. This marks the difference between a personal (filmed) blog and the television show and its docu-realistic character. *Mehubarot* is inspired by written diaries, documentaries and films that use voice-over, "I movies" in Duvdevani's (2010) terms. Two central representation frameworks: monologues to the camera and semi-staged interactions, will be discussed as means to use visually-packaged spoken language to convey different levels of exposure and sincerity to the viewers.

The series also adopts patterns of confession and exposure commonly used in soaps and reality shows. Thus it adapts the televised platform that follow ongoing projects of identity-construction, and frequently present them as journeys of self-discovery and personal development (Aslama and Pantti, 2006; Hamo 2009; Cameron 2000; Holmes 2004; Holmes & Jermyn 2004).

The paper suggests a multi-modal discussion of how the series participants use the combined tool of camerawork and spoken language to both explore and construct their identities on various levels: their private-public identity, social and family identity, and "celebrity" identity, considering the context of Israeli society and its culture. The case of journalist Dana Spector will serve as a striking example.

How Much Does the Mode of Response Matter? a Comparison of Web-Based and Mail-Based Response When Examining Sensitive Issues in Social Surveys

It is argued that traditional ways of collecting social surveys are threatened by the rising data-collection costs and the declining response rates. In an attempt to solve this problem, researchers have started to utilize cheaper and easier data collection methods, especially those focusing on various types of online data. Current research on survey methodology has criticized sample-to-population representativeness of many online surveys. At the same time, however, research on how the mode of data collection affects to responses is almost completely lacking. Our paper takes both of these issues into account by analyzing the differences between the two modes of data collection used in nationally representative studies: web-survey response and conventional mail-response. We examine the representativeness of the samples by comparing web-based to mail-based survey responses. In addition, we analyze whether the responses using Web-questionnaire are different from the mail-questionnaire responses when examining respondents' attitudes towards sensitive issues such as immigrants and patriotism. Our data are derived from the International Social Survey Program (ISSP) 2013. We selected two countries for the analysis, Finland (n=1, 243) and Norway (n=1, 585), both of which applied similar methods of data collection technique (self-conducted mail survey and web survey). The results indicate that although the popularity of the Web-surveys has increased during recent years, the mode of response is still associated with socio-demographic background. When analyzing attitudes towards sensitive issues, our results suggest that the mixed-mode survey is a reliable method of data collection especially after controlling for background variables, and correcting selectivity bias by weighting the data.

Families, Friends or Foods?: Correlates of Integration and Wellbeing Among Muslim Immigrants in East Asia

In this study comparable binomial logit models are applied to the micro-data from the Comparative Survey of Muslim Immigrants in East Asia to analyze the effects of families, friends and foods on their social integration and wellbeing in Japan, South Korea and Taiwan. The dependent variables include self-assessed adaptation to the local society as a measure of integration and overall life satisfaction as a measure of wellbeing.

The preliminary logit analysis reveals that the presence of grandparents, mother and children at home in the country of origin and the concern for foods have positive effects on adaptation among male Muslim Immigrants in Japan, while living with other family members (than wife and children), living alone and the concern for foods have positive effects on wellbeing and the concern for difficulty to get Japanese habits has a negative effect. Among male Muslim immigrants in South Korea the presence of grandparents and children at home and having ten or more Korean friends have positive effects on adaptation and the presence of spouse at home and frequent visit halal restaurants have negative effects, while the presence of spouse at home has a positive effect on life satisfaction and the presence of children at home has a negative effect. Among male Muslim immigrants in Taiwan frequent visit to halal restaurants has a positive effect on adaptation and the presence of children at home has a negative effect, while living with spouse and having ten or more Taiwanese friends have positive effects on life satisfaction and frequent visit to halal shops has a negative effect. Unexpectedly, the effect of family structure at home and variables related to foods have significant effects on the integration and wellbeing of male Muslim migrants in the three East Asian societies after controlling for demographic and socioeconomic variables.

KOJIMA, HIROSHI* (Waseda University, kojima@waseda.jp)

International Migration and the Employment of "Workers" By Farm Households in Japan

As in other parts of the globalized world, farmers in Japan have been much more rapidly aging than the general work force and some of them started to rely on foreign "workers" (under the name of "technical intern-trainees") to increase or maintain their production to cope with global competition. Farm "inheritors"

started to marry foreign women for the reproduction of farm family, particularly Chinese and Filipinas, which also facilitated the employment of foreign "workers." There are estimated to be 24,000 technical intern-trainees in agriculture in 2011, amounting to 15% of regular employees in agriculture.

Due to the lack of direct statistical information, this study uses the municipality-level aggregate data on foreign population from the 2010 Population Census and the micro-data from the 2010 Agriculture Census for selected prefectures (with high concentration of foreign "workers" and "brides") to assess the effects of international migration at the municipality level on the employment of regular and temporary farm workers at the farm household level.

According to the results of the ZIP (Zero-inflated Poisson) model for the employment of regular farm workers by farm households, the effect of municipality-level proportions of Chinese and Filipinos are not unidirectional across prefectures with a higher concentration of foreigners in rural municipalities. The effect of municipality-level proportions of women among Chinese and Filipinos are not unidirectional across selected prefectures. The results for the employment of temporary farm workers are more distinct, but not unidirectional, either. The estimated baseline proportions of households employing no regular farm workers and no temporary farm workers fit much better with the actual proportion of non-employment for temporary workers than for regular workers. It is possibly because Japanese farm households hiring temporary foreign "workers" tend to produce agricultural goods which face more severe global competition than those hiring regular "workers."

KOJIMA, SHINJI* (Ritsumeikan Asia Pacific University, skojima@apu.ac.jp)

Linking Consent and Resistance: Worker Responses to the Vulnerability of Informal Employment in Japan

Existing studies show that the increase of flexible employment arrangements in Japan have deepened the fault line between regular workers and irregular workers in addition to the historical gap that have existed between male and female workers. Ethnographic studies that examine the work experiences of irregular workers have identified the mechanism that make workers "consent" to the flexible employment regime as they work hard to adapt to the insecurities at work and thus making the best out of their limited life chances in the labor market. However, little is known about the connections between the logic of self-help/hard work that dominates their lived experiences at work and the collective forms of resistances documented by social movements scholars. This paper attempts to connect the two fields of sociology of work and the study of social movements by raising the question, how does hard work ethic lead to collective resistance? How do their work experiences shape the moral claims they make? Based on ethnographic data gathered from participant observation of factory temp workers and labor union activism from 2008 to 2009, in addition to a series of interviews to temp workers and labor activists between 2009 to 2015, I argue that the workers' moral claims for justice were shaped by the self-recognition as hard working men and women committed to the corporations they worked for. The workers' commitment to the job served to magnify the anger and disappointment with the treatment they received, which were then given a justifying language of illegality and injustice by union activists and labor lawyers during the course of struggles. I argue that work experience significantly shapes the emotions that arise inside the workers who experience the maltreatments.

Social Movement Unionism in Contemporary Japan: Community Unions' Response to Economic Crisis

The economic crisis in 2008 has affected many workers in Japan, especially the agency temporaries and fixed-term contract workers who were working in the export-oriented manufacturing industry. In response to a series of mass dismissal in a very short time, community unions that organize nonstandard workers emerged as an alternative to the mainstream enterprise unions, organizing demonstrations and holding rallies to advocate the workers' rights while pressuring the government for stronger legal-institutional regulation. This paper builds on studies that use social movement unionism as a theoretical concept to analyze labor movements by the marginalized workers in both Western European and East Asian societies. Existing studies argue that the sociopolitical impact of social movement unionism in Japan is limited due to the absence of coalitions with civil societies, in addition to the loose, personal ties that bind union activists. Based on unique data gathered from participant observation of community union activism from 2008 to 2009, in addition to a series of interviews to labor activists between 2009 to 2015, this paper demonstrates that the particular form of social movement unionism practiced in contemporary Japan is patterned in three ways: Coalition-building is mostly limited to labor unions; Web of connections within labor factions are dense yet limited across factions; Emerging few community unions are seeking to bridge historical divisions among labor while reaching out to civil

societies, yet coalitions mostly remain ad hoc. This paper argues that the active networks among labor serve to both enable and constrain their movement activities. Community unions that seek to build coalitions across fissures are struggling to manage both cultural and political obstacles that hinder the formation of a deep coalition.

Personal Experiences of Health and Illness on the Internet: Dipex International Collaboration and Healthtalk Australia (healthtalkaustralia.org)

Current research on health information seeking has identified the internet as an increasingly important resource. Other people's stories of illness experiences found on websites are particularly valued. Growing use of such resources suggests that the online information based on other people's experiences may help in making better informed decisions regarding one's health and alleviate distress. Illness experiences, in the form of online stories, provide insight into living with illness, not just for patients but also for their family members / informal carers, friends, healthcare providers, and policymakers. Stories highlight strategies that others use to negotiate their everyday life and approach the future, and offer alternative sources of information about health services and activities that others found helpful or enjoyable.

Well-presented stories can inspire, engage and improve individual lives and promote health in an emotionally meaningful way. Online health information based on the experiences of others is above all valuable for providing insight into living with an illness, and the complexities inherent in making decisions about health, other aspects of daily life, and self-care. A high quality online database of people's stories of health and illness experiences has the potential to improve communication between healthcare providers and patients, building more cooperative and collaborative relationships.

This presentation will discuss the DIPEx International (DI) research collaboration on health and illness experiences that includes universities in Australia, Europe, Canada, US and Asia, focusing in particular on the example of the Healthtalk Australia (*http://healthtalkaustralia.org/*). DI members, including Healthtalk Australia, use qualitative research methods developed by the Oxford University Health Experiences Research Group (HERG) to underpin the development of a unique online database of personal illness experiences. To date, the DI collaboration has resulted in almost 200 online resources or websites detailing experiences of health and illness in international context.

KOLAHI, MOHAMMAD REZA* (Institute for Social and Cultural Studies (ISCS), reza.kolahi@gmail.com)

Typology of Religiosity in Iran: Supernal Religiosity and Sublunar Religiosity

Presupposition of this research is that there are constant conflicts and discontinuities between mundane life and religious beliefs. Given such contradictions, how do some religious people maintain their beliefs? This question is based on the assumption that religiosity of religious people is cohesive and unchanged. This research challenges such notion. Contradictions of today's life do not necessarily end in dilemma of keeping one's faith or disbelief. Rather it leads to change and reshaping of religiosity and creates new forms. Therefore we can ask what are the consequences of conflicts between religious beliefs and mundane life for religiosity of religious people? How Religiosity of religious people changes in order to resolve such conflicts? This research uses life story method. Narratives of religious people is studied through narrative analysis of their story of their religious changes from childhood, based on deep interviews and blog posts. Findings show that conflict between religious beliefs and mundane life leads to two different religiosities titled as "supernal religiosity" and "sublunar religiosity". In supernal religiosity contradiction between religious beliefs and lived reality is resolved through creating a distance between them. World breaks into two poles of heaven and earth. Earth is the place of defect, sin and impurity. Felicity and perfection would be postponed to "the other world". Worldly life serves hereafter life. Strict dichotomies of "right-void" and "good-evil" are formed. Narrative of sublunar religiosity is never resolved. The challenge goes on. "Mundane reality" gradually takes over and is officially accepted. Waiting for "ultimate felicity" is put aside. Dichotomies would collapse. Good and evil would mix. "Other world felicity" replaces "this world calm". Heavenly solace is replaced with Worldly solace and faith relations between God and humans is replaced with Moral relations among earth duelers.

Rediscovering the «Subject» in Post-Foucauldian Era of Conceptualization

In contrast to classical theory of the subject, the present state of its theory and concept can be described more from standpoint of activity and processual approach, rather than a "statical" viewpoint: becoming subject is more important than to be subject; to resist, to elude from standardized practices, social procedures, symbolic signification by social institutions – an indispensable condition in attempt to become the subject: «Run Lola Run».

Huge role in this process of subjectivation plays phenomenon of "becoming" – a key concept of late post-modernism (Deleuze, Guattari). In classical theory of formation of subject we are talking about stages and phases that an individual passes to become himself or to become just function of any social organization. Today, "becoming" becomes meaningful in itself as a process of subjectivation. Becoming is valuable in itself and not these species of status and existence which it binds. Goals of becoming contained in itself. Being the subject – is constantly being on the «line of flight» (Deleuze).

But how is possible an infinite becoming the subject? Well, in situations when individual is open to "event" (Badiou). Event always occurs suddenly and often is opposed to historically legitimized social practices and discourses. To respond to an event means to abandon familiar and historically legitimized forms of interpretation and action, it means to oppose to them. Separating yourself from old, pronouncing new – is condition of subjectivation. Therefore, the subject, following event, in the process of formation of a new himself, invents new arguments in discourses and new types of social action. To pronounce his own discourse, to act in unexpected direction, to try to make a new and non-standard, to rebel against symbolic and powerful suppression (Kristeva, Zhizhek) – such position about subject we can find in late post-structuralism after Foucault.

Future Scenarios in Ageing Research

Future studies are of central importance for ageing research in Europe. Ageing research is currently flourishing is Europe, because Europe has the oldest population in the world. This population is still ageing, which changes e.g. family constellations, labourmarket structures and older peoples' social identities. Moreover, it inspires companies, researchers and policymakers to prepare for the future, e.g. through workplace modifications, policy reforms, and restructured research agendas. Unfortunately, many statements about future social consequences of population ageing ignore the element of uncertainty. They either work with one constant scenario only, or they define alternative scenarios through mere modifications of mathematical equations. As a result, these studies overlook the qualitative impact of on-going social change and the complexities of society, which are key topics in sociology. This presentation makes suggestions on how to fill this lacuna. It argues that studies on the future of ageing societies need to utilize qualitatively different scenarios if they want to outline a comprehensive picture of possible futures. Using insight from a literature review, expert interviews, and a focus group, this presentation suggests useful sets of scenarios for studies on the future of ageing societies. A key finding is that there are several "most suitable sets of scenarios", because scenarios differ across research topics. A second key finding is that the "most suitable sets of scenarios" changes over time, because scenarios need to keep up with advances in our knowledge and beliefs. The findings of this presentation help to establish future studies as an integral part of ageing research. Moreover, they indicate how ageing research can increase its impact on future-oriented action.

Retirement Age during the 2008 Economic Crisis

The 2008 economic crisis impacted retirement age in Europe. The crises led to fundamental social changes, such as increased unemployment rates, foreclosing companies, the incorporation of new austerity measures in social policies, and the reframing of individuals' identities. These changes set a new framework for retirement in Europe. Before the crisis, delaying retirement was a policy priority. Because of the crisis, however, the chances for employment in old age decreased, and policymakers need to weigh the importance of old age employment against the one of youth employment. As a result, the opportunities and interests in delayed retirement change. This presentation demonstrates how retirement age in Europe changed since the onset of the economic crisis. Also, it outlines changes in social inequalities in retirement age. The analyses are random-effects multilevel models. These models can capture universal and country-specific effects. Data stem from the Survey of Health, Ageing and Retirement in Europe. A comparison of these data from 2006 and 2012 highlight changes since the onset of the crisis. Findings reveal an increase of the effective retirement age, which probably is due to pension reforms taking effect. Findings also reveal changes in social inequalities in retirement age, which probably stem from a combination of pension reforms and the economic crisis. These findings indicate that we need to revisit theories about retirement that we developed before the onset of the 2008 crisis. Also, retirement policies might have to be reconsidered, because the 2008 crisis gave them unintended side-effects.

Physical Punishment in Light of Criminological, Socio-Cultural Diversity and Human Rights Approaches: Ghana and Finland

Regarding physical-punishment, this paper aims to examine the obscurity of 'what is true of all societies and what is true of one society at one point in time and space' (Bendix, 1963; Nelken, 2010). Based on evidence from Sub-Saharan Africa and the Nordic region – Ghana/Finland, this paper deploys a more critical examination at criminology-claims on physical punishment and delinquency connection. In Sub-Saharan region, physical punishment is a normative and 'functional' way of child-rearing (Baokye, 2013), whereas such a practice is socio-legally seen as 'dysfunctional' in the global West. Nordic countries have been the first to ban corporal punishment of children in 1970s/1980s (Durrant, 2000).

In criminology, there is a long-standing assumption that physical-punishment is a risk factor in terms of children's susceptibility to involve in criminality (Leober et al., 2001; Farrington et al., 2012). Yet, mainstream criminology-claims (Anglophones) are reflective of western culture alone (Kalunta-Crumpton, 2004). This paper addresses criminological risk discourses vis-à-vis cultural variations and recent developments in children's human rights perspectives and childhood sociology. Drawing from insights on cultural variation of social contexts (Hofstede, 1980; Smith, 2004), long-term historical perspective on Nordic and Sub-Saharan regions (e.g McKaskie, 2003) and comparative criminology data (Boakye, 2013; Farrington, 2015), this paper will discuss contextual developments from two regions to tease out what is true of all societies and what is true of one society at one point in time and space. The UN Convention (1989) on children's rights is discussed in relation to global-sociocultural diversity in child-rearing (Frankenberg et al, 2010).The analysis provides a critical model of physical-punishment and harm linkage in dominant criminological models pointing towards the recognition of socio-cultural diversity. It is suggested that mainstream criminological claims about juvenile delinquency and 'troubled families' association are not universalisable (Ibrahim, 2015); yet tensions remain in relation to contemporary children's rights.

A Network Analysis of Sustainability Governance: A Case Study of United States Agriculture

Multi-stakeholder initiatives have become a leading mechanism for fostering sustainability transitions. While often perceived as inclusive and democratic forms of governance, recent research raises questions regarding the role of power and politics in multi-stakeholder initiatives. This paper presents a social network analysis of three agricultural sustainability multi-stakeholder initiatives in the United States: Field to Market, The Stewardship Index for Specialty Crops, and the National Sustainable Agriculture Standard Initiative. Examining the social networks of participants in each of these initiatives, the connections and relationships of participants in the US agrifood system are documented. The findings, first, indicate that certain interests are disproportionately represented in specific initiatives. Second, they illustrate that the composition of members in multi-stakeholder initiatives influences the sustainability metrics and standards that are developed.

The Efficiency of Patronage Networks in Post-Maidan Ukraine

The protest of 2013/2014 in Ukraine is claimed a sign of substantial transformation of the Ukrainian society, which widely supported the rule of law and political and economic transparency. The surveys show growing support for the 'Western vector' in Ukrainian foreign and internal policy. The results of early parliamentary elections of 2014 show, however, that the transformation is far from being completed.

In this election in 82 of 198 majoritarian constituencies* where vote took place, the incumbent MPs secured reelection. In number of cases MPs previously connected with the Party of Regions were elected in the constituencies where in proportional elections the voters supported the pro-Maidan parties. Therefore, the voters simultaneously voted for the parties, who were to overtake the power due to Maidan's success and for the individual MPs who supported the Maidan suppression. This kind of ambiguity is not new in Ukraine and has many reasons, one of which is lack of knowledge about how the political system works or lack of trust in political institutions.

In our work we analyse the election campaign tactics (candidate leaflets, press materials), interviews (with election observers and voters) and data of pre-election surveys as well as surveys that measure social values. We found that in majoritarian constituencies patronage networks are used by both the MPs previously connected with the Party of Regions as well as the ones from new parties in power. This tactic remains effective as it used to be in all the elections conducted so far from the very beginning of Ukrainian independence. It seems that the patronage networks remain one of the key factor of success in elections in post-Maidan Ukraine.

----

*) Due to annexation of Crimea and separatists' actions in Donbas, there was no voting in 27 constituencies

Leaving Parental Home in Germany: "Hotel Mama" Revisited.

It is a widely held belief that in Germany, likewise in other Western societies, the age of leaving parental home has risen. Already in the 1980s, sociologists posited that life transitions in young adulthood are occurring later and, in a general sense, altered temporal life course patterns reflect changes in the organization of the 'modern life course'. This heavily influenced public perception with recurring media reports dealing with a new generation unwilling to leave "Hotel Mama".

Nevertheless, empirical evidence is anything but clear. For cohorts born in the 1960s and later, over the years contradictory findings have been published. This is due to the fact that many studies relied on general population surveys, which do not allow small-scale cohort comparisons and which are often associated with statistically not reliable estimations of cohort-specific coefficients regarding leaving home. Comparing findings from earlier studies, we in fact find variation regarding the median age of leaving home.

We pooled seven datasets (N=31.336) that cover comparable information on leaving home in West Germany for cohorts born 1925 to 1984. This data-base enables us, for the first time, to provide reliable estimations of changes in the process of leaving home. It entails key explanatory factors which cover individual and contextual conditions affecting the decision process of leaving home. Even though the dataset does not allow differentiating target states (single household vs. joint household with a partner), we can answer two relevant empirical questions: Can we empirically confirm an increase in the median age at which young people leave parental home in a cohort comparison? If this is the case, for which cohorts does this trend apply and how do socio-structural factors affect the process under study?

Our analyses show less change than usually assumed and, simultaneously, we find considerable social gradients concerning the home leaving process.

Connecting Generations? Contacts Between Parents and Adult Children in a Mobile World

Intergenerational cohesion and support across the whole life course are important characteristics of parent-child relationships in contemporary societies. Next to financial support, care and help or support of grandchildren, contacts between parents and their adult children are another important form of intergenerational solidarity in contemporary societies. Thereby, different kinds of contacts as well as their frequency depend strongly on geographic proximity between adult generations. But nowadays in times of modernization, characterized by increasing social mobility, globalization and new technologies, families are able to face the challenge of greater geographical distances and time restrictions with various communication opportunities.

Although contacts between parents and their offspring are not only relevant for the individuals themselves but also for society in general (e.g. social isolation in advanced age), little is yet known about the determinants, country-specific differences and especially changes over time. Due to the relevance of intergenerational contacts as a relevant precondition for many other forms of (functional) solidarity, the presentation addresses contact frequencies in an international and time-related perspective. Based on the 4th and 5th waves of the Survey of Health, Ageing and Retirement in Europe (2010-2013) including 13 countries, namely Austria, Belgium, the Czech Republic, Denmark, Estonia, France, Germany, Italy, the Netherlands, Slovenia, Spain, Sweden and Switzerland the research questions are: (1) How intense are parent-child-contacts in general and (2) especially over time? Furthermore, using a two-wave-panel design embedded in a multilevel setting, the paper addresses the following specific questions: (3) Which micro-, meso- and macro-structural changes can explain an intensification or reduction of intergenerational contacts in European families and (4) can the usage of modern technologies such as the internet contribute an environment for maintaining or even intensifying intergenerational contacts over distances between parents and children?

RC16-201.4

KONNO, MINAKO* (Tokyo Woman's Christian University, konno@lab.twcu.ac.jp)

"Reasonable Pluralism": A Concept of Diversity for a Free and Just Society

While commonly viewed as a political theorist, John Rawls presents a normative theory that is very sociological in its aspiration and scheme. Rawls's concept of "reasonable pluralism" can be used to designate a desirable society in which diverse ways of life can flourish, yet social and structural injustices do not pass under the guise of value pluralism. Concerns for social injustices have led many theorists to argue that it is necessary for a society to limit the social space of freedom with law and other political devices. The scope of such direct social control has often been expanded far beyond its original intention, betraying our profound commitment to a free society.

How is it possible to conceive a society with ample social space for people to freely pursue their own ends and life projects, at the individual as well as associational levels, while unjust gender, class, ethnicity and other social divisions and stratifications can be publicly identified and collectively tackled? Rawls's vision of political liberalism with the idea of reasonable pluralism offers a promising answer to this question and points to a direction of effective "indirect" social betterment.

Liberalism has been criticized for its classical public-private distinction, for its inability to handle social injustice in so-called private spheres. Feminism has been an especially adamant critic, for gender injustice is typically identified in the sphere of the family. It may be considered that political liberalism exacerbates the problem as it claims that it is liberalism only for the public domain. In fact, this is not the case. Rawls falls short of vindicating his own theory. This presentation aims at a better understanding of the potentials of Rawls's political liberalism as a sociological theory.

Emotional Survival: A Drive for Boys' Love Fans in Japan

Boys' love (BL) is an emerging genre of popular leisure culture in Japan (e.g., cartoons, comics, novels) mostly produced by women for female consumers. Its central theme is romantic and sexual relationships among male characters. Although the genre has recently received academic attention (e.g., Levi, McHarry, & Pagliasotti, 2010), the existent research is limited to non-normative gender and sexuality aspects of BL products. Voices of BL fans have not been heard. The present study aimed at filling this gap by exploring "why Japanese fans consume BL products."

The constructivist grounded theory approach was employed (Charmaz, 2014). A recruitment letter was posted on a website that provided BL-related information (e.g., new titles, reviews). Nine semi-structured interviews (103 minutes, on average) were conducted via Skype, except for one case where an online instant messenger was used. Immediately after transcribing audio-recordings of the interviews, initial line-by-line coding was conducted, followed by more theoretical focused coding within and across emergent categories. Memos were written throughout this simultaneous data collection and analysis process to advance and leave the records of analysis.

For the Japanese fans across varying commitment levels, their BL pursuits were a strategy to maintain emotional well-being and survive their daily lives. They felt gradually and constantly "worn out" – sometimes because of their stressful jobs or their non-normative views and gender identities. They were well aware that homo-erotic stories in BL products are often sanitized and romanticized. This was why these stories served as fantasy that was in a sharp contrast to their real lives where the emotional wearing out occurred. Through reading the stories, they regained emotional energy – the process described as "healing," which helped them

re-engage with their actual lives. The findings are discussed in light of serious leisure (Stebbins, 2007) and gender and sexuality issues in Japanese society.

Evolving Patterns of Governance of and By Expectations - the Graphene Hype Wave

Anticipation in the form of expectations, visions, scenarios, market forecasts, foresight and impact assessments has become a pervasive element in the governance of new and emerging science and technologies. This holds not only for dedicated governance tools as foresight or roadmapping processes, but also for a broad range of diverse, sometimes implicit anticipatory practices, such as certain types of scientific articles, which contribute to shaping expectations regarding particular science and technology fields as well as broader visions of socio-technical futures. In our paper we suggest to understand these anticipatory practices as being part of an evolving governance structure, where anticipation in the form of expectations, visions etc. contribute to the governance of science and technology, but may themselves be shaped and governed by these evolving governance structures. The paper suggests the concept of governance of and by expectations to capture this double relationship and uses this lens to investigate how expectations regarding the new material graphene, up to hype, have been shaped by various anticipatory practices. We follow these practices and expectations through different spaces related to science, policy and markets, which are all characterized by specific sets of anticipatory practices. In so doing, we show firstly, how the (anticipatory) governance patterns evolve over time, and secondly, how the graphene hype emerged, along with the emergence of graphene as a techno-scientific field. We suggest that what we observe may be described as a hype wave moving through time and spaces, rather than as a purely temporally structured hype cycle.

Consequences of Inequality in Education Become Clear in the Labor Market

Coming back to the discussion about the effects of increasing the number of students, it is useful to verify the approaches that are practiced for analysis of inequality in education. There is no doubt that it is necessarily to study the inequality not only at the entrance to the university, but also for graduation from it. But is it enough? Perhaps we should go further in our researches and define inequality not by the formal level of education. How education actually turns out to be mover of social mobility for the individual? In other words, it is necessary to consider what opportunities on the labor market are given by education. It is no secret that various universities provide different quality of education. This is a significant cause of social inequality, which manifests itself when a university graduate entering the labor market. Studies show that children from high status families receive quality schooling; it gives them the opportunity to go to universities, which provides quality higher education; then they get relevant job and status. For children from the lower strata the life career develops differently. Usually they are not graduates from the best schools; as result, they often receive poor quality higher education; and then obtained university degrees do not give them the opportunity to get a good job and high status. We observe one of the effects of mass higher education: those who previously (at previous decades) were outsiders at the entrance to the universities became winners now; and then their victory turns defeat when they graduate from university and go to labor market. The research challenge is to link the inequality in the educational sphere with inequality in the labor market.

Migrant Domestic Workers and Family Life. International Perspectives, 2015, Edited By Maria Kontos and Glenda Bonifacio

This timely and innovative book delivers a comprehensive analysis of the non-recognition of the right to a family life of migrant live-in domestic and care workers in Argentina, Canada, Germany, Italy, Lebanon, Norway, the Philippines, Slovenia, South Korea, Spain, the United Arab Emirates, the United States of America, and Ukraine. Combining legal, sociological and social policy perspectives, it takes an interdisciplinary approach to international and national legal frameworks, the political economy of globalised reproductive labour, and the

experience and coping strategies of migrant domestic and care workers. Highlighting constructed, ideological and imagined responses to life away from home, it offers theoretical, empirical and international perspectives on the right to a family life. Bringing together established and emerging scholars from a variety of academic disciplines, it focuses in particular on the voices of migrant domestic workers and their positioning as active subjects with agency to articulate their needs and claims.

The Impact of Professionalization Processes of Migrant Trade Union Members on Their Positioning Towards Anti-Immigrant Public Discourses

In the last decades within the big industrial firms with a large number of migrant workers, some of the migrant workers could experience an unexpected upward mobility through their participation in the trade union and especially the workers councils. Some of them could gain access to the most privileged positions of representatives of the workers who are freed from the work in the production and can dedicate their working hours to managing the interests of the workers in relation to the strategies of the firm management. These migrants experience a transformation from worker in the production to a union official/manager in the firm and in this was an unexpected upward social mobility.

In the focus of my presentation are the biographical processes of transformation and professionalization these workers experience and the impact of these processes on their self-positioning towards current public anti-immigrant discourses.

Having Vocational Education and Underpaid Internship: Project of Human Capital Formation Among Disadvantaged Youths in China

In contemporary China, under the ideology that education and training are the key to the future of individuals, families and children place a high value on education. At the same time, academic credentials are traditionally valued higher than vocational ones as they are commonly regarded as more promising for high status jobs and economic success. When an increasing number of children from resourceful families chase academic qualifications in the expanded education market, vocational degrees are left for poorly performing students and those from poor families. This paper describes the high demand for the vocational credentials and internship opportunities among the disadvantaged youths, and their strong commitment to the belief in human capital investment. It also investigates the expansion of vocational schooling and internships that operates in the guise of training and skill development that match the needs of ever-changing labour market. Based on the fieldwork data collected in vocational schools in Chengdu, I find the students learn to ease every opportunity to invest on their own human capital to ensure their forward career progression. They look for courses to acquire additional certificates, complete unpaid or underpaid internship programs to train themselves at the own costs. When these learning and training programs are promoted to young people as ways to enhance their employability, the labour market only tap these programs as sources of inexpensive and flexible labour. This paper showcases the aspirations of disadvantaged classes in the human capital regime of neoliberal times, and their fear of lagging behind the crowd in the globalizing and neoliberalizing Chinese economy that built on a flexible and precarious labour regime.

The Complex Political Context of Conservative Mobilization in Japan: Utilizing the Event Data from Periodicals

Since the 1990s, conservative movements have become more conspicuous in the Japanese sociopolitical arena, exemplified by initiatives advocating historical revisionism in textbooks, patriotic grassroots movements weighing national pride, and movements against voting rights for foreign residents. What triggers such conservative movements in Japan? Social movement scholars have produced much research on political opportunity structures tracing the relationship between movements and political contexts. Similarly, researchers have paid close attention to the political and/or policy threats. Drawing on both literatures, this paper explores how political opportunities and threats affect conservative mobilization in Japan. Here, however, methodological issues arise. How can we conduct researches on conservative or right-wing movements, when researches are often

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

regarded as hardly sympathizing with the movement? How can we obtain appropriate data on conservative mobilization? One might regularly participate in and observe certain conservative meetings and have in-depth interviews with participants, as qualitative method suggests. Though these researches are extremely insightful, methodological limitation still remains. With this in account, this paper attempts to provide another research method in studying conservative movements in Japan: creating the event data from conservative organizations' periodicals. Unlike previous researches, utilizing periodicals mainly for discourse analysis, this paper utilizes them for numbers: the number of events and participants. This attempt also intends to provide a clue for a quantitative research design on conservative movements, where such data sources are rare. With the event data from periodicals of "Japan Conference," the conservative umbrella group with the largest membership in Japan dealing with various conservative policy drives such as constitutional revision, consisting of date, claims, place, and mobilizing number of participants, this paper examines the relationship between conservative mobilization (the number of participants) and wider political contexts. With multilevel regression analysis, the paper contributes to giving fresh light on studies of conservative mobilization.

Investigating Family Relations through Court Cases: Qualitative Endeavours and Pitfalls

Qualitative research of intergenerational relations is faced with two data collection problems. First, consent has to be thought from at least two individuals. When investigating intergenerational conflicts and disputes, the likelihood to recruit respondents decreases dramatically. Second, disputes around inheritance and inter-vivo gifts also involve to a large degree exploitation of vulnerable family members such as elderly abuse. For good reasons, social researchers have to go through thorough ethical review to interview victims of such family conflicts. We propose to tap into underexplored court case data bases to investigate intergenerational family conflicts. Court cases contain detailed information about extended family relations, family history, object of dispute and amount of financial transfer. These court cases reveal rich and complex social data that can be used both for qualitative and – after sufficient coding – quantitative analysis. In addition, data is available in digital repositories to allow historical studies over time and comparative research. The paper draws on a current research project and highlights the benefits and pitfalls related to analysing court cases qualitatively. Several data management tools are presented to deal with the amount of data and how to aggregate the data into a mixed-methods design. In the conclusion we discuss how qualitative administrative data of court proceedings and the juridical system can be harvested for social research.

Welfare Markets. Politics of Privatisation and Embedding Institutions

Over the last two decades we witnessed a marketisation of welfare programmes and social services in advanced welfare states. Mature welfare states incorporated market mechanisms and established private programmes were growing to unprecedented scale. In this context, little is known about the regulatory differences of these markets across welfare regimes and how these markets were implemented. This paper addresses both questions in a comparative study of pension and education markets in Germany, Sweden and the United States. Based on six comparative case studies, the evidence suggests that welfare markets are embedded in the existing welfare regime.

Drawing from theories of institutional change and actor-centred approaches (Fligstein 2001), I argue that previous institutional features of public welfare programmes such as access, administration, financing and choice serve as templates for welfare market regulation. However, powerful actors are able implement rules that favour their market position. Such persuasive actors can be partisan actors, organised labour, business interest groups or strong welfare user groups. Depending on the political power balance, superior actors are able to innovate and implement path alternating market features.

Despite the pivotal influence of actors on some regulatory features, overall highly embedded welfare markets suggest a strong path dependence and continuity of welfare regimes in the market sphere.

The paper not only scrutinises the introduction of welfare markets, it also studies subsequent market reforms. This long term horizon underscores the long shadow of critical junctures, though it also reveals constant political intervention into market regulation to mitigate unintended consequences. Usually, both naïve and subversive market behaviour are perceived as unintended and provoke rather pragmatic than partisan political intervention. In the conclusion, these findings

are discussed in the wider context of regulatory policy, nudge theory and welfare reform.

KORBER, STEFAN* (University of Auckland, s.korber@auckland.ac.nz)

MICRO-Foundations of Encroachment in the Professional Service Sector

Sociologists (e.g. Abbott, 1988; Goode, 1960) have long been interested in the struggle between professions over specific task domains and their attempts to create boundaries to related occupational groups to secure "privileges and opportunities to a restricted number of eligibles" (Parkin, 1979, p. 44). Some professions thereby continuously strive to cross those boundaries and to expand their jurisdiction when they move into areas of work that are occupied by adjacent professions (Rothman, 1984). Organisational scholars have identified professional service firms (PSFs) and their attempts to legitimise and institutionalise new ways of providing professional services as key actors in the process of jurisdictional expansion and institutional change (Muzio, Brock, & Suddaby, 2013; Suddaby & Greenwood, 2001). Large accountancy firms, for example, have been encroaching on the jurisdiction of the legal profession since the 1980s. This paper sheds more light on the micro-foundations of jurisdictional expansion in the professional service sector by exploring the mundane, day-to-day actions of professionals who are in the process of creating new service areas (within PSFs) that encroach the knowledge territory of other professions. Bridging intrapreneurship theory and the literature on institutional work, this paper identifies the dynamics and activities that take place when professionals challenge and undermine institutionalised behaviour guidelines in their efforts to explore and exploit opportunities outside professional boundaries. Methodologically, this is done by drawing on a single, longitudinal case study of an engineering firm that is currently in the process of diversifying into areas of professional work that are traditionally done by adjacent professions. The quasi-ethnographic approach of spending a prolonged time within the firm while new service areas unmerge and unfold offers unique insights that capture social action of professional activities and logics in their organisational and institutional context 'in vivo and in situ' (c.f. Smets & Reihlen, 2012; Lawrence, 2013).

Governance of Content on Political Suicide in Times of Financial Crisis

According to Durkheim, at particular moments, every society has a certain tendency to suicide. Social factors i.e. transformation processes and social disruptions are alone responsible for people's suicide. If a person is strongly integrated in society, s/he is not in risk of suicide. Crisis, in turn, destroys social stability and disintegrates society; this disintegration leads to increased number of suicides. A number of self – immolations in Bulgaria or a pensioner shooting himself in front of the Greek Parliament are some recent and widely media covered examples of suicides in the Europe of crisis. What does 'responsible media reporting' promoted by the World Health Organisation mean in times of financial crisis under given circumstances? According to the law, with very few exceptions, coverage of suicide is legal but as health professionals argue, it is not necessarily legitimate.

What we know about the act of suicide and the ways in which media are regulated to report on it has been largely based on studies and contexts of relative financial and political stability. If we approach suicide as a political act in the case of crisis, as one that constitutes an ultimate way of protest, then the question is raised, whether the codes and regulatory frameworks governing its coverage are sufficient and appropriate. Through this extreme means of communication, individuals act to protest and to demonstrate the condition of the society, automatically denying their possibility to speak out in the future.

In this paper the process of suicide as political act and as an act of silencing is discussed from a media governance perspective with emphasis on media ethics and their insufficient regulatory effect. From the point of view of the public right to know, this paper analyses the interventional practice of dismissing the social dimension of the phenomenon and limiting it to individual acts without political implications.

'We Can Only Request What's in Our Protocol': Technology and Autonomy in Healthcare Professionals' Work

The National Health Service (NHS) system in England has been subject to successive IT-led reforms, designed to 'modernize' the way healthcare is provided. The implications of these reforms for healthcare professionals' work have been studied from a range of perspectives (e.g. inter-professional roles, values and the contested process of change). Yet little attention has been paid to the implications of information technology for healthcare professionals' work autonomy and task discretion. The present study seeks to fill this gap by examining the impact of new electronic patient records on work standardization, autonomy and discretion. We report evidence from two case studies of NHS Trusts that implemented a national electronic patient record, the National Care Record Service, a part of the National Programme for Information Technology (NPfIT) in the NHS in England. The paper argues that standardization of tasks and routinization of work is not limited to low-skill sectors, but is a possible consequence even in 'high-skill' healthcare sectors, in which professionals are usually expected to be able to 'work around' new systems by upholding their professional values. Specifically, it shows that the introduction of IT limited the work autonomy and task discretion for both nurses and clinicians by engendering routinization, through computerisation, of three aspects of healthcare professional work namely the delivery of care; the conduct of healthcare professionals and the interaction between healthcare professionals and patients. It concludes that although there is evidence of reallocation of discretion between different professional groups and opportunities for workarounds (albeit limited), new information technologies tend to constrain professional autonomy and discretion without necessary realizing efficiency gains as espoused by managers.

KOROTAYEV, ANDREY* (russian academy of sciences, akorotayev@gmail.com)

Evolution of Global Political Protest Patterns in the Long Run: Arab Spring As a Trigger of a Global Phase Transition?

We all felt that in 2011, in the world in general (and the Arab World in particular) something unusual was happening. However, in our view, to assess the true scale of these unusual events is still hardly possible without the involvement of the quantitative empirical data. Such an analysis suggests that in 2011-2012, the World-System had experienced in some respects a phase transition to a qualitatively new state (denoted as phase transitions B). However, this phase transition is somewhat reminiscent of a phase transition of the early 1960s (denoted as phase transition A). The first (after 1919) phase transition occurred in the early 1960s and was associated with the growth of the global information connectivity and improvement of means of protest self-organization in connection with the spread of television, portable transistor radios, megaphones and other technologies of the Fourth Kondratieff cycle. The phase transition has been prepared by a new wave of growth in the global information connectivity and improvement of the means of protest self-organization due to the proliferation of technologies of the Fifth Kondratieff wave (Internet, satellite TV, twitter, mobile phones, social networks, etc.). This time again, although the spread of these technologies was going for years prior to 2011, the enormous potential for the generation and dissemination of protest activity was realized in a rather abrupt way.

KORS, JILLIS* (Saxion, j.kors@saxion.nl)

The European Happy Research Exchange Program (TEHREP) or How to Overcome Borders That Leads to Good Research for a Better Understanding of Social Enterprises.

The social enterprise is trending topic at different levels in society. At the micro level municipalities and citizens are dealing with it, at the meso level national governments have given it a high place at the political agenda and at the macro level the European Union has done a great deal of work.

If we take a closer look at the patchwork of literature and visible initiatives, the excitement about the concept is rather strange. We do not have that much information on the workings or outcomes of social enterprises. The only tangible result we have is a definition: a business with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or the community, rather than being driven by the need of maximize profit for shareholders and owners.

There are a lot of important questions to be answered and maybe sociologists are the first to deal with these questions at all levels in society and in different countries. With the definition of a social enterprise in mind colleagues of different countries (e.g. Denmark, The Netherlands, Germany, Macedonia, Estonia) got the idea of working together in organizing good (participative) research to explore an interesting concept. They organized themselves in The European Happy Research Exchange Program (TEHREP) for a better understanding of the workings and outcomes of social enterprises.

To understand the social enterprise is to do research with different stakeholders. TEHREP is working with different topics at all levels of society (e.g. human rights, poverty, community building, social innovation). Besides sociologists with an academic background there is also collaboration with colleagues from universities of applied science. A fruitful combination. The first results are now delivered. It shows us that social enterprises can only be understood at the level of grassroots by organizing interdisciplinary and international collaboration.

KOSKELA, VESA* (University of Turku, vpkosk@utu.fi)

War: The Final Word in Managing Risk

This presentation will constitute a part of my ongoing PhD dissertation dealing with meaning and rationale of war. It is intended to be a broader look into the phenomenon of war and associated discourse. The work draws upon theoretical contributions from a variety of disciplines and theories, namely securitization theory, speech act theory, and frame analysis. Critical linguistics has also had an impact and the work of Lilie Chouliaraki informs the critical strain of this work.

The presentation I intend to submit for this Committee deals with discourse of war. The problematique of assigning the status of war to a particular phenomenon occupies part of this presentation, but foremost attention is given to evaluating war or application of physical force as a vehicle for managing or eliminating risk. The discourse that informs an event partially constitutes it, so understanding how an issue is named and framed is critical in understanding its nature and function.

By studying previous works on discourse and legitimation of war, and evaluating them against my own research focussing on the Russo-Georgian war of 2008, I seek to achieve a clearer picture of those indicators that inform language making war palatable and possible. Legitimation describes the function that many discourses exhibit in relation to a "war", particularly elite discourse, and has been a well-researched topic. However, I intend to look at this issue as one of control. By way of framing and semantic manoeuvring war and acts of war can be brought into the realm of security by the speaker(s), where normal rules and mores can bend and cease to apply. This is the prospect of securitization, a theory in Security Studies well-suited to supplement an otherwise discursive project delving into contemporary conception of war.

The Work of Pickering and Luhmann Theoretically Viewed from within Current Social Work Practice

In his book The Cybernetic Brain Sketches for Another Future Pickering (2011) disseminates the English cybernetics in a very practical manner by presenting few central scholars and their actual doings. Furthermore, he elaborates further his own thinking presented in 1995 in the The Mangle of Practice Time, Agency and Science. The work of Pickering has been influental in the field of science and technology studies.

The theory of social systems developed by Niklas Luhmann has been widely utilized when studying social work and social services. In this paper the contribution of Pickering is brought into a dialogue with Luhmannian theories of society. This is done in order to achieve new understanding useful when studying the mangle of practice in current social services dealing with new innovations and technologies.

Children and Families of Transnational Migrants

The use of concept of transnational migration, as a framework for researching family and children, requires Historical Sociology due to different kinds of transnational migration, such ethnic migration (Japanese-Brazilian) and migration across boundary (Mexican-American). The notion of socioeconomic formation, its

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

social production process and relationship, and social conditions of people's lives can accomplish this historical approach (Marx 1976:38). Based on Marx, Lefebvre shows that socioeconomic formation combines capitalist social relationships with social relationships and institutions that belong to another era. Thus, the notion of socioeconomic formation implies an unequal development of any society. It means that productive forces, social relationships, politics, familial organization and socialization of children do not change at the same historical rhythm. According to Lefebvre, his method comprehends description of social life, coexistence of social relationships that belong to different periods of time, and phenomenon's history and genesis. As Lefebvre says, there is no reproduction of social relations without production of relations and there is no repetition without creation of new social relations (Martins 1996: 13-23).

Different kinds of transnational migration have to be related to different countries' social formations. Although the social capitalist relationships are dominant in all countries currently involved, one can find social relationships from another period of time such as tribal social relationships coexisting with capitalist social ones. As family organization and socialization of children requires more time to change, one needs to describe types of family organization and socialization of children in sending and receiving society. How does countries' social formation require transnational migration? How does transnational migration affect the organization of family and the socialization of children?

Non/Regularization of Guatemalans in Soconusco: Strategic Action As a Privilege

Using stories generated via semi-structured interviews with Guatemalans (16 women and 10 men) residing in Tapachula (Mexico), we explore why some foreign citizens who, according to Mexican legislation, are eligible for regularization still remain fully or partially undocumented.

Our research project "La construcción de la otredad, género y acceso a recursos y a derechos", which has been informed in design and implementation by the theory of structuration, has generated data that allow us to question one of the central concepts suggested by this theory: 'the dialectic of control'. This concept states that 'the most seemingly "powerless" individuals are able to mobilise resources whereby they carve out "spaces of control"'(Giddens 1984, 197). Strategic action – an action based on the ability of people to distance themselves from social structures in order to theorise about these structures and/or formulate ways of using/changing them – is considered to be important for such mobilization (Mouzelis 1989). We argue that strategic action, however, is a privilege of those who have the resources to withdraw from meeting their everyday immediate needs. By arguing that strategic action is a privilege, we are not negating the agency of a migrant and his/her internal capability to undertake such actions (Nussbaum 1997). We simply want to call attention to the idea that the fulfilment of this internal capability can be severely handicapped by limitations stemming from social actors' positions in society. In the case of our respondents, the lack of resources available for them and their lives' precariousness – understood as 'instability, lack of protection, insecurity, and social or economic vulnerability' (Anderson 2010, 303) – prevented them from developing, as well as from implementing strategic actions for changing their current situation, for example, via existing schemes of regularization.

KOTZE, PAUL* (University of the Free State, kotzepc@ufs.ac.za)

Against Wrong Turns and Dead Ends: Ensuring That the Ontological Turn Is Indeed a Turn to the Real

A plethora of new ontological frameworks have burst onto the scene over the last few years, many claiming to seal the various ruptures that have challenged the internal coherence of sociology since its inception as a scientific discipline. Some of these approaches do indeed seem to transcend the subject/object, micro/macro dualities that have haunted our science since its beginning, yet there is little consensus between these perspectives regarding the nature of reality. Although they claim to indicate solutions to the dichotomies inherent to current sociological practices, they rarely agree on the nature of alternative ontological and epistemological frameworks. Some champion the object, others the subject, while yet others claim the discovery of a monistic ontology that does away with the subject/object distinction once and for all! This is an indication that, for all their innovation, the schools of thought comprising the ontological turn have not managed to transcend the problems that plague the conventional sociological paradigms. Why? Because, like those before them, they have unconsciously fractured the holon of manifest reality, and taken their favoured part to represent the whole. In this way either agency, structure or meaning, all of which are integral facets of social reality, become conflated with reality itself, which results in many enlightening, but ultimately partial truths. While the ontological turn is a sorely needed development, it is up to us to make sure that it is an integral movement,

aimed not merely at generating another limiting dogma or nurturing new cults of personality, but at fundamentally rethinking our existence as social beings and the ways in which we understand this existence. This paper attempts to explore the nature of manifest reality with the aim of excavating a sound ontic and epistemic foundation upon which truly integral ontological and epistemological frameworks may be constructed.

KOUBEK, MARTIN* (Charles University, martin.koubek@ff.cuni.cz)

From Emancipation to Social Work? a Dialogue Between Frames and Discursive Field of Pro-Roma Activists in the Czech Republic after 1989

Roma people are one of the most endangered minorities (not only) in the Central and Eastern European countries (CEECs). Roma and pro-Roma activists find themselves in a difficult situation – divided, threatened by racism from one side and by poverty from the other. The paper analyses their struggle for recognition in the past twenty years in the Czech Republic in five years/distinctive periods - 1992, 1997, 2002, 2007, and 2012. Using frame analysis, it shows how activists change their self-designation and diagnostic, prognostic, motivational frames in a dialogue with changing lines of their discursive and strategic action field. Complementary claim-making analysis is used to describe an interaction between their discursive and collective action repertoire.

Although there have been studies describing several and predominantly general self-designation and identity frames in relation to mobilization of the Roma movement in CEECs, there has still yet to be a systematic analysis. Those studies tell us little about the way these frames and their relations changed in time. And there is also no manifestation of the dynamic and dialogical character of activists framing and political claim-making, mobilization and collective action.

The paper shows that despite some assumptions in literature about frames and fixed identities of Roma activists in the Czech Republic, they respond and adapt to their political and discursive field. In the new millennium activists started to prefer a more individualistic approach to Roma integration. The focus of their framing switches from political and (multi)cultural to socio-economic domain (and assimilation) partly in relation to the development of donor funding (and especially EU funds). With these shifts the target audience switched from the public in the nineties to donors where frame resonance was focused. This affects collective mobilization and the protest participation is mostly driven by their allies with anti-racist and multicultural claims.

Change and Continuity in School-to-Work Transitions of Young People in the MENA Countries

Five years after the Arab Spring in the Southern Mediterranean and the fading of its democratic promise, issues of entrenched social inequalities and lack of social justice are back on the agenda of academic and policy research in the region. Young people in the Arab countries in North Africa and the Middle East meet with more difficulties in their school-to-work transitions than before and many more of them feel socially excluded. What are the old and the new challenges youth in the region is facing today and what are the dominant patterns in the trajectories to adulthood for different groups among them?

This paper addresses these questions taking stock of the international comparative project 'SAHWA. Researching Arab Mediterranean Youth: Towards a New Social Contract'. The study focuses on the experiences, views and prospects of young people in Morocco, Algeria, Tunisia, Egypt and Lebanon. It combines a representative survey in each of the 5 countries and a wide range of ethnographic studies in different social spaces conducted in 2015. The paper will analyze the differences in youth transitions among the countries, given their different economic, political and social context, as well as will highlight the common trends in the region. The examination of the inequalities in the school to work transitions will take into consideration their entanglement with family and housing transitions and wider identity formation processes.

KOVACHEVA, SIYKA* (University of Plovdiv, siykakovacheva@gmail.com)

Coping with Uncertainty in the Transitions to Autonomy of Arab Youth

The paper examines how Arab youth deals with uncertainty in the passage to autonomy five years after the Arab Spring. Theoretically this paper builds upon the concept of uncertainty in understanding the dilemma of structure and agency

in youth transitions and applies it to the specific context of five North African and Middle East Arab countries – Morocco, Algeria, Tunisia, Egypt and Lebanon. Young people's choices between school and work, family formation, emigration or political engagement are analysed as heavily dependent upon the financial and cultural resources of the parental family, gender and rural/urban inequalities and yet influenced by young people's own coping strategies and individual life projects.

The analysis is based upon data coming from a comparative research project combining a representative survey with 2000 respondents in each of the five countries and interviews-in-depth with young people in different settings. A focus is placed on youth unemployment and involvement in the informal economy in unfavourable local labour markets with inconsistent public policies and how these limiting structural conditions are subjectively evaluated and transformed. The combination of quantitative and qualitative data allows a reflection on the process of managing uncertainty with regards to the past experiences, present meanings and future aspirations of young people.

Towards Strategic Health Workforce Planning - Experiences from the Joint Action of European Health Workforce Planning and Forecasting Project

The operation of health systems highly relies on the human resources of the health sector. In health workforce planning (HWFP) process, countries tend to focus firstly on monitoring the current human resources, the domestic skilled capacities, and secondly on the future needs for ensuring the sustainable operation of the healthcare system and the quality of care.

12 EU country practices were analyzed and several aspects of the HWFP complex picture was examined in the frames of the "Joint Action of European Health Workforce Planning and Forecasting" project, in order to have a clear understanding of the operation and gaps of different HWFP systems, data and processes.

The results showed that the main elements, essential steps that highly influence comprehensive HWFP are: the extended attention and awareness of the topic, setting up goals and commitment to them, incorporating the experiences of longstanding traditions, the dedicated group - high level stakeholder involvement, proper communication flow, support of online platforms and IT solutions, clarity of the real environment analysis and current country situation, excellent data coverage and quantitative models, easy data source linking, mostly individual but anonymous datasets, implementation linked to policy actions, and evaluation and maintenance of established systems. Based on the practices of different EU countries we might experience different levels and actions taken in the HWFP development continuum, where experiences from countries having more advanced HWFP systems could support countries with less systematic HWFP to incorporate significant aspects.

The planning intentions, strategic design, implementation and assessment are considered to be crucial in health workforce policy and later on, in practice. Strategic approach often needs to be improved by continuous measurement and monitoring; revision and evaluation of efficiency-effectiveness of formerly set targets, mechanisms to achieve the desired result; and incorporating the benefits of qualitative methods to interpret and fine-tune quantitative planning.

The Future through the Eyes of the Key Stakeholders: Hungarian Backcasting Scenarios on the Future of Economic Higher Education

In 2015 a backcasting experiment took place in Hungary on the future of economic higher education. Backcasting is a participatory future scenario building exercise that enables participants to leave the constraints and realms of the present behind and visualise an ideal scenario in the not too near but not too distant future. These visions can then be used to back track the necessary steps that may lead towards such desired outcomes and hence identify implementable measures especially for policy-makers. As opposed to forecasting, this technique does not try to attempt to identify and extrapolate current trends but uncovers the underlying aspirations of stakeholders and finds paths to suit these expectations. This particular research ran two two-day backcasting workshops with two groups of stakeholders. The first one consisted of lecturers, researchers and higher education administrators both from operative and strategic levels. The second group involved students studying currently in economic higher education institutions. Both groups used the timeline of 2050 as their envisioned state of the higher education system. The aim of this paper is to present the resulted scenarios and show how the visions of these two stakeholder groups relate to each other. The visions cover a wide range of topics such as the means and methods of transferring knowledge in the future; the changing relationships between students and educators; the virtual and physical spaces used in higher education; or the role economic higher education plays in the society of the future.

Japanese Classical Musicians in Europe: Institutional Constraints and Survival Strategies

In my presentation I will examine career building processes of Japanese professional musicians on the Polish and French markets of classical music to see whether a profession of classical musician can be conceived as cosmopolitan. On account of its universal language, we tend to imagine that the art world (Becker 1982) of classical music encourages equal international exchanges and is open to all musicians regardless of their national, cultural or personal characteristics be it nationality, education, language, value system etc., provided that they have an excellent command of the musical instrument (technique, expression etc.).

To verify whether this cliché reflects reality I have carried out over 40 interviews with Japanese musicians, music teachers, composers, who currently pursuit their professional career in Poland or in France, as well as with those who being unable to do it, have come back to Japan.

The Japanese migrating to or circulating around Europe are already formed as musicians and social actors when leaving Japan. If they wish to perform their profession outside the Japanese environment, they will have to adopt conventions (Becker 1982) produced by people from the given environment to cooperate with them.

Will they have equal opportunities to compete on the European world of classical music and become a part of the highly skilled privileged migrants or rather end up as another type of precariat (Coulangeon 1998) due to uncertain professional conditions? What are then objective (relatively independent from individual decisions, such as education system, labor market, immigration law etc.) and subjective (resulting from the person's individual choices), factors in biographies of the Japanese, which influence professional orientations (Hughes 1972)? Ultimately, what does it tell us about shifts on the labor market triggered by globalization and universalization at least in the domain of arts?

RC48-JS-53.2

KOWALEWSKI, MACIEJ* (University of Szczecin, maciej.kowalewski@whus.pl)

Grumblers, Malcontents, Activists. Does Ritual Complaining Lead to Political Activism?

Although complaining is well-recognized by psychologists and economists, the political potential of "expression of dissatisfaction" (Kowalski 2003) is still not clear (Ward, Ostrom 2006). One of the reason is that complaining appear in different forms, from "grumbling" to consumer complaining behavior or submitting official civil complaints. Does complaining, defined in terms of grievance communication, have a political meaning? Some theories of emotions in social movements suggest that dissatisfaction can be a prelude to outrage (Goodwin, Jasper 1999), but if complaining could lead to social change, the change may be negative, destructive, or reversed as well. Researching discontent built up around negative emotions, raises then serious theoretical problems: some of these relate to the cultural tolerance for complaining (Wojciszke 2004), while others relate to the political ability of authorities to manage dissatisfied (Cichocka, Jost 2014).

Urban movements are good example to research the complex relation between the ritual complaints and political mobilization. The difficulty that we face here concerns the nature of reported claims. Dissatisfaction of xenophobic groups with the influx of migrants representing a different culture or religion,

although organized as a social movement is not usually referred to the term of "urban movement". In that sense "right to the city" does not mean "right to complain" automatically. It is worth to examine then, in what sense urban middle class belong to the "ritual complaining class" ("klagende Klasse", see Lepenies 1992) and if it has the ability to organizing political change around urban issues.

KOZHISSERI, DEEPA* (Indian Institute of Technology, kozhisseri@gmail.com)

Conservation Project Triggers Food Security Crisis: Attappady Hills, South India

This paper argues that large funded projects for environment conservation among farming communities could have an adverse impact on agriculture and food security. This is especially true if livelihood generation and eco restoration divert agriculturists to wage labour. In 2013 there were 31 infant deaths and high malnutrition among the indigenous communities in Attappady hills in South India. This was immediately after Attappady Wasteland Comprehensive Environmental Conservation Project a state run project with assistance from Japan Bank for International Cooperation just wound up in 2012 after running for 16 years. This paper posits that while this project contributed to the growth of secondary forests it weaned away a large chunk of the indigenous population away from their lands affecting their food security. Afforestation, soil and water conservation activities were undertaken in which the indigenous communities found employment. Many small agriculturists turned to these activities for wages moving away from farming coarse millets which formed their traditional diet. They began to be completely dependent on the public distribution system and market for rice which replaced millets in their diet. They also sold off their livestock in keeping with project goals which denied them access to draught animals. The project brought in large flows of money and the state wanted this to be spent to ensure the project continues. Contractors were recruited to keep the project going. By the last phase of the project buildings had come up, numerous vehicles plied and an entire parallel development economy flourished in this indigenous belt. When the project stopped the tribes were severely cash strapped and their agriculture was also neglected. The menace from wild animals, water scarcity and lack of timely subsidies deterred them from agriculture. Only those indigenous farmers growing millets for their own use, without pesticides, have been secure.

From Macrosociology to an Experiential Critique of Global Modernity

From macrosociology to an experiential critique of global modernity
In recent years the concept of modernity has been criticized as the ideological keystone of Eurocentrism. It is suspected that it hinders sociology and the social sciences in general to move away from colonial and post-colonial structures of knowledge production, and that it reproduces narratives that reaffirm European superiority. Although I consider this criticism as absolutely necessary I content that it is valid only for certain uses and discursive practices—above all those that can be found in many examples of the so-called "theories of modernization".

Contemporary debates about modernity could already be seen as important correctives. They do not only tackle the problems of Eurocentrism and methodological nationalism, but they also turn away from using "modernity" as a teleological normative concept. Instead, they see in it a conceptual tool that allows to address the global entanglement of human affairs from multiple perspectives.

However, as macrosociological theories they still presuppose the existence of clearly defined patterns of modernity that can take different shapes and colors, but that do not change substantially.

In my paper I content that more attention must be paid additionally to concrete experiences that people in different parts of the world have made with and within global modernity. In order to account for these experiences it would be necessary to complement the examination of macrosociological parameter with a philological reading of cultural texts that include sociological and philosophical theories, but are not limited to them. Such a "close reading" will reveal the complexity of experiences lived in different parts of the world, but also the production of multiple "imaginaries", "critiques" but also "project" of modernity. In my paper I will discuss some Latin American examples.

KRABEL, JENS* (Coordination office "Men in Early Childhood and Care" c/o Catholic University of Applied Sciences, krabel@koordination-maennerinkitas.de)
MARTIN PALOMO, MARIA TERESA* (Carlos III University of Madrid, mtmartin@polsoc.uc3m.es)

Men in Early Childhood and Care – Can They Contribute to Professionalisation Processes in Early Childhood Education and Help to Rethink Theoretical Dimensions of Care Work?

In this paper the authors discuss theoretical and practical dimensions of care work in the professional context of early childhood education and care (ECEC). They start from a theoretical consideration of the complexities of care work, exploring these from an angle that includes the material and emotional as well as the moral dimensions and their respective interconnections. Secondly, they reflect – on the basis of experiences and research results gleaned with the German model programme "More Men in ECEC", carried out from 2011 to 2013 – on the fact that male participation in ECEC, as well as their approach to care practices, are contributing to a reconfiguration of the ECEC work profession. However there are no easy ways to professionalize care work; all possible avenues present challenges such as differences in terms of the capacity to manage time or emotions according to gender-specific behaviour and social expectations. What initially appeared as a gender equality challenge in gender-mixed ECEC teams has gradually been reconfigured as a problem of professionalization of a certain type of work that involves many difficulties but also many opportunities in relation to its professionalization, among others the chance to rethink a long disputed analytical category: work.

Transforming Residential Aged Care into a Health Promoting Setting? Results from a Follow up Study on the Austrian Pilot Project "Health Has No Age"

In the context of healthy ageing, health promotion so far has mainly focused on the "young old" (e.g. workplace health promotion); in the older groups, community-dwelling aged have been addressed. Highly-aged persons, especially when in a functionally impaired state, so far hardly have been considered as target for health promotion. One important option is to address aged care residencies with the settings approach, as they have a huge impact on their clients' health.

An innovative health promoting settings-project was conducted as a pilot in three sites (900 residents, 300 staff) of Vienna's largest care provider from 2011 to 2013; evaluation used qualitative and quantitative methods. Starting with a systematic needs assessment, the project developed and implemented health promotion strategies and measures (a) for residents a mobility enhancement intervention as an RCT study, which demonstrated effectiveness; (b) for their relatives an involvement policy (c) several staff health measures. At management level, the organization formally adopted a health promotion policy and established central support structures. At the end of the pilot phase, internal and external stakeholders considered the project successful, but the impact of these strategic and structural decisions on everyday processes and on organizational culture at local level was not yet to be determined.

The paper will report on experiences and results of a follow up project, which supported further specification, roll out and sustainability of the health promotion activities in the period 2013 - 2015. Experiences with the overall implementation, a roll out of the mobility enhancement program to the organisation's other 25 residencies and staff health measures that initially brought up mixed results will be discussed.

The paper gives an insight into issues of implementation, but also viability of a health promoting setting approach and discusses potential impact on health of the highly aged.

How Past, Present and Future Are Constructed By Slow Livers? Using Qualitative Methods to Measure Temporal Practices and Values in France and Poland.

Nowadays, public debate, regarding effects of daily acceleration, difficulties with work – life balance and widespread time – pressure, takes place not only in Western societies, but also in developing countries like Poland. Due to the ongoing discussion, ideas such as Slow Life or Simply Living are getting more and more popular across different countries.

'The Slow' term seems to be misleading for many people. Contrary to popular belief, Slow Life doesn't offer parallel temporality in isolation from the rest of the

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

culture. It is not a simple slowness - this philosophy rather includes a set of values, which are implemented in everyday practices in order to live in more a conscious way. Taking into account the spread of Slow concept is worthwhile because it reveals evolution of time practices and temporal values. On the one hand, Slow is based on elements related to the past: return to the roots and closer relationships with local community. On the other hand, Slow Livers take up present struggle for the better future and improvement of quality of life. For this reason, we could ask about the type of linkage between past, present and future, created by individuals who decided to slow down in some realms. Moreover, we could wonder about personal ways to get these temporal dimensions together.

Answers to above questions will be provided by our empirical findings. The presented research projects, conducted in 2012– 2015, are proposals of using qualitative approach to explore and understand individuals' time perception. The main objective of speech is to present how past experiences in personal stories could shape present lifestyles and plans as well as time orientations. By using qualitative tools, we would like to show in which way connection between past, present and future is constructed by Slow Livers in France and Poland.

Future Scenarios As an Epistemic Practice in Urban Transportation Planning

My paper will give an insight into a current research project about contemporary practices of processing and managing the future. Based on ethnographic data about the working practice of urban transport and traffic planners, I am going to show how urban futures are being imagined, stabilized and installed by using scenario techniques. Those scenario methods can be considered as a central mean of transportation planning.

At the same time the work with scenarios can be understood as a certain "epistemic practice" (Knorr-Cetina), which can be distinguished from other forms of future imagination within the planning process. Their role of scenarios lies not so much in the calculation of a probability of occurrence but rather in being conceptualized as opportunities to enable imaginations. But how are such imaginations built? Which parts do they consist of? How do they persuade? Drawing on in-depth material on the work of traffic planners, scenario techniques become evident as an interaction of actors (different persons, groups, hierarchies), objects (paper, presentations, post-its) and techniques (computer-based, simulation models, calculation programs).

Therefore, to understand the meaning and usage of scenarios, such sociomaterial settings need a close attention. My presentation analyses how scenarios are used in concrete situations to produce "present futures" (Luhmann). Additionally, not only the way of scenario planning comes into sight, but also the future itself becomes an object of inquiry. Which parts of a certain future are detailed in scenarios? All together my contribution aims at a better understanding of scenario-planning as a technique and of the ways and forms of future it introduces.

How Cultural Tolerance for Men's Violence Against Women Influences the Sentencing of Assault Cases in Specialized Family Violence Courts

Based on fieldwork conducted in a large, urban district court, this article explores legal responses to domestic and non-domestic assaults. It finds that men who assault intimate partners receive sentences that emphasize their rehabilitative needs and often result in discharges without conviction. Conversely, non-domestic assaults are met with relative severity. These findings are not necessarily inconsistent with a 'focal concerns' framework, which suggests that judges rely on racial stereotypes and focus on 'family costs' when sentencing violent male partners. They do, however, add nuance to this theoretical frame by suggesting that sentencing processes are likely to be informed by cultural logics that are consistent with a wider array of social power asymmetries, such as those based on gender. A comparison of the narratives that accompany assault cases suggests that men, regardless of racial status, are likely to receive a 'punishment benefit' for assaulting an intimate partner.

KRAUSE, MERCEDES* (Universidad de Buenos Aires, merkrause@gmail.com)

On the Family As a Collective Subjectivity

The family functions as a system, perpetuating itself through space and time. The family imposes prohibitions and proposes collective ideals, models, values, and norms. Family standards build appropriate ways of being and behaving, which legitimize different forms of stratification by ordering everyday experiences. In this sense, the family is an important source in the intergenerational reproduction of social inequalities.

However, the family is not an indiscriminate totality that assumes acquired routines and family recipes as a joint project between its members. Ritualized practices can also be conflictive between generations. Children and young people negotiate these inherited ways of being and extend the sociocultural constructions of inequality adding meanings, experiences, and subversive performances. Thus, the paper addresses what is a collective subjectivity and what brings the introduction of this concept for understanding processes of reproduction of social classes and other dimensions of inequality through everyday family life.

Understanding Protest Outcomes: Indigenous Movements, Demand Making and the State in Latin America

Do demands and tactics matter for protest outcomes? Despite renewed attention regarding the outcomes of social movement activity, recent scholarship has produced conflicting results about protest outcomes; if any, the effects of social protest are suggested to be indirect, through the intervention of political opportunity or public opinion. Moreover, much of the literature on protest outcomes continues to focus on cases from the US and Europe, while the scholarship on indigenous social movements in Latin America has predominantly featured single case studies. By developing a theory of demand making based on the insights of studies of Latin American indigenous movements to supplement the theoretical knowledge about protest outcomes, this study successfully combines theories from the 'North' and the 'South' to explain a topical question: what explains the divergent outcomes of indigenous movements in Latin America. Analysing indigenous protest events in 13 Latin American countries between 2003 and 2013 shows that in fact choices of demands and tactics of indigenous protesters do influence the outcomes of protest to an important extent. Much of this effect relies on the economic cost implied by different demands and tactics. This is not to deny the importance of indirect factors; in particular, the nature of the political environment plays an important role in determining the outcomes of indigenous protest. Yet these results pose questions about the generalisability of such findings beyond Latin America. In particular, does the mechanism of economic cost function differently depending on the level of institutional and infrastructural development of the state? It is through exploring the role of the state in affecting the success of social movements in different settings that both commonalities and the contradictions of social movement theories from the 'North' and the 'South' can be fruitfully explored.

KRAVCHENKO, SERGEY* (Moscow State Institute of International Relations (MGIMO-University), sociol7@yandex.ru)

Globalization: From Food to Non-Food

Food is nutrition containing at least four components: first, cooked bio-natural substance that performs the reproduction of physical and mental human functionality; second, an identifier and marker of class and that influences peoples' choice of meals; third, the institutionalized cultural values and norms governing the essence of the diet and the actual human relations; forth, socio-cultural discourse that operates on all individuals who undertake to speak in this discursive field. Under the consequences of globalization, according to G. Ritzer, there emerged "nothing" and correspondingly "non-food" – both refer to a social form that is generally centrally conceived, controlled, and comparatively devoid of distinctive substantive content and make sense only when paired with "something" (in our case food) – a social form that is generally indigenously conceived, controlled, and comparatively rich in distinctive substantive content. However, in the global world no meals are either totally individualized or completely devoid of individuality, and this implies a continuum from food to non-food.

Non-food is mainly produced by the following factors: 1) globalization has led to the emergence of culturally "borderless" foods. There have appeared transnational network enterprises producing flows of non-foods overcoming barriers of countries and boundaries of their places of origin; 2) non-food (hamburgers, hot

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

dogs, pizza, etc.) is being produced all over the world in national local forms; 3) food is quickly losing its indigenous, homelike character becoming more universal and standardized, thus acquiring the essence of non-food; 4) genetic changes of bio-natural food substances with predetermined quantitative and qualitative parameters that are globally produced and controlled. This has given birth to alien-products as opposed to ecologically friendly foods; 5) there have emerged centrally conceived and controlled performative non-food; 6) all these processes have led to detraditionalization of food which is being replaced by non-food.

Memberless Civil Society in Russia: Interdependencies Between the Third Sector, the State and the Market

The appearance of civil society is considered one of the key characteristics of the Russian post-Soviet transformation. This paper aims to contribute to the session "Comparative Capitalism…" by focusing on the changing patterns of resource mobilization in Russia during the last 25 years. In particular, we examine on how mobilizing members, staff, volunteers and various financial sources – shapes internal and external relations, tactics for managing dependency, uncertainty and competition by comparing two types of NGOs: professionalized service providers and volunteer organizations. We specifically aim to systematically compare how the patterns of financial (re)distribution between the state, the market and the civil society not only integrate non-governmental organizations into the system of bureaucratic governance but also stimulate the propensity to generate profit.

The context that shaped the organizational character and the scope of activities of the Russian NGOs has been a complex combination of efforts by various actors. In the 1990s the foreign donors aimed to strengthen organizational capacities of the third sector while setting an agenda that did not really reflect the domestic issues and needs. In the 2000s governmental attempts to steer the role of the third sector increased, the legislation was introduced that to hinder foreign financial and ideological influence, to prevent political opposition. We thus aim to capture the differences and similarities between these two periods by comparing organization established during these two periods. Empirical materials include the legislative framework, interviews, observations and documents produced by and for the NGOs.

Analyzing and theoretically capturing the institutional and organizational change in civil society in Russia we aim to understand whether and how the development of the Russian third sector corresponds and differs from the international pattern of changes in civil society, characterized by diminishing membership base and concentration of resources in financial institutions, states and corporate enterprises.

Can We Demarcate the Future? a Discourse Analysis of the Future Studying Congressional Hearings in the US

It is often difficult to draw a line between "present" and "future" when studying statements in political discourse. We might all agree that complex global discursive structures profoundly shape our future but it is challenging to undertake empirical research that determines the power of such competing discursive structures and evaluates which ideas they convey. The proposed paper ventures this unexplored territory with a new method of discourse analysis to study the manifestation of transnational discursive structures about the future in congressional hearings in the US. If we want to come to grips with the repercussions of global structures, a promising research strategy is to focus on a narrow case and to simultaneously increase our attention for implicit and explicit references to transnational orders.

The guiding hypothesis of the paper is that global futures that could be expressed during the 109th (2005-7) and 110th (2007-9) US Congress differed sharply. Both sessions of the congress overlapped with George W. Bush's second term as President but the former knew a Republican majority whereas the Democrats dominated the latter. Previous research suggests that this alteration shifted debates within Congress and, equally important, gave space to new members of civil and economic society. Congressional hearings are a key element of the American political discursive landscape as they represent a forum for different policy actors to share their positions which informs political decision making.

The methodological approach developed in this paper combines qualitative content analysis and network analysis. Together, these methods provide for an approach to discourse analysis which makes it possible to evaluate the positions of actors and their claims within an epistemic community. Undertaking this analysis across time furthermore unravels how the structure of these communities has evolved over the period of a critical political shift in the composition of Congress.

Youth Support for an Authoritarian Future. Imagining a Pro-Putin Future in Contemporary Russia

Social movement researchers often consider the young as driving forces for social and political change. Young people have fewer personal constraints and research has shown that they are quicker to take to the streets than adults despite their lacking interest in conventional political participation. Recent youth-led demonstrations, ranging from the Arab Spring to Hong Kong's Umbrella Revolution, confirm the image of an idealistic youth striving for the democratic futures of their country to enable free choices and self-determination.

The case of contemporary Russia, however, sits unhappily with such visions. Those young Russians who got politically involved over the last decade expressed support for the authoritarian future offered under Putin's leadership. These young activists have been critical in shaping the future Russian's wanted and have legitimised the country's authoritarian turn. Fear about a falling back into the chaos of the 1990s and a deception with Western values are relevant to account for this situation. Young Russians, unlike during perestroika, no longer desire democracy or individual freedom but are increasingly attracted by Putin's nationalist ideas and visions of stable order. With their support for an authoritarian leader, young Russians come to terms with the uncertainty the future contains. Their preference for "sovereign democracy", as the current regime is labelled in Russia, can best be understood by trying to get into the argumentative logic of the pro-Putin youth movements.

This presentation relies on internal documents of pro-Kremlin youth movements as well as recent opinion polls, which enable a better understanding of what current Russian youth strives for and what sets them apart from the generation of their parents. The case of Russia is important as it widens our perspective on the futures which youth mobilises for and challenges the hegemony of Western-led research which proves inappropriate when applied in a different context.

KREKULA, CLARY* (Karlstad University, clary.krekula@kau.se)

Occupational Ageing: Stereotypes of Older Workers As Ornamental, Institutionalised and Productive Discourses

Stereotypes on older workers are described as commonly used and are said to have negative consequences for older workers wellbeing. They are also described as an obstacle to extended working lives. However, previous research has not problematized the separate meanings that different stereotypes may have and the consequences that they have both on older workers health and on an organisational and societal level. In this paper, I contribute to such a discussion by exploring the organizational use of seemingly contradicting stereotypes; eg on older workers as both fragile and experienced. The analysed material comes from a study on Swedish fire-fighters and includes a survey conducted among 1176 employees at 25 randomly selected fire stations with quantitative and qualitative data as well as from qualitative interviews. The analysis is based on the idea that stereotypes are not only cognitive elements but also verbal claims and discourses. The results show that stereotypes on older workers differ and they can make up both *ornamental* and *institutionalised* discourses and that these two forms of stereotypes have different effect on the health of older workers. Departing from these results, theoretical tensions and contradictions in notions on the relation between stereotypes and older workers health may be reconsidered. I will also illustrate that stereotypes make up *productive* discourses which are used also in the processes where (un)marked age, hegemonic masculinity and gender relations respectively are constructed and negotiated.

KRETSCHMANN, ANDREA* (Centre Marc Bloch, andrea.kretschmann@gmail.com)

Internal Security Law in the Making. Structures of Experience and Expectance in Austria's Discourse of a New Terrorism Act

Structures of expectance rest upon experiences. But what happens when the future seems to neglect being derived from the past, as political actors experience today? What comes to pass, when radical events of cataclysmic character seem to unfold?

In my paper I analyse the changed relationship between structures of experience and expectance in discourses of crisis. As an example, I draw on recent amendments and developments in internal security laws in Austria. My argument goes as follows: Against the background of a seemingly lost structure of experience one can rest on, extraordinary political decisions – even opposing the rule of law – can be legitimized, adopted, and cast into law. In fact, a discourse that orients itself towards crisis events unfolds an idiosyncratic evidence, generating it's political subject matters out of the merely thinkable rather than out of the average of past experiences. While since modernity political actors draw on extrapolated past experiences to make futurity expectable, in discourses of crisis, statistical knowledge becomes detached in favour of *imaginations* of possible futures. The relation between experience and expectance transforms here – even though it can be challenged, that the speech of the singular and radical event anything new. With Peter Burke one can claim that access to the future only can be guaranteed by categories and schemata already known.[1] In the end, the anticipated caesura proves to be a repetition, generated out of a collective memory.

KRETSCHMANN, ANDREA* (Centre Marc Bloch, andrea.kretschmann@gmail.com)

Regulating Carework: The Thin Line Between Law and a Better Future

Within the last decade, transnational carework for the elderly in private households in Europe has become subject of legal regulation. As governments are willing to regularise their growing irregular care economies to low costs, the regulations mostly present strong similarities to the former irregular conditions, what means they are highly liberal. This raises the issue of how careworkers and employers perceive and adapt the legal regulations respective what makes them obey the new evolving laws.

Against the background of an empirical study of such a legal regulation in Austria, the paper discusses the character of the people`s actions towards legal obedience. It thereby asks for the specifites of obedient alignments and its effects in a field deeply ethnicised, gendered, limitedly formalised and poorly paid. However, the main argument put forward is, that obediency is highly conjunct with *general* attitudes and affects towards the law, so that the legal content takes a back seat, even though quite some of the careworkers and employers perceive the new laws as 'unright'. This subsequently raises the issue of how the thin line between legal regulations in the care sector and a better future can be strengthened.

Bullying in Social Context: Are Impoverished Adolescents at a Greater Risk of Being Bullied in Affluent Neighborhoods?

This study examines how the interplay of neighborhood context and household situation influences the likelihood of bullying victimization among individual adolescents. Although scholars have emphasized that the interplay of social conditions and individual characteristics influences bullying, research on bullying rarely focuses on the interaction between individual-level and social contextual factors. We argue that impoverished adolescents living in affluent neighborhoods may face a particularly high risk of stigma and social isolation from their peers,

and hence they may be at a greater risk of becoming the victims of school bullying than impoverished adolescents belonging to impoverished neighborhoods. Accordingly, we hypothesize that 1) neighborhood income inequality is positively associated with bullying victimization, 2) adolescents from impoverished households have a higher risk of being bullied if they live in more affluent neighborhoods, and 3) peer relations mediate these conditional effects of household poverty on victimization. We use survey data on 5491 adolescents and registered data about the characteristics of 83 school districts in Iceland. We use hierarchical binary regression to examine the interactive effects of household poverty, neighborhood affluence, and relations to peers on the probability of victimization. As predicted, results show that household poverty has a significantly more pronounced effect on bullying victimization in more affluent communities. Moreover, peer relationships partially mediate these contingent effects of household poverty on victimization.

(Mis)Recognition of Migrant Youth Employability: Ethnographic Account of Activation Labour Market Policies in Finland

In Finland, as in all European countries, young people with migrant background are disadvantaged in the labour market, and part of this disadvantage remains inexplicable in quantitative analyses. This paper attempts to fill this gap by examining how immigrant employment and integration services are experienced by young migrants in Finland through the concept of (mis)recognition (Fraser 2008). We examine integration services as an extension of activating labour market policies. Activation here refers to various forms of workfare where unemployment benefits are conditional upon participation in trainings and work trials meant to enhance one's employability, and with immigrants - integration and language courses. The paper is based on multi-sited ethnographic fieldwork in the employment office and career counselling courses for young people. The fieldwork has shown that young migrants' skills and education gained outside Finland are perpetually devalued, misrecognized and even not acknowledged at all. Instead, to be re-recognized as employable, young people are supposed to invest three to five years to learn Finnish and get a new training or vocational degree in Finland as part of their activation plan. Such long-term investment delays entrance to the labour market and requires deep commitment from already qualified young people. Moreover, outcomes of this investment are uncertain and there is no guarantee that the desired employment will be achieved. Unlike most of the existing research on migrants' inclusion to the labour market— which focuses solely on individual qualifications — we argue that young migrants face structural misrecognition by institutional agents as capable, qualified and employable. Migrancy works as a key category to classify young people's qualifications and experience. In this way, we change the focus from young migrants' supposedly personal failings to the structural processes of recognition of migrant youth's capabilities.

Schola Europaea: Schooling Europeans? – a Preliminary Research Report

This presentation explores the creation of identities, values and the social production of citizens in a Type II Schola Europaea institution. Existing only for a few years, the multilingual and multicultural Type II Schola Europaea institutions are the latest development in the 'Europeanization' of public education and they represent a new object of study. To date, no research has been conducted in this area from the perspective of applied linguistics, nor has any study focused on the 'outcomes' produced by Schola Europaea institutions, such as the ways pupils in these schools express their social and political identities in their language use. Thus, the relevance of this research is that it provides new empirical information about the politics of identity construction, the dissemination of values and the potential of these unique institutions to create 'European citizens'.

In my talk I focus on pupils' patterns of identification and their system of values as are represented in their language use with special attention to pupils' expressions of their relationship to the EU (European identity creation) and the values connected to the creation of social and political identities. The linguistic investigation is performed by corpus-driven systemic-functional analysis of Transitivity processes and Appraisal. Based on Halliday's system of transitivity (Halliday and Matthiesen, 2014) and Martin & White's appraisal theory (Martin & White, 2005) the corpus-driven systemic-functional analytic approach is proven to be a highly effective instrument in exposing patterns of identification, values and self-positioning (cf. Krizsán, 2011). The findings show that particular instrumental values

related to the EU seem to be internalized by the pupils while intrinsic values, such as multilingualism seem to be implanted.

KROHER, MARTINA* (Leibniz University Hanover, m.kroher@ish.uni-hannover.de)

Jaywalking: The Relative Weight of Normative and Punitive Cues

We examined norm violations in everyday life, in terms of crossing on red. Sociological theories on social norms imply conflicting predictions of whether social approval or monetary sanctions have stronger effects on the rate of norm abiding behaviour. Therefore, our experimental design contained different treatment conditions (no treatment, one moral appeal and different punitive appeals) in form of posters. Additionally to non-reactive observations we collected information in short interviews after people crossed the street. The study was staged in two German cities, Munich and Hanover. Results for study 1 in Munich show that 41 percent crossed on red, waiting on average three seconds before violating the norm. Furthermore, both moral and punitive appeal significantly reduced deviant behaviour, whereby moral sanctions had slightly stronger effects. As well jaywalking of other persons, bad weather, the presence of a child, being in hurry, gender and age had an effect on people's decisions. Data for study 2 in Hanover have recently been collected but have not been analyzed yet. Complementing study 1, these data will allow us to estimate the elasticity of normative behaviour in response to punitive appeals.

School Closures in Rural Areas – Starting or End Point for Municipalities

SourceURL:file://localhost/Users/sigridkroismayr/Documents/call%20for%20papers/CfP_isa_2016_bartl.doc

The closures of primary schools are in many cases accompanied by protests of affected parents and communities. This is not only because of the schools educational purpose, but also because of the school's role as a stable social institution in community life. But what impacts can really be seen if primary schools are shut down? In our research we were particularly interested in possible demographical and economic consequences for municipalities.

Therefore we selected regions in which we find both municipalities where the last school had been closed and municipalities in which – in spite of school closure – one school remained within the municipal borders. In this way fourteen municipalities within five regions – Südburgenland, Murau, Außferfern, Region Weiz and the region „proximity to the regional capital" could be analysed in respect to demographical and economic changes. Moreover, only municipalities were selected where the school was closed between 2001 and 2008. This enables us to study possible development in the municipalities.

As empirical basis we used demographical and economical statistical data collected by Statistic Austria. The results illustrate that almost all municipalities reported declining numbers of inhabitants. This is primarily due to rural depopulation. The birth rates that are in particular crucial for school attendance show a different picture: Both the number of families and the number of births are stable or even increasing since the school had been closed. This refers to the important role of the federal states in this context which have changed their standards of minimum pupil numbers in schools. The economic situation shows a much more diverse picture. Although the number of working places have increased this development does not implicate that more people are employed.

The Construction and Consumption of Korean Masculinity in Japan

This study considers representations and performances of Korean masculinity in Japan, arguing that linguistic performances of Korean masculinity by Korean idols in Japan mimic representations of Korean masculinity in Japanese media, thus co-constructing a recognizable Korean male character type. While previous studies have described reception of Korean masculinities in Japan they have ignored how semiotically rich symbolic systems, including use of salient linguistic variables, construct such masculinities. They have also not considered the relationship between media characterizations and actual performances of Korean masculinity. The goal of this project to fill this gap.

Data from the Japanese drama *Sunao ni narenakute*, English title *Hard to say I love you*, featuring Korean idol Kim Jaejoong was coded for lexical items salient to gender performance, e.g. first person pronouns and discourse markers, as well as non-lexical linguistic variables, e.g. pauses and stutters. Findings indicate statistically significant variation between characters with respect to these variables

suggesting their relevance for media-constructed representations of Korean masculinities. Analysis indicated two axes of variation: Koreans versus Japanese, and Korean males versus Japanese males. Korean males were represented as both lacking full command of Japanese, and as non-heteronormative with respect to Japanese male peers, the latter case expressed via non-use of masculine performance associated variables.

Representation of Korean males was compared to media materials of Korean male idol groups in Japanese contexts, e.g. music videos, promotional appearances. While media production processes varied significantly between idols, performances of masculinity were consistant and mirrored representations of Korean males in Japanese media. Crucially, these performances deviated significantly from idols' concurrent masculine performances in Korean contexts.

The above findings suggest that stereotypical images of gentle Korean masculinity are strategically employed to effectively market 'Korean masculinity' as a cultural product in Japan and underscore how media representations and performances co-construct semiotically salient social categories.

KROPP, CORDULA* (Hochschule Munchen, cordula.kropp@sozialforschung.org)

Afns As Transformative Social Innovation

„Alternative Food Networks" (AFN) is a concept for various forms of cooperative enterprises in "short/alternative" agricultural value chains (Urban farms, Community Supported Agricultures, food assemblies, …). These initiatives hold the potential to foster a variety of social goals, such as improving food sovereignty and justice, cross-milieu interaction and community empowerment as well as favouring sustainable food practices (Rosol 2005; Goodman, DuPuis & Goodman 2012; Hankins & Grasseni 2014). Thus, AFNs have been considered as social innovations (Kirwan et al. 2013; Seyfang 2006; Grasseni, Forno & Signori 2015), which are transformative for those involved, generate a plurality of forms of knowledge together with collective capacities and promote awareness and understanding of the links between local food and global sustainable development goals (Smith & Seyfang 2013, White & Stirling 2013).

Beyond this general contribution to foster trajectories towards sustainability through innovation, experimentation and debate, my special interest is in AFN's capacity to do so because they bridge some of the typical industrial divides and rebuild connections between production and consumption, town and country, work and leisure as well as work and capital and between decision-makers and concerned people (Kropp 2013). Thus, they re-embed provisioning in a more relational network and strengthen solidarity-based assumptions of responsibility (f.i. taking into account constraints of local farming enterprises) instead of following dominant one-sided rationalities and its "organized irresponsibility" (Beck 2007).

Against the emphatic background in the research literature, the paper wants to examine the significance of AFNs between "local food movement" and "transformative social innovation" (TRANSIT 2015) following the above mentioned "bridging capacity". A discussion of all three concepts, "transformative", "social" and "innovation" will be done with respect to underlying innovation regimes (cf. Rip, Joly & Callon 2010). The paper is based in a joint German project and presents some of its first findings: http://www.nascent-transformativ.de/.

Bodies of Vulnerabilities: Using the Intersectionality Lens in Disaster Research

Social vulnerability as one core concept of disaster sociology cannot be discussed independently from patriarchy, capitalism and colonialism (Enarson et al. 2007, 132). Feminist approaches highly contribute to the debate on social vulnerability, as they not only ask for specific vulnerabilities of specific actors, but rather scrutinize the social construction of actors, or to be more precise, the bodies that are rendered vulnerable. When a disaster strikes and a social system – i.e. the unit of reference – has been disrupted, research can find a starting point by raising the questions of 'whose system' and 'who defines it' (ibid., 131)? Power and its symbolic dimensions in forming vulnerabilities, bodies and vulnerabilities of the body will be at the centre of the presentation. Research that has been conducted on disaster and gender centres on a substantializing notion of 'women' and their vulnerability, which firstly obscures the power structures associated with different categories of 'women' and 'men'; secondly this very notion neglects an emphasis on the generic vulnerability of a human body. Planning for the adaption to natural hazard induced disasters, research has advocated focusing on women's capabilities instead of presenting them one-dimensionally as weak individuals (Bradshaw and Fordham 2013). While we sympathize with this methodology we want to broaden the angle and de-construct the gendered notions of vulnerable bodies by integrating an intersectionality lens on masculinities and femininities. Capturing relations of masculinities and femininities in practice refers to struggles of sub-ordinated forms of gender practices that, in turn, relate to dominant forms

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

(Connell and Messerschmidt 2005; Connell 1995; Halberstam 1998). They find expression in different, socially constructed vulnerabilities of bodies. While the intersectional approach poses an interesting theoretical enterprise, the presentation will conclude on whether this methodological lens challenges a common ground for claims in social justice and forms of representation.

KRUMM, SILVIA* (Ulm University, silvia.krumm@uni-ulm.de)

The Impact of Critical Men's Studies on the Concept of Depression

The prevalence of depression in women is twice the rate in men while men have much higher suicide rates. It is assumed that this ´gender paradox in depression´ (Möller-Leimkühler 2008) is related to the fact that gender-specific factors are not adequately taken into account in the treatment of depressed men. From a sociological viewpoint, critical men studies are a promising approach to review the "gender dimensions of depression".

Connell's (1995) seminal work on 'hegemonic masculinities' provides a social constructionist framework for the understanding of depression among men. 'Hegemonic masculinities' is defined as a socially accepted and normative form of masculinity in a given historical setting which structures and legitimates hierarchical gender relations between men and women and in relation to subordinated and/or marginalized men (Messerschmid 2012). Men's mental health behavior, including denying vulnerability, reluctant help-seeking and self-management of depression, could be assessed as practices of avoidance of depression as a "female disease" in line with the ideals of hegemonic masculinity (Courtenay 2000).

At the basis of the results of a meta-ethnography I will present some empirical findings on men's subjective perspectives on depression. Also, I will introduce the fruitfulness of the concept of "hegemonic masculinities" for the interpretation of men's mental health behavior. Finally, the impact of critical men's studies on our understanding of "male depression" as well as some clinical implications will be discussed.

Precarity and Gender Equality – Experiences of Women and Men in Poland

The presentation will look into impact of structural change at the labour market on gender equality attitudes and practices. We will analyse the experiences of women and men in Poland and see what are the consequences of neoliberal state model and conditions of precarity on gender equality and quality of life of Polish women and men.

The research on social and economic effects of transformation and crisis in Poland indicates that women face more challenges: receive lower salaries, struggle to be promoted or to improve their competences (Desperak 2009, Czerwińska, Łapniewska, Piotrowska 2010). However, the results of the project "Gender equality and quality of life", indicate that the precarious situation at the labour market to some extent is experienced by both women and men. Lack of social security, lack of work stability, overburden, and constant availability demanded by employers are only a few factors illustrating workers' situation and its potential impact on other spheres of life (e.g. family life, civic engagement, retirement).

Through the usage of the qualitative (focus group interviews) and quantitative data (representative survey of Polish citizens) we will try to analyse impact of precarious work conditions on quality of life of women and men. How precarity is conceptualized by the study respondents? Is precarity differently experienced by both women and men? Should we search for the new indicators of gender equality, linked to work conditions, rather than using previous indicators (e.g. salary level, position in hierarchy) created in the different structural conditions of the labour market? What strategies have been used to cope with precarious condition?

The research has been conducted within the project "Gender equality and quality of life – how gender equality can contribute to development in Europe. A study of Poland and Norway" (GEQ), funded by the Polish-Norwegian Research Programme.

Consequences of Private Tutoring for Educational Attainment: The Case of South Korea

Private tutoring, defined as fee-based tutoring that provides supplementary instruction to children in academic subjects outside a formal educational system, is a widespread phenomenon across the world. South Korea is one of the countries where private tutoring is the most prevalent and the most entrenched. Spending by households on private tutoring reaches 2.9 percent of GDP, an amount nearly equivalent to public expenditure on education. Private tutoring has become a public concern since it imposes high financial burden on families and is perceived as a main culprit for the rising educational gap between children from rich and poor families in Korea. However, previous studies provide conflicting findings on the effectiveness of private tutoring with some showing positive effects on educational performance and others showing no effects. Disagreements among those studies may be due to different outcomes measured, different datasets analyzed, and/or different statistical techniques applied.

This study attempts to reconcile different findings from previous studies by estimating the effect of private tutoring on various educational outcomes based on the same dataset. Data come from Korean Educational Longitudinal Study 2005-2014, which collected information on educational progress of children from middle school years to their early twenties. We estimate ordered logit models for GPA-based ranks, OLS regression models for college SAT scores, multinomial logit models for college enrollment results. However, the standard regression approach does not consider that parents and children who take private tutoring may be different from others in unobserved as well as observed characteristics. We use fixed effect approaches and instrumental variables techniques to address the endogeneity bias. Results from different analytic methods are compared. Implications for educational inequality and social mobility are discussed.

Avant-Garde Inscribed into a Space; A Space Inscribed in an Avant-Garde 333132@Mail.Muni.Cz

The purpose of my study is to analytically describe the everyday functioning of the Theatre *Husa na Provázku* (HnP). HnP is an avant-garde theatre which is regarded one of the most important institutions in Czech "artistic and political field" – for its history (established in the year 1968 and during "normalization" times, it was entangled in the dissident and underground circles) and current political influence. Particularly, I will focus on material conditions of the theatre building and its interconnectedness with cultural narratives which are being told and believed in the institution. In my paper I will also reflect a debate on materiality within the field of cultural sociology and, more broadly, on conceptualization of materiality in contemporary studies of culture. I will argue that the "material" and the "ideal" are inseparable in our (everyday) lives. This theoretical position will be shown on the empirical example of the theatre building. I will describe how (and what) narratives, ideological and esthetical positions were inscribed into the "stone" and consequently how this "material background" determines interactions, narratives and meanings. My study is based on the ongoing ethnographic research combining several qualitative methods – participatory observation, semi-structured interviews, and document analysis.

"Intellectual Civil War": Struggle for a Master Narrative in "Chomsky Affair" 333132@Mail.Muni.Cz

The purpose of my study is to describe and analyse a recent event, concretely public scandal that emerged in the context of post-communist Czech public space. The whole event which was triggered by a visit of Noam Chomsky and his statements on East-European dissidents became known as the *Intellectual civil war* or *Chomsky Affair*. This working paper analyses the event as an important discussion, or rather clash, between identities, narratives or memory groups and more generally as a link in the chain of events that play an important role in reinterpretation of the master (hegemonic) narrative on "communist past" and "democratic present". Contribution is methodologically based on a discourse analysis of newspaper articles from given period (June – August 2014; mainstream journals, commentaries, blogs etc.). The focus is on two main groups involved in this event - "Guardians" and "Riders" of the master narrative. I will describe the discourse field which is outlined by the conflict of those two groups as well as I will focus on their arguments, rhetorical figures and cultural narratives. In the case of "Guardians" (side of the first strong critics of Chomsky´s statements) the centre of attention will be on the strong reactions they made. Those reactions are interpreted as defensive responses that are determined by the Czech post-revolutionary master narrative and its recent weakening. In the case of "Riders of the master narrative" (group of people strongly criticizing critics of Chomsky) I will focus on an attempt to redefine a post-revolutionary narrative which the group made in order to narrate the master narrative differently. In the end, I will provide a cultural-sociological analysis of cultural conditions of struggles or scandals of this kind which occasionally emerge in Czech public discourse.

Identity Capital Acquisition Among South African Youth

The paper will present findings from a longitudinal mixed method study that draws upon James Cote's (2002) Identity Capital Model to examine race, class, and gender differences in transition to adulthood among a sample of university students in the Western Cape, South Africa. The goal is to examine how significant contextual background experiences inform young people's navigation of personal change as they transition to adulthood. The identity capital model offers a lens from which we can understand identity formation among young people within the context of resources they have access to, by virtue of their social standing on the one hand, and how they acquire these resources as they negotiate their lives in different social settings. A representative sample of 600 first and second year students between the ages of 17 and 24 from four universities in the Western Cape is studied. Findings from quantitative and qualitative analysis of the first phase of the ongoing study will be presented. In particular, a) the extent and nature of identity capital resources youth bring with them as they enter the university space, b) the different and significant ways they negotiate the acquisition of new identity capital resources, and c) how race, class and gender influence their experiences of identity capital resources acquisition.

KUDO, HARUKA* (Hokkaido University, harukakd@gmail.com)

Child-Rearing Supports for Urban Families in Japan

For decades, child-rearing in Japan has been shaped by the male-breadwinner family model and familialism. Even now, more than half of mothers in dual-parent families with preschool children are not working, and gender role division of child-rearing is still persistent. Moreover, social changes such as urbanization, the trend toward nuclear families and individualization have weakened informal child-rearing supports from kin and neighborhood. Consequently, "isolated child-rearing" at home has been causing problems of anxieties and burdens of child-rearing, especially among full-time mothers in urban areas.

Since the 1990's, the Japanese government has introduced the child-rearing support policies as a measure of recovering the birthrate. From the beginning, its main focus was to supply day-care services to working mothers. In the 2000's, the policies were further developed and the social support services for full-time mothers have been gradually expanded.

In this presentation, I focus on the child-rearing supports for the full-time mothers who are taking care of infants. Based on a qualitative investigation on Japanese urban families, I examine the functions of the child-rearing supports provided by various social actors such as public institutions, NPOs and local communities. In particular, I focus on the facilities called "child-care salons," which are the open play rooms for infants and parents, and I analyze the features of these salons by comparing the types of assistances and the informal support networks they provide.

In short, these salons enable to extend the space of child-rearing from a home to the outside and increase social supports from various actors, though their functions differ in some aspects. However, these support measures have limitations and challenges in terms of gender roles in child-rearing and the concomitant roles of parents to take advantage of them.

Transforming the Bonds Between Governance and Professions: Health Reform in Germany, Sweden and Turkey

Governance and professions are bond in complex ways. As policy experts, organizational managers, lawyers, and providers of a wide range of services from teachers, doctors and carers to social workers the professions are serving as mediators between the state and the citizens, while professionalism is oiling the machinery of organizations and service provision. Over recent years, new health policies have challenged these relationships. This paper aims to reveal the contingencies of the bonds between professions and governance and the institutional pathways that create variety of transformations. In terms of method, we use healthcare reform in Germany, Sweden and Turkey as case studies drawing primarily on document analysis and research carried out by the authors. In Germany, the implementation of governance changes depends on negotiations between doctors and sickness funds and new forms of skill-mixes are therefore poorly developed. The Swedish case shows stronger integration and increasing involvement doctors and nurses in management. In Turkey, a mixed model of governance is creating new bonds among the state, the medical professions and

the market. One important conclusion drawn from our case studies is that the goals and the toolbox of governance may be similar across healthcare systems while the impact in the relationship between the state and the professions as well between the professions and organizations may take different forms.

Intersecting (Dis)Ability Studies and Racism Research – Potential for Mutual Learning

So far Disability Studies and Racism Research have not exchanged too many ideas. Their common ground can be found in the structural characteristics of western, modern, capitalist societies that individualize 'non-normal' living situations. The dethematisation of migration and disability as normal phenomena effects on individuals that are marked on the 'different' side of the binary (Attia 2013). For instance, for Disability Studies the shift of attention towards the production of abledness is still quite recent (Buchner, Pfahl & Traue 2015). The Fusion of different 'Diversities' has to consider common ground but also distinct historical processes of othering (Attia 2013). The proposed contribution wants to bring together calls for "a critical disability and development agenda" (Chataika 2012), for postcolonial, critical diversity approaches (Castro Varela 2010), the critique of a White dominated Disability rights movement (Hutson 2014) and the critique of the devaluation of 'foreign' reactions towards persons with disability (Attia 2013).

Responsive Routines

The nature of (medical) professional work is changing rapidly. Because of increased knowledge and better technologies, patients live longer but cases become more complex. This complexity requires multiple, diverging team compositions. Current literature reports poor teamwork as main cause of failures in critical care. Several *standards* to organize professional work have been introduced; they are mainly clinical and *patient* oriented. Studies demonstrate that these standards are not well incorporated in daily work processes. The fact that they are evidence-based and arise from *within* the occupation, makes it more puzzling that usage remains limited.

Our understanding of how and why new procedures get institutionalized or not is still limited. We argue that new standards must be 'woven into' technical *and* social taken-for-granted ways of working. Therefore, we look at professional *routines*, which connect individual behaviour and system action, but also link assumptions, artefacts and practices. We see standards as artefacts. This in line with scholarly work on organizational routines.

The paper presents an ethnographic analysis of how professionals in the critical care department of an academic hospital in the Netherlands use artefacts in *multiple* workflows. We question how new forms of more organized professionalism are being embedded in existing professional routines (or not). In order to advance our understanding of complex medical *processes*, we shadowed professionals from different occupational groups (e.g. anesthesiologists, surgeons).

Formal standards contrast sharply with real life practices of professional work, we show. It is a matter of treating *multiple* cases simultaneously, instead of treating individuals. Clinicians therefore have to decide on the spot, and constantly adapt practices. Unpredictable and equivocal conditions require routines that enable interpretation. Our findings demonstrate that using standards in critical care is a matter of joint *reflexivity*. Using standards is not so much about 'compliance' but about responding to high-paced workflows.

Climate Change Discourse Networks in the North and South: Comparing the US, Canada, Brazil and India

The global politics of climate change is characterized by disagreements over national emission targets and burden sharing particularly between the industrialized countries in the North and the emerging economies in the South. In this paper, our aim is to analyze these disagreements by applying discourse network analysis to over 4000 statements from the three prominent newspapers in each country. We have constructed coalitions of organizations that are engaged in the climate debate in the US, Canada, Brazil and India. We analyze the networks with the Advocacy Coalition Framework to identify how actors from various levels and sectors cluster into political coalitions by supporting or rejecting specific policy beliefs about climate change, and how these constellations vary between the countries. We find that in the North, the core beliefs that invoke the most disagreement deal with the role of climate science and the compatibility of environmental and economic values, while coalitions tend to converge in their beliefs concerning the green growth paradigm. In the South, however, there is no clear pattern of competing coalitions but actors converge on the idea of shared but differentiated responsibility and the environmental impacts of climate change. In addition, there is no explicit anti-mitigation coalition in Brazil and India whereas in both the US and Canada there is a coalition, although a minority one, of actors who oppose ambitious climate legislation. However, a common feature of all countries' discourse networks is that international actors and ENGO's are central to coalitions that advocate environmental values and push for stronger climate commitments, while actors from the national level often take more conservative positions and, in the North, are more linked to skeptical actors.

Intermarriage and Assimilation Among Arabs in the United States: Estimates, Causes, and Trends, 1990-2010

Intermarriage is a key indicator of an immigrant group's assimilation into its host society. Intermarriage has multiple socioeconomic and sociocultural dimensions, and carries significant implications for the integration of immigrants and their descendants. We use data from the 2009-2013 American Community Survey, which gives a sufficiently large sample to analyze intermarriage among Arab Americans. We provide limited comparisons with our earlier findings based on 1990 census data, which allows us to review trends over two decades during which the impact of the events of 9/11 for this population would have been felt. We first examine recent intermarriage levels and patterns for Arab Americans, and how in- and out-marriage rates for Arab men and women differ by socio-economic characteristics and major ancestry group. Next, we employ logistic regression to analyze the determinants of acculturation (including place of birth, partial Arab ancestry, and English language proficiency), structural assimilation (education, income and occupational skill level) and cultural assimilation (ethnicity/major ancestry group) on the likelihood of out-marriage. Differences among major Arab national-origin groups are also assessed. The relatively strong socioeconomic position of U.S.- and foreign-born Arabs would lead us to hypothesize that, in accordance with the basic assimilation hypothesis, Arab Americans are likely to out-marry at high rates. While we found this to be true based on 1990 census data, this may no longer hold due to the doubling in size of this population and its disparagement since 9/11. Provisional findings show that Arab Americans continue to have high intermarriage rates, with men and the native-born more likely to out-marry. The overall high levels of exogamy suggest Arab Americans are assimilating quickly. The predictors are largely similar for both sexes, but there are also some significant ethnic effects. Lastly, we look at the ethnic identification of children of out-married couples.

Indigenous Cultural Engagement As a Means of Strengthening Urban American Indian Families: Results of the Parenting in 2 Worlds Study

Maintaining and re-engaging with traditional cultural heritage is increasingly recognized as a potent factor in improving the wellbeing of indigenous communities in many regions. For the growing majority of American Indians (AIs) who live in cities in the USA rather than reservations (70%), culturally appropriate evidence-based prevention programs are often unavailable. This presentation discusses the culturally grounded parenting intervention, *Parenting in 2 Worlds (P2W),* created to strengthen protective factors among urban AI families and reduce health risk behaviors. Employing community-based participatory research in three urban AI communities with diverse tribal backgrounds, a multi-stage cultural program adaptation process uncovered and systematically incorporated common AI cultural values and practices relating to parenting into the *P2W* curriculum.

Data come from 575 parents of AI children in three Arizona cities in a randomized controlled trial of *P2W.* Parents were recruited through urban Indian centers and randomly assigned to *P2W* or an informational health curriculum, *Healthy Families in 2 Worlds (HF2W).* Parents completed self-administered questionnaires at the first workshop and a post-test at the last workshop. Tests of the efficacy of *P2W* versus *HF2W* were conducted through baseline adjusted regression models in Mplus using full information maximum likelihood estimation to adjust for attrition, and controlling for program dosage (# workshops attended). Parents in *P2W* reported significantly more desirable changes in outcomes than parents in *HF2W* on measures of parental self-agency, positive parenting practices, communication with their children about safe sex, child's discipline problems, parental substance use, AI ethnic identity, AI cultural practices, and successful biculturalism.

In addition to desired effects on parenting skills and family functioning, *P2W* resulted in significant improvements on several measures of the parents' attachment to their AI cultural heritage. Culturally adapted parenting interventions like *P2W* can effectively build on indigenous cultural heritage to promote wellbeing of AI parents and their children.

Understanding the Cross Border Trafficking of Human Beings in India and Bangladesh

Over the last few decades, trafficking in human beings has become a major international concern. Humans are not property, but they are being trafficked for commercial sexual exploitation (CSE), forced labor and also for the many other purposes. It deprives people of their human rights and freedom, and also a global health risk due to infections disease like HIV/AIDS etc. Human trafficking is one of the fastest growing profitable business estimated at about 150 billion$ per year. South Asia is considered as the second largest number of internationally trafficked persons, where around 150,000 people are trafficked annually.

Thousands of young men and women are trapped and abducted to India each year from its international border. Some of them also migrate legally and illegally to gulf countries. India and Bangladesh shares its international border of 4,097.7 km long, with 30 districts on Indian side and also fifth largest international border in the world. It has been estimated that nearly 200,000 women and girls are being taken out of country in past 10 years. And more than 50,000 women are trafficked to India every year through its international border.

The presentation will explore the trend of trafficking in human beings from Bangladesh to India for different purposes. Those migrated people are being exploited irrespective of their class gender and age in different ways. It will also try to analyze the push factors to migrate them to other place and most of times make them vulnerable for being trafficked. As it has been observed that the poor helpless families and tribal societies have become main target group of traffickers. Further it will focus on the measures taken by the both government against anti-trafficking measures.

Deprived Communities in Higher Education: Issues of Equality and Social Justice

India is a country of diversities. Diversities exist in widespread social and economic inequalities, culture, religion and its practices, languages and also in terms of natural resources. In the present century which is known as century of science and technology, in India there are many people own even multinational companies but the same time many groups of Indian population are still remain far away from the benefits of the primary needs of education and health. Scheduled caste and scheduled tribes are one of such deprived communities. After independence in 1947, India got a new Constitution which promised every citizen to promote opportunities to develop him/her in every field of life.

But even after sixty eight years of independence, the dream of members of these deprived communities remains incomplete. They are raising a voice for equality and social justice. This struggle many times observed as the struggle between haves and have-nots in Marxian terminology. These communities demand-

ing for their fair participation in every fields of economy. They are also demanding for their participation in higher education for learners of their communities and faculties as well.

This paper is an attempt to study the status of the participation of children of deprived communities in higher education, faculty participation of deprived communities, government interventions to promote their participation, problems they are facing from inside and outside and suggestions to promote their participation.

Police Reforms By Introducing Women Police Stations in Haryana: An Analysis in Context of Gender Justice

Abstract

The present police system in India resembles the colonial Irish constabulary and Indian Police Act of 1861.Various police acts do not set up any mechanism for effective political and civic control of the police force. The jurisprudence of the Code of Criminal Procedure, 1973 and some other acts/rules enshrine the power and duties of the police. The image of police is not so bright since the general tendency of the male police Investigation Officers (IO's) is of hard core and canned style probing. Recently, the Government of Haryana has undertaken certain police reforms by introducing All Women Police Stations in each district, which, indeed, will infuse confidence amongst the women victims in getting their complaints registered without any hesitation at any of these women police stations by making the victims as comfortable as possible in their given state of trauma because the reported incidents will be investigated by women Investigation Officers (IOs) only.

Normally, in semi-urban and rural areas, women police didn't get to conduct investigations but these newly appointed female staff in the police stations will change the ongoing trends and develop their skill to deal with the grievances as IO's and at other different levels. It will also enhance the ratio of women in police organization (which at present is very low i.e. 6.7%). The present study attempts to analyse the nature and dimensions of the power, duties & administrative practices of newly appointed police personnel at women police stations in Haryana. It is anticipated that apart from grievance redressal, these police stations will help promote mutual understanding between police and public in special reference to women, when the police are failed to bring laurels in earning people's faith.

New Townships in India: Inclusion, Exclusion and Governance

New Townships in India: Inclusion, Exclusion and Governance
Anchal Kumari[1]

The process of economic reforms is changing the urban structure of India. The power of globalising processes can be seen on the city spaces and lives of people. The development of privatised new townships in India is the contemporary example of the changing urban forms. Many of the new townships are exclusionary and made for upper classes or global players.

Pune is the second largest city after Mumbai in the state of Maharashtra. In the last couple of decades Pune has emerged as a national and regional hub for Information Technology. The growth of Pune has led to an increased demand for housing and office spaces; this resulted in the creation of new townships such as Magarpatta and Amanora with the world class infrastructure and services.

State, civil society and local communities are playing an active role in the creation of new townships in Pune. The traditional communities are transferring their rural socio economic advantages to urban advantages. The strategy of land acquisition involved in the formation of these new townships are minimising the possibility of resistances from the local land holding communities.

The narratives from the people who are directly or indirectly related with these townships help to understand how the production of private urban spaces contributes towards the socio-spatial transformations and socio-spatial inequalities within the cities. This paper analyses the nature of urban governance and the forms of inclusion and exclusion in these private townships. The subjective experiences of locals help to critically examine the relevance of right to the city in these new townships.

Keywords: New Townships, Private Urban Spaces, urban governance, Socio-Spatial Transformations, Inclusion and exclusion.

When the Existing Ceased to be Real: Alienation and the Tea Party's Conspiratorial Mode of Interpretation

Observers have pointed at (and mocked) the apparent inconsistencies in the worldview of Tea Party activists, often presenting them as a sign of a lack of knowledge or of political cynicism. However, during my field research on the Tea Party in interviews, group-discussions, and Tea Party meetings, I got the impression that the Tea Party activists are often perfectly aware of these inconsistencies *without* being cynical about them.

This presentation argues that alienation might be a lens through which this tension can be fruitfully understood: The Tea Party activists' relation to the world around them is determined by a strong affective investment into the socio-symbolic universe or everyday-religion (Claussen) of the free market capitalism of small producers. This everyday-religion, however, proves to be less and less compatible with the development of their empirical environment, a development that escalated in the Great Recession. However, while the affective (and material) investment of the Tea Party's core-constituency into this everyday-religion is too strong to be given up or even substantially adjusted, their relative powerlessness and social isolation also prevents its members from formulating a coherent critique of the social developments. Instead, the everyday-religion is stabilized by decoupling it from the empirical environment. The integrity of this symbolic universe is guaranteed by identification with a symbolic authority with which one can align in condemning the whole of the existing as more or less devoid of true meaning. In this world of the conformist rebellion (Adorno), especially an empirically obviously false statement can become, paradoxically, a sign of one's dedication to the truth.

The presentation illustrates this theoretical perspective with the results of the hermeneutic analysis of a short passage of a discussion conducted with Tea Party activists, and of an image used on a propaganda-pamphlet distributed by the group.

Urban Gardening and Collective Agriculture in Vienna - Citizen Partizipation As Neoliberal Strategy?

In Vienna, participation strategies are a prominent part of neoliberal urban development processes, widely applied by government and administration. Participation is typically organized by semi-state organizations in the form of public-private-partnerships where the city administration sets the framework conditions, guidelines and goals. Urban Gardening is one of the most visible areas, where participation is used as a technology to govern the neoliberal city.

In this presentation, we ask how decision making is shaped within such processes using a Foucauldian approach. Based on participant observation and interviews with community garden and collective agriculture activists, as well as members of the city administration, planning institutions and semi-state organizations, we analyze government technologies relevant in this regard. We distinguish three basic levels of corridorization of such initiatives: (1) definition of the field of possibility through city plans and development guidelines, (2) exclusion of incompatible initiatives by repression and juridical means, (3) activation of individuals as creative subjects.

Participation serves different functions according to the development tasks as defined by government: (1) to transfer knowledge about local identity formation to support the branding of new city areas, (2) to increase acceptance of top down-planning by communicating planning rationalities and by offering limited options for co-design, (3) to functionalize people for processes of the culturalization of the city, (4) to create an image of a permeable state acting to fulfill the needs of citizens. These functions are altered by dynamics of reinterpretation, appropriation and resistance of subjects.

We conclude that (1) participation primarily serves a technology to govern within a neoliberal urban development (e.g. positioning Vienna within the international city competition), that (2) this attempt has to deal with non-intended social dynamics, which (3) nevertheless do not reach a level of impact able to significantly influence neoliberal agenda setting.

Comparative Analysis of Two Models of Conflict Resolution in Somalia

Comparative analysis of two models of conflict resolution in Somalia
The Somali Republic was not in existence as sovereign state starting from 1991, after many groups of Somali armed opposition groups fought and able to overthrow the dictatorial government of General Said Barre. These armed opposition

fighting groups able to build a common goal to eliminate the regime but unable to build common central government to govern the country. The former British Somali colonial territory withdrew from this chaotic situation and able to create Somaliland Republic in 1991. The Somaliland Republic built in the last two decades a basic democratic institutions and became peaceful country in the violent unstable region of Horn of Africa. The other part of former Somali republic has been in war from 1991 until today. To stabilize and help to form central government in Mogadishu, many United Nations' military missions were sent to the country and finally at this time the African Union Mission in Somalia (AMISON) is fighting against Al-Shabab, to eliminate the organization and to help to build central government in Somalia but AMISON is very far to realize its objectives.

The paper compares two models of conflict resolution in solving the violent conflict in Somalia. The Somali people built their indigenous model of democracy for many centuries of their existence as one people. The Somaliland Republic people using their indigenous model of conflict resolution, resolved their internal disagreement in peaceful way and built their democratic state. The southern Somali territories using the foreign imposed conflict resolution did not able to build peace in the country. We discuss these two models of conflict resolution and the negative role of Ethiopia and Kenya in Somalia for their ambition to control Somalia with blessing of USA.

KUMSA, ALEMAYEHU* (Charles University, alemayehu.kumsa@fhs.cuni.cz)

What Is the Root Causes of the Rise of Jihadist Movements in Africa?

African continent is the home of Indigenous African religion and other Middle East originated international religions of Christianity and Islam from the very beginnings of their origin until today. These religions existed relatively in peace with each other for many centuries side by side.

Contemporary Africa faced Islamic sectarian violent conflicts in many countries of the continent. Starting from the eastern coast of the continent, al-Shabab in Somalia starting from 2006 until today controlling vast part of the country, in the north of the continent the Egyptian Islamic jihad, The Libyan Islamic Fighting Group, Al-Qaeda in the Islamic Maghreb (IQIM), Ansar al-Dine in Mali, Movement for Unity and Jihad in West Africa (MUJWA) in Southern Algeria& Mali. The strongest from all these groups is Boko Haram in North-East Nigeria.

The paper examines the internal problems of these countries from the economic, social and political point view, such as unemployment, lack of enough practical education, corruption of political elite and the security forces uninterested to solve these sectarian violent conflicts in peace negotiation, because of their interest to have more budget for the army which gives advantage for higher officers to siphon the money for themselves.

We also elucidate the external influence of western states such as USA, Great Britain and France in influencing the violent conflict in Africa for their geo-strategic interests for Africa's precious natural resources and to expand their military bases in Africa in the name of fighting against the so called global terrorism. We also discuss the ideological inspiration of these groups which emanated from Taliban and Al-Qaeda.

Demonstrating the Use of Thematic Analysis in Family Research

Thematic Analysis has been defined by Boyatzis (1998) as a process to be used with qualitative information. It is used to describe social phenomena and is a process for encoding qualitative data. Phenomenological studies usually include the use of themes that makes sense of data collected. This article will demonstrate how the Attride-Stirling Thematic Network Analysis was used to examine the corpus obtained from data collected to describe commuter couples in Jos, Nigeria. The Thematic Network Analysis is a web-like-illustration that summarizes the main themes constituting a piece of text (Attride-Stirling, 2011). The corpus consists of transcripts from semi structured interviews and time diaries. Themes were derived based on research questions and related literature on commuter couples and coded using the Thematic Network Analysis. It is the desire of this paper to demonstrate the rigour applied to the method of data analysis. It aims to stay true to the method used and tools employed. This is painstakingly done to indicate credibility, robustness, trustworthiness and transparency.

The New Cold War? 'Sexual Democracy' Vs. 'Sexual Sovereignty'

Western "culture wars" have recently acquired a distinctively global dimension. The issues of gender equality, reproductive and LGBT rights divide nowadays not only politicians, activists and religious leaders but national governments, too. The new Cold War-style lines of contention are being drawn in terms of the rhetorical oppositions between "sexual democracy" (SDem) and "sexual sovereignty" (SSov).

Based on analyzing a variety of printed media and Internet resources, this paper examines relevant public debates within global and national (esp. Russian and Dutch) contexts. Conceptually, I challenge the habitual binary framing of these debates in terms of the West vs. the rest, or modernity vs. tradition. Instead, I argue that, despite being locally embedded and divergent on a number of important accounts, the discourses and the policies of SDem and SSov *converge on instrumentalizing gender and sexuality* as key markers of national identity and as tools for constructing European and Russian "others": intolerant "Orientals" (Muslim immigrants or "Putin's Russia") or "amoral permissive-liberal internationalists." These tendencies are interwoven with further convergent trends, e.g. moralizing citizenship and inventing traditions, i.e. apparently eternal "traditions of tolerance" in Western countries and, in the Russian case, similarly perennial national adherence to "traditional family values." In both cases, the rhetoric of the rights (or rejection thereof) of women, children and LGBT serves to "imagine" the homogeneous national (e.g. Dutch or Russian) and regional (European) spaces and thus symbolically ameliorate the rising sense of insecurity, which is associated with the decline of the European welfare state, the EU crisis, perceived "immigrant threat," and the accelerating political, ethnic and demographic instability in Russia.

The Return of "Moral Progress"? a Proposal

The notion of "the moral development of the human species" has almost disappeared from the sociological theorizing and research as a result of the decades of often justified criticisms of this notion from post-positivistic and post-modernist perspectives. While political and moral philosophers have recently been actively reclaiming the idea of moral progress, we, sociologists, have largely ignored this trend. In this paper, I propose some reasons for revisiting this attitude and outline a project of how relevant debates can be reinterpreted from a sociological perspective. I proceed from the idea that sociological theory—from Durkheim to Parsons, Simmel to Elias, and Mead to Habermas—has a rich tradition to discussing moral development in terms like "value generalization," "social learning" and "the civilizing process." Disentangled from the vestiges of the 19th century notion of unilinear, deterministic and Eurocentric notion of "moral progress"(and "decline"), these ideas, I argue, are still fit to guide us interpreting contemporary research data and current social controversies. To "idealistic" (the development of human reason) and biological-deterministic (evolutionary) approaches, sociology is able to offer a "materialistic" alternative, which directs the researcher's attention to the changing forms of association and the developments in social technologies. In particular, I outline the interrelations and analogies between the developments in social technologies of control and surveillance (including the "technologies of the self") and the trends in material technologies, especially communication technologies. In addition to these conceptual benefits, I explore the practical implications of the proposed perspective on moral development for analyzing and informing current public controversies on such issues as marriage equality and the refugee crisis.

Dispute Patterns in Post-Communist Central-Eastern Europe

Paper presents results of 4-years project on Patterns of Disputes and Disputes Treatment in Popular Legal Culture started in 2013. It includes survey of representative national sample in Poland (2014) and local samples in Daugavpils (Latvia, 2014/15), Drohobych (Ukraine, 2014) and Cluj-Napoca (Romania, 2014) as well as several Polish urban municipalities. The Polish local data are under longitudinal analysis (1977/8; 2002/3; 2013/15) checking the influence of politico-legal regime's change. The international comparison is supplemented by interethnic comparison of Latvians, Poles and Russians within Latvia, Romanians and Hungarians within Romania and Poles and Ukrainians within Poland checking the national context factor versus ethnic differences. As shown in previous publication by authors (Fuszara & Kurczewski in Maclean, Eekelaar & Bastard Managing Family Justice in Diverse Societies, Hart 2015) Eurobarometer's data show CEE patterns are close to SE on some aspects but different on the other. NWE, whether traditionally Protestant or Catholic shows more trust more in the administration of justice and institutionalised mediation. In former Communist Europe, informal direct agree-

ments are more often trusted and institutions less often. In Southern Europe, the general distrust both in reference to the institutions and to the people prevails. The regression analysis will explore the significance of individual characteristics from among gender, age, economic affluence, education and personal trust as predictors of preference for institutionalised settlement (court), dyadic negotiations and exit in the basic types of disputes. Declared frequency of disputesin last 3 years and action patterns advocated for types of disputes as described in the vignettes are basic indicators of popular dispute culture in CEEurope.

Race, Religion, and the Political Incorporation of Contemporary Immigrants: The Case of Indian Americans

Using a case study of Indian Americans, my presentation will examine how race and religion interact to shape the political mobilization of contemporary immigrants. Indian Americans are becoming politically active. What is particularly striking about this group is that they have mobilized around a variety of identities to influence U.S. policy. Some identify as Indian Americans, others as South Asians, and yet others on the basis of religious identity as Hindus, Muslims, Sikhs, and Christians. A growing group identifies in terms of their party affiliation as Democrats and Republicans. There is also an adult, second-generation population that is getting involved in civic and political activism in very different ways than from their parents' generation. My research focused on a variety of Indian American advocacy organizations and found that differing understandings of race, as well as majority/minority status in India and in the United States produced much of the variation in the patterns of civic and political activism of the various groups. I demonstrate that these activism patterns can be explained by the ways in which race and religion intertwine with the characteristics of groups and political opportunity structures in the United States.

KURIEN, PREMA* (Syracuse University, pkurien@syr.edu)

The Incorporation of South Asian Minorities in Canada and the United States

My presentation will draw on ongoing research to examine two minority religious groups of South Asian origin (Hindus and Sikhs) that have broadly similar patterns of migration to Canada and the United States and have close ties with their compatriots across the border, but yet manifest divergent activism profiles around North American as well as homeland issues. My presentation will examine how different opportunity structures (both national and local), and differences in the characteristics of the groups, shape how they frame their grievances and mobilize. It also aims to uncover the factors that influence the form that their mobilization takes, specifically, whether it is "ethnic," "racial," or "religious." Focusing on Hindu and Sikh communities and advocacy organizations serving these groups in Toronto, Vancouver, New York/New Jersey, and northern California, this project is being conducted through interviews and analysis of available information about the organizations.

KURTENBACH, SEBASTIAN* (Institute of Sociology and Social Psychology, kurtenbach@wiso.uni-koeln.de)

Understanding Neighbourhood Effects

One of the key concepts in urban sociology during the last two decades is neighbourhood effects. The assumption is, that a context, like a neighbourhood, mediates norms and values. Meanwhile the context itself can be material, like the broken window theory suggested, or immaterial, like the network theory suggests. The findings point in the direction, that neighbourhood effects exist, but they are non-linear and differs over time and groups. But it is not clear yet, how a neighbourhood effect works. Therefore, the contribution suggests a model to close this "research gap". A five step-model to explain the takeover of deviant behaviour is derived from the literature about neighbourhood effects, environment-fit-models and cognitive dissonance. The model is tested through a mixed-method design, which includes results of an ethnographical fieldwork of three month, structural participant observations (N=1.557), qualitative interviews with inhabitants and local stakeholders and a quantitative survey (N=300) in a highly segregated neighbourhood in Cologne (Germany). The contribution ends with a suggestion how to develop the model and gives an outlook to further research.

Gradual Differentiation and Justifiable Cognizance: Adjusting the Notion of Functional Differentiation

A central point of Luhmann's theory of society is the importance of functional differentiation as the defining feature of modern (world) society. The notion of function systems is very helpful in this regard and it has allowed an advancement of the theory of society in many respects. Nevertheless there are also some limitations in using Luhmann's systems theory in this context. I would like to point out two major difficulties. First, the concept of autopoiesis, which is attractive from the point of view of theoretical generalization, becomes a hindrance when the aim is to account for the empirical variety of world society. The notion of autopoiesis makes it difficult to think of differentiation as a gradual concept, which is however necessary in order to understand the outcome of worldwide differentiation processes. A return to earlier versions of Luhmann's theory that did without autopoiesis may be the remedy in this regard. Second, Luhmann's theory lacks sensitivity when it comes to actual new societal developments such as the internet. Consequences – for example with regard to copyright and property regimes – are not just a matter of the operation of different function systems, but the cognizance of the latter is not yet routinized. Therefore, questions of worth and justification are especially relevant in such context, but ignored by Luhmann's theory. I propose that Boltanski's and Thévenot's work on conventions of justification may be used in order to address this blind spot of the theory.

RC20-251.1

KUSCHE, ISABEL* (Aarhus Institute of Advanced Studies, isabelkusche@aias.au.dk)

Political Self-Reflection on Political Representation: Constituency Service As a Topic in Parliamentary Debates

Political representation and its crisis is a recurrent topic in the mass media and scholarly debate. Interestingly, there is not much research on whether and how this topic is addressed in the realm of politics itself. Yet, political communication encompasses such self-reflective operations that attempt to grasp what politics is about and what may be wrong with the relationship between politicians and voters. In the course of parliamentary debates, references are made to abstract concepts such as democracy and, admittedly, most of the time these references seem to be empty signifiers. However, there are also cases where politicians themselves address the question whether political representation is deficient, for example when arguing for or against more plebiscitary elements. In my paper I would like to focus on another example, which has widely been ignored by the scholarly debate so far, namely the relevance and status of constituency service. A comparative content analysis of parliamentary debates in Great Britain and Ireland in the latter case reveals a long-standing political debate about whether the level of constituency service in Ireland is an expression of true democracy or petty clientelism. In the British House of Commons, in contrast, self-reflection on constituency service is very rare. I argue that the notion of self-descriptions of social systems (here the political system), introduced by Niklas Luhmann, helps to understand this difference.

KUSHWAHA, ARUN* (Jawaharlal Nehru University, arunsociology@gmail.com)

Nationalism and the Construction of Muslim Identity:a Study of Print Media in North India

Religion is one of the significant criteria of defining identity. It not only reflects differences but also forges cultural and political boundaries between followers of different faiths. In India's political history, religion emerged as one of the critical ways in defining nationalism. The religious component of identity construction is based on a hegemonic idea that rests on the creation of majoritarian self and minority others. India is largely a Hindu dominated country where an expansive Hindu identity (include Jains, Buddhists and Sikhs) has been celebrated whereas some religions particularly Islam and Christian face the tag of outsider. The Hindu majoritarian discourse has stigmatized these supposedly 'Non-Indic' minority religions as problem communities whose nationhood claims are suspected.

The 'otherisation' of largest minority population, Muslims due to the certain psychic notions have not only marginalised and ghettoized themselves from larger society as well as by themselves. The larger role of state in the institutionalisation of stereotypes has sanctioned the other institutions to do the same. In between them.one of the major institution is media, especially print media which imparts not only biased knowledge, but also establish it with their daily ritualistic practices. It can be proved through the analysis of media coverage of either Ayodhya, Gujarat or Mujjafarnagar.

The basic idea of the whole work is to focus upon the historical construction of the concept of nationalism in colonial period as well as its continuation in contemporary India. It will also focus on the role of religion as a means of identity construction and its application in Indian context on Muslim religion. It would analyse the role of Print media in the construction of Muslim identity in India. This study will take Ayodhya as a case study to study print media.

How "Genuine Democracy" of the Council of Europe Influences Political Institutions of the European States

The aims of the paper are to set factors that influence the involvement of the Council of Europe in democracy promoting and to explain the concept of the modern model of European democracy generated with its participation. The including of democracy in the agenda of the CE on the one hand is determined by the need to answer on challenges of the crisis of liberal democracy and on the other hand represents a kind of cover for various forms of intervention of international organization in the sphere of domestic policy of its member-States. Due to a complex organizational structure discussions and operations in the field of democracy are transferring to the level outside the permanent control of the States. However the CE remains a classical instrument for intergovernmental co-operation. It is mainly supporting national efforts to reform political systems. The degree of its penetration in the internal affairs depends on the balance of power in organization, will of member States, the impact of civil society and external pression. General trends are determined by growing cooperation with the European Union. EU countries have an automatic majority voting in the Committee of Ministers. The political engagement of the members of the Parliamentary Assembly prevents the Assembly to be an institution of genuine democracy. The Council of Europe is expanding its cooperation with non-governmental actors, focuses on issues of democracy in the former socialist countries and involves countries that are not its members to various spaces of co-operation. Substantive content of the resolutions and recommendations of the Council of Europe in the field of democracy is determined by double standards. Formal democratic principles are taking in consideration selectively, when it corresponds to the foreign policy interests of the elites of the leading States.

Precarious Work, the Middle Class and the Risk of Poverty in South Korea

Korea's rapid economic recovery in 1999-2000 was hailed as a great success, but the subsequent reforms have changed the labour market dynamics which have then gradually deteriorated quality of life at the level of individuals and households. The structural reform, which to some extent stabilized the Korean economy, resulted in the drastic growth of non-regular workers, low-wage workers and the unemployed. In consequence, it is believed that a great deal of household lost the middle class status. Does the reform for flexible labour market produce the working poor in Korea? The paper aims to examine the relationship between precarious work and the risk of poverty. We will also trace the diminishing size of the middle class.

Low-wage and non-regular employment historically emerged as introducing flexibility in the labour market for the purpose of reducing high and persistent unemployment. However, its impact on overall unemployment is ambiguous and it is blamed for increasing the level of economic insecurity and the risk of poverty. Thus, a number of researches use the concept 'precarious work' to indicate uncertain, insecure and poor work conditions and point out it is often coincided with social problems such as poverty and social exclusion. Yet, the linkage between the characteristics of precarious jobs and poverty is not sufficiently investigated.

This article explores the characteristics of labour market in Korea and examines the causal relationship between household head's employment status and the likelihood of the middle class status, and the risk of poverty at the household level. Implications of this research can be extended to other countries which share similar labor market characteristics with Korea.

Cultural and Institutional Impediments to Mediation in Post-Soviet Countries: Focus on Ukraine

Mediation as an Alternative Dispute Resolution (ADR) institution is aimed at speedy resolution of various types of disputes by the parties with the assistance of the neutral mediator avoiding traditional litigation in state courts. It is currently being promoted by the international community and European Union in Ukraine as a viable instrument of peace-building and dispute resolution in all areas of social life.

Mediation is being introduced in Ukraine and other post-Soviet countries since early 1990-ies. However, by today it becomes obvious that these efforts encounter significant challenges and difficulties. The hypothesis of this study is that cultural, psychological and institutional impediments might exist which call for specific, hand-tailored approaches in fostering mediation and dialogue in post-Soviet countries.

This paper will present preliminary results of the empirical study of mediation institutionalization in Ukraine based on a series of semi-structured interviews to be conducted in three cities in Ukraine in March-April 2015. The study employs broadly conceived socio-legal approach that will analyse the filed-work data within a broader context of current Ukrainian socio-economic and political situation. The paper will address the question about specific cultural and institutional impediments and possible measures to mitigate them.

Converser Et Classifier : La Construction De L'autre Dans Les échanges Quotidiens

Les conversations quotidiennes et leur contenu illustrent certains mécanismes par lesquels les classifications, les frontières et les descriptions de l'Autre sont maintenues et actualisées, notamment les connotations ordinaires du sexisme et du racisme. Ces limites et descriptions des figures de l'Autre telles que présentes dans les échanges quotidiens entre individus se sont transformées sous le joug de certaines transformations sociales récentes. Si les classifications se sont historiquement construites sur la base symbolique de grandes oppositions (normal/pathologique ; conforme/déviant ; nous/eux…), nous suivons l'hypothèse qu'aujourd'hui prédomine un régime de l'inclusion qui, par un appel à la moyenne, placent les phénomènes sur un continuum. Comment se jouent alors au quotidien les classifications profanes des rapports sociaux, des identités, des conduites et des inconduites individuelles ? Dans le cadre de nos recherches sur la normativité conversationnelle, nous nous intéressons à la construction de ces figures telle qu'étayée dans des récits de conversation. Cette méthode, selon laquelle un participant rencontre le chercheur pour relater les conversations quotidiennes auxquels il a pris part au cours d'une période de temps donnée, permet d'avoir accès à la mise en récit des échanges et à leur ancrage dans des univers de signification situés et subjectifs. Ces récits d'interaction nous indiquent un certain nombre de sujets de conversation (de quoi parle-t-on ?), mais également quelques grandes opérations utilisées dans les échanges au quotidien : partager, raconter, définir, expliquer, valoriser, dévaloriser. Comment se construit la figure de l'Autre et ses déclinaisons dans ces récits de conversations? Comment se développent, au sein des échanges, les classifications de la «normalité» et de l'«anormalité» ? Et inversement, quel rôle ont les conversations dans les processus de classification?

Ontology or 'Virtuology'? On the Nature of the Social

The much talked about 'ontological turn' in the social sciences risks to overlook the distinctive contributions of prominent sociologists such as Pierre Bourdieu and Niklas Luhmann to our understanding of sociality or the social. Although they unfold quite divergent approaches, both primarily conceptualize the social as 'a space of possibilities to act' (Bourdieu) or 'a space of possibilities to communicate' (Luhmann). Actions or communications are thus understood as the actualization of one possibility within a space that comprises in principle countless other alternatives but is at the same time structured on the basis of class and/or field positions (Bourdieu) or social expectations (Luhmann).

Partly inspired by the writings of Gilles Deleuze (particularly his notion of 'Matter') and those of Geiorgio Agamben (particulary his notion of potentiality), the presentation will give a more general twist to the basic intuition underlying the theories of Bourdieu and Luhmann. The social is not something that is given (Durkheim's social facts) but a virtual realm of potentialities to act together that is contingely ordered by both situational social structures (expectations) and the structured potentialities (habitus) of the participating individuals. Ontology is thus replaced by 'virtuology', or the axiom that everything that 'is' refers to both a virtual space of countless possibilities to act and the intermediating mechanisms that always confine but never determine, in the strict sense, the actualization of of these possibilities. The social therefore consists of 'everything that could happen', 'that which may be expected to happen', and 'that which happens'.

LAGESON, SARAH* (Rutgers University-Newark, sarah.lageson@rutgers.edu)

"Digital Punishment" in Online American Media

Americans love crime. The criminal justice system is revered in popular culture and news media. Millions of people scour the internet to assess our own moral compass, take cues from other's digressions, and bear witness to justice and punishment. Historically, we have learned about crime through mainstream news media and fictional depictions. Yet, the internet has dramatically changed this landscape, and for the first time, mug shots and jailhouse rosters are available at the click of a button. Importantly, the U.S. context is significantly different than the European model of the "right to be forgotten." By comparing EU and US perspectives on privacy, I describe the growth of what I call "digital punishment" in the U.S. using a mixed methods approach: through interviewing those who run criminal history and mug shot websites, by analyzing the content they produce, and by interviewing those who are working to clear their criminal record through legal means – but are faced with the reality of an endless digital trail. There are consequences to these practices, especially in how these websites help to spread incorrect and dismissed records. While criminal history data changes rapidly at the jurisdictional level, there is not a system in place to ensure corresponding updates are made online. These crime websites thus constitute a new form of punishment: They culminate in a curated and searchable online history, which is often unknown to the website subject until they face consequences of these records. These records communicate powerful signals of guilt by attaching a criminal label to millions of arrestees, simultaneously introducing a host of social and psychological consequences.

Performing on the Situated Global Stages: Comparing the Cosmopolitan Visions and Sustainable Future Scenarios Proposed in Shanghai and Milan Expos

As an emergent global mega-event, World Expo not only performs globality and cosmopolitanism under the competing international frameworks, but also provides creative scenarios for future societies. Current researches on global events (Luke, 1998; Roche, 2000; Urry, 2003, 2010) tend to emphasis on the shaping of globality neglecting the situated perspectives. Drawing upon theories of global events, cosmopolitanism and Haraway's situated knowledge, this paper argues for 'situated cosmopolitan visions and future scenarios' by comparing two current World Expos in 2010 Shanghai and 2015 Milan.

2010 Shanghai Expo—themed by city and sustainability—multiply centered China, Mid-East and Europe on the global symbolic orders through spectacular architectures, sustainable designs and branded cultures. Its sustainable future scenarios were more based on commodity aesthetics and technological advancements. 2015 Milan Expo—themed by sustainable food culture—emphasizes loosely on the global symbolic orders, though the newly emergent European countries stand out and less developed Africa and South-east Asia organized through clustering representations. Its alternative future scenarios emphasize more retrospectively with local and natural wisdoms.

Based on field observations and spatial textual analysis on exhibitions and media representations, this research makes three comparisons of the two World Expos. Firstly, it examines the world symbolic order made in the two Expos; Secondly, it explores how the Expo themes have been articulated to demonstrate their sustainable future scenarios; Thirdly, it reflexively examines the materiality based representations in the Expos in hyper-real postmodern era (Harvey, 1996; Eco, 1987) when competing with other media in the time of refugees and financial hardship. It concludes that Expos should be considered as 'situated global stages' performing situated cosmopolitan visions with emergent future scenarios of the host countries and regions.

LAI, GINA* (Hong Kong Baptist University, ginalai@hkbu.edu.hk)

Transition to Higher Education and Social Capital Inequality

Social network researchers argue that unequal access to social capital is a major factor of social mobility. School as an important social organization provides the platform for one to establish social ties and through these ties, social capital can be accumulated and activated for instrumental purposes. However, the production of social capital inequality in the school setting is little understood. Further, researchers have observed that educational expansion has changed the form of educational inequality from qualitative differentiation (types and prestige of educational institutions) to quantitative differentiation (educational level) and social inequality is maintained as a result. The impact of horizontal educational stratification on social capital inequality thus deserves an investigation.

Data for analyses come from a panel study of high school students randomly drawn from urban Nanjing in 2010. The analytic sample consists of 667 students who attended university in China in 2013. Access to social capital is indicated by the individual's links to a selection of occupations with varying levels of occupational prestige through school peers, friends, and acquaintances. Social capital reported in 2010 and 2013 are compared. Respondents report a decline in social capital after entering university, particularly non-elite institutions. Students from better family backgrounds tend to attend elite universities and have greater access to social capital, but suffer a greater loss of social capital when they enter non-elite universities. No significant difference in change of social capital by family background is found for students attending elite universities. These findings suggest that while mass education may help increase the social mix on campus, horizontal educational stratification helps maintain the social capital advantage of socioeconomically advantaged students. Further, even when the disadvantaged groups enter elite institutions, there are factors other than contact opportunities hindering them from social capital accumulation. Implications of the findings for social mobility will be discussed.

The Renewal of Weaving Culture and Tribal Community for Tluku Women in Taiwan

Tluku tribe, one of indigenous people in Taiwan, locates in west part of Hualien county. *Tluku* tribe has been characterized by the craft of textile weaving. In addition, this weaving craft has become the symbol of ideal women since it is particularly performed by women in terms of the gender division of labor . Compared with other tribes, there is higher proportion of women still participating in textile weaving by traditional loom as well as newly improved machine. In fact, *Tluku* women play an important role on the revival of weaving culture in Hualien. This research tries to investigate the mechanism of conservation of weaving culture, which refers to the interlocking process of female laboring, cultural identity and market profit . More specifically, the dimensions of production and consumption are observed. The dimension of production is related to the weaver's body skills, family memory, and consideration of use value as well as exchange value. The dimension of consumption refers to the changing identity of the consumers/users, the intervention of local organization and government. Under this process, the mechanism for the conservation of weaving culture is pursued and the tribal community could be renewed.

Abortion Among Unmarried Female Migrant Workers in China: Modes of Parental Influence

Despite the absence of official data, extensive evidence at national and regional levels indicates a rising trend of premarital abortion in China during the past three decades. Premarital abortion is often perceived as the eventual consequence of increasing sexual freedom and of the lack of sexual and reproductive health (SRH) knowledge of young women, and the phenomenon is even more prevalent among female migrants, who usually have poorer SRH knowledge. While migration and the prevalence of unprotected sex may be the reasons for the increase in the number of unintended pregnancies among young female migrants, these factors can hardly account for their choice of abortion, which is often constituted by various kinds of considerations influenced by interpersonal power dynamics and the preexisting socio-cultural and economic structure where individuals are situated. This paper argues that parental influence is one of the factors that influence the abortion decision of unmarried female migrants in China. It attempts to reveal and examine the role played by parents and parent-daughter interactions during the process of abortion decision-making. Based on ethnographic observations and in-depth interviews with 30 (n=30) women who have experienced at least one premarital abortion in a city in Shandong, China, this paper illustrates the considerations behind parents' direct and indirect involvements in daughters' abortion decisions, as well as their negotiations. As reflected by the data, parental involvements are mediated by parents' expectations on their daughter's future husband, marriage and family life, which are often shaped by the living ideals constituted under the current socio-economic structure and embedded with their own cultural and moral beliefs in marriage, reproduction and family. Three modes of parental influences are classified, reflecting various degrees of parental control and daughter's autonomy exercised in the course of abortion decision-making, as well as the changing parent-daughter relationship dynamics in contemporary China.

Meta-Analysis on Youth Political Engagement in Tunisia, Egypt, Morocco, Lebanon and Algeria - and Beyond

This paper focuses on the findings of the 15 partners broad EU-funded project (FP7, 2014-2016) titled SAHWA: Researching Arab Mediterranean Youth: Towards a New Social Contract (www.sahwa.eu) that focuses qualitatively and quantitatively on young people living in Morocco, Algeria, Tunisia, Egypt and Lebanon. More precisely, the paper focuses on the findings under the theme 'youth political engagement', theme coordinated by the Finnish Youth Research Network. The expression 'political engagement' allows to see forms of political interventions also under non-conventional forms of action and organizations. It involves examining the forms, content, and origins of the stakes young actors have and act upon in a given setting. Current literature emphasises the need to study young actors' political engagements on several inter-linked levels, but there is little empirical research dealing with a multi-layered approach involving several countries in one project, like Sahwa. Here the multi-layered approach refers both to survey and qualitative research local national researchers are conducting in different geographical locations, and to several different interlinked themes of the study. Me-

ta-analysing the Sahwa data (i.e. 15 ethnographies and survey of 10,000 respondents) on youth political engagement, my aim of this paper is to answer following questions: What are the underlying conditions of youth engagement and mobilization in Arab Mediterranean countries? What are the forms, factors, causes and means of youth participation? Who are the politically active youth and whom do they represent? What kind of actors of social and political change these Arab Mediterranean youth are today and in the future?

LAINE, SOFIA* (Finnish Youth Research Network, sofia.laine@youthresearch.fi)

"We Still Have Walls Where to Paint". from Two Young Actors' Initiative to a Global Graffiti Movement. Case Study of "Zwewla" ("Miserables")

Young Tunisian student, initiator of the movement "Zwewla" ("Miserables") says that behind his graffiti is clearly expressed social demand: Two youngsters started the movement because the problems of unemployment, poverty and marginalization were not discussed properly in formal national politics. They choose graffiti because it is accessible to all, simplifying the message when it also comes easier across. In this paper I study Zwewla movement, its' past and current stage, and how its' key actors expresses visions for alternative futures. As such graffiti is one of the oldest ways of communicating, recently strongly combined with social media. Politics for the local disadvantaged and the global audience intertwine in these activists actions. As the *Zwewla* is nowadays a global social movement, its action strategy aims to support both the localised and global presence, and therefore my paper also focuses on the both sites: First, *on local collective self-presentation*, i.e. graffiti tags, visions and actions of young Tunisian actors I have longitudinally followed from the year 2013; second, on *global collective self-presentation* that can be viewed from Facebook pages and blogs of the followers across the world. Both collective self-presentations are part of the process of collective identity formation and a necessity for a global social movement. Therefore ethnography that tries to understand the phenomena needs to use diverse methodologies in order to capture young actors' political argumentation. My paper sheds light to different dimensions of my ethnography: grounded and militant (i.e. embodied in certain political spaces and times, also in collaborative terms), multi-sited, visual and digital – and from this hybridity I draw my analysis of the actor's perspectives on the future and how these perspectives shape their subjectivity. This study is part of the research project *Youth and political engagement in contemporary Africa* (http://blogs.helsinki.fi/yopo-africa/) funded by Academy of Finland [258235]

Finnish National Level Youth Organizations and Legitimacy

The focus of this study is on a specific type of Nonprofit Organizations; Youth Organizations. These are defined as organizations whose members are young or who target a significant part of their activities at young people. The main questions of the study examine what kinds of aims these organizations have for youth participation; what kind of opportunities to participate they arrange for the youth as participants, members, volunteers and governors; and how the hybrid characteristics of these organizations are related to the various roles they define for themselves as enablers of youth participation.

The fourth important question addresses the concept of legitimacy: How do the organizations legitimize the roles they take towards their young constituents? Within this, it is also relevant to ask who are the other stakeholders that are used as sources of legitimacy. Whose assessment of the legitimacy of the organization is considered important and how it is gained in practical terms? What does this mean in terms of accountability? In the Finnish context, the role of the public sector is very important, as almost 75 percent of the national youth organizations are funded by the Ministry of Culture and Education either as annual subsidies or as project support.

The empirical data of my study consists of survey data with 113 respondents and interview data from semi-structured interviews with 20 paid and volunteer leaders in youth organizations. The questions of legitimacy will be answered mainly on the basis of qualitative analysis of the interview data using a mixture of content and narrative analysis.

Visual Data in the Research of Tradition: Using Photo-Elicitation Method in the Study of the Intermediate Period of the Latvian Song and Dance Festivals

The Latvian Song and Dance Festival is traditional cultural mega-event that has taken place in Latvia since 1873 and has been recognized as an important expression of the nation's culture and cultural heritage. The Festival is included in the Representative list of the Intangible Cultural Heritage of Humanity by UNESCO together with resembling festivals of the other Baltic States. As nation's tradition it embraces thousands of people taking part in highly developed amateur art movement. As there have been public discussions of the future scenarios of this tradition, researchers are focusing to define preconditions of preserving and criteria for continuity of the Festival in a changing and innovative environment. The Festival takes place every five years, thus attention is particularly on the intermediate period between festivals and daily practices of the amateur art movement and participants individual motivation to inheriting the tradition. Theoretical foundation of the research is based on tradition perceived as cultural strategy with specific goals and impacts to sustain social identities and connections using symbolic communication. (Bronner, 2011). The research objective is to identify individual and community practices, internal and external models of symbolic communication of participants and to establish coherence to mechanisms to safeguard tradition in the intermediate period between festivals, when the authority of the tradition is decreased. Empirical study is based on participatory forms of visual research methods, revealing dimensions of the data difficult to obtain from traditional research strategies in social sciences (Hughes, 2012). To analyze daily routine of participants, there has been applied photo-elicitation strategy to procure meaningful information from subject with the use of visual stimulation (Margolis and Pauwels, 2011). Findings reveal aspects and symbolic meanings important to participants, nevertheless it indicates to the responsibility of the whole community to sustain the tradition in the intermediate period of the Festival.

Training Need Assessment, Social Entrepreneurship and Employment in Informal Sector: Line Drawn from Public Sector and Educational Institution in India

Public Sector Enterprises (PSEs) in India after 1947 were set up as a result of the conscious policy decision. The decision was made in context of the development strategy adopted at the beginning of the planning era with the broad macro-economic objectives of higher economic growth, self-sufficiency in production of goods and services, long term equilibrium in balance of payments and low and stable prices. PSEs have also been known as an intervention for economic development and the larger social gains for by providing employment to people. In 2016, India is prophesied to become the world's fastest-growing major economy. But, despite of these, unemployment still prevails among the youths of the country. Therefore, this study was an attempt to look at solutions to the problem of unemployment. On this basis, the study objective undertook cases from informal sector to find out how they function within the contexts fulfilling the state's larger social goals. Also, in line with the management intervention, 'training', for these youths has been reflected upon through evidences from PSEs. The study was done in two parts. First, it confined itself to formal sector, taking PSEs to gain evidences on how the youths can get the right knowledge, skills and attitude to be employed. Second, the study looked upon for cases on youth run enterprise or action to suffice the study objective. Where, youths of an educational institution in India were focused, as education is a prime source of development for a nation. The study was descriptive in nature following both quantitative and qualitative approaches. Where, social entrepreneurship was found as one answer to the issue, in the interim, the study also discusses training needs assessment as a step in training that needs to be considered in the process and also for future study implications.

Exploring the Lives of Sri-Lankan Migrants Working in Korea

Data gathering for the research that is discussed here is currently underway. The main objective of the research is to explore the nature of social and work life experienced by Sri Lankan migrants working in Korea with a special emphasis on work-related issues and concerns.

The research deals with qualitative data gathered through interviews with 30 Sri Lankans currently working in Korea. Data was collected largely through online interviews, with a few interviews being conducted face-to-face.

The tentative patterns identified in the data shows a marked improvement of the individuals' and his/her family's financial standing due to earnings made in Korea. Compared to the income they earned in Sri Lanka prior to migration, they and their families are now able to enjoy a more comfortable life which is largely a result of the improved income status.

However, the study also revealed several areas of work-related difficulties encountered by these workers in Korea. The Sri Lankan migrants seem to be having difficulties adapting to the austere work ethic in Korea which according to them is far more rigid than what they have experienced in Sri Lanka as well as achieving an optimum work-leisure balance. Further, the solidarity between employers and employees appear to be contingent on the effectiveness of the workers' productiveness.

Additionally, all the respondents were unanimous in claiming that their Korean employers and colleagues continued to treat them as 'strangers/outsiders' even after being employed for several years. Often, such treatment is reflected in day-to-day conversations between Korean employers/co-workers and Sri Lankans. This issue of recognition seems to be making it difficult for the migrants to develop a sense of belonging that would facilitate their integration into wider Korean society.

LAMARRE, ANDREA* (University of Guelph, alamarre@uoguelph.ca)

Embodying Otherwise: Theorizing Embodiment in Eating Disorder Scholarship

The body is an "absent presence" in eating disorder scholarship. While significant time is spent tracing the contours of the body through body image research, a deep analysis of the lived body as precondition for experiencing the world is less common in both mainstream and feminist works on eating disorders. The visceral experience of self-starvation, self-induced vomiting, exercise to the point of collapse, and other behaviours coded as "extreme" but holding deep and unrelenting pull for some are undertheorized. In the wake of twin currents of biomedicalization and post-structuralism in eating disorder research, theory hesitates around the edges of embodiment. In this paper, I seek to find the body in eating disorder scholarship, uncovering these missing bodies and exploring how they have been theorized about, around, and (on occasion) with. Theorizing embodiment as intersectional, intercorporeal, and dynamic, I draw on a growing body of literature focusing on sensorial perception and blend this with an unlikely ally: philosophical and sociological accounts of embodiment drawing on Merleau-Ponty, Foucault, Weiss, Grosz, and Braidotti. I argue that the body is often figured as undifferentiated, stereotypically white, female, and young, limiting our imagination about what an eating disorder is, who might suffer from an eating disorder, and, importantly, who might recover. Taking an embodiment-oriented approach allows us to move beyond diagnostic discourses, which entrench Cartesian dualisms, and purely discursive accounts that render bodies passive sponges for cultural imagery. Instead, we might consider how culture and diagnostic practices alike are produced by and mediated through bodies. We might open up new possibilities for diverse embodiments and scaffold lasting recovery.

Is Access to Public and Private Universities a Matter of Social Justice?

Limited access to University Education (UE) for young people with low socio-economic status has frequently been seen as a phenomenon which perpetuates the social status quo and leads to a polarized system of UE (Crozier et al., 2008).

Recently, there has been a surprising growth of private UE in various countries (e.g. Polland, Hungary, Chile) and this is often linked to political and economic factors (Levy, 2004; Espinoza and Gonzalez, 2013). Private UE has recently changed the educational landscape in Cyprus as well, and approximately half of the stu-

denotes a presenting author. Abstracts are organized by first presenting author's last name.

dents attend private universities (MoEC, 2014, page 43), a finding also reported for other countries (Espinoza and Gonzalez, 2013).

However, attending private UE is costly whereas public education is usually free or low-cost. Students' desire to achieve access to UE often leads to unsustainable degree of debt which causes additional stress and burden on students and their families (Cooke et al, 2004).

The objective of study is to describe the population that accesses public and private University education in Cyprus and to discuss the political and social implications of the phenomenon.

Contrary to the existing literature, and contrary to our expectations, the results suggest that the social status of the family (e.g. parents' education and occupation) is not a major predictor of whether a student attends a private or a public university. It was found that the financially disadvantaged students, however, (those who had to work and also wished they could have more support from their families), were more likely to attend private universities.

We consider our findings to be important for both policy makers and educationalists and we will discuss the next steps for future research.

LAN, PEI-CHIA* (National Taiwan University, pclan@ntu.edu.tw)

Compressed Parenthood: Middle-Class Parenting in Taiwan

Taiwan's fertility rate has dropped to one of the lowest in the world. Why do parents face intensified pressure, anxiety and uncertainty, despite their expanded access to cultural resources and market services? My research explores this conundrum based in-depth interviews with parents from over fifty families. I propose the concept "compressed parenthood" to describe those parents who experience time-space compression as a consequence of globalization and encounter tension and contradiction between the global and the local, or between the traditional and the modern.

Taiwan's rapid industrialization and democratization, leading to widespread intergenerational mobility and a vibrant civil society, illustrate what Chang Kyung-Sup (2010) calls "compressed modernity." The transformation of parenting scripts renders parents reflexive about their past experiences and the imagined future of their children. Middle-class parents lament their own 'lost childhood' in a poorer, authoritarian Taiwan; they are determined to break with the traditions of childrearing and to bring more happiness and autonomy for their own children.

Middle-class parents can mobilize expanded resources thanks to "time-space compression" (Harvey 1990) in the global village. Their changing style of childrearing, under the marked influence of US culture, marks their upward mobility and cosmopolitan engagement. Some attempt to cultivate children's global cultural capital by sending them to all-English kindergartens, elite schools, and summer camps in the US. Some other parents try to protect children from the harm of traditional pedagogy by choosing Western alternative education that jettisons textbooks and examinations.

However, parents feel anxious when they face disjuncture between cultural scripts and institutional reality. Dual-earner parents in Taiwan struggle with long working hours and have limited time to carry out the new script of intensive parenting. These parents also feel concerned about whether their children can survive intense educational competition in a local culture that is still dominated by collectivism.

RC06-86.10

LAN, PEI-CHIA* (National Taiwan University, pclan@ntu.edu.tw)

New Parenting Scripts and the Production of "High-Risk Families": The Case of Taiwan

While Taiwan's fertility has dropped to one of the lowest in the world, the cultural scripts for childrearing become increasingly labor-intensive and expert-guided. The public discourses on childhood and parenthood dramatically transformed during the past few decades. The status of children changed from laboring bodies for military nationalism to healthy bodies under biopolitical governance. And the role of parents transformed from the enforcer of child discipline to the recipient of parental education.

The new cultural scripts of parenting, with penetrating global influence, often mismatch, disjoint or conflict with local reality in Taiwan. For instance, parents are advised to spend a substantial amount of time in communicating and interacting with children. However, most workplaces in Taiwan are not family-friendly in terms of culture and organization. Dual-earner parents widely depend on afterschool programs or kinship networks for childcare. Despite their aspiration to break with the traditions of childrearing, parents must rely on grandparents, who either cohabitate or live nearby, to raise children together.

Starting in the 1990s, Taiwan's government has developed a system of medical surveillance to monitor children's health and also actively promotes parental education as the normative practice of modern family. The working class, immigrant mothers, and other socially disadvantaged parents are increasingly burdened with social blame and labeled as "high-risk families" under state surveillance. Taiwan's capital outflow and labor inflow in recent decades have affected job security the most for working-class men. Many are pressured to seek foreign brides from Southeast Asia and China and form a new type of global family. The new scripts

of parenting, especially the prohibition of corporeal punishment at home and the expectation for parental participation at school, implicitly hold class-biased assumptions about parents' time flexibility and capacity to communicate with children.

LANG, NATALIE* (University of Goettingen, natalie.koyel.lang@gmail.com)

Religious and Gender Negotiations on Facebook: Female Hindu Practitioners Claiming New Roles in La Réunion

La Réunion, a French overseas department in the Indian Ocean, is characterised by its religious and ethnic diversity resulting from multiple waves of migrations, including Indian indentured labourers. After a long phase of sparse contact with India, a recent reorientation towards India and Hinduism by Reunionese of Indian descent leads to a renegotiation of Hinduism as diasporic religion. More recently, Hindus have established facebook as important site of religious negotiations, where Hindus in La Réunion establish contacts with Hindus in India and numerous places in the diaspora. By taking the examples of two major Reunionese facebook pages consecrated to Hindu religion and selected facebook chronologies of individuals, this paper examines the negotiation of gender roles in Reunionese Hindu religious practice. The paper argues that women's claims in the offline environment to participate in certain rituals are reinforced and supported by pictures posted and discussions led on facebook. For example, the increasing demand of women walking on fire, a devotional practice which had not been performed by Reunionese women for a long time, manifests itself in photographs of fire walking women posted on facebook and the accompanying comments, which often include felicitations to the female practitioners. Moreover, the possibility of virtual interactions serves as an access to religious knowledge which can be used to justify certain claims, such as information on women walking on fire in India. The paper concludes that in contrast to negotiations about gender-specific tasks in offline temple ceremonies, virtual negotiations on facebook start from a different basis, as both women and men can post and have access to knowledge about religious practices in India and worldwide. The paper is based on participant observation conducted during 12 months' anthropological field work in La Réunion (2014-2015) in the context of a PhD research project.

Factorial Surveys in Social Psychology: Testing within Respondent Variance Homogeneity in Factorial Surveys

That the residual variance of responses net of experimental treatments and additional indicators is homogenous is a fundamental assumption of factorial surveys. Therefore, it has become common practice to control the variance heterogeneity between individuals induced by differing response situations using random effects when analyzing factorial surveys. But based on theories about personality differences between individuals it is expectable that the residual variance is also heterogeneous within respondents. Specifically, we hypothesize that the variance component within respondents increases with their expressiveness. Moreover, since expressiveness is a general personality trait it is plausible that the type of variance heterogeneity it induces constitutes a common type of measurement error.

We model the within respondent variance of factorial surveys using mixed-effect location scale analysis and test the influence of expressiveness on this variance component. As test cases we use two factorial surveys on tertiary students' preferences with respect to internships. In both surveys expressiveness is measured using the standard items of the respective Big Five sub-scale. One of the samples used consists of respondents experienced in answering surveys while the other sample is composed of inexperienced individuals in this regard, enabling us to assess the effect of practice on expressiveness induced measurement error. Furthermore, we check how the influence of expressiveness changes if we control other sources of measurement error in factorial surveys (like e.g., violations of the interval scaling assumption regarding response behavior). In addition, we evaluate the impact of expressiveness based measurement error on estimated individual preferences. First results indicate support for our central hypothesis, the within respondent variance of factorial survey answers is larger for students with a higher expressiveness score.

Excluded from within: Knowledge, Class and Massification of University Access in Developing Countries

This paper departs from the assumption that access to higher education will continue to increase globally. A prominent feature of the contemporary tendency of expansion of access to higher education is inclusion of disadvantaged socio-economic groups and people from lower status and social classes. Thus, massification in higher education is characterized by differentiation, diversification and stratification of the sector. Notwithstanding, a typical contradiction is outlined. The contradiction has manifested by what we termed exclusion from within where a meaningful relation to scientific reasoning is denied to these popular classes. The 'progressive' massification of access to the knowledge institution does not guarantee access to powerful knowledge that remains highly selective and exclusive to the elites by means of effective relation to knowledge. The paper goes on to explore and discuss the differentiating features of access to higher education, particularly in developing countries. It argues that massification will, over time, undermine the capacity of the universities to deal effectively with its knowledge production function whereas simultaneously evolving towards meeting the societal demands of high social mobility and rates of return from the investment in higher education. In the knowledge economy and society provision of access as a form of commodity to popular classes may lead to even growing inequalities. The paper concludes by considering a way to address the paradox.

Colonial Modernities: Timing, Motive, and Otherness

Most works on multiple modernities have focused on civilizational cultures and suggest that different cultural heritages promote different modernities. Much of the comparative-historical literature, however, suggests that powerful international actors have shaped social relations in dramatic ways over the past several centuries, yet little attention has been paid to how international influence could promote different varieties of modernity. This paper starts to fill in this literary gap by considering how colonialism promoted particular forms of modernity. It describes how colonial officials and their collaborators (including missionaries and merchants) had particular biases and interests that prevented them from trying to copy the form of modernity that emerged among the early modernizers. Instead, their focus on control, conversion, and profits caused colonial actors to promote new forms of modernity. Using the nation state, a pillar of modernity, as an example, it describes how colonialism and missionaries were predisposed to recognize ethnic difference and encourage communal self-rule as a means of control and conversion before introducing the nation-state model at independence. This sequential combination created divisions and competition that made the nation-state model unworkable in many instances, promoting crisis, violence, and the rise of new models that had to deal with plurinational realities.

Mindfulness in Cooperation

Discussions on "relational expertise" (Anne Edwards) or "transformative agency" (Yrjö Engeström) currently point to a new development of professionalism. This professionalism is especially required in high reliability organisations and high performance workplaces. Main features are (1) the capacity to change and develop work activities self-dependently with regard to complex tasks, (2) the competence to act flexible with respect to quality and safety requirements, (3) the non-heroic commitment to connect one's own expertise to the expertise of others while solving problems. This new professionalism thus takes into account that complexity cannot be mastered by one person, or by meticulous planning and prescribing routines only. This paper elaborates against this background the concept of 'mindful cooperative competence' (Langemeyer 2015). 'Mindfulness' is according to Karls Weick, Kathleen Sutcliffe and others a certain ethos enacted and cultivated in several professional activities in high-reliability organisations to ensure that teams can undertake the right steps in critical situations. It describes how teams can foster their intuition for critical incidents and methods that help preventing disasters. Being mindful is therefore not only a matter of individual awareness, keenness and flexibility but also an outcome of professional cooperation. To create a 'cognitive infrastructure' (Weick) has became a tactic of professionals to ensure that their agency is resilient in face of unexpected problems. On the basis of two research projects conducted in the fields of heart surgery (more precisely re. the profession of perfusionists) and IT-work, the development of 'cooperative competence' is scrutinized. The conducive as well as the inhibiting aspects of work practices and of the behaviour of teams are explained by means of a new model of professional cooperation. This model is also used to compare professionalism in different forms of cooperation.

Voices of Hope from the Shadows of War: Accounts of Peace in the Life-Stories of Young People in Afghanistan

In war settings children and adolescents are usually among those who are most affected by violence. In Afghanistan, a country that has been shaped by war for decades and that is currently facing a dramatic increase in the level of violence, more than two thirds of the population is younger than 24 years. Due to a lack of political representation, their voices are marginalized. If one is interested in the societal potential of peace, one has to look at this next generation. This presentation is based upon a qualitative research project with young people in the Northern provinces of the country. It is aimed at understanding how experiences of everyday violence affect identity constructions, visions of society, and social agency of young people, by using narrative interviews and drawings. Despite traumatizing experiences of violence that are reflected in the empirical material, accounts of a peaceful future are elaborated and their contributions to powerful discourses that influence political decision-making processes are discussed.

Alienation: Past, Present and Future

Societies in general and modernity in particular are typically compromises between their positive and negative consequences. Traditional *gemeinschaft* societies provided people with a cohesive community, stable identity, and more or less comprehensive meaning systems typically based on God(s) and strict rules. But life was short, nasty and brutish, there was very little individuality, freedom or avenues for self-fulfillment. With the rise of modernity, typically its capitalist forms, there was indeed greater freedom and individuality, but as a Marxist perspective would also point out, the foundation for social society was the production of commodities which enabled the owners of capital to accumulate wealth, power and status, while the majority of people who produced that wealth face alienation understood in terms of powerlessness, social fragmentation, thwarted self-fulfillment, etc. The concept of alienation has faced a number of critiques not the least of which has been its sanitization in which the critical moments of a social – political critique have been cleansed and all that remains is an apolitical notion of dehumanization qua entrapment within an "iron cage" or a transitional phase of anomie in which old meanings are lost while new ones await. Furthermore, well for Marx alienation was based primarily on the capitalist production of commodities, we've seen the utility of the concept in understanding such areas as service work, political domination, consumerism and the nature of subjectivity

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

(identity and emotions). Thus we would argue that alienation, in its many contemporary iterations remains a rich and vital concept. But what of the future? Given the unpleasant affects that are consequences of alienation, we see the concept as intrinsic to various expressions that might provide either escapes from alienation through the many fandoms and audiences of popular culture as well as impel transformative social movements.

Contested Futures and Smart Technologies

Contested Futures and Smart Technologies
Debora Lanzeni and Elisenda Ardevol
We endorse digital technologies with the promises of a better way of life, solving our problems of managing the world complexity, allowing better participatory policies and helping us in our daily-life. At the same time, we are in trouble with its dark side of surveillance, control and inequality distribution of power. But digital technologies developments, practices and users are not homogeneous and different images of future are in dispute.

This paper wants to critically analyse Digital Culture promises and worries, taking into account the tensions raised by different material practices, understandings and moral orders (Boltanski and Thévenot, 2006) around the role of digital technologies in performing futures, what kind of futures are imagined and how these images of the future design our present and perform current fears and desires. In special, we will examine how different visions of future are embedded in digital design. Drawing in our ethnographic fieldwork, we will unpack the "smart" technologies in relation to two contested image of future: that of "smart cities" –based on the development of the image of a self-auto-regulated city- and that of "smart citizens" –based on the believe that smart technologies empower citizens to control their cities and quality of life. For that purpose, we will develop an analytical framework to understand this contested futures by unpacking the relationship between the social imaginary (Castoriadis, 1997), utopic visions (Moore, 1990) and the visions of future (Suchman, 2011; Watts, 2015; Kinsley, 2012) that are embedded in everyday digital technology developers.

Childhood in the Network Society: Bridging Communication and Childhood Studies

This work argues that communication studies and the analysis of domestication modalities of media by children became central to understand the reconfigurations in children's frames of existence. If the link between the institutional frames of childhood and macro-social phenomena identified by the theories of late modernity continue to have a central relevance (Allison, Jenks and Prout, 1998), today as twenty years ago, it seems, however, that in this temporal gap other processes occurred or deepened, particularly at the communicational level, indicating transformative conditions of those frames. It is proposed the conceptual notion of the emergence of a networked childhood that, on the one hand, departures from essentialist proposals around the digital nativity of children, but on the other hand, recognizes that frames of social life of children changed with the development of a networked communication model, which brought innovations in the modalities of mediation and action. The notion of networked childhood refers to a shift in the structure of relevance (Thompson, 1995) between the lived experience and the types of mediated experience and the continuum established between these two types of experience – variable according to children's placement in social space -, and to the spatio-temporal changes of childhood contexts. The notion also intends to indicate a procedural logic of social action, that is, children are not simply networked in their play and interaction with others. They act daily on a network logic by connecting or disconnection peer or family networks and different media and technological realities. For instance, it is argued that children's domestication of new media defies established notions of public and private and the concept of literacy and expertise, which brings challenges in terms of public policy and domestic mediation and informs contemporary processes of social construction of childhood and of children's rights and duties.

Linguistic Policies and Attitudes. the Case of Descendents of Immigrants in Catalonia

In Catalonia (Spain) there have been implemented integration policies initiatives which place focus on the creation of a common public culture, in which 'Catalan should be the backbone of a common and multilingual project of coexistence, including the knowledge of the languages present in Catalonia (Catalan / Spanish / immigrants' L1) as an element of progress and social mobility' (Generalitat de Catalunya 2008, 49). Consequently, Catalan becomes the quintessential element which allows intercultural communication, social mobility and cohesion (Generalitat de Catalunya 2008, 2009, 2013).

Therefore, without question, one of the most important dimensions of reaching this goal concerns the linguistic attitudes which immigrant children construct.

Within this framework, the objective of the present communication is to analyse the socio-demographic, socio-familiar and psycho-social, educational, and linguistic predictors which determine whether the linguistic attitudes are located above or under the average, in the case of descendents of immigrants from Ecuador, the rest of Hispano-America and Morocco.

The data presented was collected following the application of an attitude and self-identification questionnaire, as well as that of parallel linguistic competences tests in Catalan and Spanish. The main results suggest that, although when measured in a bivariate fashion there are numerous influential variables, when introduced into logistic regression models the most important connections are with the self-identification sphere, the birthplace (and implicitly the home language), and language use.

As significant conclusion it should be highlighted that different attitudinal profiles are observed, which raises questions about the policies developed.

Socioenvironmental Development As a Guided Self-Organized PHASE Transition

SOCIOENVIRONMENTAL DEVELOPMENT AS A GUIDED SELF-ORGANIZED PHASE TRANSITION
Development is an evolutionary socioeconomic process characterized by the improvement in the sustainable satisfaction of the basic needs of the population related with a societal system.

A socioeconomic system has four types of interrelated economic processes:
a) Production of goods.
b) Exchanging part of the goods produced for other goods produced outside the system.
c) Investing part of the available goods to enlarge its productive infrastructure.
d) Consuming part of the available goods to satisfy the needs of its population.
It is the balanced development of these four types of economic processes what allows the development of the socioeconomic system.

The socioeconomic system may be modeled as a complex adaptive system in interaction with its environment. Its four economic processes have properties expressed as state variables associated with a value that is changing through the development process. The analysis of the development dynamics is based on the behavior of these state variables.

An underdeveloped society is not able to satisfy the basic physiological and safety needs of the majority of its people because its state is on the basin of a poverty attractor. Then it must implement a guided self-organizing phase transition to a sustainable development attractor as following:
1. Analyze its economic processes through participatory workshops.
2. Define short, medium and long-term development objectives.
3. Prioritize problems to be solved in the development process.
4. Identify and collect the appropriate resources to solve the detected problems.
5. Programming, implementing and monitoring the specific actions to address the problems identified.

In this paper a conceptual model of the development process is presented, based on the Complex Systems Approach and tested through a field research and a detailed case study in the State Chiapas.

Oportunidades Para Un Nuevo Tipo De Diálogo Con Los Públicos De La Organización. análisis De La Adaptación De Las Organizaciones Políticas De ámbito Regional

La comunicación se centra en las organizaciones de tipo político y, concretamente, en aquellas que desempeñan su actividad a nivel regional o autonómico. El objetivo es conocer de qué manera estas organizaciones han adaptado sus estrategias de comunicación para adaptarse a los retos del paradigma multisoporte y 2.0. Con este fin, el *paper* repasa la evolución experimentada por las organizaciones políticas en el ámbito de la web (creación de websites, desarrollo de perfiles en medios sociales, etc.), poniendo especial atención a sus usos tecnopolíticos fuera de momentos puntuales de campaña electoral. Asimismo, analiza su posicionamiento ante las implicaciones de la ciberpolítica y el impulso del nuevo espacio público online. A partir de ello, el texto ofrece resultados de una investigación centrada en las principales organizaciones políticas de la comunidad vasca. Dicho estudio se ha realizado a partir de técnicas cualitativas (análisis de websites organizacionales y entrevistas en profundidad) que han permitido conocer las principales dificultades y ventajas que encuentran estas organizaciones en el uso de plataformas virtuales para comunicar a sus públicos -medios de comunicación y ciudadanía- de manera más directa y eficaz. En este sentido, se ha buscado conocer también la visión de los principales medios del entorno sobre la eficacia comunicativa de las acciones que estos partidos llevan a cabo vía web.

Revisiting the Concept of Professional Authority

There is not an elaborate tradition of research on authority within the sociology of professions. In broader social and sociological debates, however, the changing roles of professions and professionals are typically used as a key example of how authority positions in society are not what they used to be. While some social theorists claim a larger dependence on specialized expertise in 'reflexive modernization', the most common narrative is one of erosion, either because individualized citizens trust professionals less or because professions as a whole have been run over by political regulation.

The concept of authority has a Weberian origin, and yet does not fit clearly within the power-centered Neo-Weberian tradition. This is because a strong professional authority requires not simply a monopoly on certain tasks nor is it just an ideological legitimation of monopoly. It further includes what Starr terms 'legitimate complexity', i.e. whether citizens, society or the state considers the profession as having a necessary ability to interpret a piece of reality. Having a profession's judgments accepted as necessary does not depend directly on the legal protection of monopoly, but rather on the profession's ability to constitute themselves as an exclusive cultural authority on the area in question. It is thus essential to consider different dimensions of authority, while still associating it with the generic phenomenon of authority in society.

This paper revisits and elaborates on the concept of professional authority. The purpose is not simply to identify a forgotten tradition or elaborate on the alleged loss of professional authority. The aim is rather to clarify the notion as to allow a systematic and comparative empirical scrutiny. How does authority vary between professions and between different citizen groups and how may different forms of political regulation likely affect or challenge professional authority?

Is Shinto Secular? the 2016 G7 Meeting at Ise in Light of Postwar Japanese Secularism

In June 2015, it was announced that the 2016 G7 meeting would take place close to Ise Shrine in Mie Prefecture, Japan. The suggestion to enter the bid was made to the Governor of Mie by staff working directly under Prime Minister Abe Shinzô, who during his time as prime minister has had closer ties to the shrine and the Shinto establishment than most of his predecessors. Although Ise Shrine as a historical site dates back millennia, it has retained its role as the locus of modern era Shinto nationalism well after State Shinto was disestablished in 1945.

It has been suggested that the constitutional secularism of post-war Japan can be divided into two periods, based on how the courts have viewed Shinto. Before 1997, Shinto was generally equated with *culture* and hence not affected by the separation of state and religion posited in Articles 20 and 89 of the Constitution, but since the landmark *Ehime Tamagushiryô* case in 1997 this has changed and Shinto is now generally – but no exclusively – considered a "religion" in legal terms. This is a position that has been much criticized by the National Association of Shinto Shrines, with its central shrine at Ise.

Building on Jason Josephson's idea of the discourse of the "Shinto Secular", I suggest that Abe's promotion of Ise for the G7 summit lies within the discursive field of what I call the *Shinto Normative*. Although this discourse has lost ground in the Supreme Court since 1997, the idea that Shinto is something else – something closely connected to what it means to be Japanese – is still common in Japanese political discourse. In this paper, I will analyze Abe's bid to hold the G7 meeting in the vicinity of Ise in the light of Japanese secularism post 1997.

Decent Work: A Challenge for a Global Sociology of Labor

We witness a global restructuring of the meaning of labor as activity that organizes social stratification (class) and access to social rights. Coined with the term of precarization, these changes can be globally described as shifting relations of production, distribution and representation (Standing 2014). In particular, the amount of non-remunerated work increases and social policies are more and more based on market principles (ibid.).

Most of the academic writing separates between industrialized democracies and the developing world, creating two discourses that don't speak to each other. Our article instead bridges these "two worlds", by bringing into dialogue the European and the African contexts, thus contributing to a global sociology of labor.

In order to do so, we first argue that the narrow definition of work as paid-work and the fact that paid work is the most important gateway for social rights are crucial sources of social inequality – not only in terms of material resources but also in respect to recognition and participation (Young, 1990; Fraser, 2001).

We then propose a conceptualization of work based on the capabilities they generate. A typology of activities should reflect their quality and the extent to which they create valuable ways of human flourishing (Sen, 1999). From this perspective, "decent work" is a valuable and freely chosen activity, which expands human capabilities.

Finally, we argue that the study of the mechanisms that produce unequal opportunities to have a flourishing life should be based on an intersectional analysis. This means taking into consideration the ways in which gender, race and age structure the realities of work and reconsidering the role of state institutions in the reproduction of these categorical differentiations (i.e. Nickel, 2009; Scott, 1998).

We claim that this theoretical framework contributes to a better understanding of how social inequalities are organized through labour today.

The Future of International Migration in Arab Countries

La gestion des migrations internationales et du refuge dans les pays arabes se singularise par l abscence d une approche regionale a la fois dans le domaine legislative et institutionnel des migrations internationales. Cette singularite rend non seulement difficile la gestion des crises migratoires ponctuelles dans une region qui ne cesse de connaitre des conflits politiques et des vagues continues d exode, mais aussi la gestion a long terme des mobilites et des migrations internationales tout particulierement les mobilites entre les pays arabes. C est pourquoi on observe a chaque crise migratoire dans un pays arabe cas des refugies syriens recemment un mutusme des etats arabes. Quel serait donc le future des migrations internationales dans les pays arabes? Et quelle serait la politique future de gestion des migrations internationales dans la region?

Le future des migrations internationales se limiterait-il a une croissance de la presence des migrants asiatiques dans les pays du Golf et une continuite des flux migratoires des maghrebins et autres arabes vers les pays europeens et l Amerique du Nord? Au au contraire on assistera a l emergence de nouvelles perspectives des migrations internationales dans les pays arabes? Le future proche des migrations internationales dans les pays arabes est diverse. Il associe differents scenarios. Ces scenarios dependent de differents paramatres a la fois economique, demographique et politique. L objet de ce papier est de rendre compte du future proche des migrations internationales dans les differentes composantes geographique du monde arabe asavoir les pays du Golf, les pays du moyen orient et les pays du MAghreb. Scenarios qui s appuieront avant tout sur des approches regionales et non-globales, car ils ne concerneront pas l ensemble des pays arabes a la fois.

Mentoring for Institutional Transformation: Recommendations from a Comparative Analysis

Mentoring is consistently noted as a key area of transformation (for individuals and institutions) and is widely accepted as critical to professional success. Formal mentoring programs are often organized the around the goal of facilitating individual career success and may focus on women and other historically marginalized groups.

It is clear that the significant under-representation of women and members of other historically marginalized groups is not primarily a problem individual choices or individual discrimination, but a consequence of gendered (raced and classed) institutions and cultures. How do we create mentoring programs that acknowledge and address this? How can mentoring programs, which have historically focused on helping individual women succeed, challenge the gendered, raced, and classed norms that structure institutions and thus transform them?

When mentoring programs are designed and led by people who have succeeded in the structure as it exists, these individuals may be used as examples of how the structure is unproblematic and programs may not question the expectations, ideals, and organizational arrangements that create the need for such programs – a practice that may actually lead to institutional change.

Relatedly, members of under-represented groups often take on too much of the burden of service and administrative responsibilities associated with institutional change. If the work to create more inclusive and equitable institutions is done mostly by people from these groups and that work is not recognized, valued, and rewarded, our institutions will continue as they are because these people will be pushed (or kept) out.

This research examines how mentoring programs might contribute to institutional change in higher education. It analyzes mentoring models and promising practices in the United States and Austria (among other countries), and includes data from interviews with participants and administrators. As such, it considers cultural context and laws and policies that shape mentoring programs.

LAUBE, HEATHER* (University of Michigan-Flint, hlaube@umflint.edu)

Resistance and Replication: Feminists As Insiders and Outsiders in the Knowledge Economy

The presence and status of women in higher education, science, and research continues to be a concern around the world. While the numbers of women in these fields are improving, a strong presence does not always mean a strong voice for women in in these institutional arenas, particularly if they identify as feminist. Feminists inside institutions of knowledge production and dissemination may take advantage of unique opportunities to practice their politics and engage in change-making, but there are significant constraints on their ability to transform these structures while also advancing their careers.

The data for this research comes from in-depth interviews with feminist scholars/researchers who work in institutions of higher education, research institutes, as independent scholars. This comparative study includes participants from Europe, the United States, and the Global South.

Many countries have instituted policies and practices to increase the number of women in the knowledge economy – as university students, professors, and researchers. The existence of these policies, often accompanied by the goal of democratization (including gender equality), begs for attention to the ways organizational change and policies affect differently gendered individuals, the production of gendered knowledge, the gendered nature of work and careers, and social change.

This study examines why feminist scholars choose this work, how the opportunities and constraints embedded in the gendered (and raced and classed) structures of institutions shape their careers and knowledge production, and how they engage in political resistance that subtlety and not-so-subtly challenges the gendered cultures and norms (including assumptions of science) of these institutions and of society.

The analysis of the differences and similarities in institutional structures, laws and social policy, and gendered cultures provides insight into these women's experiences as both "insiders and outsiders," and the ways we can make these knowledge economies more inclusive.

Selfish Funerals: Negotiating Individualization, Reciprocity, and Social Status in Rural Africa

In the past the deep entrenchment of the individuum into layered levels of social embedding - the family, the lineage, the clan, the 'tribe' - was perceived to be the driver of of social cohesion, but also a means to generate intergenerational continuity, economic reciprocity, and the means to manage manifold risks emanating from economic, political and environmental uncertainties in rural Africa. Of course, rural Africa has been undergoing drastic changes and colonialism, proselytization, new patterns of migration, population growth, the prolieferation of 'modern' education, and the ongoing commodification of resources and commercilization of agriculture have had an comprehensive impact on social relations, the self-positioning of the individuum, and patterns of individualization. Long-term empirical research on education, social mobility and perceptions of success among young people in rural northern Ghana shows how individual aspirations and social committment are reflected, negotiated, and re-integrated in the lifes of a translocal rural-urban precariate. Commercialization, social diversification, and growing consumerism seem to promote individualization, while weak official institutions and the absence of comprehensive formal social security networks make the engagement in networks of reciprocity, often beyond kinship networks, paramount. Communitarian ideals are enshrined in ideas about social status that are linked to the individuals ability to sympathize and share, epitomizing in the realm of funerals, where the individuals value is measured by the contribution -relative to its capabily- it is making, or the the decgree of support and attention its own funeral is getting. While modernization and the differentiation of the society seems to promote individualization, perceptions of social status hinging on the the individual's performance in reciprocal networks negotiates this tendency. This raises the question whether the nexus between (post-)modernity and individualization, often perceived to be quasi -evolutionary, is conclusive, or if other constellations potentially exist.

LAURENCE, JAMES* (University of Manchester, james.t.laurence@gmail.com)

Place of Mind: An Interdisciplinary Approach to Studying the Contextual-Predictors and Valenced Social-Connectivity Pathways of Mental Health and Wellbeing Amongst Adolescents

Sociologists have long studied how the characteristics of an individual's environment (such as its urbanisation, socio-economic disadvantage, inequality, or ethnic diversity) can influence mental health and wellbeing. In recent years, the role of concepts such as social capital and network connectivity have been quantitatively investigated as a key mechanism in examining how particular environments translate into better or worse mental health outcomes. The suggestion is that facets such as social connectivity, frequency of interactions, or network density, form key pathways through which one's environment affects mental health.

Social connectivity and interactions are not, however, implicitly beneficial. Within social psychology, careful attention is paid to the valence of interactions and social contact; for example, how positive/negative social experiences are. While the former can cultivate positive outcomes, the latter can harm mental health. However, while extensive work has investigated the psychological *effects* of such positive/negative experiences, less has looked at what conditions *predict* the frequency/intensity of positive and negative social interactions.

This paper aims to draw together these literatures, integrating the concept of the *valence* of social experiences into the literature on the environmental predictors of mental health. Studies investigating the role of social capital for mental illness (and the environmental predictors of this) largely argue it is an absence of social connectivity/interaction that is harmful. However, we posit that studies have only looked at one side of social experiences. Another connectivity-pathway through which environment may matter is how far it generates more negative (as well as positive) social interactions. Using a random-sample of UK adolescents, this study investigates the role of everyday valenced-interactions in adolescent mental health. Furthermore, it will examine the conditions within young people's schools and communities which affect mental health and perform the first test of the pathways of positive *and* negative social relationships in understanding these effects.

LAURENCE, JAMES* (University of Manchester, james.t.laurence@gmail.com)

Working Together, Working Apart: An Investigation into the Policy Rationale for Workplace Diversity and Its Role in Inter-Group Relations and Social Cohesion

UK policies have been initiated to encourage access to, and the ethno-cultural diversity of, workplaces. From the national-level (e.g. UK Equality Act 2010) to local/organisational-specific programs, such policies are frequently grounded in the posited benefits of workplace diversity for organisations. However, justification for these policies has also drawn on the wider social impacts organisational diversity (or a lack thereof) can have on society; in particular, that diverse workplaces can cultivate positive inter-group relations via social mixing amongst co-workers. Given a declining but still persistent residential segregation, policy recommendations for workplace diversity have drawn on ideas that the workplace can play a key role in ethno-cultural integration.

Research in management/business studies has examined the rationale that workplace diversity benefits organisations themselves e.g. for creativity, team

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

efficiency/productivity, inter-colleague moral. However, far less work has examined the policy rationale regarding the posited effects of workplace diversity for inter-group attitudes and social cohesion more generally. Instead, most of the (sociological) literature has focused on residential communities as sites of integration/division.

This paper aims to remedy this omission, investigating how policies aimed at encouraging organisational diversity impact inter-group cohesion. Using a random-sample of individuals across the UK, this study will take a quantitative approach, applying multi-level modelling methods, to explore how workplace diversity affects inter-group attitudes and wider social cohesion. It will also examine whether policies designed to increase workplace diversity may not only improve employees' attitudes, but also how far such effects may spill over into building positive inter-group relations within residential communities. Importantly, it will also examine the pathways through which workplace-effects may operate; in particular, the role of positive (but also negative) mixing pathways. Lastly, it will perform a comparative analysis of diversity's effects across neighbourhoods to gauge the particular benefits for wider society of policies aimed at cultivating workplace diversity.

Cultural Globalization on the Printed Page: Stability and Change in the Proportion of Foreign Cultural Items in Five European Newspapers, 1960–2010

Cultural globalization is one of the key processes affecting cultural classifications and hierarchies in national contexts. The significance of national borders may have decreased during the last decades (at least in the sense of the abundance of global cultural items circulating across countries), but the influence and amount of global cultural flows are hardly similar everywhere. Distinctions between global and local might also have become more salient in novel ways. This paper presents an analysis of the changes in the relative weight of national and global culture and the arts in the cultural sections of nationally leading newspapers from five European countries – ABC/El País (Spain), Dagens Nyheter (Sweden), Helsingin Sanomat (Finland), Le Monde (France) and The Guardian (UK) – from 1960 to 2010. Through content analysis of samples of the newspapers (the unit of analysis being an article, altogether 11,775 cases), the paper examines how the composition of national and geographical origin of the artists and cultural products discussed has changed in 50 years. Thus, the paper asks whether the globalization of culture has increased or whether national culture remains dominant, to what degree there is variation according to the cultural area or art form discussed, and whether the five newspapers embedded in their national contexts are different in these respects. The analysis will cover several cultural areas, including music, literature, cinema, television and the fine arts. The results are in line with the supposed trend towards globalization of culture, but not as straightforwardly as one might expect.

Biographical Self-Presentations of International Students 'being on the Move'

When researching biographies in the context of globalization, mobility is one of the main features to take into account. Deterritorialization and cultural hybridization along with the interface of traveling and dwelling are assumed to produce new types of mobility beyond tourists and vagabonds, such as 'life-style migrants'. For members of the middle class and young people in particular, 'being on the move' is central in their lives and often expressed in their self-thematizations as 'natural' part of their biographies.

My qualitative fieldwork with international summer university students reveals how a comparatively privileged mobile generation emphasizes the importance of being in other places for processes of self-observation, self-development and biographical turns. Narrative interviews, conducted both in Berlin *and* in the students' home countries *before*, *during* and *after* their trips, were combined with participant observation, acquisition of social media postings, and personal pictures. First results indicate:

1. Biographies are increasingly connected to transnational and transcultural spaces. Students' experiences abroad become essential for post-trip lifestyles, global careers and entertaining self-thematizations on social media or back home. They are used to enhance one's status in local communities, but also serve to present universal abilities of qualification and biographical control.
2. The intercultural framing of the research in the context of international summer universities promotes group-specific narratives based on conjunctive student experiences abroad, self-discovery, adventure and authentic-

ity. It fosters common sense argumentation, valuation and explanatory description when implicit narration seems insufficient for mutual understanding.
3. Different patterns of selecting, presenting and combining experiences of mobility can be observed. Whereas social media tends to be playfully used to reproduce cultural stereotypes and to receive local affirmation for globalized biographies, the interviews reveal that periods abroad either function as exchangeable stations or as important liminal phases and rites de passage for processes of individuation, learning and transformation.

LAUX, SILKE* (University of Hannover, silkelaux@gmx.de)

International Summer University Students Between Dwelling and Traveling - a Longitudinal Study on Processes of Learning and Transformation in Consideration of Different Dimensions of Mobility

Mobility as a social phenomenon particularly requires a multi-level approach which considers temporal as well as spatial dimensions. This is due to the fact that mobility is intrinsically linked to the change of places and to reflections on the 'self' in the light of the 'other'. My qualitative empirical study, which focuses on how international summer university students ascribe meaning to their short term stay abroad, aims at an encompassing contextualization: first, by being based on three levels of data collection (data acquired *before*, *during* and *after* the students' trip abroad). Second, by incorporating into the analysis not only the destination visited, but also the usual places of residences. Third, by including into the sample students with or without migration background, with or without extensive experiences abroad. Since the beginning of my research, both dimensions have become evident as especially relevant for the experiences of students abroad. The analysis of narrative interviews – which were combined with participant observation and social media data – was based on the Documentary Method and indicates:

1. Periods abroad either function as exchangeable stations or important liminal phases and rites de passage for processes of individuation, learning and transformation. They are perceived as 'natural' parts of biographical control and prerequisites for the acquisition of 'universal' competences.
2. The dimensions 'migration background' and 'previous experiences abroad' go along with differences in the students' horizons of meaning. Those are either constituted by a reinforced search for the 'self' or the 'other', by an absent or existent sense for privileges or by multiple vs. one-dimensional schemes of comparison.
3. The intercultural framing of the research – the sample includes students from different countries as well as different institutional learning environments (summer university programs) – promotes group-specific narratives based on conjunctive student experiences abroad and orientations of self-discovery, adventure, and authenticity.

LAUX, THOMAS* (University of Chemnitz, thomas.laux@uni-bamberg.de)

Institutionalizing Freedom of the Press. a Comparative Analysis on the Structural Conditions for the Freedom of the Press in Constitutions

The study analyses the structural conditions for the spread and the institutionalization of freedom of the press in the constitution of nation states. Freedom of the press as a basic right was institutionalized by the United Nations on a global scale by the International Covenant on Civil and Political Rights in 1976. Between 1980 and 2009 the freedom of the press in law was institutionalized and thus can be found in 58 of 68 (85.3 %) newly adopted constitutions. This is surprising, because freedom of the press in action was and is violated by a high proportion of these states.

The analysis refers mostly to world-polity theory by John W. Meyer et al.. According to its assumptions, institutional isomorphism spreads globally because of the dominance of world-polity and its standards, e.g. human or political rights. Especially International Governmental Organizations (IGOs) and International Non-Governmental Organizations (INGOs) are major driving forces for the global diffusion of human rights. The empirical analysis applies world-polity theory on the institutionalization of freedom of the press in law. It focuses on the influence of IGOs and INGOs as well as on structural conditions of the states, like the political system, the legal system or the level of wealth.

The analysis is conducted by conducting a Qualitative Comparative Analysis (QCA) (Charles C. Ragin). Based on set theoretic assumptions, it allows differentiating between necessary and sufficient conditions for the institutionalization of freedom of the press. It is also a diversity- oriented method, which captures different and divergent pathways for institutionalizing freedom of the press.

The aim of the study is to identify different structural conditions and their interplay for institutionalizing freedom of the press in law. The results may enrich

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

world-polity theory in general and further explore the phenomenon of institutional decoupling.

LAVIZZARI, ANNA* (University of Kent, al392@kent.ac.uk)

Strategy, Performance, and Gender: An Interactionist Understanding of the Italian Lgbtq Movement and the Catholic Countermovement

Recent social movements scholarship is gradually moving away from (over) structuralist and mechanistic frameworks, towards a more nuanced understanding of the cultural and strategic dimensions of mobilization and collective action. This has spurred a renewed interest in understanding social movements as interactive processes, where gender is viewed as essential in understanding processes of recruitment and mobilization, strategies, frames, and forms of organization. Concurrently, participation in social movements and their gendered outcomes affect the life-course patterns of individuals in multiple ways.

For these new avenues of research, one of the core issues pertains to how young men and women interact within gendered social structures, and how they reproduce or contest gender hierarchies as they protest. This paper deploys the concept of social performance and gender performativity (that is, the process through which gendered meanings, roles, relations, and identities are continually being constructed and revised) in order to both examine the role that femininities and masculinities play in mobilization, as well as complicate our understanding of strategy in collective action. Namely, I suggest that the concept of social performance is optimally suited to make sense of non-strategic activity, and to highlight the tension between expressive and strategic action. This requires a further questioning of the continuum between strategic action and social performance: is all performance strategic, or is all strategy a performance?

The LGBT movement and the Catholic countermovement provide a case for the analysis of competing cultures of protest, where "gender" is currently the object of one of the most controversial debates in the Italian public arena. Looking at the key actors involved in this struggle for normative change, the paper aims at exploring the contended strategies, discourses, frames and performances from an interactionist perspective.

LAVRINENKO, OLGA* (Polish Academy of Sciences, lavrinenko.olga@gmail.com)

Social Identity, Procedural Justice and Political Outcomes: Testing of the Social Activists' Involvement in Anti-Authoritarianism Struggles in Belarus

Integration of social identity and social justice theories allows developing model for studies of social activists' involvement into social struggles in the conditions of authoritarianism. It is possible to hypothesize that evaluation of decision-making procedures and political outcomes as unfair have impact on social activists' involvement in the anti-authoritarianism struggles, while social identity mediates the effects of procedural justice and political outcomes judgments on social activists' involvement into social struggles. Social identity not only determines activists' involvement in social struggles (especially in the conditions of authoritarianism), but also enables explanation of the effects of procedural justice and political outcomes judgments that presumably have strong linkages with involvement into the social struggles.

The data for the study was collected in survey research of social activists' sample (N=556). Formulations of questions were adapted from Tom R. Tyler elaborations (Tyler & Caine 1981; Tyler & Blader 2003) and modified to make them reliable to measurement of social activists' judgments on social identity (identification, pride, respect), procedural fairness and outcomes (outcome level, outcomes fairness, outcome satisfaction) in Belarusian context. Besides of this, scale was elaborated to measure the degree of involvement into the social struggles.

Confirmatory factor analysis was conducted to verify whether the proposed model is a valid measure for relationships between observed variables and their constructs. Firstly, procedural justice, involvement into social struggles and three social identity measures (identification, pride, respect) were loaded on latent variable – social identity. Secondly, three outcome judgments (outcome level, outcome fairness, outcome satisfaction) were loaded on latent variable – political outcomes. Then regression analysis was conducted to test 1) the relationships between social identity and degree of involvement into the social struggles; 2) social identity mediation between procedural justice judgments and political outcomes; 3) social identity mediation between political outcomes and involvement into the social struggles.

National Habitus and the State Formation Process in Scotland

In 2014 a referendum was held in Scotland that placed the United Kingdom state in grave peril. Yet neither political nationalism in Scotland nor the managers of the UK state found it necessary to mobilise the means of physical violence to break or secure the unity of the UK state as a survival unit, although the removal of Britain's nuclear weapon system from the territorial waters of Scotland formed a central political issue during the referendum. Unlike Ireland, the fragmentation of the UK state in Scotland has thus far taken, and will almost certainly continue to take, a constitutional parliamentary form. Notwithstanding alarmist media reports and political PR, the heightened intensity of public debate and dialogue across wide swathes of Scottish society resulted in very few violent confrontations, although a single, and limited, loyalist confrontation with independence activists in the aftermath of the vote was widely reported. Despite the loss of the independence vote by 55:45%, political nationalism in Scotland, remarkably, increased its popular support. Scottish National Party membership grew from 9,500 in 2003, 25,000 in 2014 to 112,000 by 2015 (around 1 in 30 of the total electorate in Scotland), winning all but 3 seats in the UK General Election in May 2015, while the Labour Party won only a single seat compared to 41 in 2010, a catastrophic decline from its once seemingly impregnable hegemonic position throughout urban Scotland. These seismic political events occurred in a relatively short timescale and with an almost complete absence of political violence. This paper argues that the current trajectory of political nationalism in Scotland needs to be placed within the much longer historical time-scale of the British state formation process as a 'survival unit' (Elias 2012; Kaspersen and Gabriel, 2008) and the emergence of a distinctively Scottish national habitus (Elias, 2013).

LAWRENCE, ANDREW* (Vienna School of International Studies, Andrew.Lawrence@da-vienna.ac.at)

Producing and Consuming 'Green Transitions': Social Movement Challenges and Strategies

This paper critically engages with 'green transition' literature on energy politics to map possibilities for labor movements and community empowerment. It does so both to differentiate these potential benefits from those of 'green managerialism' as well as to illustrate their current realization with contemporary examples. 'Green managerialism' argues that improved environmental outcomes promote company profits through improving market access and product differentiation, and reducing costs of capital, labor, regulation, material, energy and services (Ambec and Lanoie 2008), and may also increase aggregate employment (Koskela and Schöb 1999). Although historically, the pressure for such reforms in corporate practice comes from labor and community organizations, I argue that these groups' interest in pursuing 'green transition' projects is rooted more in qualitative considerations and not primarily in those based on cost, however calculated (notwithstanding the growing consensus that wind and solar energy sources are increasingly cost-competitive with oil, coal, gas, and nuclear forms). Importantly, the mainstream leaves current relations of energy production and consumption unchallenged.

Specifically, social movements (including, prominently, labor) have an abiding concern with promoting greater degrees of popular oversight, participation, ownership, and control of renewable and sustainable systems of resource production, distribution, and consumption. Each of these factors bears directly or indirectly on questions of scale and decentralization, particularly of energy production and distribution. Taking examples from the EU, US, and South Africa, this paper illustrates how questions of oversight, participation, etc. have been framed by movement actors, the difficulties they encounter in framing issues in overly narrow and economistic terms, and concludes with some suggestions for overcoming these difficulties.

LAY, TONATIUH* (Universidad de Guadalajara, tonatiuh_lay@suv.udg.mx)

The Weakening of Civil Society and Strengthening of the De Powers in the Reform of Telecommunications Legislation in Mexico 2013-2015

Because the campaign of Enrique Pena Nieto had constant accusations of irregularities and an unprecedented support of the company Televisa, when he reached the Presidency of the Republic he summoned a *pact* with the left and right parties, trying to calm the social pressure. Through this union the government legitimized several major reforms, one of these was the telecommunications and broadcasting reform. But the *pact* as a mere political instrument, prevented criticism and proposals from civil society from getting to the legislature.

Both the legislative discussion of the constitutional reform of 2013 in the field of telecommunications, as well as the new Federal Telecommunications and Broadcasting Law in 2014, had higher receipt of proposals from the National

Chamber of the Industry of Radio and Television, while attention to civil society groups was lower, the citizen initiatives for reform were not even taken into account.

The above process culminated with the approval of the new law, which only benefits the large telecommunications, radio and television corporations, disregarding the right of citizens not only to have access to accurate, objective and timely information but also to handle their own broadcasting and telecommunications systems, thus violating Article 6 of the Constitution. Also, public policy in this area seems to close all public spaces, thus undermining the possibility of a real democracy.

This proposed paper aims to describe and analyze this process by the historical-structural method.

HIV Stigma and Coping in Romania

Background
In an era of medical advances that turned HIV into a chronic disease, stigma remains a challenge for people living with HIV (PLHIV) in Romania, discouraging them to be more socially active. The aim of the study is to identify factors associated with stigma, understanding the coping strategies PLHIV use to adapt to stigma.

Methods
A cross-sectional survey using a self-reported questionnaire was carried out between November 2014 and March 2015 among 252 adult PLHIV aware of their status for at least 6 months. A global score from HIV Stigma Scale (with 40 items, scores: 40-160) represented the dependent variable. Validated measures of quality of life (alpha= .934), coping (alpha= .843) resilience (alpha= .943) and depression (alpha= .946) were tested for association with HIV Stigma Scale (alpha=.943), Independent variables were subscales from the above mentioned scales. A linear multivariate regression was performed (adjusted r square of the final model was: .49) to identify factors associated with HIV stigma (mean 109.57, min. 57, max. 154).

Results
The most important predictors of stigma are those with a negative association: factor "social resources" from Resilience Scale for Adults (ß CI95%: -.374[-1.532 - -.515], p<.000), the domain "social relationships" from WHOQOL-HIV BREF (ß CI95%: -.306[-2.823 -.761], p<.001), followed by those with a positive association, respectively three factors from the Brief COPE Scale: self-blame (ß CI95%: .198[.795 3.574], p<.002), use of instrumental support (ß CI95%: .196[.740 4.160], p<.005) and religion (ß CI95%: .181[.451 3.357], p<.011).

Conclusion
Professionals need to better tackle the negative consequences of HIV stigma by enhancing personal development of the person which can create the premises for building social resources and relationships, but also supporting PLHIV to develop functional, adapted coping strategies and not only internalise the public blame.

LAZAR, FLORIN* (University of Bucharest, florin.lazar@sas.unibuc.ro)

Social Workers in Romania. Results from the First Study of Registered Social Workers

Background
After being banned for more than 25 years during communist regime, social work education was re-established in Romania in 1990 after the fall of the Iron Curtain. There have been 20 generations of social workers, being estimated that more than 35,000 graduated one of the 23 universities offering social work training nationwide, but no study was carried out on the characteristics of this workforce. As other studies have underlined (Barth, 2003; Dedoussi et al., 2004; Facchini & Lorenz, 2013; Flores et al., 2012; McCormack, 2001) to describe the workforce of social workers a professional organization is the most reliable source of data gathering and the most legitimate.

Methods
Administrative data of 4607 social workers registered until June 2014 in the National Register of Social Workers held by the National College of Social Workers of Romania were analysed.

Results
The profile of Romanian social worker is: female (88%), aged 36, working in public social services (75%), for more than 3 years and being trained in one of the main university centres in Romania. Almost a quarter of them graduated faith-based universities (mostly Orthodox). The main domains where social workers are employed are: General Directorates for Social Work and Child Protection (at county level), Public Social Work Services (at city/local level), child protection, faith-based/religious organisations, health and disability. Only 1% are in private

practice and 20% work in non-profit organisations, while 3% are unemployed. While the majority are employed as social workers, there continue to be some administrative positions where social workers are to be found, such as inspector, counsellor, referent or civil servant.

Implications
The high employment rate in the public sector makes social workers vulnerable to political decisions and public budgetary cuts in austerity times. Research may serve in advocacy campaigns for better positionning of the professional organisation.

LAZAREVIC, PATRICK* (TU Dortmund, Patrick.Lazarevic@TU-Dortmund.de)

Rating Your Health: An Examination of Non-Health-Related Factors and Differential Item Functioning in the Self-Rating of Health

Cross-nationally comparative analyses are frequently used in order to identify social policy influences on health and health inequalities. A substantively meaningful comparison is based upon the assumption that subjects or data are comparable. In the case of self-rated health (SRH), this comparability is questionable due to manifold factors, such as differential expectations for ones' health, varying frames of reference, or cultural contexts. Also, it is highly likely that such ratings are influenced by non-health-related factors like personal, interviewer, or methodological characteristics. The present paper aims to identify such non-health-related influences on a person's SRH.

In a first step we predicted SRH using a wide range of objective health factors based on the information of 14,400 participants of the fifth wave of the Survey of Ageing, Retirement and Health in Europe (SHARE). In a second step, we used a model covering factors such as interviewer characteristics, satisfaction with life, and the country of origin in order to explain the residuals of this first regression, and thus the variance steming from non-health-related aspects. All analyses were also carried out separately by gender and age-groups in order to identify differential response behaviors for these groups.

The basic health model explained a high amount of the variance ($R^2 = 0.46$), with only minor differences by sex and some differences by age-groups. As for the non-health-related model, consistent influences of the interviewers' own SRH, the general life satisfaction of the participant and the country of residence (with Swedes and Belgians reporting more positively) were overall found to explain a modest amount of variance ($R^2 = 0.09$), with some differences by gender and age-group. These results illustrate the necessity for researchers to take factors such as age-specific response behavior and non-health-related influences into account to provide a valid base for evidence-based public policies.

"(Anti-) corruption in Vietnam and Singapore, analysis of cultural and institutional conditions"

Vietnam's struggle against corruption is stuck for a long period regardless of the recognition of the global trillion-dollar pandemic as "internal enemy to national development". There is a shortage of vision, insights, innovative methods and political will for change. Exacerbating this problem, corruption research in Vietnam was mainly small-scaled, project-based, diagnostic or sector-focused while cultural conditions and social construction of corruption is underestimated. Alternatively, this study analyses the cultural and institutional conditions comparatively for Vietnam and Singapore, in search for the best applicable anti-corruption practices. Singapore is the best choice to reflect most clearly how different visions of development, capitalism and socialism, with similar national contexts of Confucianism, colonial heritage and pre-modernity conditions can lead to opposite measures and achievement of anti-corruption. Research findings confirm that Vietnamese cultural and formal institutions interplay in spreading corrupt practices. The key institutional determinants are the authoritative political system, inefficient public governance, weak law enforcement and rule of law, weak civil society and censored press that hinder transparency, accountability, leading to bear opportunities, to loosen rewards and to reduce the costs for corruption. On the other side, common tolerance on corruption as a solution for social transactions, and transitional "social value disorder" nurture corrupt practice. A hypothesis of conditioned radical-system-change resolution, through knowledge transfer, is required if Vietnam wants to transform itself like Singapore in response to corruption. . More specifically, the Vietnam's reforms bears winners and losers through widening inequality gaps and injustice due to the emergence of minor illegitimate "new rich", rent-seeking public officials at the expense of majority of poor, vulnerable groups such as voiceless and land-losing farmers. A strong requirement for the rule of law, good governance, transparency, accountability, integrity in public sector is necessary.

LE GRAND, ELIAS* (Stockholm University, elias.legrand@sociology.su.se)

Bauman and Maffesoli on Identity, (de)Individualisation and Neo-Tribal Sociality

This paper discusses the relationship between identity construction and individualisation in the context of neo-tribal forms of sociality. Originally developed by Maffesoli, neo-tribes or *tribus* are typically conceived as elective, ephemeral, affective, non-instrumental and tactile forms of associations. As such neo-tribes are seen as resulting from a breakdown of traditional class structures and processes of deindividualisation – a massification and 'tribalisation' of (Western) societies. But for Bauman and other commentators neo-tribal associations are rather a response to increasing individualisation in that they re-embed individuals in society and serve as a source of belonging and meaning, however temporary. Maffesoli also argues that in the postmodern era, the notion of the individual has been replaced by what he calls 'persona', a fragmented sense of self likened to a changeable mask in which different roles are enacted in interaction. Critically engaging with Bauman's and Maffesoli's arguments, the paper seeks to complicate the elective and fragmented character of neo-tribes and their role in identity formation. Rather than elective and open to everyone it is argued that individuals' involvement in neo-tribes are tied to social inequalities. This is partly acknowledged by Bauman who argues that the poor lack the financial means to participate in neo-tribes. However, he underplays the role of cultural and symbolic resources in structuring such participation. Similarly, the paper argues that while individuals participate in a plurality of neo-tribes serving to express different facets of their selves and senses of belonging, neo-tribal lifestyles may still be chosen and constructed according to some core organising values and tastes, the appropriation of which are tied to the acquisition of valued resources unequally distributed among different groupings of individuals. These arguments are developed via a discussion of recent research on 'foodies' and on different food-oriented contexts of neo-tribal sociality, particularly sites of 'alternative' food provision.

RC13-157.4

LE GRAND, ELIAS* (Stockholm University, elias.legrand@sociology.su.se)

Conviviality and Belonging or Distinction and Exclusion? Neo-Tribal Leisure Practices in Contemporary Consumer Culture

This paper addresses the question of whether and how leisure can be a social and moral good, in the context of neo-tribal forms of sociality. Following the foundational work of Maffesoli, neo-tribes or *tribus* are usually conceived as temporary, fluid, inclusive and emotionally charged forms of communality formed in and through leisure activities and spaces. Many scholars deploying the concept argue that in an increasingly individualised world where individuals are disembedded from traditional social structures and collective identities such as those based on class, neo-tribal leisure practices can serve to re-embed them into collective forms of conviviality, identification and belonging, however fleeting. Hence neo-tribes can be interpreted as a positive counterforce to the potential negative effects of individualisation such as anxiety, alienation and a loss of community. It is argued that while some aspects of neo-tribal sociality are beneficial and tied to an inclusive, non-instrumental and democratic sensibility, they are coupled with processes and relationships tied to the reproduction of social and symbolic hierarchies, as well as to often subtle forms of exclusion. In this way, the paper suggests that neo-tribal forms of sociality may be bound up with hierarchies of value and tied individuals' differential access to economic, cultural and social resources. As a consequence those lacking in such resources may be excluded from participating in certain neo-tribal forms of sociality. These arguments are developed by exploring recent research on neo-tribal leisure sites in the domain of 'alternative' food provision, including farmers markets, food festivals, food cooperatives and food box schemes.

I Feel Bad, What Else? Prescribing As a Non Linear Relation

With the rise of biomedicine and EBM in psychiatry, mental disorders have been perceived as entities logically embodied in a linear relation between etiology, diagnosis and drug treatment. But, what does it mean for the practice of GPs? When a patient argues she/he feels bad, everything remains opened.

Social studies pointed out that physicians and patients gather a limited series of information during medical interviews: somatic or organic trouble, social or relational factor, structure of personality or natural inclination, psychology of self or individual expression. By selecting and sometimes arranging this kind of information in a comprehensive way, physicians and patients often make a "diagnosis with explanation", that is an interpretation as a social and a whole meaning.

Mental Suffering and Risk Society in Brazil

This essay aims to reflect about mental suffering, in contemporary society, understood as the product of profound changes in western industrial societies, within a context of reflective modernization. Differently from the first modernization process, now the certainties of industrial society itself are called into question, thus throwing the individual into the 'turbulent waters' of what Ulrich Beck named 'Risk Society'. Within this context, risks result from human decisions and their consequences or collateral effects, which result from the successes and radicalization of the modern processes. The risks are not perceived as external, natural or divine, but as the result of the choices taken by individuals. This produces what Beck calls the Individualizing Process, or Individualization, that relates to the deconstruction of the life structure which constitutes modern industrial societies and to the (re)construction of a new structure, in which the individuals should produce, decide and assume responsibility for their own biographies. Here, the life projects, the risks, the decisions and their choices and consequences come to be perceived and centred in the individual. New ways of social reintegration deconstruct the symbolic frame of reference. The choices and individual burden of self-biography produces a kind of 'biographies and identities of risk', susceptible to crises and deeper mental suffering. A kind of 'subjectivity of risk', crossed by crises and by mental suffering, due to the overhead of the individual, abandoned to their choices, condemned to their freedoms and choices. Brazil, which passes through an acceleration of industrial development, profound changes in the family, labor market and consumption, and epidemiological transformations - typical transformations of the individualization process - faces a rising tide of mental illness. It is essential to understand this scenario and the specifics of the risk society, to approach an understanding of contemporary forms of suffering and how to handle them.

CHERUBINI, DANIELA (University of Milano-Bicocca)

Arab Mediterranean Youth and the Representation of the Future

Young people's relationship with the future is a key issue in sociological reflection and a strategic point of departure for the analysis of social change. Main debates on this issue revolve around young people's strategies to confront an uncertain future and to maintain some forms of biographical projectuality in a context of rapid transformations and widespread economic and social uncertainty.

The paper will address these issues drawing on qualitative research on the representations of the future expressed by young people of Arab Mediterranean origin in Italy. It explores how their orientation towards the future is changing, mostly in relation to the dramatic political change of their countries of origin. According to current research, prevalent narratives of the future expressed by European youths seem to be articulated around the idea of the crisis, while the visions of the Arab youths tend more to convey an idea of trust and progress. The analysis will show how the young people of Arab Mediterranean origin who live in Italy deal with these divergent visions of the future, coming to an original synthesis between these polarities.

The paper is part of the FP7 research project "Empowering the new generation: towards a new social contract in South and East Mediterranean countries (SAHWA)".

The Crisis of Work Sociology in the Era of Neoliberalism: The Case of South Korea

In South Korea, work regime and labor market have been transformed toward flexibilization since the neoliberal restructuring launched under the economic crisis taking place in 1998. The dominant reform discourse has been driven by neo-classical economists, who imported the US-based neoliberal theories. The sociologists, who are majoring in the labor studies and sociology of work, have produced the discourse of resistance against the neoliberal reforms of labor markets, but failed to gain the public influence in the contested discourse. My paper is to delineate the failed resistance by sociologists in Korea and try to explain why they failed.

Loss of Authenticity: A Case Study of Jeon-Ju Hanok Village(Korean Traditional House) in South Korea

Jeon-Ju Hanok Village is located in Jeon-Ju, South Korea. The origin of Hanok was when the forceful breakdown of the doors of the castle allowed the Japanese to enter into the castle and to rule over the commercial supremacy till 1945. To fight against this, Koreans started to make the Hanok village which was to show their consciousness of conflict and patriotism.

According to the recent study, tourists visiting Hanok village are increasing by million every year, recording 6 million tourists in 2014. The main programs that attract tourists are handicraft exhibition, Korean traditional academy such as playing Korean traditional musical instruments and also allowing the tourists to understand and to experience Korean traditional wedding, make Korean traditional food and build Hanok house.

With the increasing development, a lot of restaurants, café and shops have entered into the village. It has become convenient for the tourists to enjoy food and coffee, buy cosmetics and souvenir. Moreover, couples and families are able to make great memories by taking pictures in Hanbok (Korean traditional clothes) which they can borrow from the shop. Accommodation for the tourists is also available in Hanok house where all the necessities are placed in modern style.

The purpose of the tourism has become hazy as the tradition gets clouded over with the convenience. The entrance of convenient store, cosmetic shops and cafes are destroying the original sights of the Hanok village. Also, the accommodation system that serves modern style of stay in a traditional house does not allow the tourists to fully experience the perfect tradition of Korean house.

These disadvantages will let Hanok village loss its traditional identity and the tourists will lose their expectation of original purpose, which was to experience the tradition.

Inquiring into the Policy of Integration of Early Childhood Education and Care in Taiwan: From a Politics of Difference

The pursuit of social justice and capacity for self-development has been regarded as one of the major goals that all the democratic societies should run for it. However, the provision of equal educational opportunity in Taiwan is more focused on lower and upper secondary education systems, such as 9-year compulsory education enacted in 1968 and 12-year basic education enacted in 2011, and less on preschool education provision. On the other hand, the policy of equality of educational opportunity in current Taiwan is more like the distributive paradigm which restricts the meaning of social justice to the morally proper distribution of material goods such as resources, income and wealth. This kind of policy tends to ignore the social structure and institutional context that often help determine distributive patterns. While distributive issues are crucial to a satisfactory conception of justice, as Iris Young argues, it is a mistake to reduce social justice to distribution. Young's politics of difference remind us that the concept of social justice includes all aspects of institutional rules and relations, and the concepts of domination and oppression, rather than the concept of distribution, should be the starting point for a conception of social justice. Since the Policy of Integration of Early Childhood Education and Care was enacted in 2012, there are still some controversies with the provision of equal opportunity for early childhood education, such as the defects of the policy, the difference of policy design, the diversification of interest parties, the lack of fair competition environment, and so on. Therefore, this paper, by means of Young's politics of difference, rather than the distributive policy, tries to inquire into whether and how the Policy of Integration of Early Childhood Education and Care can achieve social justice and capacity for self-development in Taiwan's early childhood education system.

Local Residents Empowerment in Post 3.11 Community Reconstruction-Creating Disaster Game"Crossroad:Oarai"

The devastating and lingering effects of the accident at the Fukushima Nuclear Power Plant have exacerbated the already complicated and difficult process of recovery from the 2011 Tôhoku Earthquake. Because even experts sometimes provide totally different views on the safety of radioactive contamination, the boundary between scientific truth and misconception has been blurred considerably. It caused that residents in affected areas avoid to face the problems of radioactive contamination and harmful rumors about nuclear crisis. For resolve this problem, we conducted to develop an Oarai version of the "Crossroad" Disaster Game called "Crossroad: Oarai". The original "Crossroad" game is an educational risk communication tool that presents players with dilemmas faced by a diverse range of actors dealing with the aftermath of and responses to the Great Hanshin earthquake. Participants deepen their understanding of disaster prevention, reduction, reconstruction, and recovery by answering yes or no questions about these dilemmas. The new version we developed is based on the experiences of residents during and after the 2011 Tôhoku Earthquake in Oarai town Ibaraki prefecture Japan. This community suffered the tsunami and radioactive contamination and harmful rumors about nuclear crisis. The questions created by Oarai people including hotel operators, fishers, housewives, and town officials, starting during the earthquake and tsunami and continuing through the recovery. In this study, we held the "Crossroad :Oarai "gaming workshops in Oarai and used narrative analysis to clarify the residents' concern through this approach. We found out that local residents who concerned about the negative perspective from society rather than the real damage affects from disasters. Through this game, residents communicated to each other and shared the variety views in community. This study also showed an empowered communities approach for local communities to shape decision-making and set the agenda.

Internalizing Serious Leisure As a Means to Promote Well-Being

Serious leisure (SL) is an ongoing, systematic pursuit of the skills, knowledge and experiences required in a leisure activity (Stebbins, 2007). To become serious, a recreationist immerses into the subculture of a particular SL activity and establishes a leisure identity and career (Shipway & Jones, 2008). Ultimately, it becomes a central life interest (Stebbins, 2007). Since abundant information shows how SL leads to various benefits (Brown, 2007; Stalp & Conti, 2011), the subsequent need is to examine the link between SL and well-being (Stebbins, 2007). Several reasons support this need. First, recent empirical evidence shows that there are multiple motivations for SL and that identified regulation is a stronger motivation for serious leisure experiences, compared to other motivations in line with the Organismic Integration Theory (Lee, 2013). Identified regulation means that recreationists internalize the norms and values of an SL subculture. The process of internalization provides a sense of volition and a sense of freedom, which lead to psychological well-being (Ryan, Huta, & Deci, 2008). Further, previous studies reveal that less-internalized experiences, such as peer-pressure (Stebbins, 2005) and gender expectation (Dilley & Scranton, 2010), can discourage recreationists from engagements. A lower sense of volition may lead to reduced well-being. For example, Vallerand et al. (2006) found that a passion for sports driven by external regulations leads to negative emotions. Moreover, SL influences one's lifestyle in ways that may not be recognized by outsiders (Anderson & Taylor, 2010; Dilley & Scranton, 2010). The interaction of SL and other life domains may have a profound effect on how we define a good life. However, the levels of internalization may determine how recreationists' capacities to cope with the conflicts between SL and other life domains, and ultimately achieve an optimal leisure lifestyle (Stebbins, 2005).

The Impact of Government's Integration Policy on Services of Religious NGOs for Immigrants

This study examines the dynamics between religious NGOs for immigrants in the context of multicultural society in Korea through the theory of 'governmentality'. As the proportion of immigrants continues to increase, the government has implemented various policies to the adaptation and the integration of these immigrants simultaneously with the active participation from a number of NGOs, in the dimension of civil society. In particular, religious NGOs play a pivotal role in immigrant-related, in which these activities are profoundly influenced by the government policies.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

This research attempts to analyze the impact of government's integration policy among three major religious NGOs (namely Catholicism, Protestantism, and Buddhism) in application to the immigrants through the theory of 'governmentality'. The qualitative methods are utilized such as the participant observations and in-depth interviews, between October 2014 to October 2015, with the leaders and members of seven religious NGOs including Catholic, Protestant, Buddhist, and non-affiliate organizations in the local community.

Our findings reveal that although the three religious NGOs have different values and objectives initially, the differences have decreased to uniformity as the government's integration policies heavily intervened in services of the religious NGOs. Religious NGOs have demonstrated implicit or explicit tensions and competition between groups. Competition stemming from the tension has been intensified due to the effect of governmentality. These tensions and competition result in a duplication of activities between groups as well as restricting themselves on activities to realize their own value. NGOs for immigrants in the local community exercised various efforts in alignment to overcome the governmentality. In conclusion, this study significantly contributes to the social analyses on the dynamic relations between the government policy and NGOs' activity as well as between NGOs in the local community setting and the social significance of building solidarity based on mutual trust of religion-based NGOs to adhere to their own values.

LEE, SANGJI* (IOM-MRTC, lsj4482@hanmail.net)

The Public Role of Religious NGOs and the Problem of Social Integration: How Are Religious Markets and Public Religions in Conflict?

What are the public roles of religion in the light of discourses on social welfare? Subtle clashes have been noticed between theorists of religious markets and those of public religions: whether one emphasize the private role of market-oriented innovation or the public role of religions in civil society. We need to explore the commonalities and differences between the two theories. In Korea, religious organizations have played major roles in the civil society. Especially, in this era of globalization, many religious NGOs have participated in the public activities for immigrants.

My research tries to analyze the roles of religious NGOs for immigrants and examine how socially integrative each of three major religions (e.g., Catholicism, Protestantism, and Buddhism) is in its activities for immigrants in Korea. For this task, I utilizes qualitative methods such as participant observations and in-depth interviews, from October, 2014 to October, 2015, with the leaders and members of six religious NGOs including Catholic, Protestant, Buddhist, and non-affiliate organizations.

On the one hand, religious market theory reflect on the competitive circumstances of religious NGOs to secure or recruit more believers. In contrast, the theory of public religion can explain religious NGOs' activities supporting the human rights of immigrants in the public sphere. There are common activities for the immigrants' welfare at the private level, which are not covered by the government.

Religious NGOs demonstrate implicit or explicit tensions and competition between groups based on different religious characteristics, objectives and services. Especially, different directions of activities raise tension between religious NGOs. This circumstances could impede integration of local community. In conclusion, this study contribute to examine closely of the roles of religion in the civil society in context of multiculturalism and explain the main cause the dynamics between religious NGOs.

When Narrative Is Failed: A Comparative Study of Environmental Movement Narratives of Buddhist Society in South Korea

In this study, I have tried to reveal the dual aspects of social movement of religious organizations through the case of South Korean Buddhist societies. Environmental movement is the most important area of religious organization's social participation in Korea since late 90's. In these movements, religious societies have been contributed to make the whole society to *reflect the compressed modernization process* and to search for the alternative way of life. A lot of movements were quite successful because of their rich resource mobilization potential including both material and social hegemonic one. However, in these movement process, most central element to successful mobilization was the construction of *narratives* that is sufficiently strong that they could interpret environmental issues as their own religious task: that is, *the secular* should be translated into *the sacred*. When this construction failed, mainly because of political-economic repression, environmental issues remained mere inner doctrinal controversy in religious societies. I will show different consequences of strength of narratives through the comparison between two representative environmental movements of Korean Buddhists: anti-movement against national development of *Mt. Chunsungsan* tunnel and *Mt. Bukhansan* tunnel.

Religion, Identity, and Muslim Second Generation School Outcomes in Europe

This paper explores the influences of religiosity, ethnic identity, and national identity on the outcomes of Muslim second generation immigrant children, who as a group consistently tend to be more religious than the native population and who are often viewed as a religious "other." Born and raised in the host country while experiencing multiple cultures, how do Muslim second-generation immigrants identify themselves, and how might religiosity relate to their identity as well as their school outcomes? Research questions are explored using the Children of Immigrants Longitudinal Survey in Four European Countries (CILS4EU). Study 1 examines the functional role of religiosity of Muslim second generation high school students on school performance in Germany, based on the theoretical arguments of the context-dependent mechanisms of religion as a "bridge" or "barrier" for immigrant outcomes. Results through multilevel modeling indicate that although Muslim students have lower school grades than their non-Muslim counterparts, the presence of religious peers has positive effects for the outcomes of nominal Muslims, i.e. Muslims who are not religiously active. Findings of this study partially confirm and partially refute the notion of religion as a "barrier" in Western European contexts. Study 2 explores how context impacts the relationship between religiosity and identity as well as the possibility of hyphenated identities (expressing both ethnic and national attachment) among Muslim youth. As expected, results indicate that more religious Muslim children tend to express stronger ethnic identity and weaker national identity than their less religious counterparts, which is further influenced in contexts where anti-Muslim sentiment is higher. In addition, preliminary results suggest that less religious Muslim students are more likely to express hyphenated identities (both ethnic and national attachment). This paper aims to disentangle and examine the complex relationship between meso-contexts, identity, and religiosity of immigrant youth.

Leisure Education Governance for Ageing Well: The Serious Leisure Perspective (SLP)

This paper explores the theoretic and practical implications of the serious leisure perspective (SLP) – the theoretic framework that synthesizes three main forms of leisure, known as serious pursuits (serious leisure / devotee work), casual leisure, and project-based leisure – when applied to the development and analysis of leisure education governance for ageing well. Leisure in this paper, mainly dealt with in the process where there is a dynamic interplay between people and the society, is defined as un-coerced, contextually framed activity and leisure education is also viewed as a lifelong developmental process. My plan is to critically review previous theoretic and empirical studies on the issues relating to leisure education governance. First, the author proposes that leisure and leisure education need to be reappraised with reference to the contemporary context which seems to have an age-integrated structure between education, work and leisure that were once perceived to be clearly separated by a simple image of economic work life. Then, I draw attention to discussions of governance (especially, policy network theory) being construed as a theoretic and practical perspective at the policy level. Here, some of issues which agencies (or actors) must consider, when preparing a practical alternative to leisure education governance for ageing well, are reviewed. Lastly, this paper applies the SLP to the development and analysis of leisure education governance, while trying to come up with better solutions to the problems it could face. Due to these efforts, the paper contributes to the development of a corpus not only focused on knowledge of leisure education governance but also on knowledge for leisure education governance.

LEE, YOUNG HEE* (The Catholic University of Korea, leeyoung@catholic.ac.kr)

Towards a Global Climate Citizenship?: Focused on "World Wide Views on Climate and Energy 2015" in Korea

What is a global climate citizenship, and how can it be formed? This paper tries to answer the question based on a citizens' participation project on a global level, "World Wide Views on Climate and Energy (WWViews) in 2015", where I served as a national project manager in Korea. WWViews is a multisite citizen consultation on global issues such as biodiversity or climate change. The core of WWViews method is to have citizens at multiple sites deliberate the same issue on the same day. The theoretical framework upon which WWViews is based is deliberative democracy. The WWviews public consultation method is a kind of mixture of some deliberative forums like consensus conference and deliberative polling.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

10,000 citizens from 76 countries including Korea participated in the WWViews event on climate change on the same day, 6th June in 2015. In Korea 70 randomly selected citizens around the whole country participated in the one-day long deliberations on climate change issue along with other global citizens. The day was divided into 5 thematic sessions, where 13 small groups composed of 5-8 citizens deliberated on the issue assisted by a trained facilitator. After the deliberation, citizens voted individually on the prepared questions related to the issue. Votes were then collected and reported to the World Wide Views website, where results could be compared as they arrived throughout the day – starting in Fiji in Pacific Ocean and finishing on the American West Coast.

It can be said that WWViews is one example of how new, collaborative networks on the global issues can be established globally. This paper will try to scrutinize how much has "World Wide Views on Climate and Energy 2015" contributed to the formation of "global climate citizenship" on a global issue like climate change through analyzing WWViews experience in Korea 2015.

Patient Centered Professionalism? Mental Health Care Workers' Response to Patient Participation

Patient participation is an important development in Dutch mental health care. Enhanced patient centeredness is considered an key condition to achieve quality of care. One way to realise this is allowing patients to have voice in care and treatment.

Notwithstanding a general positive attitude towards patient participation, mental health professionals show ambivalent responses to it. In practice, this development confronts them with dilemmas. What if patients make 'wrong' decisions from a professional perspective? Who determines 'good care'? Patient and professional logics may clash and discussion about the boundaries of professional domains may arise.

We investigate whether these possible clashes between patient and professional logics are linked to the definition of professional domains and the occupational attitude of professionals. Professionals vary in their occupational attitude, degree of professionalization and professional content and focus. We explore how different types of mental health professionals respond to the described dilemmas and to which extent they are open to patient participation. Four types of mental health professionals are compared: psychiatrists, psychologists, nurses and social workers.

During the first research phase, a comparison is made by analyzing formal professional frameworks, displayed in documents like professional profiles, codes of conduct, professional guidelines and protocols. During the second research phase, representatives of the four professions are interviewed.

We present intermediate results, covering the document analysis and the first series of interviews. Preliminary results of the document analysis for three professions show clear differences between them. Social workers' frameworks show more openness to patient participation than the frameworks of psychatrists and nurses, which put more emphasis on professional responsibility.

From further analysis and the interviews, we expect multiple responses of different mental health professionals to patient participation. Not acknowledging these differences may impede further development of patient participation in mental health care.

Turning Points during Transitions to Adulthood – the Descendants of Immigrants in Germany

Transitions to adulthood are a major topic in research on life courses, education, labor markets, and migration. In our mixed methods study, we analyze the early life courses of descendants of immigrants through adolescence, young adulthood, and midlife. We use the German socio-economic panel (SOEP), a representative longitudinal study of about 30,000 respondents and complement this data with 30 in-depth biographical interviews we conducted with long-term SOEP respondents in 2015. This combination of data allows studying transitions to adulthood in detail and helps understanding what factors shape trajectories.

In our paper, we focus on turning points during the transition to adulthood. Turning points are sequences in a life course during which paths are redirected. Our focus lies on early adolescence and young adulthood, since turning points often occur during early adolescence and continue into young adulthood. We ask how do turning points unfold, and what role do they play in upward or downward social mobility? What experiences during childhood and adolescence influence how turning points unfold? What factors shape potential turning points during the transition to adulthood? In our analysis, we track influential factors such as institutional structures, family and kin relations, peer networks, and individual agency

to understand how they shape turning points and thus influence educational and labor market trajectories.

What If Citizens Participate in Research Project ? a Democratic Governance of Science.

There is a growing demand to include Civil Society in research process last few years. One reason frequently cited in favor of CSO involvement in research is that it can help "democratize science", giving citizens a voice. Participatory action research, as well as collaborative planning or technological assessments for instance are very different ways of including Civil Society Organisations in research projects. Despite the potential importance of CSOs, little was known until recently about the practice of including them in research projects.

While many research projects involve citizens in specific actions (such as consensus conferences), few include individual citizens not organized in a collective group. (Examples are projects dealing with citizen science, the social sector and the arts). It is very difficult to involve citizens directly and in every step of research projects. CSOs can provide direct access to citizens' views, and in many cases act as a skilled mediator between the research team and citizens' inputs. The majority of research projects with CSO participation feature CSOs that address specific interests such as patients, industry, agriculture, fishing, etc. But that seems to be changing. The progressive awareness of environmental risks by different stakeholders have highlighted that public engagement "upstream" in research project could help to find robust solutions (Callon, Lascoume, Barthe, 2001) to environmental matters.

In this paper we will analyse how and to what extent scientific research projects including CSOs may mobilize and create new collaborative routines and innovate in the environmental field.

We will use 15 case studies of 15 participative research projects coming from the CONSIDER project.

Hence, CSO involvement in research tends to be able to overcome some sorts of scientific closure, when sharing diagnostic and research tasks in such manner that every partner commitment is recognized.

When Participatory Research Tackles Environmental Stakes. Science, Democracy and Expertise

There is a growing demand to include Civil Society in research process last few years. One reason frequently cited in favor of CSO involvement in research is that it can help "democratize science", giving citizens a voice. Participatory action research, as well as collaborative planning or technological assessments for instance are very different ways of including Civil Society Organisations in research projects. Despite the potential importance of CSOs, little was known until recently about the practice of including them in research projects. Moreover it is important to be aware that CSO members involved in such projects are generally not lay citizens; they tend to be skilled and educated and may have research experience. They are valued as experts.

While many research projects involve citizens in specific actions (such as consensus conferences), few include individual citizens not organized in a collective group. (Examples are projects dealing with citizen science, the social sector and the arts). CSOs can provide direct access to citizens' views, and in many cases act as a skilled mediator between the research team and citizens' inputs. The majority of research projects with CSO participation feature CSOs that are seeen as experts and that address specific interests such as patients, industry, agriculture, fishing, etc. But that seems to be changing. The progressive awareness of environmental risks by different stakeholders have highlighted that public engagement "upstream" in research project could help to find robust solutions (Callon, Lascoume, Barthe, 2001) to environmental matters.

In this paper we will analyse how and to what extent scientific research projects including CSOs may mobilize and create new collaborative routines and innovate in the environmental field.

Global Online Labour Markets: Theoretical Perspectives and Initial Findings

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

We present theoretical perspectives and early results from iLabour, an ERC Starting Grant funded project on the social construction of global online labour markets on the Internet. The iLabour project is premised on the idea that ICT adoption is changing the social, technical, and institutional arrangements through which work and earnings are allocated in society. Previously these arrangements were shaped and enforced through processes of legislation, collective bargaining, and local negotiation. Today, as part of the ongoing digitization of almost every aspect of society, these arrangements are increasingly being shaped and constrained by private software systems that mediate between workers and employers.

The project studies transnational online labour markets (OLMs), also referred to as online work platforms, online staffing platforms, and crowdsourcing marketplaces, forming part of the so-called "platform economy" or "gig economy". For example, a platform called Upwork has 4.5 million registered workers (contractors) and over a million registered employers (clients) in 180 countries, and facilitated over half a billion USD worth of transactions last year. The project addresses questions about the size and growth of these markets, the kinds of rules that they institutionalize, the politics and processes through which these rules are shaped, and the ways in which traditional labour market organizations as well as novel worker initiatives succeed or fail in influencing their rules. We will also ask what kind of an economy OLMs contribute towards – a global race to the bottom, a playful economy of moonlighters, or a network economy of individual entrepreneurs? We tackle these questions through an ambitious programme of conventional social research and innovative data science methods, including transaction data obtained directly from Upwork.

Making Sociology Viable: Certifying Practitioners and Accrediting Programs

Individual practitioners may be certified as more than adequately trained and experienced, while teaching programs may be accredited as having the faculty, facilities and curriculum necessary for a well-rounded education. In the United States the Association for Applied and Clinical Sociology (AACS) certifies individual practitioners at the Master's or Doctoral level. The process involves an evaluation by previously certified peers and includes the submission of a portfolio and the completion of a demonstration in which applicants showcase their action oriented work. Certification is not state licensure.

The Commission on the Accreditation of Programs in Applied and Clinical Sociology (CAPACS) accredits sociology programs at the Baccalaureate, Master's, and Doctoral level. The program must meet curriculum standards in the areas of sociological theory, methods, skills, and practical experience such as an internship as well as having adequate faculty, resources, and facilities to support the program. Accreditation assures the quality and performance of the program.

Applied, clinical, and public sociology- can be made stronger as a profession if it is populated by practitioners who are certified graduates of accredited programs.

Social Investment Perspective and European Union: An Iron Fist in Velvet Glove?

Despite economic downturn and neo-liberal ideas, the Social Investment Perspective should assist social policy to sustain and strengthen its raison d'être in Europe. Despite criticisms, the discussion seems to miss the wood for the trees. The reason for synthesizing the social investment strategy was to re-align Keynesian and neo-liberal social policy and to provide a viable alternative for policy makers (Morel et al. 2012). To foster economic growth, full employment and social cohesion (as well as inclusion) simultaneously, Morel et al. want to re-channel welfare state resources to address skill demand and to provide social security and social services that support a more flexible labor market and raise overall employment rates. Actors on national and supra-national level should reconsider their policies accordingly.

Fierce debates succeeded, but have omitted the European Commission's Social Investment Package. The European Commission has published numerous social policy papers under the Social Investment Package in 2013. Those documents can serve as an indicator on the degree of neo-liberalism incorporated in the social investment perspective by a main actor. As the European Union, especially its non-majoritarian institutions like the Commission, is condemned as neo-liberal driving force, the impact of the social investment perspective in its social policy papers is crucial.

To be able to assess the effect of the social investment perspective and extend of neo-liberalism in European social policy, the article elaborates theoretical aspects on neo-liberalism in relation to the social investment perspective and establishes criteria for the assessment. Second, the developed grid measures the share of neo-liberal social policy in core European social investment policy documents via a qualitative content analysis. Subsequently, key aspects are discursively elaborated to provide for depth. Third, the discussion ties together the empirical findings and theoretical arguments and, fourth, the conclusion evaluates the direction of the European social policy.

Towards a Global Civic Minimum? the Idea and Practice of Minimum Income Security

The idea of a social minimum to be secured to all human beings is widely accepted, advanced by political philosophers like Rawls and by international organizations like the ILO (Convention no. 102, 1952; Declaration on 'Social Protection Floors' 2012). In (most) Western welfare states, fighting poverty is the least common denominator, and this implies a notion or even specification of a social minimum. In the face of vast inequalities, states and international organizations tend to give priority to securing at least a minimum for the poor, as in Sustainable Development Goal no. 1. Basic socio-economic security not only provides welfare but also enables citizens to participate in public affairs (civic minimum).

The rise of social protection since the 1990s, both in global discourses and in countries of the global South, especially of social assistance, suggests that the idea and practice of a social minimum is spreading worldwide. The paper puts this suggestion to the test, based on original data from the interdisciplinary FLOOR project, taking income security as example.

The paper (first) seeks to conceptualize and operationalize the notion of a social minimum. Second, the paper inquires into the notion of a social minimum in three global arenas: international human rights law and human rights discourses; discourses on development by international organizations; and domestic policies and institutions in low and middle income countries. We find that minimum income security is largely absent in global politics, not only in practice but more fundamentally even in ideas, norms and policy designs. Third, the paper seeks to explain the weakness of the idea of a social minimum, naming discursive and organizational factors.

We conclude that basic security is not a moral minimum in global politics, political rhetoric notwithstanding. This qualifies the notion of an emerging global social policy.

Family Configurations and Territorial Imprint. Initial Findings of the Famille Et Logements Survey

For the first time since the French population census was redesigned in 2004 (replacing the traditional exhaustive census with annual waves on population samples), a new round of the *Famille* (Family) survey was conducted in 2011. The new survey, organized by INSEE entitled *Famille et logements*(Family and housing), covers a sample of 360,000 individuals in metropolitan France. The LiLi team (INED-Migrinter) has been closely involved in this operation since the questionnaire design stage and is contributing to survey data analysis. The survey data describe the wide range of family configurations and the spatial distribution of families, notably in cases where family members have more than one place of residence. A sample of this kind offers an opportunity for detailed analysis of changes in family behaviours from one generation to the next and within different social groups. It also provides a means to quantify the frequency of atypical or rare family situations – stepfamilies, adopted children, non-cohabiting couples, etc. – which remain undetected in standard survey samples of between 3,000 and 20,000 people, but which are nonetheless socially significant. Last, the sample design offers scope for analyses at both national and regional levels.

After describing an original research tool that brings together research teams and public data producers, we will present a series of initial findings to illustrate the most original aspects of this survey. This is the first survey of its kind produced by French Statistics that (a) identifies same-sex couples; (b) gives exact details of the conjugal tie (cohabiting union, civil partnership, marriage) and (c) identifies non-cohabiting unions. We will therefore begin by examining the different types of union before focusing on family living arrangements in spatial terms (living in the household most of the time, sometimes, or living elsewhere) to identify national configurations and their geographical imprint.

LEMANCZYK, MAGDALENA* (The Kashubian Institute, m_lemanczyk@wp.pl)

Ethnic Mobilization of the Kashubians after the Democratic Turn in Poland

The Kashubian-Pomeranian movement is now one of the most – if not the most – culturally rooted and recognizable group in Pomeranian Voivodship (Northern Poland). Its ethnic activity has a centuries-long tradition, including socio-cultural, political and economic aspects. It can be argued that over the years Kashubs developed attitudes and ideas of self-governance, self-organisation, and civic-mindedness – not only in Poland, but also in Canada and in USA. A crucial role in struggles around the rights of Kashubian plays the Kashubian-Pomeranian Association (Zrzeszenie Kaszubsko-Pomorskie, ZKP) whose members are engaged in the process of interaction with all levels of political agendas (local, regional, national). The best example is Donald Tusk, President of the European Council, former Prime Minister of Poland, and also co-founder and chairman of the Civic Platform (*Platforma Obywatelska*) party. Poland's democratic breakthrough provided the Kashubian community with new opportunities and the ZKP started to play the role of a quasi-regional political movement but it must be pointed out that there has never been a Kashubian political party in Poland.

Civic engagement resulted in an increasing prestige of the community but it also led to internal debates about identity, the process of politicization, the commitment to culture and local activities etc.

Changes in the legal status of Kashubians were, on the one hand, an effect of democratisation

in Poland, on the other hand, a result of not always consistent regulations of the legal status of Kashubians, related to constitutional rights, educational and language issues, and access to the media.

The aim of this paper is to present the main trends of functioning the Kashubian-Pomeranian movement and its multidimensional effects that influenced symbolic and ethnic political representation, as well as the effects of the recognition of the only regional language in Poland ie. Kashubian language (2005).

Political Ontologies. Perspectives and Problems of New Materialist Scholarship

Recently, social and political theory has demonstrated a renewed theoretical interest in matter and materiality. The "new materialism", as it is sometimes called encompasses a plurality of different approaches and disciplinary perspectives, ranging from science and technology studies via feminist theory and political philosophy to geography. The new materialist scholarship shares the conviction that the "linguistic turn" or primarily textual accounts are insufficient for an adequate understanding of the complex and dynamic interplay of meaning and matter.

The talk critically engages with the ontological underpinnings and the political perspectives of the new materialism. By focusing on Jane Bennett's idea of "vibrant matter" and Karen Barad's account of "agential realism", I will discuss conceptual ambiguities and unresolved tensions in new materialist scholarship. The talk seeks to clarify these theoretical problems and argues for a relational account of agency and ontology that allows for a more materialist account of politics.

Values Attributed to Arab Professionalism in Arab Academic Journalism Education

This study is set in the Arab world in times of uprisings, when the media and social media are considered instrumental in giving a voice to the struggles for a better world and creating the future the Arab people aspire. Exploring the values attributed to professionalism in Arab journalism education, the theory of the professions suggests itself. The appeal of the professions is proliferating outside of the Anglo-American space, yet, hitherto, little is known in sociology about the professions in the Arab world.

Professionalism is a value that institutions of tertiary education in the Arab world strive for, in universities as well as in academic journalism programmes, with objectives highlighting marketable skills and/or sophistication, committing to excellence and ethics. This observation leads to the question whether this variation stakes out an understanding of Arab professionalism, and to which definition it points.

The study was piloted in Jordan, and carried out in Lebanon, Morocco (2013) and Egypt, Qatar (2014). Ninety-six face-to-face interviews were conducted by the author. The respondents represent media academia (faculty, students), media practitioners and their audiences, social media, journalistic associations, policy-makers, donor institutions.

The study suggests that Arab professionalism may well be described as "non-amateur, regular work that follows specific standards and provides a living (but does not necessarily create wealth). Ethical values preside over the profes-

sion. The professional is bound to achieve excellent work results through comprehensive and certified knowledge - possibly based upon academic research and gained in academic programmes - and through an altruistic motivation, servicing the beneficiaries, the individual as well as the society". Associations are not being introduced as a trait in journalistic professionalism, at least not pro-actively. Respondents highlight that this description of Arab professionalism outlines the ideal and does not necessarily reflect reality.

Changes Among Post-Patriarchal Men and Fathers

Recent German Family Politics aims at changing traditional attitudes towards mother- and fatherhood, masculinity and feminity. During the past decade, for example, introducing incentives for fathers taking parental leave as well as campaigns for more men in professional childcare show, that the patriarchal order is challenged. At the same time we still recognize a strong stability of gender order regarding the gendered division of labor, occupational payment for women and men, gendered practices of housework, caring etc.. The wellknown tension between persistence and transformation increases, not at least because of changing masculinities.

In our research projects on 'involved' fathers and men working in the child-care-profession we found an acceptance of what we call 'alternative masculinities'. We will argue that masculinities are in flux. Masculinities (can) appropriate elements usually associated with the feminine, yet they are at the same time intent on maintaining hegemonic masculinity as a reference point. We will discuss the impact those findings have on the patriarchal dividend. The question to ask is: Can men in general still gain the patriarchal dividend, as Raewyn Connell argued?

Gender and Materialities. How to Gain Access to Embedded Gendered Knowledge

Gender knowledge and gender order are also embedded in materialities. Beside that taken for granted knowledge from Gender Studies, in Sociology it is not that clear how we can gain methodological access to the empirical datum of embedded knowledge (in materialities).

In our study funded by the German Research Foundation on the production of inequalities in the dramaturgy of museums, we work with a practice-theoretical framework and the methods of unstandardized observation in public spheres of different types of museum. By working with a specific protocolling instrument, we collect on the one hand data of architectural elements, of ordering objects etc and on the other hand data of sensual and affective experiences in the social space of the museum.

We will contribute first finding from our research to the roundtable, focussing on the entry areas of museum as spaces of transition where gender play a central role.

LENZ, ILSE* (University of Bochum, ilse.lenz@rub.de)

Changing gender orders, varieties of gender regimes and institutional changes

The paper will argue that presently the gender order in postindustrial welfare states is in a process of transformation with open end. This is not only a result of the current crisis but of internal structural and institutional changes and global influences and interchanges. Main actors driving this transformation are global capitalism with its increasing economisation and flexibilisation of workforces, gender movements mobilising for equality and diversity of gender and sexualities, internet communities propelling international and transnational discourses and communications and political actors on the global and national level in the global multilevel system. Thus, I will argue for an action-oriented perspective and theorising the interconnections between actors effecting institutional change on the mesolevel and structural transformation at the macro-level.

The institutional changes are shaped by the variety of gender welfare regimes and their different development paths on one hand and international institutional learning on the other. This argument will be substantiated by comparing institutional changes considering the household, care work and gendered employment, gendered political participation in – now changing – liberal, social democratic and conservative gender welfare regimes. Changes in these institutions do not take

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the same direction and fundamental tensions emerge between them as with neo-liberal employment flexibilisation and stabilisation of the conservative household with its inequal division of labour.

But the transformation on the macro level and the institutional changes are interlinked with a deep going cultural change in the understanding of gender: Its meaning is shifting internationally from dualistic biologistic gender dualism to gender diversity embracing diverse social gender and sexual representations and practices. I will argue that theorising on macro transformation and institutional change on the meso level should be related to cultural change.

Preference Falsification, Social Influence and Triggering Events of Abrupt Social Changes

Kuran's models of *preference falsification* helped us to better understand why some abrupt social changes take us by surprise but are perfectly explainable in hindsight. To him, sudden changes in public opinion are sometimes the result of certain social influence processes that put an end to a lasting period of conceal-ment of private preferences. In this paper, we present an Agent-Based Simulation that allows us to overcome some of the main limitations of Kuran's models. (1) Unlike classical mathematical models based on homogeneous and utility maxi-mizing agents, we model heterogeneous actors guided by simple and cognitive feasible decision rules (heuristics) conditioned by time, space and social interac-tions. (2) Our model captures the central role of status hierarchies in *preference falsification*: the concealment of beliefs is highly dependent on face-to-face inter-actions between high and low status agents. (3) We also model the impact of *pref-erence falsification* on beliefs adaptation. While the concealment of private pref-erences could be seen as a result of social forces operating upon the individual, our model shows that micro-level social influence processes taking place in small groups explain the spread of *preference falsification*, but they also have the poten-tial for its reversal. Analyzing the simulation outputs we identify some triggering events that can lead to a massive disclosure of private preferences and thus to an abrupt change in public opinion. Specifically, we focus our analysis in the role of exogenous factors affecting (1) agents' beliefs about others' opinions, (2) people's political thresholds for preference falsification, and (3) changes in the distribution of private preferences. The knowledge of these triggering events could help us to improve our ability to steer social influence dynamics in such a way that the undesirable and distorting gap between public and private political preferences could be overtaken, thus leading to relevant social changes.

Social Ontology and Model-Building Practices of Generative Social Science

In this comunication, we seek to explore the interrelation between the philo-sophical debates on Social Ontology and model-building practices of the so-called *generative social science*. Our aim is twofold. First, we sketch how Social Ontology debates are conditioning computer simulations. For example, we show how the research agenda of computer modelers is affected by the debate on the "super-venience versus causal" nature of micro-macro relations or the debate on the basic building blocks of social reality. As we show, modelers' conceptualization (or lack of conceptualization) of the nature of social facts and processes seriously condition the explanatory potential of the *generative social science*. Consequently, we advocate a more explicit and clear philosophical underpinning of simulation practices. And second, we present some examples of how simulations practically resolve some of the traditional debates of Social Ontology. In daily practices of computer modelers, a practical solution is needed for philosophical questions as: what is a social structure? how social facts emerge? how institutional facts affect individual behavior? We conclude that Sociology would make a leap thanks to a deeper philosophical grounding of computer modeling practices and a more practical orientation of philosophical debates on social ontology.

RC16-199.3

LEONARDI, EMANUELE* (Centre for Social Studies, University of Coimbra, leonardi@ces.uc.pt)

Biopolitics As Method

The paper aims at delineating a general methodological framework – defined *biopolitics as method* – through which a situated object of study (in this case the current environmental crisis) can be politically investigated. Michel Foucault's no-tion of biopolitics, in fact, allows for the elaboration of a simultaneously ontolog-

ical and epistemological grid of intelligibility which is potentially able to fruitful-ly articulate the productive frictions between the *formal status* of theory and its *historical consistency*. In particular, the newly articulated concept of population whose peculiar naturalness opens up a new field of power intervention – the *en-vironment* – which will be defined as the permanent negotiation between natural and historical determinations.

Foucault's "biopolitical hypothesis" is discussed in depth and subsequently problematized in its methodological implications. As a red thread, the research question which is deployed is the following: *how can a biopolitical framework help us in defining the specific features of the ecological crisis*? To properly answer, the pa-per proposes a methodological understanding of the notion of biopolitics based on some revisions to it proposed by Giorgio Agamben and Michael Hardt and Antonio Negri. Through a critical discussion of some of their philosophical formu-lations, a (post)Marxist-Foucauldian methodology is proposed. It is grounded on three fundamental assumptions: a) the simultaneously ontological and historical character of the concept of *freedom* in the late Foucault; b) the politico-epistemo-logical explanatory power provided by the notion of *antagonistic tendency* as elab-orated by the Italian *workerist* tradition, and lately popularised by Hardt and Negri; c) the philosophical articulation of the relation between ontology and politics such as the one proposed by Agamben, in which the two elements are thought as *dis-tinct but inseparable*: they are not the same thing, but outside of their relation they lose their meaning as theoretical categories.

Working-CLASS Ecology Environmental Issues and Labour Resistance at the Ilva Steel Plant in Taranto, Apulia (Italy)

In what terms can we speak of the working-class as an environmental subject, and how can we understand its ecology? How does the concept of working-class help us advance our understanding of ecological crises and of environmentalism? The paper will address these issues in both theoretical and empirical terms. In the first part, against the background of the recently emerged field of environmen-tal labour studies, we will offer a critical review of environmental sociology and political ecology highlighting the contribution they have given to a redefinition of class and social inequalities in general. We will then elaborate our own definition of 'working-class ecology', as that which is developed upon the experience of na-ture, the environment, and environmental politics made by those human groups who are daily engaged in physical work for their subsistence and reproduction (in industry, service jobs, agriculture, fisheries etc.), and who typically live in seg-regated or marginalized spaces that can be understood as the 'sacrifice zones' of the industrial system. In the second part, we will apply such concept to the case of a working-class community in the city of Taranto, southern Italy, where the threatened closure of a giant steelmaking complex, the ILVA plant, due to serious violations of environmental regulations, is jeopardizing thousands of jobs, thus forming a threat to the local community's subsistence and identity. We will be investigating the surreptitious way through which both governmental and busi-ness actors have actively prevented the making of a class-based environmental consciousness in Taranto, by examining i) how the socio-discursive formation of the 'sacrifice zone' has historically emerged and shaped the local community's life and identity; ii) how a sustainable way out from such a production-based impasse can be envisioned, which crucially incorporate the working-class perspective.

Cosmopolitanism, European Identities and Solidarity

Solidarity and mutual recognition either among Europeans and non-Europe-ans have become the most urgent question in Europe. The Greek crisis, the unre-solved problem of the refugee flows to Europe, as well as the consequent rise of anti-European and xenophobic populism in some EU member states are all signs of this. In this paper we assume the cosmopolitan perspective (Delanty 2009; Beck 2006; Giddens 2007) - beyond its normative dimension, using it for empirical ap-plication - as a conceptual tool for the interpretation of changes in the values and in the structure of interests at the basis of European identities. We affirm, as main hypothesis, that in Europe there is an emergence of new cosmopolitan values – such as mutual recognition, care and hospitality and an attitude of openness as opposed to closure – coming from the hybridation of local/regional/national cultures (Geertz 1999). Aspiration to improve social justice and tackle global chal-lenges have become social practices, as well as ethical and political responses, and not only ideals. A "rooted cosmopolitanism" (Beck 2006) emerges through the experience and activism of civil societies, sometimes cooperating with munic-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ipalities and local institutions, which provide an important empirical evidence for conceiving solidarity beyond the terms of common economic interests, but also in terms of relations of mutual interdependence and engagement in shared projects of imagining another Europe. We focus on civil society actors, members of trans-national organisations - individuals as well as social groups – which we consider a significant target for an empirical exploration of cosmopolitan social relations as a factual process, as well as on the social and institutional conditions which allow/impede practices of inclusiveness which incorporate diversity.

Shifting Masculinities in Later Life - a Review of Research 2000-2015

Research on the lives of ageing men has undergone something of a renaissance in the past fifteen years. This has not only let the field of research grow rapidly but it has also meant taking on new approaches and new themes, including opening up a broader understanding of bereavement, caring, grandfatherhood, sport, sexuality, health, retirement and social networks among other roles and activities that are central to older people's lives in contemporary societies. The vast majority of these studies are qualitative, which allows us to understand the personal experiences of older men at the same time as viewing these within the changed parameters of later life. However, the role of masculinities in how older men make sense of their later life and how their sense of masculinity may have changed over the life course is not a consistent theme within the field of ageing men research. This may be due to an ongoing resistance within gerontology to acknowledge the role of gender, as well as an echo of a 20th century men's studies tradition of viewing masculinity as a topic of youth and fatherhood. This paper will present the central themes that have been developed from a review of literature on ageing men and masculinity from 2000 to 2015. The analysis will show that viewing the lives of older men through a traditional or dominant lens of masculinity does not help to understand what older men do or not do, or why and how they do it. Instead it appears that shifts to masculinities however nuanced are important to recognize if we are to gain a better understanding of older men's lives. What is still missing are biographical approaches to mapping changes to masculinities across the life course as well as the respective historical context in which they took place.

Building Cases: Victims of Trafficking As a Socio-Legal Category

How does a personal story become a case of a victim of trafficking? Based on an French-German ethnographic study of local institutional practices aiming at the control, policing and empowerment of 'victims of human trafficking', we analyse how a person comes to be categorised as a victim of trafficking, as she is processed through the system, from being identified as a victim by a social counselling centre, to being processed by the police and finally to the way the courts deal with these victims as witnesses. How do different local actors adopt legal categories in the daily interactions with their clients? The presentation will illustrate continuities as well as discontinuities within that process, circulations of knowledge between different actors, and power relations that produce certain representations of the 'victim of trafficking' within state discourse. Furthermore, we are interested in the ways in which such categorisations are being legitimised and which consequences result from these processes for the people subject to the classifications, and what 'looping effects' (Hacking 1986) result. Drawing on ethnographic research conducted in Germany as well as with regard to the framework by Valverde & Rose (1998) and Jane Scoular (2010), the paper will ask how different legal frameworks are employed or ignored in institutional regulatory practices in the case building and thus in the production of 'the trafficking victim' as a socio-legal category.

Therefore, we look at the 'Victim of human trafficking' as a social and political category, a classification in Hacking's sense (Hacking 2006), produced by a set of different institutional actors and their classifying and categorising actions of women in prostitution – rather than a mere statement of fact. Human trafficking is thus not a problem that can be fixed without understanding its shifting meanings.

LETAMENDIA, ARKAITZ* (University of the Basque Country (UPV/EHU), arkaitzletamendia@hotmail.com)

Linking Types of Protest Tactics and Structural Conflicts: Some Key Points from the Study of the Social Form of the Protest in the Basque Country

Do structural material conflicts –around the modes of distribution of resources or the control of coercive means of the national state- incentivize material and disruptive tactics of protest –like strikes, barricades or confrontational direct actions? On the other hand, do cultural and symbolic conflicts –around the recognition of minority identities or moral questions- encourage auto-expressive, visually symbolic and dramatized tactics of collective action –like parodies, performances and audiovisual modes of protest?

I suggest that nowadays this connection between types of conflict and protest is not total. To develop this idea, I present the concept of *Social Form of the Protest*, which refers to the characteristic types of conflict and protest tactics in a concrete place and time. Through the *Protest Event Analysis* technique, I apply it to the Basque case in the 1980-2013 period. In this case, I establish that whereas the structural conflicts remain fundamentally material –struggles around national liberation and modes of distribution of wealth-, the protest repertoires become progressively more auto-expressive, parodic and visually symbolic. To explain this process, I consider the dialectic interaction between creativity of protesters, repression of authorities and aesthetization of social practices caused by the specialization of time in the global late capitalism. Finally, I propose that in order to promote deep social changes through collective action, a certain coherence between types of protest tactics and structural conflicts –in function of their respective degree of materiality and symbolism- is required.

LEUNG, TERRY* (The Chinese University of Hong Kong, terryleung@cuhk.edu.hk)

"Consensus" in Participatory Management: What Is in a Name?

Participatory practices are increasingly recognized as the propitious vehicle for enhancing effectiveness of welfare provisions. As the participation rhetoric popularizes, more and more welfare service users and frontline practitioners are able to participate in decision-making for the organizations through the discursive spaces provided. Whilst proponents of the Habermasian model of communicative action trust in critical intelligence of both the service users and frontline workers to acquire communicative rationality and achieve eventual consensus through dialogue (e.g. Hayes & Houston, 2007), critics fear that emphasis on consensus can be easily exploited as a technology of legitimation to sustain management authority (e.g. White & Farr, 2012).

Modified nominal group technique was used in four service centres of a welfare service organization in Hong Kong, to seek consensus between the service users and service practitioners on the mechanism of user participation in respective service centre. The presentation will analyze the discursive process in sequential meetings for the purpose, and interrogate how validity claims were constructed for achieving consensus. The findings will inform further discussion on managing tensions in consensus building, and facilitating capacities for collaborative decision-making in participative spaces with the welfare service users and frontline workers.

Beyond Incineration? Beyond Incineration? Representing Gasification for Municipal Solid Waste (MSW) Treatment

As a low-cost alternative to landfill, incineration has become the dominant technology for managing municipal solid waste (MSW) – and increasingly contentious. Public controversy has opened up opportunities for better forms of energy-from-waste (EfW) conversion, especially advanced thermal treatment (ATT). This is promoted as cleaner and greener, offering better control over hazardous emissions and better energy recovery.

This paper analyses how diverse UK stakeholders represent gasification in relation to incineration as options for waste-management, particularly in support policies of state agencies and in local authority procedures for waste-management tendering. The analysis links two theoretical concepts: technological expectations becoming socially shared and thus mobilising resources (Borup et al., 2006, Kon-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

rad, 2006); and social representations whereby new ideas become anchored onto familiar frames of reference (Moscovici, 1984, 2000).

Some stakeholders have conflated *incineration* and *ATT* – for divergent agendas. NGO opponents have equated them in order to oppose the entire category for contradicting the waste-reduction hierarchy. By contrast, some industrialists have emphasised recent improvements which make incineration an ATT or even superior to such 'unproven technologies'.

By contrast, other stakeholders converge in promoting gasification through a differential anchoring. They represent small-scale gasifiers as going beyond incineration – by avoiding or solving its problems (hazardous emissions and bottom ash, 'feeding the beast', venting surplus heat, etc.), while also matching its advantages (reliable operation and thus bankability). Technological expectations, e.g. for more efficiently recovering energy and more flexibly replacing fossil fuels, have help to justify state support an early-stage demonstration gasifier, which later gained waste-management contracts with several local authorities. The technology was promoted as 'not incineration', despite NGO criticism that ATT is 'incineration in disguise'. Depending on what representations become socially shared, the outcome will affect the prospects for justifying new waste-treatment plants and for moving facilities up the waste hierarchy.

LEVIDOW, LES* (Senior Research Fellow, L.Levidow@open.ac.uk)

Sustainable Intensification: Agroecological Appropriation Versus Contestation?

The 'sustainable intensification' agenda has sought to make conventional agro-food chains more environmentally sustainable through a 'toolkit' incorporating agroecological methods, GM crops, no-till (optionally with herbicides), etc. There have been ambivalent responses – welcoming recognition of agroecological techniques, but also resenting their appropriation for productivist aims. Indeed, the concept 'sustainable intensification' blurs the distinction between an agroecological agenda and Green Revolution capital-intensive agenda. In Europe a hostile response has come from CSO-farmer alliances promoting agroecology to link several objectives: knowledge-exchange about biodiversity, farmers' independence from input suppliers, food sovereignty and short food-supply chains remunerating farmers for agroecological methods.

This tension arises from a neoproductivist paradigm seeking to reconcile productivist aims with resource conservation. It faces the challenge to locate the environmental sustainability and resilience of national food-supply systems within current globalisation patterns (Marsden, 2012). The tension can be illuminated by the theoretical framework 'food regime', for analysing potential transitions beyond the agro-industrial regime which has been globally dominant since the 1970s. New strategies for capital accumulation have incorporated 'green' or 'quality' products which were previously associated with alternative trajectories from social movements. This tendency has been theorised as a nascent corporate-environmental food regime (Friedmann, 2005, 2009); this concept helps to contextualise sustainable intensification.

The tension around that concept can also be illuminated by innovation-systems theory, whereby a niche innovation can either transform the wider regime or else accommodate it. The latter 'conform' strategy seeks to persuade dominant institutions that the innovation eventually can become competitive without long-term external support. Disagreements arise over proposals for institutional reform, depending on whether the empowerment strategy is to conform or transform (Smith and Raven, 2012). This framework helps to analyse how agroecological methods can play the role of incorporation and/or contestation vis a vis the dominant agro-food regime.

The Role of Sub-National Governance in Global Social Protection: A Comparative Case Study of Spain and USA in Health Care

Much research on how migrant workers and their families get protected and provided for, sidesteps a key set of actors who can hold enormous sway over social policies affecting immigrants: sub-national and regional governments. Although immigration policy is largely the responsibility of the national government, in countries where political power is decentralized, sub-national governments go beyond their national counterparts in regulating social welfare provision to immigrants, either by restricting or extending it.

Using the theoretical framework of "resources environment" (Levitt at al, 2015) to analyze, and understand the transforming world of global social protections, this paper aims to bring into discussion the way receiving countries conceive the access of immigrants to health care. To begin understanding the extent to which sub-national governments can offset national policies concerning immigrants' access to health care, this paper analyzes health care reforms in two immigrant receiving nations, Spain and the United States, with the focus on the tension between the state and the subnational governments: New York and California for the case of United States and the Autonomous Communities of Madrid and Andalucía for the Spanish case.

Both countries are among the most decentralized states and both have high levels of immigration (although Spain's history as a major immigrant receiving country is fairly recent), with the challenge to manage undocumented immigration. Nevertheless, they differ very strongly in the definition of universal health care coverage in historical terms and as regards the ranking in the world of their respective health care systems by the World Health Organization.

In this way, this paper shows 1) how two countries with different health care traditions conceive migrants access to health after the economic crisis and the implementation of the reform; 2) the extent to which sub-national governments, marked by left/right ideological perspectives, have scope in implementing the legislation.

Engendering the Urban Social Movement and Public Housing Policy in Brazil

This article analyzes the transformations taking place within the Sao Paulo housing movement and explores how these changes challenge the gender neutrality of housing public policy at different levels of the Brazilian state. Based on interviews of social movement leaders, state and civil society feminists and documental research, this paper first considers the political, social and economic context during the 2000s when women leaders in the Sao Paulo urban housing movement worked with feminists from the World Women's March to progressively integrate a gendered analysis of social relations in their understanding of urban housing issues. By characterizing the housing movement as a women's movement, it illustrates how a strategic alliance among this movement, the women's movement, civil society networks and sectors of the PT contributed to the adoption of public policies that take into consideration the specificities of urban women. Through different narratives, it illustrates the empowerment of this movement's female activists and demonstrates why social change concerning gendered public policy came from below and outside of the political system when different social and political actors forming a leftwing network pressured governments to elaborate new gender specific urban housing policies.

Since the Workers' Party (PT) gained power at the federal level in 2003, it created public policy conferences around women's and urban issues where social movements and civil society actors have participated in order to create a greater awareness about gender specific problems, propose public policies to address them and question the absence of gender equity in participative democracy. The "women and city" paradigm was constructed as a result of the new leadership role of women in the housing movement, and their collaboration with other civil society actors such as feminists, NGOs working on urban reform, international cooperation agencies and sectors of the PT.

Why Should We Study Fatality Ratio?

As Martin Shaw asserted, the new Western way of war in the post-Vietnam is typified by the transfer of risk from soldiers to enemy civilians to reduce own casualties, and by implication, the political costs stemming from the growing social sensitivity to casualties domestically. Risk-transfer is accomplished by using excessive lethality with relatively limited discrimination between combatants and noncombatants, while exercising greater caution to avoid civilian casualties probably increases own soldiers' risk. This paper addresses a methodological challenge: How to measure variations in risk-transfer. Scholars identified variations in risk-transfer practices in the same arena but have not measured their reflections in fatality numbers. Others measured fatality ratio to analyze risk-transfer, but only between soldiers and enemy civilians. They thus ignored the possibility that even within the same arena, variations or stability in the ratio between own soldiers to enemy civilians do not necessarily indicate variations in the scale of risk-transfer. Another variables, such as the nature of the mission or changes in the enemy's capabilities, may play their part as well. Therefore, more ratios should be considered. Focused on Israel-Gaza wars (2006-2014), three arguments are presented. First, the combination of four categories of fatality ratio should be factored in to measure variations in risk-transfer, as follows: between own combatants and enemy civilians; between own combatants and enemy combatants; between enemy combatants and enemy civilians; between own civilians and enemy civilians. Second, affinity between numbers and practices should be identified to test the extent to which the fatality ratio is mirrored by practice on the ground while vari-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ations in practices are reflected in variation in the fatality ratio. Third, different figures provided by different agencies should be weighted to evaluate how figures reflect different perspectives about how to discriminate between combatants and noncombatants, as the international law prescribes

15 Years of Expansion and Implausible Results. Effectivenes, Efficiency and Sustainability of CCTV System in PoznaÅ„, Poland.

Civil security technologies and their implementation are characterized by high complexity and multi-stakeholder involvement (Bierwisch 2015). Even though most studies note that development of closed-circuit television (CCTV) cameras is mostly supported by urban inhabitants (Honess and Charman 1992, Ditton 2000) evidence of its crime prevention capabilities are neither significant nor conclusive (Welsh and Farrington 2002, Piza 2014). More, academics and beneficiaries argue that both CCTV evaluation authors and sources used exhibits high uncertainty (BBCLA 1999, Armitage 2002). Vast majority of CCTV evaluations focus on one year prior and one year after camera's installation period (Darcan 2012, Gill and Spriggs 2005). Thus, legal, equity and privacy ambiguities are raised (Hempel and Topfer 2004, Dienel 2004).

On the one hand, Western European research acknowledges the omnipresence of CCTV in public spaces. A desire for a more comprehensive or codified decree is stressed (Morgan 2013). On the other hand, Eastern Europe countries are lacking such studies. This is particularly the case with Poland where proliferation of CCTV systems started at the beginning of the 2000s. Despite that, research on the influence of CCTV systems on urban environment features and crime reduction is yet to be developed (Waszkiewicz 2010, Lewandowski 2015).

Taking these into account, main aim of this paper is to address the evaluation question whether CCTV implemented in Poznań (ca. 500,000 inhabitants) with one the most developed CCTV systems in Poland is: a) effective; b) efficient and; c) sustainable. Study on the impact of CCTV on crime deterrence consists of five categories of crime: vehicle theft, theft from vehicle, vehicle burglary, aggravated assault and robbery. Results of the analysis covers 10 years (2005-2014) of crime recorded. Through a selection of three comparable pairs of areas (i.e. experimental and control) the processes of proliferation and legitimisation of this socio-technical devise will be deconstructed.

Social Construction of Technology As a Perspective Explaining Stability in Flood Risk Management in Poland.

Floods cause biggest losses among all natural disasters in Poland (Biedroń 2012). Two river floods of 1997 and 2010 created losses of 3 bln euro each (Choryński 2012). In coping with floods, the rapid increase of river water is conceptualized mainly as external, physically driven phenomenon (Kundzewicz 2011). Dealing with floods means for professionals to "keep water out" and the hydro-technical measures are promising tool for it. Simultaneously, hydro-technical approach is increasingly contested as ineffective in terms of flood management and as harmful for the environment (Żelaziński 2007)

At the same time, both academics and practitioners stress that flood risk management need to be more holistically and proactively managed (Driessen 2013) and that vulnerability approach should be taken into account with the same attention (Birkmann 2013). Different solutions are thus provided. In order to decrease future flood losses there is an emphasis put on improving insurance system and on using spatial planning more effectively (Jabareen 2013).

We claim the social constructivism perspective can contribute to the paradigm shift. Thus, the aim of this reserach is to analyze flood risk management in Poland throughout a period of 25 years from the social construction of technology perspective (SCOT). We argue that technological frames of reference that strategists, technicians and users have about embankments, reservoirs, crisis communication systems, meteorological warning, flood maps, drainage and irrigation infrastructures can explain (lack of) dynamics in flood management in Poland.

Through the 3 domains of SCOT (Orlikowski 1994, *i.e.*the nature of technology, technology strategy and technology in use) the following research questions will be answered: To what degree the process of framing technology:

a) Differs according to the group that actor belongs to?;

b) Has changed over time since communism collapse in 1989?;

c) To what degree it have influenced legal acts, programmes and projects conducted?

Feminist Online Activism: An Alternative Utopia or Same Old, Same Old?

Many feminists have grasped opportunities presented by social media to extend, deepen and develop engagement with feminist politics. However, the trolling of visible and audible women demonstrates that the web, once envisaged as heralding a new, democratic, public space, suffers under the same gender inequalities as the offline world. In the UK, some online abuse – or 'ebile' (Jane,2014) – directed at feminist commentators has received intense media attention (examples include Caroline Criado-Perez and Mary Beard) but many others also experience abusive, sexualised, misogynist online communication.

This paper reports findings from a national UK study of experiences of online abuse amongst people who debate feminist politics. Rather than focusing on definitions or categorisations of abusive communications, it will examine the experiences of those receiving them, asking: how do they describe their experiences? How do they respond to them? What impacts do these experiences have, especially in terms of their use of online space and engagement in feminist politics?

Drawing on a tradition of feminist research about sexual and domestic violence, it will explore whether online abuse is usefully conceived as a form abuse or violence towards women. Following this tradition, in which women are conceived as 'survivors', rather than 'victims', this paper will acknowledge the agency that survivors enact and will explore the strategies and tactics deployed to confront and challenge online abuse. Their reasons for, development and use of such strategies will be examined as a form of 'community policing' to understand how the community regulates itself, and how self-regulation connects with regulation by official social and legal agencies (Williams, 2006). In examining the consequences, the paper will address experiences of fear and women's engagement with on-line and off-line space, in the context of scholarship about the impact of fear and the gendering of space (Pain, 1991).

LI, CHENG* (University of Campinas, lichenglc5@hotmail.com)

Labour Surplus Economy Under Transitions

Labour surplus economy as a concept is considered as a theory analyzing an economy, featuring in mainly a great number of rural labour force in excess of its capacity under a certain level of development and the reallocation process of the so-called "surplus" labour force within its economic dualism (rural-urban). And the economic development model is often defined in terms of the transfer of a large proportion of workers from agricultural to industrial activities according to Fei and Ranis. Along with three decades of economic reform in China, under the context of rapid improvement of industrialization and radical expansion of urbanization, labour mobility experienced from a restrict control to a gradual loosening, presented an unprecedented mass transfer globally. Studies from UNESCO released that migrant workers contributed 16 percent of its GDP growth over the past 20 years.

However, such a development model is highly questioned by the persistent fermentation of the wide-spread labour shortage, plus gradual and diminishing of the demographic dividend, as well as the current growing labour costs. A balanced & developmental idea, based on the transfer neither in the way to create high urban unemployment nor in the way of keeping rural labour force underemployment or indifference in the unproductive activities, initiated a heterodoxy model - "Tripartite Labour Supply Model", spurned the traditional dualism of labour market by trichotomy. The innovative idea as to separate the labour market into triple divisions (agricultural producer, floating migrants and urban labour markets), together with 35 years database both from the theoretical and practical perspectives demonstrated an alternative interpretation over the so-called "Lewis Turning Point", released the profound reasons behind the increasing wages of migrant workers, as well as the possible solutions to the developmental bottleneck based on the labour surplus economy.

Occupational Safety and Health Guidelines for the Retail Industry

Centered among the service sector, retail development is expanding dramatically in most countries, especially in these developing economies, for example, nearly 20 per cent accounted for the regional GDP in ASEAN. This growth not only contributes towards the development of economy but also creates employment opportunities. For instance, 19 per cent in Brunei Darussalam, 18 in Indonesia, 17 in Malaysia and 16 per cent of Thailand employment share are taken up by the retail industry.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Occupational Safety and Health (OSH) is an important part of the workplace environment. Both the worker and the employer have a responsibility to keep the workplace a safe environment. Yet comparative mapping of several national profiles of OSH legislation has revealed current standards of OSH for the retail sector to be seriously inadequate or even absent. However, the public face of safety and health is often restricted to incidents when fatal accidents or serious incidents occur, it is also important to remember that OSH includes such aspects as the general wellbeing of all workers. Taking the retail workers as example, every year many people suffer long-term injuries at the workplace, subsequently affecting their lives and their ability to work. Furthermore, the retail environment necessitates some unique OSH conditions to be taken into consideration.

This research will determine the legal and practical provisions for OSH in the retail industry in various countries and retail establishments. These have been classified according to the various OSH risks, are to serve as guidelines for the implementation of specific legislation by governments, specific regulation by retail stores, as well as further campaigns and training by trade unions.

Becoming Labor Movement NGOs in China

This abstract is for RC44 roundtable session 'Transformation of Chinese labour.'

Can Chinese labor nongovernment organizations (NGOs) foster a labor movement through collective action? The prevailing literature suggests that they have not facilitated worker collective action and face strong constraints in doing so. However, some labor NGOs have changed from provider of recreational and legal services to advocates of collective bargaining and collective action since 2011. To explain this transformation, I argue that a critical dimension of understanding labor NGOs' activities and their roles in labor movement is their relationship with rural migrant workers (RMWs). I further argue that, through a process of collective experiential learning, some labor NGOs have transformed to empower worker collectives and contributed to a fledgling labor movement. Since the late 1990s, Chinese labor NGOs were mainly created by former RMWs and supported by funding sources that have concern for this marginalized population. The NGOs' initial practices focused on recreational and cultural activities and legal counselling and aid, which corresponded to the major needs of RMWs seeking to live and work in the cities. These earlier practices enhanced the NGOs' experiential learning about the effectiveness and viability of their action strategies. Contradictions between prior action strategies and the absence of significant improvements among RMW *groups* prompted some labor NGOs to experiment and/or to adopt another viable strategy, namely collective bargaining as a method to empower worker collectives to address the root causes of their problems. Collective experiential learning, i.e., practical learning between labor NGOs and between labor NGOs and RMWs, underlay the transformation process. These transformed, labor movement NGOs empower worker collectives through developing leadership among workers and advising them on collective contention tactics. I draw on one-year participatory observation of 5 labor NGOs in Guangdong and interviews with 67 staff from 38 NGOs.

Father's and Mother's Work Hours and Children's Social and Emotional Wellbeing

We are witnessing an important transition from post-industrial economies to service economies, so called the "24/7 economy." One of the consequences of this new economy is a high proportion of workers including parents who work very long hours. Around 19.0% of Australian fathers worked (> 55 hours weekly) when their children aged 5 and 20% did so when their children aged 8. In Germany 15% fathers of children with similar age (3-4) work > 55 hours weekly. This study examines the impact of fathers' and mothers' long work hours on the social and emotional wellbeing (mental health) of children and adolescents, using longitudinal data from the Western Australian Pregnancy Cohort (Raine) Study and fixed-effect models. The findings show a curvilinear relationship between parents' work hours and children's social and emotional wellbeing, and this relationship differs by child and parent gender. Optimal work hours (35-40 hours for mothers and 40-44 weekly for fathers) are beneficial for children's mental health, but not working or working less than optimal hours or working long hours (41 or more weekly for mothers and 45 and more for fathers) were associated with an increase in social and emotional problems in children. Mother's work hours primarily impact on girls' and fathers' work hours mainly influence boys' mental health. Together these findings are consistent with both work-family conflict and work-family enrichment theories, and they lend a strong support to social policies that aim to enable mothers to increase their participation in the labour market on the one hand, and on the other to enable fathers to take a greater share of child care and child rearing responsibilities in the home. Future research is needed to examine mechanisms which underpin the link between parents' work hours and children's social and emotional health.

Influence of Mothers' Work Hours on Child Overweight and Obesity: Evidence from the Western Australian Pregnancy Cohort Study

Abstract

The rapid increase in child overweight and obesity in the last four decades worldwide has drawn much research attention to the link between child body mass index and mothers' labour force participation, which have also increased in the same time period. Previous studies show a consistent association between mothers' work hours and the body mass index (BMI), independent of family socioeconomic and demographic characteristics. However, limited research has investigated the mechanisms that underpin the association between maternal work and child BMI. Further, much of previous research on this topic is based on cross-sectional data that do not allow researchers to address the issue of causality. The majority of exiting studies are based on US data and only few studies are conducted in other developed economies.

This study aimed to address these limitations, using longitudinal data from the Western Pregnancy Cohort (Raine) Study and both random-effects and fixed-effects models to provide robust estimates of the independent effect of mothers' and fathers' work hours on child body weight from age 2 through to age 10. The study further aimed to assess three potential mechanisms (TV viewing in children, family functioning, and child sleep) that may mediate this effect.

The Influence of Husband Involvement on Women's Postpartum Recovery and Family Relationship: The Case of Beijing

In nowadays China, the tradition of "Doing the Month" still has a significant influence on people's values and behaviors. However, this is to a great extent challenged by the rapid social economic development as well as the change of family structures. Under this circumstance, the role of the newborn's father who traditionally used to be excluded from the process of "Doing the Month", becomes more important than ever before. In this paper, we found that the husband's involvement (whether husband takes care of the newborn baby at night) not only have a great influence in helping with the wife's postpartum recovery, but also could improve the spousal even the family relationship. Therefore, relevant social regulations, policies, as well as organizations should further encourage husband to participate more in the puerperal care. So that more harmonious families could be built and more advanced culture of fertility could be promoted.

Ethnic Density, Immigrant Enclaves, and Latino Health Risks: A Propensity Score Matching Approach

This study aims to distinguish the effect of residential isolation from the effect of immigrant concentration in predicting health among the Latino population, the largest and the fastly growing minority group in the United States. It asks the following two research questions: (1) Are Latino ethnic density and immigrant concentration positively or negatively associated with them having high blood pressure and high cholesterol level? (2) Are these associations robust after taking into account neighborhood selection bias? Pooled data from the 2006 and 2008 Southeastern Pennsylvania Household Health Survey (N=1,563) were linked to census-tract profiles obtained from 2005-2009 American Community Survey. Results from both multilevel models and propensity score matching analyses suggested that neighborhood Latino density did have impact on Latino adults' health risks over and above individual risk factors, while the observed effect of immigrant concentration were likely due to selection bias as a result of residential preference. This study contributed to the literature by theorizing racial/ethnic isolation and immigrant concentration as two distinct residential patterns that may

　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

have divergent implications on minority health while directly addressing sample selection bias in observational studies.

Neighborhood Racial Diversity and Metabolic Syndrome: Findings from 2003-2008 National Health and Nutrition Examination Survey

This study investigated the independent association between neighborhood racial/ethnic diversity and metabolic syndrome in the United States, and focused on how individual and neighborhood characteristics (i.e., sex, age, urbanicity, neighborhood poverty) moderated this association. Individual-level data from 2003-2008 National Health and Nutrition Examination Survey (NHANES) were linked to census-tract profiles from 2000 decennial census. Stratified multilevel random intercept logistic regression models were estimated to examine the contextual effects of tract-level racial/ethnic diversity on individual risks of metabolic syndrome. Results showed that increasing racial/ethnic diversity within a neighborhood was associated with decreasing risks of being diagnosed metabolic syndrome among women, younger adults, and residents living in urban or poor neighborhoods. The findings point to the potential benefits of neighborhood racial/ethnic diversity on individual health risks. Study implications are discussed.

Join the Eco-Innovation Bandwagon: Evidence from Chinese Firms

China, the largest greenhouse gas emitter with a fast-growing economy, faces challenges in dealing with environmental issues. In three decades, the Pearl River Delta (PRD) region has become the "factory of the world" and one of the most polluted coastal zones in China[1]. Its industry sector consumed two-thirds of its energy and emitted the most carbon dioxide[2]. However, some companies have launched eco-innovations to improve their environmental performance.

What are the driving forces and barriers to eco-innovations? How technologies are being used to address environmental issues? This presentation seeks to address these questions and offer insights into innovation processes under business and sociological perspectives, namely the Porter Hypothesis and the theory of ecological modernization. It focuses on examining factors that may trigger the introduction of cleaner technologies and environmental improvements. Furthermore, the work aims to invite discussions on eco-innovations in the context of an emerging economy and technical resolutions of environmental issues through the greening of industry.

Based on empirical research conducted in 100 companies from more than a dozen industries located in the PRD region during 2013 and 2014, this work combines quantitative and qualitative methods of primary data collection including survey, interview, and participant observation. Secondary data, such as environmental audit reports are used to obtain detailed information on organizations' environmental performance and a better understanding of its products and processes.

The claims made by the Ecological Modernization and the Porter Hypothesis are supported in some respects. Strict environmental regulation can drive the process of innovation with environmental and economic gains. More specifically, such policy is most likely influence strategic decision-making for export-oriented firms and companies possessing capacities to take environmental actions. Although some firms move beyond control technology to cleaner technologies, most of them tend to focus on incremental innovation.

LIANG, GUOWEI* (Johns Hopkins University, gliang4@jhu.edu)

Labor Resistance and Capital Response in China's Auto Parts and Garment Industry

Conventionally, academics tend to portray Chinese migrant labor as not only in very low wage jobs but also was confronted with serious labor rights violations. However, given the rising wave of labor unrests and increasingly serious labor shortage in China over the last decade, these previous docile migrant workers have become the main forces of labor resistance. Then the question comes that how has capital and the state respond to fix this crisis of capitalism accumulation and dose migrant worker have other employment alternatives to fight back?

Based on author's ethnographic fieldwork in auto parts industry and garment industry in Pearl River Delta, which is the epicenter of labor resistance in China,

this paper will analyze capital-state's main strategies to fix the crisis of capitalism accumulation and explore the effects of labor's mobility. As a result of strikes in Auto parts industry, while many efforts have been make by state and/or capital to accommodate labor unrests, such as automation, products upgrading and promoting collective bargaining, the increasing tendency for management to recruit young and well-educated migrant worker and their ample employment alternatives also increased their potential of activism. In garment industry, it is very hard to substitute workers with automation and therefor highly relies on the labor input of skilled workers. Garment workers have been strategically make use of their workplace bargaining power to form resistance. In order to increase worker's productivity and reduce their resistances, garment mills tend to recruit married couples and older workers. However this strategy also leads to the emergence of capital's inability to cover the cost of labor reproduction of these married, order workers, such as the coverage of social insurance and schooling of migrant kids.

No One Left behind? an Institutional Ethnography on Indigenous Women's Experiences in Social Assistance

This study explores the disjuncture, which is resulted from the gaps between the governmental definition of needs and people's subjective one. Relying upon institutional ethnography as the approach to investigation, the inquiry starts with Orchid, an indigenous single mother's failed experience in applying for social assistance to solve her daily financial difculties. Taking upon Orchid's experience as the standpoint of inquiry, I interview the different social actors who participate in the institutional processes to understand the similar experiences shared by Orchid and the other "unqualified" applicants for social assistance.

Anchored with the embodied experiences in the local, this study traces beyond what happens at the specific time and space to examine the trans-local social relations of social assistance, which coordinate the particularity of individuals' experiences in encountering government policy and system. In this article, first I examine the institutional discourses, which attach to poverty and social assistance in the context of contemporary Taiwanese society. Then I illustrate how the government policy and institutional processes work to create the group of people who are eligible for entitling social assistance. Third, I explicate why and how the particular group of indigenous women are "unqualified" for social assistance. I examine how the material constraints and ideological discourses work together to (re)shape their gendered and racialized experiences.

Institutionalization of Gender Equality in Contemporary Taiwan: A Preliminary Institutional Ethnographic Exploration

Three decades after the women's movement started, contemporary Taiwan has witnessed big progresses in amending and legislating gender-related laws. The women's movement also helps to establish the academic discipline of Gender Studies, which means that experiences of gender has been institutionalized as a discipline of knowledge. Not only is gender being institutionalized as knowledge, it is institutionalized as everyday work across different sectors, departments, and organizations. Along with the implementation of Gender Mainstreaming in 2000, the institutionalization of gender equality within the public sector brings in resources and funding to the third sector. Examining the work knowledge of first-line workers whose work are associated with gender-related laws enables us to explore the power relations within the institutionalized discourse of gender equality. Starting from the standpoint of first-line workers, the researcher has conducted fifteen interviews, including workers from NGOs, the public sector, and schools, in order to explore their everyday work and their work knowledge which reflects the ideological practices of the institutionalized discourse of gender equality. Meanwhile, the researcher keeps field notes on her everyday work and interactions with first-line workers from gender-related work. The preliminary results of the research are (1) the patriarchal nature of social relations embedded in the public sector and the third sector are often in conflicts with the workers with feminist or gender studies backgrounds; (2) work knowledge differ from first-line workers who possess degrees in gender studies and workers who are not trained in relevant areas which results in different ways of institutionalizing gender equality in the local fields; (3) the institutionalized discourse of gender-related work is social-work oriented which diminishes work knowledge from a feminist perspective. The preliminary exploration demonstrates that work knowledge of the first-line workers participate in different processes of institutionalization in the local practices.

Dispute Resolution in Transitional China

This paper addresses the questions of when and how Chinese people bring inter-personal conflicts to various dispute-resolving revenues. I combine a representative social survey of 560 individuals in a major Chinese city with in-depth interviews and ethnographic observation in a court-affiliated mediation office in the same city. Analyses of the survey data focus on how Chinese peoples' perception of law's legitimacy relates to their tendency to resort to formal and informal mechanisms as conflict-solving strategies. I find that both the perceived level of law's legitimacy and reported tendency to litigate vary across different types of laws. The decision of whether to moblizing formal legal resources appears to be a combination of the invidual's perception of the legitimacy of the law, her evaluation of the nature of the conflict, and the material, social, and cultural captial at her disposal.

Analyses of interviews and ethnographic observation shed light on how Chinese people make the decisions of (not) going to court and how they navigate the system with either help from or obstacles set up by legal professionals.I find that, similar to what happens in lower level courts in other parts of the world, ordinary Chinese citizens often seek redress from formal legal institutions in the hope of being acknowledged and empowered while not having in mind the likely outcome of further loosing control over the processes in which their conflicts unfold.

LICHTENSTEIN, BRONWEN* (University of Alabama, blichten@ua.edu)

HIV Stigma, Sexual Disclosure, and the Law

This paper addresses the growing divide between the U.S. public, which largely believes in punishing PLWH for non-disclosure to sexual partners, and the public health sector, which seeks to reform HIV laws in order to destigmatize HIV, promote testing and ART, and reduce HIV infections around the globe. I will begin the talk by describing the impasse between law enforcement and public health actors over effective measures for HIV prevention in the United States. The talk will highlight the case of HB50, an Alabama bill that seeks to increase the penalty for sexual non-disclosure from a misdemeanor crime with a 3-month jail term, to a felony crime with a 10-year prison term and registration as a sex offender. I will describe the origins of the bill in relation to national publicity over church-going African American women in Montgomery, Alabama, who were infected by their pastor in 2015. I will also describe health advocates' countervailing efforts to stop the bill because of their concerns that harsher penalties would lead to greater stigma and less willingness to be tested for HIV or seek medical care in the AIDS Belt of America. The talk will offer sociological explanations for the increase in HIV criminalization across the United States. These explanations include the lack of awareness about medical advances in HIV care, homophobia in the socially conservative states, conflations between "HIV and murder" in response to high-profile cases about male predators and women victims, and the desire for revenge when ideas about betrayal, immorality, and lethality influence political actions on HIV/AIDS. I will argue that these actions stand in the way of "A World Without AIDS" if legalized stigma interferes with public health goals for eliminating HIV.

Invented Communities and Social Vulnerability. the Post-Disasters Dynamics of Extreme Events

A current challenge around the world is to decrease vulnerability and increase the robustness of societies in order to minimize the adverse effects of climate-related extreme events. Experience of extreme events can be used to reduce the vulnerability by developing capacities to handle extreme events. Thus, even if extreme events cannot be fully prevented or even predicted, it is possible to develop more robust systems. This paper focuses on the social dynamics of disasters on local level; what happens with local identity and social cohesion after experienced extreme events? Which spatial ontology – in terms of local identity and geographical belongings – are constructed, through which processes is it constructed and with what implications with regard to social vulnerability? The empirical object of this study is the largest forest fire in Swedish history, which took place in August 2014 and involved 2,300 person to fight the fire and evacuate people. The empirical material consists of two interview studies, of forest professionals involved in managing the forest fire or its aftermath (N=10) and of stakeholders (eg. forest owners, residents, environmental organisations, insurance companies) (N=19), and a postal surveys to all property owners (land owners, permanent residents, summer cottagers, N=1000) in the area affected by the fire. The analysis finds that a specific local community where invented, in the sense that earlier conflicts

where down-played and blame was externalised leading to the shaping a shared identity and unified experiences. This identity increased the community's capacity to handle the post-fire situation. At the same time, this homogenisation of experience and polished affinity implied a suppression of differences and dissimilarities that existed in the community. Thus, the post-disaster dynamics are pivotal for which social practices that emerges and which local identity that are invened, which greatly affect the social vulnerability of a community.

The Axial Status of the Enlightenment

The term "Axiality" embeds two concepts. One refers to religious/philosophical movements based on other-worldly, transcendental premises that originated in what Jaspers called the Axial Age: Hinduism, Confucianism, Judaism, Greek philosophy. Bellah's *Religion in Human Evoluti*on provides the most masterful analysis of these movements. The second, even more fundamental concept embraces later religious and philosophic movements, including Buddhism, Christianity, and Islam, each with various sectarian offshoots, that developed in large part as intensely meaningful recombinations of elements of the original Axial Age movements. All of the axial movements include basic conceptions of the sacred that transcend the profane or everyday world and anchor systems of belief about the good, the right, the valuable for all dimensions of human life. The philosophies of the Enlightenment share with the axial religions the key attribute of transcendental foundation, but do not concern the sacred or source of meaning and value as applying to human experience in its full diffuseness. Rather the Enlightenment conception of Reason introduced a cultural differentiation that established secular (or profane or everyday) morality as a sphere of culture autonomous from religion. Along with transcendental Reason, conceptions of natural law and natural (or human) rights, optimism regarding progress in practical human affairs, and this-worldly conceptions of duty and obligation, each element viewed as prior to experience in any specific societal setting, imbued secular social life and institutions with a new dignity. Philosophy and practical social thought turned to problems of the *design* of social institutions with an ethical seriousness new in human history. The emphasis on rationalization of institutions of secular society that has characterized the modern age derives from the transcendental anchorage for Reason achieved by the Enlightenment. The paper will explore this conception of moral culture deriving from the Enlightenment.

The Fragmentation of Social Conflicts in Western Europe. a Typology of Non-Institutionalized Labor Protests

During the last few years, Western Europe has experienced a new cycle of social unrest. This wave of conflict was caused by the financial and economic crisis since 2008/09 and the following austerity politics in EU member states. Besides economic recession, the crisis has led to severe social cuts, interventions into collective bargaining, and lower wages. Therefore, many of the recent struggles focus on social issues and the working environment. However, significant proportions of these conflicts such as bossnapping in French companies 2008/09 or riots in London 2011 and Stockholm 2013 take place outside the established institutions of industrial relations and the parliamentary system respectively. We argue that social conflicts in Western Europe increasingly fragmentize. As a result, there is a growing number of "non-institutionalized social conflicts", which remind on former epochs of capitalism like 19th century industrialization or food riots in late 18th century. In order to make this hypothesis plausible, we apply a three-step argument: Firstly, we propose a theoretical framework that allows an appropriate explanation of the ongoing "barbarization of social conflict" (Honneth). We state that "institutional isolation" (Dahrendorf) of class conflict, which in the postwar period was established on three levels (welfare state and parliamentary system; sectoral collective bargaining; co-determination on the plant level), erodes today. This erosion of formerly well-established conflict facilitating institutions eventually leads to a greater appearance of "non-institutionalized social conflicts" characterized by a new repertoire of contention. We then, secondly, present a typology of these new conflicts consisting of (I) mass protests and political strikes, (II) plant occupations and (III) urban riots. Thirdly, we use original data from JenaConflict-Dataset (n=5521) to analyze frequency and distribution of these conflicts in the last decade. Additionally, two case studies of Germany and England for what qualitative data is adopted are briefly introduced.

Internet Use and Well-Being in Later Life: A Midway-Level Approach

According to previous research, Internet use may play a role in promoting well-being in later life, since there is considerable evidence of a positive association between Internet use and psychological well-being. Yet, there are substantial weaknesses in the existing body of knowledge, particularly the lack of differentiation between the four main online functions common to older adults, namely, *communication*, *information*, *task performance*, and *leisure*. Most studies have treated Internet use as a single activity, and this macro-level approach is likely to provide potentially misleading generalizations. Other studies have focused on specific online activities, i.e., they have used a micro-level approach that cannot be extrapolated to generalizations. Thus, the role of Internet use in promoting healthy and active aging was poorly understood. Applying a mid-level approach, namely, simultaneously but separately examining each of the four main online functions, the present study aimed to explore the associations between the use of each function and users' well-being. Data were collected online with a sample of 306 Internet users aged 50 and over. Respondents were asked to report the extent to which they make use of each function, and evaluate their well-being based on two measures: depression (measured by the CES-D scale, Radloff, 1977) and life satisfaction (measured by the SWLS, Diener et al., 1985). Analysis indicated that using the Internet for inter-personal communication and for information seeking were the most common usages, followed by task performance (e.g., banking, shopping). Using the Internet for leisure and recreation was significantly less common. However, of the four functions only leisure significantly associated with well-being: it was positively associated with life satisfaction and negatively associated with depression. Results remained stable after controlling for sociodemographic variables. These findings pointed at a paradoxical situation, according to which the most beneficial use of the Internet is the one less adopted.

Measuring Risk Perception in Later Life: The Perceived Risk Scale

Purpose: This study aimed to initially examine the psychometric properties and factor structure of a new integrative risk perception instrument, the Perceived Risk Scale (PRS). The various existing instruments evaluating risk perception have been focusing on specific hazards/risks (e.g. environmental, technological) and evaluated hazards by measuring/assessing probability and severity by the associated adverse effect. Unlike those instruments, this nine-item scale simultaneously refers to various risks including terror, health risks, car accidents, violence and financial risks. To date, risk perception has not been evaluated as an integrative subjective broader perception, and it was hardly explored in older age. Potentially applicable to additional age groups, this tool was intentionally developed to be appropriate for older adults coping with general and age-related challenges.

Methods: The study was based on an online survey with 306 respondents aged 50 years and over, of which half resided in a high risk area (namely in region with high probability to rockets attacks). The RPS was examined using exploratory factor analysis. Concurrent validity was also examined.

Results: The EFA indicated a two-factor structure, 'later-life risks' and 'terror risks'. A high percentage of explained variance, as well as good internal consistency were found for the entire scale and for each of the factors. Concurrent validity was supported by significant positive associations with respondents' depression and negative associations with their life satisfaction.

Conclusion: These findings suggest that the RPS is reliable and valid, and appropriate for evaluation of risk perception in later life. Such evaluation may be most useful on predicting and optimizing of intervention on risk reduction and well-being in later life.

Beyond Civil Society: Spiritual Empowerment, Work, and Social Engagement in China

This paper investigates how the spiritual empowerment in the workplace enables Chinese Christian professionals to exert positive impacts on the wider society. Much of the broader literature on spirituality, religion and the workplace shows how religious values can contribute to enhancing the effectiveness of business leaders, the creation favourable workplace environment, the improvement in the workers' and organizational performance, etc. Many such studies tend also to advocate that business leaders, managers and entrepreneurs pay much more attention to the cultivation of a conducive environment for workers to integrate spirituality and religiosity into their working life. Insights from such studies, while

useful in certain cultural and political contexts (such as those in Euro-American societies where most of these studies are conducted), might not be applicable in an authoritarian political regime like China due to the high level of political sensitivity surrounding religious matters. Based on in-depth interviews and participant observation, and utilizing concepts of spiritual and religious capital, this paper shows that, firstly, Christian professionals eschew a clear separation between religious faith and work. Importantly, they seek to exert positive impacts in the workplace as a way to transform the wider society deemed mired in serious moral crisis. Many respondents discursively construct a boundary separating Christians and non-Christians in the workplace, regarding themselves as more 'moral' and imbued with positive qualities that are lacking in the workplace and contemporary society. This happens in a socio-political context where Christians constitute a religious minority and where religion, especially Christianity, is still deemed a highly sensitive cultural and political issue in China. Secondly, this paper argues for an alternative to the usual 'civil society' approaches to understand religious social engagement in authoritarian political regimes.

Religion, Social Media, and 'Civil Society' in China

This paper examines whether religion, through a case study of online Christianity, contributes to the development of civil society in China. It examines how the global interconnectedness of the Internet influences the Christians in China and the diaspora, in terms of how they communicate their faith, build their communities and mobilize for their causes. Herbert (2011: 633) has noted that electronic media has enabled "wider circulation of religious symbols and discourses across a range of social fields, which tends (even in secularized societies) to move religion out of the differentiated religious sphere to which it is notionally confined in liberal versions of modernity and into various contested public spheres". The paper discusses whether online social media allows Chinese Christians in the mainland and overseas to engage in religious and socio-political discourses in the same space, and if boundaries between the social and political domains established by the modern secular Chinese state are constantly being blurred and transcended in the process. The paper then examines whether the potential blurring of boundaries between the "religious" and the "socio-political" in the online practice of Christianity enables Chinese Christians to mobilize themselves in respond to socio-political issues, and hence becoming actors in, and contribute to, the development of civil society in China.

The Digital Workers in Brazil: Between Creativity and Precariousness.

This paper analyzes the work of software developers and the changes in canonical conceptions of regulated labor. To work is to stay most of the time connected on social networks as a means those workers stay on the market, as well as a condition of constant updating and qualification in the profession. The despacialization of the labor becomes a form of organization of capital and enterprises, with profound implications on the worker's lives and fragilization in the division between labor and personal life. The research studied these "symbolic analysts" "in companies with different sizes and customers aiming to recover the perception of these workers on" digital work "as "creative work "and your strategies to stay in career and in the labor market.

Brazilian Ouvidorias: Searching for the Public Use of Reason

The Brazilian Federal Constitution of 1988 spread and reinforced several experiences of participation that formerly had a disjointed existence. This was the case for public *ouvidorias* (ombuds offices), one of the several participatory institutions (such as councils and conferences) which were empowered in the context of re-democratization. At that time, the focus on participation as an input for developing democratic political representation created highly enthusiastic expectations concerning the future of democracy in Brazil. The *ouvidorias* are concerned with the promotion of the public use of reason within state organizations. Currently, they are fully institutionalized. There are over 1.000 *ouvidorias* at the federal, state and municipal levels. Although they are institutionally consolidated, little is known about these institutions. Whether in the academic field or in State statistics, there are few studies and information on this wide universe. In this research, I took into account the regulations of 93 *ouvidorias* at the federal level in order to analyze the conditions of political autonomy that they are granted. The research results

***** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

reveal precarious conditions for the achievement of their democratic potentials. The main problem concerns the mechanisms of choice of the highest authority of an *ouvidoria*. Often the person who fills this position is chosen by the highest authority of the organization that should be socially controlled. The current way that the chiefs of *ouvidorias* are nominated, the lack of time delimitation for the duration of their terms, the reduced influence on the decision-making process of governmental organizations and the absence of accountability practices aimed at the broader society are the main obstacles that threaten social control and participation within these institutions, as well as reinforce the patrimonialist features they were supposed to counter.

LIMONCELLI, STEPHANIE* (Loyola Marymount University, slimonce@lmu.edu)

Laboring Against Human Trafficking: INGOs, Unions, and Anti-Trafficking Responses

Though less publicized than sex trafficking, labor trafficking has been a focus of many activists over the last 25 years. Hundreds of international nongovernmental organizations (INGOs) are working to address labor trafficking in the world today, yet only a handful of unions have been part of counter-trafficking responses. This is surprising given that unions have in the past participated in the anti-sweatshop movement and in combating child labor. Why haven't these groups joined forces? Through a qualitative study consisting of a content analysis of the reports, pamphlets, and web-based materials of a stratified sample of 30 INGOs and 10 unions working on labor trafficking, as well as in-depth interviews with representatives of these organizations, this project explores the framings of labor trafficking used and the alliances formed. I hypothesize that framings of labor trafficking as a criminal activity and/or a problem primarily of migration may be part of the reason for the disjuncture. In addition, different organizational structures and mandates play a role, with INGOs often working to provide services to victims after the trafficking experience and unions working to address working members' concerns. This may facilitate the perception that each group is dealing with different populations and forestall understandings that labor trafficking can happen in the context of legal migration as well as in industries (e.g., construction, agriculture, hospitality, etc.) in which both formal and informal work takes place.

LIMONCELLI, STEPHANIE* (Loyola Marymount University, slimonce@lmu.edu)

The Emergence and Development of Anti-Human Trafficking Advocacy Worldwide

Efforts to combat human trafficking have grown in the last few decades, with states, international governmental organizations (IGOs) and nongovernmental organizations (NGOs) working around the world to address the trade of people under conditions of force, fraud or deception. How has contemporary anti-trafficking advocacy developed globally and why? One perspective, world polity theory, emphasizes the development of global norms disseminated by an increasing number of international nongovernmental organizations (INGOs) around the world, while another, the "coercion" perspective, tends to emphasize the way powerful states in the world system dominate advocacy efforts due to political power, control of funding, and dominance in agenda setting in IGOs. Does one of these models explain the emergence and development of anti-trafficking advocacy better than the other?

Using data on 1,861 anti-trafficking NGOs worldwide as well as secondary sources to qualitatively analyze the historical development of anti-trafficking advocacy globally, this study demonstrates a more complicated process than either perspective predicts. While world polity correctly posits the important influence of IGOs and INGOs, it tends to underestimate the role of domestic NGOs and states in advocacy and overstate the coherence of world cultural principles and cooperation among INGOs. While the coercion perspective shows us that powerful states can work to define issues in ways that support their interests and engage in global agenda setting using political and economic influence, it underestimates the autonomy and/or influence of states and INGOs headquartered in the global south. A more nuanced perspective would help us to better analyze the emergence and development of issue-based advocacy worldwide as well as the role of states, IGOs, and NGOs in global governance.

LIN, CHUN-WEN* (National Chiayi University, linchunwenellen@gmail.com)

One Story, Differently Told: What Went Wrong in the Competence-Based Schools

For many years in educational systems worldwide, not falling behind, if not standing out, in global economy competition has been attached a highest pri-

ority. Taiwan made no exception; however, in the 'competence' rush came the dilemmas. For one thing, educational equality has been compromised to the extent that the competent students, very often from upper-middle classes, got a lot more so, and the incompetent even more incompetent in, say, communication (in foreign language and in mother tongue as well) and leadership. For the other, due to the emphasis on competition, the once long-held Confucian values, for example, humility and benevolence, have been greatly eroded. Students nowadays have become success-driven and for that matter, individualistic.
